**Results:** The majority of women reported being infected by a stable partner, and were diagnosed late. Forty-one percent were denied services at least once, and fifty-six percent travel to another municipality for care, traveling an average of two hours each way. More than one-fifth of the sample reported violations of confidentiality by health workers with respect to their diagnosis. One hundred percent reported stigma associated with their HIV diagnosis. Women in the sample reported less access to education and economic resources than the general population, and almost half reported having not eaten any meals on more than one day in the past week. Forty percent of women had suffered consequences from the armed conflict including internal displacement and physical and sexual violence, and thirty-nine percent reported domestic abuse.
**Conclusions:** Women infected by a stable partner are outside of typical risk groups targeted by current prevention efforts, treatment and services. Access to services are complicated by distance, lack of money for transportation, and childcare/homemaker duties. Stigma and discrimination worsen economic conditions of these women, and high rates of confidentiality violations and unresponsive civil services along with high rates of physical, emotional and sexual violence have caused mistrust in the justice and health systems.
Healthcare services must be adapted to serve the needs of poor, rural, female patients. These services must guarantee transportation costs and nutritional supplements in order for patients to successfully continue treatment.

# RACISM AND OTHER FORMS OF ETHNICITY-BASED SOCIAL EXCLUSION

## THPED396

### EXPERIENCES OF DISCLOSURE AND DISCRIMINATION AMONG BLACK AND OTHER MINORITY ETHNIC GROUPS IN THE UNITED KINGDOM: FINDINGS FROM THE STIGMASURVEYUK 2015

S.G. Okala[1], W. Crenna-Jennings[2], I. Lut[2], L. Benton[2], P. Kirwan[1], M. Hibbert[1], D. Asboe[3], C. Kunda[4], R. Mbewe[4,5], J. Morton[4,6], I. Reeves[7], M. Ross[4,8], W. Sseruma[4,9], G. Valiotis[4,10], A. Wooton[4,8], V. Delpech[1], A. Hudson[2,4]
*[1]Public Health England, London, United Kingdom, [2]Family Planning Association, London, United Kingdom, [3]British HIV Association, London, United Kingdom, [4]StigmaIndexUK2015 Advisory Group, London, United Kingdom, [5]Positively UK, London, United Kingdom, [6]Terrence Higgins Trust, London, United Kingdom, [7]Homerton University Hospital NHS Foundation Trust, London, United Kingdom, [8]Clinic Q, London, United Kingdom, [9]NAZ, London, United Kingdom, [10]HIV Scotland, London, United Kingdom*
*Presenting author email: s.okala12@imperial.ac.uk*

**Background:** The HIV epidemic in the UK disproportionately affects persons from ethnic minorities. We used the community-led STIGMASurveyUK2015 conducted among people living with HIV (PLHIV) to examine differences in the experiences of HIV-related stigma and discrimination between people from black, Asian and other minority ethnicities (BAME) and white UK born people (non-BAME).
**Methods:** The HIVStigmaSurveyUK2015 invited PLHIV through >120 cross-sector community organisations and 46 clinics to complete an anonymous web-based questionnaire. The inclusion of BAME people was defined by community groups. Descriptive, univariate and multivariate regression analyses were performed.
**Results:** Among 1,576 participants, 583 (37%) identified as BAME, including those of black ethnicity (58%), white-non UK born (19%), Asian (6%) and other ethnicities (16%). BAME mean age was 43 years (range 17-76), 53% were men, 44% women and 3% trans. 87% of black persons identified as heterosexual, 65% of white-BAME, 57% of Asian and other ethnicities as MSM vs 81% as MSM for non-BAME.
Significantly fewer BAME felt in control about the disclosure of their HIV status (82%% vs 92% p<0.001) and had disclosed their status to friends (64% vs 86%, aOR:2.1, 95%CI:1.6-2.) and employers/co-workers (38% vs 50%, aOR:1.5, 95%CI:1.1-2.0) than non-BAME, adjusted for sexuality and gender. 18% of BAME felt that they had no or low levels of support when disclosing to their sexual partner, family, friends, or co-workers/employers vs 10% among non-BAME (p<0.001). Disclosure in the healthcare was high in both groups: 93% for BAME vs 97% for non-BAME. However, fewer BAME felt supported than non-BAME (79% vs 88% p<0.05). Moreover, 40% of BAME reported being treated differently in healthcare during the last 12 months vs 29% of non-BAME (p<0.001) and among these a higher proportion of BAME avoided care when needed compared to non-BAME
(71% vs 57% p<0.001).
**Conclusions:** In the UK, PLHIV from BAME communities are particularly vulnerable to HIV-related stigma and discrimination, with less control over and support during disclosure of their status and more experiences of discrimination in healthcare. These findings call for culturally and settings targeted interventions to address HIV-related stigma and discrimination that severely affect PLHIV access to healthcare and support.

# EXPERIENCES AND IMPACTS OF HOMOPHOBIA AND TRANSPHOBIA

## THPED397

### SOCIAL ECOLOGICAL IMPACTS OF HOMOPHOBIA AND TRANSPHOBIA ON HIV VULNERABILITIES AMONG GAY, LESBIAN, BISEXUAL AND TRANSGENDER PEOPLE IN SWAZILAND

C. Logie[1], J. Jenkinson[2], V. Madau[3], S. Sibiya[3], X. Mabuza[3], W. Nhlengethwa[4], P.A. Newman[2], S. Baral[5]
*[1]University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada, [2]University of Toronto, Toronto, Canada, [3]Rock of Hope, Manzini, Swaziland, [4]Southern Africa Nazarene University, Manzini, Swaziland, [5]Johns Hopkins University, Baltimore, United States*
*Presenting author email: jesse.jenkinson@gmail.com*

**Background:** While Swaziland has a broadly generalized epidemic, gay, bisexual and other men who have sex with men (MSM) have distinct HIV acquisition and transmission risks in Swaziland. Little is known, however, about the lived experiences of these men as well as transgender persons, and lesbian, bisexual and other women who have sex with women (WSW) in Swaziland. We used a social ecological theoretical framework to explore experiences of homophobia and transphobia, and the impacts of homophobia and transphobia on HIV vulnerabilities, among lesbian, gay, bisexual and transgender (LGBT) people in Swaziland.
**Methods:** We conducted semi-structured in-depth interviews with MSM (n=23); WSW (n=16); and transgender persons (n=12) in Mbabane and Manzini, Swaziland. We conducted key informant interviews (n=13) with persons working on LGBT, HIV and human rights issues, and with media, educators and peer research assistants. Interviews were conducted in siSwati, digitally recorded and transcribed verbatim, then translated into English. We analysed interviews using narrative thematic techniques to identify and report themes.
**Results:** Participants discussed multi-level experiences of homophobia and transphobia at intrapersonal, interpersonal, community, and structural levels that collectively appear to potentiate HIV vulnerabilities. Intrapersonal experiences of internalized stigma reduced self-esteem, which lowered safer-sex self-efficacy and contributed to sexual risk practices. At the interpersonal level, participants discussed engaging in multiple, concurrent, and heterosexual relationships to hide their sexuality. Participants described alcohol use as a strategy to cope with homophobia/transphobia, and LGBT community socializing centred in bars/clubs. Homophobia intersected with HIV-related stigma to produce beliefs that LGBT persons were 'demonic', 'promiscuous', and responsible for the HIV epidemic. Participants reported experiences of homophobic 'corrective' rape targeting gender non-conforming persons. At the structural level, the criminalization of homosexuality and discrimination in healthcare settings limited LGBT persons' access to HIV prevention, including education, condoms and lubricant.
**Conclusions:** Findings reveal the utility of the social ecological model in understanding multi-level impacts of homophobia and transphobia that elevate HIV vulnerability among LGBT persons in Swaziland. Comprehensive approaches to HIV prevention should consider addressing distal drivers of HIV—such as homophobia and transphobia—to ensure access to the HIV prevention and care continuum, including new prevention technologies, among LGBT persons in Swaziland.

## THPED398

### DEPRESSION AND SEXUAL BEHAVIOR STIGMA AMONG MEN WHO HAVE SEX WITH MEN (MSM) IN THREE WEST AFRICAN NATIONS

S. Stahlman[1], F. Drame[2], A. Kane[2], D. Diouf[2], R. Ezouatchi[3], D. Castor[4], A. Bamba[3], A. Kouamé[5], M. Thiam[3], I. Njindam[1], G. Fako[6], N. Leye-Diouf[7], U. Tamoufe[6], S. Ketende[1], C. Lyons[1], S. Baral[1]
*[1]Johns Hopkins Bloomberg School of Public Health, Epidemiology, Baltimore, United States, [2]Enda Santé, Dakar, Senegal, [3]Enda Santé, Abidjan, Cote D'Ivoire, [4]USAID, Office of HIV / AIDS, Bureau for Global Health, Arlington, United States, [5]Ministère de la Santé et de la Lutte contre le Sida, Programme National de Lutte contre le SIDA, Abidjan, Cote D'Ivoire, [6]Global Viral, Yaoundé, Cameroon, [7]Hôpital Le Dantec, Dakar, Senegal*
*Presenting author email: amadrameh@yahoo.fr*

**Background:** Growing evidence suggests that the prevalence of depression among MSM is higher than that of non-MSM in many parts of the world, with studies citing high levels of stigma as a potential contributing factor. However, data on the prevalence and correlates of depression from low- and middle- income countries including West Africa are limited.
**Methods:** Data were collected using respondent-driven-sampling from MSM aged 18 years and older across multiple cities in Cote d'Ivoire (N=1,101), Cameroon (N=307), and Senegal (N=727). Participants were administered a survey including questions about lifetime experience or perceptions of sexual behavior stigma. Positive screens for depression were measured using a cutoff of 10 or greater on the PHQ-9. Logistic regression was used to explore bivariate associations of stigma with depression.
**Results:** Prevalence of depression among MSM ranged from 10.7% in Cameroon, 15.9% in Cote d'Ivoire, and 24.1% in Senegal. Prevalence of sexual behavior stigma was most commonly reported in the context of broader social settings, for example with verbal harassment being reported by 30.6% in Senegal, 37.1% in Cameroon, and 38.3% in Cote d'Ivoire.
However, MSM also reported sexual behavior stigma in the context of family and healthcare settings. In all countries, the odds of depression were significantly higher among those who had felt excluded by family members, been verbally harassed, or been blackmailed (Table 1). In Cote d'Ivoire, stigma from all settings (family, healthcare, and broader society) was significantly associated with increased odds for depression.

| | Senegal | | Cote d' Ivoire | | Cameroon | |

*[Table 1. Bivariate Associations with Depression]*

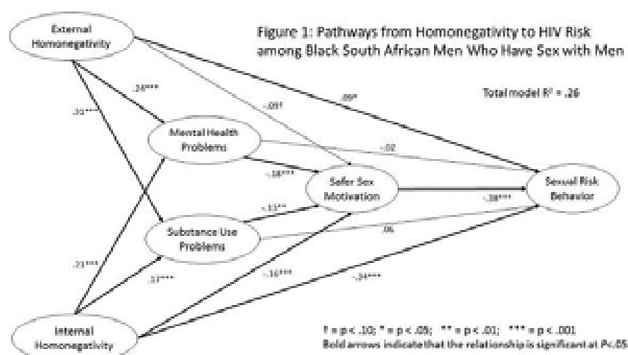
**Conclusions:** Depression among MSM was found to be prevalent in these three West African nations and strongly linked to experiences or perceptions of sexual behavior stigma. Extensive efforts are needed to scale up mental health interventions in the African context, and reducing or mitigating stigma is a necessary step to improving mental health outcomes for these men.

## THPED399

### PATHWAYS FROM HOMONEGATIVITY TO HIV RISK AMONG BLACK SOUTH AFRICAN MEN WHO HAVE SEX WITH MEN

J. Knox[1], T. Sandfort[2], C. Dolezal[2], S. Shiau[1], T. Lane[3], V. Reddy[4]
*[1]Columbia University, Epidemiology, New York, United States, [2]Columbia University, Psychiatry/Gender, Sexuality and Health, New Yorl, United States, [3]University of California San Francisco, Center for AIDS Prevention Studies, San Francisco, United States, [4]University of Pretoria, Faculty of Humanities, Pretoria, South Africa*
*Presenting author email: justinryanknox@gmail.com*

**Background:** Homonegativity, a negative evaluation of expressions of same-sex sexuality, has external and internal components. Externally it includes informal and institutional discrimination against people who practice same-sex sexuality. Internally, homonegativity manifests itself as negative feelings, thoughts and behaviors about one's same-sex sexuality. Homonegativity is related to various health problems and behaviors.
We assessed pathways from homonegativity to HIV risk behavior (see Figure 1) among a sample of black South African men who have sex with men.
**Methods:** 480 black MSM in the metropolitan area of Tshwane, South Africa, recruited through respondent-driven sampling, reported on experiences with external homonegativity (discrimination), internal homonegativity (internalized homophobia, gender dysphoria, sexual identify confusion), substance use (hazardous drinking (AUDIT), drug use (DAST-9)), mental health (boredom, hopelessness, self-esteem, self-confidence, unhappiness, depression), safer sex motivation (IMB constructs) and sexual risk behavior (frequency of UAI over the past 6 months). Measures were standardized and pooled to create indexes. We conducted a path analysis using sets of linear regression analyses.
**Results:** The median frequency of UAI over the past 6 months was 1 [IQR: 0-3]. Figure 1 shows the results of the path analysis.



*[Figure 1. Pathways from Homonegativity to HIV Risk among Black South African Men Who Have Sex with Men]*

Internal and external homonegativity predicted UAI through mental health problems and substance use problems via safer sex motivation. Internal homonegativity also predicted UAI through safer sex motivation. The impact of mental health and substance use problems on UAI was via safer sex motivation. Internal and external homonegativity also independently predicted UAI directly. These variables explained 26% of the variance in UAI.
**Conclusions:** Homonegativity, both internal and external, has a direct and indirect impact on sexual risk behavior among black South African MSM. In order to be effective, HIV prevention efforts addressing this critical population incorporate attention for stigma faced directly and indirectly by black South African men who engage in same-sex sexuality.

### AN URGENT ADVOCACY ACTION IN MOROCCO: THE FIRST CASE ACQUITTING A PERSON LIVING WITH HIV FROM VOLUNTARY SEXUAL TRANSMISSION

M.A. Douraidi[1], M. Ahmar[2], M. Karkouri[3], H. Himmich[4]
*[1]Association de lutte contre le sida, Plaidoyer et des droits humains, Casablanca, Morocco, [2]Association de lutte contre le sida, Casablanca, Morocco, [3]University Hospital Ibn Rushd, Faculty of Medicine and Pharmac, Casablanca, Morocco, [4]Association for the Fight against AIDS (ALCS), Casablanca, Morocco*
*Presenting author email: doura3s2@gmail.com*

**Background:** The response to HIV / AIDS in Morocco intends to be coordinated, participatory, transparent and accountable. Yet important sectors are not aware of two important political components of this response namely: the National Strategic Plan on HIV/AIDS and the National Strategy on "AIDS and human rights".

Tuesday 19 July
Wednesday 20 July

Friday 22 July
Late Breaker Posters
Author Index

This is shown in the case of a woman living with HIV following ARV treatment, married and accused of "voluntary sexual transmission of HIV" to two men she had consensual sexual relations with. The legal recourse did not come from the two men in question but from the police. It was therefore, in our view, a serophobia campaign wrapped into a trial for adultery in which the husband was secondarily charged with willful transmission of HIV to his wife. Both husband and wife were victims of stigmatizing and discriminatory social representations from the police, the public prosecutor and the media.
**Methods:** Thanks to a watch on people living with HIV (PLHIV) human rights' violations, the ALCS became aware of this case and opted for a strategy of urgent intervention.
3 advocacy axes were defined:
• A media campaign to act against serophobia
• Awareness raising among police officers
• Preparation of an advocacy strategy with three human rights lawyers: it was articulated on the constitutional bases that prohibit discrimination, the national response strategies and the substantive defects detected in reports from the judicial police.
**Results:** the woman was discharged. This jurisprudence will be used to affect future legal situations. The prefect of police of the city of Tangier organized a meeting at the police headquarters where were invited all heads of police services in the region and during which we outlined the axes of the national response strategies, as well as the main axes of our advocacy against discrimination and stigmatization of key populations and PLHIV.
**Conclusions:** We need to strengthen an approach based on rights and reinforce the skills of officials in the Ministry of Health to communicate on the national HIV strategy to other departments. A specific advocacy targeting police officers, prosecutors and judges is also necessary.

## THPED401

### THE ECONOMIC COST OF HOMOPHOBIA IN LOW- AND MIDDLE-INCOME COUNTRIES

E. Lamontagne[1], M. D'Elbee[2]
[1]UNAIDS, Economics and Development Analysis Unit, Genève, Switzerland,
[2]Universite Paris-Est Creteil, Paris, France
*Presenting author email: lamontagnee@unaids.org*

**Background:** Despite noticeable progress in the inclusion of gay men and other men who have sex with men (MSM) in society, homophobia, stigma and discrimination are still largely prevalent. This discrimination based on sexual orientation has a cost: unemployment, denied promotion, poor mental health, suicide, and vulnerability to HIV infection. The objective of this study is to develop and present a model for estimating the economic cost of homophobia in all low and middle-income countries (LMIC).
**Methods:** We estimated the productivity and health-related costs of homophobia. The productivity cost is represented by the earnings differential between gay men and their heterosexual counterparts. The health-related cost is represented by the value of life-year loss due to homophobia. We calibrated the model for 162 countries by developing a Homophobic Climate Index that takes into account both the institutional homophobia, characterised by the laws and legislations recognising, protecting or criminalising homosexuality, and the social homophobia, represented by the level of acceptance and justifiability of homosexuality. The cost of homophobia has been estimated for each country with a lower and an upper bound, where the population of gay men and other MSM represents 1% or 3% of the male (15-64) population respectively.
**Results:** Our results show that for all LMIC countries, the cost of homophobia ranges between US$ 30.8 - 92.3 billion per year, representing 0.12-0.37% of GDP. This share is twice higher than the one found in high-income countries (0.06-0.18 % of GDP). More importantly, the cost has a nonlinear progression; it increases disproportionately with higher homophobia. As such, the economic cost of homophobia among the bottom ten most homophobic countries reaches 0.19% - 0.58% of GDP, four times the share in the top ten most inclusive LMIC countries. Latin America is the region where the cost of homophobia represents the lowest share of GDP (.05- 0.16%).
**Conclusions:** Homophobia is a human tragedy and takes lives. The cost is particularly high in low and middle-income countries. Such results highlight the importance of fighting against discrimination promoting inclusive policies for sexual minorities, particularly among low and middle-income countries as an efficient engine of economic and social development.

## THPED402

### MOVING FROM INSULT TO INCLUSION: HOMOPHOBIA AND TRANSPHOBIA IN ASIA-PACIFIC EDUCATIONAL INSTITUTIONS

J. Sass[1], K. Humphries-Waa[1], X. Hospital[2]
[1]UNESCO Bangkok, Bangkok, Thailand, [2]UNESCO Dakar, Education, Dakar, Senegal
*Presenting author email: x.hospital@unesco.org*

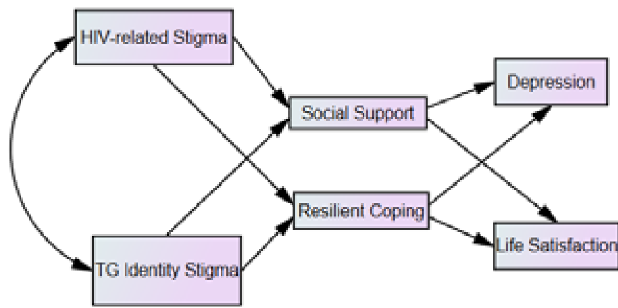
**Background:** LGBT young people are globally at increased risk of self-inflicted violence including suicide, often as a consequence of harassment and exclusion experienced in schools and other settings. Homophobia and transphobia has also been associated with sexual and substance use behaviours that increase the risk of acquiring HIV infection. This study is the first to assess the prevalence, types and impact of violence among LGBT students in Asia-Pacific, wellbeing outcomes impacting on HIV vulnerability, and prevention/response mechanisms.
**Methods:** Systematic analysis of >500 published/unpublished reports, peer-reviewed literature, media reports and programme evaluations from 40 countries in Asia-Pacific, as well as direct input from over 400 key stakeholders in the region. Results were validated at a regional consultation with >100 civil society, government and academic partners from 15 countries.
**Results:** The majority of LGBT students report being bullied, up to 80% in South Korea, and have higher rates than non-LGBT peers. 10 countries document institutional discrimination and exclusion, including misrepresentation in textbooks/curricula, and gender-specific regulations/facilities. Gender non-conforming youth, including third gender and transgender persons, report higher levels of peer and teacher victimization in India, Nepal, New Zealand and Vietnam. Help-seeking is infrequent; 68% of Thai victims hadn't told anyone, 1/4 of whom said "nothing would happen even if someone were told." 71% of bullied same-sex attracted and gender questioning (SSAGQ) Japanese boys reported anxiety, and 13% depression, while 21% of bullied Australian SSAGQ has skipped school, and 24% had drops in marks. Indonesia, Mongolia, Philippines and Viet Nam studies found associations between self-stigma and risk behaviours impacting on HIV transmission. Only 2 countries address SOGIE-based bullying in national policy, 5 mainstream SOGIE in national curriculum, 1 institutionalizes SOGIE-inclusive pre-service education at-scale, and 3 have extensive links to counselling/health services.
**Conclusions:** High levels of verbal, physical and sexual harassment, abuse and violence are experienced by LGBT young people in Asia Pacific schools, having a toxic impact on mental health and educational performance and achievement - with potential lifelong impacts on employment options and economic earning potential. Prevention and response mechanisms are woefully inadequate and far from the SDG principle to "leave no one behind".

## THPED403

### PATH ANALYSIS OF THE INFLUENCE OF TRANSGENDER IDENTITY STIGMA AND HIV-RELATED STIGMA ON DEPRESSION AND LIFE SATISFACTION AMONG HIJRAS/TRANSGENDER WOMEN IN INDIA

V. Chakrapani[1,2], M. Shunmugam[1], M. Sivasubramanian[2], M. Samuel[3]
[1]Centre for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India,
[2]The Humsafar Trust, Mumbai, India, [3]Department of Social Work, Madras Christian College (MCC), Chennai, India
*Presenting author email: murali.shunmugam@gmail.com*

**Background:** Limited empirical studies are available on the influence of multiple stigmas on the mental health and well-being of transgender women (TGW) in India. We examined the influence of transgender identity stigma (TGS) and HIV-related stigma (HIVS) on depression and life satisfaction among TGW in India. We hypothesised that resilient coping and social support would mediate the relationship between TGS/HIVS on depression and life satisfaction (See the diagram).
**Methods:** We administered structured survey questionnaire among 300 hijras/TGW recruited through community agencies from 3 urban (Mumbai, Delhi and Kolkata) and 3 rural (Sangli, Kancheepuram and Kumbakonam) sites. Except TGS scale, standardised scales were used for collecting data on the study variables. We conducted path analysis using IBM SPSS Amos-21 and assessed the significance of the total, direct, and indirect pathways through bootstrap confidence intervals.
**Results:** TGS had a significant total effect on depression and life satisfaction, but HIVS did not. Similarly, TGS (but not HIVS) had significant direct effects on social support and resilient coping, and both social support and resilient coping independently had significant direct effects on depression and life satisfaction. While social support mediated the effect of both TGS and HIVS on depression and life satisfaction, resilient coping mediated the effect of only TGS, not HIVS.
**Conclusions:** Our findings indicate the key role of TGS on depression and life satisfaction among TGW, and the mechanisms by which TGS might exert its effect. The findings have implications for inclusion of multi-level stigma reduction programmes to promote the mental health and well-being of TGW in India.



[Path analysis: Influence of HIV-related stigma and TG stigma on Depression and Life Satisfaction]

### STIGMA TOWARDS MEN WHO HAVE SEX WITH MEN IN NIGERIA: NOVEL METHODS AND WIDE-RANGING IMPACTS FOR HIV, SEXUALLY TRANSMITTED INFECTIONS AND MENTAL HEALTH

C. Rodriguez-Hart[1,2], R. Musci[2], R.G. Nowak[1], I. Orazulike[3], U. Ononaku[3], T. Crowell[4], S. Baral[2], M. Charurat[1]
*[1]University of Maryland Institute of Human Virology, Baltimore, United States, [2]Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, [3]International Center on Advocacy and Rights to Health, Abuja, Nigeria, [4]U.S. Military HIV Research Program (MHRP), Bethesda, United States*
*Presenting author email: crodri32@jhu.edu*

**Background:** Criminalization and stigmatization of homosexuality may have important effects on healthcare engagement and disease incidence among men who have sex with men (MSM) in sub-Saharan Africa (SSA). Understanding these effects can inform interventions to improve health for MSM. This study aims to assess patterns and predictors of stigma and whether a composite measure of stigma is associated with increased HIV prevalence, sexually transmitted infection (STI) prevalence, STI incidence, and suicidal ideation among Nigerian MSM.
**Methods:** The Trust study is a prospective cohort study of Nigerian MSM using respondent driven sampling in Nigeria that started in 2013. Socio-demographic characteristics, suicidal ideation, stigma, HIV and STI status at enrollment and STI incidence over time were included. Latent class analysis was used to develop stigma classes. Predictors of class and distal outcomes were added and the analysis was clustered by city.
**Results:** Three stigma classes of low, medium, and high emerged (see Table) with 60% of the 1,371 individuals in the medium or high classes. Participants who were higher socio-economic status, more open about their homosexuality, and engaged in receptive anal sex were significantly more likely to be in the high stigma class compared to the low stigma class. As stigma class increased from low to medium to high, the proportion of each outcome increased (HIV prevalence: 23%, 36%, 53%, $\chi^2$ p< .001; STI prevalence: 14%, 20%, 23%, $\chi^2$ p=.043; STI incidence: 8%, 10%, 15%, $\chi^2$ p=.110; suicidal ideation: 18%, 32%, 47%, $\chi^2$ p< .001).

| | Full Sample (n=1371) | | Three-class Stigma Model (98%, 1349)* | | |
|---|---|---|---|---|---|
| | | | Low (40.0%, 541) | Medium (47.3%, 636) | High (12.7%, 172) |
| Stigma Indicator | N | % | Conditional item probabilities: | | |
| Family Made Discriminatory Remarks | 277 | 20.2 | 0.01 | 0.27 | 0.57 |
| Friend Rejection | 266 | 19.4 | 0.02 | 0.22 | 0.63 |
| Fear of Seeking Health Care | 402 | 29.3 | 0.12 | 0.36 | 0.60 |
| Police Refused to Protect Them | 212 | 15.5 | 0.05 | 0.15 | 0.52 |
| Scared to Walk in Public | 256 | 18.7 | 0.05 | 0.18 | 0.63 |
| Verbally Harassed | 445 | 32.5 | 0.00 | 0.43 | 0.97 |
| Blackmailed | 323 | 23.6 | 0.01 | 0.30 | 0.71 |
| Physical Violence | 272 | 19.8 | 0.01 | 0.21 | 0.77 |
| Rape | 232 | 16.9 | 0.08 | 0.20 | 0.33 |

All questions are asked of participants as have they ever experienced each item and was it because they have sex with men.
* 22 participants were excluded because they had a missing response for at least 1 stigma indicator.

[Table 1. Results of the latent class analysis for the three-class model]

**Conclusions:** Using novel methods, this analysis revealed that stigma is pervasive among Nigerian MSM, particularly among those who were more open about their sexuality, and is associated with increased risk of HIV, STIs, and suicidal ideation, suggesting a need to address stigma in strategies to improve MSM engagement with HIV prevention and the HIV Care Continuum.

# STIGMA AND DISCRIMINATION REGARDING PEOPLE WHO USE/INJECT DRUGS, SEX WORKERS, SEXUAL MINORITIES AND OTHER SOCIAL GROUPS AFFECTED BY HIV

*[1]University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada, [2]University of Toronto, Dalla Lana School of Public Health, Toronto, Canada, [3]Jamaica AIDS Support for Life, Kingston, Jamaica*
*Presenting author email: tunagus@gmail.com*

**Background:** In Jamaica homosexuality is criminalized, and there is reported violence targeting lesbian, gay, bisexual and transgender (LGBT) persons. Young gay, bisexual and other men who have sex with men in Jamaica have HIV rates of 28%--the highest in the Caribbean. Stigma and discrimination elevate exposure to HIV and reduce access to HIV prevention. Scant research has explored the lived experiences of LGBT youth in Jamaica. We explored stigma, discrimination and coping among LGBT youth in Kingston, Jamaica.
**Methods:** We conducted individual semi-structured interviews with young (18-29 years old) gay/bisexual men (n=20), transgender women (n=20), lesbian/bisexual women (n=20), and key informants working with LGBT people (n=13) in Kingston, Jamaica. We also held three focus groups with young gay/bisexual men (n=10), transgender women (n=8), and lesbian/bisexual women (n=6) in Kingston. We digitally recorded and transcribed verbatim interviews and focus groups. We applied narrative thematic analytic techniques to analyze themes in the data.
**Results:** Participant narratives revealed stigma and discrimination targeting LGBT youth in Jamaica spanned interpersonal (family, friends), community (religion, media), and structural (healthcare, laws, police, housing, employment) facets of life. Stigma and discrimination threatened health and wellbeing, with impacts felt at intrapersonal (reduced self-esteem, fear, isolation, substance use) and structural (limited housing and employment access) domains. Participants discussed experiences of verbal, physical, and sexual violence (including 'corrective rape') directed towards LGBT persons. Family rejection and employment barriers contributed to high rates of homelessness, poverty, and engagement in survival sex work. Violence perpetrated by police, community and clients converged with poverty and stigma to increase exposure to HIV. Healthcare provider stigma limited access to HIV prevention, treatment, care and support. Stigma was exacerbated for lower socio-economic status and gender non-conforming youth. Coping strategies included LGBT support networks, community building, and advocacy.
**Conclusions:** Findings highlight stigma and discrimination contribute to precarious living for LGBT young people in Jamaica. Stigma targeting LGBT people limits access to health care, housing, employment, justice, and HIV prevention services. These structural vulnerabilities elevate exposure to HIV, violence, and mental health challenges. Interventions are required to address the complexity of social and institutional exclusion experienced by LGBT youth in Jamaica.

## THPED406

### EXPERIENCES OF STIGMA IN A SAMPLE OF HIV-POSITIVE GHANAIAN MEN WHO HAVE SEX WITH MEN (MSM): A QUALITATIVE STUDY

A. Ogunbajo[1], T. Kershaw[2], F. Boakye[3], N.D. Wallace-Atiapah[3], L. Nelson[4]
*[1]Yale University, New Haven, United States, [2]Yale School of Public Health, Social & Behavioral Sciences, New Haven, United States, [3]Priorities on Rights and Sexual Health, Accra, Ghana, [4]University of Rochester, Rochester, United States*
*Presenting author email: adedotun.ogunbajo@yale.edu*

**Background:** In Ghana, men who have sex with men (MSM) bear a high burden of the HIV epidemic.
In addition, same-sex sexual practices and HIV are highly stigmatized. Yet, there is limited knowledge about experiences of stigma as a result of MSM identity and/or HIV status in this sub-population. This qualitative study explored various experiences of HIV- and sexual identity-related stigma and the impacts of 'felt' and 'enacted' stigma on Ghanaian MSM living with HIV.
**Methods:** Between May and July 2015, in-depth, semi-structured interviews were conducted with 30 MSM living with HIV in Accra, Ghana. Participants were recruited through key informants and snowball sampling. Eligibility criteria for the study were: (1) birth-assigned male sex, (2) ages 18 years or older, (3) HIV-positive serostatus, and (4) history of oral or anal sex with another male. Following informed consent, interviews were conducted in a private office at a local NGO. Interviews were transcribed verbatim and data was analyzed using an open and axial coding approach with qualitative data analysis software (NVIVO 10).

Tuesday 19 July
Wednesday 20 July
Thursday 21 July Poster Exhibition
Friday 22 July
Late Breaker Posters
Author Index

**Results:** The average age of participants was 29.1 years (S.D. = 7.7) and more than half (N=16, 53%) self-identified as gay/homosexual. The results demonstrated that:
1) participants had experienced stigma related to HIV- and/or MSM- status from family, friends, community members, and clinical staff and in clinical, community, and workplace setting,
2) stigma from family and friends were mainly tied to known and perceived sexual orientation and gender expression while stigma from clinical staff were tied to HIV status, and;
3) experience of stigma resulted in some participants' reluctance to seek HIV-related medical services, avoid social settings, lose employment, and internalize negative messages regarding HIV and homosexuality.
**Conclusions:** Anticipation of or experiences with stigma might dissuade Ghanaian MSM from participating in ongoing HIV response efforts. Providing sensitivity training to healthcare providers and public campaigns to discourage HIV- and MSM- related stigma may help remedy this problem. Devising innovative strategies to combat stigma on basis of sexual orientation and HIV status might help reduce disparity in HIV and increase health-seeking behavior among MSM populations in Ghana.

## THPED407

### COMMUNITY MOBILIZATION AND ORGANIZING FOR PEOPLE WHO USE DRUGS IN UGANDA

W. Twaibu[1], C. Baguma[2]
*[1]Uganda Harm Reduction Network (UHRN), Health and Rights, Kampala, Uganda, [2]Uganda Harm Reduction Network (UHRN), Programs, Kampala, Uganda*
*Presenting author email: bagzkriss@yahoo.com*

**Background:** Uganda Harm Reduction Network (UHRN) is a youth-led drug user network established in 2008 to respond to drug use in Uganda. The network advocates for practical interventions aimed at supporting and addressing issues of men and women who use drugs. The network also seeks to provide a national platform for health and policy programs that promote good practices and advocate for a supportive environment for the adoption, implementation and expansion of harm reduction programs for people who use drugs (PWUDS) in Uganda.
**Description:** UHRN focuses on community mobilization through outreaches, advocacy for human rights protection for drug users and drug policy reform, call for donor support for HIV-related harm reduction services, sustainable livelihood programs and advocacy for the inclusion and adoption of comprehensive harm reduction package such as; Needle and Syringe Exchange programmes (NSE), Opioid Substitution Therapy (OST) and other drug dependence treatments (detox and non coercive rehab), HIV prevention, (HCT), Antiretroviral therapy, Prevention and treatment of STIs, Condom programmes for drug users and their partners, Targeted education and communication (IEC ) for PWUDs and other partners, Vaccination and diagnosis and treatment of viral hepatitis and Prevention, diagnosis and treatment of TB.Conducted 14 HCTs in partnership with MARPI Mulago, and out of the HCT done 280 drug users were found positive, Conducted 8 Community dialogues on HIV and SRHR targeting drug users, Conducted 2 community meetings with police officers and drug users, Reached 5,918 drug users have been reached with HIV/AIDS and TB information, out of these 269 are injecting drug users. 27 PWUDs referred to Butabika hospital for mental and psychotherapy treatment, Procured 91,210 pieces of male condoms procured and distributed to drug users, 721 brochures with health tips and information about UHRN were disseminated to the community targeting drug users.
**Lessons learned:** Working as a collective network allowed for strong collaboration and strengthened the work of the group, beyond what individual organisations may have achieved.
**Conclusions/Next steps:** Conduct massive mobilization of drug users to create awareness and demand for quality and non discriminatory care, right to information and right based services delivery.
Build PWIDs capacity and to resist violation and seek legal redress.

## THPED408

### SOCIAL COHESION, HIV STIGMA AND HIV/STI OUTCOMES AMONG FEMALE SEX WORKERS LIVING WITH HIV IN THE DOMINICAN REPUBLIC

M.A. Carrasco[1], T.Q. Nguyen[1], C. Barrington[2], M. Perez[3], Y. Donastorg[3], D. Kerrigan[1]
*[1]Johns Hopkins Bloomberg School of Public Health, Health, Behavior and Society, Baltimore, United States, [2]University of North Carolina Gillings School of Global Public Health, Department of Health Behavior, Chapel Hill, United States, [3]Instituto Dermatalogico y Cirugia de Piel Dr. Humberto Bogart Diaz, HIV Vaccine Research Unit, Santo Domingo, Dominican Republic*
*Presenting author email: s892@hotmail.com*

**Background:** Social cohesion has been shown to be an effective strategy to improve consistent condom use (CCU) and reduce HIV/STI risk among female sex workers (FSW). However, these relationships have not been studied among FSW living with HIV for whom limited interventions have been developed to date.
We assessed the association between social cohesion, CCU and STI among FSW living with HIV and the potential mediating effect of HIV and sex work stigma in this association.
**Methods:** Using data from the *Abriendo Puertas* cohort (n=268) of FSW living with HIV in the Dominican Republic, we conducted multivariate logistic regression and we fit three structural equation models (SEM) to further examine these pathways. Models 1 and 2 separately tested HIV and sex work stigma as pathways between social cohesion and CCU with clients and steady partners. Model 3 included HIV and sex work stigma and an interaction term to test their layered effect.
**Results:** Logistic regression demonstrated a statistically significant relationship between social cohesion and CCU with clients (AOR = 1.65, CI: 1.11 - 2.45) and STIs (AOR: 3.76, CI: 1.159 - 12.162). In SEM, we found that in model 1, social cohesion was associated with HIV stigma and with CCU with clients, but not with CCU with steady partners. HIV stigma was a significant pathway between social cohesion and CCU with clients and steady partners, pointing to a mediating effect. In model 2, social cohesion was associated with CCU with clients but not with steady partners; and cohesion was not associated with sex work stigma, indicating *no* mediating effect. In model 3 there were no significant associations except for one between social cohesion and CCU with clients, with no evidence of a layered mediating effect.
**Conclusions:** Findings indicate that social cohesion has a significant protective effect on CCU and STIs and should be promoted among FSW living with HIV. Findings also indicate that HIV stigma mediates the effect of social cohesion on CCU with clients, highlighting the critical need to address HIV stigma within the context of comprehensive, community-based approaches to improve HIV/STI outcomes among FSW living with HIV.

## THPED409

### SEX WORK IN TIMOR-LESTE: NAVIGATING SOCIAL, CULTURAL AND LEGAL IMPEDIMENTS TO A RIGHTS-BASED HIV/AIDS RESPONSE

H. Jose[1], P. Rawstorne[2], P. Gonzaga[3], S. Nathan[2], S. McGill[1]
*[1]Australasian Society for HIV, Viral Hepatitis and Sexual Health Medicine (ASHM), International, Sydney, Australia, [2]UNSW Australia, School of Public Health and Community Medicine, Sydney, Australia, [3]n/a, Dili, Timor-Leste*
*Presenting author email: scott.mcgill@ashm.org.au*

**Background:** Timor-Leste is a young, low-income country in Southeast Asian with a population of approximately 1.2 million people. As in many contexts, sex work in Timor-Leste occupies a delicate social, cultural and legal space which can be an impediment to sound human rights-based public health responses for female sex workers (FSW). As part of a national size estimation of key populations at risk of HIV/STIs in Timor-Leste, this qualitative study explored the nature of these structural factors and their interplay with the implementation of HIV/STI programs for FSW.
**Methods:** Drawing on ethnographic approaches, semi-structured interviews were undertaken using field notes, including recording of verbatim quotes, with 24 FSW and relevant secondary informants across Timor-Leste. Interviews covered the legal, cultural and social context for sex workers. Data were analysed with involvement of the third author (a local researcher well-connected to the populations) using an inductive thematic analysis approach where common themes and discrepant cases were coded with attention to the participants' reported experiences and key events.
**Results:** While experiences varied across participants and districts, many FSW reported family- and community-level stigma, with 'shame' and loss of dignity often associated with sex work. In some districts, *tara bandu* (*lit.*: 'to place a ban'), a form of traditional law used to regulate 'undesirable' behaviours, had reportedly turned sex work further underground. One particular *tara bandu* (originally instated to protect women from discrimination and/or sexual abuse) had reportedly been applied to sex work, with social isolation and heavy financial penalties imposed on FSW. Despite the semi-legal status of sex work in Timor-Leste, informants in urbanised settings reported high levels of persecution from law enforcement.

**Conclusions:** Even in a relatively small context such as Timor-Leste, a large variation was reported in the degree to which sex work was accepted. Ongoing social and law enforcement challenges for FSW highlight the need for continued investment in sex work advocacy and community building.

## THPED410

### WHO'S AFRAID OF THE HOMOSEXUAL? HIV-RELATED MISCONCEPTIONS IN THE LEBANESE CONTEXT

N. Nasr
*Arab Foundation for Freedoms and Equality, Beirut, Lebanon*
*Presenting author email: nour@afemena.org*

**Background:** This research was designed to fill a serious information gap in advocacy work relating to sexual and gender rights in Lebanon. So far advocacy in the field has been localized and based on individual incidents, and has not expanded to include Lebanese institutions and society at large. This research aims to provide critical and previously unavailable information by measuring and qualifying attitudes towards sexual and gender rights in Lebanon through surveying key constituencies and communities as well as the public at large.
**Methods:** The project takes the form of eight surveys of key stakeholder sectors with particular relevance to the status and future of gender and sexual rights in Lebanon. These include: high school teachers, health professionals, legal experts, human resource specialists, political party officials, religious leaders, media, and security. More specifically, we look at both quantitative and qualitative data collected among 240 professionals from those key stakeholder sectors in relation to misconceptions surrounding homosexuality, among which the assumption that HIV infections are confined to the gay community, as well as an evaluation of the degree of stigma associated with HIV infection.
**Results:** Results show that the misconception that "most homosexuals have HIV/AIDS" varied from 37% for legal professionals and 34% for political leaders to 7% for the media. A significant proportion of respondents remained undecided, ranging from 33% for health professionals to 47% for political leaders. This suggests that the "movable middle" constitutes an important proportion of responses which could be capitalized on in further advocacy efforts. In addition, follow-up showed, for instance, that a shocking 83% of respondents working in the medical field believed that there was a link between homosexuality and transmittable illnesses, citing reasons like "unnatural intercourse always leads to transmittable infections" and "homosexuals are usually promiscuous".
**Conclusions:** This study aims to ultimately provide an accurate and well-researched basis for future advocacy initiatives, specifically elucidating where efforts should be most concentrated given the greater socio-political milieu. Without this information, current and subsequent advocacy campaigns will not yield optimal results as key questions about the exact nature and location of challenges and opportunities are still vague and disputed.

## THPED411

### THE IMPORTANCE OF MEASURING AND ADDRESSING ANTICIPATED STIGMA AND DISCRIMINATION: ASSOCIATIONS WITH SEEKING GENERAL AND HIV-SPECIFIC HEALTH SERVICES AMONG MALE AND FEMALE SEX WORKERS IN KENYA

L. Nyblade[1], D.K. Mbote[2], C. Barker[3], D. Mwai[2], T. Oneko[2], A. Dutta[3], J. Kimani[4], J. Morla[1], H. Musyoki[5], S. Njugana[6], M. Sirengo[5], C. Kemunto[7], J. Mathenge[8], P. Mwangi[9], T.O. Abol[10], M. Stockton[1]
*[1]RTI International, Global Health, Washington, United States, [2]The Palladium Group, Nairobi, Kenya, [3]The Palladium Group, Washington, United States, [4]University of Nairobi, Nairobi, Kenya, [5]National AIDS and STI Control Programme (NASCOP), Nairobi, Kenya, [6]KEMRI, Nairobi, Kenya, [7]Survivors, Kisumu, Kenya, [8]Health Options for Young Men on HIV, AIDS and STIs (HOYMAS), Nairobi, Kenya, [9]The Bar Hostess Empowerment and Support Programme, Nairobi, Kenya, [10]Keeping Alive Societies Hope, Kisumu, Kenya*
*Presenting author email: lnyblade@rti.org*

**Background:** HIV-related stigma and discrimination (S&D) is an established barrier to HIV prevention, testing, linkage to care and adherence to treatment. Less is known about how S&D specific to sex work, particularly anticipated (fear of) stigma, affects healthcare seeking behavior. In response, the USAID-and PEPFAR-funded Health Policy Project collaborated with four civil society organizations, the National AIDS & STI Program, the Kenya Medical Research Institute, and the University of Nairobi to conduct a cross-sectional study measuring the prevalence of different types of stigma and their relationship to health seeking behavior among male and female sex workers (MSW/FSW) in 2015.
**Methods:** A modified respondent-driven sampling process resulted in a snowball sample of 497 FSW and 232 MSW across four sites. Anticipated stigma and its relationship to health seeking was assessed through direct questions, as well as through multivariate logistic regressions to determine whether MSW/FSW who anticipated different types of stigma at least once in the past 12 months were more likely to delay or avoid seeking HIV-related services while controlling for other variables, including self-reported HIV status.
**Results:** Significant proportions of MSW and FSW reported that they avoided or delayed needed health services in the past 12 months due to anticipated stigma (table 1). FSW anticipating verbal (OR 2.43, p-value=0.027), physical (OR 2.05, p-value=0.045), or sexual (OR 2.56, p-value=0.005) manifestations of stigma were more likely to delay seeking needed HIV-related services than FSW who did not. MSW anticipating sexual (OR 2.33, p-value=0.022), physical (OR 2.23, p-value=0.068), or housing (OR 2.21, p-value=0.05) stigma were more likely to avoid or delay needed HIV-related services. Both FSW (OR 2.62, p-value=0.019) and MSW (OR 2.85, p-value=0.039) anticipating health worker stigma were significantly more likely to report complete avoidance of needed HIV-related services.

| Table 1: Avoided/delayed services in the last 12 months due to fear of... | MSW | FSW |
|---|---|---|
| Disclosure of selling sex | 47% | 53% |
| Disclosure of having sex with men | 49% | N/A |
| Stigmatizing treatment at health facility for selling sex | 48% | 65% |
| Stigmatizing treatment at health facility for being MSM | 55% | N/A |
| Being asked to be tested for HIV or tested without consent | 25% | 36% |

*[Table 1]*

**Conclusions:** Anticipated stigma can affect willingness to utilize health services and undermine the HIV response. Measuring different types of stigma and their effects is important for designing targeted stigma-reduction programs.

## THPED412

### SOCIAL SUPPORT AND RESILIENT COPING AS MEDIATORS OF THE IMPACT OF SEXUAL MINORITY STIGMA ON MENTAL HEALTH: EVIDENCE FOR A PSYCHOLOGICAL MEDIATION FRAMEWORK

V. Chakrapani[1], M. Shunmugam[1], P.P. Vijin[1], C.H. Logie[2], P.A. Newman[2], M. Samuel[3]
*[1]Centre for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India, [2]Factor-Iwentash Faculty of Social Work, University of Toronto, Toronto, Canada, [3]Madras Christian College (MCC), Department of Social Work, Chennai, India*
*Presenting author email: cvenkatesan@hotmail.com*

**Background:** Few studies have assessed how sexual minority stigma affects the mental health of self-identified men who have sex with men (MSM) and transgender women (TGW) in India, populations with a high HIV burden. We tested whether social support and coping act as mediators of the effect of sexual minority stigma on mental health as informed by Hatzenbuehler's Psychological Mediation Framework.
**Methods:** We conducted a cross-sectional survey among MSM (n=300) and TGW (n=300) recruited from 3 urban (Mumbai, Delhi, and Kolkata) and 3 rural (Sangli, Kancheepuram and Kumbakonam) sites in India. Standardised scales were used to measure depression (outcome variable), MSM stigma/Transgender identity stigma (predictor variables), and social support and resilient coping (tested as moderators and parallel mediators). The mediation and moderation models were tested separately for MSM and TGW, using Hayes' PROCESS macro in SPSS.
**Results:** Participants' mean age was 29.7 years (SD 8.1). MSM stigma and transgender identity stigma were significant predictors (significant total and direct effects) of depression, as were social support and resilient coping. Among MSM and TGW, both social support and resilient coping mediated (i.e., significant specific indirect effects) the effect of stigma on depression, supporting the Psychological Mediation Framework. We did not find evidence for the moderating role of social support and resilient coping on the effect of sexual minority stigma on depression.
**Conclusions:** We found empirical evidence for the mediating role of social support and resilient coping on the impact of sexual minority stigma on depression among MSM and TGW. In addition to stigma reduction interventions at the societal level, future interventions should focus on improving social support and promoting resilience among MSM and transgender women.

## THPED413

### STIGMA, DISCRIMINATION AND HEALTH SEEKING AMONG MEN WHO HAVE SEX WITH MEN (MSM) IN BOTSWANA

G.N. Tsheko[1], D.S. Rakgoasi[2], G. Jacques[3]
*[1]University of Botswana, Educational Foundations, Gaborone, Botswana, [2]University of Botswana, Population Studies, Gaborne, Botswana, [3]University of Botswana, Social Work, Gaborone, Botswana*
*Presenting author email: gntsheko@gmail.com*

**Background:** Interventions to prevent the spread of HIV and other types of support target the heterosexual population with very little targeting sexual minorities such as men who have sex with other men. Due to criminalization and its concomitant hostilities, the activities of such sexual minorities have remained secret and/or underground, and subject to social stigma, ostracism/alienation and contempt.
**Methods:** This paper utilizes Botswana data derived from a 2013 SADC funded Sexual Minorities cross sectional survey in three countries, namely Zimbabwe, Botswana and Zambia, to explore the sexual and HIV risk knowledge, attitudes and practices of MSM.
Data were analyzed in SPSS, using univariate and bivariate techniques and descriptive statistics. Some qualitative data were also used to explicate quantitative findings.
**Results:** The results show that while only 4.2 percent indicated that they felt afraid to seek health care due to their sexual orientation, over a fifth (22.1%) were denied health care because of their sexual orientation; and over half (57%) experienced either verbal or physical abuse and 10.8% experienced police or legal discrimination, and 14.5% experienced blackmail because of their sexual orientation. Over a quarter (28.1%) felt that healthcare workers were not capable to meet their health seeking needs because of their sexual orientation.
**Conclusions:** Although a small proportion reported fear of accessing healthcare services, a larger proportion were either denied access, experienced resentment or were exposed to physical abuse or harassment after disclosing their sexual orientation. This indicates the need to promote equal access to healthcare services for sexual minorities as for the heterosexual community.

## THPED414

### CONNECTION BETWEEN SEXUAL BEHAVIOURS OF HIV-POSITIVE MSM AND DISCRIMINATION THEY FACE FROM OTHER MSM: FINDINGS FROM A QUALITATIVE FORMATIVE RESEARCH IN TAMIL NADU, INDIA

V. Chakrapani[1], T. Subramanian[2], T. Kershaw[3], R. Nelson[1], M. Rajan Hari[1], A. James[1], P.P. Vijin[1]
*[1]Centre for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India, [2]National Institute of Epidemiology (NIE), Chennai, India, [3]Yale School of Public Health, Yale University, New Haven, United States*
*Presenting author email: cvenkatesan@hotmail.com*

**Background:** Literature has documented that HIV-positive MSM (HIV+MSM) who have experienced discrimination might engage in risky sex. However, limited information is available from developing countries on how sexual behaviours of HIV+MSM as perceived by other MSM could lead to discrimination. As part of a qualitative formative research to refine a theory-based sexual risk reduction intervention for HIV+MSM, we explored the connections between the perceptions of HIV-negative/unknown status MSM on the sexual behaviours of HIV+MSM and their discriminatory attitudes/behaviours towards HIV+MSM.
**Methods:** In 2015, we conducted focus groups and in-depth interviews with 34 MSM (16 HIV+MSM; 18 HIV-negative/unknown status MSM) in urban/ruralTamil Nadu, India. Narrative thematic analysis was conducted using NVivo-10.
**Results:** HIV-negative MSM did not trust that HIV+MSM would be using condoms and opined that HIV+MSM should not be sexually active, should not come to cruising/sex work sites, or should engage only in non-penetrative sex. Outing the HIV status of MSM to potential sexual partners (including clients of sex work) was not seen as discrimination, but justified as a necessary act to prevent others from getting HIV. HIV-negative MSM reported distancing oneself from HIV+MSM, treating them as 'untouchables' in community settings, and even blackmailing them to reveal their HIV status to their partners if they do not stop having sex. HIV+MSM seemed to have internalised these negative attitudes among HIV-negative MSM about the sexlife of HIV+MSM and reported being abstinent, not engaging in sex work, reduction of the number of sexual partners, and always using condoms during anal sex. However, HIV-positive MSM did report that they have at least a few supportive MSM friends and steady partners.
**Conclusions:** Lack of understanding about the sexual rights of HIV+MSM have led HIV-negative MSM to deny fulfilling sexual life for HIV+MSM, and abstinence as a pre-requisite for getting support from other MSM. Sexual risk reduction interventions among HIV+MSM need to take into account the link between sexual behaviour of HIV+MSM and discrimination within MSM communities. Intervention at the MSM community level is needed to promote acceptance of HIV+MSM within MSM communities and to raise awareness about the sexual rights of HIV+MSM.

## THPED415

### CREATING AN ENABLING ENVIRONMENT FOR SCALED UP HARM REDUCTION SERVICES FOR PEOPLE WHO USE DRUGS THROUGH CAPACITY BUILDING AND SENSITIZATION OF PARTNERS AND STAKEHOLDERS IN TANZANIA

D. Lucas, A. Voets, R. Okola
*Medecins du Monde (MdM), Dar es Salaam, Tanzania, United Republic of*
*Presenting author email: fieldmanager.hr.mdmtz@gmail.com*

**Background:** In Tanzania people who use drugs (PWUD) are highly stigmatized. Laws and policies that criminalize drug use contribute to this, as does a lack of knowledge in the general society. This stigmatisation undermines resource mobilisation for HIV prevention (and other) services for PWUD and in many ways increases the risks of PWUD to HIV and other blood-borne infections. Besides it limits research that could contribute to evidence-based decision making.
**Description:** Since 2012 Médecins du Monde (MdM) provides training and sensitization sessions to partners and stakeholders of its harm reduction (HR) program in Dar es Salaam. Almost 7,000 stakeholders have been reached: 270 representatives from NGOs and CBOs; 600 medicals; 100 para-medicals; 5,000 police officers and recruits; 260 religious and local leaders; 80 members of PWUD networks; 340 councillors, mayors and members of district and regional health management teams; and 40 journalists. Sessions focus on the relation between drug use & HIV; HR packages & principles; effects of stigma; human rights; and drug policies.
**Lessons learned:** Monitoring of trainees shows that their knowledge has significantly improved and that practically all of them positively changed their attitude towards PWUD. This has led to a sharp decrease in police harassment and to improved access to health services for PWUD. Besides more NGOs & CBOs became interested in providing comprehensive HR services to PWUD. Lastly, including PWUD as co-facilitators increased mutual understanding as well as self-esteem and assertiveness of those PWUD involved.
**Conclusions/Next steps:** The environment for PWUD has changed dramatically in Dar es Salaam and - to a lesser extent - in the country, thanks to MdM capacity building and sensitisation work, alongside high level advocacy activities. MdM has increased its sensitisation, advocacy and capacity building activities outside Dar es Salaam, with the goal to enhance the scale up of comprehensive HR services for PWUD in Tanzania.

## THPED416

### HIV-RELATED STIGMA AND DISCRIMINATION AMONG WOMEN: FINDINGS FROM THE STIGMASURVEYUK 2015

W. Crenna-Jennings[1], I. Lut[1], D. Asboe[2], L. Benton[3], M. Hibbert[4], J. Jefferies[3], P. Kirwan[4], C. Kunda[3], R. Mbewe[3], S. Morris[3], J. Morton[5], M. Nelson[2], S. Okala[4], H. Paterson[6], I. Reeves[7], M. Ross[8], L. Sharp[6], W. Sseruma[3], L. Thorley[3], G. Valiotis[9], A. Wolton[8], V. Delpech[4], A. Hudson[1]
*[1]Family Planning Association, London, United Kingdom, [2]Chelsea and Westminster Hospital, London, United Kingdom, [3]StigmaIndexUK - 2015, London, United Kingdom, [4]Public Health England, London, United Kingdom, [5]Terrence Higgins Trust, London, United Kingdom, [6]Glasgow University, Glasgow, United Kingdom, [7]Homerton University Hospital, London, United Kingdom, [8]Clinic Q, London, United Kingdom, [9]HIV Scotland, Glasgow, United Kingdom*
*Presenting author email: alastairh@fpa.gov.org*

**Background:** Women make up a third of the 85,500 people accessing HIV care in the UK in 2015. The STIGMASurveyUK 2015 provides the opportunity to examine the lived experiences of HIV-positive women in the UK.
**Methods:** The STIGMASurveyUK 2015 was co-designed by people living with HIV (PLHIV), clinicians and researchers. Adults living with HIV in the UK were recruited through community HIV organisations and NHS clinics to complete an online survey. Descriptive, univariate and multivariate regression analyses were performed.
**Results:** Among 1576 participants, 378 (24%) were women, of whom 19 (5%) identified as trans. Mean age was 44 (range 19-76 years): 337 (89%) identified as heterosexual, and 269 (71%) as a black, Asian and other ethnic minority (BAME).
58% (146/250) of BAME women reported activity in a faith group in the last year compared to 14% (15/106) white British/Irish women (p< 0.001); 22% (48/218) of women reported becoming more active in their faith group since diagnosis compared to 12% (47/407) of men (p=0.001).
In the past 12 months 28% (106/372) of women reported feeling blame towards others in relation to their HIV status compared to 21% of men (245/1164, p=0.001).

Fewer women reported experiencing rejection by a sexual partner (18% vs 33% of men, p<0.001). More transwomen reported worrying about verbal harassment (50%, 9/18 vs 21%, 74/346) and experienced exclusion from family gatherings (39%, 7/18 vs 17%, 60/342) than other women.
In primary healthcare settings, women were more likely to report low control over disclosure of their status (aOR 1.65, *CI 1.05, 2.59)* and little support following disclosure (aOR 1.99, *CI 1.23, 3.21*) compared to men after adjustment for demographics. 53% (8/15) of transwomen reported being treated differently to other patients at their GP (53%, 8/15) cf 15% (49/318) of other women; almost half (7/16) reported hearing negative comments from a healthcare worker about their HIV status or PLHIV compared to 17% (54/324) of other women.
**Conclusions:** Women feel less support in healthcare settings with regard to their HIV, and transwomen experience disproportionate levels of discrimination. Interventions to increase sensitivity and support within the healthcare and faith settings are advisable.

## THPED417

### A QUALITATIVE STUDY OF PREP STIGMA, PRIDE AND PREDICTED COMMUNITY BENEFITS AMONG MSM AND MALE SEX WORKERS

K. Underhill[1], K. Guthrie[2], D. Operario[3], S. Calabrese[4], C. Colleran[5], K.H. Mayer[6]
*[1]Yale University, Center for Interdisciplinary Research on AIDS and Yale Law School, New Haven, United States, [2]Miriam Hospital, Providence, United States, [3]Brown University School of Public Health, Providence, United States, [4]Yale School of Public Health, New Haven, United States, [5]The Miriam Hospital, Providence, United States, [6]The Fenway Institute, Boston, United States*
*Presenting author email: kristen.underhill@yale.edu*

**Background:** PrEP implementation raises questions about potential impacts on stigma, attitudes, and norms in MSM communities. Media reports on "Truvada whores" suggest some negative attitudes about PrEP among MSM, and a popular view that PrEP users are irresponsible or promiscuous. We interviewed MSM and male sex workers to explore attitudes toward PrEP, awareness of PrEP stigma within the MSM community, and expectations of how PrEP may change community norms and HIV-related stigma.
**Methods:** We conducted in-depth interviews with 31 MSM and 25 male sex workers in Providence, RI, in 2013-14, building on results of 8 prior focus groups (n=38). Participants were HIV-negative or of unknown status and reported recent unprotected anal sex with an HIV-positive or unknown-status partner. Interviewers provided information about PrEP and explored PrEP knowledge, acceptability, predicted social stigmas or benefits associated with PrEP, and predicted changes in community norms. Interviews were audiorecorded and analyzed in NVivo.
**Results:** Knowledge of PrEP was low, but some participants had heard of stigma associated with PrEP use. When informed of PrEP, some MSM expressed stigma-related concerns about using PrEP, including fears of seeming promiscuous, HIV-positive, or ill. Several MSM in primary partnerships, including sex workers with female partners, noted that PrEP use would imply infidelity; for these men, the need for covert use made daily PrEP less acceptable. But most participants reported low predicted stigma, or noted that stigma would not impede their own use. Some described PrEP as a potential catalyst for reducing HIV stigma among MSM, and even suggested that PrEP would promote community inclusion of HIV-positive individuals and increase MSM community empowerment. Several sex workers also viewed PrEP as a lever for personal change, suggesting that PrEP use is proof of increased self-worth and can provide a foundation for other health behaviors.
**Conclusions:** Strategies are needed to help PrEP users educate partners, family, and peers to reduce potential misconceptions driving PrEP stigma. But both MSM and male sex workers express positive expectations of PrEP as an agent of community and individual empowerment. PrEP outreach efforts and messaging should leverage these expectations to maximize PrEP acceptability.

## THPED418

### COGNITIVE FACTORS MEDIATE THE ASSOCIATIONS BETWEEN PERCEIVED DISCRIMINATION AND HEALTH BEHAVIORS IN HEAVY DRINKING HIV-INFECTED MSM

D. Pantalone[1], T. Wray[2], A. Afroz[3], K. Mayer[4], P. Monti[2], C. Kahler[2]
*[1]University of Massachusetts, Boston, United States, [2]Brown University, Providence, United States, [3]The Fenway Institute, Fenway Health, Boston, United States, [4]Harvard Medical School/Beth Israel Deaconess Medical Center, Boston, United States*
*Presenting author email: david.pantalone@umb.edu*

**Background:** Men who have sex with men (MSM) are the risk group in the U.S. with the highest incidence and prevalence of HIV. Modern HIV treatments are highly effective although various barriers to optimal health exist, including problematic alcohol use—especially notable for its high prevalence, i.e., 2-4x higher in HIV-infected vs. uninfected samples (Azar et al., 2010). In addition, HIV-positive MSM face discrimination due to both their sexual orientation and HIV status. Discrimination towards HIV-positive MSM occurs across multiple levels of society, including interpersonal, structural, and institutional, and can include overt rejection or discriminatory acts, criminalization of HIV nondisclosure to sex partners, and more. In this study, we test a hypothesized model in which the association between (A) HIV-related or sexual orientation-related discrimination and (C) health behaviors (medication nonadherence, cigarette smoking, condomless anal sex, drug use, alcohol problems) is hypothesized to be mediated by (B) cognitive factors.
**Methods:** We used baseline (pre-randomization) data from 185 participants in an alcohol reduction trial. We recruited primary care patients at an urban LGBT health center. Participants were HIV-positive, male, over age 18, met NIAAA heavy drinking criteria (avg 14+ drinks/week or 1+ binge/month), reported sex with another man in the prior 12 months, and those taking HIV medications were on a stable regimen for 3+ months. We used psychometrically valid survey instruments when available (e.g., CES-D, SIP, Multiple Discrimination Scale, etc.).
**Results:** Participants, mean age of 42.2, had been living with HIV for an average of 9.8 years. Most identified as White (73%) or Black (22%), with 17% endorsing Latino ethnicity. Nearly all (94.6%) were prescribed ARVs. Men reported an average of 5.8 drinks/day on their 16.5 drinking days (of the last 30). The model evidenced acceptable fit, $\chi^2(18)=9.17$, $p > .05$; RMSEA=0.05; CFI=0.97. HIV-related discrimination did not significantly predict the mediators; sexual orientation-related discrimination predicted both hostility and depression, each of which predicted alcohol-related problems; depression predicted medication non-adherence.
**Conclusions:** Future research should investigate factors through which HIV-related discrimination is associated with health behaviors in heavy drinking HIV-infected MSM. Interventions for heavy drinking HIV-infected MSM should address sexual orientation-related discrimination.

# PUNITIVE LAWS AND ENFORCEMENT PRACTICES REGARDING HIV TRANSMISSION, DRUG USE, SEX WORK, SEX BETWEEN MEN, SODOMY AND/OR SEX OUTSIDE OF MARRIAGE

## THPED419

### #REPEAL19A: A SUCCESSFUL CAMPAIGN AGAINST THE CRIMINALISATION OF HIV IN VICTORIA, AUSTRALIA

P. Kidd[1,2], J. Manwaring[2], H. Paynter[3]
*[1]Living Positive Victoria, Melbourne, Australia, [2]Victorian AIDS Council, Melbourne, Australia, [3]Co Health, Melbourne, Australia*
*Presenting author email: paul@kidd.id.au*

**Background:** The criminalisation of HIV transmission, exposure and nondisclosure persists in most parts of the world, despite widespread criticism of its impact on public health and human rights. HIV-specific criminal laws have been particularly criticised by international agencies including UNAIDS and the Global Commission on HIV and the Law.
**Description:** The #Repeal19A campaign targeted Australia's only HIV-specific criminal offence, section 19A of the Crimes Act 1958 in the state of Victoria, as part of an advocacy strategy developed during the lead-up to the AIDS 2014 International AIDS Conference in Melbourne. We constructed a compelling case for repeal of the law, drawing together legal, public health and human rights arguments; brought together a coalition of supportive agencies from the HIV, LGBTI rights and human rights sectors; used the media to build a community consensus for change; and advocated with the leadership of the major political parties in the period leading up to and during the conference. As a consequence of commitments given during the conference, section 19A was repealed by a unanimous vote of the Victorian parliament in May 2015.
**Lessons learned:** The repeal of section 19A is a major part of the legacy of hosting AIDS 2014 in Melbourne. Our campaign showed that a targeted and well-researched advocacy case can be developed in a complex area of public policy to build a compelling narrative for political change. We increased awareness of the issue of criminalisation among the gay community and obtained a clear commitment from government to ensure HIV is treated as a public health issue.
**Conclusions/Next steps:** The criminalisation of HIV has not ended in Victoria, however the #Repeal19A campaign delivered commitments from both sides of politics to an evidence-based approach to HIV policy that prioritises public health and human rights over criminal sanctions. We continue to press for improved policy responses, including prosecutorial guidelines to ensure that criminal and public health laws work more effectively together.

### HIV CRIMINALIZATION IN CALIFORNIA: A COMPREHENSIVE ASSESSMENT OF ENFORCEMENT, EQUITY AND EFFECTIVENESS OF CRIMINAL LAWS TARGETING PEOPLE LIVING WITH HIV

A. Hasenbush[1], A. Miyashita[1,2]
*[1]UCLA School of Law, The Williams Institute, Los Angeles, United States, [2]UCLA School of Law, The Los Angeles HIV Law and Policy Project, Los Angeles, United States*
*Presenting author email: hasenbush@law.ucla.edu*

**Background:** More than two-thirds of states and territories across the United States have HIV criminal laws. Such laws exacerbate HIV stigma and disincentivize individuals from knowing their HIV status. While U.S. federal agencies have called for legal reform, ensuring these laws are consistent with modern science and public health, no U.S.-based research has previously analyzed comprehensive enforcement data representing a population-based sample. This presentation will review California data, including updated results from a previous study, highlighting new findings on disparities, correlation with new infections, recidivism, and changes over time.
**Methods:** Researchers obtained California Department of Justice CORI (Criminal Offender Record Information) data, which record contacts with the criminal justice system, from arrest through sentencing. The data were cleaned and coded to assess the extent of the laws' enforcement over time, geographically, and by race and sex. The data were investigated for evidence of disproportionate representation of specific subgroups. All data were analyzed using Stata v13.1. Inferential statistics were used to test differences between subgroups.
**Results:** 800 people had contact with the California criminal system from 1988 to June 2014 related to their HIV. 95% of all incidents impacted people suspected of solicitation, which does not require sexual contact to prosecute. Black people and Latino/as made up two-thirds (67%) of the people who had HIV-related criminal contact, but just half (51%) of California's PLWH. Women made up 43% of those who had HIV incidents, but less than 13% of California's PLWH. White men were significantly less likely than others to be charged. Nearly every charged incident resulted in conviction, and 91% of convictions were sentenced to incarceration for an average of over two years. 48% of HIV-based sentence enhancements for sex offenses were for oral copulation.
**Conclusions:** Almost all HIV prosecutions involved conduct that poses low or negligible risks of transmission. California HIV criminal laws have been disproportionately enforced against women and people of color. These analyses demonstrate the laws' lack of equity or effectiveness in reducing new infections, and the presentation will demonstrate how criminal justice data analysis can be used to inform HIV criminalization reform efforts in other legal contexts around the world.

## THPED421

### HIV CRIMINALIZATION LAWS HARM OUR PATIENTS! NURSES ADVOCATE FOR AN END TO UNJUST LAWS THAT PROMOTE STIGMA AND DISPARITIES

C. Treston[1], J.C. Phillips[1,2], A. Webel[1,3]
*[1]Association of Nurses in AIDS Care, Akron, United States, [2]University of Ottawa, School of Nursing, Ottawa, Canada, [3]Case Western Reserve University, Frances Payne Bolton School of Nursing, Cleveland, United States*
*Presenting author email: carole@anacnet.org*

**Background:** The stigma associated with HIV remains high and fear of discrimination causes some to avoid HIV testing, disclose HIV status or access health care. In 32 US states, there are laws that criminalize HIV exposure, based on outdated and erroneous HIV risk and transmission information. These criminal laws contradict public health messages and disregard current knowledge about treatment efficacy and significantly reduced transmission potential with an undetectable HIV viral load.
**Description:** The Association of Nurses in AIDS Care (ANAC) advocates for public health policy grounded in evidence, human rights and the delivery of socially just health care. In 2015 ANAC issued a policy statement calling for the reform of unjust and harmful HIV criminalization statutes. Significant research on laws, health disparities and current evidence provided the base for this policy. Included was a call for education on the negative public health consequences of HIV criminalization and its contribution to HIV related stigma and discrimination. ANAC is an affiliate of the American Nurses Association, who represents the interests of America's 3.4 million registered nurses. They formally adopted our statement for HIV criminalization reform. Information about the intersection of HIV criminalization with stigma, human rights and barriers to engagement in health care was distributed nationally through both nursing organizations' membership communications and to the national media.
**Lessons learned:** In the USA, nurses are consistently rated the most trusted profession and source of health information by the general public. Nurses have considerable influence in communities on health beliefs and nursing practice is guided by the Nursing Code of Ethics. Yet in a 2014 survey of nurses more than 25% were unaware of HIV criminalization laws at all and 60% were unaware of HIV exposure without transmission laws.
**Conclusions/Next steps:** ANAC will expand education to other nursing organizations and seek other nursing organization endorsements. Since most HIV criminalization legislation reform occurs at the state level we will engage with state nursing organizations for reform efforts. Nurses can have an influential and powerful voice as public policy advocates. Professional nursing organizations have an obligation to educate members on issues that intersect human rights and health care, such as HIV criminalization.

## THPED422

### "I INTENDED TO ACHIEVE SEXUAL PLEASURE NOT TO GIVE MY PARTNER HIV": PROBLEMS WITH THE LEGAL TESTS USED TO ASSESS INTENTION IN CRIMINAL CHARGES FOR TRANSMISSION OF HIV

A. Stratigos
*HIV/AIDS Legal Centre, Surry Hills, Australia*
*Presenting author email: alexs@halc.org.au*

**Background:** UNAIDS states *that "any application of criminal law to HIV non-disclosure, exposure or transmission should require proof, to the applicable criminal law standard, of intent to transmit HIV."****[i]*** The difficulty with this proposition is that *'the applicable criminal law standard'* varies significantly by jurisdiction, and mental culpability for HIV transmission to a sexual partner is difficult to ascertain.
The HIV/AIDS Legal Centre filed an appeal in the High Court of Australia for a client convicted of intentional HIV transmission to a sexual partner. The broader aim of this case, beyond achieving a favourable outcome for the individual, was to clarify the following questions:
1. Can foresight of potential consequences be used to establish intention to achieve a specific result, being HIV transmission? and
2. How can a court assess whether a person has the requisite mental and physical intent to be charged with HIV transmission?
3. What is the relevance, if any, of lies told, or the length of the relationship, to assessing intent?
These questions have not been determined in a court at this level worldwide.
[i] UNAIDS, Guidance Notes 2013, *Ending overly broad criminalization of HIV non-disclosure, exposure and transmission: Critical scientific, medical and legal considerations*, at 26.
**Description:** The matter will be heard by the High Court of Australia in February 2016, and judgement hopefully delivered prior to the conference. Full submissions are at: http://www.hcourt.gov.au/cases/case_b69-2015
**Lessons learned:** Proceedings in the lower courts demonstrated that jurors and the judiciary fail to understand the reasons why people may not disclose their HIV status; including fear of abandonment, discrimination, violence, shame, embarrassment, and/or being in denial. The courts formed the view that non-disclosure in the context of an 18 month relationship amounts to intent to transmit HIV.
**Conclusions/Next steps:** The proceedings can be utilised by HIV advocates to progress the need for prosecutorial guidelines. Police, lawyers and the judiciary must recognise that issues around HIV transmission and intent are unique and therefore a standard criminal law approach cannot be taken. The outcome will provide guidance for lawyers on how to successfully defend HIV non-disclosure charges, refuting the assumption that non-disclosure equates to intentional HIV transmission.

## THPED423

### CRIMINAL RISK FOR PLHIV IN FRANCE AS A RESULT OF UNPROTECTED SEXUAL RELATIONS

M. Celse, P. Gaudin, J.-P. Couteron, J.-P. Dozon, P.-Y. Geoffard, A. Guimet, J. Massot, P. Mathiot, S. Musso, L. Geffroy, P. Yeni
*French National AIDS & Viral Hepatitis Council, Paris, France*
*Presenting author email: michel.celse@sante.gouv.fr*

**Background:** Several trials initiated in France against people living with HIV (PLHIV) have shown that the transmission and/or exposure to the risk of sexual transmission of HIV, in certain conditions, constitute a criminal offence. PLHIV are not familiar with these conditions, and nor are the prevention and care providers.
**Methods:** The French National Aids Council (CNS) conducted an in-depth legal analysis of the 23 criminal convictions for HIV transmission and/or exposure identified in France.
**Results:** According to very constant case law, the proceedings are based on the offence of "administration of harmful substances causing physical or psychological harm to another person" (AHS) [*French Criminal Code, Art. 222-15*]. The analysis of the elements required to prove the offence shows that any unprotected sexual

relation between HIV-discordant partners shall potentially incur the HIV-positive partner's criminal liability. The intention to harm is not necessary, as the awareness of exposing other persons to the risk of transmission is sufficient to constitute the offence. The offence shall still be constituted, including when the HIV-negative partner is informed of the risk and consents. The exposure to the risk may be pursued, even in the absence of an effective transmission of the virus. The protection of sexual relations shall be understood *a priori* by the use of a condom. The admissibility of other means of protection and, in particular, the use of antiretroviral drugs in prevention remains uncertain, for it has not yet been observed in a French trial.
**Conclusions:** The analysis shows the scope of the potentially objectionable acts on the basis of AHS. Whereas the number of actual criminal prosecutions, albeit very moderate, is rising noticeably, and the circumstances of the events pursued before the courts are diversifying, it appears important to improve the information for PLHIV on their legal rights and responsibilities. To do so, the prevention and support actions for PLHIV must incorporate the criminal risk dimension.

## THPED424

### NURSES' KNOWLEDGE, ATTITUDES AND DOCUMENTATION PRACTICES IN A CONTEXT OF HIV CRIMINALIZATION: A SECONDARY SUB-GROUP ANALYSIS OF DATA FROM CALIFORNIA, FLORIDA, NEW YORK AND TEXAS NURSES

J.-L. Domingue, J.C. Phillips, M. Gagnon, J. Kilty, A. Vandyk
*University of Ottawa, Ottawa, Canada*
*Presenting author email: jdomi012@uottawa.ca*

**Background:** Under international legal norms, HIV criminalization is considered an overly broad use of criminal law. In the United States, at least 33 states have HIV-specific criminal laws. The content of HIV-related criminal laws varies across states and there is currently no guidance or standard for when those statutes should be applied. Current literature on HIV-related criminal laws highlights challenges for persons living with HIV (PLWH) and nurses who work with them in clinics, communities, and public health settings. Information about nurses' knowledge of HIV-related criminal laws and the impact of HIV criminalization on nurses' practices is limited.
**Methods:** This study is a secondary sub-group analysis, which fits within a larger national study on nurses' knowledge of HIV-related criminal laws where they practiced. Data from nurses (*n* = 386) in California, Florida, New York and Texas was used to provide exemplars of nurses' knowledge of HIV-related criminal laws and the impact of different HIV-related criminal law approaches on nursing practices.
**Results:** Only 29% of nurses (*n* = 112) knew whether or not the state in which they practiced had a specific law regulating sexual exposure of HIV without disclosing HIV status; 13% of nurses (*n* = 49) felt they possessed the expertise to educate PLWH about legal regulations and consequences; 21% of nurses (*n* = 84) understood implications of HIV-related criminal laws for their scope of practice, professional duty, and responsibility: and 76% of nurses (*n* = 295) acknowledged they should acquire expertise to appropriately counsel patients about those laws.
**Conclusions:** Lack of knowledge of HIV-related criminal laws can adversely affect the nurse-patient relationship. Nurses are at risk of losing the trust of persons living with or at risk of acquiring HIV if they do not address this knowledge gap. The dismal number of nurses that knew whether the state where they practiced had an HIV-related criminal law emphasises the urgent need for education interventions such as webinars, online modules and newsletters.

## THPED425

### WHAT'S THE LAW GOT TO DO WITH IT? CREATING AN ENABLING LEGAL AND POLICY ENVIRONMENT FOR YOUNG PEOPLE TO ACCESS HARM REDUCTION SERVICES IN ASIA-PACIFIC

E. Christie[1], Y.Y. Shwe[2], B. Harrison[2], K.C. Win Htin[2], J. Sass[3], M. Huntington[1], A. Valeriano[2], J. Acaba[4], X. Hospital[5]
*[1]DLA Piper, Sydney, Australia, [2]UNAIDS, Bangkok, Thailand, [3]UNESCO Asia-Pacific Regional Bureau of Education, Bangkok, Thailand, [4]Youth LEAD, Bangkok, Thailand, [5]UNESCO Dakar, Dakar, Senegal*
*Presenting author email: x.hospital@unesco.org*

**Background:** An estimated 3.8 million people inject drugs in Asia-Pacific, the majority of whom started injecting in their late teens and early twenties, according to behavioural surveys. HIV prevalence among people who inject drugs (PWID) under age 25 is >5% in seven countries, with the majority of this age cohort in 12 countries not having accessed HIV testing in the last year. In recent years, the Committee on the Rights of the Child has asked States to ensure that their criminal laws do not impede access to specialized and youth-friendly harm-reduction services. This review analysed the application of this recommendation.
**Methods:** A systematic review of national and federal drugs ordinances, laws and policies; national AIDS and national drug strategies; public health and safety codes; protocols and clinical guidelines on OST and NSP; and other laws concerning age of majority was undertaken among 38 countries and 2 territories in Asia-Pacific. Content analysis of >100 documents focused on legal minimum age requirements to access opioid substitution therapy (OST) and needle syringe programmes (NSPs), parental consent requirements, and special discretions/exemptions, and data verified with country partners.
**Results:** Of the 40 countries and territories reviewed, only 13 countries in Asia-Pacific have laws and policies enabling independent consent for young people to access needle and syringe programmes (NSPs) and/or opiate substitution therapy (OST) programmes. Some countries/territories (Australia, Hong Kong SAR, New Zealand) apply the mature-minor principle, require specialist assessments/opinions (Australia, Indonesia) or have differential age access for OST/NSP (Myanmar, Viet Nam). A punitive legal environment exists more generally in the region, with 11 countries applying compulsory detention, and 15 countries imposing the death penalty, on drug users.
**Conclusions:** Policy and legislative reform is required to expand access to effective HIV and health services, including harm reduction programmes and voluntary, evidence-based treatment for drug dependence among young PWID. Countries should recognise the evolving capacity of adolescents to make decisions about their well-being, and establish guidance for health workers to understand their legal and professional obligations to enable access to effective HIV and health services, including harm reduction programmes and voluntary, evidence-based treatment for drug dependence and overdose management.

## THPED426

### GENDER DIFFERENCES IN POLICING BEHAVIORS: IMPLICATIONS FOR HIV PREVENTION AMONG PERSONS WHO INJECT DRUGS (PWID) IN TIJUANA, MEXICO

T. Rocha Jiménez[1], M.L. Rolón[1,2], S.A. Strathdee[1], I. Artamonova[1], C.L. Magis Rodríguez[3,4], A. Bañuelos Pérez[5], D. Abramovitz[1], E. Patiño Mandujano[2,6], J. Arredondo[1], M. Morales[1], E. Bustamante Rojo[2,7], E. Clairgue Caizero[7], M.G. Rangel Gómez[4,7], L. Beletsky[1,8], Proyecto ESCUDO
*[1]University of California San Diego, Division of Global Public Health, La Jolla, United States, [2]Universidad Xochicalco, Facultad de Medicina, Tijuana, Mexico, [3]Centro Nacional para la Prevención y el Control del VIH/SIDA, México DF, Mexico, [4]Secretaría de Salud, México DF, Mexico, [5]Secretaría de Seguridad Pública Municipal, Dirección de Planeación y Proyectos Estratégicos, Tijuana, Mexico, [6]Dirección Municipal de Salud, Tijuana, Mexico, [7]Comisión de Salud Fronteriza México-Estados Unidos, Sección México, Tijuana, Mexico, [8]Northeastern University, School of Law and Bouvé College of Health Sciences, Boston, United States*
*Presenting author email: trochaji@ucsd.edu*

**Background:** Policing practices such as syringe confiscation, harassment, and extra-legal syringe-related arrests fuel HIV risk and transmission worldwide among PWID. Preliminary evidence suggests that female police are less likely to use force or to engage in abuse and harassment. Despite calls for improving gender balance in law enforcement, there is little research on gender differences in policing practices in this male-dominated profession. Our objective was to examine potential differences in policing behaviors between male and female officers that could shape the HIV risk environment among PWID in Tijuana, Mexico, where syringe possession is legal without a prescription.
**Methods:** Baseline surveys from police officers were collected in 2015 by our bi-national team as part of a department-wide Police Education Program (PEP) in Tijuana, Mexico. Data from all active-duty municipal police officers were analyzed. Depending on distributional assumptions, the outcomes were examined using the Pearson $\chi 2$ or Fisher exact tests.
**Results:** To date, among 485 police officers on street patrol, 64 (13.2%) were female and 421 (86.2%) male, median age 35 (IQR: 28-39) and 36 (IQR: 31-42) respectively. Most (96.9%) male officers reported encountering syringes while on duty vs. 90.6% of female officers (P=0.03). Among officers encountering syringes on-duty, female officers reported confiscating syringes less often (60.9%) compared to male officers (77.5%; P=0.008). Female officers also reported less stop and search encounters of PWID that lead to syringe confiscation (29.4%) compared to male officers (50.9%; P=0.03).
**Conclusions:** These data suggest gender differences in policing practices that could promote the uptake of HIV prevention. In particular, female police officers may serve as potential peer models. Global programs that work with police to reduce HIV vulnerability among PWID should tailor interventions to address these gender differences. These data add a public health imperative to further efforts to promote the importance of gender-balance in policing across the world.

### CRIMINALIZATION OF HIV NON-DISCLOSURE: NARRATIVES FROM YOUNG MEN LIVING IN VANCOUVER, CANADA

R. Knight[1], A. Krüsi[2], A. Carson[3], K. Shannon[2], J. Shoveller[3]
*[1]Simon Fraser University, Faculty of Health Sciences, Burnaby, Canada, [2]British Columbia Centre for Excellence in HIV/AIDS, Vancouver, Canada, [3]University of British Columbia, School of Population and Public Health, Vancouver, Canada*
*Presenting author email: akrusi@cfenet.ubc.ca*

**Background:** Today's young men, especially young MSM, are a key population that are launching their sexual lives amidst evolving legal frameworks regarding HIV and a proliferation of novel advances in HIV testing and treatment (e.g., TasP, PrEP). Yet, few studies have examined how the criminalization of HIV non-disclosure, alongside evolving intervention 'landscapes', influence perceptions of HIV-related risk.
**Methods:** We analyzed data from 100 in-depth, semi-structured, individual interviews with young men ages 18-30 in Vancouver, Canada, on the topic of HIV and the criminalization of HIV non-disclosure. The current analysis describes the health and social risks that these young men associate with an HIV diagnosis in the context of Canada's current legal framework pertaining to HIV non-disclosure.
**Results:** Our analysis revealed two dominant narratives in relation to HIV criminalization: *justification* and *interrogation.* Within the justification narrative, participants asserted that criminalization approaches could be justified because they reflect the gravity of the perceived social impacts of unknowingly acquiring HIV from a seropositive partner (e.g., status loss, discrimination, isolation). Justification narratives did not tend to be based on the perceived health implications of becoming infected as HIV was frequently described as a manageable and treatable condition, as opposed to a life-threatening disease. *Interrogation* narratives tended to problematize the idea of criminalizing HIV. First, these narratives emphasized how universal access to HIV prevention, treatment and care has brought HIV into the realm of a chronic - and a preventable - condition that no longer infers a 'death sentence'. Secondly, legal frameworks that criminalize people living with HIV were characterized as creating barriers to HIV testing uptake, as well as impeding access and reducing retention to care for those living with HIV. These concerns were particularly salient among participants who viewed themselves as being at 'elevated' risks for HIV, including MSM and men who inject drugs.
**Conclusions:** The narratives identified in our analysis identify a diversity of perspectives pertaining to the criminalization of HIV non-disclosure. They also reveal the extent to which the inclusion of young men's voices will be helpful in developing community-informed strategies for legal reform that meaningfully reflect the evolving intervention 'landscape'.

## THPED428

### GLOBAL TRENDS IN HIV CRIMINALISATION

E.J. Bernard[1], S. Cameron[2]
*[1]HIV Justice Network, Brighton, United Kingdom, [2]Global Network of People Living with HIV, Amsterdam, Netherlands*
*Presenting author email: edwin@hivjustice.net*

**Background:** HIV criminalisation describes the unjust application of the criminal law to people living with HIV based solely on their HIV status - either via HIV-specific criminal statutes, or by applying general criminal laws. HIV criminalisation is a growing global phenomenon of great concern, increasingly recognised as a key public health and human rights issue.
**Methods:** A desk review of criminal proceeding reports and legal texts curated on the HIV Justice Network website as part of the research for the *Advancing HIV Justice 2* report supplemented with data from GNP+'s Global Criminalisation Scan and Google searches. 'Recently reported' data covers March 2013-September 2015. Presented data will include laws and cases to July 2016.
**Results:** Seventy-two countries currently have HIV-specific laws, rising to 101 jurisdictions when individual US states are included.

*[Jurisdictions with HIV-specific criminal laws]*

Notably, 30 countries in Africa have such laws, including new overly-broad laws in Uganda (2014) and Nigeria (2015). Not all countries enforce HIV-specific laws and other countries apply general laws. At least 58 countries have reported HIV-related criminal cases - 32 used general laws, 23 used HIV-specific laws and 3 used both.

*[Jurisdictions where prosecutions have ever taken place]*

Most recently reported HIV criminal cases occurred in the United States (104 in 34 jurisdictions) and Canada (17 in 7 provinces) with additional cases reported in Europe (36 in 14 countries), sub-Saharan Africa (9 in 4 countries) and Australasia (7 in 2 countries).
**Conclusions:** Despite increasing advocacy and global normative guidance, more efforts are required to end inappropriate laws and prosecutions, involving innovative strategic partnerships amongst multiple stakeholders.

## THPED429

### PUNISHING HIV: DOES RACE IMPACT SENTENCING UNDER CRIMINAL HIV EXPOSURE AND DISCLOSURE LAWS IN THE UNITED STATES?

T. Hoppe
*University at Albany State University of New York, Sociology, Albany, United States*
*Presenting author email: thoppe@albany.edu*

**Background:** Social movements in the United States have recently drawn attention to the racial disparities in the American criminal justice system. Studies have shown that Black heterosexual men are disproportionately convicted under at least one U.S. state's HIV disclosure law (Michigan). These findings raise questions about how evenly American HIV-specific criminal laws are applied. However, no study has yet examined whether there are racial or gender differences in the length of criminal sentences handed out under American HIV exposure and disclosure laws.
**Methods:** This study compares the length of criminal sentences by race and gender under HIV-specific criminal laws in five U.S. states: Arkansas, Florida, Michigan, Missouri, and Tennessee. Data describing convictions under each state's HIV-specific criminal law were obtained from state authorities, including state Departments of Corrections, state court administrators, and state-run sex offender registries. Additional data points were obtained from local court clerks and newspaper reports.
**Results:** Overall, 357 convictions were identified in the five states studied between 1990 and 2015; 307 cases were sentenced to incarceration in jail or prison while 50 were sentenced to probation. The average incarceration sentence was 83.26 months, while the average probation sentence was 44.81 months. Overall, black men were assigned lengthier incarceration terms (109.79 vs 73.64 months for white men) and probation sentences (55.73 vs 35.57 months). In four out of five states, black men were given greater prison sentences, with the greatest disparity observed in Arkansas (278.86 months vs. 139.50 for white men). Overall, men were sentenced to lengthier incarceration terms (98.16 vs 36.35 months for women) and probation terms (46.51 vs 38 months for women). Few Black women were convicted in most states, with the exception of Florida; in that state, sentences between Black and white women were similar (27.32 vs 25.42 months for white women).
**Conclusions:** Overall, this study suggests that there are important racial and gender disparities in sentencing under U.S. HIV disclosure and exposure laws that mirror broader patterns in the American criminal justice system. These findings suggest advocates may wish to appeal to broader frameworks of racial injustice in their efforts to reform these laws.

## THPED430

### THE ROLE OF SCIENTIFIC EXPERTS IN COMBATTING UNJUST HIV PROSECUTIONS: A CANADIAN EXAMPLE

C. Kazatchkine[1], R. Elliott[1], E.J. Bernard[2], P. Eba[3]
*[1]Canadian HIV/AIDS Legal Network, Toronto, Canada, [2]HIV Justice Network, Brighton, United Kingdom, [3]UNAIDS, Human Rights and Law Division, Geneva, Switzerland*
*Presenting author email: ckazatchkine@aidslaw.ca*

**Background:** In 2012, the Supreme Court of Canada ruled that a person living with HIV can be prosecuted for not disclosing their HIV positive status before having sex that poses a "realistic possibility of transmission." Despite the well-established impact of low viral load on HIV transmission risk, the Court decided that a person could be convicted of aggravated sexual assault even if they had used a condom or had an undetectable viral load.
**Description:** In response to a Supreme Court decision at odds with scientific evidence, six distinguished Canadian HIV scientists and clinicians took ground-breaking action to advance justice by co-authoring the ''Canadian consensus statement on HIV and its transmission in the context of the criminal law.'' Based on a literature review, the Canadian statement was published in 2014 in a medical journal with the endorsement of more than 75 scientific experts from across the country.
**Lessons learned:** Because the notion of risk and the nature of the HIV infection are at the center of prosecutions, scientific experts have an important role to play to ensure that the criminal law is based on the most accurate and available scientific evidence rather than fear, ignorance and prejudice. In Canada, the consensus statement is an extremely useful tool for advocates working against unjust prosecutions. It also supports defense lawyers representing people living with HIV and scientific experts testifying in court. Some indications of a positive impact in court proceedings are emerging. Since the SCC's 2012 ruling, at least one lower court decision has concluded, based on medical evidence, that there was no "realistic possibility of transmission" in the case of person who had condomless sex with an undetectable viral load.
**Conclusions/Next steps:** As demonstrated in, for example, Denmark, Switzerland or Iowa, scientific evidence can influence positive legal change. But in many other jurisdictions, people are prosecuted despite a minimal, or even non-existent, risk of HIV transmission. Unjust HIV criminalization undermines public health and human rights. Internationally, it is vital that scientists undertake joint efforts with advocates to bring science to justice.

## THPED431

### ADVANCING HIV JUSTICE: BUILDING MOMENTUM IN GLOBAL ADVOCACY AGAINST HIV CRIMINALISATION

E.J. Bernard[1], S. Cameron[2], J. Hows[2]
*[1]HIV Justice Network, Brighton, United Kingdom, [2]Global Network of People Living with HIV, Amsterdam, Netherlands*
*Presenting author email: jhows@gnpplus.net*

**Background:** HIV criminalisation impacts public health and human rights, undermining efforts to end AIDS. The unjust application of criminal law to people living with HIV based solely on their HIV status, either via HIV-specific criminal statutes, or by applying general criminal laws, is a growing, global phenomenon.
**Description:** A desk review of criminal proceeding reports and legal texts curated on the HIV Justice Network website as part of the research for the *Advancing HIV Justice 2* report supplemented with data from GNP+'s Global Criminalisation Scan and Google searches. Recently reported data so far covers March 2013-September 2015 but will be updated to July 2016.
**Lessons learned:** Key developments in case law and law and policy reform have taken place in numerous jurisdictions, most of which came about as a direct result of advocacy from individuals and organisations working to end the inappropriate use of the criminal law to regulate and punish people living with HIV.
However, a complex picture emerges of advocacy successes and proposed laws in some of the same countries/regions of the world suggesting disparate approaches to HIV criminalisation that are sensitive to local social, cultural, epidemiological and political contexts, as well as the capacity of advocates to challenge such laws and prosecutions.

*[Jurisdictions with HIV criminal laws recently enacted, proposed or defeated and those with improved legal environments 2013-2015]*

Although the evidence base against HIV criminalisation is strong, evidence alone is often not enough for policy- and lawmakers who want to be seen to be doing something to impact the HIV epidemic and who may be more swayed by emotive or 'popular' arguments rather than implement a rational, evidence-based response.
**Conclusions/Next steps:** Despite a growing number of advocacy successes leading to improved legal environments for people living with HIV, much more work is required to strengthen advocacy capacity to ensure a more just, rational, evidence-informed criminal justice response to HIV that will benefit both public health and human rights.

## THPED432

### HIV CRIMINALISATION IN SUB-SAHARAN AFRICA: FAILURE TO UPHOLD SCIENTIFIC, MEDICAL AND HUMAN RIGHTS RECOMMENDATIONS

P. Eba[1], E. Bernard[2], C. Kazatchkine[3], L. Cabal[1]
*[1]UNAIDS, Geneva, Switzerland, [2]HIV Justice Network, Brighton, United Kingdom, [3]Canadian HIV/AIDS Legal Network, Toronto, Canada*
*Presenting author email: patrickeba@icloud.com*

**Background:** In the past 15 years, 27 sub-Saharan African countries have adopted HIV specific laws to protect the rights of PLHIV. Yet, they raise serious public health and human rights concerns, including with regard to punitive provisions that allow for overly broad criminalisation of HIV non-disclosure, exposure or transmission.
In recent years, advocacy and litigation efforts against overly broad HIV criminalisation have led to change in some countries.
The 2013 UNAIDS guidance note on ending overly broad HIV criminalisation provides scientific, medical and human rights evidence and arguments to analyse and challenge these problematic punitive provisions.
**Methods:** The study reviewed 26 HIV-specific laws in sub-Saharan Africa. HIV criminalisation provisions in these laws were analysed against six key recommendations of the UNAIDS guidance, namely:
(i) limit criminalisation to intentional HIV transmission;
(ii) no criminalisation for non-disclosure or exposure;
(iii) no criminalisation for condom use;
(iv) no criminalisation where the person has low viral load or is on effective treatment;
(v) no criminalisation when undiagnosed; and
(vi) no criminalisation in case of consent to HIV risk prior to sex (e.g. via disclosure of HIV status).
**Results:** Twenty four out of 26 HIV-specific laws criminalise HIV non-disclosure, exposure or transmission. Of these, only nine restrict criminalisation to cases of alleged transmission. Eight countries criminalise alleged HIV non-disclosure and twelve criminalise potential or perceived HIV exposure. Seven countries allow for criminal liability on the basis of negligence or recklessness, in spite of the recommendation to limit criminalisation to malicious intent. Only eight countries exclude criminal liability in cases involving condom use or other risk reduction methods. Seven countries have provisions that could be interpreted to bar criminal liability when a person has low viral load or is on effective HIV treatment. Finally, only seven countries limit criminal liability to people who have been previously diagnosed, and only eight countries recognise consent, via disclosure to the sexual partner, as a valid defence.
**Conclusions:** HIV criminalisation provisions fail to take into account best available scientific and medical recommendations and human rights principles and are likely to compromise HIV responses. This analysis supports the need for further advocacy efforts against criminalisation.

## THPED433

### PROGRESS TO INTEGRATE HUMAN RIGHTS PRINCIPLES TO THE APPLICATION OF CRIMINAL JUSTICE TO PEOPLE LIVING WITH HIV IN SCOTLAND

A. Collins, G. Valiotis
*HIV Scotland, Edinburgh, United Kingdom*
*Presenting author email: george.valiotis@hivscotland.com*

**Background:** From 2011 to present, HIV Scotland undertook a range of actions to improve criminal justice policy and practice as it applies to HIV in Scotland; our aim was to ensure that people living with HIV are not unfairly treated or disadvantaged within the criminal justice system in Scotland.
**Description:** HIV Scotland had serious concerns about the impact of criminal prosecution for HIV transmission. We identified a lack of clarity on the law in Scotland and need for more consistent decision making and transparency. We lobbied for prosecution guidance and worked with the Crown Office Procurator Fiscal (COPFS) and other NGOs to develop this in 2012. We have complimented this work by supporting partners to better respond to instances of prosecution. In addition, HIV Scotland, in partnership with Police Scotland and key stakeholders, developed a Standard Operating Procedure for police officers who may be required to investigate allegations of transmission. We now sit on several police working groups and work collaboratively with them to improve the way the police respond to and support people affected by HIV and BBVs.
**Lessons learned:**
- Prosecution guidance is effective: there have been no prosecutions in Scotland since its introduction in 2012.
- Tensions can exist between public health and criminal justice policy, but human rights based approaches provide a useful tool in bringing these areas together.
- There can be poor understanding and co-ordination between justice and health services. There is a need for government leadership and also community action to push for change. Third sector agencies are well placed to bridge this divide.

**Conclusions/Next steps:**
- We will work with the COPFS to annually review the application of the guidance, and ensure it reflects the latest evidence about HIV transmission. The next review is scheduled for May 2016.
- We will maintain participation in police reference groups to identify and collaborate on other areas for improvement.
- We are in the process of developing a joint criminal HIV transmission investigation protocol, in partnership with lead agencies across justice, health and government.

## THPED434

### IMPACT OF SAME SEX PROHIBITION LAW ON SERVICE UPTAKE BY MEN WHO HAVE SEX WITH MEN (MSM) IN PORT-HARCOURT, NIGERIA

B.C. Eziefule, S.C. Iwuagwu
*Centre for the Right to Health, Programs, Abuja, Nigeria*
*Presenting author email: beziefule@yahoo.co.uk*

**Background:** The same sex prohibition law in Nigeria outlaws gay clubs, organizations, their sustenance, processions and meetings. It makes public show of same sex amorous relations illegal and proclaims those who enter into same sex marriage liable to a prison sentence of 14 years and 10 years for those who form or support gay organizations and activities.
However, data have suggested that MSM are at high risk of HIV in Nigeria. Given the legal, criminalizing and stigmatizing environment in Nigeria, CRH conducted a small study to evaluate the impact of the law on Program uptake among MSM in Portharcourt
**Methods:** The goal of the Study is to serve as a baseline to generate information on impact of same sex law on service uptake among Men who have sex with Men. A focus group study was conducted with 30 MSM aged 20 to 25 in Portharcourt who reported ever having had anal intercourse with another man. They were met in small groups of 10 each. Open ended questions were used to illicit answers from them.
**Results:** A total of 30 respondents participated in the study. Majority 85% agreed they were freer before the coming into force of the law; a total of 60% of the participants reported intense apprehension with the law. 90% reported inability to uptake medical services for fear of stigma and homophobia. Approximately 63% of men reported fear of their immediate family members and now live double lives. 30% reported they have dropped out of their cohort behavior change communication sessions as they are not sure who they will meet at such meetings and in its vicinity. 20% reported set ups by friends and they ended up in security and community victimizations and stigmatization.
**Conclusions:** The same sex prohibition law in Nigeria is a great disservice to HIV programming and other health service provision for MSM in Nigeria. The law has opened greater doors for exploitation, stigmatization and victimization of MSM individuals affecting their uptake of services and poses greater threat of cases of HIV new infection among the general population. The law should be abolished in the interest of public health.

## THPED435

### RECKLESS ENDANGERMENT: SEX WORKERS' HEALTH AND HUMAN RIGHTS UNDER THE *PROTECTION OF COMMUNITIES AND EXPLOITED PERSONS ACT*

S.K.H. Chu[1], J. Clamen[2], R. Elliott[1], K. Pacey[3], T. Santini[2]
*[1]Canadian HIV/AIDS Legal Network, Toronto, Canada, [2]Stella, Montreal, Canada, [3]Pivot Legal Society, Vancouver, Canada*
*Presenting author email: relliott@aidslaw.ca*

**Background:** After Canada's Supreme Court invalidated several provisions of the *Criminal Code* dealing with prostitution because they violate sex workers' rights by undermining their health and safety, the federal government introduced the *Protection of Communities and Exploited Persons Act* (PCEPA). Despite numerous attempts by sex workers and allies to engage with politicians, the PCEPA was passed in December 2014 without meaningful consultation with the sex workers most affected by the law.
**Description:** The PCEPA purports to address "exploitation that is inherent in prostitution" by criminalizing many activities that are essential for sex work to be carried out safely. These include: communicating in public — or in any place that is in view of, or is next to, a school ground, playground or daycare — to offer or provide sexual services for consideration; purchasing sexual services; and "receiving a material benefit" from, "procuring" or advertising sexual services. Sex workers, clients and third parties who work in the sex industry are captured under many of these provisions, which can include penalties of fines, imprisonment or both.
**Lessons learned:** The PCEPA reproduces many of the harms produced by the previous laws the Supreme Court held were unconstitutional. Sex workers face increased isolation; have decreased ability to screen clients or to negotiate clear terms of services with clients; are less able to establish safe indoor work spaces; have decreased ability to access the services of third parties; are prevented from advertising their services; and are unable to benefit from health, safety, labour and human rights protections. Street-based sex workers experience increased displacement, while all sex workers — particularly migrant sex workers — face barriers to accessing police protection. The PCEPA has also led to a confused law enforcement mandate that conflates trafficking and sex work, resulting in the detention and deportation of sex workers. Consequently, sex workers face increased risk of violence, as well as greater stigma and discrimination.
**Conclusions/Next steps:** Although sex workers and allies are prepared to return to court to challenge the PCEPA, they are hoping to work cooperatively with a newly-elected government to create a new legislative framework that respects and protects sex workers' rights.

## THPED436

### HIV CRIMINALIZATION IN EAST AFRICA: A RIPE TIME TO CHALLENGE THE LAW AND POLICY

D. Kiconco Musinguzi
*Uganda Network on Law Ethics and HIV/AIDs, Director, Kampala, Uganda*
*Presenting author email: kicdor@uganet.org*

**Background:** HIV criminalization is the unjust application of criminal law based on solely HIV status and this has most time occasioned injustice for persons living with HIV. East African countries are at crossroads, all 5 countries have enacted HIV Specific criminal laws. Recently, Presidents of the partner states signed into law the East African HIV prevention and Management Act founded on human rights principles and equity for vulnerable and key population. At the same time This happens the Kenyan Court has annulled provisions of the HIV ACT for being unconstitutional and viague with effet of causing ambiguity and miscarriage of Justice.
**Description:** Content of the national laws was analyzed in comparison with the Regional Act , HIV leaders and activists debated and reviewed the opportunities for law reform , bench marking with other jurisdiction in other regions and consultation with Government representative including the ministry of East Africa. Analysis of the political governace on all 5 countries.
**Lessons learned:** The enactment of the content of Regional law has an opportunity to cure the legislative gaps in the national laws. Zanzibar has already drafted an HIV Act with like provisions, without HIV criminal laws. Kenya's breath rough with strategic legislation increases chance of using the judicial system as an advocacy platform. Learning from Kenya, Uganda has prepared a similar constitutional petition.
The legitimacy and the legal power that lies in the regional law can be exploited by a regional HIV activist to cause reform of national laws. Tanzania HIV leaders who did not oppose the passing of the law was to open space for dailogue. New presidents in the region present new political leadership that are likely to support law reform.

**Conclusions/Next steps:** The new momentum of advocacy and the opportunities that lie in the judicial and regional legislative breakthrough in the East African countries have the capacity to cause the reform of the HIV criminilisation laws in East Africa. Regional HIV leaders need to collaborate in mobilizing community action of PHLIV and all policy makers to make this policy change a reality.

## Harm reduction, including needle and syringe programmes, opioid substitution therapy and supervised injection facilities

### HIV seroconversion among drug users receiving methadone maintenance treatment in China: a qualitative study

C. Wang[1], C.X. Shi[1,2], Z. Wu[1], B. Zhang[3], H. Chen[4], H. Wang[3], N. Zhang[1], K. Rou[1], X. Cao[1], W. Luo[1]
*[1]National Center for AIDS/STD Control and Prevention, Beijing, China, [2]Yale School of Public Health, Center for Interdisciplinary Research on AIDS, New Haven, United States, [3]Yunnan Institute for Drug Abuse, Kunming, China, [4]Chongqing Center for Disease Control and Prevention, Chongqing, China*
*Presenting author email: cynthia.shi@yale.edu*

**Background:** China's HIV/AIDS epidemic has historically been driven by injection drug use. To control the spread of HIV, China initiated a national methadone maintenance treatment (MMT) program in 2004, which is now the world's largest MMT system with 767 clinics and 184,000 clients receiving treatment in 2014. Many clients continue to engage in drug-related and sexual HIV-risk behaviors, and the estimated HIV seroconversion rate among Chinese MMT clients is 0.20-0.66/100 person-years. We sought to explore the experiences of newly-diagnosed HIV-positive MMT clients and to better understand their perceptions of MMT, HIV risk, and HIV prevention.
**Methods:** In 2012, we recruited clients of 13 MMT clinics in Chongqing and Kunming who had a baseline HIV-negative test result upon MMT entry and had been diagnosed with HIV within the past 12 months. Semi-structured qualitative interviews of 60-90 minutes were conducted to discuss HIV risk perception, past behavior history, and prevention methods. Field notes were coded manually and analyzed for common themes.
**Results:** Among the 27 participants who were interviewed, two-thirds were male, the mean age was 40 years, and the mean duration of drug use prior to MMT was 10.7 years. The mean duration between MMT initiation and HIV diagnosis was 2.1 years. Participants self-reported their mode of infection as injection drug use (N=15), sexual contact (N=7), either injection drug use or sexual contact (N=3), or unknown (N=2). Common themes were the difficulty of drug abstinence despite receiving MMT, social pressure to continue using drugs, limited access to clean needles, and low knowledge of effective HIV prevention measures. Many participants thought that they would be able to visually distinguish whether an injection or sexual partner was HIV-infected. Participants also felt that they could moderate their HIV risk by only injecting or having sex with regular long-term partners.
**Conclusions:** We found that clients who seroconverted while on MMT perceived themselves to be at low HIV risk and had limited knowledge of HIV prevention methods. In addition to MMT, comprehensive HIV prevention services for drug users should include counseling on sexual HIV-risk behaviors and improved access to clean injection equipment.

## Prevention programmes, including introduction of biomedical technologies

### THPEE438

### Clinical outcomes from a pilot study examining the PrePex device for VMMC in South Africa

G.N. Dean[1], S. Frade[2], D. Taljaard[2], D. Rech[2], HIV-Negative Males aged 18-49
*[1]Centre for HIV/AIDS Prevention Studies, Research, Boksburg, South Africa, [2]Centre for HIV/AIDS Prevention Studies (CHAPS), Research, Johannesburg, South Africa*
*Presenting author email: gen@chaps.org.za*

**Background:** Circumcision devices make the procedure quicker, simpler and potentially more cost-effective, and have the opportunity to make the provision of VMMC easier to scale-up. The primary aim of the safety component of the study was to monitor clinical Adverse Events (AEs) and device-related adverse incidents.
**Methods:** The sample included 803 HIV negative men, aged 18 to 49 years, from three sites in Gauteng province. Men were followed for 56 days from day of device placement (Day 0).
**Results:** A total of 15 865 people went to the clinic to access circumcision services during the study period, however only 5 500 of these were between the ages of 18 and 49 years. Almost half of all participants (44%) were between the ages of 25 and 34 years, and 40% were 18 to 24 years of age. Of the 5 500 clients, 828 (15.1%) people were both eligible and opted to have circumcision done using the PrePex device. There were 20 AEs, giving an AE rate of 2.5%, mainly due to infection, bleeding, self-removals (resulting in surgical interventions), severe pain, problems voiding, and insufficient skin removal as well as delayed wound healing. The majority of the 23 withdrawals prior to device application were due to "lack of device fitting" (device size was too small or too big), and due to medical conditions (phimosis or genital warts).
In Orange Farm, the greatest number of clients were size A; in Katlehong the greatest number of clients were size B; and in Zola the greatest number of clients were size C.
**Conclusions:** The AE rate obtained for the current study was 2.5%, 0.5% higher than surgical. This result can be considered "good" as this is the first of many pilot studies examining device-related AEs. Uptake seems to be high with 15% of the total number of males accessing VMMC services opting for PrePex. The relatively low AE rate coupled with the increased uptake of PrePex indicates that men are more likely to opt for device-related circumcision, thus increasing the number of men circumcised and ultimately decreasing the incidence and prevalence of HIV/AIDS cases overall.

### THPEE439

### Uptake of HIV services among female sex workers (FSWs) in a high HIV burden setting in Western Kenya: Tekeleza program experience

G. Muthumbi
*International Medical Corps, Programs, Nairobi, Kenya*
*Presenting author email: grace@internationalmedicalcorps.org*

**Background:** FSWs remain marginalized population disproportionately bearing high HIV burden and account for 14.5% of new HIV infections in Kenya. Criminalization of sex work limits access to HIV prevention, care and treatment services. HTC is an entry point to HIV prevention care and treatment services but uptake among FSWs remain low at 68% and 38% HIV Treatment uptake. Tekeleza program was established in 2010 to offer combination HIV prevention care and treatment services to FSWs in Nyanza which has 15% HIV prevalence among adults 15-69 years.
**Methods:** Services offered at seven drop in centers (DiCEs) include information on safer sex practices, HTC services are offered at enrollment; during quarterly visits and before provision of Post exposure prophylaxis (PEP) for non-occupational sexual exposure to HIV care and treatment, condom education, demonstration and provision, family planning, STI screening and Treatment and TB screening and referral, cervical cancer screening and treatment. The female sex workers were enrolled and followed up on quarterly basis.
**Results:** Data was analyzed for services offered to 5,890 FSWs enrolled in 7 DiCEs from 2012-2014. Ten percent (n=564) had known HIV positive status at enrolment. HTC uptake was 99.6% (n=5,309) up from 83% in 2012, positivity of 15.2% (n=809), prevalence of 23.3% (n=1,373), 1,373(100%) enrolled into care, 70% (n=958) eligible for Highly Active Anti-Retroviral Therapy (HAART) were initiated, 5 lost to follow up giving 99.2% retention 12 months since initiation. Ninety percent (n=5293) made return visits. Out of 5,293 tests at revisits, 0.6% (31) seroconverted, 62% (n=19) at first follow up visit. 3,482 received long acting family planning methods (69% injectable; 19% implants). Of 3,129 screened for cervical cancer using the visual inspection with acetic acid (VIA), 732 (12%) had positive results and received cryotherapy. 10,617 were screened for STIs, 9.3% (n=991) treated for STIs.
**Conclusions:** Uptake of HTC services and retention on HAART was high among FSWs, and low seroconversion rate was observed.

## THPEE440

### AN EXPLORATORY ANALYSIS TO DEVELOP A CONCEPTUAL MODEL OF 'PATIENT-BLAME' IN THE CONTEXT OF THE ROLL-OUT OF 'UNIVERSAL TEST AND TREAT'

G. Hoddinott[1], L. Viljoen[1], K. Nel[1], H. Myburgh[1], M. Simwinga[2], K. Shanaube[2], J. Seeley[3,4], V. Bond[2,4], on behalf of the HPTN 071 (PopART) Study Team
*[1]Desmond Tutu TB Centre, Department of Paediatrics and Child Health, Stellenbosch University, Cape Town, South Africa, [2]Zambart, Lusaka, Zambia, [3]MRC/UVRI Uganda, Entebbe, Uganda, [4]LSHTM, Department of Global Health and Development, London, United Kingdom*
*Presenting author email: graemeh@sun.ac.za*

**Background:** Universal Testing and Treatment (UTT) offers new hope as a global strategy to limit the HIV epidemic. Effectively implementing UTT requires well-resourced, motivated healthcare providers (HCPs) working at facilities and in communities. In our study, HCPs consistently expressed a perception that clinical resources are currently overburdened and concern that UTT might exacerbate this. Further, some HCPs also blamed patients (often indirectly) for undesired outcomes (late initiation or treatment interruptions). We present an exploratory analysis to develop a conceptual model of 'patient-blame' to optimize UTT roll-out.
**Methods:** HPTN 071 is a cluster-randomised trial in Zambia and South Africa with three arms:
(A) enhanced testing plus immediate ART initiation,
(B) enhanced testing and treatment per national guidelines, and
(C) standard of care.
We analysed structured health service observations, 157 interviews and 19 group discussions with HCPs across the 21 trial sites over 30 months. Conceptual trends are identified through narrative analysis.
**Results:** We identified three related cognitive processes important to patient-blame. For HCPs, patients' treatment outcomes are important both for individual patient care and for public health implementation targets. When HCPs feel unable to meet public health targets, they may deflect responsibility for this onto patients. Also, when patients ('lay') do not do what HCPs ('experts') think they should, then the HCPs' expert authority is challenged. HCPs may reclaim this power by labelling such patients as 'bad'. Finally, like victim-blame, 'innocent' patients having undesired health outcomes threatens belief in the world's justness. Rather than accepting this, blame is affixed to patients who 'must have done something to deserve it'. UTT is perceived to potentially exacerbate each process by (a) setting targets perceived to be even more ambitious, (b) having more patients who are perceived as relatively 'well' but who may opt out of treatment (counter to targets), and (c) requiring resolution of the 'just-world tensions' more frequently.
**Conclusions:** The combination of HCPs' concern that the health system has limited capacity to deliver quality care under UTT plus normative (even positive) cognitive processes can enable patient-blame. Training and health system strengthening should be implemented alongside UTT roll-out to mitigate HCPs' concerns and facilitate optimal implementation.

## THPEE441

### A TOTAL MARKET PRICING STRATEGY TO INCREASE CONDOM MARKET SUSTAINABILITY IN TANZANIA

A. Beyer[1], B. Keller[1], M. Higbie[1], A. Chalamila[2]
*[1]Population Services International, Dar es Salaam, Tanzania, United Republic of, [2]PSI Tanzania, Program, Dar es salaam, Tanzania, United Republic of*
*Presenting author email: achalamila@psi.or.tz*

**Background:** In 2012, only 43% of the total market need for condoms was met in Tanzania. Most supply was either free or one of two highly subsidized condom brands: Salama and Dume. To increase the use as a percent of need, it was necessary to reduce subsidy and address market inefficiencies including artificially low prices, while sustaining or increasing volumes. In 2012, the subsidized condom market was 95 million condoms, and the total market net value was $1.14 mil USD.
**Description:** To increase the value of the market while increasing volumes, PSI developed a three pronged strategy:
(1) Increase price of Dume branded condom to cost recovery while sustaining or slightly diminishing volumes;
(2) maintain a low priced/high volume Salama condom; and
(3) support to the public sector to better targeting and uptake of free condoms.
Target audience segmentation and marketing strategies were aligned to pricing strategies. Dume marketing included 3 years of an initially heavy consumer investment targeting older men to build equity as a high end brand, followed by 2 years of intensified trade marketing. Dume price from importer to the trade increased by 140% from 2011 to 2012 (with a slight price decrease by 2015 of 6%). The Salama strategy included a heavy focus on trade marketing, sales commissions and a repositioning of the brand in 2014 to target younger consumers.
**Lessons learned:** The net impact resulted in an increased overall market value, driven by price increases from $1.14 mil USD to $1.634. The total market volume increased from 95 million in 2012 to 120 million in 2015.
**Conclusions/Next steps:** A clear and consistent total market strategy with a focus on price can result in increased value and volume in a market which can allow for a reduction in subsidy. A balanced approach is needed, pulling demand side and supply side marketing levers to ensure brand relevance and acceptance of increased pricing. The strategies for free and subsidized condoms must be coordinated to ensure equity. There is need to further measure the commercial sector contribution and facilitate greater opportunity for commercial brands.

## THPEE442

### ENDING THE AIDS EPIDEMIC IN WOMEN AND GIRLS IN SUB-SAHARAN AFRICA: THE POTENTIAL ROLE OF A PREVENTIVE AIDS VACCINE

T. Harmon[1], K. Fisher[2], M. Warren[2], J. Stover[3], Y. Teng[3], A. Näveke[1]
*[1]International AIDS Vaccine Initiative, Advocacy, Policy, and Communications, New York, United States, [2]AVAC, New York, United States, [3]Avenir Health, Glastonbury, CT, United States*
*Presenting author email: anaeveke@iavi.org*

**Background:** Pervasively high HIV prevalence and incidence in women and girls in Sub-Saharan Africa (SSA) contrasts with gains seen in other populations or regions. A wide spectrum of social and cultural factors, including gender inequality and violence, can prevent women and girls from accessing existing prevention options. Women aged of 15-24 are twice as likely to be living with HIV as their male peers. Modeling has articulated the impact a preventive vaccine could have in reducing new HIV infections in low- and middle-income countries (LMICs) when added to scaled-up existing and emerging prevention, treatment, and care. A new sub-analysis of data demonstrates the particular impact an AIDS vaccine with strong uptake could have on women and girls.
**Methods:** New infections averted in women aged 15-24 were calculated for 18 SSA countries, assuming a base case vaccine (introduced in 2027, 3 doses, 70% efficacy, 5 years duration) achieving good uptake (50-70% depending on age tier) is implemented in combination with full scale-up of programs in LMICs as outlined in UNAIDS' Investment Framework Enhanced (IFE). The impact on young women in all SSA countries is calculated based on the impact in the 18 countries, adjusted with the ratio of new infections in young women in all SSA countries versus in these 18 countries.
**Results:** A vaccine of base case characteristics reduces annual new HIV infections in young women in SSA by 46% one decade after introduction, by 72% in the 25th year after introduction, and by 91% in the year 2070. A vaccine would reduce cumulative new infections in young women by 29% in the first decade, by 46% in the first 25 years, and by 58% by 2070.
**Conclusions:** AIDS vaccines would be fundamental to conclusively ending the AIDS epidemic in young women in SSA. Implementing existing and emerging prevention options targeting women and girls in the near-term while sustaining vaccine R&D efforts will be necessary to enhance prevention choices for women and girls, and to achieve and sustain the end of AIDS. These data provide strong evidence for sustained support for AIDS vaccine R&D toward globally effective vaccines for incorporation into comprehensive health programs.

## THPEE443

### THE S'KHOKHO 'BUSHCAN' INITIATIVE: KICK A BUSH AND CONDOMS FALL OUT

J. Pienaar
*S'Khokho Community Health, Hilton, South Africa*
*Presenting author email: jpienaar@skhokho.org*

**Background:** Residents in rural areas have limited access to condoms due to distance, cost and time involved in travelling to public health facilities around which most condom distribution efforts are centralized.
**Description:** In an effort to increase access to condoms in these areas, we explored the feasibility and efficacy of condom distribution by placing condocans on trees along informal footpaths used by residents. Since October 2012, steel condocans typically seen in clinic settings were erected on trees along pathways in 'bushy' areas with high levels of foot-traffic at several rural locations in the Umgungundlovu District of KwaZulu-Natal. Due to their location, the condocans were referred to as "bushcans". Condom uptake was closely monitored, and the bushcans were restocked whenever necessary.
**Lessons learned:** Following the introduction of the bushcans, male condom distribution increased by 237% from October 2012 to December 2012. Condom distribution in these areas increased on average by 187% from October 2012 to October

2015 with more than 408 000 condoms distributed over the 3 year period using these bushcans alone. Discussions with residents revealed that they were pleased with the increased access to condoms via these bushcans and they further recommended other areas for potential implementation of this initiative.
**Conclusions/Next steps:** This bushcan initiative highlighted that condoms are not as easily accessible to all South Africans as is often thought. By providing access to condoms in a discrete and convenient manner, these 'bushcans' have the potential to increase access to condoms in other rural and peri-urban areas in South Africa, where communities face similar barriers to access.

## THPEE444

### IMPLEMENTING A SUCCESSFUL PREP PROGRAM: LESSONS LEARNED FROM THE LARGEST LGBT COMMUNITY HEALTH CLINIC IN NEW YORK CITY

P. Carneiro[1], S. Stephanos[1], S. Mosher[1], J. Barrios[1], A. Fortenberry[2], U. Belkind[3], P. Meacher[3], A. Radix[3]
*[1]Callen-Lorde Community Health Center, Prevention and Outreach, New York, United States, [2]Callen-Lorde Community Health Center, Nursing, New York, United States, [3]Callen-Lorde Community Health Center, Medicine, New York, United States*
*Presenting author email: pcarneiro@callen-lorde.org*

**Background:** With 50,000 new infections each year in the US there is an urgent need to incorporate new strategies for prevention, especially in key populations such as MSM, transgender women and Black/African American communities. The approval of Truvada (TDF/FTC) for Pre-Exposure Prophylaxis (PrEP) by the US FDA in 2012 invigorated prevention efforts. Uptake has been slow as facilities struggle to address community awareness, staff training, access, visit costs and ensuring quality of care delivered.
**Description:** Callen-Lorde Community Health Center (CLCHC) is an LGBT-focused center in NYC. PrEP was initiated in a pilot phase in 2012 and scaled up as a discrete program in 2015. CLCHC's program focus is on connecting key populations (MSM, Transgender people and people of color) to PrEP. The initial demand for services was overwhelming and threatened to overload clinic capacity. Challenges included providers' unwillingness to prescribe, lack of provider knowledge, navigating complex insurance and medication assistance programs, clinical workflow, time constraints, protocol development, data collection, ensuring cultural competency and maintaining a sex-positive environment, free of PrEP-stigma. Several operational meetings were convened with internal and external stakeholders to design a centralized program that ensured consistent and quality care.
**Lessons learned:** A clinical workflow was established to minimize the clinicians' role and maximize the role of non-clinical staff, e.g., patient navigators & HIV counselors. Templates and electronic flags were implemented to document PrEP consultations, order specific labs and track patients using an innovative prescription algorithm. The implementation of self-collected STD specimens reduced the burden on clinical staff. The clinic designed videos (available on YouTube) to address common questions about PrEP. PrEP Specialists were hired to carry out all administrative functions, troubleshoot medication access and assist with counseling on adverse effects and monitoring adherence.
**Conclusions/Next steps:** Once aware, there is demand from the LGBT community for PrEP. Multi-disciplinary teams of clinicians, social workers, nurses and HIV counselors must collaborate in order to support patients throughout the PrEP care continuum. Agencies must allow flexibility and innovation to take place when developing PrEP protocols and programs.

## THPEE445

### IMPLEMENTATION OF THE WHO RECOMMENDATION FOR NEEDLE AND SYRINGE PROGRAMS TO DISTRIBUTE LOW DEAD SPACE SYRINGES: ACCEPTABILITY, UPTAKE AND FEASIBILITY

W. Zule[1], A. Latypov[2], D. Otiashvili[3], S. Bangel[1], A. Boymatov[4], G. Bobashev[5]
*[1]RTI International, Substance Use, Gender & Applied Research, Research Triangle Park, United States, [2]Management Sciences for Health, Leadership, Management and Governance, Kiev, Ukraine, [3]Addiction Research Center, Alternative Georgia, Tbilisi, Georgia, [4]Public Organization Apeyron, Dushanbe, Tajikistan, [5]RTI International, Center for Data Science, Research Triangle Park, United States*
*Presenting author email: zule@rti.org*

**Background:** In 2012, the World Health Organization (WHO) issued recommendations for needle and syringe programs (NSP) to offer their clients low dead space (LDS) insulin syringes, a biomedical technology, to reduce HIV transmission.
**Description:** This pilot implementation study, conducted in 2015, assessed the acceptability and uptake of LDS needles among 100 NSP clients in Kulob and 100 in Khujand, Tajikistan. Eligibility criteria included injecting at least weekly and obtaining needles/syringes from the NSP at least twice in the past 30 days. The study provided each NSP 25,000 LDS needles. NSP staff distributed marketing flyers and LDS needles to all NSP clients and gave each research participant 20 LDS needles at baseline. NSP staff collected data at baseline and 2-month follow-up interviews. The primary outcomes included acceptability and uptake of the LDS needles, and the feasibility of NSP promoting and distributing LDS needles. The two month follow-up rate was 99.5%.
**Lessons learned:** The maximum capacity of LDS insulin syringes is 1-mL. In the formative phase participants reported using 2-mL or 5-mL syringes, therefore, we provided LDS needles that fit on 2-ml and 5-ml syringes. Acceptability of the LDS needles was high with 100% of participants reporting trying them, and 96% liking them. Most (67%) of participants reported using LDS needles in the past 30 days, and 25% reported using them exclusively. The high uptake resulted in both NSP running out of LDS before all follow-up interviews were completed. In a multiple logistic regression model, that adjusted for city, the number of injections in the previous 30 days (OR = 0.91; 95% CI = 0.88, 0.94) and the date of the follow-up interview (OR = 0.91; 95% CI = 0.85, 0.97) were negatively associated with using LDS needles in the previous 30 days. Among participants (n=147) who reported using a regular needle at follow-up, the primary reasons were: LDS needle not available (71%); prefer regular needles (22%); and LDS needles wrong size (6%).
**Conclusions/Next steps:** In cities where LDS insulin syringes are not acceptable to people who inject drugs, LDS needles are an acceptable alternative that can be implemented with minimal marketing.

## THPEE446

### ACCESS TO POST-EXPOSURE PROPHYLAXIS FOR CONSENSUAL SEXUAL ACTIVITY AND COMBINATION PREVENTION IN HIV CLINICS IN BRAZIL: QUALITATIVE FINDINGS FROM THE COMBINE! STUDY

D. Ferraz[1,2], G. Calazans[1], T. Pinheiro[1], E. Zucchi[3], the Combine! Study Group
*[1]University of São Paulo, Preventive Medicine, São Paulo, Brazil, [2]Oswaldo Cruz Foundation (FIOCRUZ), School of Government in Public Health, Brasília, Brazil, [3]Universidade Católica de Santos, Graduate Program on Public Health, Santos, Brazil*
*Presenting author email: dulce_ferraz@yahoo.com.br*

**Background:** Despite strong evidences on the efficacy of biomedical HIV prevention, comprehensive analyses within the context of healthcare services and the daily routine of social groups most exposed to risk of infection are lacking. We aimed to understand facilitators and barriers to the access to post-exposure prophylaxis for consensual sexual activity (nPEP).
**Methods:** As part of a multicenter pragmatic clinical trial on pre- and post-exposure prophylaxes and the combination HIV prevention methods, in-depth interviews were conducted with 42 nPEP users in 5 healthcare clinics in Brazil.
**Results:** The nPEP users are mainly men (heterosexual and homosexual), but women also search for the prophylaxis.
Individuals usually report seeking information on how to avoid infection after they experiment accidents in sexual intercourses with casual partners, people living with HIV (PLWH) or in the context of sex work. Internet, other health services and PLWH are the main sources of information about nPEP and where it is available.
Priority assistance for nPEP was reported as a facilitator to entry services. Reported barriers include: nurses' and doctors' misconceptions about nPEP; confusing protocols in emergency settings; receptionists' poor knowledge of preventive services offered by the clinics. Interactions with professionals were evaluated positively.
Services were mainly described as fast, clarifying and non-discriminatory. Nevertheless, a few reported judgmental attitudes from counselors and receptionists as well as embarrassment for having to report sexual exposures in reception desks or in non-private medical settings. Others complained about not been informed about alcohol restriction during PEP. Some reported that the quality of care overcame their expectations, especially considering they are offered in public, non-paid services.
**Conclusions:** Access to information about nPEP still relays on individual initiatives, being little known by users prior to accidents. Organizational barriers to be overcome to improve access to nPEP include: expanding information on the its availability; overcoming knowledge gaps among healthcare professionals; providing qualified information in all users-healthcare providers interactions; and guaranteeing private settings.
As PEP services are likely to be involved in the offer of methods such as PrEP, those improvements will contribute to promote access to and use of broader HIV prevention packages.

## EARLY INFANT AND ADULT MALE CIRCUMCISION PROGRAMMES

### THPEE447

### MODELING COSTS AND IMPACTS OF INTRODUCING EARLY INFANT MALE CIRCUMCISION FOR LONG-TERM SUSTAINABILITY OF THE VOLUNTARY MEDICAL MALE CIRCUMCISION PROGRAM

E. Njeuhmeli[1], P. Stegman[2], K. Kripke[2], O. Mugurungi[3], G. Ncube[3], S. Xaba[3], K. Hatzold[4], A. Christensen[5], M. Schnure[6], J. Stover[7]
*[1]US Agency for International Development, Washington, DC, United States, [2]Avenir Health, Washington, DC, United States, [3]Ministry of Health and Child Care, Harare, Zimbabwe, [4]Population Servies International, Harare, Zimbabwe, [5]Jhpiego, Dar es Salaam, Tanzania, United Republic of, [6]Palladium Group, Washington, DC, United States, [7]Avenir Health, Glastonbury, United States*
*Presenting author email: pstegman@avenirhealth.org*

**Background:** Voluntary medical male circumcision (VMMC) is an effective HIV prevention strategy for males. Since 2007, the President's Emergency Plan for AIDS Relief has supported VMMC programs in 14 priority countries in Africa. Today several of these countries are transitioning to program sustainability and maintaining high levels of male circumcision in the population.
Alternative strategies being considered: circumcising adolescents over the long term, integrating early infant male circumcision (EIMC) into existing programs, or some combination of the two.
**Methods:** The paper uses the Decision Makers Program Planning Tool (DMPPT) 2.0 model to assess the cost and impact of VMMC sustainability strategies in multiple countries, particularly in Zimbabwe. The model was populated with national estimates of population, mortality, and HIV prevalence and incidence using the Spectrum/Goals model and the Zimbabwe Demographic and Health Survey 2010-2011. Various scenarios were analyzed to 2051. Additional sensitivity analyses examined the effects of different timing of introducing and scaling up EIMC, and of different discount and baseline MC prevalence rates.
**Results:** Adopting a strategy to introduce EIMC immediately, or in a phased approach increases the total number of circumcisions needing to be performed, but will not substantially decrease HIV incidence. It may, however, result in cost savings, depending on the ratio of cost of EIMC vs. cost of adolescent VMMC. This timing of the introduction of EIMC, and the duration of scale-up, whether over five or ten years, had only a marginal impact on the number of infections averted, the cumulative cost of the program, and on the number of VMMCs required to avert a single HIV infection.
**Conclusions:** Introducing EIMC into existing VMMC programs provides little or no additional reduction in HIV incidence, and is being considered as part of sustainability plans because of implementation and safety considerations. Because the relative cost of EIMC compared to adolescent VMMC is still unknown, the overall cost effectiveness of introducing EIMC will depend on findings from future costing studies. But if the cost is 50% or less than the cost of adolescent VMMC, then the introduction of EIMC for sustainability of the VMMC program will be cost saving for most countries.

### THPEE448

### EARLY INFANT MALE CIRCUMCISION IN REPRODUCTIVE AND CHILD HEALTH SERVICES: USING AN INTEGRATED SERVICE DELIVERY MODEL IN TANZANIA

K. Ngonyani[1], A. Christensen[2], E. Njeuhmeli[3], R. Muhombolage[1], E. Mlanga[4], G. Msemo[5], G. Lija[5]
*[1]Jhpiego, Iringa Town, Tanzania, United Republic of, [2]Jhpiego, Dar es Salaam, Tanzania, United Republic of, [3]USAID, Washington DC, United States, [4]USAID, Dar es Salaam, Tanzania, United Republic of, [5]MOHCDGEC, Dar es Salaam, Tanzania, United Republic of*
*Presenting author email: kanisiusy.ngonyani@jhpiego.org*

**Background:** Three randomized controlled trials have demonstrated that male circumcision reduces female to male heterosexual transmission of HIV by 60%. Since 2009, Tanzania has extensively scaled up voluntary medical male circumcision (VMMC). Early infant male circumcision (EIMC) is seen as a possible long-term, sustainable strategy for an AIDS-free generation. The more infants who are circumcised, the fewer adolescents and adults will need circumcision in the future. When compared to VMMC, EIMC requires less time, has a shorter healing period and may be more cost-efficient. Tanzania introduced EIMC as a pilot in 2013. Tanzania's pilot used an integrated model of service delivery with EIMC services offered within existing Reproductive and Child Health (RCH) services.
**Description:** For the EIMC service, parents are educated about EIMC service during antenatal care (ANC), maternity and/or postpartum care as well as during well-baby visits. EIMC services are offered in the outpatient RCH clinic. Infants can be linked to other well baby services and parents are offered HIV testing and counseling. Infants that are HIV-exposed are linked to PMTCT services. Provider interviews were conducted to elicit their perspectives on the integrated EIMC service.
**Lessons learned:** Eight health facilities offer EIMC services as pilot sites in Iringa Region and a total of 57 health care providers were trained in EIMC provision with over 3,800 male infants circumcised as of December 2015. The RCH health care providers perceive EIMC as a good practice and EIMC being integrated within RCH reduces delays in EIMC service. However, during interviews conducted to elicit their perspectives on the integrated EIMC service, providers felt that their work responsibilities have changed since the introduction of EIMC services, noting that their workload had increased and their work plan or schedule had changed.
**Conclusions/Next steps:** Delivering EIMC services as part of an integrated RCH package was successful during the Tanzania EIMC pilot. RCH providers need support in time management and service efficiencies to streamline EIMC service delivery. Furthermore, a formal costing study using an integrated EIMC approach is needed to inform scale up of this service.

### THPEE449

### ACCEPTABILITY OF NEONATAL CIRCUMCISION BY PREGNANT WOMEN IN KWAZULU-NATAL, SOUTH AFRICA

R. Phili[1], Q. Abdool Karim[2]
*[1]NHLS, Durban, South Africa, [2]CAPRISA, Durban, South Africa*
*Presenting author email: roger.phili@yahoo.com*

**Background:** Studies on voluntary medical male circumcision (VMMC) have provided convincing evidence on its efficacy to provide partial protection against female-to-male HIV transmission in circumcised men. Following this evidence the WHO and UNAIDS formulated recommendations for VMMC implementation settings with generalised HIV epidemics and low circumcision prevalence. The recommendations stipulate an implementation that ensures VMMC services to all infants up to 2 months old (neonatal medical male circumcision/NMMC) and at least 80% of male adolescents.
We explored the acceptability of NMMC amongst pregnant women who are candidates for granting of consents for NMMC procedures in order to inform the guidelines for NMMC implementation and its possible integration with other Maternal, Child and Women's Health (MCWH) programmes.
**Methods:** Nurses and counsellors at two public health facilities were trained to provide NMMC counselling and offer NMMC to pregnant women who presented for ante-natal care (ANC) services. The counselling included the benefits of NMMC in HIV prevention later in life, the surgical procedures, risks and the benefits of the procedure. Data on NMMC acceptance, refusals and reasons for refusals were recorded in the registers and subsequently captured onto an SPSS database. Data was analysed to establish the acceptability of the procedure and the feasibility of integration NMMC with MCWH programming. Qualitative thematic analysis was used to analyse the reasons for NMMC.
**Results:** The NMMC acceptance was high (82.9%) among the 1778 women who participated. There was no significant age difference between women accepting and those refusing NMMC (p=0.089). Most refusals were due to the women requiring consultations with partners and / or family prior to consenting (41.3%), fear of the procedure (23.8%), cultural reasons (15.9%) and no reasons given (15.3%).
**Conclusions:** Findings provide evidence of the possible high uptake of NMMC at public health institutions and the feasibility of its integration with other MCWH programmes. However the presence of socio-cultural issues mainly related to support for traditional circumcision and the need for further consultation with family members appear to influence women's decisions on the granting of consents for NMMC.

### THPEE450

### MEDICAL MALE CIRCUMCISION COVERAGE FROM 2007 TO 2014 IN RAKAI, UGANDA

X. Kong[1], G. Kigozi[2], F. Nalugoda[2], J. Ssekasanvu[1], G. Nakigozi[2], C. Latkin[3], L. Chang[4], D. Serwadda[5], M. Wawer[1], R. Gray[1], Rakai Health Sciences Program
*[1]Johns Hopkins University, Epidemiology, Baltimore, United States, [2]Rakai Health Sciences Program, Kalisizo, Uganda, [3]Johns Hopkins University, Health, Behavior and Society, Baltimore, United States, [4]Johns Hopkins University, Baltimore, United States, [5]Makerere University, Kampala, Uganda*
*Presenting author email: lchang8@jhmi.edu*

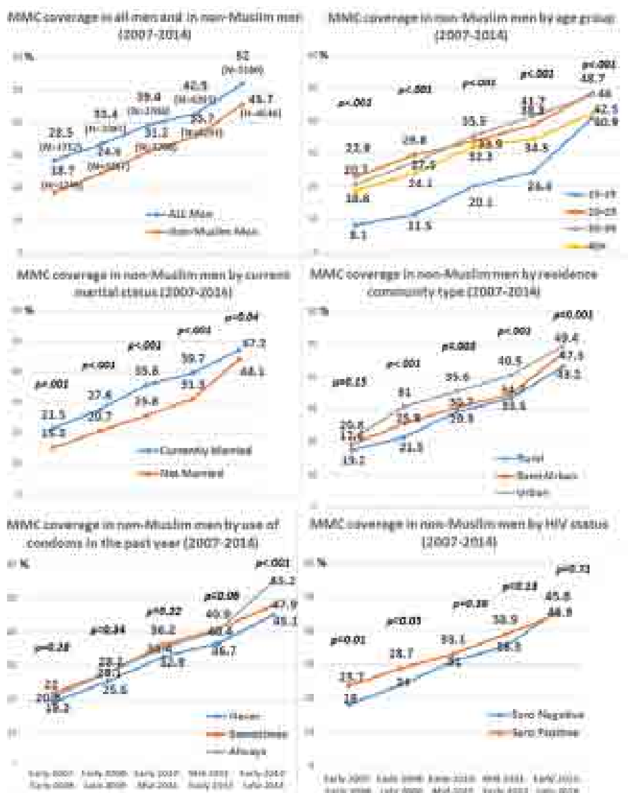
**Background:** Medical male circumcision (MMC) is an important HIV prevention strategy in Sub-Saharan Africa. In 2011, WHO/UNAIDS set the strategic goal of achieving "MC prevalence of at least 80% among 15-49 year old males" by 2016 in 14 priority countries, including Uganda. Reaching this goal requires monitoring and evaluation to assess program performance and identify subgroups with low cover-

age. Using population-based data in Rakai, Uganda, we estimated MMC coverage in men aged 15-49 years and by their demographics, risk profiles, and HIV serostatus from 2007 to 2014.

**Methods:** The Rakai Community Cohort Study conducts population surveillance of consenting residents aged 15-49 in rural Rakai every 12-18 months. MMC services were provided through randomized trials during 2004-06. Since 2007, free services were scaled up under PEPFAR funding. We used data from 30 communities consistently surveyed from 2007-2014. Each survey collected sociodemographic, behavioral, and health care seeking information, including self-reported circumcision status. Blood samples were collected for HIV testing. We estimated MMC coverage in all men and by subgroups. Chi-square tests were used to compare coverage by characteristics in each survey.

**Results:** Figure 1 shows MMC coverage in men and by non-Muslim men's age, marital status, residence type, sexual behaviors, self-perceived risk of HIV exposure, and HIV status. From 2007-2014, coverage in all men increased from 28.5% to 52.0%. Coverage was initially lower in 15-19-years olds but increased in 2014. Coverage was consistently higher in married men and in urban communities, and lowest in men with no sex partners in the prior year. Coverage did not significantly differ by condom use, self-perceived risk of HIV exposure, or by HIV serostatus.

**Conclusions:** Increasing MMC coverage in all subgroups suggested that MMC became normative, but coverage fell short of WHO/UNAIDS target, indicating the need for demand generation to reach the 80% coverage goal.



*[Figure 1. MMC coverage in all men and by Non-Muslim men's characteristics]*

## THPEE451

### WOULD EARLY INFANT MALE CIRCUMCISION BE MORE COST-EFFECTIVE THAN ADULT MEDICAL MALE CIRCUMCISION FOR HIV PREVENTION IN SUB-SAHARAN AFRICA? RESULTS FROM WESTERN KENYA

W. Obiero[1], M. Young[2], R. Bailey[3]

*[1]University of Illinois at Chicago, Chicago, United States, [2]Emory University, Atlanta, United States, [3]University of Illinois at Chicago, School of Public Health, Chicago, United States*

*Presenting author email: rcbailey@uic.edu*

**Background:** Sub-Saharan African (SSA) countries, including Kenya, are considering early infant male circumcision (EIMC) for HIV prevention to complement and perhaps replace adult male circumcision (AMMC) programmes. Evaluation of the costs and effectiveness of EIMC in comparison to AMMC are required for budgeting and resource allocation decisions. Such analyses should incorporate the effects of complementary interventions, especially treatment as prevention. Comprehensive evaluations of this type are lacking.

**Methods:** Using a narrow health systems perspective and actual male circumcision programme data, we conducted a cost-impact evaluation comparing AMMC to an AMMC plus EIMC (AMMC*plus*) programme in western Kenya. Incremental cost and effectiveness ratios (ICERs) were calculated. Inputs included: personnel time and remuneration, consumables, non-consumables, management/supervision, mobilization, training, and monitoring/evaluation. Impact estimates were adjusted for under-15 mortality and vertical transmission of HIV. Extreme case scenario analyses were conducted adjusting for discount rates, lifetime HIV treatment costs, priority population targets, and efficacy and scope of complementary HIV prevention programmes. 2014 is the reference year. We used a modified version of the Decision Makers Program Planning Tool for analyses.

**Results:** Under the reference case, one AMMC costs $40.11 (range $36.08, $46.14). One EIMC costs $58.23 (range $29.37, $114.15). Between 2008 and 2030, AMMC is expected to avert 81,346 (40,409, 116,835) incident infections and 33,933 (25,550, 50,258) AIDS deaths with 8 (6, 10) AMMCs per HIV infection averted (HIA) at a cost of $435 ($323, $676) per HIA and net savings of $4,315 ($3,952, $13,900) per HIA. AMMC dominates AMMC*plus* when fewer than 80% of infants are circumcised. Above 80%, AMMC*plus* results in an ICER of $384 (315, 813) per HIA. Our results are sensitive to the scale-up of complementary HIV programmes and are robust to discount rate.

**Conclusions:** Using WHO thresholds, MMC, at any age is highly cost-effective in western Kenya. AMMC dominates AMMC plus EIMC unless EIMC coverage is greater than 80%. Governments considering introducing EIMC services should consider complementary programmes and the long horizon between EIMC introduction and HIV impact. It is unlikely EIMC programmes could achieve 80% prevalence and therefore be cost-effective relative to AMMC programmes in Kenya.

## THPEE452

### THE IMPACT OF CLINICAL ASSOCIATES ON EXPANDING HIGH-QUALITY, COST-EFFECTIVE VOLUNTARY MEDICAL MALE CIRCUMCISION (VMMC) SERVICES IN SOUTH AFRICA

J. Otchere-Darko[1], S. Ngcobo[2], L.C. Monji[1], J. Capati[3]

*[1]Centre for HIV & AIDS Prevention Studies (CHAPS), Johannesburg, South Africa, [2]University of Pretoria, Department of Family Medicine, Pretoria, South Africa, [3]American International Health Alliance, Pretoria, South Africa*

*Presenting author email: jbcapati@yahoo.com*

**Background:** In 2008, South Africa's National Department of Health (NDOH) established a new mid-level cadre called Clinical Associates (ClinAs) to fill critical human resource gaps at rural district hospitals, enable task sharing, and increase efficiency while maintaining a high standard of care. With support from the American International Health Alliance (AIHA), more than 600 ClinAs have completed a three-year bachelor's level training course and are currently deployed in rural, under-resourced sites throughout South Africa. ClinAs are trained to provide a range of HIV prevention, care, and treatment services, including VMMC, which reduces the risk of female-to-male HIV transmission by up to 60%.

**Description:** The Centre for HIV and AIDS Prevention Studies (CHAPS) started recruiting ClinAs to perform VMMC services in 2013. CHAPS currently employs 15 ClinAs, who provide an average of 1,500 VMMCs per month at 16 sites in four provinces.

**Lessons learned:** A program evaluation conducted in 2015 assessed the applicability of ClinAs' VMMC training and found that quality of care provided by ClinAs is comparable to that of doctors. Additional research revealed that when ClinAs work with doctors as part of a multi-disciplinary clinical team, health facilities enjoy cost savings of up to 60%. ClinAs also enable task-sharing, allowing doctors to rotate and provide supervision at multiple sites while ClinAs provide VMMC, counselling, and follow-up care.

**Conclusions/Next steps:** ClinA training and deployment has the potential to significantly reduce costs, increase efficiency through task sharing, and rapidly expand access to VMMC without compromising quality of care. Other countries should invest in and utilize similar mid-level cadres to support their efforts to address HIV prevention and the 90-90-90 goals.

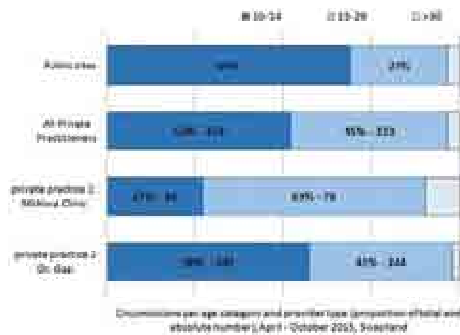
### INCREASING UPTAKE OF CIRCUMCISION SERVICES AMONG 15-29 OLD SWAZI MALES THROUGH PRIVATE PRACTITIONERS

A. Adams[1], J. Vandelanotte[2], D. Rech[3], V. Maziya[4]
*[1]University of Amsterdam, Institutre of Social Science Research, Mbabane, Swaziland, [2]CHAPS, Country Director, Mbabane, Swaziland, [3]CHAPS, CO-CEO, Johannesburg, South Africa, [4]Ministry of Health, SNAP, Mbabane, Swaziland*
*Presenting author email: alfredk.adams@gmail.com*

**Background:** HIV prevention has reached a new era, marked by biomedical advancements in HIV prevention such as voluntary medical male circumcision (VMMC) among others. Faced with the world's highest HIV prevalence (31% among 18-49 year olds), the Government of Swaziland, with support from the United States Agency for International Development (USAID) and technical assistance from the Centre for HIV/AIDS Prevention Studies (CHAPS), aims to increase uptake of VMMC, especially among males aged 15-29 years, to have an immediate impact on HIV incidence. Over the past 5 years, the proportion of men circumcised in this age group has declined from 78% (2010) to 26% (2015).
**Description:** in 2015, CHAPS engaged 3 private practitioners in April 2015 on a cost per circumcision basis, after a positive experience with private doctors in South Africa. Private practices can be attractive for men, who often don't visit public facilities (long queues, poor service, focus on maternal and child health, no privacy, lack of trust in quality of the service). CHAPS provides an MC kit, training and quality assurance. The private practice does demand creation, provides the service and assures follow-up.
**Lessons learned:** Private practitioners successfully reached 15-29 year olds (45% of all private clients), a significantly higher proportion than the other partners (27%), at a cost per circumcision of US$ 65 (SZL 900). Practitioners recruited among existing clients, in high schools and in workplace settings around their practice. Men are taking up VMMC in a men friendly setting.



*[Circumcisions per age category and provider type]*

**Conclusions/Next steps:** Engaging private practitioners is a cost-effective strategy to reach 15-29 year olds. CHAPS is expanding the private practitioners' network, and is exploring to incorporate best practices in public VMMC sites where feasible: providing a men friendly setting and focusing recruitment efforts in high schools and workplace settings.

## THPEE454

### EARLY INFANT MALE CIRCUMCISION USING THE ACCUCIRC DEVICE: EXPERIENCES FROM NATIONAL SCALE UP IN BOTSWANA

R. Wandira
*Jhpiego, Voluntary Medical Male Circumcision, Gaborone, Botswana*
*Presenting author email: ronald.wandira@jhpiego.org*

**Background:** Botswana has the second highest HIV prevalence (18.5%) globally and has been earmarked by WHO and UNAIDS among high priority countries for scaling up voluntary medical male circumcision (VMMC). WHO and UNAIDS recommend early infant male circumcision (EIMC) due to its cost-effectiveness, safety, and reduced risks compared to adult and adolescent circumcision. Countries are considering various devices for EIMC. Although rare, serious potential complications have been associated with some devices. Botswana program is the first to implement EIMC in routine reproductive health services using the AccuCirc device in a successful fully integrated approach, positioning it as a model program.
**Description:** During pilot services in two referral hospitals, with some technical support from PEPFAR, a small number of midwives and doctors in maternity wards were trained to offer EIMC using the AccuCirc device. Upon reaching proficiency, these providers at the pilot facilities were trained on clinical training skills and capacitated to be EIMC master trainers. The pilot facilities became training hubs for cascading training. Demand creation was conducted in antenatal clinics, outpatient education sessions and at traditional (Kgotla) meetings. To date, 277 providers (majority midwives) have been trained. Overall, twenty five EIMC service delivery points have been established, covering most districts. Nurse midwives have conducted 95% of 3,334 procedures in 24 months through December 2015 in this fully integrated model, managed and financed by government.
**Lessons learned:** Task shifting to nurses has helped overcome the staff shortage associated with a doctor depended model. Integration has enhanced government ownership. EIMC training using the master trainers has increased program reach. Due to proper scheduling of staff and procedures, providers report no burden from including EIMC in their regular work. The pre-packaged device kits ease the supply chain management. Challenges include loss to follow up and obtaining consents from partners and guardians.
**Conclusions/Next steps:** Roll out of EIMC to supplement and sustain coverage of VMMC using the AccuCirc device in a fully integrated model was is feasible in this fairly resource constrained setting. Systematic assessment of safety and cost of AccuCirc device based services in this model is recommended.

## THPEE455

### A RANDOMIZED TRIAL OF EARLY INFANT MALE CIRCUMCISION PERFORMED BY CLINICAL OFFICERS AND REGISTERED NURSE MIDWIVES USING THE MOGEN CLAMP IN RAKAI, UGANDA

E. Nelson Kankaka[1], T. Murungi[2], G. Kigozi[1], F. Makumbi[3], D. Nabukalu[4], S. Watya[5], N. Kighoma[6], R. Nampijja[7], D. Kayiwa[6], F. Nalugoda[8], D. Sserwadda[9], M. Wawer[10], R.H. Gray[11]

*Presenting author email: tmurungi@rhsp.org*

**Background:** Medical male circumcision (MMC) for HIV prevention is a priority in 14 East and Southern African countries, and the long-term sustainability of MMC programs could best be achieved by offering early infant male circumcision (EIMC.) However, the acceptability and safety of EIMC provided by non-physicians is unknown.
**Methods:** We conducted a trial of EIMC provided by newly trained clinical officers (CO) and registered nurse midwives (RNMWs) newly trained in using the Mogen clamp and topical anesthesia in 4 health centers in rural Rakai, Uganda. Mothers were invited to participate in the trial and 501 healthy neonates aged 1-28 days with normal birth weight and gestational age were randomized to CO (n=256) and RNMWs (n=245), and were followed at 24 hours, 7 and 28 days.
**Results:** Of the 701 mothers invited to participate in the trial, 525 consented to circumcision (74.9%) and 24 were found ineligible on screening (4.4%). The procedure took an average of 10.5 minutes. Follow up was over 90% at all scheduled visits. The rates of moderate/severe adverse events were 2.4% with CO and 1.6% with RNMW surgeries (p=0.9). All wounds were healed by 4 weeks post-circumcision.
Maternal satisfaction with the procedure was 99.6% for infants circumcised by COs and 100% among infants circumcised by RNMWs.
**Conclusions:** Early infant male circumcision was acceptable in this rural Ugandan population, and can be safely performed by registered nurse midwives who have direct contact with mothers during pregnancy and delivery. EIMC services should be made available to parents who are interested in the service.

### COMPETENCE-BASED TRAINING OF NON-PHYSICIAN HEALTH WORKERS IN THE PROVISION OF EARLY INFANT MALE CIRCUMCISION (EIMC) USING THE MOGEN CLAMP IN RAKAI DISTRICT, UGANDA

E. Nelson Kankaka[1], G. Kigozi[1], D. Kayiwa[2], N. Kighoma[2], F. Makumbi[3], T. Murungi[4], D. Nabukalu[4], F. Nalugoda[4], R. Nampijja[5], D. Sserwadda[6], S. Watya[7], M. Wawer[8], G. Nakigozi[1], D. Namuguzi[9], R.H. Gray[8]
*[1]Rakai Health Sciences Program, Studies, Kalisizo, Uganda, [2]Rakai Health Sciences Program, Circumcision, Kalisizo, Uganda, [3]Makerere University School of Public Health, Kampala, Uganda, [4]Rakai Health Sciences Program, Statistics, Kalisizo, Uganda, [5]Rakai Health Sciences Program, Quality Control, Kalisizo, Uganda, [6]Rakai Health Sciences Program, Management, Kampala, Uganda, [7]Rakai Health Sciences Program, Circumcision, Kampala, Uganda, [8]Johns Hopkins Bloomberg School of Public Health, Epidemiology, Baltimore, United States, [9]Makerere University College of Health Sciences, Surgery, Kampala, Uganda*
*Presenting author email: kighoma@rhsp.org*

**Background:** Early Infant Male Circumcision (EIMC) is a key component of combination HIV prevention in high HIV burden countries. However, provision of EIMC is limited due to lack of qualified providers and concerns about potential complications. Adequate competence-based training of non-physician personnel using a structured curriculum can avoid complications and enhance scale-up of EIMC in regions with low physician coverage.
**Methods:** Didactic and practicum training in the provision of EIMC using the Mogen clamp uder topical anesthesia was conducted for 10 Clinical officers (COs) and 10 Registered Nurse Midwives (RNMWs) in preparation for a trial on safety and acceptability of EIMC in Rakai, Uganda. Neonates whose mothers provided written consent were assigned in tandem to the 20 trainees. Each trainee performed at least 10 circumcision procedures. Ongoing assessment of competency was based trainer feedback provided immediately after surgery.
**Results:** A total of 202 babies were circumcised by trainees but only100 (5 per trainee) were used for the assessment of trainee's competence i.e. Procedures 1, 3, 5, 7, and 9.
In a pretest of competency, 20% of COs and 10% of NMWs scored above the pass mark (set at 80%). By 7th EIMC procedure , all trainees had achieved pass mark competency. The variability in performance scores significantly declined with increasing number of procedures performed.The median time per was similar between COs (13 minutes) and NMW s (12 minutes). Safety of EIMC was comparable between COs and NMWs. Four moderate insufficient skin removals occured; 2 by CO s and 2 by NMWs.
**Conclusions:** Training of non-physicians improved knowledge and competency in EIMC and the gain in competency was similar among COs and NMWs using the same training program.

### IMPACT OF DECENTRALISATION ON ART SERVICES AT COMMUNITY LEVEL IN RURAL NORTHERN UGANDA: RESULTS FROM THE LABLITE POPULATION SURVEYS

G. Abongomera[1,2], S. Kiwuwa-Muyingo[3], P. Revill[4], L. Chiwaula[5], T. Mabugu[6], A. Phillips[7], E. Katabira[8], M. Muzambi[6], C. Gilks[9,10], A. Chan[5,11], J. Hakim[6], R. Colebunders[2], C. Kityo[1], J. Seeley[3,12], D.M. Gibb[13], D. Ford[13], on behalf of the Lablite Project Team
*[1]Joint Clinical Research Centre, Kampala, Uganda, [2]University of Antwerp, Antwerp, Belgium, [3]Medical Research Council, Uganda Virus Research Institute, Entebbe, Uganda, [4]University of York, York, United Kingdom, [5]Dignitas International, Zomba, Malawi, [6]University of Zimbabwe Clinical Research Centre, Harare, Zimbabwe, [7]University College London, London, United Kingdom, [8]Infectious Diseases Institute, Makerere University, Kampala, Uganda, [9]Imperial College London, London, United Kingdom, [10]School of Population Health, University of Queensland, Brisbane, Australia, [11]Division of Infectious Diseases, Department of Medicine, University of Toronto, Toronto, Canada, [12]London School of Hygiene and Tropical Medicine, London, United Kingdom, [13]Medical Research Council Clinical Trials Unit at UCL, London, United Kingdom*
*Presenting author email: gabongomera@jcrc.org.ug*

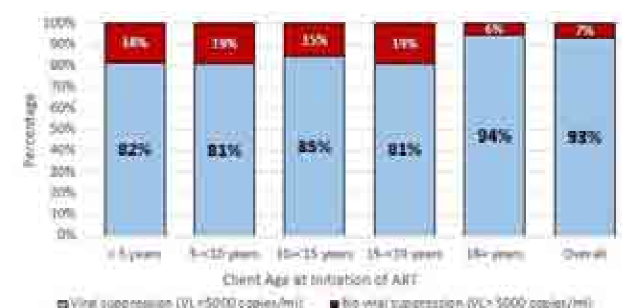
**Background:** The Lablite project carried out unlinked cross-sectional population-based surveys in rural Northern Uganda before and after decentralisation of ART services. ART for Option B+ was provided at a local primary care facility (Lira Kato HC) from April/2013 and general ART from September/2013.Prior to decentralisation, people had to travel 56-76km round-trip for ART.
**Methods:** Households in the 2 parishes closest to Lira Kato were visited between March-April/2013 and again between January-March/2015. Up to 3 adults were interviewed per household.
**Results:** 2124 adults in 1351 households were interviewed in 2013; 2123 adults in 1229 households in 2015. In 2015, 1454 (69%) individuals knew Lira Kato provided ART services. HIV-testing in the last year had increased from 1077 (51%) in 2013 to 1298 (61%) in 2015 ($p<0.001$); prevalence of self-reported HIV in individuals ever-tested was similar (136/1730 (8%) in 2013 and 133/1907 (7%) in 2015).
ART coverage increased significantly from 74/136 (54%) in 2013 to 108/133 (81%) in 2015 ($p=0.01$). Post-decentralisation, 47/108 (44%) of those on ART were in care at Lira Kato; most of the remainder (55/61) were in care at the mission hospital (56km round-trip). 33/47 (70%) individuals initiating ART after September/2013, initiated at Lira Kato (including 10 Option B+ women).
Only 10/71 patients who started ART elsewhere had moved to Lira Kato for follow-up. Reasons given by 59/61 individuals for not accessing ART at Lira Kato included concerns about drug-stock-outs (30 (51%)), starting ART before ART availability at Lira Kato (13 (22%)), lack of trust in clinicians at Lira Kato (5 (8%)) and stigma (4 (7%)); all 61 knew Lira Kato provided ART. Although 3/47 current ART patients at Lira Kato reported not being able to collect ART in the past year due to drug stock-out (2) or health worker not available (1), only 1/47 had missed a clinic visit due to distance/cost. Across secondary-level facilities, corresponding numbers were 1/61 and 9/61.
**Conclusions:** ART coverage increased after decentralisation combined with Option B+ roll-out. Patients who started ART prior to decentralisation were reluctant to transfer to their local facility; the majority feared drug stock-outs. Patients attending secondary-level facilities were more likely to miss collecting ART due to distance/cost.

## THPEE458

### EARLY RESULTS AND LESSONS FROM THE SCALE UP OF VIRAL LOAD TESTING IN 13 DISTRICTS OF SOUTH-WESTERN UGANDA

M. Walakira[1], E. Kajungu[1], J. Mutagubya[1], C. Rwabugiri[1], I. Nakachwa[1], E. Bitarakwate[2]
*[1]Elizabeth Glaser Paediatric AIDS Foundation, Programs, Kampala, Uganda, [2]Elizabeth Glaser Paediatric AIDS Foundation, Kampala, Uganda*
*Presenting author email: mwalakira@yahoo.com*

**Background:** The 2013 WHO consolidated guidelines on antiretroviral treatment (ART) recommend viral load (VL) testing as the preferred monitoring tool for diagnosing and confirming treatment failure. The Uganda Ministry of Health (MOH) set up a viral load testing laboratory at the Central Public Health Laboratory (CPHL), processing VL samples from all health facilities in 2014.
The scale up of VL testing in low-resourced, rural settings raises challenges for planning, specimen transmission and incorporating quality viral load testing into existing service delivery.
**Methods:** EGPAF supported the MOH to roll-out VL testing to 85 high-volume ART sites in South-Western Uganda in 2015. In collaboration with CPHL, multidisciplinary teams of health workers were trained in VL testing and site-specific action plans developed. Sites received start-up supplies for dried blood spot sample collection and standard operating procedures for integrating with the existing sample transportation network.
**Results:** After training 374 health care workers (clinicians, laboratory technicians, nurses/midwives), VL testing rapidly scaled up. Between July and October 2015, 13,500 clients on ART longer than 6 months received VL testing. Adults >19 years achieved 94% suppression. Those <19 years had much lower rates of suppression: 81% for those 15-19 years and 5-10 years.



*[Viral suppression rates]*

**Conclusions:** VL testing in low resource rural settings is feasible with strong collaboration and planning.

Overall, children <19 years enrolled on ART have lower viral suppression rates compared to adults, with the lowest rates among children between 5-10 years and adolescents from 15-19 years.
Urgent interventions are needed to determine whether low VL suppression among those < 19 years is due to poor adherence or to treatment failure.
EGPAF will sustain these gains through continuous analysis and use of data, integrating QI approaches and building MOH capacity to address identified gaps.

## THPEE459

### USE OF MOTORCYCLE HEALTH COURIER MODEL IMPROVED ACCESS TO LABORATORY SERVICES AMONG HIV-INFECTED PERSONS IN RURAL EASTERN UGANDA, A CASE OF TORORO LABORATORY HUB

P. Okwalinga[1], S. Okoboi[2], L. Ssali[2], L. Opendi[3], E. Ocamare[4]
*[1]The AIDS Support Organization, Laboratory Hub, Kampala, Uganda, [2]The AIDS Support Organization, Research, Kampala, Uganda, [3]The AIDS Support Organization, Psychosocial, Kampala, Uganda, [4]The AIDS Support Organization, Medical, Kampala, Uganda*
*Presenting author email: okwalinga1977@yahoo.com*

**Background:** Inaccessibility of laboratory testing services in Tororo and Manafwa districts owing to challenges in transportation of samples and results to and from the testing facilities led to very few patients accessing laboratory testing services. In 2013 through partnership with Tororo District leadership, TASO and CDC introduced the motorcycle health courier model with the aim of improving timely access to laboratory testing services for PLWHIV in the supported districts of Tororo and Manafwa.
**Description:** TASO hired two trained Motorcycle Health courier personnel in July 2013 to improve efficiency through timely collection and transportation of samples including delivery of results. Each courier supported one district with a coverage of 22 health facilities in Tororo and 16, in Manafwa. Their schedules involved visiting at least 5 to 7 facilities a day to collect samples, deliver previous results and distribute some vital testing supplies. Samples collected would be delivered to the hub Laboratory before 3pm for analysis.
**Lessons learned:** The average distance covered by the couriers in one day between the facilities was 120km. 38 public health facilities within 2 districts of Tororo and Manafwa were able to access laboratory testing services and timely delivery of results. Data analyzed before and after the recruitment of health couriers indicated a10 fold rise in CD4 testing from 2409 tests in 2013 to 21627 tests in December 2014. Liver Function Tests and Renal Function Tests increased from 0 to 39507 within the same period, and Complete Blood Count testing improved from 19 to 5345. The test turnaround time was one week down from the previous 1-2 months. There was continuity of testing services due to improved stocking and redistribution of testing supplies by the couriers. Challenges reported by the health couriers included unfavorable weather and bad roads.
**Conclusions/Next steps:** Use of motorcycle health courier model significantly improved access to laboratory testing services in public health facilities in Rural Eastern Uganda. Programs scaling up laboratory testing services in resource-limited settings should consider use of motorcycle health couriers to improve access and improve quality of lives of patients since its sustainable.

### CHARACTERISTICS OF PEDIATRIC PATIENTS ENROLLED IN HIV CLINICS OVER TIME IN KISUMU, KENYA

P.O. Owiti[1], M. Mburu[1], J. Lewis-Kulzer[2], S.B. Shade[3], G. Nyanaro[1], M.A. Guze[2], C. Blat[2], C.R. Cohen[2], E.A. Bukusi[1], L. Abuogi[4], RCTP-FACES Team Study Group
*[1]Kenya Medical Research Institute- FACES (Family AIDS Care and Education Services) Program, Center for Microbiology Research, Kisumu, Kenya, [2]University of California, Department of Obstetrics, Gynecology and Reproductive Sciences, San Francisco, United States, [3]University of California, Department of Medicine, Center for AIDS Prevention, San Francisco, United States, [4]University of Colorado, Department of Pediatrics, Denver, United States*
*Presenting author email: poyaro@kemri-ucsf.org*

**Background:** New HIV infections among children in Kenya declined from 44,000 in 2000 to 12,940 in 2013. AIDS-related deaths claimed 10,390 children in 2013 and 103,000 children remained in need of ART in 2015. Despite progress made, more efforts are needed to meet the UNAIDS 90:90:90 goal for children. This study aimed to describe the characteristics and outcomes of HIV exposed infants tested and the children enrolled in HIV care and treatment from 2007-2013.
**Methods:** We assessed trends in age at enrollment, time to ART initiation and 12-month outcomes in a cohort of children≤14 years of age enrolled in HIV care and aggregated trends in infant infections in two facilities supported by Family AIDS Care & Education Services (FACES) in Kisumu, Kenya. Descriptive analysis included proportions for categorical variables and median (inter-quartile range (IQR)) for continuous variables. Wilcoxon rank-sum, chi-square and log-rank tests were used to test for trends over time.
**Results:** HIV-exposed infants testing HIV positive peaked at 18% in 2009 and decreased from 2010 - 2013(8%, 11%, 1%, 2% respectively) (p< 0.001). Concurrently, the number of children enrolled yearly decreased over time from 295 in 2007 to 92 in 2013.Median enrolment age was 3.9(IQR 1.3,7.9) years (Table1). Three-quarters of those eligible for ART were initiated. The median time from eligibility to ART initiation decreased over time, from 33 days in2007to 12 days in 2013 (p< 0.001). We found no significant trends over time in the proportion of pediatric patients active in care (p=0.93), lost to follow-up (LTFU) (p=0.80), dead (p=0.73) or transferred out (p=0.111) by 12 months after enrollment. The proportion of children remaining alive and active in care was lowest in 2010 (63%) and highest in 2013 (83%).
**Conclusions:** The number of HIV-infected children enrolled into care declined over time, as did infant infections in recent years. Further examination is warranted to determine if declining enrollment may be due to fewer intrapartum and neonatal infections. Time to ART initiation has also declined among newly diagnosed children living with HIV.

## THPEE461

### A DOSE-RESPONSE RELATIONSHIP BETWEEN EXPOSURE TO AN HIV PREVENTION INTERVENTION AND PREVENTIVE BEHAVIORS IN MOZAMBIQUE: FINDINGS FROM THE CAPABLE PARTNERS PROGRAM (CAP)

F. Gennari[1], E. Oliveras[2], I. Seff[3], E. Marinda[4], H. Bryant[2]
*[1]George Washington University, Milken Institute School of Public Health, Prevention and Community Health, Washington, United States, [2]FHI 360, Maputo, Mozambique, [3]George Washington University, Milken Institute School of Public Health, Global Health, Washington, United States, [4]Health Info Matrix, Johannesburg, South Africa*
*Presenting author email: floriza.gennari@gmail.com*

**Background:** Mozambique has seen improvements in condom use and in the uptake of voluntary HIV counseling and testing (VCT), yet the overall uptake of preventive behaviors (such as reduction of sexual partners) is limited. Continued investments have been made in HIV prevention programs, including community-based behavior change communications (BCC) efforts carried out by FHI360's Capable Partners Program (CAP). However, evidence from Mozambique is limited regarding the minimum dosage of intervention programming necessary to encourage behavior change.
**Methods:** In 2014, we conducted a multi-phased household cluster survey in 12 districts in 4 provinces of Mozambique where CAP was implemented. We interviewed 923 individuals aged 15-64 (399 men, 524 women), 624 of whom were exposed to CAP BCC, and 299 who were not exposed to any HIV intervention. Participation was divided into three levels according to respondent involvement in eight CAP activities in the past 6-12 months: low (1-3 instances of participation), medium (4-6 instances) and high (more than 7 instances). Activities included one-on-one talks with a peer educator, participation in discussion groups, and watching theater performances or films about HIV/AIDS. The participation variable was regressed on five outcomes: intention to seek VCT in the next 6 months, ever sought counseling and testing for HIV/AIDS (individual VCT), ever gone for an HIV test with any of their sex partners (couples VCT), condom use at last sex, and current multiple concurrent partners.
**Results:** Our results suggest a significant dose-response relationship between CAP participation and three outcomes: intention to test for HIV at low (AOR=2.67; 95%CI:1.49-4.78), medium (AOR=4.29; 95%CI:2.14-8.58), and high (AOR=5.71; 95%CI:3.32-9.81) participation, individual VCT at low (AOR=2.66; 95%CI:1.52-4.67), medium (AOR=3.60; 95%CI:2.14-8.58) and high (AOR=5.71; 95%CI:3.32-9.81) participation and couples VCT at low (AOR=3.73; 95%CI:1.52-4.67), medium (AOR=4.31; 95%CI:1.79-10.38) and high (AOR=9.41; 95%CI:4.48-19.79) participation.
For condom use, only a medium level of participation was positively associated with reporting condom use at last sex (AOR: 2.81; 95%CI:1.49-4.78), while no association was found for current multiple concurrent partners.
**Conclusions:** Initial findings suggest higher levels of participation in CAP activities are significantly associated with increased intention to seek VCT, and reporting individual and couples VCT. Investing in greater dosages of intervention programming may be worthwhile for behavior change.

## THPEE462

### IMPLEMENTATION OF THE WORLD HEALTH ORGANIZATION 2013 ANTIRETROVIRAL THERAPY GUIDELINES IMPROVES IN A PRIMARY HEALTHCARE SETTING IN UGANDA

G. Ojamuge[1], A. Semeere[2], S. Asiimwe[3], I. Jonathan[1], J. Kiwanuka[1], J. Gonzalez Perez[1]
*[1]AIDS Healthcare Foundation, Kampala, Uganda, [2]Infectious Diseases Institute, Kampala, Uganda, [3]Integrated Community Based Initiatives, Kampala, Uganda*
*Presenting author email: george.ojamuge@aidshealth.org*

**Background:** In 2013, the World Health Organization (WHO) released new guidelines recommending ART initiation for all patients with CD4< 500 cells/mm³. However, there is limited evidence on the extent of adoption of those recommendations in primary healthcare settings. We assessed the proportion of patients initiated on ART at CD4> 350 cells/mm³ and the predictors of ART initiation before and after implementation of the 2013 guidelines in an HIV clinic supported by the AIDS Healthcare Foundation (AHF) in Uganda.

**Methods:** We conducted a cross sectional study among patients attending St. Balikuddembe HIV clinic in Kampala. We compared proportion of patients initiated on ART with CD4>350 cells/mm3 between June 2012 to May 2013 (2012-2013) -still using WHO 2010 guidelines- and June 2013 to May 2014 (2013-2014) -using the new WHO 2013 guidelines-. Multivariate logistic regression was used to determine other factors associated with ART initiation.

**Results:** We studied 2,003 patients with a median age of 33 years (IQR 28-40) of which 58.3% were female. Median CD4 baseline was 295 (IQR 169-404) cells/mm³, 10.7% were in WHO stage III or IV. During the period 2013-2014, 60.3% of the patients initiated on ART had a baseline CD4> 350 cells/mm³ compared with 47.8% in 2012-2013. Time to ART initiation was 21 days (IQR 3-63) in 2012-2013 compared with 1 day (IQR 0-8) in 2013-2014. Factors associated with ART initiation at CD4>350 cells were period of ART initiation (2013-2014 vs 2012-2013: Odds ratio (OR) 1.4; 95% confidence interval (CI) 1.2 - 1.7; p=< 0.001), WHO stage (stage 4 vs stage 1: OR 0.4; 95% CI 0.2 - 0.9; p=0.029), sex (male vs female: OR 0.8; 95% CI 0.6 - 0.9; p=0.017) and age.

**Conclusions:** We observed a progressive increase of patients with higher CD4 initiated on ART following implementation of the WHO 2013 guidelines in an urban HIV clinic in Uganda. We also found that female sex and WHO stage 1 were independently associated with ART initiation at CD4> 350 cells/mm³. Time from enrolment to ART initiation significantly reduced after fully implementing 2013 guidelines probably due to better health status of clients initiated at higher CD4.

## THPEE463

### WORKING TOWARD THE FIRST '90': IDENTIFYING HIV-INFECTED CHILDREN THROUGH INPATIENT PITC

M. Mukaminega, G. Antelman, J. Obedi, E. Assenga, A. Kanuya, A. Buulu, R. van de Ven
*Elizabeth Glaser Paediatric AIDS Foundation, Dar es Salaam, Tanzania, United Republic of*
*Presenting author email: mmukaminega@pedaids.org*

**Background:** The pediatric 90-90-90 initiative is driving program efforts to close the treatment gap between children and adults. The first "90" challenges us to identify 90% of children living with HIV, and most programs turn to aggressive and targeted provider initiated testing and counseling (PITC) efforts to achieve this. In Tanzania, pediatric wards are a priority area for PITC and EGPAF partnered with local government health management teams to integrate targeted, accountable, and sustainable pediatric PITC efforts at high volume facilities in four regions (Arusha, Kilimanjaro, Lindi, Tabora).

**Description:** Strategies to routinely test children for HIV were agreed upon with local government officials and included: orientation/training of pediatric ward staff in counseling and HIV testing, adding PITC to the daily clinical meeting agenda, and assigning testing targets to staff members or shifts. Patient-level PITC data are recorded in standard registers and submitted to district and regional authorities every quarter. With support from EGPAF, data were reviewed quarterly and feedback on performance was provided to sites.

**Lessons learned:** From January 2014 to September 2015, 122,657 children were admitted at 123 participating health facilities. The coverage for PITC at the pediatric wards was 47% in hospitals compared to 38% in primary facilities (p< .001). A total of 958 (1.8%) children were identified as newly HIV-infected, 83% of these were attending the 41 hospitals where the HIV-positive yield was also higher (1.9%) compared to the yield at primary level facilities (1.3%, p< .001). While the coverage of PITC increased from 40% in the first quarter to 55% in the last quarter, the yield of HIV-positive children identified declined from 2.8% to 1.6%.

**Conclusions/Next steps:** Integrating PITC within pediatric wards is a good strategy to identify HIV-infected children. Introducing PITC as a planned routine service, including routine monitoring through existing structures contributes to sustained efforts and needs to be promoted, in particular, at high volume hospitals. With declining positivity rates due to increased coverage it becomes important to analyze the yield from PITC within pediatric wards and balance it with earlier case finding strategies to maximize yield.

## THPEE464

### IMPLEMENTATION OF ROUTINE VIRAL LOAD MONITORING IN A LARGE URBAN CLINIC IN UGANDA

M. Nsumba[1], R. Musomba[1], A. Kaimal[2], H. Tibakabikoba[2], I. Lwanga[2], M. Lamorde[2], B. Castelnuovo[1]
*[1]Infectious Diseases Institute, Makerere University College of Health Sciences, Research, Kampala, Uganda, [2]Infectious Diseases Institute, Makerere University College of Health Sciences, Prevention, Care and Treatment, Kampala, Uganda*
*Presenting author email: mnsumba@idi.co.ug*

**Background:** Routine viral load (VL) monitoring has recently been introduced in Uganda. In order to achieve the third 90-90-90 (90% of patients on ART with undetectable VL) target set by UNAIDS, it is paramount that patients failing ART are promptly switched to another treatment. We evaluated actions taken for patients with VL>1,000 copies/ml accessing care at the Infectious Diseases Institute, a large urban HIV Centre in Kampala, Uganda.

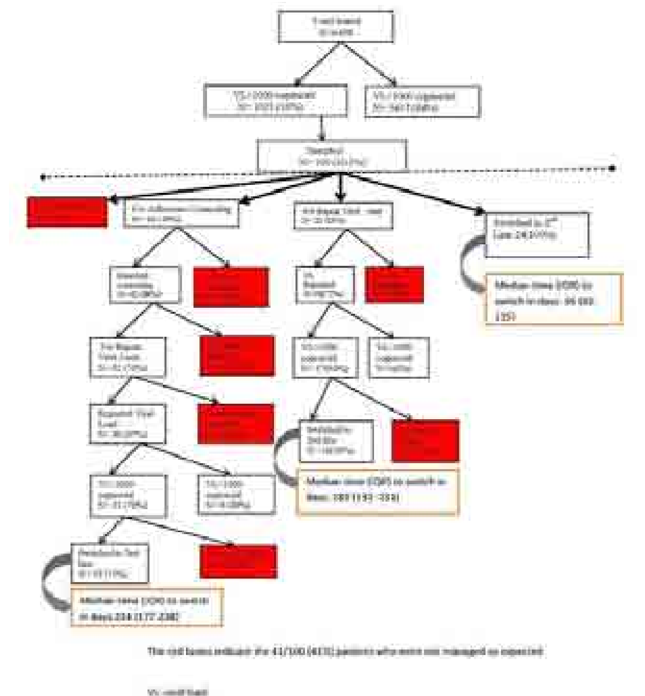
**Methods:** As per internal guidelines, VL results >1,000 copies/ml are flagged by a quality assurance officer and sent to the requesting clinician. The clinician fills a "decision form" choosing:

1) refer for adherence counselling
2) repeat VL after 3 months
3) switch to second line.

We performed data extraction on a random sample of 100 patients with VL test>1,000 copies/ml between January-August 2015. For each patient, we described the action taken by the clinicians.

**Results:** 6,936 patients had their VL done between January and August 2015, of which 1,021 (16%) had >1,000 copies/ml .Of the 100(10.1%) clinical files sampled 61% were female, median age was 39 years, 81% were on 1st-line ART, 19% on 2nd-line, median CD4 count was 249 cells/µL, median $\log_{10}$ VL 4.42 (IQR: 3.98- 4.92). Figure 1 summarizes the action taken for the patients. Doctor' decisions were; refer for counseling 49%, repeat VL for 25%, and switch to second line for 24% patients. 41% were not managed according to the guidelines. Of these, 29 (70.7%) are active in care 7 were tracked (5 (12.2%) lost to program, 2 (4.9%) dead; for 5 patients were not tracked.

**Conclusions:**



*[Figure 1 showing clinical decisions and actions taken]*

Despite the implementation of internal health system to manage patients failing ART, we found substantial leakages in the monitoring "cascade". Additional measures and stronger clinical supervision are needed to make every test count, and to ensure appropriate management of patients failing ART.

## THPEE465

### MULTI-MONTH SCRIPTING FOR ART: A FRAMEWORK TO OPTIMIZE RAPID ADAPTATION AND SCALE UP IN UGANDA

B. Andrew[1], V. Kiggundu[2], T. Minior[2], R. Ferris[2]
*[1]Uniformed Services University of the Health Sciences, Bethesda, United States, [2]US Agency for International Development, Office of HIV/AIDS, Washington, United States*
*Presenting author email: rferris@usaid.gov*

**Background:** WHO recommends less frequent medication pickups (3-6 months) for people stable on antiretroviral therapy (ART). Multi-month scripting (MMS) for ART provides an opportunity for willing, stable patients and the health systems that serve them to maintain positive health outcomes and potentially reduce costs. We provide a framework, which identifies challenges and opportunities to optimize rapid and successful scale-up of MMS in Uganda.

**Description:** To combat a national HIV prevalence of 7.3% and support nearly 1.5 million people eligible for ART, the Ugandan Ministry of Health incorporates 3-4 monthly drug refills for patients stable on ART in its National HIV and AIDS Strategic Plan 2015/2016 - 2019/2020 (NSP). Results from MMS pilot programs internationally are promising. For instance, stable patients in a Médecins Sans Frontières (MSF) program in Malawi attend clinic once every six months and once every three months to collect their ART. Retention in care at 12 month follow-up was 97%. Similarly, pilots in Uganda show promising results for decentralizing ART. Our analysis of recent literature, case studies, and guidelines (including WHO treatment guidelines, the Ugandan National Antiretroviral Treatment guidelines, and the Uganda NSP) provides a framework to optimize rapid adaptation and scale-up of MMS for ART in Uganda.

**Lessons learned:** We found five common factors key to successful MMS implementation:
1) permissive policy,
2) empowered providers,
3) a patient-centered focus,
4) a robust commodity platform, and
5) an appropriate monitoring and evaluation (M&E) plan.
(Table 1)

| Factors Key to Success | Essential components | Opportunities | Challenges |
|---|---|---|---|
| Permissive policy | 1) Allow the dispensation of 3-4 months of ART; 2) Enable community health workers to dispense ART | 1) Uganda's current norm is 2 months of ART but existing policy supports extension of MMS; 2) MMS program is potentially cost-saving | 1) Policy changes required for further task-shifting |
| Empowered providers | 1) Train community health workers to monitor adherence; 2) Train nurses to supervise community health workers; 3)Strengthen provider toolbox with mHealth | 1) Existing policy emphasizes „nurse-driven" care; 2) MMS can relieve overcrowded clinics; 3)mHealth shown to improve adherence in Uganda | 1) Under-developed community systems; 2) Developing and supporting new training programs; 3) Developing and supporting new community health workers |
| Patient-centered focus | 1) Identification of stable patients eligible for MMS program; 2) Community-based ART dispensation; 3) Community-based monitoring of adherence and treatment failure | 1) Patient desire for convenience; 2) Prior success of community-based programs in Uganda | 1) Determining the clinical and immunological requirements for eligibility; 2) Identification of communities for rapid roll-out of MMS programs; 3) Streamlined care for patients who fail treatment |
| Robust commodity platform | 1) Forecast models to insure stable ART availability as sites convert to MMS; 2) Viral load and laboratory availability | 1) 80% coverage with viral load targeted for 2017 in Uganda | 1) Needed improvement in supply chain management systems; 2) Fear of stock-outs at sites converting to MMS |
| Appropriate M&E plan | 1) Frequent and robust documentation of all MMS participants; 2) Training all health workers in monitoring purpose and methods | 1) Successful MSF Malawi protocol can be used as prototype | 1) Transferring data from community sites to evaluators; 2) Determining reasons for patient drop-out |

*[Table 1: A framework to optimize rapid adaptation and scale-up]*

**Conclusions/Next steps:** While there may be some barriers to the implementation and sustainability of MMS for ART in Uganda, the potential benefits to the stable HIV-positive patient and to the Ugandan healthcare system should outweigh these challenges. The proposed framework will assist in identifying and mitigating some of these challenges.

## THPEE466

### TOLERABILITY OF SECOND-LINE ANTIRETROVIRAL THERAPY (ART) AMONG PATIENTS IN A RURAL HIV CLINIC: TASO UGANDA

J. Birungi[1], Z. Cui[2], M. Nanfuka[3], M. Nyonyintono[3], J. Kim[2], S. Okoboi[1], J. Zhu[2], P. Munderi[4], P. Kaleebu[4], D. Moore[2,5], M. Nafuka[6]
*[1]The AIDS Support Organisation (TASO), Research, Kampala, Uganda, [2]BC Centre for Excellence in HIV/AIDS, Vancouver, Canada, [3]The AIDS Support Organisation (TASO), Research, Jinja, Uganda, [4]MRC/UVRI Uganda Research Unit on AIDS, Entebbe, Uganda, [5]University of British Columbia, Vancouver, Canada, [6]The AIDS Support Organisation(TASO) Jinja, Research, Kampala, Uganda*
*Presenting author email: nanfukam@tasouganda.org*

**Background:** The expansion of access to Antiretroviral therapy (ART) in sub-Saharan Africa has led to an increase in number of patients requiring second-line ART. We conducted an analysis of ART patients at the AIDS Support Organization (TASO) clinic in Jinja, Uganda who had been switched to second-line therapy to assess tolerance and immunologic response after six months of second-line ART.

**Methods:** We enrolled participants who have been receiving a Non-Nucleoside Reverse Transcriptase Inhibitor (NNRTI)-based first-line ART regimen for at least four years at TASO-Jinja. TASO patients are monitored every one to three months with CD4 cell count testing every six months. Routine viral load (VL) monitoring is not available. We measured HIV VL at study enrollment. Patients with VL≥1000 copies/mL were counseled on adherence and asked to return in three months for a second VL test. We switched participants to second-line therapy, containing lopinavir/ritonovir if the VL remained ≥1000 copies/mL. We surveyed patients for 16 medical symptoms related to ART toxicity and measured CD4 cell counts and weight comparing data collected prior to switching and those collected six months afterwards.

**Results:** Among the 1091 patients screened at enrollment, a total of 113 (10.3%) had VLs≥1000 copies/mL of whom 97(86%) were subsequently switched to second-line ART. Of those switched 74% were female, the median age was 40 years (Q1-Q3: 35-44) and had been receiving ART for a median of 6.6 years (5.2-7.5 years).

We did not observe any increases in reported symptoms six months after switching compared to before switching. Specifically there was no change in reports of diarrhea (2.3% vs. 1.2% p=0.56). We noted marginally significant decreases in reports of headaches (9.3% vs. 2.3%, p=0.06) and pruritus (9.3% vs. 2.3%, p=0.06). We also observed a non-significant increase in CD4 counts from 218 to 223cells/mm3 (p=0.37). Participants who switched drugs also had significant gain in weight with median 56 (Q1-Q3: 52-62) to 57 (Q1-Q3: 53 - 63) kg (p=0.04).

**Conclusions:** Second line treatment appears to be very well tolerated in this setting. Among patients switched to lopinavir/ritonavir, the weight increased and a trend towards increases in CD4 cell counts after six months of therapy observed.

## THPEE467

### HIV PREVENTION, TREATMENT AND CARE PROGRAMMES FOR STUDENTS AND STAFF AT TECHNICAL VOCATIONAL AND EDUCATIONAL (TVET) COLLEGES IN SOUTH AFRICA

G. Setswe[1,2], R. Ahluwalia[3], N. Mbelle[1], S. Sithole[3], M. Mabaso[1], S. Sifunda[1], V. Maduna[1]
*[1]Human Sciences Research Council, HAST, Pretoria, South Africa, [2]University of Venda, Department of Public Health, Thohoyandou, South Africa, [3]Higher Education AIDS Programme, HEAIDS, Pretoria, South Africa*

**Background:** The goal of this study was to assess HIV prevention, treatment and care programmes and services available students and staff in the TVET sector in South Africa.

**Methods:** We conducted a national cross-sectional survey to assess HIV prevention, treatment and care programmes and services available to students and staff with a sample of 4,500 students and 900 staff in all 50 TVET colleges. The study utilized a multi-stage cluster sampling design to select a sample of campuses and classes within campuses. All students at the sampled class and all staff at the sampled campus were eligible to participate.

**Results:** Seven in 10 students and staff obtained their services from government health facilities, 11% of students and 35% of staff from medical doctors, and while 8% students and 32% of staff from private health facilities.

Approximately 68% of staff members used TV, 59% radio and 48% newspapers to access information on HIV, while the figures for students were 20% for TV, 20% for radio and 17% for newspapers.

Online and social media were used much less frequently than traditional mass media to obtain information on HIV.

Overall, TVET colleges did not rank highly as a source of information on HIV for their students and staff. TVET colleges in some provinces were more likely to be mentioned as a source of information. They were Limpopo (32%), Mpumalanga (27%), Western Cape (23%) and Eastern Cape (22%). Only 16% of respondents in the Free State indicated that their colleges provided information on HIV.

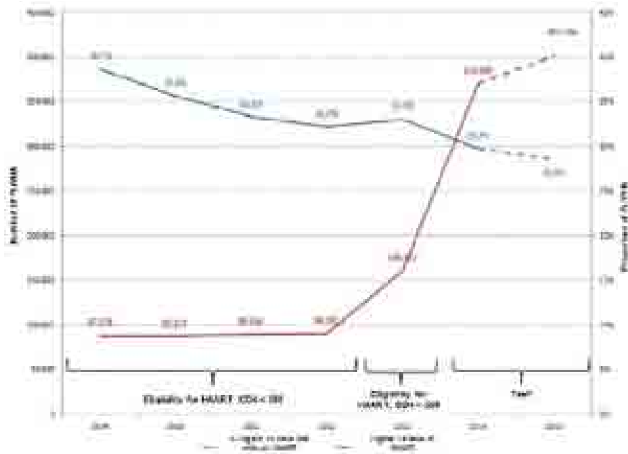
**Conclusions:** Students and staff both relied overwhelmingly on government health facilities AIDS-related health services. Staff members used the mass media quite extensively for HIV and AIDS information; only a minority of students did the same. Again, students showed an unusually low interest in the mass media as a source of health information and social media have not taken off strongly as sources of HIV information at TVET colleges.

## THPEE468

### STRATEGIES TO REDUCE THE HIV TREATMENT GAP IN BRAZIL

A.F. Kolling, M. Moura, M. Freitas, A. Benzaken, A.R. Pascom, F. Mesquita
*Ministry of Health/Health Surveillance Secretariat, Department of STDs/AIDS and Viral Hepatitis, Brasília, Brazil*
*Presenting author email: ana.kolling@aids.gov.br*

**Background:** In 2013, Brazil published a normative protocol implementing the "Treatment for All", being the first developing country to recommend antiretroviral therapy (ART) for all people living with HIV/AIDS (PLWHA), regardless of CD4 and viral load. In 2014, out of the 781,000 PLWHA in Brazil, 83% were diagnosed and 62% started HAART. In order to monitor the gap monthly and conducting active surveillance of people in gap, a clinical monitoring system, "SIMC", was developed by the Brazilian Ministry of Health.
**Description:** "Treatment for All" has increased ART coverage , along with a narrowing of the treatment gap. Data from SIMC showed that 30% of the patients being monitored had at least one CD4 showing less than 500 cells/mm3 and had not started treatment in 2013. In 2014, around 60,000 people started HAART. In Brazil, between 2009 and 2014, the number of PLWHA being treated increased 53.2%.



*[Number of PLWHA aged 18 and over eligible for HAART and Treatment Gap, by year of discharge. Brazil, 2009 to 2015]*

**Lessons learned:** "Treatment for All", in the context of the Brazilian Unified Health System, has allowed Brazilian states and municipalities to implement the guidelines promptly. In addition, the fact that asymptomatic PLWHA may be followed up by the Primary Care units improved the access to treatment and the linkage to health services. In the end, it helps to reduce morbidity and mortality due to AIDS and to improve quality of life.
**Conclusions/Next steps:** The reduction in the gap and the expansion of treatment may have shown progress in the proportion of PLWHA who started treatment, which rose from 44% in 2012 to 62% in 2014. This is an important result, considering the increase in the number of people eligible for treatment, the management of HIV/AIDS in primary health care and SIMC implantation along with a reduction in the gap from 33% in 2013 to 29% in 2015.

## THPEE469

### USE OF ART DATA AND STRENGTHENING COORDINATION OF THE TRANSITION TO NEW FIRST-LINE ANTIRETROVIRAL TREATMENT REGIMENS: LESSONS LEARNED IN ANGOLA

P. Gaparayi[1], G.E.D. Manuel[2], E.D.S.L.P. Pedro[3], M.Â.d.C. Francisco[2], N.N. Victor[4], D. Mabirizi[5], M.L. Furtado[6]
*[1]Management Sciences for Health, Pharmaceuticals and Health Technologies Group, SIAPS Project, Luanda, Angola, [2]Instituto Nacional de Luta contra o SIDA (INLS) (National HIV and AIDS Control Institute), Clinical Department, Luanda, Angola, [3]Instituto Nacional de Luta contra o SIDA (INLS) (National HIV and AIDS Control Institute), Logistics Unit, Administration and General Services Department, Luanda, Angola, [4]Instituto Nacional de Luta contra o SIDA (INLS) (National HIV and AIDS Control Institute), Department of Administration and General Services, Luanda, Angola, [5]Management Sciences for Health, Pharmaceutical and Health Technicalogies Group, SIAPS Project, Arlington, United States, [6]Instituto Nacional de Luta contra o SIDA, Luanda, Angola*
*Presenting author email: pgaparayi@gmail.com*

**Background:** Following the 2013 WHO consolidated guidelines on antiretroviral therapy (ART), the Angola National AIDS Control Institute changed ART standard treatment guidelines (STGs) from AZT-based to TDF-based regimens as the preferred first-line regimen for adults initiating ART. One year after dissemination of the new STGs, health facilities reported continued high use of AZT, despite sufficient availability of recommended TDF-based products.
**Description:** In June 2015, a national multi-disciplinary Quantification Technical Working Group (QTWG) was established to promote collaboration between prescribers and logistics teams in forecasting and supply planning of HIV and AIDS commodities.
Subsequently, a retrospective analysis of patient and logistics data from January to July 2015 confirmed that 75% (n = 8,955) of adult patients were still being initiated with AZT-based regimens, and TDF-based products were at high risk of expiring. The majority of prescribers reported lack of awareness of the availability of recommended products, and pharmacy teams were inadequately involved in the dissemination of the new STGs and could not include the products in their requisitions.
**Lessons learned:** Engagement of prescribers and dispensing teams in quantifying and monitoring stock levels of HIV and AIDS products is essential in transitioning to new regimens. Three months after establishment of the QTWG, patients are increasingly being initiated with TDF-based regimens, and the reported average monthly distribution (AMD) of products corroborates this trend. The AMD of the recommended TDF/FTC/EFV increased from 840 treatments per month to 9,577 per month (11.4-fold increase), while the AMD for AZT/3TC and AZT/3TC+EFV (co-formulated) decreased tremendously in the same period (6.5- and 3.8-fold decrease, respectively).
**Conclusions/Next steps:** First, regular review of ART data in compliance with recommended guidelines is important in establishing a gap in practices that significantly influences the performance of the supply chain. Second, establishing a continuous two-way communication between supply chain managers, prescribers, and dispensers contributes to ensure the availability of recommended ARV formulations, allowing STG compliance and better patient care. Using existing coordination mechanisms such as facility Drug and Therapeutics Committees can provide substantive improvement, thereby reducing the risk of stock-outs of wrongly overutilized products while avoiding wastages of under-prescribed products.

## THPEE470

### FOLLOW-UP AND PROGRAMMATIC OUTCOMES OF HIV-EXPOSED INFANTS REGISTERED IN THE LARGEST HIV CENTRE, LILONGWE, MALAWI: 2012 - 2014

W.F. Ng'ambi[1], S. Ade[2], A.D. Harries[2,3], D. Midiani[4], P. Owiti[5], K.C. Takarinda[2,6], S. Gugsa[1,7], S. Phiri[1]
*[1]Lighthouse Trust, Lilongwe, Malawi, [2]International Union Against Tuberculosis and Lung Disease, Paris, France, [3]London School of Hygiene and Tropical Medicine, London, United Kingdom, [4]Ministry of Health, HIV Department, Lilongwe, Malawi, [5]Academic Model Providing Access to Healthcare (AMPATH), Eldoret, Kenya, [6]Ministry of Health and Child Care, AIDS and TB Department, Harare, Zimbabwe, [7]International Training and Education Center for Health (I-TECH), Seattle, United States*
*Presenting author email: wingston.ngambi@gmail.com*

**Background:** The Martin Preuss Centre (MPC), Lilongwe, Malawi, provides integrated care to People Living with HIV and HIV-exposed infants and children. The aim of the study was to assess follow-up and programmatic outcomes of HIV-exposed infants at MPC from 2012-2014.
**Methods:** Retrospective cohort study using routinely collected HIV-exposed infant data of registered from 2012-2014.Data for HIV-exposed infants were collected using national standardised patient charts and then entered in customised Microsoft access database. Descriptive analysis was done using STATA 13.0 (Stata Corp.,

College Station, Texas). Data were analysed using frequencies and percentages.

**Results:** A total of 1035 HIV-exposed infants registered from 2012-2014. Of the total, 844(81%) infants were registered after 6 weeks of age (median age = 32 weeks, IQR: 10-59 weeks). Guardians were usually mothers, mostly on antiretroviral therapy. Missing data in baseline characteristics ranged from 2%-36%. By 24 months 96% of the infants available to be tested got HIV-tested; 8% of the HIV-tested infants were HIV-positive and of these 43% started antiretroviral therapy. Overall, 501(48%) HIV-exposed infants were declared lost-to-follow-up in the database. Of these, 346(69%) were line-listed for tracing; of these, 271(78%) had lost-to-follow-up status confirmed through patient charts; of these, 138(51%) were traced; and of these, 86(62%) were truly not in care, the remainder being wrongly classified. Commonest reasons for true lost-to-follow-up were mother/guardian unavailability to bring infants to MPC, forgetting clinic appointments and transport expenses. There were 31 children brought back to care, leaving 55(40%) of those traced still lost-to-follow-up.

**Conclusions:** Active tracing of HIV-exposed infants contributed to improving retention in care of HIV-exposed infants. However, there is need to improve programmatic data documentation and better follow up and link HIV-positive children to antiretroviral therapy.

## THPEE471

### REACHING THE FIRST 90% IN A GENERALIZED EPIDEMIC: WHAT ELSE WILL IT TAKE?

P. Kasonde, T. Malebe, C. Mwale, G. Sitenge, M. Welsh
*FHI 360, Lusaka, Zambia*
*Presenting author email: nkole2013@gmail.com*

**Background:** Access to HIV testing and counselling (HTC) is the first step to accessing HIV/AIDS - services. Despite significant progress in increasing access to HTC, only 50% of PLHIV globally have ever tested for HIV. In Zambia this proportion is higher but still less than 70%. Success with the UNAIDS 90:90:90 strategy is predicated on reaching HIV+ individuals with HTC. In generalized epidemics such as ours in Zambia, targeted HTC efforts are needed. We tested two community-based HTC approaches to increase the yield of HIV positive individuals: door-to-door and using the HIV positive index client approaches.

**Description:** In June 2015, we selected seven districts to test the two approaches. In each district, we selected two health facilities and their surrounding communities based on high HIV prevalence and population. We developed standard operating procedures and documented the community engagement process which included exploration, and mobilization with stakeholders and oriented the counsellors. For the door-to-door approach, households were visited by HTC counsellors and HTC done after verbal consent. In the index client-based approach, clients were identified at the health facility, informed of this opportunity to extend HTC services to their families. Those consenting facilitated access to their homes

**Lessons learned:** 6031 households were visited in the door-to-door approach; 29037 individuals were reached and 99.9% tested. Of these, 614 (2.1%) tested HIV positive and 610 were referred to clinics for HIV services. 292 (48%) of those referred reached and 274 (94%) were deemed eligible and were initiated on combination antiretroviral therapy (cART). In the index client approach, of 17,185 clients tested, 908 (5.2%) were found to be HIV positive and referred to ART services. Of these 908 clients, 65% reached the facility; 516 (88%) were found to be eligible for ART and of these, 69% of were initiated on cART.

**Conclusions/Next steps:** Acceptability for HIV testing was very high in both HTC strategies. However, more PLHIV were identified through the index client approach (5.2%) than through the door-to door approach (2.1%) - two-fold higher. Targeting HIV positive index clients may be more strategic and cost effective in a generalized epidemic, especially if focused in high HIV prevalence areas.

## THPEE472

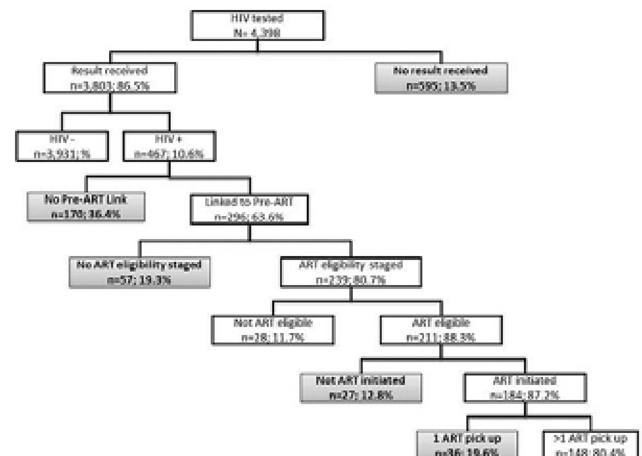
### ARE UNDOCUMENTED OUTCOMES JEOPARDIZING 90-90-90 GOALS? ASSESSMENT OF HIV TESTING AND LINKAGES TO CARE AND TREATMENT IN MANICALAND PROVINCE, ZIMBABWE

K. Webb[1], V. Chitiyo[1], T. Mukotekwa[1], D. Patel[1], P. Mafaune[2], C. Nzande[2], S. Page-Mtongwiza[1], T. Maphosa[1], B. Engelsmann[1]
*[1]Organisation for Public Health Interventions and Development (OPHID) Trust, Harare, Zimbabwe, [2]Ministry of Health and Child Care, Manicaland Province, Mutare, Zimbabwe*
*Presenting author email: tmaphosa@ophid.co.zw*

**Background:** Accurate health information systems are central to tracking progress towards attainment of 90-90-90 goal and elimination of HIV in Zimbabwe by 2030. With an estimated adult HIV prevalence of 16.7%, routinely reported HIV program data is documented in paper-based registers at the majority of health sites in Zimbabwe. The objective of our targeted assessment was to establish current rates of HIV test yields and documented linkage of HIV positive (HIV+) individuals to care and treatment.

**Methods:** A simplified probability proportional to size technique was used to select 11 health facilities in Makoni and Mutare Districts of Manicaland Province. In this retrospective cohort analysis, all individuals testing HIV+ between January and March 2015 were traced through facility registers to document subsequent access to HIV care and treatment services. De-identified data was entered into MSExcel and analyzed descriptively using StataV12.

**Results:** Among the 4,398 with documented HIV testing, result receipt outcomes were missing for 13.5% (n=575). HIV+ results were documented for 10.6% of those tested. Cumulative 'losses' due to undocumented outcomes resulted in over half of all individuals identified as HIV+ (n=290; 62%) subsequently disappearing from the HIV care and treatment cascade.



*[Cascade of missing data along HIV testing, care and treatment (N=4398)]*

Greatest documentation losses occurred at linkage of PLHIV from testing to pre-ART care (36.4%; n=170) and ART eligibility assessment (19.3%; n=57). Process evaluation findings revealed need for standard operating procedures to guide documentation of patient outcomes following referral and patient transfers.

**Conclusions:** Our assessment revealed a large proportion of indeterminate outcomes among individuals accessing HIV testing, care and treatment services. Such undocumented outcomes will pose extreme challenges to accurate determination of 90-90-90 goals. In the short term, enhanced standard operating procedures are required to systematically document patient referrals and outcomes. Support is required to pursue MOHCC-led implementation of feasible and effective electronic patient monitoring systems in the HIV care and treatment program.

## THPEE473

### HIV TESTING IN THE WORKPLACE AS A COLLECTIVE EFFORT: THE IMPETUS OF LOTTERY INCENTIVES

M. Weihs[1,2], A. Meyer-Weitz[2]
*[1]Human Sciences Research Council, Port Elizabeth, South Africa, [2]University of KwaZulu-Natal, Discipline of Psychology, Howard College, Durban, South Africa*
*Presenting author email: martin.weihs1@gmail.com*

**Background:** Lotteries are used to address the relatively low uptake of HIV testing in South African companies but very little is known of the psychosocial processes involved. The influence of lotteries has to be understood specifically in efforts to understand, predict and support employees' HIV testing behaviour at the workplace.

**Methods:** A post-test only quasi-experimental, explanatory mixed method approach was adopted in which quantitative data for the experimental studies were first collected at four companies in the Nelson Mandela Bay Municipality, followed by qualitative studies conducted in the same companies. Data were collected in two experimental conditions.

In Setting 1 [control group (n=88), experimental group (n=110)], entry into the lottery was dependent on HIV testing,

in Setting 2 [control group (n=147), experimental group (n=169)] entry was not dependent on HIV testing. In-depth interviews were conducted [Setting 1 (n = 17); Setting 2 (n=16)] two weeks after the testing event.

The theory of planned behaviour was used as guiding theory. Principal component analysis, as well as t- and chi-square tests, and logistic regression were conducted to analyse the data. Thematic analysis was used to analyse the qualitative data.

**Results:** The constructs of the theory of planned behaviour explained 40% of the variance in HCT behaviour intention ($R^2$ = .40). The strongest predictor of behaviour intention was the subjective norm ($B$ = .435 and $p$ < .001). Data suggest that

workers' intention to test for HIV was not based solely on a chance to win a lottery prize. The qualitative data revealed that the introduction of the lotteries renewed employees' personal interest in HCT. The excitement facilitated social interactions and seemed to mitigate the burden of HIV stigma.
**Conclusions:** The announcement of lotteries made shop-floor workers develop a stronger intention to participate in workplace HIV testing through anticipation of stronger social support and encouragement from partners, friends, and colleagues. Participation in HCT did not seem to hinge only on the likelihood of winning a prize. The results showed the importance of providing an opportunity to openly discuss HIV testing and permitting HIV testing to become socially sanctioned and seen as part of a collective effort.

## THPEE474

### Strengthening referral linkages to treatment for key populations who test positive to HIV in Port-Harcourt City, Rivers State, Nigeria: innovative strategies and lessons

U. Nta[1], I. Iyortim[2], I. Okekearu[3], N. Mbaba[4], O. Ofurum[1]
*[1]Society for Family Health, HIV Prevention/Programs, Port Harcourt, Nigeria, [2]United States Agency for International Development, AOR-SHiPS for MARPs Project, FCT, Nigeria, [3]Society for Family Health, Chief of Party - SHiPS for MARPS/HIV Programs, FCT, Nigeria, [4]Society for Family Health, Port Harcourt, Nigeria*
*Presenting author email: uduaknta@yahoo.com*

**Background:** Early diagnosis and linkage to treatment for persons who test positive to HIV is critical for viral suppression in such individuals. Programme data collected between 2013- 2015 on the Strengthening HIV Prevention Services (SHiPS) project shows that Key Populations (KPs) who test positive to HIV do not have effective access to early treatment and linkage to continuum of care in the project location
**Description:** The SHiPS project aimed at *improving the health of people in Nigeria by reducing the prevalence of HIV among MARPs* initially had challenges with linkage to treatment. Access to treatment services by project beneficiaries was challenging and as such positive KPs referred were lost to follow up. To address this gap, referral methodologies adopted included:
· Counselor testers or Guardian Angel Escort services.
· Motivation and Reward of HIV Counselor testers.
· Phone tracking either Health Care Worker or counselor tester initiated.
· Partnering with treatment partners
· Community Transport Services (CTS) either prearranged or public services.
· Health Care Worker integration through 'Drop in center'.
**Lessons learned:** Between May and December 2015, a mix of these strategies were adopted (tested) to improve referrals. The percentage of KPs successfully linked to treatment improved from 0% in previous months to 58% on the average. Lowest rate achieved was 17% in the first month (May), which peaked at 81% in third month (July), and plateaued at 62% and above in the last months. The following lessons were learnt**:**
· Improving KPs access to early treatment requires a mix of referral approaches.
· Non financial motivation and reward of 'high achievers' counselor testers promote community drive to achieving results.
· Escort services provided by counselor testers / 'guardian angel' improve confidence of referred KPs in hard to reach communities.
**Conclusions/Next steps:** · There is a need to mainstream referral strategies into country's prevention plan and HIV Counseling and Testing protocol.
· Capacity building as a means of non financial motivation and reward of counselor testers should be Institutionalized.
· There's need to explore public private partnerships to improve CTS for positive KPs.

## THPEE475

### Pangaea Global AIDS and the Clinton Health Access Initiative (CHAI) best practices case study series: lessons learned

M. Rejbrand[1], I. Mahaka[2], K. Taylor[1], B. Plumley[1]
*[1]Pangaea Global AIDS, Oakland, United States, [2]Pangaea Global AIDS, Harare, Zimbabwe*
*Presenting author email: mrejbrand@pangaeaglobal.org*

**Background:** Pangaea Global AIDS, in partnership with the Clinton Health Access Initiative documented and costed a series of case studies that demonstrates effective approaches to HIV service delivery in Sub-Saharan Africa. The goal for this project is to document successful approaches that increase demand for and sustained use of HIV services which can provide a resource for country level program implementers, advocates, and donors to better determine how to scale up programs effectively and gain maximum benefit from resource investments.
**Description:** The Best Practices Case Study series includes:
(1) Zvandiri CATS Model: Supporting HIV+ Adolescents, Zimbabwe
(2) Government of Mauritius, Harm Reduction Program for People Who Inject Drugs(PWIDS)
(3) AMPATH's Perpetual HIV Counseling & Testing(PHCT) Program, Kenya
(4) Liverpool Voluntary Counseling & Testing (LVCT) Health: Provision of Health Services for Men Who Have Sex with Men(MSM) and Sex Workers, Kenya
(5) Government of Uganda, HUB Model: Increasing Access to Lab Services.
**Lessons learned:** Key findings from case studies:
(1) Demand Creation: All programs promoted the engagement of clients through home visits, "Youth Corners" in health facilities, targeted community outreach to vulnerable populations, and using harm reduction strategies as a gateway to access other key health services.
(2) Task Shifting: The Zvandiri program promotes peers as the central contact for adolescents; The HUB Model of specimen transport enables lower-level facilities to refer specimens to regional referral hospitals and laboratories; AMPATH's PHCT counselors are delivering key services such as HIV testing and screenings for non-communicable diseases(NCDs).
(3) Integration of Services: AMPATH's integration of services provides opportunities to 'normalize' HIV care and treatment.
(4) Improved Technology: The use of hand held devices by AMPATH & Zvandiri enables real time client monitoring, quality control, and field support.
(5) Collaboration: In all case studies, partnerships are key to success. Governments, NGOs, and community organizations working collaboratively with defined roles and responsibilities improved outcomes across the treatment cascade.
**Conclusions/Next steps:** The methodology used to create the case studies and cost estimates can serve as a template for replication at country level. This can facilitate discussion and a better understand what factors and enabling environments contribute to the development of effective programs.

## THPEE476

### Impilo Iqala Ekhaya (Health Starts at Home): linkage to care and treatment initiation following home-based screening in rural South Africa

A. Beeson[1], A.P. Moll[2], J. Madi[3], N. Nkomo[3], V. Guddera[3], L. Andrews[4], R. Brooks[4], G. Friedland[4], S. Shenoi[4]
*[1]University of Colorado School of Medicine, Denver, United States, [2]Church of Scotland Hospital, Tugela Ferry, South Africa, [3]Philanjalo Care Centre, Tugela Ferry, South Africa, [4]Yale University School of Medicine, Yale AIDS Program, New Haven, United States*
*Presenting author email: beeson.amy@gmail.com*

**Background:** In order to reach 90-90-90 targets and decrease morbidity and mortality from HIV, the South African health system must scale up identification of HIV-positive individuals and early linkage to antiretroviral therapy (ART). However, there is no consensus about the most effective delivery model at this crucial step in the cascade of care, particularly in rural areas plagued by staff shortages. There is an urgent need for operational data to produce scalable models that successfully engage South Africa's marginalized rural citizens.
**Description:** From February to December of 2015, 11 lay community health workers (CHWs) performed 2898 screenings in traditional Zulu homes, integrating tuberculosis symptom screening, noncommunicable disease screening, and HIV counseling and testing (HCT). Among participants, 2388 (82.4%) were women, median age was 42 years (IQR 27-60), 188 (6.5%) were already taking ART, and 1470 (50.7%) agreed to HCT. Among those undergoing HCT, 27.5% reported never having tested before. CHWs identified 75 participants in need of linkage to HIV care, including 46 who were newly diagnosed and 29 with previously known HIV-positive status not yet on ART. CHWs then provided counseling, phone calls, repeat visits, and in some cases accompaniment to local clinics.
Among those newly diagnosed, median age was 33 years (IQR 26-42). Thirty-two (70%) were linked to care with a median time to linkage of 3 weeks. Of those linked to care, median CD4 count was 301 (IQR 252-508) and 23 (72%) subsequently initiated ART. Among those with previously known status, 17 (58%) were linked to care and 11 (65%) initiated ART. In total, 49 participants were linked to care and 34 initiated ART.
**Lessons learned:** Home-based HCT and linkage is most successful when CHWs visit repeatedly, developing relationships of trust with their neighbors. More than 80% of those tested and found to be HIV-infected were women; alternative community-based strategies are needed to test and link men.
**Conclusions/Next steps:** Trained CHWs effectively identified community members living with HIV and linked them to care. Home-based screening in rural KwaZulu-Natal uncovers high-risk groups who do not routinely test for HIV, particularly young women, and provides opportunities for critically timed ART.

## THPEE477

### FACTORS ASSOCIATED WITH WEIGHT GAIN AMONG ADULT PATIENTS INITIATING ANTIRETROVIRAL THERAPY IN PORT HARCOURT, NIGERIA: A RETROSPECTIVE COHORT STUDY

A.O. Olaleye[1], G. Owhonda[2], O. Daramola[3], I. Adejo[3], H. Olayiwola[4], J.I. Inyang[4], T. Afolabi[4], E. Ohuoba[4]
*[1]Achieving Health Nigeria Initiative, Case Management, Abuja, Nigeria, [2]Rivers State Ministry of Health, Public Health, Port Harcourt, Nigeria, [3]Achieving Health Nigeria Initiative, Programme Management, Abuja, Nigeria, [4]Achieving Health Nigeria Initiative, Port Harcourt, Nigeria*
*Presenting author email: kayodeolaleye2012@gmail.com*

**Background:** Weight loss is a significant problem among HIV-positive patients. Although initiation of ART is often associated with weight gain and increased protein synthesis, lean tissue is not restored in some patients. Furthermore, weight gain among patients initiating antiretroviral therapy (ART) has been associated with survival. However, factors associated with weight gain among patients initiating ART have not been adequately described. This study aimed to identify predictors of weight gain over two consecutive six-month intervals among HIV-positive patients initiating ART in a health facility in Port Harcourt, Nigeria.
**Methods:** We reviewed clinical records of a cohort of HIV-positive patients who were 15 years or older initiated on ART at a hospital in Port Harcourt, Nigeria between January 1, 2010 and December 31, 2014. Age, gender, occupation, employment, education, marital status, tuberculosis status, CD4 count, haemoglobin at baseline (prior to initiation on ART), initial ART regimen, drug adherence and weight at baseline, six and twelve months were measured. Generalized estimating equation (GEE) modelling with a logit link was used to determine predictors of weight gain over the two consecutive six-month intervals.
**Results:** Of the 596 HIV-positive patients included in this study, 403 (67.6%) were females and the mean age was 29.0 ± 9.5years. During the follow-up period, 38.4% and 28.8% of the patients had weight gain of 1kg or more following ART initiation in the first and second intervals respectively. Predictors of weight gain include male gender [adjusted Odds Ratio, aOR = 1.29, 95% CI: 1.12-1.48], being married [aOR =0.86, 95% CI=0.76-0.96], use of contraceptives [aOR =1.12, 95% CI=1.01-1.23], WHO stage 3 [aOR = 1.51, 95%CI= 1.12-2.02], patients considered as tuberculosis (TB) suspects [aOR = 1.87, 95%CI= 1.26-2.02].
**Conclusions:** The proportion of HIV-positive patients who had weight gain of 1kg or more within twelve months of initiating ART was low in this cohort. Various baseline factors contribute to weight gain in this population, including gender, marital status and use of contraceptives. Knowledge of these factors can assist in ensuring that HIV-positive patients achieve optimal weight gain following the initiation of ART.

## THPEE478

### "IF MY HUSBAND LEAVES ME I WILL GO HOME AND SUFFER, SO BETTER CLING TO HIM AND HIDE THIS THING": GENDER ISSUES AND WOMEN'S PARTICIPATION IN MALAWI'S OPTION B+ PROGRAM

V. Flax[1], J. Kadzandira[2], J. Yourkavitch[3], S. Mughogho[2], M. Banda[2], N. Carbone[1], E. Meier[1], A. Munthali[2]
*[1]University of North Carolina, Carolina Population Center, Chapel Hill, United States, [2]University of Malawi, Centre for Social Research, Zomba, Malawi, [3]ICF International, Washington, United States*
*Presenting author email: flax@unc.edu*

**Background:** In Malawi, approximately 20% of women who start lifelong ART under the Option B+ prevention of mother-to-child transmission (PMTCT) program discontinue participation. The role of gender in women's PMTCT participation is not well documented.
**Methods:** This study used qualitative methods to identify gender issues contributing to women's participation or discontinuation of PMTCT. We collected data in 4 districts in central and southern Malawi and purposefully selected 1 urban and 1 rural health facility per district. We conducted 8 focus group discussions with adult men and in-depth interviews with 32 women enrolled in PMTCT, 32 women who had dropped out of the program, 16 health workers, and 8 stakeholders from organizations that support PMTCT services. Transcripts were coded for themes using content analysis, then entered into data matrices to facilitate comparisons.
**Results:** Lack of partner communication, fear of HIV status disclosure, fear of HIV-related stigma, and insufficient male involvement in PMTCT were the most common themes and were interlinked. Women stated that they bear the burden of disclosing to their husbands because they are tested during antenatal care and their husbands rarely go to the clinic with them, despite clinic programs encouraging male participation. Many women said they fear HIV disclosure because they are economically dependent on their husbands and worry about divorce. Women who did not disclose to their husbands or other relatives found it difficult to continue in the PMTCT program. Some women said that the frequency of clinic visits and the use of a special room or day of the week for PMTCT effectively disclosed their status publicly, contributing to stigma. Men described their role in PMTCT as limited to financial support and encouraging women to take ART. Stakeholders and health workers stated that women are more likely to adhere to ART when their husbands are involved. Nearly all participants stressed the need for community awareness and male sensitization related to PMTCT.
**Conclusions:** To improve women's long-term participation in PMTCT, programs should support women's HIV disclosure by encouraging couples' counseling and testing, developing acceptable strategies to broaden male involvement, and facilitating stigma reduction activities in communities.

## THPEE479

### ELIMINATION OF MOTHER TO CHILD TRANSMISSION OF HIV: GAPS IDENTIFIED IN URBAN PRIMARY HEALTH CARE FACILITIES IN JOHANNESBURG, SOUTH AFRICA

N. Chandiwana, L. Fairlie, S. Sawry, N. Mvundla, S. Mdanda, S. Mullick
*Wits Reproductive Health and HIV Institute (Wits RHI), University of the Witwatersrand, Johannesburg, South Africa*
*Presenting author email: nomathemba.chandiwana@gmail.com*

**Background:** The World Health Organization's four prongs to eliminate Mother-To-child transmission (eMTCT) of HIV and improve maternal health include:
1) Primary prevention of HIV infection in women;
2) Prevention of unplanned pregnancies in HIV-positive women;
3) Prevention of vertical HIV infection through ART prophylaxis;
4) Treatment of HIV-positive women and their families.
While programmes have prioritised prongs 3 and 4 with success, implementation gaps remain. This study evaluated the uptake and potential gaps in services related to the eMTCT and maternal health programme in Johannesburg, South Africa.
**Methods:** We conducted a cross-sectional study between October 2015 and January 2016, at 2 primary health clinics in inner-city Johannesburg. Eligible postnatal women (>18 years old) attending immunization visits with their infant (< 18 months old) were approached for consent and interviewed on their uptake of comprehensive eMTCT services. All consenting mothers and infants of sero-positive mothers were tested for HIV at study enrolment.
**Results:** Among 349 postpartum mothers, 215 (62%) were HIV-positive at study enrolment, with 9/139 (6.5%) reportedly HIV-negative in pregnancy subsequently testing positive at study enrolment. Two thirds of women (234/349) attended their first ANC visit in the 2nd and 3rd trimester and 75% (261/349) attended the recommended 4 ANC visits. A high number of women reported unplanned pregnancy, 66% and 67% of HIV-negative and -positive women, respectively. While 34% of HIV-negative women reported that their partner had multiple sexual partners, only 20% used condoms during their pregnancy. The median age of infants at enrolment was 3.3 (IQR: 1.5-9) months and the HIV transmission rate was 0.9%. Postpartum, 294 (84%) women accessed family planning, with 52% (152/294) choosing injectable contraception.
**Conclusions:** This study demonstrated many successes and a few missed opportunities in the implementation of all 4 WHO eMTCT strategies. Gaps identified related to unplanned pregnancy and prevention of new HIV-infections. Increased efforts to reinforce condom use are necessary. High pregnancy or postpartum HIV transmission rates in women increase the risks of HIV transmission to infants and regular retesting post-partum is essential. Therefore, amid successes, prongs 1 and 2 of the WHO eMTCT strategy require increased focus in programmatic settings.

## THPEE480

### CHALLENGES AND OPPORTUNITIES FOR IMPROVING EARLY INITIATION OF ART: A THEMATIC ANALYSIS OF EXPERIENCES AMONG INDIVIDUALS RECENTLY DIAGNOSED WITH HIV

K. Merritt[1], S. Kesselring[1], D. Moore[1,2], A. Kaida[1,3], J. Montaner[1,4], S. Parashar[1,3], H. Samji[2,3,5], J. Duddy[6,7], C. Osborne[1], R. Baltzer-Turje[8], A.B. Collins[1], R. Hogg[1,3]
*[1]BC Centre for Excellence in HIV/AIDS, Epidemiology & Population Health, Vancouver, Canada, [2]University of British Columbia, School of Population and Public Health, Vancouver, Canada, [3]Simon Fraser University, Faculty of Health Sciences, Burnaby, Canada, [4]University of British Columbia, Faculty of Medicine, Vancouver, Canada, [5]British Columbia Centre for Disease Control, Vancouver, Canada, [6]Pacific AIDS Network, Vancouver, Canada, [7]Canadian Institutes for Health Research, Centre for REACH in HIV/AIDS, Ottawa, Canada, [8]Dr. Peter AIDS Foundation, Vancouver, Canada*
*Presenting author email: kmerritt@cfenet.ubc.ca*

**Background:** Clinical guidelines in the province of British Columbia (BC), Canada, advise individuals diagnosed with HIV to initiate antiretroviral therapy (ART) immediately to improve long-term health outcomes and decrease the likelihood of transmission. This thematic analysis explores individuals' experiences and attitudes

towards ART initiation within a setting where ART and related care are provided at no direct cost to patients.

**Methods:** "Engage" is a prospective cohort study of new ART initiators, nested within the provincial Drug Treatment Program at the BC Centre for Excellence in HIV/AIDS. Between March and August 2015, 20 Engage participants were purposely recruited: 10 whom initiated treatment "late" (defined as a CD4 cell count of ≤ 500 cells/µL) and 10 whom initiated "early". The framework of the interview guide was designed to elucidate participants' experiences relating to HIV testing, diagnosis, care, and treatment. A research-trained person living with HIV conducted in-depth interviews. All interviews were recorded and transcribed. Using NVivo 10.2 Software, three researchers thematically analyzed these data.

**Results:** The participants were 15% female and the median age was 41 years (1st-3rd quartile [Q1-Q3]: 30-47). Participants who reported seeking treatment immediately indicated that they were well informed about ART and wanted to achieve an undetectable plasma viral load (pVL) to minimize transmission. Other themes included minimal concern around medications impacting daily life, and normalization of ART as standard medical practice for HIV. Participants who reported avoiding treatment or care indicated that ART was considered to be a last resort once symptoms provided no alternative, which was due to either stigma (in the form of denial or fear of others becoming aware of their status), or lack of understanding around the individual benefits of ART. Other themes for delaying treatment included doctors presenting ART as optional based on CD4 cell count and pVL levels, and feeling overwhelmed or fearful about HIV and complexity of HIV care.

**Conclusions:** Education levels around ART efficacy emerged as a common theme for persons seeking and avoiding treatment. These results suggest that scaling-up educational initiatives around ART efficacy should be prioritized in order to increase early ART initiation.

## THPEE481

### WHAT INFLUENCES PATIENTS' PRESENTATION STAGE FOR HIV SERVICES IN RURAL SOUTH-WESTERN UGANDA? A QUALITATIVE INVESTIGATION OF PATIENTS' VIEWS IN THE CONTEXT OF CURRENT POLICY RECOMMENDATIONS

D. Bukenya Yiga[1], S. Paparini[2], J. Seeley[1,2], R. Newton[1,3], J. Nakiyingi-Miiro[1], A. Kamali[1], O. Bonnington[2], A. Wringe[2]

[1]*Medical Research Council, Uganda Virus Research Institute Programme on AIDS, Kampala, Uganda,* [2]*London School of Hygiene and Tropical Medicine, London, United Kingdom,* [3]*University of York, York, United Kingdom*

*Presenting author email: dominic.bukenya@mrcuganda.org*

**Background:** Despite recent changes in HIV policies broadening HIV care (e.g. Option B+; revising CD4 threshold for ART initiation to ≤500 cells/µl; pre-ART Cotrimoxazole provision) some patients continue to present 'late' for initiation into the care system which compromises subsequent health outcomes. Less understood are patients' perspectives on such policy changes and the impact they may have on the stages at which people present for services once they know their HIV status. We therefore conducted a study to understand the influence of HIV care policy changes on the healthcare-seeking experiences of people living with HIV (PLWH) in rural South-western Uganda.

**Methods:** Thirty- three in-depth interviews were conducted with PLWH sampled from a health and demographic surveillance ART clinic between September-December 2015. To focus specifically on issues of presentation to services, we randomly sampled 18'timely' presenters (CD4 ≤500 cells/**µl**) and purposively sampled 15'late' and 'crisis' participants (CD4 < 500). Interviews were audio recoded, transcribed, translated and analysed thematically.

**Results:** Generally, participants exhibited no awareness about the policy changes. Reasons for presenting late included: feeling asymptomatic, work-related commitments and mobility. For women, previous HIV negative tests followed by a positive test during pregnancy and inadequate partner support combined with household and childcare chores create obstacles to timely access of services. Other reasons for late presentation, for both sexes, included long queues and clinic waiting time, health workers' rudeness, transport costs and fear of being seen.

Timely presentation for HIV care services for women was supported by exposure to HIV counselling during pregnancy, having children and a desire to stay alive to facilitate children's future plans. Loss of dear ones due to HIV motivated men and women to seek care. Campaigns about ART effectiveness and being open about one's own HIV status also influenced care-seeking decisions.

**Conclusions:** Despite areas of policy improvement which enable access to HIV services there remain individual, societal and facility-level obstacles to timely presentation for HIV services in our study area. Some of these can be ameliorated through programme-specific reviews and investment in the local HIV services quality to better meet the needs of PLWH.

## THPEE482

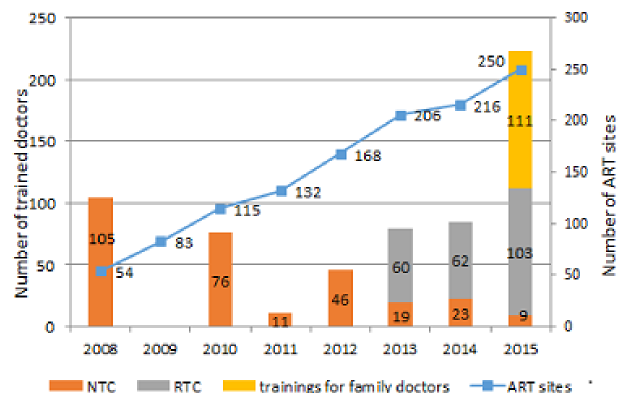
### CHALLENGES OF INCREASING ART COVERAGE IN UKRAINE

I. Sobolieva[1], N. Nizova[1], L. Hetman[1], M. Riabinchuk[1], H. Batsiura[2], V. Boyko[2], L. Legkostup[2]

[1]*Ukrainian center for Disease Control, Kyiv, Ukraine,* [2]*Shupyk National Medical Academy of Postgraduate Education, Kyiv, Ukraine*

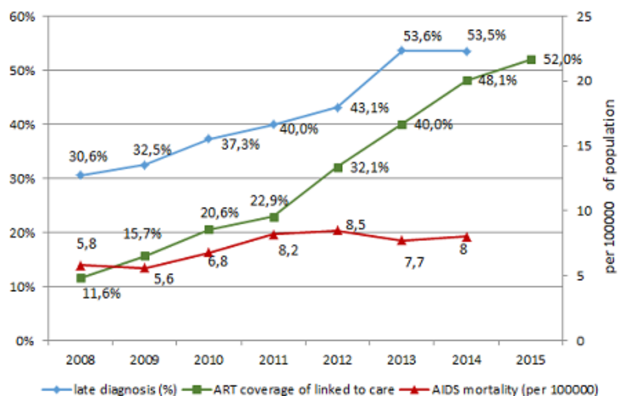
**Background:** Ukraine is one of the 30 countries implementing UNAIDS "Fast track" strategy to reach "90-90-90" goals. As of 01.10.2015 p., there were 127 377 officially registered HIV-infected citizens of Ukraine. Annual HIV incidence reaches near 20 thousands cases. 66106 persons receive ART. In 3 upcoming years this figure is targeted to hit 118000 persons.

**Description:** To ensure universal access to ART across the country, decentralization processes are in place. Number of ART sites has increased from 54 to 250 since 2008. To facilitate decentralization, National Training Center (NTC) under support of the Global Fund started training of infection disease doctors (IDD) on management of HIV patients. Regional Training Centers (RTC) joined the process in 2012. Family doctors started being trained on HIV/AIDS aspects since 2015.



*[Data on trained specialists and nuber of ART sites]*

Starting from 2008, number of people receiving ART increased from 7657 to 66106 persons, almost 9 times, with ART-coverage from 11,6% to 52% among those under medical supervision. In the mean time, number of patients with HIV diagnosed on late stages (III-IV clinical stages) is on the rise, reaching 53%, as well as AIDS mortality rate.



*[Late diagnose, mortality and coverage of ART]*

**Lessons learned:** Implementation of "90-90-90" strategy, to ensure timely HIV identification, access and adherence to ART, is impossible just with participation of IDD at specialized facilities and health care units. It is of crucial importance to engage primary care physicians and allied professions.

**Conclusions/Next steps:** National strategy on reducing morbidity and mortality from AIDS will ensure:

- Increase of ART coverage;
- Further integration of services;
- Phased and broad involvement of primary health care;
- Institutionalization of educational programs;
- Effective monitoring, evaluation

### LINKING HIV TESTING CLIENTS TO TREATMENT AND MEDICAL MALE CIRCUMCISION SERVICES: RESULTS FROM NEW START HTS SERVICES IN FOUR DISTRICTS IN SOUTH AFRICA

B. Gorogodo, E. Anyachebelu, Z. Mabeleng, N. Nhlabathi
*Society for Family Health, Monitoring and Evaluations, Johannesburg, South Africa*

**Background:** The South African National Strategic Plan (2012-2016) recommeded that screening for HIV must take place in multiple settings including communities, workplace, schools and tertiary institutions. The Society for Family Health franchise network New Start, provides mobile and homebased HIV testing services (HTS) to these populations and facilitates their referral and linkage into care, treatment and medical male circumcision (MMC). Clients that require referral services are provided with a referral letter. 48 hours post-referral the coordinator makes follow-up calls to clients, which includes confirming with the clinic to verify effective linkage.
**Methods:** We analyzed 163 445 New Start HTS client referral records from October 2014 to September 2015 from four districts. Statistical analysis for quantitative data was conducted using SPSS version 23 and thematic content analysis was used for open ended qualitative data retrived from the same client records.
**Results:** Overall, 3% (5104/163 445) of all HTS clients were diagnosed HIV positive with 63% (3221) of these being female. Of the positives, 36% (1856) accepted referrals for antiretroviral therapy (ART)/care services, and 80%(1495) of the acceptors completed referrals. Of the HIV positive female clients, 34% accepted referrals as compared to 41% of their male counterparts. 59% of the HIV positive females completed ART referrals compared to 64% of males ( p=0.001).
Of the 4,975 men referred for MMC, 100% accepted referrals and of these 60% completed MMC referrals. Referral completion for MMC was higher among HTS clients reached with mobile services than among clients reached through homebased and static services; 64%, 54%, and 50% respectively (p= 0.035). The main reasons given for not completing referrals were: other competing priorities, being at work, being in school and structural barriers such as lack of transport and psycho-social barriers.
**Conclusions:** Overall these findings show that acceptance of referral to ART among HIV positive HTS clients is low, though referral completion rates are high. Findings also show that referral completion for MMC was low, while referral acceptance was universal Programs should strengthen referrals for MMC services inter alia address identified barriers to referral acceptance and completion.

## THPEE484

### ROLLING OUT OPTION B+ IN MALAWI: CIVIL SOCIETY'S CONTRIBUTION

D. Odali
*Umunthu Foundation, Blantyre, Malawi*
*Presenting author email: umunthufoundation@gmail.com*

**Background:** Option B+ was developed in Malawi in 2010 and adopted in 2011 in response to the impracticality of implementing World Health Organization (WHO) guidelines on prevention of mother-to-child-transmission of HIV (PMTCT) in the country - about 70% of pregnant women were attending antenatal services without reliable CD4+ testing.
Umunthu Foundation works hand in hand with the government to deliver sustainable public health interventions to prevent vertical transmission of HIV through Option B+ in a peri-urban area of Blantyre, where prevalence among pregnant women is higher than the national average.
**Description:** Realizing the important role of civil society to complement the government of Malawi in its efforts to roll out Option B+, Umunthu has focused on strengthening HIV prevention through Option B+ in all its project sites in Bangwe and Limbe, which are included in the 520 health facilities accredited to provide this service.
Project activities include: HIV testing and pre- and post-test counseling for all pregnant women attending antenatal services, providing antiretroviral therapy (ART), collecting blood samples from exposed infants for HIV diagnosis, working with Queen Elizabeth Central Hospital to process results, disclosing results and supporting mothers.
**Lessons learned:** Option B+ has led to an increase in HIV positive pregnant women receiving ART in Bangwe and Limbe and a decrease in the number of babies being diagnosed with HIV. Out of **18,602** pregnant women tested for HIV since 2012, **2,909** pregnant women tested HIV positive and were referred for treatment. Out of **2,909** exposed babies born to HIV positive mothers, only **145** babies tested positive.
**Conclusions/Next steps:** Civil society's contribution in closing the gaps to implement Option B+ has been critical. Umunthu's service delivery, including provision of permanent staff and sustainable HIV test kit supplies, have contributed significantly to the successful roll out of Option B+ in Bangwe and Limbe. The Ministry of Health and Population has awarded the project Certificates of Excellence in HIV testing and ART by for the last 4 years. More work needs to be done to promote adherence and retention for acceptance and community support for ART as treatment for life.

## THPEE485

### OPTIMIZING THE RESPONSE OF PREVENTION AND TREATMENT: ESTIMATION OF THE COSTS OF PREVENTION OF MOTHER TO CHILD TRANSMISSION OF HIV (PMTCT) IN NIGERIA

O.O. Amanze[1], S. Bautista-Arredondo[2], S.G. Sosa-Rubi[2], D. Contreras-Loya[2], A. Kwan[2], G.L.H. Fuentes[2], K.M. Ogungbemi[1], G.A. Ashefor[1], J. Anenih[1], A. Adeyemi[3]
*[1]National Agency for the Control of AIDS (NACA), Strategic Knowledge Management, Abuja, Nigeria, [2]National Institute of Public Health (INSP), Health Economics, Mexico, Mexico, [3]MEASURE Evaluation, Strategic Information, Abuja, Nigeria*
*Presenting author email: amanze111@yahoo.com*

**Background:** HIV burden in Nigeria is heavily borne by women and the national program has responded by, among other actions, expanding Prevention of Mother-to-child Transmission of HIV (PMTCT) services. This intervention requires an integrated 'cascade' of services which can reduce the risk of vertical transmission, and is fraught with challenges that need to be addressed such as: poor domestic funding, donor dependency, and inadequate political willpower at state and local levels, among others. The objective of this work is to estimate average costs of services along the PMTCT cascade of services and to analyze the determinants of efficiency of PMTCT in Nigeria.
**Methods:** A cross-sectional observational study was conducted in Nigeria. A nationally representative sample of 194 facilities was selected, with data collection between December 2014 and May 2015. Applying micro-costing methods, relevant inputs (personnel, supplies, utilities, equipment and property) and output data were collected retrospectively for 2013. Staff costs were computed with self-reported time allocation methods. Quality was captured by administering medical provider-vignettes and patient-exit-interviews.
**Results: :** Average cost per PMTCT client tested was US$ 72; US$ 3,022 per client tested and positive; US$ 3,563 per client on ART; and US$ 4,558 per infant on prophylaxis. 62% of PMTCT costs per client tested were accounted for by staff costs; followed by HIV antiretroviral drugs (12%); HIV test kits (9%); utilities (9%); capital (6%); and training (2%). Costs varied across levels of care, with less cost per client tested in third level of care. Higher numbers of clients were correlated with lower average costs per client tested. The negative relationship between costs and scale explained around 50% of the variability of unit costs.
**Conclusions:** Our findings showed enormous variability in costs and opportunities to increase efficiency across facilities. Due to the high proportion of the overall cost that staff comprises, optimizing human resources allocation is fundamental to increasing efficiency. Expanding the volume of PMTCT services will improve levels of efficiency in the HIV prevention response, as long as acceptable levels of quality are maintained throughout different levels of production.

## THPEE486

### THE INVISIBLE KILLER: A PILOT PROJECT ON CRYPTOCOCCAL MENINGITIS SCREENING, DIAGNOSIS AND MANAGEMENT IN HIGH VOLUME HOSPITALS IN ETHIOPIA

H.G. Kebede[1], H. Seyoum[1], Y. Abebe[1], S. Fisseha[1], D. Assefa[2], H. Ayalneh[1], Z. Messele[1], V. Mulema[3], N. Assanne[4], M. Kiros[5], H. Reda[1], E. Gezahegn[6], N. Tulu[6]
*[1]Clinton Health Access Initiative, Addis Ababa, Ethiopia, [2]Clinton Health Access Initiative, Access to Medicine, Addis Ababa, Ethiopia, [3]Clinton Health Access Initiative, Kampala, Uganda, [4]Ethiopian Public Health Institute, Addis Ababa, Ethiopia, [5]Federal Minstry of Health, Addis Ababa, Ethiopia, [6]ICAP-Ethiopia, Addis Ababa, Ethiopia*
*Presenting author email: dalemu@clintonhealthaccess.org*

**Background:** Cryptococcal infection is a leading cause of death among people living with HIV/AIDS (PLWHIV). The mortality from cryptococcal meningitis (CM) in Ethiopia remains high mainly due to late diagnosis. To improve early diagnosis and HIV/AIDS treatment outcomes, the WHO conditionally recommended routine serum or plasma Cryptococcal Antigen (CrAg) screening in ART-naïve adults with a CD4 count < 100 cells/µl in populations with CrAg prevalence >3%. CHAI, in collaboration with MoH & ICAP implemented a pilot cryptococcal screening project using rapid test kits (RTKs) aimed at generating data on CrAg prevalence among patients with CD4 counts < 100 cells/µl and determining the feasibility of using RTKs.
**Description:** The pilot targeted 23 high volume hospitals from June 2015 to June 2016. CHAI in collaboration with MoH and ICAP developed a CM screening algorithm, job aides, testing SOPs, and patient tracking tools. CHAI also procured and distributed CrAg Lateral Flow Assay tests. Sensitization meetings, training, and mentorship were conducted. The pilot further ensured that the RTK proficiency testing yielded accurate results through external quality assurance (EQA) in 14 hospitals. Costing for health commodities was also conducted.
**Lessons learned:** Between June to November 2015 (mid-term analysis), 410 ART naïve adult clients with CD4 count of <100 cells/µl have been tested, of which 34(8.3%) were CrAg positive (Table 1). In addition, a significant proportion (23%) of clients

were enrolled at CD4 counts <100 cells/µl. The EQA indicated 100% concordance for both strong positive and strong negative samples and 92.9% (n=13) concordance for weak positive samples. The cost of managing CM is ten times as high (~$380) as screening and prophylaxis.
**Conclusions/Next steps:** The prevalence of CrAg among ART naïve clients with CD4 count < 100 cells/µl calls for introduction of CrAg screening in HIV chronic care. Despite the increase in the ART eligibility criteria from CD4 350 to 500 cells/µl, data from this pilot indicates that significant number of clients are still presenting late and are therefore susceptible to developing life threatening opportunistic infections, including CM. Screening for CrAg using RTKs is feasible and is also cost saving in resource-limited settings.

## THPEE487

### INVESTIGATING THE STATUS AND BARRIERS TO SCALE UP OF PAEDIATRIC PROVIDER-INITIATED TESTING AND COUNSELLING IN MALAWI

I. Ouansafi[1], N. Hariharan[2], P. Agarwal[1], J. Joseph[2], T. Barker[2], K. Suggu[2], K. Ng'ona Namachapa[3], G. Nyirenda[1]
*[1]Clinton Health Access Initiative, Paediatric HIV and TB, Lilongwe, Malawi, [2]Clinton Health Access Initiative, Boston, United States, [3]Ministry of Health, Department of HIV and AIDS, Lilongwe, Malawi*
*Presenting author email: iouansafi@clintonhealthaccess.org*

**Background:** Malawi's paediatric HIV coverage at 49% lags significantly behind adult coverage at 67%, and an estimated 50,000 children living with HIV who are in need of antiretroviral therapy (ART) remain untreated. Identifying all HIV+ children and linking them to treatment is critical to achieving the UNAIDS 90-90-90 targets. Malawi has had a provider-initiated testing and counselling (PITC) policy since 2009; however, a large number of children remain undiagnosed. An assessment was conducted to review the performance and uptake of paediatric PITC, understand the quality of services provided, and identify barriers and potential solutions to increase uptake.
**Methods:** A mixed methods assessment was conducted in 2015 at 38 facilities in six districts prioritized by high estimated paediatric treatment gaps. Quantitative data was collected through reviews of HIV testing and counselling (HTC) and admission registers from 2014 in outpatient, inpatient and nutrition wards. Qualitative data was compiled through surveys with HIV Service Providers (clinicians, HTC counsellors, EID and ART focal persons) about their experience with paediatric PITC and infant testing.
**Results:** Across all facilities, a median of 1.1% of children receiving outpatient or inpatient health services were tested via PITC, and a median of 6% of children tested positive. In facilities with inpatient wards, a median of 7% of admitted children were tested via PITC, with 10.4% testing positive. Paediatric testing efforts have been mainly focused on the exposed infant population through the PMTCT programme: among all children 12 months to 14 years tested via PITC, 55% were 12-24 months (4.0% yield) and 23% were 5-14 years (13.1% yield). The majority (66%) of clinicians believed they were not as effective at providing paediatric PITC as they could be, the top two reasons stated being lack of training (54%) and high workload (29%).
**Conclusions:** The assessment demonstrated that paediatric PITC uptake in Malawi is extremely low and needs to be strengthened to scale-up paediatric ART coverage and improve health outcomes. The assessment results informed the development of the Malawi 2016 HIV Testing Services guidelines, ensuring an adequate focus on paediatric case finding strategies, and will be used to inform the operationalization of HIV testing strategies.

## THPEE488

### TARGETED SPONTANEOUS REPORTING: SCOPING OPPORTUNITIES TO CONDUCT ROUTINE PHARMACOVIGILANCE FOR ANTIRETROVIRAL TREATMENT ON AN INTERNATIONAL SCALE

B. Rachlis[1,2], R. Karwa[3,4], C. Chema[3], S. Pastakia[3,4], S. Olsson[5], K. Wools-Kaloustian[3,6], B. Jakait[3,7], M. Maina[3,7], M. Yotebieng[8,9], N. Kumarasamy[10], A. Freeman[11], N. de Rekeneire[12], S.N. Duda[13], M.-A. Davies[14], P. Braitstein[2,3,15]
*[1]Ontario HIV Treatment Network, Ontario HIV Cohort Study, Toronto, Canada, [2]University of Toronto, Dalla Lana School of Public Health, Toronto, Canada, [3]Academic Model Providing Access to Healthcare, Eldoret, Kenya, [4]Purdue University, College of Pharmacy, West Lafayette, United States, [5]Uppsala Monitoring Centre, Uppsala, Sweden, [6]Indiana University, School of Medicine, Indianapolis, United States, [7]Moi Teaching and Referral Hospital, Eldoret, Kenya, [8]Ohio State University, College of Public Health, Columbus, United States, [9]University of Kinshasa, Kinshasa School of Public Health, Kinshasa, Congo, Democratic Republic of the, [10]YRGCARE Medical Center VHS, Chennai Antiviral Research and Treatment Clinical Research Site (CART CRS), Chennai, India, [11]Johns Hopkins University, Bloomberg School of Public Health, Baltimore, United States, [12]University of Bordeaux, Bordeaux, France, [13]Vanderbilt University Medical Center, Department of Biomedical Informatics, Nashville, United States, [14]University of Cape Town, Centre for Infectious Disease Epidemiology and Research, Cape Town, South Africa, [15]Moi University, College of Health Sciences, School of Medicine, Eldoret, Kenya*
*Presenting author email: pbraitstein@gmail.com*

**Background:** Increasing numbers of HIV-infected people receive antiretroviral treatment (ART), driving a need to enhance global drug safety monitoring. Targeted Spontaneous Reporting (TSR) is a cost-effective pharmacovigilance method that has great potential to enhance reporting of ART-related adverse events. However, as a new pharmacovigilance approach, the feasibility of TSR, notably in low- and middle-income countries (LMICs), is unknown. Using data from the International epidemiologic Databases to Evaluate AIDS (IeDEA) Consortium, we sought to 1) develop a list of facility characteristics that constitute key assets in the conduct of TSR, and 2) describe the existing capacity of IeDEA-participating facilities to conduct TSR.

| Category | Variables | Rationale | Overall Capacity of Included Facilities, Total n=137 |
|---|---|---|---|
| Outcome Ascertainment and Follow-up | • Follow-up of individuals receiving medications, including key populations such as pregnant women and children; • Presence of an outreach program; • Ascertainment of deaths; • Patient fees | Patients lost to follow-up are a source of selection and ascertainment bias in evaluation of adverse events (AEs). The ability to know and document outcomes among key populations like pregnant women and children is especially important. Service fees can inhibit patient retention in care and routine ordering of laboratory tests and other services that can identify AEs. | Follow up key populations: • Pregnant women: 43.1% • Children (HIV exposed and/ or infected): 56.2% Presence of an outreach program: 53.3% Active outreach (including phone calls and home visits): 80.3% Patients do not have to pay for laboratory tests: 73% |
| Laboratory Monitoring | • Availability and turnaround time of lab tests (e.g., HIV RNA, HIV DNA, CD4 count, Hemoglobin, Total lymphocytes, ALT/ AST, Creatinine, and Lactate) | Laboratory information including baseline and follow-up testing is necessary for detection, identification, and confirmation of AEs. | On site availability of: • HIV RNA PCR: 32% • CD4 Count: 52.6% • Hemoglobin: 72.3% • Total lymphocyte count: 52.6% • ALT/AST: 51.1% • Cholesterol: 41.6% • Creatinine: 51.8% • Lactate: 33.6% Turnaround time range: <1 -100 days |
| Documentation: Sources and Management of Data | • Unique patient identifiers, • Presence of an electronic database, • Medical history, • History of opportunistic infections (history and follow-up), • Cancer history, • Linkage to pharmacy database, • AEs and their outcomes, • Classification system for AEs and use of standard definitions, • Availability of internet | These data are needed to identify AEs, support TSR activities, and link clinical and pharmacy visits to understand patterns of drug use and their association with AEs. Critical information includes a unique identifiable patient, their medical history and clinical status at follow-up to document any changes, standardized text on data capture instruments. Longitudinal patient data including medication, clinical and AE data are needed to appropriately classify AEs and report the outcomes. | Patients given a unique ID for tracking purposes: 83.2% Use of an electronic database (on site or use of data center): 83.2% Monitoring of opportunistic infections (at each visit until resolved): 62% Linkage to pharmacy data;: 34.3% Adverse events recorded: 73.7% |
| Human Resources | • Availability of physicians, pharmacists, pharmacy assistants and data recorders (to record AEs) | Core clinic staff are required to identify, capture and report AEs | Full time pharmacist: Median: 1 per weekday (Range: 0-32) Pharmacy assistants: Median: 1 per weekday (Range: 0-32) Physician to assess events: Median 2 per weekday (Range: 0-30) Data capturer: Median 1 per weekday (Range: 0-32) |

*[Rationale for characteristics explored and capacity of included IeDEA facilities]*

Tuesday 19 July
Wednesday 20 July
**Thursday 21 July** Poster Exhibition
Friday 22 July
Late Breaker Posters
Author Index

**Methods:** Our facility characteristics list was generated through a literature review and consultation with expert stakeholders and was used to describe the capacity for conducting TSR. IeDEA facility data were drawn from a 2009/2010 site assessment that included reported characteristics of adult and pediatric HIV care programs including outreach, staffing, laboratory capacity, adverse event monitoring and pharmacovigilance, and non-HIV care. Descriptive statistics and frequency calculations of characteristics were explored by region and overall category.
**Results:** We included 137 facilities from: East Africa (43), Asia-Pacific (28) West Africa (21), Southern Africa (19), Central Africa (12), Latin America (7), and North America (7). Key facility characteristics were grouped into those related to Outcome Ascertainment and Follow-up; Laboratory Monitoring; Documentation: Sources and Management of Data; and Human Resources. Based on the reported presence of key facility characteristics, most facilities had adequate structures in place to support TSR, including clinics in LMICs.
**Conclusions:** There is a large existing capacity to conduct TSR. With a few enhancements, especially related to data collection specific to adverse events, TSR could become a standard component of facility activities.

## THPEE489

### WHAT HAPPENS WHEN PREP IS IMPLEMENTED? EXPERIENCES OF A HIGH VOLUME COMMUNITY-BASED LGBT ORGANIZATION IN NEW YORK CITY

P. Carneiro[1], S. Stephanos[1], S. Mosher[1], J. Barrios[1], A. Fortenberry[2], U. Belkind[3], P. Meacher[3], A. Radix[3]
*[1]Callen-Lorde Community Health Center, Prevention and Outreach, New York, United States, [2]Callen-Lorde Community Health Center, Nursing, New York, United States, [3]Callen-Lorde Community Health Center, Medicine, New York, United States*
*Presenting author email: pcarneiro@callen-lorde.org*

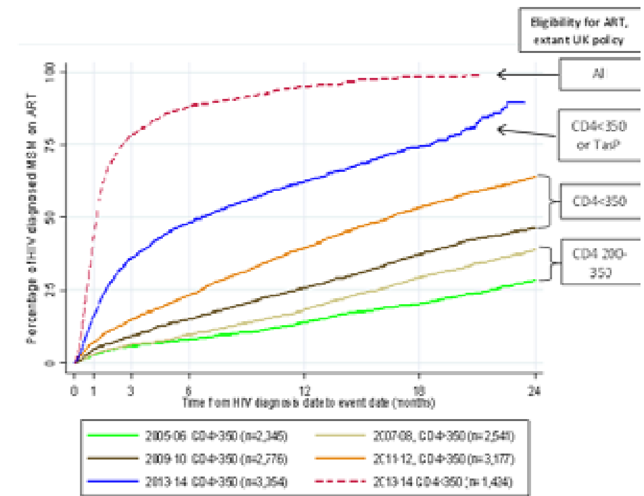
**Background:** Following the FDA approval of Truvada for Pre-Exposure Prophylaxis (PrEP) in July 2012, Callen-Lorde Community Health Center (CLCHC) implemented what would be one of the first and largest PrEP programs in the United States.
**Description:** In 2015, CLCHC delivered 1,050 PrEP prescriptions to patients interested in HIV prevention. An average of 87 patients were prescribed PrEP each month. 77% of patients self-referred for PrEP,14% transitioned to PrEP after completing post-exposure prophylaxis, 4% continued PrEP after participation in a demonstration project, and 5% reported being in an open and/or serodiscordant relationship as a reason. PrEP clients were 18-77 years, with 43% between 28 and 37 years; 32% < 27. The racial distribution was diverse: 58% White/Caucasian, 12% Black and 22% Hispanic/Latino ethnicity. PrEP was accessed via private insurance (57%), public insurance (26%) and by uninsured patients (17%) utilizing medication assistance programs.
**Lessons learned:** Upon implementation of the program there was high demand for PrEP. Medical staff required dedicated training to manage complex and constantly changing insurance requirements. Uninsured patients had to be linked to medication assistance programs or low/no cost health insurance plans. Insured patients encountered challenges due to high copayments, insurance denials or mandatory mail order delivery programs. Some programs delivered medication to our clinic, which necessitated ongoing tracking and distribution by our staff. The impact on clinic flow was minimized by sharing the tasks of the PrEP visit with a team of providers, testers, nursing and PrEP specialists. New protocols were developed, including one that facilitated patient self-swabs for STD screening. Patient navigation was a key aspect of our program, as was interdepartmental cooperation.
**Conclusions/Next steps:** As scale-up of PrEP continues, clinics considering implementing PrEP programs need to be prepared for high demand and proactively put systems into place to facilitate patient access, including strategies to deal with complex insurance issues, tracking of patients and quality assurance.

## THPEE490

### 'MIND THE GAP': PROGRESS TOWARDS IMMEDIATE ART INITIATION FOR ALL UK PERSONS LIVING WITH DIAGNOSED HIV, 2005 - 2014

A. Skingsley, Z. Yin, V. Delpech, N. Gill
*Public Health England, HIV/STI Surveillance, London, United Kingdom*
*Presenting author email: valerie.delpech@phe.gov.uk*

**Background:** The benefit of treatment as prevention (TasP) will be greatest with immediate ART initiation upon HIV diagnosis. Successive UK guidelines have promoted earlier ART initiation. We compare the cumulative probability of initiating ART by years in a cohort of new early HIV diagnoses (CD4 ≥350) to show the progress produced by changing policies. The opportunity remaining is demonstrated by comparison with what is currently achieved for new late HIV diagnoses (CD4 < 350), where universal ART is recommended.
**Methods:** Multiple ascertainment systems including annual follow-up ensures comprehensive data are available for UK HIV cases. Average linkage to care is 90% and virological suppression is 95% of those on treatment. All 49,683 new HIV diagnoses from 2005-2014 linked to care were analysed.
We conducted a Kaplan-Meier analysis of time from HIV diagnosis date to either ART start date or death, or last care attendance date if not on ART by CD4-cell count at diagnosis (< or ≥350) and bi-annual year of diagnosis.
**Results:** The cumulative probability of initiating ART by 12 months following HIV diagnosis among people with CD4≥350 increased over time from 21% in 2005/6 to 62% in 2013/14 (Figure 1). This trend was sustained over 24 months, though the greatest difference between probabilities initiating happened before 6 months. The increase was greater than among those initiating with < 350 (76% in 2005/6 and 95% in 2013/14). In 2013/14, an additional 33% had started ART by 12 months under universal treatment among CD4< 350 compared to TasP among CD4≥350.



*[Kaplan-Meier estimates of time to ART start for bi-annual HIV diagnosis groups, CD4 count and extant ART start policy - UK HIV diagnoses 2005-2014]*

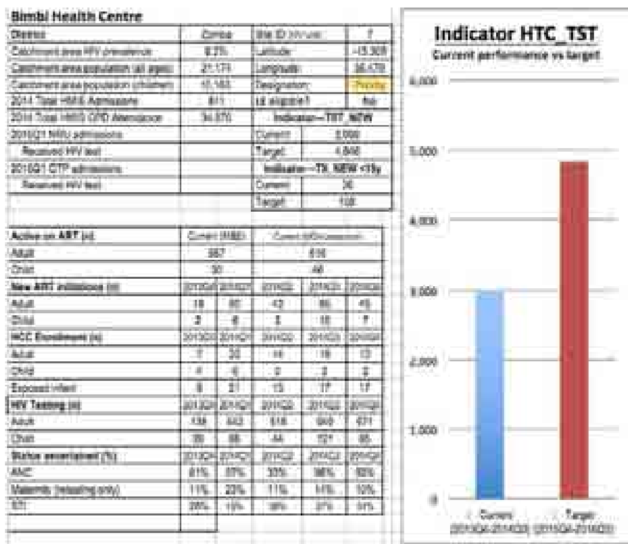
**Conclusions:** UK ART policy changes have led to a substantial shortening of the average time to start ART, with most of this improvement happening in the initial 6 months after diagnosis. There remains considerable opportunity to shorten the time further, possibly through offering universal ART regardless of CD4 count.

## THPEE491

### PREPARING FOR HIV TESTING AND COUNSELING SCALE UP: HIGH-YIELD RAPID ASSESSMENT FOR PLACEMENT OF A PILOT CADRE OF DEDICATED HTC COUNSELORS IN MALAWI

R. Flick[1,2,3], K. Simon[1,4], E. Kavuta[1], M. Harawa[1], T. Beyene[1,4], K. Namachapa[5], C. Kayuni[1], P. Kazembe[1,4], M. Kim[1,4], S. Ahmed[1,4]
*[1]Baylor College of Medicine Children's Foundation Malawi, Lilongwe, Malawi, [2]University of North Carolina Project Malawi, Lilongwe, Malawi, [3]University of Colorado School of Medicine, Denver, United States, [4]Baylor International Pediatric AIDS Initiative at Texas Children's Hospital, Baylor College of Medicine, Houston, United States, [5]Malawi Ministry of Health, Department of HIV/AIDS, Lilongwe, Malawi*
*Presenting author email: elijak.kavuta7@gmail.com*

**Background:** Despite rapid progress, only 31% of children living with HIV are on antiretroviral therapy (ART). Since HIV testing is a key entry point, the Malawi Ministry of Health (MOH) recommended establishment of a dedicated cadre called HIV Diagnostic Assistants (HDA), responsible for facility-based HIV testing. Our program was asked to pilot the HDA cadre at 124 new sites in the southeast zone of Malawi to increase testing and treatment. The degree of expansion and lack of familiarity with the region demanded a rapid but thorough evaluation before implementation.
**Description:** We conducted a rapid site assessment of 124 health facilities in six districts to evaluate baseline rates of HIV testing and treatment and barriers to scale-up. Teams including a clinician, M&E, program staff and MOH representative visited two facilities a day on average. Teams assessed human resource, infrastructure, and commodity needs. Sites were evaluated through semi-structured interviews with facility managers and a collection of predetermined observations. Summary measures were tabulated and entered into a database that generated an automated facility-level dashboard for each site. The exercise took six weeks.



[Figure 1. Example of baseline site dashboard produced by assessment]

**Lessons learned:** Use of comprehensive but concise tools geared towards rapid assessment allowed efficient collection of key data. Prompting same-day tabulation of key measures allowed rapid and clear feedback. Definitions of common terms must be standardized to allow reproducible measurement of staffing needs; for example using "dedicated HTC counselor" to describe staff whose core responsibility is HIV testing, instead of "HTC counselor" which describes anyone trained to conduct testing regardless of contribution to testing coverage.
**Conclusions/Next steps:** Assessment results are guiding placement of recruited dedicated pilot HDAs according to ministry TORs. As recruitment proceeds, training on PITC for all facility staff will be expanded. The use of automated facility-level dashboards will continue using a combination of data sources to monitor progress and allow real-time feedback to staff.

## THPEE492

### PROJECTING HIV HERD IMMUNITY THROUGH HIGH ART COVERAGE AND VIRAL LOAD SUPPRESSION IN KWAZULU NATAL, SOUTH AFRICA

L. Dlamini
*KZN Department of Health, HAST Unit, Richards Bay, South Africa*
*Presenting author email: linda.dlamini@kznhealth.gov.za*

**Background:** KwaZulu Natal "in the past twenty three (23) years has recoreded the highest HIV
prevalence among the 15 - 49 year olds which has remained stable at 37.4% in 2011 and 2012" SANDoH. To succeed in meeting the global target of zero new HIV infections systems had to be put in place. The province has the highest numbers of clients remaining in ART care in the country having recorded 1 039 511 patients at 31 December 2015 (DHIS).
**Description:** A retrospective quantitative provincial HAST program data review was conducted in January 2016 to establish ART coverage in the province and identify areas with high proportions of new clients testing positive. An instantaneous hazard will be used with the Weibull function to determine the hazard of time since eligibility for treatment. From 2008 scale up strategies had been recommended to improve ART coverage, followed by the nurse initiated ART in 2010 and the high transmission interventions in 2011. ART services had evolved from hospital based services to primary health care and now the province is piloting community based models using mobile services.
**Lessons learned:** The province recorded 262 023 new HIV positive tests of which 160 237 were non pregnant females and 101 773 were males. this cohort had 2 697 HIV positive tests for children aged 19 to 59 months, 3 641 in the age group 5 - 14 years 239 017 for 15 - 49 years and 10 078 for people older than 50 years. Only 222 233 patients were started on ART during the same period. This indicate that the rate of new infections is still higher than the rate of putting patients on treatment.
**Conclusions/Next steps:** It is projected that if new HIV infections are to be averted 90% of PLHIV would have to be put on treatment and be virally suppressed. 87.8% viral load suppression at 12 months in December 2015 for patients who were done viral load tests which is 40% of the targeted cohort was recorded. Districts have implementation plans (DIP) to improve percentages of viral loads done to be able to achieve ART impact on HIV prevention.

## THPEE493

### PRIORITY FAST TRACKING HIV RESPONSE IN WEST AND CENTRAL AFRICA TO HALT HUMAN AND MEDICAL CONSEQUENCES OF LOW ARV COVERAGE

S. Bachy[1], K. Fonck[1], K. Akerfeldt[2], A. Banda[3], M. Philips[4]
*[1]Médecins Sans Frontières, Analysis & Advocacy Unit - Health Access, DG, Brussels, Belgium, [2]Médecins Sans Frontières, Analysis & Advocacy Unit - Health Access, DG, London, United Kingdom, [3]Médecins Sans Frontières, Operations Department, OCB Coordination HIV-Advocacy, Johannesburg, South Africa, [4]Médecins Sans Frontières, Analysis & Advocacy Unit - Health Access, DG, Heffen, Belgium*
*Presenting author email: mit.philips@brussels.msf.org*

**Background:** While access to HIV treatment expanded worldwide, Médecins Sans Frontières (MSF) witnesses first-hand serious delays in scale-up in West and Central Africa (WCA), where only one in four people living with HIV (PLHIV) have access to treatment and only 15% of children, much below average coverage in Southern Africa. The region accounts for 18% of all PLHIV, 45% of children born with HIV, 21% of new infections and one third of AIDS related deaths. Without urgent acceleration for the region, worldwide plans to reach the 90-90-90 targets by 2020 are in jeopardy.
**Description:** We investigated key obstacles for expanded antiretroviral treatment (ART) initiation and retention in care in WCA, focusing on contexts where MSF provides HIV services, including three in-depth case studies (DRC, CAR, Guinea). Systematic review of key indicators for ART coverage, enabling factors and strategies including alternative models of care was done.
**Lessons learned:** Recurrent crises compound problems, but backlog relates mainly to pre-existing health system problems. Integrating HIV care within weak health systems without ensuring equitable access undermines effective, timely and quality HIV-services. Early initiation and retention in care is hampered by frequent stock-outs, financial barriers and lack of staff motivation. Relatively lower HIV prevalence decreases priority for government and international actors. Global Fund is main or only funding source. Reluctance to task shifting, lay counsellors, longer periods of drug refills, community approaches etc. prevail. Pressure from patient associations is weak, with insufficient support to groups advocating for PLHIV's needs and rights, combating stigma and monitoring access barriers.
**Conclusions/Next steps:** Countries with biggest treatment gaps and most urgent unmet needs have proportionally less benefited from effective scale-up strategies. Governments and international actors need to step up fast track responses to close treatment gaps by adapting existing approaches. Urgent mobilization of all health actors is needed to mitigate barriers to ART initiation and adherence, including ensure HIV testing and treatment free of charge for all PLHIV, decentralised &simplified ART provision, task-shifting, guaranteeing uninterrupted supply of HIV-commodities. Prone to crises or instability, relevant and regularly updated contingency plans need to be developed and implemented to ensure continued treatment and enrolment.

## THPEE494

### POC CD4 IMPROVES EFFECTIVE REFERRALS FROM COMMUNITY TO CLINICAL SETTINGS IN LESOTHO

M. Jubilee[1], D. Dixon[1], N. Lebona[1], M. Mohale[1], N. Taruberekera[2]
*[1]Population Services International, Maseru, Lesotho, [2]Population Services International, Johannesburg, South Africa*
*Presenting author email: mjubilee@psi.co.ls*

**Background:** Lesotho has a generalized HIV epidemic with an adult prevalence of 23%. Despite this high HIV burden, majority, 84% of women and 63% among men ever tested for HIV, and of those who test positive, only 52% of females and 48% of males have been linked to care. A number of studies have examined the impact of facilitated referrals on linkage to care, but few have looked at the impact of POC CD4 testing using country specific program data.
**Description:** We conducted a retrospective analysis of 42,605 records of clients 2 years and older, seen between October 2014 and September 2015, through our mobile HTC, home-based and static sites. For each client, data collected included client's demographics, HIV results and referrals, testing history and uptake of non-communicable diseases. In late 2013, PSI/Lesotho integrated 15 PIMA machines into counselling sessions to improve effective referrals. Machines were used during mobile, home-based and static sites. From a total of 30 counsellors working from these channels, only 15(50%) had access to PIMA while the rest had to refer to nearby clinics or their colleagues. In this case, effective referral is defined as newly diagnosed HIV-positive client from the CDC-funded New-Start project who successfully completed referral to HIV-care by means of referral slip or PRE-ART enrollment within 3 months of diagnosis.

Friday 22 July
Late Breaker Posters
Author Index

Tuesday 19 July
Wednesday 20 July
Thursday 21 July Poster Exhibition
Friday 22 July
Late Breaker Posters
Author Index

**Lessons learned:**

| Channel | Total positive | CD4 uptake | Referral acceptance | Effective referral |
|---|---|---|---|---|
| Static site | 521 (8.9%) | 260 (49.9%) | 510 (97.9%) | 305 (59.8%) |
| Mobile HTC | 2150 (8.9%) | 1294 (60.2%) | 2092 (97.3%) | 1318 (63%) |
| Home-based HTC | 733 (5.9%) | 386 (52.7%) | 686 (96.6%) | 437 (63.7%) |
| Total | 3404 (8%) | 1940 (57%) | 3288 (96.6%) | 2060 (62.7%) |

*[Table1: HIV-positive yield, CD4 and referral uptake: Oct2014-Dec2015]*

Almost 74.2% with CD4 testing completed referral cycle compared to only 46% amongst those without CD4 testing (p< 0.001). About 78.2% of those with less than 500 CD4 count completed referrals compared to 66.8% among those with higher CD4 count, 500 and above (p< 0.001).
**Conclusions/Next steps:** A higher proportion of those receiving POC CD4 count were successfully linked to HIV care. Overall, these findings support deployment of more PIMA machines particularly at mobile and stand-alone HIV testing services where there are more HIV positives.

## THPEE495

### HUMANA PEOPLE TO PEOPLE (HPP) DEMONSTRATED ENHANCED, TIME-BOUND TESTING COVERAGE, LINKAGE TO CARE AND TREATMENT THROUGH HOME-BASED HTC THAT REACHED LARGE NUMBERS OF TARGETED POPULATION IN ZAMBIA AND SOUTH AFRICA

I.O. Hansen[1,2], M. Sugata[3], K. Zimondi[4]
*[1]Humana People to People, Harare, Zimbabwe, [2]New Delhi Industry Hospital & Health Care, Delhi, India, [3]Public Health Advisor & Leader (TB, HIV, STI, RCH Diabetes, M/E) New Delhi Industry Hospital & Health Care, Delhi, India, [4]HPP South Africa, Johannesburg, South Africa*
*Presenting author email: titan@humana.org*

**Background:** 90-90-90 treatment targets have evolved to drive massive upscaling of HIV testing & ART coverage by 2020. The primary requirement to achieve those targets is to bring larger volume of population under HTC services, knowing their status within shorter span of time, refer and link to ART. HPP has through its members a strong global presence in the field of HIV, and has demonstrated enhanced and time-bound testing coverage through home-based HTC in Zambia and South Africa.
**Description:** HPP has implemented TCE (Total Control of Epidemic) for the last 15 years and demonstrated the effectiveness of house-to-house, one-on-one intensified screening, risk assessment, mobilizing for and scaling up HTC. TCE in Zambia and South Africa have carried out home-based HTC services to bring larger amount of the local population under testing coverage. In Zambia 96,000 people were tested through home-based HTC services within a catchment population of 350,000 in Lusaka (28% of total population) between Apr - Sept'15 (average monthly coverage 16,000 or 5% of catchment population) with detection of around 10% sero-positivity. Of the 9,710 people who tested HIV positive in the catchment areas in Lusaka 6,424 completed linkage within 6 months or 66%. HPP tested 72,375 people with home based HTC in three sub-districts of South Africa between Mar'15 - Sept'15 with sero-positivity (6% East London, 7% Nelson Mandela Bay and 10% in Govan Mbeki).
**Lessons learned:** Home-based HTC is operationally feasible within the time-bound approach of the TCE strategy where the uptake of testing services with immediate referral to care and treatment of people tested HIV positive can be rapidly augmented within the families in absence of stigma and prejudices.
**Conclusions/Next steps:** HPP advocates for home-based HTC followed by high level of linkage to care and treatment to make it an integral strategy to achieve 90-90-90 treatment targets focusing chiefly on key population in HIV high burden countries.

## THPEE496

### MOBILE CLINICS FOR SCALE UP OF HIV CARE AND TREATMENT IN RURAL MOZAMBIQUE

M.A. Ouenzar[1], N. Hellmann[2], I. Ramiro[3], B. Alface[3], N. Mehta[2], C. Lucas[1], A. Nhanala[1]
*[1]Elizabeth Glaser Paediatric AIDS Foundation, Maputo, Mozambique, [2]Elizabeth Glaser Paediatric AIDS Foundation, Washington DC, United States, [3]Directorate of Health of Gaza Province, Xai Xai, Mozambique*
*Presenting author email: ali.ouenzar@gmail.com*

**Background:** Mozambique has one of the world's highest rates of HIV, with a prevalence of 11.5%. Human resource and infrastructure shortages limit access to care for Mozambique's rural poor. The National HIV/AIDS Response, launched in 2013, promotes massive scale-up of antiretroviral therapy (ART) over three years. Consequently, EGPAF initiated the mobile health clinic (MHC) program in Gaza province. This evaluation seeks to look at the contribution and effectiveness of MHC in reaching programmatic goals.
**Description:** In 2013, three EGPAF-supported MHCs began operating in three southern districts where people living with HIV and AIDS were estimated to number 93,050. Each MHC, comprised of one clinician, one nurse, two counselors, and one driver visits eight peripheral health centers (PHCs) every two weeks. MHCs provide comprehensive HIV services, most notably prevention of mother-to-child transmission and care and treatment, including access to drugs and point-of-care CD4-count machines, which were not previously available at PHCs. These teams also provide technical assistance and mentoring to PHC staff. The fractions of MHC-provided services in the three covered districts were compared for the years 2013 and 2014.
**Lessons learned:** Each period shows wider geographic coverage and significant contribution of MHCs in reaching new populations. MHCs also reach areas where treatment access was previously limited; and the bimonthly visits have created a strong supply chain for drugs. The multidisciplinary MHC training at PHCs has resulted in improved quality of services as well as the capability to function independently in the future. For example, in 2014 the uptake of cotrimoxazole prophylaxis (90% vs 80%, respectively) and CD4 cell counts within 1 month of new client enrollment (72% vs 62%, respectively) was higher among MHC clients than fixed site clients. Also, loss to follow-up was lower among MHC clients.

| Indicators | 2013 MHC Percent Contribution (MHC clients/ MHC+Fixed site clients) | 2014 MHC Percent Contribution (MHC clients/ MHC+Fixed site clients) | p-value for MHC contribution change from 2013 to 2104 |
|---|---|---|---|
| HIV-positive adults and children receiving at least one clinical service | 9.9% (3,311/33602) | 18.9% (7644/40405) | <.0001 |
| New HIV clinical care patients enrolled | 20.9% (3096/14838) | 34.5% (5098/14768) | <.0001 |
| Adults and children newly enrolled on ART | 14.9% (1202/8088) | 32.5% (3351/10322) | <.0001 |
| Adults and children currently receiving ART | 7.8% (1370/17491) | 19.7% (5065/25731) | <.0001 |

*[MHC Contribution to Total Clients Served in 3 Southern Districts of Gaza, 2013-2014]*

**Conclusions/Next steps:** MHCs efficiently allow for rapid HIV C&T expansion to remote populations and improved on-site capacity of PHCs, even with significant geographic and economic barriers. Next steps include continued evaluation and identification of sites ready to transition to fixed service sites.

## THPEE497

### RAISING DOMESTIC RESOURCES THROUGH THE PRIVATE SECTOR FOR HIV CARE AND TREATMENT WITH HEALTH INSURANCE IN KENYA

L. Weir[1], A. Gatome-Munyua[2]
*[1]Abt Associates, International Health, Bethesda, United States, [2]Abt Associates, Nairobi, Kenya*

**Background:** In order to achieve the 90-90-90 goals, rapid scale-up of HIV care and treatment is imperative in sub-Saharan Africa, a challenge in a global climate of stagnant donor resources for HIV. Kenya's private health sector (PHS) plays a significant role in the delivery of the nation's health services. Fifty-one percent of all health facilities are in the PHS, 40 percent of total health financing is from private sources, and the PHS provides ART for 24 percent of HIV positive clients accessing treatment. However, only 17 percent of Kenyans have health insurance, and private funding for HIV declined from 28 percent in 2009 to 7 percent in 2013.
**Description:** Mobilizing private financing for health via insurance mechanisms can increase sustainable access to HIV care and treatment via PHS sources, simultaneously increasing domestic financing for HIV. Under the USAID-funded SHOPS project, Abt Associates implemented a four year multipronged approach to increase sustainable uptake of HIV services via insurance coverage. First, SHOPS focused on strengthening insurers to sustainably deliver improved insurance products incorporating HIV services. Second, health facilities and private providers were engaged to strengthen their ability to accept insurance in serving PLHIV, while also addressing the cost and quality of services. Third, SHOPS utilized data from multiple sources, both financial and epidemiological, to understand the profile of PLHIV who could afford insurance and conducted a survey to better define the knowledge of insurance among low-income clients. Finally, SHOPS increased the distribution of insurance among PLHIV by promoting the sale of two insurance products and supporting an insurance knowledge campaign.
**Lessons learned:** SHOPS succeeded in increasing insurance coverage for over 20,000 lives, demonstrated an increase in understanding of insurance products among target beneficiaries by over 7 percent, and resulted in reduced costs in claims processing for PHS providers by approximately 17 percent.

**Conclusions/Next steps:** Engagement with the PHS to address issues across stakeholders is critical to increase domestic funding for HIV and ensure PLHIV can access care and treatment. SHOPS's experience identifies opportunities for continued engagement, the demand for insurance products that meet the needs of PLHIV, and the strengthening of insurance companies as partners to achieve 90-90-90.

## THPEE498

### UNIVERSAL HIV RAPID-SCREENING OF PREGNANT PATIENTS ADMITTED FOR DELIVERY: A COST-EFFECTIVENESS ANALYSIS

R. Scott[1], S. Crochet[2], C.-C. Huang[3]
*[1]MedStar Health Research Institute and Washington Hospital Center, Womens' and Infants' Services (WIS), Washington, United States, [2]Emory University, Atlanta, United States, [3]MedStar Health Research Institute and Washington Hospital Center, Washington, United States*
*Presenting author email: rachelkscott@hotmail.com*

**Background:** Maternal to child transmission (MTCT) of HIV is largely preventable through screening and antiretroviral treatment, including maternal and neonatal prophylaxis, and Cesarean delivery (CD) for high or unknown viral load. Given the high prevalence (1.9%) and incidence (0.087%/year) of HIV among reproductive-age women in Washington D.C., our medical center recently implemented universal HIV rapid-screening of patients admitted for delivery in an effort to diagnose patients who were not previously screened or who seroconverted during pregnancy, to decrease MTCT.
**Methods:** We hypothesized that universal HIV screening would be cost effective in a high HIV prevalence and incidence area, such as D.C. We conducted a cost-effectiveness analysis to compare cost and quality-adjusted of life-years (QALYs) of our universal screening strategy with the two current alternative standards of care (1.Rapid screening for patients without screening in the third trimester; 2.Rapid screen for patients without any prenatal screening). Costs included materials and services of HIV rapid testing, associated treatments and delivery modes, and lifetime medical costs of treating perinatally-acquired HIV. We applied a 3% discount rate for the measure of QALYs. We obtained reference parameters, including cost information, incidence and prevalence data, from the D.C. Department of Health, published expert opinions, and medical literature. We developed a decision model taking into consideration HIV prevalence and cumulative incidence, HIV screening during prenatal care, sensitivity and specificity of HIV testing, CD rate, and risk of vertical transmission in different scenarios. Sensitivity analyses estimated the impact of variances in QALYs, estimated lifetime medical costs, HIV prevalence and cumulative incidence.
**Results:** The incremental cost-effectiveness ratio for universal screening was $15,801/QALY, compared with standard 1. Standard 2 was inferior to standard 1 in both effectiveness and cost, and was therefore excluded from further analysis. The results remained robust to sensitivity analysis. In areas with annual cumulative incidence rate of < 0.04% (i.e. < half the rate in Washington, D.C.) the incremental cost-effectiveness ratio for the expanded program would exceed $53,802/QALY, and exceed commonly applied cost-effectiveness thresholds.
**Conclusions:** Universal rapid HIV screening to decrease MTCT in patients admitted for delivery appears cost effective in Washington D.C. and populations with high HIV incidence.

## THPEE499

### MORTALITY AMONG CHILDREN AND ADOLESCENTS BEFORE INITIATION OF ART IN CENTRAL KENYA

A. McLigeyo, P. Wekesa, J. Njenga, F. Mbate
*Center for Health Solutions - Kenya, Nairobi, Kenya*
*Presenting author email: amcligeyo@chskenya.org*

**Background:** The HIV epidemic has had a negative impact on child and adolescent survival and mortality. Prior to recent changes in guidelines for initiation of ART, children and adolescents ART initiation was based on several immunological and clinical criteria. We reviewed data of patients who died prior to initiation of ART in Central Kenya.
**Methods:** A cross-sectional analysis of mortality data of pre-ART children and adolescents aged 0-19 years from 39 facilities between 2012 and 2015 in Central Kenya. Data was collected from patient medical records and validated with electronic medical records. Descriptive statistics were used to analyze the data.
**Results:** Data from 105 pre-ART patient aged 0-19 years was analyzed. Of these, 15% were between 0-23 months, 20% between 24-59 months, 20% between 5-9 years, 28% between 10-14 years and 17% between 15-19 years. Half of these were female (50%). Most of the patients (80%) were at WHO stage I at enrolment and 60% at death. Median CD4 count was 555 cells/mm3 at enrolment and 593.5 at death. Majority (82%) developed opportunistic infections prior to death with tuberculosis being most common at 23%, wasting (20%) and pneumonia (12%), candidiasis (5%) and cryptoccocosis (2%). Of the under 5 years, z-scores were available for only 20% of the patients, with 75% of these reported as moderate or severe wasting. The mean time-to-death from initiation of care was 24.7 months, with 7.7 months among infants less than 23 months, 13.1 months among children aged 24-59 months, 18.2 months among children aged 5-9 years, 39.1 months for 10-14 years olds and 37.2 months for those between 15-19 years.
**Conclusions:** Early mortality is commonest among those aged below five years and TB and wasting the commonest co-morbidities. These findings support intensive case finding for TB and current WHO recommendations to initiate ART in all children aged below 5 years regardless of CD4 count.

## THPEE500

### MORTALITY AMONG CHILDREN AND ADOLESCENTS ON ART IN CENTRAL KENYA

P. Wekesa, A. McLigeyo, J. Njenga, F. Mbate
*Center for Health Solutions - Kenya, Nairobi, Kenya*
*Presenting author email: pwekesa@chskenya.org*

**Background:** The scale up of antiretroviral therapy among children and adolescents has resulted in decline in HIV related mortality in Sub-Saharan Africa. However, late presentation, late initiation of antiretroviral therapy (ART), malnutrition and co-morbidities affect survival even among those already on ART. We describe clinical characteristics and time interval to death of children and adolescents who died while on ART at HIV clinics in Central Kenya.
**Methods:** A cross-sectional analysis of mortality data of children and adolescents aged 0-19 years from 39 facilities in Central Kenya, who initiated ART between 2012 and 2015. Data was collected from patient medical records and validated with electronic medical records of patients who died at the health facilities. Descriptive statistics was used to analyze abstracted data.
**Results:** Data from 55 children and adolescents who died while on ART was analyzed. Of these, 22% were aged 0-23 months, 24% were 24-59 months, 22% were between 5-9 years, 18% between 10-14 years and 15% between 15-19 years. Of these 49% were female. Most of the patients were in WHO stage I and II at diagnosis and death (54% v 53% respectively). Median baseline CD4 count at initiation was 300 cells/mm$^3$ compared to 361.5 cells/mm$^3$ at death. Majority of the patients (91%) had opportunistic infections before death with the most common being tuberculosis (TB) at 35%. HIV wasting, pneumonia, cryptococcosis, and candidiasis occurred in 24%, 13%, 5%, and 4% of the patients respectively. Documented z-scores amongst 23% of the under 5s indicated moderate to severe wasting in 92% of the patients. Mean time-to-death was 29.7 months but varied by age group with 9.3 months among 0-23 months, 19.5 months between 24-59 months, 41.8 months for 5-9 year group, 30.1 months for 10-14 year group and 23.6 months for 15-19 year group.
**Conclusions:** Tuberculosis infection and wasting were most common predictors of mortality among children and adolescents who died while on ART. Time to death was least among infants, children under 5 years and late adolescents aged 15-19 years. We recommend targeted follow-up tailored to age categories and intensified screening and management of tuberculosis and wasting of children and adolescents.

## THPEE501

### ANTIRETROVIRAL DRUG TOXICITY IN HIV-INFECTED PATIENTS STARTING THERAPY: A RETROSPECTIVE ANALYSIS OF TIME TO TOXICITY AND REGIMEN TYPE

P. Wekesa, A. McLigeyo, J. Njenga, F. Mbate
*Center for Health Solutions - Kenya, Nairobi, Kenya*
*Presenting author email: pwekesa@chskenya.org*

**Background:** Prolonged ART is necessary to sustain morbidity and mortality benefits. Toxicity may develop use. We determined survival time from ART initiation to toxicity development.
**Methods:** A retrospective analysis of patients on follow-up for five years since ART initiation at 25 Ministry of Health facilities was done. The primary predictor variable was initial ART regimen while age, sex, and CD4 count at ART initiation were confounders. Data were abstracted from an electronic database,Kaplan Meier used to estimate survival time and Cox regression analysis for multivariate analysis. Censoring variables for the study were death within follow up time, LTFU, TO, Stop of ART for reasons other than toxicity and follow-up for 5 years without toxicity.
**Results:** Of the 26,699 patients, 11.3% were children below 15 years, 34.4% were male and mean age was 34.2 years. Median follow up time was 11.7(IQR 2.4 - 29.2)

months and 9.5% developed toxicity. The mean CD4 at ART initiation was 186.6 cells/mm³. The starting ART regimens were stavudine-based given to 36.4%, tenofovir- based to 31.4%, zidovudine-based to 20.3%, abacavir-based to 5.7% and non-standard regimens to 6.2% of the patients. The overall unadjusted mean survival time from ART initiation to toxicity development was 51.0 months (95% CI: 50.8, 51.4). Time to development of toxicity among patients on stavudine was 48.9 (95% CI: 48.5, 49.4), non-standard regimens 51.3 (95% CI: 49.7, 52.9), tenofovir, 54.4 (95% CI: 53.4, 55.3), abacavir, 55.3 (95% CI: 54.0, 56.5) and zidovudine, 55.4 months (95% CI 54.8, 56.0). Adjusting for age, sex and CD4 at ART initiation, patients on non-standard regimens and stavudine were more likely to have a shorter time to toxicity development compared to patients on tenofovir with a hazard ratio (HR) of 1.6 (95% CI 1.3, 2.1) and 2.1 (95% CI 1.8, 2.5) respectively. The relative hazards for development of toxicity for patients on abacavir compared to patients on tenoforvir was marginally significant, HR 1.4 (95% CI 1.0, 2.0). There was no statistical difference in time to development of toxicity for patients on zidovudine compared to patients on tenofovir.

**Conclusions:** Toxicity following prolonged ART developed earlier in patients on non-standard and stavudine based regimens.

## THPEE502

### A CLUSTER-RANDOMIZED TRIAL TO PROMOTE COMBINATION HIV PREVENTION USING MHEALTH-SUPPORTED CHWS IN A HIGH-PREVALENCE FISHING COMMUNITY: DESIGN AND BASELINE CHARACTERISTICS OF THE MLAKE TRIAL IN RAKAI, UGANDA

L. Chang[1], I. Mbabali[2], X. Kong[1], H. Hutton[1], A. Long[1], A. Thomas[1], E. Bugos[1], J. Ssekasanvu[2], C. Kennedy[1], R. Amico[3], F. Nalugoda[2], S. Reynolds[4], T. Quinn[4], D. Serwadda[2], M. Wawer[1], R. Gray[1], G. Nakigozi[2]
*[1]Johns Hopkins University, Baltimore, United States, [2]Rakai Health Sciences Program, Kalisizo, Uganda, [3]University of Michigan, Ann Arbor, United States, [4]National Institutes of Health, Bethesda, United States*
*Presenting author email: larrywillchang@gmail.com*

**Background:** Novel, intensive, yet economical approaches, are needed to increase combination HIV prevention uptake in high-prevalence, localized epidemics. We designed and initiated a household-based, mHealth (mobile phones for health) supported community health worker (CHW) intervention and are evaluating its impact in a cluster-randomized trial (mLAKE: mHealth Lakefolk Actively Keeping Engaged) in a high HIV prevalence Lake Victoria fishing community in Rakai, Uganda.

**Methods:** The study setting has an adolescent/adult HIV seroprevalence of 36%. The community was divided into 40 clusters. 10 CHWs were trained to use motivational interviewing-informed methods to increase uptake and adherence to HIV prevention and treatment services. A mHealth smartphone application was designed for CHW use to expedite and structure their counseling approach. The intervention was nested within the Rakai Community Cohort Study (RCCS) which conducts detailed interviews with all consenting residents and collects samples for HIV and viral load testing at ~18 month intervals. Using RCCS data, baseline study arm characteristics were compared and study power calculated.

**Results:** In September 2015, 40 clusters containing 2088 RCCS participants were randomized 1:1 to intervention and control arms (intervention arm n=996; control arm n=1092). Baseline characteristics were balanced between arms, including primary study outcomes (see Table).

| Characteristics [1] | Intervention Arm | Control Arm | MDD Ratio [5] |
|---|---|---|---|
| Age, mean (IQR) | 30.8 (7.7) | 30.0 (7.9) | - |
| Cluster size [2] | 49.8 (12.4) | 54.6 (10.2) | - |
| HIV Prevalence [3] | 37.5 (10.1) | 35.4 (9.9) | - |
| Male [3] | 48.9 (10.2) | 53.5 (9.3) | - |
| HCT Coverage [3] | 99.1 (1.5) | 99.0 (1.3) | - |
| HIV Care Coverage [3,4] | 75.2 (12.2) | 74.3 (10.3) | 1.15 |
| ART Coverage [3,4] | 66.0 (15.5) | 67.0 (10.7) | 1.20 |
| Male Circumcision Coverage [3,4] | 56.9 (11.7) | 62.0 (13.4) | 1.23 |
| Population Prevalence of Detectable Viremia [3,4] | 10.9 (4.9) | 11.3 (4.2) | 0.553 |

*[Study arm baseline characteristics]*

[1] Except for age which is arm-level, all results are at the cluster-level;
[2] mean (SD);
[3] mean % (SD);
[4] primary study outcomes;
[5] Minimum Detectable Difference Ratio

Over the initial 4 months of the study, CHWs counseled a total of 892 participants (mean 89.2 clients per CHW, range 48-185) guided by the mHealth application.

**Conclusions:** It is feasible to implement a cluster-randomized trial of a novel mHealth CHW intervention in a high-prevalence fishing community. Baseline characteristics are comparable between study arms. The study should have adequate power to detect moderate differences in important HIV-related outcomes to be assessed in 2017-2018.

## THPEE503

### USING QUALITATIVE METHODS TO EXPLAIN THE UPTAKE OF AN INTERVENTION TO ACCELERATE ANTIRETROVIRAL THERAPY (ART) INITIATION IN UGANDA

F.C. Semitala[1,2], C. Camlin[3], J. Wallenta[4], L. Kampiire[5], R. Katuramu[5], G. Amanyire[2], J. Namusobya[2], D. Havlir[4], M.R. Kamya[1,2,5], E. Geng[4]
*[1]Makerere University College of Health Sciences, Internal Medicine, Kampala, Uganda, [2]Makerere University Joint AIDS Program (MJAP), Care and Treatment/ Research, Kampala, Uganda, [3]University of California San Francisco, Obstetrics, Gynecology & Reproductive Sciences and Division of Prevention Science, San Francisco, United States, [4]University of California San Francisco, Internal Medicine, San Francisco, United States, [5]Infectious Diseases Research Collaboration, Research, Kampala, Uganda*
*Presenting author email: semitala@gmail.com*

**Background:** The Streamlined ART study (STARTs) demonstrated that a theory-based intervention targeting health care worker behavior and using point-of-care CD4 testing machines (PIMA) to streamline processes increased initiation of ART on same day as eligibility from 18.3% to 70.8% in 20 government-run clinics in Uganda. We used qualitative methods to explain intervention uptake.

**Methods:** We carried out in-depth interviews with 24 health care providers, 81 patients and 9 study staff to understand perceptions, attitudes and contexts of changes in practice. Data analyses were informed by the Theoretical Domains Framework for health care worker behavior change that proposes four determinants: environmental context, social influences, professional identity, and behavioral regulation.

**Results:** Uptake of more rapid ART initiation occurred in an environmental context facilitative of provider behavior change. A network, from the Ugandan NGO to facility health workers and into the cadre of HIV-infected individuals serving as peer educators, enabled rapid dissemination of new practices at facilities through existing social ties for communication, implementation, and accountability. Peers provided pre-test counseling and information at facilities, and were role models and advocates for ART initiation. Providers felt a sense of pride with attainment of new knowledge and skills from training, and were gratified by providing higher quality care. The use of PIMA relieved providers from frustrations of lost or delayed lab results, and led to higher patient satisfaction (due to reduced costs because of ability to initiate ART immediately, with fewer return clinic visits). However, some lab personnel perceived that the PIMA resulted in their increased workload and reduced income from travel reimbursements by obviating need for lab staff to transport samples.

**Conclusions:** As intended, STARTs reduced barriers to provision of high quality care. Uptake of STARTs also was mediated by unanticipated factors: persuasive peer educators provided 'vicarious efficacy' for patients as models for successful ART uptake, prior to patients' contacts with authoritative providers: along with a desire to avoid return visits, these influences may have facilitated patients' readiness to initiate ART quickly, often on same day eligibility was determined. These findings offer positive insights for the uptake of test and treat approaches for HIV.

## THPEE504

### “TOUGH TALKS”: DEVELOPING A VIRTUAL REALITY APPLICATION TO SUPPORT HIV SATUS DISCLOSURE AMONG YOUNG MSM

K. Knudtson[1], K. Soni[1], K. Muessig[2], M. Adams-Larsen[3], R. Artstein[4], A. Leuski[4], D. Traum[4], W. Dong[2], D. Conserve[2], L. Hightow-Weidman[5]
*[1]UNC-Chapel Hill, Institute of Global Health and Infectious Disease, Chapel Hill, United States, [2]UNC-Chapel Hill, Health Behavior, Chapel Hill, United States, [3]Virtually Better, Inc, Atlanta, United States, [4]University of Southern California, Institute for Creative Technologies, Los Angeles, United States, [5]UNC-CH, School of Medicine, Chapel Hill, United States*
*Presenting author email: lisa_hightow@med.unc.edu*

**Background:** After diagnosis, persons living with HIV, including young men who have sex with men (YMSM) continue to engage in sexual risk behaviors. HIV-status disclosure can decrease risk, however currently there are no scalable interventions for youth. Virtual reality (VR) technologies can be leveraged as innovative approaches to communication skill building and sexual risk reduction.
**Description:** Tough Talks is a VR application designed for HIV+ YMSM to practice disclosing their status to intimate partners in a safe, confidential environment. Created in collaboration between two research universities and a software company, Tough Talks is delivered via a laptop and tablet. YMSM first select a disclosure setting and realistic avatar to disclose their status to. Avatars and scenes were designed by and with MSM to ensure appropriateness and resonance. Avatars respond from a database of over 100 phrases, developed and refined through 4 focus groups with HIV+ and HIV- YMSM and 45 usability sessions with 15 HIV+ YMSM. Users currently disclose via chat; future iterations will include ability to speak to the avatar. At this development stage, an automatic algorithm suggests responses to user utterances, which are then verified or changed by a human operator in real time. Presently, the algorithm provides 40-60% appropriate responses; performance improves with increased usability data.
**Lessons learned:** VR is a powerful, scalable technological tool for addressing complex behaviors like HIV status disclosure. To optimize uptake and utilization, the program must be visually and linguistically tailored for end-users. Scenarios and realistic avatars allowed participants to feel immersed and invested, resulting in strong emotional responses. Participants wanted options to type or speak to the avatar; noting that typing felt like a first-step toward speaking their status out loud.
**Conclusions/Next steps:** VR can be used to simulate in-person conversations in an immersive, nonjudgmental environment. Tough Talks presents a novel opportunity to practice disclosure strategies prior to engaging in these difficult and stressful situations. As the application is refined, ultimately the human operator will not be needed, facilitating broad scale-up. Future iterations will feature expanded disclosure scenarios and avatar selections including partners, friends, and family members.

## THPEE505

### COMMUNITY-BASED PHARMACISTS’ CONFIDENCE LEVEL IN COMMUNICATING WITH PHYSICIANS ABOUT HIV-POSITIVE PATIENTS ANTIRETROVIAL THERAPY TREATMENT

J. Kibicho[1], J. Owczarzak[2]
*[1]University of Wisconsin-Milwaukee, College of Nursing, Milwaukee, United States, [2]John Hopkins University, Bloomberg School of Public Health, Baltimore, United States*
*Presenting author email: kibicho@uwm.edu*

**Background:** Effective HIV patient care is largely dependent on communications between healthcare professionals across the HIV continuum of care. Pharmacists as medical experts are a valuable resource to physicians treating persons living with HIV (PLWH) with multiple chronic conditions. We are not aware of any studies examining pharmacists’ confidence communicating with physicians treating PLWH. Our study examines how community-based pharmacists’ confidence communicating with physicians impacts their ability to provide adherence promotion activities (APA) to PLWH.
**Methods:** We surveyed community-based pharmacists providing HIV patient care. We asked pharmacists to rate 27 APA activities (assessment, monitoring) and 4 questions about their confidence-level communicating with physicians (knew appropriate questions, discussing therapy challenges) on 3-point Likert Scale. We used factor analysis to generate an APA index ($\alpha$=0.92) and phy-pharmcomindex ($\alpha$ = 0.90). Univariate generalized linear modelling (GLM) and multivariate GLM were done to identify significant pharmacist (e.g., age, education) and pharmacy (e.g., type, size) factors associated with APA.
**Results:** 40% of the 188 pharmacists from 37 U.S. states surveyed worked in top HIV MSAs. Most were female (63%), Caucasian (67%) and HIV certified (73%). 33% worked in specialty-only pharmacies. A majority (85%) worked closely with physicians. 8% were not very confident about appropriate questions and 13% discussing ART regimen challenges. In univariate GLM, HIV+ clientele, prescription volume, public insurance, HIV certification, HIV organization membership, and phy-pharmcomindex had higher odds of APA; age and fulltime status had lower odds. In multivariate GLM, HIV certification, HIV organization membership and phy-pharmcomindex had higher odds [$OR_{certification}$: 1.432 ($p< .05$); $OR_{membership}$: 1.596 ($p< .05$); $OR_{phy\text{-}pharmcomindex}$: 1.552 ($p< .01$)], while fulltime status had lower odds [$OR_{fulltime}$: 0.700 ($p< .05$)] of APA.
**Conclusions:** Many pharmacists are confident asking the right questions and discussing ART therapy with physicians. Pharmacists who are confident communicating with physicians are 50% more likely to provide APA, after controlling for HIV certification and membership. As the last providers patients see before medications, pharmacists knowledgeable of appropriate questions and confident communicating therapy-related concerns with physicians can ensure PLWH are adherent to ART and avoid medication-related adverse effects. Our findings have significant implications for community-based pharmacists’ continuing efforts to promote adherence among PLWH.

### CREATING AN ONLINE HIV PREVENTION AND TREATMENT CASCADE USING THE ADAM'S LOVE ELECTRONIC HEALTH RECORD SYSTEM

T. Anand[1,2], C. Nitpolprasert[1,2], P. Phanuphak[1,3], J. Jantarapakde[1], J. Keeratikongsakul[1], S. Promthong[1], S.J. Kerr[3], K.E. Muessig[4], L.B. Hightow-Weidman[5], J. Ananworanich[2,6,7], N. Phanuphak[1,2]
*[1]The Thai Red Cross AIDS Research Centre, Bangkok, Thailand, [2]SEARCH, The Thai Red Cross AIDS Research Center, Bangkok, Thailand, [3]HIV-NAT, The Thai Red Cross AIDS Research Centre, Bangkok, Thailand, [4]University of North Carolina at Chapel Hill, Gillings School of Global Public Health, Department of Health Behavior, Chapel Hill, United States, [5]Behavior and Technology Lab, Institute for Global Health and Infectious Diseases, University of North Carolina at Chapel Hill, Chapel Hill, United States, [6]U.S. Military HIV Research Program, Walter Reed Army Institute of Research, Silver Spring, United States, [7]Henry M. Jackson Foundation for the Advancement of Military Medicine, Bethesda, United States*
*Presenting author email: tarandeepsinghanand@gmail.com*

**Background:** Electronic health record (EHR) systems reduce the fragmentation of care, providing clients instant access to healthcare data and encouraging participation in their own health. Costs, fear of and actual data breaches, and securing client confidentiality remain key challenges. We developed Asia’s first EHR for men who have sex with men (MSM) and transgender (TG) people.
**Description:** myhealth.adamslove.org, a web-browser based EHR system launched by The Thai Red Cross AIDS Research Centre (TRCARC) in December 2015 as part of the Online Test and Treat Study, an implementation science research project to facilitate an online HIV prevention and treatment cascade. The EHR includes consent and registration processes, risk-assessments, appointment scheduling, visit reminders, live video guidance for HIV testing, access to post-test counseling summaries, HIV and STI test results, treatment referrals for HIV and STIs, treatment monitoring information including CD4 counts, viral loads and antiretroviral treatment. To ensure data security, the system is built on an IBM web server application and includes one-time password (OTP) system for two-factor authentication.
**Lessons learned:** Within one month of launch, 22 MSM and one TG were recruited online for HIV testing using the EHR. 65.4% were < 25 years, 46.2% were first time testers, 63.4% hid their sexual identity to family, friends or coworkers, 62.5% had used drugs in the past six months and 53.8% sometimes or never used condoms. All were HIV negative. All reported being very satisfied with their overall EHR experience, including the online consent and registration process, security and privacy aspects and appointment scheduling feature. Almost half (42.3%) revisited the EHR to check their post-test counseling summaries and lab results. However, there were initial technical difficulties with the OTP system due password delivery interruptions. These were addressed by troubleshooting directly with local mobile network operators and whitelisting internet protocol (IP) numbers. Other technical issues included inconsistent microphone or webcam function, and disruptions in live video chat due to slow Internet connections.
**Conclusions/Next steps:** EHR is an innovative intervention to engage young MSM and TG youth in online test and treat strategies. Longer-term data is being collected to demonstrate evidence across the use of EHR to improve health outcomes.

### THE IMPACT OF PATIENT-PROVIDER ATTACHMENT ON HIV-1 RNA PLASMA VIRAL LOAD SUPPRESSION AMONG PEOPLE LIVING WITH HIV/AIDS IN BRITISH COLUMBIA

L. Ti[1,2], B. Nosyk[1,3], Z. Cui[1], S. Jabbari[1], R. Barrios[1,4], J. Montaner[1,2]
*[1]British Columbia Centre for Excellence in HIV/AIDS, Vancouver, Canada, [2]University of British Columbia, Department of Medicine, Vancouver, Canada, [3]Simon Fraser University, Faculty of Health Sciences, Burnaby, Canada, [4]Vancouver Coastal Health Authority, Vancouver, Canada*
*Presenting author email: mintti@cfenet.ubc.ca*

**Background:** Previous studies have shown that continuity with healthcare providers can positively impact patient- and health system-related outcomes, including better adherence to medications and reduced healthcare costs. However, the literature is limited to common chronic conditions such as diabetes and congestive heart failure; the hypothesis has not been tested among people living with HIV/AIDS (PLHIV). The objective of this study is to examine whether patient-physician attachment can play a role in improving HIV treatment outcomes among PLHIV, in the interest of informing effective interventions and health system changes to meet the UNAIDS 90-90-90 target.
**Methods:** Using comprehensive linked population-level data, we included PLHIV in British Columbia following their first dispensation of highly active antiretroviral therapy (HAART). Generalized linear mixed effects regression models were constructed to determine the relationship between patient-provider attachment, defined as the percentage of HIV-related services provided by the physician who provides the most services in the calendar year and categorized into quartiles, and HIV-1 RNA plasma viral load (VL) suppression.
**Results:** Between 1996 and 2013, 6,228 individuals were included in the study; 980 (15.7%) were female and the median age was 42 years (Q1-Q3: 36-49 years). At baseline, the median patient-provider attachment was 83% (Q1-Q3: 60-100%) and 2,536 (40.7%) of individuals achieved VL suppression. In a multivariable model adjusted for various demographic, behavioural and clinical confounders, there was a positive association between patient-provider attachment and VL suppression when compared to 11-59% attachment: 60-82% attachment (adjusted odds ratio [AOR] = 1.52; 95% confidence interval: 1.34 - 1.72); 83-99% attachment (AOR = 1.29; 95%CI: 1.11 - 1.49); and 100% attachment (AOR = 1.48; 95%CI: 1.32 - 1.67).
**Conclusions:** In this study, we found that patients who had a higher level of attachment to their provider for HIV-related services were more likely to achieve VL suppression. However, the findings indicate that beyond having an attachment of 60%, there were no significant benefits in patients' HIV treatment outcomes. Our findings demonstrate that strong relationships between patients and their providers are needed to maximize VL suppression, which in turn will reduce HIV-related morbidity and mortality, and secondarily HIV transmission in this setting.

## THPEE508

### IMPROVING EARLY ENROLLMENT IN HIV CARE AMONG PERSONS DIAGNOSED IN COMMUNITY SETTINGS IN THE KINGDOM OF SWAZILAND: PRELIMINARY FINDINGS FROM COMMLINK, AN INTEGRATED HTC, MOBILE-HIV-CARE, AND LINKAGE-CASE-MANAGEMENT DEMONSTRATION PROJECT

D. Williams[1], B. Bhembe[2], D. MacKellar[1], M. Dlamini[2], S. Mlambo[2], J. Byrd[3], P. Preko[4], T. Ao[4], A. Auld[1], S. Mazibuko[5], P. Faura[2], C. Ryan[4]
*[1]U.S. Centers for Disease Control and Prevention, Division of Global HIV/AIDS and Tuberculosis, Atlanta, United States, [2]Population Services International Swaziland, Mbabane, Swaziland, [3]ICF Macro, Atlanta, United States, [4]U.S. Centers for Disease Control and Prevention, Country Office, Mbabane, Swaziland, [5]Swaziland Ministry of Health, National AIDS Programme, Mbabane, Swaziland*

**Background:** Two studies published in 2015 on 1,186 persons diagnosed with HIV in community settings in Swaziland estimate that only 14% and 26% enrolled in HIV care within 3- and 6-months of diagnosis, respectively. To improve early enrollment in HIV care, CommLink is a novel demonstration project that integrates community-based HIV testing and counseling (CBHTC) with mobile HIV care and linkage case management (LCM).
**Description:** Implemented in the Hhohho region of Swaziland, consenting HIV-positive, out-of-care clients identified through CBHTC receive in a mobile unit PIMA CD4 testing, baseline clinical assessment, sexually-transmitted-infection treatment if indicated, and a seven-day supply of cotrimoxazole. Medical charts and test results are transferred to referral HIV-care facilities. ART-adherent expert-client counselors provide LCM for up to 90 days. Services include first-visit escort and expedited care at referral facilities; regular telephone contact for psychosocial support; and face-to-face counseling on HIV care, disclosure, and partner/family-member HTC. Data on closed cases (clients completed or timed-out of LCM) were recorded on data-collection tools and analyzed using Excel.
**Lessons learned:** From June through December 2015, of 175 eligible clients, 167 (95.4%) consented to participate and 98 (58.7%) cases were closed. Of closed cases, most received clinical and LCM services, were escorted to or met at facilities, enrolled in HIV care, and were initiated on ART if eligible. Similar outcomes were achieved among men and women, and younger and older clients (table). Of 65 partners/family members tested, 15.4% were HIV-positive.

| Closed Cases | Total (n) | Comm Link CD4 Tested (%) | Comm Link WHO Staged (%) | ART Eligible (CD4 ≤ 350 and/or WHO stage III/IV)(n) | Cotrim-oxazole Provided by CommLink (%) | Comm Link Escorted or Met at Care Facility(%) | Enrolled in Care ≤ 90 days (%) | ART Initiated ≤ 90 days among eligible (%) |
|---|---|---|---|---|---|---|---|---|
| All | 98 | 83.7 | 82.7 | 35 | 85.7 | 88.8 | 90.8 | 94.3 |
| Sex: Male | 54 | 83.3 | 79.6 | 23 | 85.2 | 92.6 | 92.6 | 91.3 |
| Female | 44 | 84.1 | 86.4 | 12 | 86.4 | 84.1 | 88.6 | 100.0 |
| Age: <15 | 9 | 88.9 | 88.9 | 0 | 88.9 | 77.8 | 77.8 | - |
| 15-24 | 16 | 87.5 | 75.0 | 3 | 87.5 | 93.8 | 87.5 | 100.0 |
| 25-34 | 44 | 79.6 | 79.6 | 19 | 86.4 | 90.9 | 90.9 | 94.7 |
| >34 | 29 | 86.2 | 89.7 | 13 | 82.8 | 86.2 | 96.6 | 92.3 |

*[Preliminary Findings from CommLink]*

**Conclusions/Next steps:** Compared with standard referral services from recent studies in Swaziland, CommLink improves early enrollment in care among clients diagnosed in community settings and is a promising method to help similar programs achieve high rates of early enrollment in care. Next steps include scale-up to other regions of Swaziland and providing same-day ART initiation from mobile units (expected March 2016). Evaluation of the program's effect on retention in HIV care is also planned.

## THPEE509

### "BEING A FRIEND": A COMPREHENSIVE APPROACH TO ENGAGE MSM INTO HIV SERVICES

D. Thanh Tung
*Hai Dang Club (Lighthouse Club), Ha Noi, Vietnam*
*Presenting author email: thanhtung.was@gmail.com*

**Background:** Recently community-based organizations (CBO) outreach service targeting MSM in Vietnam has proved to be highly effective for improving MSM accessibility and acceptance of HIV/AIDS and sexual health services. However, in Hanoi such activities seem to be less effective than in HCM City. Stigma and discrimination constitute major barriers to essential HIV/AIDS and sexual health services among MSM in Hanoi, especially the young ones. With the supports from the Center for Community Health Research and Development - an implementing partner of the USAID Community Link for HIV Prevention project, the Lighthouse Club - a youth-led CBO of MSM in Hanoi - initiated "being a friend", an unconventional approach to address these barriers.
**Description:** The club is the first youth-led CBO focus on young MSM dare to change and develop a Facebook fanpage called Gtown and one of the first to reach MSM via social networks. Instead of traditional harm reduction and referrals services, the new initiative offered a comprehensive service package that cover broader but intimate aspects of MSM clients' needs such as STIs, psychological support, and vocational orientation. Social networks were used to increase out-reach magnitude. Also frequent dialogue with HIV service providers has been established to make health workers "friends" to MSM clients, thus improving their attitude and quality of services.
**Lessons learned:** After 12 months of operation, the club referred 309 MSM to HIV testing services in Hanoi, of which 15 or 5% detected HIV positive which is 2% higher than reported, and 80% of the detected cases received treatment. Moreover, 10 HIV public clinics have practiced MSM-friendly services and several hidden clients decided to disclose and join in club events promoting MSM health.
Comprehensive solutions that combine thorough understanding, meeting specific needs of clients and effective networking with service providers is what makes our services stand out.
**Conclusions/Next steps:** Risks of HIV infections among young MSM in Hanoi are higher than officially reported. This problem can be more effectively addressed if the MSM community takes proactive and innovative approach to assist the public and health facilities to develop more friendly and appropriate services for themselves.

## THPEE510

### THE SEXUAL AND REPRODUCTIVE HEALTH NEEDS OF ADOLESCENTS LIVING WITH HIV AND AIDS: TASO-RUKUNGIRI EXPERIENCE

C. Masereka[1,2]
*[1]Bishop Stuart University, Public Health, Kampala, Uganda, [2]The AIDS Support Organisation, Public Health, Kampala, Uganda*
*Presenting author email: mcol561@gmail.com*

**Background:** Many program design focus on pediatric or adult care without adequately addressing the needs of a growing segment of adolescents. Recent study finding shows that prenatally infected adolescents are sexually active, have poor preventive practices and strong desire to have children, yet fear of disclosing not only their sexual behavior and desires, but also pregnancies when they occur. TASO Rukungiri devised a strategy and established adolescent friendly services
**Methods:** In 2013 TASO-Rukungiri established adolescent friendly services with a focus on adolescent reproductive health. Three health workers and 3 counselors were trained on delivery of adolescent services, who then trained 30 adolescent peer educators across two age groups (10-14 and 15-24 years). The adolescent who had been trained supported the other adolescents in the need of adolescent reproductive health, adherence, positive living, and sharing experience as HIV positive and general sensitization about HIV issues.
**Results:** From September 2014 to March 2015, 60 male and 80 female were enrolled in the friendly adolescent clinic and trained. In this period there has been an increase in disclosure from 71 % to 91%, access to PMTCT for those choose to become pregnant from 4 to 20%, family planning from 10-40 % and cancer screening from 2- 45%. They further report a free environment to discuss their reproductive issues with their counselors and health service providers.
**Conclusions:** The training of peers, medical and counsellor in addressing the needs of adolescents is the way to go in addressing the sexual needs of the adolescents Friendly adolescent clinic is the way to go in order to address the reproductive health needs of the adolescents living with HIV and AIDS.

## THPEE511

### CONCEPTIONS OF AGENCY AND CONSTRAINT FOR HIV POSITIVE PATIENTS AND SERVICE PROVIDERS TO SUPPORT LONG-TERM ENGAGEMENT WITH ART CARE

E. Stern, C. Colvin, N. Gxabagxaba, C. Schultz, G. Meintjes
*University of Cape Town, Cape Town, South Africa*
*Presenting author email: cj.colvin@uct.ac.za*

**Background:** In the wake of the optimism around antiretroviral therapy (ART) as prevention, addressing the barriers to long-term ART adherence is critical. This is particularly important given the tendency to individualize or use a blame discourse to ascertain why HIV positive patients "fail" to adequately adhere to ART, and not sufficiently exploring contextual reasons for poor adherence that may require varying solutions.
**Methods:** Using a syndemics framework, this study took place at 3 clinics and 1 hospital in Khayelitsha, South Africa to document the contextual factors that challenged ART adherence in this community. Interviews were conducted with 19 HIV positive patients who had defaulted on ART and were admitted to Khayelitsha Hospital for clinical complications, and 9 ART service providers including doctors, nurses and HIV counsellors. Interviews assessed reasons patients defaulted on ART with the consequence of requiring hospitalization and explored ways this could be prevented. Data from both groups were analyzed collectively using thematic analysis.
**Results:** The interviews revealed a landscape of competing environmental risks with adhering to ART including patients' regular migration with the Eastern Cape province interrupting their treatment, and poverty hindering patients' access to food to take with ART and transport to attend clinics. Yet, all patients managed to overcome these contextual barriers at some point in their treatment phase indicating the fluidity of patients' needs and decision-making. Distrustful relationships with service providers could inhibit patients' understanding of ART, ability to seek support and/or interrupt their care. Patients also described more unfamiliar expressions of rationale and agency underlying non-adherence, such as carefully managing their CD4 count to not risk losing their disability grant, and testing their bodies' physical limits without ART medication.
**Conclusions:** The study speaks to the need to appreciate social and structural barriers related to ART adherence, and how these are negotiated by specific sub-groups including according to gender and age, to support an appropriate response. It is imperative to assess patients' subjective trajectory of their ART journey, decision-making and agency with adhering to ART, their relations with HCWs, and how these dynamics are intertwined with broader health systems and power constraints.

## THPEE512

### LINKAGE TO CARE FOR INDEX CLIENTS IN THE ASSISTED PARTNER SERVICES (APS), KENYA

B. Wamuti[1], M. Goyette[2], P. Macharia[3], K. Asbjornsdottir[2], B. Sambai[1], M. Dunbar[2], A. Ng'ang'a[3], P. Maingi[1], F. Abuna[1], B. Richardson[2], M. Golden[2], D. Bukusi[1], P. Cherutich[3], C. Farquhar[2]
*[1]Kenyatta National Hospital, Nairobi, Kenya, [2]University of Washington, Seattle, United States, [3]Ministry of Health, Nairobi, Kenya*
*Presenting author email: bwamuti@gmail.com*

**Background:** Early diagnosis and linkage to care of newly infected HIV seropositive individuals is critical for HIV suppression and improved life expectancy. Healthcare worker assisted partner services (APS) have been used to increase HIV case finding among individuals unaware of their HIV serostatus. We analyzed linkage to care among index cases that received APS.
**Methods:** Between August 2013 and September 2015, the APS Study, a cluster randomized clinical trial, was conducted in 18 HIV Counseling and Testing (HCT) facilities in Central and Western Kenya to evaluate the effectiveness of healthcare worker APS in augmenting linkage to care for HIV seropositive individuals and their sexual partners. The sites were divided equally into intervention sites (sexual partners notified immediately after index enrolment), and control sites (notification conducted 6 weeks after index enrolment). Linkage to care was defined as self-reported HIV Comprehensive Care Center (CCC) registration. We evaluated linkage to care for index clients at the 6 week follow-up visit.
**Results:** Of the 1760 clients approached to the study, 1119 (63.6%) were enrolled [female: 62%, median age: 30, married monogamous: 55%], 964 (86%) returned for the 6 week follow-up visit, with 473 (49%) in the immediate arm. 876 (91%) clients had ever registered at a CCC, 718 (74%) had blood drawn for CD4 count and 359 (37%) reported taking ART since study enrolment. Index clients in the immediate arm were more likely to enroll in HIV care by the 6 week visit (440/473, 93% versus 436/491, 88.8%; OR 1.69, 95% CI: 1.02 - 2.81) compared to those in the delayed arm. Among those who enrolled in HIV care during the first 6 weeks, the immediate and delayed arms had similar proportions of index clients receiving a CD4 blood draw (OR 1.24, 95% CI 0.63 - 2.46) and taking ART (OR 1.03, 95% CI 0.33 - 3.28).
**Conclusions:** In this Kenyan population, APS was associated with increased index client enrollment in HIV care, with no significant difference in CD4 blood draw or ART use. This linkage to care benefit of APS may be a result of active healthcare worker involvement in the follow-up of their sexual partners.
**Funding:** NIH R01-AI1099974

## THPEE513

### HIGH ACCEPTABILITY FOR WORKPLACE BASED HIV TESTING IN A CLOSED COMMUNITY OF FACTORY WORKERS IN PUNE, INDIA

J.S. Pawar[1], N. Jogalekar[2], N. Panchal[1], U. Gawade[1], S. Jadhav[1], S. Deshpande[2], C. Kadu[2], S. Goli[1], S. Ghule[1], S. Bembalkar[2], R. Gangakhedkar[1], S. Godbole[2]
*[1]National AIDS Research Institute, Clinical Sciences, Pune, India, [2]National AIDS Research Institute, Epidemiology, Pune, India*
*Presenting author email: jyotispawar.pawar@gmail.com*

**Background:** Migrant labourers have low access to health care and HIV-testing services (HTS).To make HIV test accessible, we tested a workplace intervention for a closed community of factory workers mostly living on premises in Pune, India.
**Methods:** A team of doctors, counsellors,nurses set up a temporary sample-collection facility on premises for HIV and Haemogram tests. An awareness talk was followed by invitation to avail HTS. HIV reports were provided individually in a nearby facility, with post-test counselling at which time views and attitudes about HIV-testing were assessed.
**Results:** Of 100 awareness lecture attendees, 81(mean age 29yrs) volunteered and underwent HIV-testing. HIV-test report could be given to 71 as10 participants returned to native place. While, only 18% reported having contemplated getting tested in past, 81% availed HTS. Peer motivation (90.4%), curiosity (63%), workplace testing opportunity (49%) were most cited reasons for HIV-testing. Only 16.7% showed willingness to share report at workplace while majority wanted to share report with family, physician and friends.
Attitudinal data summarized in graph below indicates high awareness about HIV, however negative attitudes about individual's rights for voluntary HIV-testing and rights to have a family.
**Conclusions:** High acceptability and low stigma, for workplace HIV-testing can be attributed to peer-motivation, curiosity and easy testing access. This seems to be a promising approach to achieve the first of the WHO 90-90-90 goal among migrants in Pune, India. Although group education was useful in retention of knowledge and some positive attitudes, it was inadequate to bring about attitudinal changes regarding family life of People Living with HIV/AIDS (PLHIV).

## THPEE514

### THE CHURCH WORKPLACE: A MISSED OPPORTUNITY FOR SCALING UP HIV RESPONSE

B.B. Dube
*Lutheran Communion in Southern Africa (LUCSA), HIV and AIDS Desk, Johannesburg, South Africa*
*Presenting author email: hivaidsofficer1@lucsa.org*

**Background:** Although faith leaders shape attitudes and behaviours around HIV and AIDS within society, little is known about current attitudes towards HIV and AIDS and risk behaviours among church employees in Southern Africa. A better understanding of attitudes and practices among church employees is needed to discern gaps and inform the design of effective faith-based interventions that model positive behaviours and reduce stigma.
**Description:** To ascertain attitudes and practices around HIV and AIDS among church employees in Southern Africa, a survey of 157 Lutheran lay-workers and clergy in three countries (Malawi, Mozambique, and Zimbabwe) was conducted during training workshops where all participants volunteered to respond to a set of questionnaires on knowledge, attitudes and practices on HIV and AIDS and the stigma index.
Purposive sampling was used to select a small group of church workers to participate in focus group discussions. Using a semi-structured focus group guide that covered the same areas as the questionnaire, 30 participants from the total sample (10 from each country, comprising men and women) participated in the discussion. The SPSS package was used to analyse data.
**Lessons learned:** Levels of risk behaviours were high among married middle-age/elderly employees where 43 (40%) of the survey respondents, all being males, reported having multiple concurrent sexual partners. Only 25 (20%) of survey questionnaire respondents and 18 (60%) of focus group participants reported regular condom use. Although more than 94 (60%) of all respondents reported that they would be comfortable working closely with PLHIV, 19 (20%) of these demonstrated attitudes of stigma (stating "they deserve it") toward PLHIV and people who identify as LGBTQI. More males than women admit to higher risk behaviour while a high percentage of the respondents including men and women revealed tendencies of discrimination.
**Conclusions/Next steps:** Church employees show high risk behaviours and still uphold attitudes of stigma towards people living with HIV. Intensifying HIV and AIDS programmes tailored to church workplaces is needed to target these gaps so that churches become an effective player in leading behaviour change and eliminating HIV and AIDS-related stigma.

## THPEE515

### A SCOPING ANALYSIS OF THE REFERRAL SYSTEM FOR HIV SERVICES IN TANZANIA

C.J. Mushi[1], C. de la Torre[2], W. Odek[3], M. Ntiro[4]
*[1]The Palladium Group, Moniotoring and Evaluation Unit, Dar es Salaam, Tanzania, United Republic of, [2]ICF International/MEASURE Evaluation, Rockville, United States, [3]The Palladium Group/MEASURE Evaluation, Dar es Salaam, Tanzania, United Republic of, [4]Ministry of Health, Community Development, Gender, Elderly and Children, Dar es Salaam, Tanzania, United Republic of*
*Presenting author email: charles.mushi@thepalladiumgroup.com*

**Background:** To achieve full continuum of care, HIV programs require strong linkages among prevention, testing, clinical care and social support services, which are often delivered by different providers working out of diverse locations that range from the community to tertiary hospitals. Referrals facilitate the movement of clients and the exchange of health information from provider to provider. MEASURE Evaluation's approach to strengthening referrals in Tanzania entails assessing the status of referral system, designing referral system monitoring guidance and establishing referral system monitoring as a priority at national and sub-national levels.
**Description:** In 2014, MEASURE Evaluation conducted document review and consultative meetings with several key informants to better understand the configuration and functionality of HIV referral systems at the national and sub-national levels in Tanzania. Key informants within the Ministry of Health, Community Development, Gender, Elderly and Children (MOHCDGEC) included technical teams from prevention of mother-to-child transmission (PMTCT), home-based care (HBC), HIV testing and counseling (HTC), and care and treatment (CT) programs, and from the Department of Social Welfare. We also interviewed monitoring and evaluation officers from implementing partner organizations working at the community and health facility levels. The key issues addressed were:
1) existence of national referral guidelines and tools for HIV programs;
2) mechanisms to support referral system monitoring at national and sub-national levels; and
3) configuration, status and functionality of the current referral system.
**Lessons learned:** The key informants noted that there are different national guidelines for each program area, such as HBC, PMTCT, CT, HTC, which discuss the importance of referrals, but many of the guidelines do not elaborate on coordination or implementation of referral system. Many referrals continue to be made verbally. Lack of mechanisms for referral monitoring, such as referral registers, tracking system, proper documentation of referrals made and completed, linkage between community and clinical services and lack of Quality Improvement (QI) teams affect the functionality of referral system.
**Conclusions/Next steps:** Without strong referral monitoring system at the national and sub-national levels, the functionality of referral system will not be effective. Referral performance indicators are required to improve the referral system.

## THPEE516

### REACHING KEY POPULATIONS IN URBAN SETTINGS THROUGH HOME-BASED HIV TESTING AND COUNSELING BY URBAN HEALTH EXTENSION PROFESSIONALS IN ETHIOPIA

Z.A. Geletu[1], M. Kowalski[2], A. Tesfaye[1], S. Umer[1]
*[1]John Snow, Inc, Addis Ababa, Ethiopia, [2]John Snow, Inc, Boston, United States*
*Presenting author email: zelalem.adugna@gmail.com*

**Background:** Home-based HIV testing and counseling (HBHTC) is a widely accepted strategy for countries seeking to expand HTC. It is widely believed that HBHTC addresses logistical barriers, increases access to needed services, and potentially reduces stigma.The USAID-funded, John Snow, Inc.- implemented Strengthening Ethiopia's Urban Health Program (SEUHP) provides HBHTC focused capacity building support such as materials development, training, and continuous quality improvement for urban health extension professionals (UHE-ps).
**Description:** In Ethiopia, although HBHTC has been offered as a component ofthe Urban Health Extension Program (UHEP) package of services, some Regional Health Bureaus were reluctant to include HBHTC in the service package because of concerns regarding the quality of services provided by UHE-Ps. SEUHP demonstrated the advantage of these professionals in expanding access to HTC at the household level to reach key population groups such as discordant couples, widows, pregnant women, and out-of-school youth.
**Lessons learned:** Between October 2013 and December 2015, UHE-psin 37 cities and towns counseled and tested **8,198** targeted members of these key populations. Of these, **75 (0.9%)** tested HIV positive and were linked to health facilities and other social service providers. After demonstrating the efficacy of this approach, HBHTC has been included in the UHEP service packages in all Ethiopian regions. Better identification of the target population, comprehensive mapping of local health and social service providers, developing guidelines for integrating HBHTC with other community-based health initiatives (such as TB), and developing supervision guidelines for UHE-ps are important next steps.
**Conclusions/Next steps:** In Ethiopia, the implementation of the UHEP created opportunities to expand access to HTC services. HBHTC is a less controlled and more complex intervention than facility-based HTC and the quality of HBHTC is therefore a concern. Key strategies to address quality issues in HBHTC such as proficiency testing, external quality assessment, and supervision systems should be in place. Further study is needed to better understand the level of the acceptance of HBHTC by the target population, their satisfaction with services provided, and the cost-effectiveness of HBHTC compared to facility-based testing. In addition, Ethiopia must develop a HBHTC policy to guide its proper planning and implementation.

## THPEE517

### RESULTS OF COMMUNITY-BASED RAPID HIV TESTING ON KAP IN MOLDOVA

L. Caraulan[1], L. Gherman[2], V. Slobozian[2]
[1]*Center for Health Policies and Studies, Chisinau, Moldova, Republic of,* [2]*Soros Foundation, Chisinau, Moldova, Republic of*

**Background:** Low uptake of HIV testing is one of key barriers in the HIV treatment cascade in Moldova. This operational research measured outcomes of community-based rapid testing on uptake of key affected population (KAP) with HIV testing and linkage to care.
**Methods:** Rapid saliva-based HIV testing and counseling was conducted by 14 community-based organizations (CBOs) in PWID, SW and MSM through outreach and community settings. People with preliminary positive test results were accompanied or referred to public facility for confirmatory HIV testing and linkage to HIV care.
**Results:** A total of 2,630 people from KAP received community-based rapid HIV tests during year 2015. Of the 2,630 tested, 95 (3.7%) had a preliminary positive HIV test result. From them 47 persons (49%) reached the public facility for confirmatory testing and 34 people (72%) were newly diagnosed with HIV and 8 people (17%) had already a known status, 5 (11%) had a negative result. Of the 34 newly diagnosed with HIV, 27 (80%) have a CD4 test. From the other 48 persons (51%) with preliminary positive HIV that did not reach the public facility in 2015, 18 (38%) declined confirmatory testing and 30 (62%) have immigrated internally or externally, went to prison or the information was missing. CBO continue work with each person towards its status confirmation and linkage to care.
Results highlighted main bottleneck in linkage between CBO and public health facility and determined efforts to improve the leakages in the HIV care continua.
**Conclusions:** Community based testing can efficiently reduce gaps in HIV testing and linkage to care of KAP. Continuous monitoring allows identifying bottlenecks and quality improvement and design interventions to further increase linkages between community-based prevention programs and public health providers.

## THPEE518

### DATA QUALITY ASSURANCE SYSTEM AS A TOOL TO IMPROVE CARE CONTINUUM IN CLINICAL PROGRAMS IN RUSSIA AND UKRAINE

A. Zakowicz[1], A. Chuykov[1], G. Tyapkin[2], I. Shumilova[3], D. Reijer[4], Z. Shabarova[1]
[1]*AHF Europe, Amsterdam, Netherlands,* [2]*AHF Ukraine, Odessa, Ukraine,* [3]*AHF Russia, Moscow, Russian Federation,* [4]*AIDS Healthcare Foundation, Nairobi, Kenya*
*Presenting author email: zoya.shabarova@aidshealth.org*

**Background:** Quality of data is considered to be one of the most important factors which determine the success of HIV care programs and patient outcomes. To monitor and evaluate programs and respond to the program challenges, Europe Bureau of AIDS Healthcare Foundation developed a data quality assurance system (DQA).
**Description:** DQA system consists of monthly reports, covering key issues related to patient flow and quality of services. Every month each doctor receives lists of patients who missed appointments without reason, lists of patients who have not had a CD4 or viral load test in the past six months, lists of active patients eligible but not on ART and lists of deceased patients where no reason for death has been documented. Within two weeks, clinics identify these patients , take actions to return lost patients into care and start eligible patients on ART or clarify reasons of death. The DQA system was implemented at 7 sites in Russia and 14 sites in Ukraine in the beginning of 2013.
**Lessons learned:** We compared performance of AHF-supported clinical programs in Russia and Ukraine in 2012 and 2015. HIV-related death rates decreased from 24.3/1000 in 2012 to 11.7/1000 in 2015 in Ukraine and from 16.7/1000 to 11.0/1000 for Russia. The lost-to-follow-up rate decreased from 5.5% to 0.6% in Russia, and from 2% to 0.1% in Ukraine. At the same time, antiretroviral coverage increased from 44% to 60% in Russia and from 67.3% to 81.2% in Ukraine. The number of eligible clients who had yet to initiate ART decreased from 22% out of all clients in 2012 to 8.3% in Russia, and from 8% to 2.7% in Ukraine. Mean CD4 counts at initiation increased from 228 cells/mcl in 2012 to 344 in 2015 in Russia, and from 183 to 263 in Ukraine.
**Conclusions/Next steps:** Development and implementation of DQA system greatly improved patient outcomes and performance of clinical programs in Russia and Ukraine. Thorough data quality assurance should be performed at every HIV care facility and wider use of DQA system across Eastern Europe should be implemented.

## THPEE519

### EFFECTIVENESS OF A MONETARY INCENTIVE ON GENERAL PRACTITIONERS' BEHAVIOUR OF PROMOTING HIV TESTING FOR PREGNANT WOMEN IN THE PRIVATE SECTOR

S. Adams[1], B. Van Wyk[2]
[1]*University of the Western Cape, School of Public Health, Bellville, South Africa,*
[2]*University of the Western Cape, School of Public Health, Panorama, South Africa*
*Presenting author email: bvanwyk@uwc.ac.za*

**Background:** Early HIV testing is a crucial step for pregnant women in preventing mother-to-child transmission of HIV. In the public sector nearly all pregnant women presenting at antenatal clinics are screened for HIV. However, according to a large medical-aid administrator in South Africa, only 21.96% of pregnant women on their medical aid claimed for an HIV test as part of their antenatal care in 2012. Previous studies indicate that monetary incentives over and above the negotiated rate may motivate health providers to promote screening to patients, and this may lead to increases in the uptake of testing.
**Methods:** A quasi-experimental, 'before and after' study design, was conducted among 2,934 general practitioners who managed pregnant women on medical aid. Data was extracted from the billing system of a private medical insurance company in South Africa. The effectiveness of the intervention was assessed by comparing uptake of HIV testing in the pre intervention period between April 2011 and September 2012, and post intervention period between March 2013 and August 2014. A subgroup analysis was done to determine variations in the outcome measures, by practitioner and patient characteristics.
**Results:** There was no statistically significant difference in HIV testing by general practitioners in this network pre and post the intervention. Compared to general practitioners aged 25-44 years, those practitioners older than 65 years old were 13% less likely to test (OR 0.87, CI: 0.74-1.01) and those between 45 and 65 years were 9% less likely to do an HIV test (OR 0.91, CI: 0.85-0.98). This study found that as patients' age increased, they were more likely to be tested: beneficiaries aged 35- 44 years were 15% more likely to be tested compared to beneficiaries aged 15-24 years (OR 1.15, CI: 1.1-1.21).
Medium income beneficiaries were more likely to be tested compared to low income beneficiaries (OR 1.09, CI: 1.03-1.16) and beneficiaries from the "high income" scheme grouping were less likely to be tested (OR 0.87, CI: 0.82-0.92) compared to the low income scheme grouping.
**Conclusions:** General practitioners' behaviour to comply with clinical guidelines and best practice, has no association with the presence of financial incentives.

## THPEE520

### INTERVENTIONS TO INCREASE UPTAKE, RETENTION AND ADHERENCE TO HIV SERVICES: A CASE OF THE AUTOMOTIVE AND AGRICULTURE SECTOR IN THE EASTERN CAPE PROVINCE

T. Mazorodze[1], A. Heynes[2], N. Mcoyi[2], B. Domke[2]
[1]*Automotive Industry Development Centre, Wellness Department, Port Elizabeth, South Africa,* [2]*AIDC EC, Wellness Department, Port Elizabeth, South Africa*
*Presenting author email: aheynes@aidcec.co.za*

**Background:** While there has been massive investments aimed at combating HIV&AIDS in South Africa, a little has been done to develop interventions that can increase uptake, retention and adherence to HIV services especially at a time when South Africa recently adopted the new UNAIDS strategy code named 90-90-90 aimed at achieving an AIDS free generation by year 2020. This study presents the success story of the Automotive Industry Development Centre Eastern Cape (AIDC EC) wellness programme in achieving high HCT uptake in the automotive and agriculture sector in the Eastern Cape province.
**Description:** The AIDC EC Wellness management programme, with a specific focus on HIV & AIDS, is targeted at employees working in the automotive industry in Nelson Mandela Bay as well as citrus farm workers within the Sarah Baartman district (previously known as Cacadu district) in Eastern Cape Province. The programme offers baseline assessments such as situational assessments, cost benefit analysis, KAPB surveys and health risk assessments such as HIV Counselling and testing, Blood pressure assessment, Glucose, TB Risk assessment and Body Mass Index.
**Lessons learned:** Based on the Information Motivation Behavioral skills (IMB) model, the programme has, since 2009, through its tailored, culturally competent behavioural interventions achieved an average HCT uptake of 85% in the automotive and 70% in the agriculture sector. Using behavioural interventions such as facilitated screenings, educational theatre, posters and peer educator training sessions, the AIDC EC wellness programme has reached approximately 5000 employees in the automotive and agriculture sector since its inception. Results from the wellness drives shows that HIV prevalence is high in the Agriculture sector (22%) as compared to the automotive sector (6%). Employees who tested positive were referred to nurses and social workers for further counseling, care support. To ensure sustainability of the programme, a follow-up study is often conducted to ascertain what happens after employees test positive.

**Conclusions/Next steps:** The success of the AIDC EC wellness programme provides evidence that behavioural models are an effective way of increasing HCT uptake, retention and adherence to HIV Services.

## Interventions to enhance uptake of HIV prevention interventions e.g. voluntary medical male circumcision, condom use, pre-exposure prophylaxis (PrEP) use, post-exposure prophylaxis (PEP) use

### THPEE521

### Expanding access to HIV post exposure prophylaxis (PEP) in Brazil

J. Toledo[1], M. Freitas[2], H. Barroso Bernal[2], J. Uesono[2], A.R.P. Pascom[2], A.S. Benzaken[2], F.C. Mesquita[2]
*[1]Ministry of Health of Brazil, HIV/AIDS, STI and Viral Hepatitis Department, Brasilia, Brazil, [2]Ministry of Health of Brazil, HIV/AIDS and Viral Hepatitis Program, Brasilia, Brazil*
*Presenting author email: joao.toledo@aids.gov.br*

**Background:** By 2014, Brazilian recommendations on PEP were available in four different protocols: occupational exposure, occasional sexual exposure, sexual violence and reproductive planning. Different ARV regimens were recommended in each of these protocols, in an individual approach, making them difficult to be followed by general practitioners in non-referral centers. This approach raised two major issues: (1) unawareness of PEP as preventive method for HIV; and (2) lack of ARV prescription resulting from prejudice or moral judgment in cases of sexual exposure. We present a strategy to expand access to PEP in Brazil, analyzing trends in PEP prescription following the release of a new protocol.
**Description:** The new PEP protocol was released in July 2015 bringing new approaches: (1) consolidation of PEP protocols into one single protocol; (2) PEP procedures based on algorithms; (3) one single preferred ARV regimen; (4) the use of PEP in emergency rooms; (5) reduced time of follow-up; and (6) focus on the feasibility of prescribing PEP in any healthcare facility, by any physician, regardless of previous experience.
**Lessons learned:** Simplifying ARV recommendations for PEP has increased the use of this technology. Between 2014 and 2015, there was a 50,9% increase in PEP prescription. Moreover, there were more than a two-fold increase in use of ARV in cases of occasional sexual exposure in 2015 (18,559) when compared to 2014 (7,912). The preferred ARV regimen (tenofovir/lamivudine/atazanavir/ritonavir), which had never been prescribed for PEP before the publication of the new guidelines, was the most prescribed regimen in 2015: 37,3% (6,919) of all regimens used.
**Conclusions/Next steps:** Brazil's new approach on PEP showed outstanding results, mainly on expanding access to this technology. A consolidated protocol, an algorithm-based PEP procedure, one single preferred ARV regimen and focus on prescription by non-specialized professionals have led to the greatest increase in PEP use in the history of Brazil's public health system.

### THPEE522

### Impact of mass media initiatives on HIV prevention among young people: a case for Straight Talk Foundation (STF), Uganda

R. Imakit[1], S. Ajok[2], D. Talima[2], A. Namakula[2]
*[1]Straight Talk Foundation, Research and Evaluation, Kampala, Uganda, [2]Straight Talk Foundation, Kampala, Uganda*
*Presenting author email: sajok@straighttalkfoundation.org*

**Background:** The impact of mass media initiatives on HIV prevention among young people is debatable. In 2004, the UNAIDS Inter-Agency Task Team on Young People decided that timely review of progress and evidence for the effectiveness of interventions, focusing explicitly on interventions to prevent the spread of HIV among young people in developing countries was paramount. STF aimed at finding out if adolescents who are exposed to mass media interventions practice more safe behaviors than those who are not exposed.
**Methods:** A cross-sectional descriptive and analytical study design utilizing both qualitative and quantitative methods was employed. The study took place in 7 rural districts where a structured questionnaire was used to collect data. 1,189 young people aged 10-25 participated in the study. Data was entered using EPIDATA and later exported to SPSS version 19 for analysis. Bivariate and multivariate analysis was conducted. Consent and assent was obtained; ethical clearance sought from Uganda National Council for Science and Technology (UNCST).
**Results:** 70.4% of young people were exposed to at least 1 mass media intervention while 39.6% were unexposed. Results show that there is a relationship between the intervention exposure and age; sex; and school status (all p-values <0.05). Young people who were exposed to any interventions were 1.5 times more likely to mention that a person looking healthy can still be infected with HIV /AIDS (p-value=0.016 (aOR=1.5). Young people exposed to some intervention were more likely to have more sexual partners, though were also twice as likely to have used a condom at their last sexual intercourse (p-value=0.001; aOR=2.4). At p-value=0.000 and aOR=2.9, exposed young people were three times more likely to have ever visited a health facility for SRH/HIV services. Exposed young people were two times likely to have tested for HIV (aOR=2.2, p=000). Young people with multiple exposure were almost five times as likely to report taking a decision to get circumcised so as to prevent HIV (p-value=0.000 (aOR=4.7).
**Conclusions:** Consistent and intensive exposure to mass media interventions increases uptake of SRH/HIV prevention services such as HIV counseling and testing, condom use, as well as safe medical male circumcision.

### THPEE523

### Age, geo-spatial location and planned sexual encounters influence microbicide use: experiences with women in KwaZulu-Natal, South Africa

E. Govender[1], L.E. Mansoor[1], Q. Abdool Karim[1,2]
*[1]Centre for the AIDS Programme of Research in South Africa (CAPRISA), Durban, South Africa, [2]Columbia University, Department of Epidemiology, New York City, United States*
*Presenting author email: eliza.govender@caprisa.org*

**Background:** Young women bear a disproportionately high burden of HIV infection in sub-Saharan Africa, prioritizing pre-exposure prophylaxis (PrEP) as an integral part of HIV prevention combination strategies. Women initiated HIV prevention technology options require consistent adherence which is imperative for product effectiveness. With several PrEP clinical trials underway; exploring the user profiles, enablers and barriers to various product uptake, and development of a user-informed product identity; ensures the effective implementation of HIV prevention technologies during PrEP roll out.
**Methods:** This study utilized the opportunity of post-trial access to tenofovir gel for the CAPRISA 004 women (trial) and non-trial women from three geo-spatial settings (urban, rural and semi-urban) to identify the profile of women most likely to use HIV prevention technologies, understand what influences user choices and how this contributes to the development of a brand identity that is culturally relevant and context specific. Six participatory workshops using participatory action research with art-based activities and discussion groups were conducted in KwaZulu-Natal with 104 women from diverse age groups, geo-spatial locations and; social status to understand product needs and positioning of the product for future PrEP roll out. The data was analysed using thematic analysis to understand women's choices.
**Results:** The study found that women's acceptability of PrEP, and their description of how the product represents them differed according in rural and urban areas. Most urban women identified confidence, sexiness and classy as an indicator of how they would like to brand PrEP, while rural women focused on highlighting that the use of PrEP indicates respect, responsibility and confidence. Urban-rural differences in responses suggest a market segmentation for promoting HIV prevention technologies that is contextually specific, culturally relevant and locally responsive. Majority of urban and rural women in the study correlated adolescent sexual activity as an indicator of product readiness. Various sexual encounters further determined the types of HIV prevention technologies women would consider.
**Conclusions:** In line with WHO's recommendation that PrEP should be an additional prevention choice for people at risk of HIV, this study underscores the importance of user participation in pre-& post clinical trial setting for the promotion of HIV prevention technologies.

## Interventions to improve adherence to treatment and prevention behaviours and technologies

### THPEE524

### The effect of engagement in economic strengthening interventions on ART adherence in Ethiopia

T. Bezabih
*World Food Programme, Programme, Addis Ababa, Ethiopia*
*Presenting author email: tsegazeab.bezabih@gmail.com*

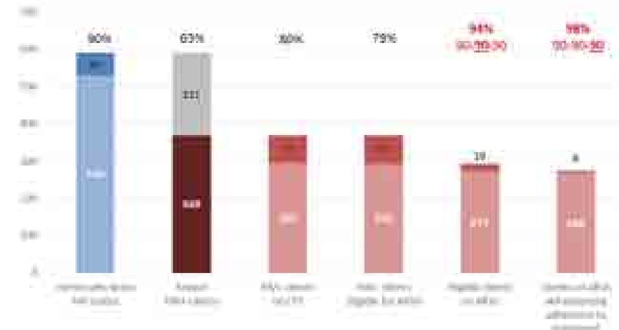
**Background:** Economic strengthening (ES) interventions are increasingly promoted to support the economic well-being and food security of people living with HIV (PLHIV) in resource poor settings. However, little is known about the contribution of engagement in ES activities on their antiretroviral treatment (ART) adherence. This study aims to assess the impact of ES interventions in Ethiopia designed to address poverty and food insecurity on treatment adherence.
**Methods:** Comparative cross-sectional design was employed to compare food insecure PLHIV benefitting from the ES project of WFP Ethiopia to food insecure PLHIV not participating in ES. The study covered a total of 1240 food insecure PLHIV in both groups identified using a set of criteria. In this study, two approaches, namely, Visual Analogue Scale (VAS) and AIDS Clinical Trials Group (ACTG) questionnaire were employed to measure ART adherence.
**Results:** Using the VAS approach to measure ART adherence, 9.9 percent of the ES group and 25.9 of the comparison group reported taking the medication below the standard requirements, which is a 95% adherence level. The proportion that reported poor ART adherence (below 85%) was 5.1 percent among the ES group and 16 percent among the comparison group (P=0,000). Applying the ACTG approach, which measures ART adherence by the number of pills taken out of the total prescribed in the last four days before the survey, the adherence level of 98.6 percent of the ES group was reported to be 'good'. The corresponding figure for the comparison group was 86.7 percent. Controlling for socio-economic and demographic variables using logistic regression models, engagement in ES activities increases the likelihood of having good ART adherence by a factor of 2.4 and 5.6 respectively (as measured by VAS and ACTG approaches) compared to those PLHIV that are not engaged in ES.
**Conclusions:** The findings of the study consistently suggest that one's engagement in ES contributes for improvement of ART adherence among food insecure PLHIV. If further studies validate this result, ES should be taken as key strategy to improve HIV treatment adherence in resource poor settings where adherence is an issue of concern.

### THPEE525

### Improving access to care to achieve the UNAIDS 90-90-90 treatment targets in rural Malawi: lessons learned from the Global AIDS Interfaith Alliance (GAIA) village based follow-up program for HIV+ individuals

A. Bvumbwe[1], E. Schell[2,3], J. Jere[1], E. Geoffroy[2], T. Schafer[2], K. Kabwere[4], J. Goldman[5]
*[1]Global AIDS Interfaith Alliance, Limbe, Malawi, [2]Global AIDS Interfaith Alliance, San Rafael, United States, [3]University of California, San Francisco, United States, [4]Mulanje District Health Office, Mulanje, Malawi, [5]Elizabeth Taylor AIDS Foundation, Beverly Hills, United States*
*Presenting author email: eschell@thegaia.org*

**Background:** To reach the ambitious UNAIDS 90-90-90 treatment targets, programs must focus on the hardest-to-reach populations lacking access to comprehensive treatment and care services, such as those living in remote, rural, high HIV prevalence areas in Malawi. Currently 95% of HIV service delivery in Malawi is facility based, far from many villagers.
To reach the 90-90-90 targets it is estimated that 30% of all services should be delivered in the community. GAIA's Elizabeth Taylor Mobile Clinics, operating since 2008, have helped fill the testing gap, but follow-up for initiation on treatment and adherence support remains challenging.
**Description:** In January 2014, GAIA initiated a Follow-up Nurse Coordinator (F/C) Program for clinic clients, primarily those testing HIV-postive. Nurses travel by motorbike to client homes to connect them to care. They encourage clients to seek confirmatory testing, evaluation for treatment initiation and treatment adherence. The F/Cs provide patient education and encourage adherence to treatment regimens as patients move along the treatment cascade until stable on antiretroviral therapy (ART).
**Lessons learned:** Outcomes for 590 clients to date: 64% remain in care, 26% were discharged from the program stable with health improving, 3% died, 2% opted out of care and 4% were lost to follow-up. Of the 79% of clients eligible for treatment according to the WHO treatment guidelines for resource limited settings, 94% were on ART and 98% were self-reporting adherence to treatment. Seventy-four percent of all HIV clients were on ART regardless of eligibility compared with a national estimate of 49% on ART.



*[GAIA Follow-up Nurse Coordinator Client Outcomes]*

**Conclusions/Next steps:** F/Cs dedication to serve remote populations fosters trust with communities and improves ART initiation and treatment retention. The coordinators identified important HIV care and treatment program gaps to be included in future iterations, including nutritional support, support groups, and ART adherence clubs for HIV+ individuals in impoverished villages.

### THPEE526

### How to best reach adolescents who use drugs and increase service demand among them: lessons learnt from the Bridging the Gaps programme in Ukraine

A. Shebardina, K. Maksymenko
*AIDS Foundation East-West, Programme Department, Kiev, Ukraine*
*Presenting author email: anastasiya.shebardina@afew.org.ua*

**Background:** Reaching young key populations with effective HIV/STI prevention is crucial for curbing the growth of the HIV epidemic. According to UNICEF (2011) in Ukraine young people who injectdrugs (PWID) have higher risk of HIV-infection, STI, Hepatitis B, C due to their risky behaviour (33%). 12% of all PWID began injection drug use under the age of 15, and 72% under 18.years old. Only 24% of adolescent PWID are reached by prevention programmes. The study conducted within the programme "Bridging the Gaps: Health and Rights for Key Populations" funded by the Ministry of Foreign Affairs of the Netherlands, aimed to identifying effective interventions that contribute to reaching adolescents who use drugs and improving their adherence to HIV/STI prevention efforts.
**Methods:** Information was collected in four cities in Ukraine among 85 young drug users aged 14-19 years and 24 local service providers.11 group discussions were held with clients who received services at least once a week (25 girls and 36 boys), and 24 individual semi-structured interviews were conducted with clients who had dropped out of the programme (12 girls and 12 boys). Descriptive analysis was done for every intervention followed by comparative analysis.
**Results:** Adherence to programme is determined by the way clients got initial access to services. Voluntary applying for services seemed to guarantee better adherence, but was more difficult to accomplish since it requires significant effort to reach and engage young drug users. Clients who were referred by governmental authorities faced difficulties in building trust with social workers and psychologists from HIV-service NGOs. Barriers to access and adherence included stigma and discrimination, lack of service providers' knowledge in addressing violence, lack of knowledge on sexual and reproductive health issues and services available for young people.
**Conclusions:** Abuse, stigma and discrimination that adolescents experienced from service providers negatively impact service demand. It can be increased if clients are involved in the decision making regarding programme activities and engage in more active participation as volunteers. More capacity building is needed to address stigma and discrimination among service providers, including police, probation, education and social service agencies staff.

## THPEE527

### FACILITY-BASED STRATEGIES FOR ENHANCING RETENTION AND ADHERENCE AMONG PEOPLE WITH HIV AND AIDS IN MALAWI: THE EXPERT CLIENT MODEL OF CARE

A.I. Chibwana[1,2], A. Mateyu[1], G. Mateyu[1], V. Vanschoor[1], I. Mayuni[1], G. Sankhulani[1], A. Matengeni[1], J. Msonkho[1], J. Van Oosterhout[1], F. Caltado[3], A. Chan[3], D. Garone[3,4]
*[1]Dignitas International, Medical, Zomba, Malawi, [2]College of Medicine, Malaria Alert Centre, Community Health, Blantyre, Malawi, [3]Dignitas International, Medical, Toronto, Canada, [4]Medicins Sans Frontieres, Medical, Brussels, Belgium*
*Presenting author email: alinafechibwana@gmail.com*

**Background:** In settings with high HIV burden and shortages of health staff, task-shifting strategies have used lay health workers to enhance retention in care and adherence to ART. While it is well accepted that patients derive benefits from peer support, there is limited recognition of the increasing role of lay health workers in Malawi.
**Description:** Dignitas International and the Malawi Ministry of Health have scaled-up an Expert Client (EC) program in 106 health facilities in the South Eastern region of Malawi after a pilot phase at Zomba Central Hospital. ECs are HIV positive individuals who are open about their status and are trained in providing psychosocial support, health promotion and defaulter tracing. They work in ART-PMTCT and Under 5 clinics and receive remuneration as lay health workers. Between August 2014 and December 2015, 328 ECs were enrolled. Routinely collected program data from 106 health facilities from August 2014 to December 2015 was used to explore the role of ECs in HIV service delivery.
**Lessons learned:** ECs reached 675,405 patients with health promotion messages, weighed 231,878 patients, and screened 56,069 children's nutritional status. Out of 1,070 defaulters identified by ECs, 802 (75%) returned into care, 98 (9%) were not found, 107 (10%) were on ART in other facilities and 63 (6%) were deceased. ECs gave psychosocial support to 362,458 individuals of whom 47,997 were Option B+ women and followed-up 6,813 PMTCT women and 7,000 HIV-exposed babies in their homes. Challenges in the program included dissatisfaction with low remuneration, continuing need of mentoring and training of an increasingly large workforce, false identity of ART patients and unofficial transfers making follow ups difficult. ECs offered a remarkable range of support to patients and relieved the burden of formal health workers by performing health promotion, defaulter tracing and simple medical tasks.
**Conclusions/Next steps:** A Further evaluation is needed of the contribution of ECs to reaching the 90-90-90 UNAIDS targets and how this compare to other types of lay-health workers, also in terms of cost-effectiveness. A more formal inclusion of ECs in the health care structure needs to be considered and prioritized in Malawi.

## THPEE528

### IMPROVING ADHERENCE TO HIV CARE AND TREATMENT WITH CONDITIONAL CASH TRANSFERS IN A CARIBBEAN MIDDLE-INCOME COUNTRY

Z. Miller[1], K. Sutherland[2], G. Barrow[3,4], N. Skyers[3], I. Thame[2], Q. Nguyen[2]
*[1]Ministry of Health, Jamaica, Monitoring & Evaluation Unit, St Andrew, Jamaica, [2]Clinton Health Access Initiative, St. Andrew, Jamaica, [3]Ministry of Health, Jamaica, HIV/STI/Tb Unit, St Andrew, Jamaica, [4]University Hospital of the West Indies, Centre for HIV/AIDS Research, Education and Services (CHARES), St. Andrew, Jamaica*
*Presenting author email: nailah82@gmail.com*

**Background:** Conditional cash transfers (CCTs) have proven to be a powerful intervention with potential to improve adherence to care for PLHIV. Despite success in increasing free access to care, this intervention was considered for Jamaica as adherence remains a major challenge. Assessments of missed appointments highlighted financial constraints thus leading to implementation of new structural approaches to address economic barriers to care.
**Description:** The project sought to pilot a CCT programme to affect behaviour change by improved adherence to HIV/AIDS care. The targets were to enroll 100 PLHIV susceptible to inconsistent and low clinic attendance who were assessed to need financial assistance (to ensure that those most in need were enrolled), and that 70% of intended appointments would be kept. Other elements of enrollment included transfer from a nearby large site to one of three smaller sites facilitating shorter wait period times and increased opportunity for monitoring. Conditions for disbursements over 12-months included on time doctor's visits, diagnostic tests, prescription refills and counselling sessions.
Despite over 2,500 active PLHIV from referral sites, uptake was slow and recruitment of 100 persons took 9 months, even though eligible clients who expressed dissatisfaction with the service at the large clinics were actively targetted. Furthermore, throughout the programme, counselling sessions had to be added as eligible for disbursements; and in spite of rewarding different elements of care, 10 participants (10%) became LTFU, 8 who never attended any of their appointments.
**Lessons learned:** Targets were achieved - 100 participants enrolled and over 70% completed all 4 doctor's visit, 4 counselling sessions, 2 CD4 tests and 2 VL tests - affirming that CCTs can work. However, implementation challenges suggest that financial need was not necessarily the main factor hindering adherence. This was reinforced in the programme delivery which became more than just financial disbursements as workers also intensified participant follow-up, making it difficult to primarily credit the socioeconomic support for its success.
**Conclusions/Next steps:** Further monitoring is needed to establish if participants continue to adhere to treatment without CCTs, and if viral suppression among those on ART was achieved. Consideration must also be given to mechanisms to strengthen and/or prioritize individual follow-up.

## THPEE529

### IMPROVING ADHERENCE TO TREATMENT AND PATIENT SAFETY BY IMPLEMENTING AN HIV/TB ACTIVE SURVEILLANCE SYSTEM IN SWAZILAND

K. Kunene[1], K. Matshotyana[1], F. Bhembe[2], N. Shongwe[2]
*[1]Management Sciences for Health, Systems for Improved Access to Pharmaceuticals and Services, Mbabane, Swaziland, [2]Ministry of Health, Mbabane, Swaziland*
*Presenting author email: kkunene@msh.org*

**Background:** Burdened with an HIV prevalence of 26%, a TB incidence rate of 1,350 per 100,000, and an HIV/TB co-infection rate of more than 80%, Swaziland has mounted a forceful response, focusing on high-impact interventions, including placing over 80% of people living with HIV on treatment. The high number of people on antiretrovirals (ARVs) and the toxicity associated with these medicines accentuate the need to monitor and manage their adverse drug reactions (ADRs) for improved patient safety and adherence. Timely and effective management of ADRs reduces the ill effects experienced by patients that may lead to non-adherence.
**Description:** The Ministry of Health, with support from the USAID-funded Systems for Improved Access to Pharmaceuticals and Services (SIAPS) Program, established an HIV/TB active surveillance system to improve ADR management and inform decision making. The two-year prospective observational cohort study was introduced at five pilot hospitals providing HIV/TB services. The process included:
· Developing protocols and tools, including an electronic pharmacovigilance (PV) database
· Training health care professionals
· Clinicians enrolling treatment-naïve HIV patients and TB patients starting a new regimen (and monitored their ADRs for an initial period of two years).
· Monthly data collection, analysis, causality assessment, and supportive supervisory visits
· Developing a quarterly newsletter to disseminate PV data and share latest knowledge
**Lessons learned:** There are presently 3,031 patients enrolled in the active surveillance system (from June 2013-December 2015) (52% females and 48% males) with 1,136 ADRs reported, of which gastrointestinal effects (19%) and peripheral neuropathy (17%) are the most common, with nephrotoxicity, hepatotoxicity, and ototoxicity being the most severe. The evidence from the active surveillance activity supported the subsequent expansion of the system to three more facilities in May 2015, and active surveillance of ADRs for patients on ARVs has been adopted as part of the standard of care.
**Conclusions/Next steps:** Swaziland has effectively established an integrated PV system to reduce the risks associated with ADRs. The findings have been used to inform the revision of treatment guidelines and develop job aids for health professionals and patients to facilitate early identification and management of ADRs to promote patient safety and adherence.

## THPEE530

### APPLICATION OF TOOLS FROM MARKETING RESEARCH, DESIGN THINKING, AND BEHAVIORAL PRIMING TO UNDERSTAND VARIATION IN PATIENT EXPERIENCES AND OPPORTUNITIES FOR IMPROVING ADHERENCE AMONG ADULTS LIVING WITH HIV IN TANZANIA

A. Rao[1], P. Njau[2,3], A. Mnyippembe[3], K. Hassan[3], N. Czaicki[1], N. Kapologwe[4], S. Bautista-Arredondo[5], S.I. McCoy[1]
*[1]University of California, Berkeley, Berkeley, United States, [2]Ministry of Health and Social Welfare, Dar es Salaam, Tanzania, United Republic of, [3]Health for a Prosperous Nation, Dar es Salaam, Tanzania, United Republic of, [4]Regional Medical Office, Shinyanga, Tanzania, United Republic of, [5]Instituto Nacional de Salud Pública (INSP), Cuernavaca, Mexico*
*Presenting author email: smccoy@berkeley.edu*

**Background:** Traditional approaches to improving HIV treatment adherence rely on the perspective of clinicians and policymakers. To better understand the patient experience and aspects of daily life that influence adherence, we applied an empathy-

based approach by adapting tools from marketing research and design thinking. We aimed to identify and assess latent factors influencing treatment adherence among adults living with HIV infection and tie intervention development directly to the patient experience. The ultimate goal was to develop and evaluate an intervention incorporating concepts from behavioral priming, which is when a stimulus indirectly influences behavior.

**Description:** At two HIV primary clinics in Shinyanga, Tanzania, we used four steps from design thinking: watch, listen, map, and test. This process included disciplined clinic and household observations, in-depth semi-structured and photo-based interviews, an approach to brainstorming to avoid group-think, focus groups for feedback on iterative intervention designs, and journey mapping. This process excited patients, engaged health staff, and raised fresh insights.

**Lessons learned:** We identified five 'patient segments,' an idea derived from the concept of customer segments, which describe perception of health, risk factors for poor adherence, and potentially successful interventions. For example, the "Big Picture Thinker" segment is motivated to stay healthy by their personal goals such as supporting their families. Ideal interventions for this segment should praise personal commitment and underscore treatment's role in maintaining health. In contrast, the "No Tomorrows" segment is typically younger, asymptomatic, and primarily motivated by pressing social aspirations such as marriage. Ideal interventions for this segment are discreet, support immediate goals, and impart a long-term perspective. We created corresponding "journey maps" for each segment to represent stages in the treatment experience that influence adherence. These maps guide when and how to support each group.

**Conclusions/Next steps:** The use of patient-centered tools to guide innovation is new in the HIV context. These tools are rooted in empathy, place the patient at the center of ideation, and can help identify user-specific insights related to preferences, motivation, and barriers in order to change attitudes or behavior. We used these tools to develop and refine interventions using behavioral priming, whose effectiveness we are evaluating in an ongoing study.

## THPEE531

### SAVINGS GROUPS: A CATALYST TO ENHANCE RETENTION ON CARE FOR WOMEN ON ART IN LOW-INCOME COMMUNITIES OF KITWE, ZAMBIA

P.C. Kambole[1], M. Tembo[2]
*[1]Prolife Advancement and Education Partners (PLAEP), Management, Kitwe, Zambia, [2]Prolife Advancement and Education Partners (PLAEP), Kitwe, Zambia*
*Presenting author email: priscakambole@gmail.com*

**Background:** Economic vulnerability has been documented as one of the key drivers of HIV infection in Zambia particularly for women and girls. HIV prevalence in Kitwe stands at over 20%. Prolife Advancement and Education Partners (PLAEP), a grass root faith based organization with support from USAID through the Zambia Led Prevention Initiative and the Positive Action Children Fund (PACF), has facilitated formation and operation of savings groups. At the end of 2015, over 500 women were members of the savings groups and saving consistently. Each group has at least 20% members who are HIV+. Savings groups have not only contributed to quantitative benefits such as increased incomes and improved nutritional status but also qualitative benefits such as improved assertiveness and discipline that has resulted in improved adherence to ART.

**Description:** PLAEP trained and deployed community volunteers resident in the target communities to monitor the weekly operations of the savings groups. The community volunteers collect information from the groups on their savings, lending and membership status of the groups. HIV+ members periodically volunteer to provide motivation and encouragement to new group members and new groups that are formed. As the economic status improved, the HIV+ members improved in self esteem. They became more open about their HIV status with other group members. Furthermore, the discipline developed in saving, borrowing and returning the borrowed funds has resulted in positive attitude in the uptake of ART.

The table below demonstrates the increase in the number of savings groups, their savings and the number of HIV+ women adhering to treatment and sharing their status with other women over a period of 4 years.

| Description | 2012 | 2013 | 2014 | 2015 |
|---|---|---|---|---|
| Number of Savings Groups(SGs) Formed | 2 | 4 | 11 | 26 |
| Number of women in the SGs | 20 | 52 | 168 | 510 |
| Amount of Savings in the SGs(USD$) | 600 | 3000 | 11000 | 37000 |
| Number of women disclosing their HIV status | 1 | 3 | 10 | 20 |
| Number of sex workers who are members of the SGs | 0 | 0 | 0 | 10 |

*[Table 1]*

**Lessons learned:** Savings groups are a cost effective intervention providing economic and psychosocial benefits to HIV+ women in low income communities contributing to adherence to treatment.

**Conclusions/Next steps:** Promote savings groups to ART clients at health centers in high density low income communities to contribute to improvement to adherence and retention in care.

## THPEE532

### MENTOR MOTHERS ENHANCING THE QUALITY OF EMTCT SERVICES THROUGH ADHERENCE SUPPORT IN UGANDA

S. Auma, H. Natukunda, D. Matsiko, M. Mbule
*mothers2mothers, M&E, Jinja, Uganda*
*Presenting author email: sarah.auma@m2m.org*

**Background:** UNAIDS Fast-Track Strategy to end the AIDS epidemic has indicated that high and consistent anti-retroviral therapy (ART) adherence is important in ensuring viral suppression. In Uganda, 66% of patients have three months adherence records; 90% good adherence, 7% fair adherence while 3% report poor adherence to ART. To establish the need for ART adherence support and contextualize adherence programming for Option B+ mothers in East Central Uganda, mothers2mothers (m2m) conducted a rapid assessment. m2m is a non-governmental and non-profit organization that works towards eliminating paediatric HIV and empowering women to nurture families using a peer approach.

**Description:** Sixteen high volume health facilities were conveniently sampled for the rapid assessment prior to roll out of the m2m adherence programme that would engage peer mentor mothers (MMs) in maternal ART adherence education, 7-day recall adherence assessment, and client follow-up. Ministry of Health client records for Option B+ mothers on treatment for 9-12 months (n: 197) were reviewed, data analysed using Excel, MMs trained and supported to provide adherence support and report outcomes. A follow-on assessment (n: 165) was conducted four months after the m2m adherence programme to assess the contribution of MMs towards patient adherence to therapy.

**Lessons learned:** Mothers receiving adherence education by facility health workers prior to maternal ART initiation improved from 56% (ci 49-63%) to 74% (ci 67-80%), and mothers assessed for non-adherence during their last visit from 60% (ci 53-67%) to 73% (ci 66-80%). Over the same period, MMs provided adherence education and pre-assessment for non-adherence to a monthly average of 1188 (100% of mothers seen by MMs). The proportion of Option B+ mothers identified in the category of 'low adherent clients' using a 7-day recall period declined from 7% (n: 1140, ci 55-88%) in September 2015 to 2% (n: 778, ci 24-45%) in December 2015. MMs contributed to increased coverage of adherence support and reduced non-adherence among peers.

**Conclusions/Next steps:** The positive differences between the pre-intervention and post-intervention periods confirm the contribution of MMs in increasing coverage of adherence support and reducing non-adherence among peers in Uganda. This has implications for control and eventual eradication of HIV infection and resistance.

## THPEE533

### ADHERENCE TO SCHEDULED CLINIC APPOINTMENTS FOR PEOPLE LIVING WITH HIV ON TREATMENT IN 8 FACILITIES IN CÔTE D'IVOIRE

G. Furlane[1], S. Stender[2], K. Ouattara[3], H. Harrison[4], J.E. Korte[5], D. Bassalia[6]
*[1]Jhpiego, Global Program Operations, Baltimore, United States, [2]Jhpiego, Cape Town, South Africa, [3]Jhpiego, Abidjan, Cote D'Ivoire, [4]Jhpiego, Baltimore, United States, [5]Medical University of South Carolina, Charleston, United States, [6]Ministere de la Sante et de l'Hygiene Publique, Abidjan, Cote D'Ivoire*
*Presenting author email: gahan.furlane@jhpiego.org*

**Background:** Sustained adherence to antiretroviral therapy (ART) is essential to achieve and maintain HIV suppression, to avoid drug resistance, and to improve survival of people living with HIV (PLHIV). Adherence to scheduled clinic visits can provide an indication of ART adherence. In 2013 in Côte d'Ivoire, 67% of clients started on treatment were known still to be alive and on treatment after 12 months. One local study indicates 38% of loss to follow up (LTFU) occurs within the first 6 months. Jhpiego is supporting the government of Côte d'Ivoire to develop and implement an integrated chronic care model to improve patient adherence and retention. A quasi-experimental pre-test post-test design with intervention and matched comparison sites is being undertaken to evaluate the intervention's impact. ART adherence and predictors of adherence were analyzed using baseline data from 8 facilities.

**Methods:** Data were collected from 488 HIV clinical records for PLHIV 15 years of age or older who initiated ART between 1 January 2013 and 31 July 2015 in urban health centers. Data on sociodemographic characteristics, health history, HIV care received, and appointment attendance were collected. Using STATA, adherence to care was measured by comparing scheduled vs. actual date of clinic visit. Associations between adherence and patient characteristics were also assessed.

Tuesday 19 July
Wednesday 20 July
Thursday 21 July Poster Exhibition
Friday 22 July
Late Breaker Posters
Author Index

The study received IRB approval from Johns Hopkins School of Public Health and Côte d'Ivoire National Ethics and Research Committee.
**Results:** Of the 488 eligible clients, only 395 had appointment data. Participants were on average 44.6% (SD 0.35) adherent as defined by attending a visit within three days of a scheduled appointment. The median number of days between scheduled and actual attendance of appointments for clients was 13. Age, gender, matrimonial status and education level were not correlated with adherence to scheduled appointments.
**Conclusions:** The current standard of care in Côte d'Ivoire necessitates PLHIV to visit a facility 8-12 times in the first year after initiating ART. The baseline results indicate a high risk for LTFU and potential drug resistance. A patient-centered approach, including bringing ART closer to the patient might address some of the issues contributing to low adherence, and if effective, improve patient outcomes.

## THPEE534

### OUTREACH WORKERS IN THE PREVENTION OF MOTHER TO CHILD TRANSMISSION OF HIV (PMTCT) PROGRAMME IN INDIA: CHALLENGES AND OPPORTUNITIES

N. Suryavanshi[1], V. Mave[2], A. Kadam[1], S. Kanade[1], S. Sivalenka[3], K. Sampath[3], P. Harvey[3], R. Gupta[4], A. Hegde[5], J.M. White[6], N. Gupte[2], A. Gupta[2], R.C. Bollinger[2], A.V. Shankar[6]
*[1]Lakshya, Society for Public Health Education and Research, Pune, India, [2]Johns Hopkins University, School of Medicine, Baltimore, United States, [3]CDC, India, Division of Global HIV and Tuberculosis, New Delhi, India, [4]National AIDS Control Organisation, New Delhi, India, [5]National AIDS Control Organisation, WHO Consultant, New Delhi, India, [6]Johns Hopkins University, Baltimore, United States*
*Presenting author email: nishisuryavanshi@hotmail.com*

**Background:** Outreach workers (ORW) are critical front-line health personnel and yet are often least equipped to address many challenges of their clients. The Indian PMTCT programme is one of the largest in the world and engages ORWs to facilitate uptake of services. However limited programmatic data are available and programme effectiveness is unknown. As part of baseline assessment of the COMmunity-Home Based INDia (COMBIND) Prevention of Mother to Child Transmission of HIV study, which will evaluate a mHealth technology based intervention to enhance ORW capacity in India, we collected baseline data on some of the challenges faced by ORWs and the opportunities perceived by them to enhance PMTCT programme implementation.
**Methods:** Group discussions from 40 ORWs from 3 trainings in three districts of Maharashtra were analyzed using thematic approach. An assessment of the primary challenges faced by ORWs as well as their perception of a novel behavioral training and mHealth platform to facilitate their work activities was performed.
**Results:** Numerous challenges exist for ORWs as they engage with their clients, such as lack of HIV testing kits, antiretroviral drugs (ARVs), lack of training/knowledge of PMTCT infant feeding guidelines among hospital staff. ORWs state that client's challenges include financial costs travelling to ART center, loss of daily wages, non-affordability of infant formula, and financial dependence on family. Both ORWs and clients reported lack of motivation and rude behavior of health care staff and not providing maternity services to women in the PMTCT programme. ORWs mention that there is a critical need for tools and trainings that can develop their capacity to communicate, engage, deliver appropriate care and guidance and enhance client's positive attitudes.
**Conclusions:** Given the significant challenges faced by ORWs and to address their perceived opportunities, we conclude that a tool that enhances the ORW's interpersonal counseling skills to better engage clients to access and retain in care and treatment is urgently needed. COMBIND study intervention using mHealth technology that supports effective communication through counseling videos, scripts and SMS alerts may enhance the ORW's capacity to increase uptake of PMTCT services by their clients may optimize PMTCT programme implementation.

## THPEE535

### THE EFFECTS OF FINANCIAL INCENTIVES ON VIRAL LOAD SUPPRESSION AMONG HOMELESS PEOPLE WITH HIV

T. Ghose[1], V. Shubert[2], M. Stanton[3], S. Chaudhuri[1], F. Malik[2], V. Poitevien[2]
*[1]University of Pennsylvania, School of Social Policy and Practice, Philadelphia, United States, [2]Housing Works, Inc, New York, United States, [3]University of Connecticut, Center for Health Intervention and Prevention, Storrs, United States*

**Background:** While the evidence on the association between financial incentives and antiretroviral (ARV) adherence is mixed, previous efficacy studies have not examined this intervention in conjunction with integrated care in healthcare settings. This study examines the effectiveness of the Viral Load Suppression Intervention (VLSI), a two-year demonstration project at a large healthcare and social service agency in New York City. In order to achieve viral suppression (≤200 copies/ml) among homeless people with HIV on ARVs, the VLSI added a quarterly $100 gift card incentive to existing agency services such as primary care, psychosocial services, and case management. We hypothesize that financial incentives for marginalized people with barriers to adherence, when added to services, can trigger behavior change around adherence.
**Methods:** Using 441 participants as their own controls, we assessed laboratory results at three-month intervals for a year prior to VLSI enrollment, and followed participants for 21 months post-enrollment. Multiple pre-intervention time-points established a stable baseline, allowing us to control for engagement with existing services and examine the effects of adding the financial incentive.
**Results:** Among 441 participants at 21 months, 90% were virally suppressed, compared to 66% at enrollment (p< .0001). Comparing longitudinal data before and after enrollment, we found that 69.4% of participants were virally suppressed at every time-point after enrollment, compared to 50.3% of participants who were virally suppressed at all time-points before enrollment (p< .0001). Moreover, participants were virally suppressed at 83% of time-points post-enrollment, compared to 72% of time-points pre-enrollment (p< .0001).
**Conclusions:** Financial incentives added to existing services significantly improved ARV adherence among clients. These results, in conjunction with results from previous research, indicate that while financial incentives by themselves may not be effective, they interact with available services in real-world agency settings to significantly improve adherence among clients confronted with barriers such as homelessness, substance use and mental illness. The VLSI provides a protocol for utilizing financial incentives that can be implemented in other agencies serving similar at-risk populations on ARVs. Our results lay the foundation for future research that examines the ways in which financial incentives interact with agency services to effect health behavior change.

## THPEE536

### FLEXIBILITY AND STRUCTURE: USING AN INNOVATIVE MULTIMEDIA PLATFORM FOR ADAPTABLE ART ADHERENCE COUNSELING

J. Rowe[1], A. Kingon[1], A. Pearson[1], C. Mellins[2], R. Robbins[2], H. Gouse[3], J. Joska[3], M. Henry[3], R. Remien[2]
*[1]Columbia University, Center for Teaching and Learning, New York, United States, [2]New York State Psychiatric Institute and Columbia University, Psychiatry, New York, United States, [3]University of Cape Town, Psychiatry and Mental Health, Cape Town, South Africa*
*Presenting author email: jr2502@columbia.edu*

**Background:** Given the staggering numbers of people living with HIV in South Africa (SA), policy shifts to increase eligibility for antiretroviral therapy (ART), rapidly changing ART counseling policies, and the substantive role lay counselors with variable training play in counseling, an engaging, easily modifiable, structured approach to delivering ART adherence counseling is required. Electronic platforms offer potential strategies to address these needs.
**Methods:** Masivukeni is a multimedia laptop-based platform and tool, developed by a joint international team, for lay-counselors to deliver ART adherence counseling. Masivukeni uses video, visually impactful content, and interactive exercises to engage patients and empower counselors to effectively teach, guide, and problem-solve. Masivukeni runs locally, offline. The sessions are standardized, while offering patient-level personalization. Modifications can be deployed platform-wide as ART policies change. Counselor use of the tool is recorded. From 2007-2016, a pilot study and large-scale randomized controlled trial of the platform and tool were implemented in SA impoverished communities.
**Results:** Through intensive collaboration with patients, clinics, Departments of Health (DoH), and NGO counselor training centers, Masivukeni underwent multiple changes. These included addressing the need for both ART initiation and defaulter counseling sessions, videos in multiple languages, content changes to reflect newer ART regimens, monitoring (e.g. recording the length of time spent on activities), adding a patient notes field, and automating assessments to facilitate lay-counselors screening for mental health and alcohol/substance use problems. Counselors and patients gave positive feedback and noted ways to shorten sessions. Clinic and DoH partners suggested integration of additional content to address other comorbid health conditions. They also suggested features to generate usage reports for supervision, quality assurance, and health tracking.
**Conclusions:** With increasing prevalence of technology and internet access in SA, Masivukeni can be further modified to allow online delivery, centralized data management, counselor oversight, and integration with health care systems. Content-wise, Masivukeni can be adapted to integrate additional complementary modules covering comorbid health conditions. A district level implementation study incorporating these adaptations, as well as other lessons learned, is necessary to evaluate scalability.

## THPEE537

### STRENGTHENING COMMUNITY STRUCTURES FOR SUSTAINED ART PROVISION IN RESOURCE LIMITED SETTINGS

A.M. Bugembe[1], V. Mayega[1], A. Wasswa[1], M. Swartling[2]
[1]*Rural Action Community Based Organization, Kampala, Uganda,* [2]*Pharmacists without Borders Sweden, Uppsala, Sweden*
*Presenting author email: huqqer@gmail.com*

**Background:** In Uganda there is a nationwide program to provide free antiretroviral treatment (ART). Despite this, the uptake of HIV care is still low in many of the rural areas. To address this, Rural Action Community Based Organisation (RACOBAO) in partnership with Pharmacists without Borders Sweden, funded by Forum Syd, implemented a project with the purpose of increasing uptake, retention and adherence to ART services.
**Description:** The project targeted people living with HIV, from remote rural communities of Kinuuka, Mpumudde, and Kasagama in Lyantonde district in south western Uganda from January 2012 to December 2013. The main duty bearer was the district health office. Health workers at lower level units were trained as a prerequisite for accreditation of those units as static ART sites. PLHIVs identified and seconded volunteers that were trained as treatment helpers providing individual support to clients, including adherence counseling. They also formed a linkage between clients and health workers through quarterly interface meetings. In addition, PLHIV were mobilized into support groups for peer counseling and advocacy for ART services.
**Lessons learned:** The training of health workers led to the accreditation of three health centers as static ART sites. Since then, this innovative approach that begun in Lyantonde became a national policy and was rolled out nationally 2015. Uptake to care tripled from 1,350 in 2012 to 5,467 in 2014 and to 6,495 by December 2015. Retention to care among the targeted PLHIV increased to 92% by December 2015 way above the 80% national average. Treatment helpers bridged the gap for monitoring of PLHIV in their homes, a mandate of the government health workers. The advocacy platforms for PLHIV improved their visibility and their capacity to present their needs to duty bearers. These approaches spearheaded by RACOBAO formed a model that was successfully replicated in neighboring Sembabule district during 2014-2015.
**Conclusions/Next steps:** Imbalances in the access and adherence to ART services are a function of structural and policy issues and this model aims at addressing both. It has successfully been implemented and evaluated in two rural districts in Uganda and can be replicated nationally to increase uptake, retention and adherence to ART services.

## THPEE538

### SUCCESSFUL INTEGRATION OF NURSE INITIATED TREATMENT OF HIV IN NQUTHU, UMZINYATHI AND ITS IMPACT ON THE HEALTH SYSTEM

Z. Ntombela[1], A. Zungu[2]
[1]*Umzinyathi Health District, Health, Dundee, South Africa,* [2]*Department of Health KwaZulu Natal, Umzinyathi Health District, Dundee, South Africa*
*Presenting author email: andile.zungu@kznhealth.gov.za*

**Background:** Nquthu sub-district is one of South Africa most challenging areas for health intervention implementation due to its deep rural setting and in one of the most deprived parts of the country. Umzinyathi numerous challenges mean that it is often chosen to pilot and implement new services to assess cost and practicability before national roll-out. The district has been in the forefront of the roll out for both HIV and TB related interventions from the first pilots of ARV's to the development and implementation of community based treatment of MDR.
**Description:** Umzinyathi trained and appointed NIMART Nurses to work in all functioning Primary Health Care facilities for new cases of HIV. The aim was to reduce time, cost implications and other difficulties associated with treatment access and initiation in overburdened central facilities. Nquthu has one District Hospital and has 14 clinics and 4 mobile clinics for a population of ~160,000. We have used data from the period 2009 - 2015 for all HIV treatment initiations at all sites in the Sub-District.
**Lessons learned:** Since the start of the programme in 2012/13, over 81.4% (6126) of all new case initiations have taken place at PHC level, with Hospital initiations falling from a high of 1709 in 2010/11 to just 337 in 2014/15. Equally, the numbers of people being initiated on treatment has significantly increased year on year to a combined total of 2816 initiations in 2014/15, up 65% on the best pre-intervention enrolment figures, despite the slight reduction in overall HIV tests being carried out over the same period from 249,000 to 189,000
**Conclusions/Next steps:** NIMART has been successfully implemented, embedded and embraced in Nqutu with a significant impact on cost to both patient and Health facilities. The reduced costs and time in travel to facilities for patients mean that new patients are more likely to access treatment sooner. This in turn ensures that more patients are on treatment earlier, reducing critical care costs and improving outcomes for patients. The burden on Medical Officers based at district Hospitals has been significantly reduced, freeing them up for more critical roles within the facilities.

## THPEE539

### CHALLENGES OF TRANSITIONING FROM HEALTH FACILITY BASED ADHERENCE CLUBS TO COMMUNITIES

N. Tshuma[1], O. Mosikare[1], K. Muloongo[1], O. Alaba[2], P. Nyasulu[1]
[1]*Monash University, Johannesburg, South Africa,* [2]*University of Cape Town, Cape Town, South Africa*
*Presenting author email: ndumiso@care.co.za*

**Background:** Patient retention in care is a critical challenge for antiretroviral treatment programs. Adherence clubs are an option for rapid service delivery where 30 patients are allocated to a group and meet either at a facility or community venue for less than an hour every 2 or 3 months depending on the supply of medication. Community-based models of antiretroviral therapy (ART) delivery has been recommended to support ART expansion and retention in resource-limited settings. The objective of the study was to establish perceived challenges moving adherence clubs from health facilities to communities.
**Methods:** A qualitative study was conducted at 36 clinics in Mpumalanga and Gauteng Province in South Africa in the month of December 2015 and January 2016. Purposive sampling methods were used to identify nurses, club managers, data capturers, pharmacists and pharmacy assistants who have been involved in facility based treatment adherence clubs. One-on-one key-informant interviews were conducted. A semi-structured interview design was used and interviews were digitally recorded then transcribed and analysed using thematic content analysis.
**Results:** A total of 108 health workers comprising of 36 (33.3%) males and 72 (66.7%) femalesparticipated in the study. Most of them (90.7%) indicated that taking clubs to the communities would be a good idea. However, the respondentshighlighted security, transportation of medication, distance from home to the identified venue, shortage of clinical staff for medication pre-packing and linkages togovernment database records (tier.net) were as possible challenges. Suggested solutions included linking to central dispensing unit to deliver medication, identification of venues secure and closer to patient homes, adoption and validation of community club registers by health facilities.
**Conclusions:** Health facility staff were agreeable to the moving adherence clubs from health facilities to communities. Although some challenges were identified these could be addressed by key stakeholders. However,government and non-governmental organisations need to exercise caution whentransitioning to community-based adherence clubs.

# INTERVENTIONS TO IMPROVE RETENTION IN THE PREVENTION OF VERTICAL TRANSMISSION CASCADE/CONTINUUM, INCLUDING EARLY INFANT DIAGNOSIS AND OPTION B+ PROGRAMMES

## THPEE540

### IMPROVING FIRST DNA-PCR UPTAKE FOR HIV-EXPOSED INFANTS IN SOUTH-WESTERN UGANDA

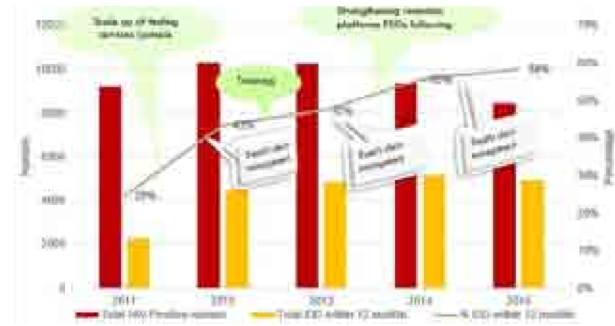
I.C. Nakachwa[1], E. Bitarakwate[1], L. Mugumya[1], E. Natumanya[2], M. Walakira[1]
[1]*Elizabeth Glaser Paediatric AIDS Foundation, Clinical, Mbarara, Uganda,* [2]*Elizabeth Glaser Paediatric AIDS Foundation, Monitoring and Evaluation, Mbarara, Uganda*
*Presenting author email: inakachwa@pedaids.org*

**Background:** In conjunction with the Uganda Ministry of Health, the Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) under the USAID-funded STAR-SW project (2010-2015), supported prevention of mother-to child HIV transmission (PMTCT) at 234 health facilities in 13 districts in southwestern Uganda. By 2011 only 25% of expected HIV-exposed infants (HEIs) in the region were receiving an initial polymerase chain reaction (DNA-PCR) test within 12 months after delivery, at a median age of 2.7 months.
**Description:** EGPAF analyzed factors contributing to this gap and implemented four major interventions to improve coverage: 1) scaling up testing to more facilities through a sample transportation network, using motorbikes to ferry blood samples and test results between facilities and the central public health laboratory; 2) streamlining supply-chain management to ensure availability of EID commodi-

Tuesday 19 July
Wednesday 20 July
Thursday 21 July Poster Exhibition
Friday 22 July
Late Breaker Posters
Author Index

ties; 3) supporting retention of HIV-positive mothers through family support groups (FSGs); and 4) training staff in active screening for HEIs in immunization clinics and other service points and collecting samples at the mother-baby care points within MCH services.

**Lessons learned:** To improve first DNA-PCR uptake for HEIs, key bottlenecks must be identified at all points in the PMTCT cascade and addressed. While scaling up access to DNA-PCR testing led to an initial spike in uptake, incremental gains in the total number of infants tested and quality of the service were only realized after targeted interventions to resolve PMTCT programming gaps were implemented (see fig 1). The median age at first DNA-PCR progressively reduced from 2.7 to 1.8 months while DNA PCR positivity fell from 8.3% to 3.7%.



*[ First DNA-PCR uptake for HIV-exposed infants in Southwestern Uganda 2011-2015]*

**Conclusions/Next steps:** Scaling up DNA-PCR services should be complemented by interventions to improve program quality.

## THPEE541

### AGE AT HIV DIAGNOSIS AND TIME TO ENROLMENT INTO HIV CARE AND ART INITIATION IN CHILDREN AGED < 1 TO 14 YEARS FROM 2009-2014, TANZANIA

R. Kisendi[1], J. Mahande[2], R. Josiah[1], S. Msuya[2], P. Mee[3], J. Renju[2,3], M. Ntiro[1], J. Todd[2,3]

*[1]Ministry of Health, Community Development, Gender, Elderly and Children, Preventive Services, Dar es Salaam, Tanzania, United Republic of, [2]Kilimanjaro Christian Medical University College, Epidemiology and Biostatistics, Moshi, Tanzania, United Republic of, [3]London School of Hygiene and Tropical Medicine, London, United Kingdom*

*Presenting author email: kisendik@yahoo.com*

**Background:** Early identification of HIV infection and timely enrollment into care are critical for successful treatment of HIV positive children. WHO recommends that all children <15 years are initiated onto antiretroviral treatment (ART) immediately after diagnosis. Information on age at which children are diagnosed for HIV and how long it takes to enroll and initiate ART is inadequate in Tanzania. We assessed changes in age at diagnosis and length of time from diagnosis to enrollment into care, and ART initiation from 2009-2014.

**Methods:** We analyzed routinely collected data from 291 HIV care and treatment clinics (CTC) with electronic recording of patient information. Demographic information of children aged ≤14 years enrolled between 2009 and 2014 were analyzed. Descriptive statistics were used to obtain median age at diagnosis, median time from diagnosis to enrolment; and proportions of children diagnosed by selected characteristics.

**Results:** 41,627 children were diagnosed with HIV and included in the analysis. Median age at diagnosis was 4.74 years (IQR 1.78-8.87) and did not change over the years. 17,306 (41.6%) were diagnosed at the age of ≥5 years. The majority were diagnosed by Provider Initiated Testing and Counseling (PITC) (83.7%) mainly through hospitals (58.6%) while Home Based Care (HBC) and Prevention of Mother to Child Transmission (PMTCT) contributed few children (0.9% each). Median time to enrolment was 2.1 days across all calendar years with 39,053 (86.9%) enrolled within 1 month. Median time to ART initiation decreased from 1.6 months (IQR 0.3-11.5) in 2009-2010 to 0.7 months (IQR 0-4.2) in 2011-2012 and 0.2 (IQR 0-1) in 2013-2014 ($p< 0.0001$). 22,502(49.9%) initiated ART within 1 month while 8,951(19.8%) initiated within ≥6 months.

**Conclusions:** Children are still being diagnosed at older ages, and few children are enrolled directly from the PMTCT program. Most children are enrolled into HIV care within a month of HIV diagnosis, but 20% of them wait more than six months before ART initiation. Strengthening the linkage between PMTCT and CTC will ensure that infants with an early diagnosis of HIV at PMTCT sites are enrolled and initiated on ART in line with WHO recommendations.

## THPEE542

### A SYSTEMATIC REVIEW OF FACILITY AND COMMUNITY-BASED INTERVENTIONS TO IMPROVE RETENTION OF HIV-POSITIVE PREGNANT WOMEN AND HIV-EXPOSED INFANTS ALONG THE PMTCT CONTINUUM OF CARE

A. Vrazo[1], M. Srivastava[2], A. Amzel[1], J. Firth[1], R. Sedillo[3], J. Ryan[1], B.R. Phelps[1]

*[1]United States Agency for International Development, Washington DC, United States, [2]USAID, Washington, United States, [3]University of California, San Francisco, United States*

*Presenting author email: asrivastava@usaid.gov*

**Background:** Despite the demonstrated success of Prevention of Mother-to-Child Transmission of HIV (PMTCT) programs in improving maternal and infant health outcomes, the poor retention seen in the "Option B+ era" poses a formidable challenge to achieving the elimination of vertical HIV transmission in low and middle-income countries (LMICs). This systematic review summarizes literature on facility-based and community-based strategies that demonstrate statistically significant improvements in retention of HIV+ pregnant and breastfeeding women and infants along the PMTCT cascade.

**Methods:** A systematic search of PubMed, EMBASE, CINAHL and PsycInfo was conducted to identify peer-reviewed studies published between 1990 - 2015 that captured significant PMTCT outcome improvements for retention of pregnant women and infants. All reviewed studies contained data on retention along the PMTCT cascade of care—from maternal HIV testing and counseling through infant diagnosis and follow-up. Studies were grouped by maternal or infant retention indicators as defined by the principal outcomes measured in each study. Study rigor was assessed by an 8-item assessment tool previously developed for systematic reviews of HIV behavioral interventions.

**Results:** Out of 686 citations reviewed, 24 articles (12 prospective cohorts, 7 retrospective cohorts, and 5 controlled trials) met criteria. Among studies of maternal retention indicators, most measured pregnant women initiated on combined antiretroviral therapy (cART) (n=11) and loss to follow-up (LTFU) rates (n=8). Among studies of infant indicators, the majority measured uptake of early infant diagnosis testing (n=14) and LTFU rates (n=10). Three community interventions, ten facility-based interventions, and eight combination interventions of community and facility-based components were reviewed. Four studies assessed retention of women and infants in Option B+ programs. Limitations of reviewed studies include small sample size, limited geographical location, and non-randomized assignment and selection of participants.

**Conclusions:** This review summarizes standalone and combination interventions, including comprehensive, family-centered care, and patient tracking, that are demonstrably effective in retaining HIV-positive mothers and their infants in the PMTCT continuum of care. Given the recent international normative guidance recommending the universal testing and treatment of all people living with HIV, additional research is needed to design effective interventions that improve retention in PMTCT and broader HIV programs.

## THPEE543

### EFFECTIVENESS OF A BI-WEEKLY MATERNAL HEALTH TEXT MESSAGES INTERVENTION AIMING TO IMPROVE CLINICAL OUTCOMES OF HIV-POSITIVE WOMEN PARTICIPATING IN MAMA SOUTH AFRICA IN JOHANNESBURG

J. Coleman[1,2], A. Thorson[2], V. Black[3], J. Eriksen[4], K. Bohlin[5], P. Mechael[6], J. Mangxaba[7]

*[1]University of the Witwatersrand, Wits Reproductive Health and HIV Institute, Johannesburg, South Africa, [2]Karolinska Institute, Department of Public Health Sciences, Stockholm, Sweden, [3]University of the Witwatersrand, Johannesburg, South Africa, [4]Karolinska Institute, Division of Clinical Pharmacology, Department of Laboratory Medicine, at Karolinska University Hospital Huddinge, Stockholm, Sweden, [5]Karolinska Institute, Laboratory Medicine, Stockholm, Sweden, [6]HealthEnabled, Cape Town, South Africa, [7]Mobile Alliance for Maternal Action, Washington, United States*

*Presenting author email: jcoleman@wrhi.ac.za*

**Background:** mHealth interventions have the potential to improve health outcomes, but mHealth intervention research focussed on HIV-positive pregnant women is sparse. Mobile Alliance for Maternal Action (MAMA) South Africa was a maternal health mHealth intervention implemented in public health clinics.

**Methods:** Between April 1, 2013, and August 20, 2014, free bi-weekly maternal health and PMTCT messaging through MAMA South Africa was offered to pregnant HIV-positive women attending public antenatal care (ANC) clinics in Johannesburg's inner-city. Messages were customised for gestational age and age of infant and relevant to the South African context. The content included maternal health and HIV-related support. We compared clinical and birth outcomes with HIV-positive pregnant women who did not receive the intervention.

**Results:** A total of 235 intervention, and 586 control participants were included. Most women attended their first ANC visits after 20 gestation (intervention: 63.8%; control: 75.7%, p=002). Controlling for differences in date of first ANC visit using ANCOVA, intervention participants attended more antenatal care visits (4.8 vs 4.3, p=0.019). Intervention participants were also more likely to attend the four recommended ANC visits (RR 1.41 (95% CI=1.15-1.72, p=0.001)). There was a trend in the intervention group towards attending infant PCR testing within the recommended six weeks after birth (81.3% vs 75.4%, p=0.064). Intervention participants were likely to have a normal vaginal delivery (RR: 1.1009 (95% CI=1.02-1.19) and a lower risk of delivering a low birth weight infant (< 2500 g) (RR=0.1368 (95% CI=0.02-1.07, p=0.035)). There was at least one piece of missing data for each participant.
**Conclusions:** While the intervention group was more likely to attend PCR testing within the recommended time, this result was not statistically significant. However, a statistically significant increase in average number of ANC visits attended was found, along with an increased likelihood of attending at least four ANC visits, and improved birth outcomes for pregnant women and newborns. Based on these findings, national maternal mHealth programmes, such as MomConnect, have potential to improve pregnancy outcomes and impact should be regularly evaluated.

## THPEE544

### Low rates of successful defaulter tracing and re-engagement in care in Option B+ women in Central Malawi

K. Phiri[1], J. Parent[1], T. Mulitswa[1], A. Schooley[1,2], R. Hoffman[2]
[1]*Partners in Hope Medical Center, EQUIP-Malawi, Lilongwe, Malawi,* [2]*David Geffen School of Medicine, University of California, Department of Medicine/Division of Infectious Diseases, Los Angeles, United States*
*Presenting author email: khumbophiri@gmail.com*

**Background:** Under EQUIP, a USAID/PEPFAR project, Health Surveillance Assistants (HSAs) were trained to trace women lost to follow up from Option B+, provide basic education about the importance of antiretroviral therapy (ART) for maternal and infant health, and encourage women to return to care. Limited data exist around whether women traced in this manner re-engage in care and are retained.
**Methods:** Between October 2014 and April 2015 we reviewed ART registers at 14 health centers in Central Malawi to determine the number of women who had defaulted from care (>60 days without ART). HSA records were reviewed to determine how many women were successfully traced, and of these, how many agreed to return to care. ART registers and patient files were reviewed three months after tracing to determine how many women re-engaged in care (defined by having at least one appointment after tracing) and were retained in care for at least 90 days.
**Results:** A total of 289 women met criteria for default and were traced by HSAs. Fifty women (17%) were successfully located and received ART education. Of these, 49 (98%) agreed to return to care and were confirmed to re-engage in care with at least one clinic appointment. Twenty-six women (53%) were retained and 23 (47%) defaulted again within three months of returning to care (Table). Among women retained, 19/26 (73%) remained in care at the same site, 6/26 (23%) transferred to another facility, and 1/26 (4%) died after re-engaging in care.

| Facility | Number of women meeting criteria for default (>60 days without ART) | N (%) successfully traced by HSAs | N (%) retained 3 months after tracing* |
|---|---|---|---|
| 1 | 12 | 6 (50) | 4 (67) |
| 2 | 6 | 1 (17) | 0 (0) |
| 3 | 12 | 4 (33) | 3 (75) |
| 4 | 29 | 1 (3) | 0 (0) |
| 5 | 5 | 4 (80) | 0 (0) |
| 6 | 15 | 12 (80) | 7 (58) |
| 7 | 45 | 4 (9) | 4 (100) |
| 8 | 25 | 4 (16) | 1 (25) |
| 9 | 16 | 1 (6) | 0 (0) |
| 10 | 61 | 1 (2) | 1 (100) |
| 11 | 25 | 7 (28) | 5 (71) |
| 12 | 19 | 2 (11) | 0 (0) |
| 13 | 13 | 1 (8) | 0 (0) |
| 14 | 6 | 2 (33) | 1 (50) |
| Total | 289 | 50/289 (17) | 26/49** (53) |

*Those who transferred to another facility or died after return to care were considered retained in care.
**Of the fifty individuals traced, one individual declined to return to care

*[Table. Site-level data on the number of women defaulting from care and successful tracing and retention rates]*

**Conclusions:** A small proportion of women who defaulted from Option B+ were successfully traced by HSAs and almost half of these women were lost from care within three months of re-engagement. Interventions that identify women's challenges and help address specific barriers are needed to improve retention in Option B+.

## THPEE545

### "When do I stop this?": Challenges to accepting lifelong treatment among pregnant women in Kinshasa, DRC, and counseling strategies to address them

M. Gill[1], J. Ditekemena[2], J. Bakwalufu[2], N. Mbonze[2], C. Nyombe[3], A. Loando[2], V. Ilunga[2], F. Fwamba[4]
[1]*Elizabeth Glaser Paediatric AIDS Foundation, Washington, United States,* [2]*Elizabeth Glaser Pediatric AIDS Foundation, Kinshasa, Congo, Democratic Republic of the,* [3]*Kinshasa University School of Public Health, Kinshasa, Congo, Democratic Republic of the,* [4]*Le Programme National de Lutte contre le Sida, Kinshasa, Congo, Republic of the*
*Presenting author email: jditekemena@pedaids.org*

**Background:** Implementation of universal lifelong antiretroviral treatment ("Option B+") for HIV-infected pregnant and breastfeeding women began in the Democratic Republic of the Congo (DRC) in September 2013. Other country experience suggests pregnant women initiated on treatment the day they are diagnosed HIV-positive are at elevated risk of defaulting from antenatal care. One study objective was to document factors contributing to loss to follow-up among HIV-positive pregnant women and suggested additional strategies to address retention.
**Methods:** In July-August 2015, 29 healthcare providers participated in interviews; 25 mentor mothers (HIV-positive expert patients) participated in four focus groups. Sixteen EGPAF DRC-supported facilities in Kinshasa with high volume and high HIV prevalence were purposively selected. Topics included women's Option B+ perceptions and experiences and counseling strategies to encourage lifelong treatment acceptance. Audio recordings from sessions were transcribed and translated from French or Lingala into English. Data were prepared for analysis using a standardized codebook and analyzed using MAXqda (V10).
**Results:** Study respondents described pregnant women's difficulty with accepting lifelong antiretroviral therapy (ART). Women often expressed shock or felt punished and struggled to comprehend, with questions such as *"When do I stop this?"* With intensive and ongoing counseling and the establishment of trusting relationships with clinic staff, most women accepted and adhered to medication. However, nearly all facilities had cases of women who refused treatment. Frequently reported reasons included conflicting guidance from pastors to pray instead of taking medication and fear of stigmatization, particularly from male partners. Table 1 depicts strategies employed by providers and mentor mothers to encourage treatment acceptance and reasons women provided respondents for refusing lifelong treatment. Responses were similar across participant groups, though providers reported drug functionality and mentor mothers reported testimonials slightly more often as strategies.

| Option B+ Counseling Strategies Used to Encourage Treatment Acceptance: |
|---|
| • Delivering counseling messages with kindness and sensitivity to cultivate a trusting relationship between provider/mentor mother and clients • Providing messages that include the importance of taking ART and how drugs function in the body • Including testimonials from mentor mothers on how they remain healthy and have prevented infection in their children • Likening HIV to a chronic disease like diabetes that requires management • Referring to a possible future cure for HIV |
| Reported Reasons for Refusing Lifelong Treatment: |
| • Relying upon religious convictions or guidance from pastors to pray instead of taking medication • Not disclosing HIV status to partner or family members out of fear of stigmatization • Believing in witchcraft or demonic origins of illness • Experiencing side effects, for those who may have initially accepted • Looking and feeling healthy • Not believing test results, possibly due to having a serodiscordant partner |

*[Table 1: Frequently Reported Option B+ Counseling Strategies and Reasons for Refusing Lifelong Treatment]*

**Conclusions:** Treatment acceptance is a significant challenge for Option B+ scale-up. Lessons learned through this evaluation to encourage treatment acceptance and promote retention could be incorporated, such as sensitization workshops for religious leaders, couples counseling strategies, and HIV-related training for mentor mothers to comprehensively address women's needs.

### IMPROVING PMTCT COVERAGE AND EFFECTIVENESS THROUGH REMINDER CALLS AND COMMUNITY INTERVENTIONS IN THE EAST REGION OF CAMEROON: EXPERIENCE FROM SIMECAM-FGSK

L.A. Amboua Schouame[1], R.M. Bidjang[2], A. Kenne[1], C. Kengne Ndé[3], E. Ngo Malabo[3], A. Kfutwah[3], J.J. Bigna Rim[1], M.C. Tejiokem[1], P.Y. Tchendjou[1]
*[1]Centre Pasteur of Cameroon, Department of Epidemiology and Public Health, Member of the Institut Pasteur International Network, Yaounde, Cameroon, [2]Ministry of Public Health, East Cameroon Regional Delegation of Public Health, Bertoua, Cameroon, [3]Centre Pasteur of Cameroon, Department of Virology, Member of the Institut Pasteur International Network, Yaounde, Cameroon*
*Presenting author email: ambschouamey@gmail.com*

**Background:** In 2014, Cameroon adopted the option B+ strategy released the previous year in the World Health Organization guidelines to eliminate mother to child transmission of HIV (MTCT). However, high rates of lost to follow-up (LTFU) observed in many countries with a generalized HIV epidemic could jeopardize the effectiveness of this strategy. Within the framework of the SIMECAM-FGSK study that aims at facilitating integration of couple-oriented counseling and option B+ in the antenatal care (ANC) package in primary health care structures, we evaluated the impact of reminder calls and community interventions on PMTCT.
**Description:** An intervention called couple-oriented counseling (COC) successfully increased the number of male partners who came back for HIV testing in ANC units in urban areas. The SIMECAM-FGSK study introduced COC in the ANC package together with option B+ intervention in the PMTCT program in six health care facilities in rural areas in the East region of Cameroon. Reminder calls were conducted if appointments were missed for at least two week. In case of unsuccessful calls, home visits (HV) were carried out. This analysis was realized in the subgroup of HIV-infected women who missed at least one scheduled visit.
**Lessons learned:** From February 2014 to September 2015, 719 pregnant women were included. Among them, 13.5% (97/719) were HIV-infected. Ninety five (98%) HIV-infected were initiated on ART and 29 (30%) missed at least one scheduled visit for care. 81 calls (median per woman: 2 (IQR, 1-4)) and 21 HV were made leading to 83% (24/29) HIV-infected women being reintegrated in care. These interventions increased retention rate among HIV-infected women to 91% at six months. This figure was significantly higher compared to 21% reported before implementing these interventions (p< 0.001). During the study period, seventy two HIV-infected pregnant women delivered and EID coverage was 72.2% (52/72); significantly higher compared to the 40% nationwide. A MTCT rate of 5.8% (3/52) was observed.
**Conclusions/Next steps:** Interventions to reduce defaulters and cases lost to follow-up maintain an acceptable rate of HIV-infected women in care, help to increase access to option B+ intervention and assess elimination of MTCT.

## THPEE547

### A FACILITY-BASED APPROACH TO IMPROVE TRACKING OF HIV-EXPOSED INFANTS IN THE PMTCT TREATMENT CASCADE: EXPERIENCE FROM SOKOTO, NORTH-WEST NIGERIA

S. Ibrahim, I. Olujuwon, F. Muhammad
*Management Sciences for Health, Clinical Services, Sokoto, Nigeria*
*Presenting author email: suleimanibrahim@msh.org*

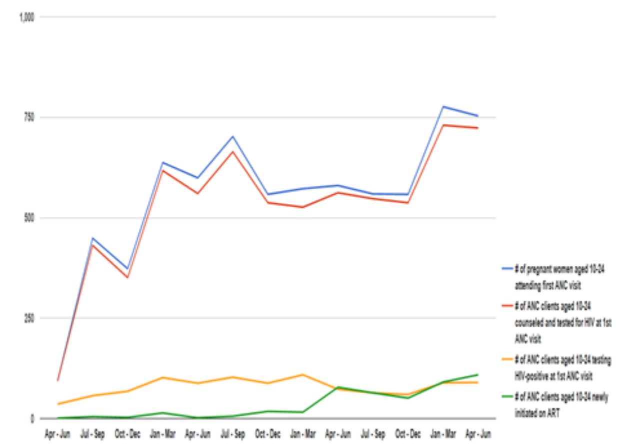
**Background:** Nigeria has the highest number of children contracting HIV in the world. However, loss to follow-up of HIV-exposed infants (HEI) along the continuum of care within the prevention of mother-to-child transmission (PMTCT) cascade remains a major challenge.
The objective of this pilot study was to describe the impact of a simple facility driven intervention in improving the tracking outcomes and retention of HEI within the PMTCT cascade especially in resource constraints settings with no electronic medical record system (EMR).
**Methods:** A unique birth cohort filing method was introduced in a tertiary hospital, which involves filing of HEI cards according to their birth month and year for easy monthly reporting of HEI outcomes at ages of 2, 12 and 18 months. A total of 109 HEI were co-opted into this pilot study for the study. The HEI that were entered into the birth cohort filing system were tracked through phone calls and home visits.
**Results:** This Exposed Infants Tracking System (EITS) revealed that a total of 56 HEI out of the 109 enrolled in the study were retained in care (51.4% retention rate) across all ages. The remaining 53 (48.6%) have been loss to follow up. The default rate increases with advancing age with 22.9% and 53% at ages 12 months and 18 months respectively. Meanwhile, all (100%) HEI within the 2 months cohort were retained. Ascertainment of HIV status in the three birth cohort revealed that at 18 months, only 36.4% had their DNA-PCR as against 40.9% at 2 months cohort. None of the HEI had HIV status determined at 12months cohort. While all DNA-PCR tests came back negative for HIV at 2 months cohort, in the 18 months cohort, 18% were positive, while 27% were discharged uninfected.
**Conclusions:** EITS is simple and easy to replicate in low resource settings. It enables easy identification of primary outcomes, promotes efficient tracking, allows for timely planning of HIV interventions, and serves as an excellent tool for research purposes.

## THPEE548

### INCREASING ACCESS TO PMTCT FOR YOUNG WOMEN IN SOUTH AFRICA

S. Ladha[1], M. Fredericks[1], D. Solomon[2], C. Simon[3]
*[1]Pathfinder International, Johannesburg, South Africa, [2]Pathfinder International, Consultant, Watertown, United States, [3]Pathfinder International, Washington DC, United States*
*Presenting author email: sladha@pathfinder.org*

**Background:** South Africa is home to the world's largest population of pregnant people living with HIV. Twenty percent of women ages 20 to 24 have begun childbearing by age 18, and among pregnant women ages 15 to 24, HIV prevalence is 19.3%.[1] Yet, PMTCT services are often not accessible to or targeted towards young people living with HIV (YPLHIV).
**Description:** Pathfinder International worked with public sector facilities to increase PMTCT provision to women between the ages of 10 and 24, using a multi-faceted approach. Youth-friendly services (YFS) were generated, dependent on resources available, either by creating separate youth zones within larger primary healthcare settings, or by creating separate youth-friendly clinics with a dedicated provider. Pathfinder collected disaggregated data to monitor use of PMTCT services by YPLHIV. To promote both scalability and sustainable capacity building Pathfinder facilitated effective leadership in 19 facilities in seven districts, developing human capacity through in-service training, strengthening of management systems, and infrastructure.
**Lessons learned:** As the graph below illustrates, over the course of the project, the number of young women accessing PMTCT services increased significantly. The interventions found to be most effective were:
• Training clinic staff to provide YFS
• Improvement of facility infrastructure
• Community-based activities to reduce stigma and generate demand.
The project also ensured sustainability and scalability through integrating youth-friendly models into existing services, and adapting to accommodate the existing resources.



*[ANC Uptake April 2011 to June 2014]]*

**Conclusions/Next steps:** In a country with a high prevalence of both HIV and early pregnancy, PMTCT services tailored towards YPLHIV are both accessible and sustainable to increase uptake of services among this vulnerable group. Issues such as training of staff to provide YFS, integration of YFS into existing health care systems, and collection and monitoring of disaggregated data need to be key aspects of any PMTCT program to ensure access for those who are most in need.

## THPEE549

### CONDITIONAL CASH TRANSFERS TO INCREASE RETENTION IN PMTCT CARE, ANTIRETROVIRAL ADHERENCE, AND POSTPARTUM VIROLOGICAL SUPPRESSION: A RANDOMIZED CONTROLLED TRIAL

M. Yotebieng[1], H. Thirumurthy[2], K.E. Moracco[3], A. Edmonds[4], M. Tabala[5], B. Kawende[5], L.K. Wenzi[5], E.W. Okitolonda[5], F. Behets[6]
*[1]Ohio State University, College of Public Health, Columbus, United States, [2]University of North Carolina at Chapel Hill, Department of Health Policy and Management, Chapel Hill, United States, [3]University of North Carolina at Chapel Hill, Department of Health Behavior, Chapel Hill, United States, [4]University of North Carolina at Chapel Hill, Department of Epidemiology, Chapel Hill, United States, [5]University of Kinshasa, School of Public Health, Kinshasa, Congo, Democratic Republic of the, [6]University of North Carolina at Chapel Hill, Department of Social Medicine, Chapel Hill, United States*
*Presenting author email: yotebieng.2@osu.edu*

**Background:** Novel strategies are needed to increase retention in prevention of mother-to-child HIV transmission (PMTCT) services and virologic suppression. We have recently shown that among HIV-infected women, small, incremental financial incentives resulted in increased retention along the PMTCT cascade. However, it is unknown whether women who receive incentives to attend clinic visits will be as adherent to antiretrovirals as those who do not.
We sought to determine whether the proportions of women in care at six weeks postpartum who adhered to their antiretrovirals (measured by pill counts) and achieved an undetectable viral load differed between the two study groups.
**Methods:** Newly diagnosed HIV-infected women, ≤32 weeks pregnant, were recruited at antenatal care clinics in Kinshasa, Democratic Republic of Congo. Women were randomized 1:1 to an intervention or control group. The intervention group received compensation ($5, plus $1 increment at each subsequent visit) conditional on attending scheduled clinic visits and accepting offered PMTCT services; the control group received usual care.
**Results:** Among 433 women enrolled and randomized (216 intervention and 217 control), 332 (76.7%) remained in care at six weeks postpartum, including 174 (80.6%) in the intervention group and 158 (72.8%) in the control group. Pill count data were available for 297 participants (89.5%), 156 (89.7%) and 141 (89.2%) in the intervention and control groups, respectively. The proportion of women with perfect adherence was 69.9% (109/156) and 68.1% (96/141) in the intervention and control groups, respectively (risk difference ([RD], 0.02; 95% confidence interval [CI], -0.06, 0.09). Viral load results were available for 171 (98.3%) and 155 (98.7%) women in the intervention and control groups, respectively. An undetectable viral load was attained by 66.1% (113/171) of the intervention group and 69.7% (108/155) of the control group (RD, -0.04; 95% CI, -0.14, 0.07). Results were similar after adjusting for marital status, age, education, baseline CD4 count, baseline viral load, gestational age, and initial antiretroviral regimen.
**Conclusions:** While provision of cash incentives to HIV-infected pregnant women led to higher retention in care at six weeks postpartum, among those retained in care, adherence to antiretrovirals and virologic suppression did not differ by study group.

## THPEE550

### THE EFFECT OF CONDITIONAL CASH TRANSFERS ON RETENTION IN AND UPTAKE OF PMTCT SERVICES VARIES BY PERCEIVED SEVERITY OF HIV AND PMTCT BENEFIT: A RANDOMIZED CONTROLLED TRIAL

M. Yotebieng[1], K.E. Moracco[2], H. Thirumurthy[3], A. Edmonds[4], M. Tabala[5], B. Kawende[5], L.K. Wenzi[5], E.W. Okitolonda[5], F. Behets[4,6]
*[1]Ohio State University, College of Public Health, Columbus, United States, [2]University of North Carolina at Chapel Hill, Department of Health Behavior, Chapel Hill, United States, [3]University of North Carolina at Chapel Hill, Department of Health Policy and Management, Chapel Hill, United States, [4]University of North Carolina at Chapel Hill, Department of Epidemiology, Chapel Hill, United States, [5]University of Kinshasa, School of Public Health, Kinshasa, Congo, Democratic Republic of the, [6]University of North Carolina at Chapel Hill, Department of Social Medicine, Chapel Hill, United States*
*Presenting author email: yotebieng.2@osu.edu*

**Background:** To elucidate the mechanisms by which a cash incentive intervention increases desired prevention of mother-to-child transmission (PMTCT) outcomes, we identified perceptual factors associated with retention in and uptake of PMTCT services through six months postpartum, and assessed their interactions with a cash incentive intervention.
**Methods:** We used data from a randomized controlled trial in Kinshasa, Democratic Republic of Congo. Four hundred thirty-three newly diagnosed HIV-infected women, ≤32 weeks pregnant, were randomized to the standard of care (control group) or to the standard of care plus small and increasing financial compensation conditional on clinic attendance and service uptake (intervention group). Perceptual factors associated with loss to follow-up (LTFU) and uptake of PMTCT services (in care and accepted all available PMTCT services) through six weeks postpartum were first identified in the standard of care group. Then, in the combined dataset, linear risk models were used to assess risk difference modification.
**Results:** In the control group, participants were less likely to be LTFU if they perceived HIV as a "very serious" health problem for their baby vs. not (perceived severity of HIV), and if they believed it would be "very likely" that they will pass HIV on to their baby if they did not take any HIV drug vs. not (perceived PMTCT benefit) (Table 1). Perceived severity of HIV was the only factor associated with increased uptake of PMTCT services. Receiving the cash incentive intervention was strongly protective against LTFU and improved uptake of PMTCT services. However, the protective effects of 1) perceived severity of HIV and 2) perceived PMTCT benefit were not additive to the protective effect of the cash incentive.

| Question | Response options | Loss to follow-up | | |
|---|---|---|---|---|
| | | Intervention group: RD(95% CI) | Control group RD(95% CI) | IC (95% CI) |
| Now think about your baby. How serious a health problem would it be if your baby had HIV? | Very serious | -0.20 (-0.37, -0.03)* | -0.13 (-0.30, 0.04)* | 0.16 (-0.04, 0.35)* |
| | Other | -0.23 (-0.41, -0.04)* | 1 | |
| How likely or unlikely do you think it is that you will pass HIV on to your baby if you do not take any HIV drug? | Very likely | -0.22 (-0.39, -0.05)* | -0.15 (-0.32, 0.02)* | 0.19 (-0.01, 0.38)* |
| | Other | -0.25 (-0.44, -0.07)* | 1 | |
| | | Uptake of prevention of mother-to-child HIV transmission services | | |
| Now think about your baby. How serious a health problem would it be if your baby had HIV? | Very serious | 0.29 (0.10, 0.47)* | 0.19 ( 0.00, 0.37)* | -0.28 (-0.52, -0.04)* |
| | | 0.38 (0.16, 0.59)* | 1 | |
| *significant at alpha = 0.20. | | | | |

*[Risk differences of the conditional cash incentive intervention, perceived HIV severity, and perceived prevention of mother-to-child HIV transmission]*

**Conclusions:** A small cash incentive intervention, perceived severity of HIV, and perceived PMTCT benefit all had protective effects on retention in PMTCT care. However, the effects were not additive, suggesting competing mechanisms.

## THPEE551

### TOWARD ELIMINATION OF MOTHER TO CHILD-TRANSMISSION OF HIV: INTEGRATING HIV TREATMENT WITHIN MATERNAL AND CHILD HEALTH SERVICES FOR IMPROVED RETENTION OF MOTHER-BABY PAIRS AND OUTCOMES IN MOMBASA COUNTY, KENYA

D. Mwakangalu[1], A.H. Bunu[2], C. Mkanyika[2]
*[1]Pathfinder International, Mombasa, Kenya, [2]Pathfinder International, Nairobi, Kenya*
*Presenting author email: abunu@pathfinder.org*

**Background:** Traditionally, MCH clinics provide prophylaxis for PMTCT, but women and infants who need ART are usually referred to HIV clinics in another area of the facility or to another facility altogether. The need to attend separate clinics creates barriers to care, including increased cost, stigma, missed appointments, and even loss-to-follow-up.
**Description:** The USAID-funded APHIAplus Nairobi-Coast project, led by Pathfinder International, supported high-volume facilities in Mombasa county to integrate HIV treatment within MCH services from 2014 to 2015. Health workers were trained, and the project provided basic equipment, ARV and OI management drugs, standard government data collection tools, ongoing mentorship, and regular supportive supervision. Key integration components included: ensuring that all pregnant and breastfeeding women were tested; initiating immediate HAART for those found to be positive; follow-up of mother-baby pairs with infant testing during immunization visits; and mothers' viral load testing, according to Kenya's national guidelines. From 2014 to 2015, a total of 340 HIV-infected pregnant women and their HIV-exposed infants (HEI) were followed throughout the cascade until 18 months of age. Data from three facilities (Coast PGH, Port-Reitz and Tudor) was collected using standard government tools during the intervention to document lessons learned.

Tuesday 19 July
Wednesday 20 July
Thursday 21 July Poster Exhibition
Friday 22 July
Late Breaker Posters
Author Index

**Lessons learned:** HIV testing at ANC remained consistently high at 98% even before the intervention; yet, provision of HAART to HIV-positive women improved markedly—from 55% (98 of 178 women) in 2014 to 99% (187 of 189 women) in 2015. DNA PCR testing of HEI at six weeks improved from 70% in 2014 to 94% in 2015, with transmission rates at six weeks of 3% in 2014 and 1% in 2015. Follow-up of mother-baby pairs at 9 months also improved from 62% in 2014 to 87% in 2015, with transmission rates of 5% in 2014 and 2% in 2015.
**Conclusions/Next steps:** Integration of comprehensive HIV care and treatment services into MCH has the potential to: expand access to ART for HIV-infected pregnant and breastfeeding women; improve follow-up and retention of mother-baby pairs; and improve provision of prophylaxis for HEI. This could help achieve elimination of vertical HIV transmission. The project has since scaled up this intervention to other high-volume MCH facilities.

## THPEE552

### EARLY ART INITIATION AMONG HIV-POSITIVE PREGNANT WOMEN IN CENTRAL MOZAMBIQUE: PRELIMINARY FINDINGS FROM A STEPPED WEDGE RANDOMIZED CONTROLLED TRIAL OF AN OPTIMIZED OPTION B+ APPROACH

J. Pfeiffer[1,2], M. Napua[3], F. Chale[4], B. Wagenaar[1,2], R. Hoek[4], J. Greenberg-Cowan[2], C. Michel[4], J. Cowan[1,4], S. Gimbel[2,5], K. Sherr[1,2], S. Gloyd[1,2], J. Manuel[3], M. Micek[6], R. Chapman[7]
*[1]University of Washington, Global Health, Seattle, United States, [2]Health Alliance International, Seattle, United States, [3]Ministry of Health, Beira Operational Research Center, Beira, Mozambique, [4]Health Alliance International, Beira, Mozambique, [5]University of Washington, School of Nursing, Seattle, United States, [6]University of Wisconsin, Madison, United States, [7]University of Washington, Anthropology, Seattle, United States*
*Presenting author email: mnapua@hotmail.com*

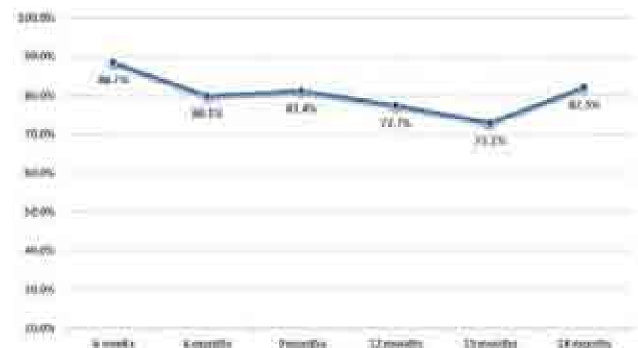
**Background:** The present randomized trial studied the performance of Option B+ in Mozambique, and evaluated an enhanced retention package in public-sector clinics.
**Methods:** 761 pregnant women tested HIV+, immediately initiated ART, and were followed to track retention across 6 clinics in Sofala and Manica Provinces, Mozambique from May 2014 - May 2015. Clinics were randomly allocated within a stepped-wedge fashion to intervention and control periods, with the intervention including:
(1) workflow modifications;
(2) enhanced patient tracking;
(3) adherence committees to systematize follow-up;
(4) active patient follow-up including home visits;
(5) text messages to patients; and
(6) improved counselling and supervision.
**Results:** During control periods, 52.3% of women returned within 10 days of their scheduled 30-day ARV pickup, compared to 70.8% of women in intervention periods (Odds ratio [OR]: 1.80; 95% Confidence interval [CI]: 1.05, 3.08). This difference was 46.1% control vs. 57.9% intervention at 60 days (OR: 1.82; CI: 1.06, 3.11), and 38.3% control vs. 41.0% intervention at 90 days (OR: 1.04; CI: 0.60, 1.82). We hypothesize effects at 90 days may be biased towards the null due to 149 women (19.6%) having clinic intervention initiation prior to their 90-day pickup. In pre-specified sub-analyses, birth prior to scheduled pickups was strongly associated with failure - women giving birth prior to their ARV pickup were 33.3 times (CI: 4.4, 250.3), 7.5 times (CI: 3.6, 15.9) and 3.7 times (CI: 2.2, 6.0) as likely to not return for ARV pickups at 30, 60, and 90 days, respectively. The intervention showed a trend towards higher effect sizes for retaining women who gave birth prior to ARV pickups at 30 days (OR: 5.0; CI: 0.52, 47.5) and 60 days (OR: 2.4, CI: 0.96, 6.2), but not 90 days (OR: 0.97, CI: 0.49, 1.9).
**Conclusions:** An enhanced retention package was effective at increasing retention at 30 and 60 days for women attending public-sector clinics. However, retention at 90 days under Option B+ was very low - only a combined 40% returned within 10 days of their 90-day ARV pickup. Targeted efforts to increase retention may be particularly important for women giving birth prior to their first few ARV pickups.

## THPEE553

### RETENTION-IN-CARE FROM DELIVERY THROUGH 18 MONTHS POSTPARTUM AMONG HIV-POSITIVE MOTHERS RECEIVING LIFELONG ART IN KIGALI, RWANDA

D. Ndatimana[1], G. Ndayisaba[1], E. Bobrow[2], M. Gill[2], L. Adair[3], L. Guay[2,4], P. Mugwaneza[5], A. Asiimwe[6], Kabeho Study Team
*[1]Elizabeth Glaser Paediatric AIDS Foundation, Kigali, Rwanda, [2]Elizabeth Glaser Paediatric AIDS Foundation, Washington DC, United States, [3]University of North Carolina, Chapel Hill, United States, [4]George Washington University, Milken Institute School of Public Health, Washington DC, United States, [5]Rwanda Ministry of Health, Kigali, Rwanda, [6]Rwanda University Teaching Hospitals, Kigali, Rwanda*
*Presenting author email: ebobrow@pedaids.org*

**Background:** The Kigali Antiretroviral and Breastfeeding Assessment for the Elimination of HIV (Kabeho) Study is an observational prospective cohort evaluation of the PMTCT program in Kigali following Option B+ implementation. Maternal retention-in-care from delivery (n=601) through 18-months postpartum was assessed.
**Methods:** Mothers enrolled from third trimester of pregnancy until two weeks postpartum from 14 high-volume sites were scheduled to attend monthly study visits, aligned with their routine PMTCT clinic visits. Health facilities conducted tracing within two weeks after missed clinic visits. If a mother did not attend a study visit within one week before or three weeks after the scheduled appointment, it was considered a missed study visit. Full retention was defined as attendance at 70-100% of scheduled visits, partial retention was 30-69.9%, and not retained in care was less than 30% of scheduled visits, excluding deaths.
**Results:** Between May 2013 and November 2015, PMTCT attendance was tracked with highest attendance at 6 weeks (88.7%), 9 months (81.4%) and 18 months (82.3%), corresponding to testing time points for HIV-exposed children. 80% of samples for early infant diagnosis were collected by 14 weeks. Thirty-four (5.8%) mothers terminated their infant's involvement; reasons included 26 relocations, 5 consent withdrawals, 3 other reasons, although women may have continued to attend PMTCT. Of the 601 women who gave birth to 608 infants, there were 32 infant deaths, with 18 of those deaths and one withdrawal before the 6-week visit.
A total of 458 (80%) women were fully retained at 18 months postpartum, 91 (15.7%) were partially retained and 31 (5.3%) were not retained in care. Overall, 121 (20%) women missed three consecutive visits throughout the study.
**Conclusions:** Retention-in-care was high, yet missed visits and thus, ART interruption remains an issue even in an urban area with easier access to facilities. Highest attendance was at testing times for HIV-exposed children.



*[Figure 1. PMTCT attendance from delivery through 18 months postpartum among Kabeho Study participants receiving lifelong ART]*

## THPEE554

### VIROLOGIC OUTCOMES AMONG WOMEN INITIATING ANTIRETROVIRAL THERAPY THROUGH THE OPTION B+ PROGRAM IN MALAWI: 6 MONTH RESULTS FROM THE PURE STUDY

M. Hosseinipour[1], C. Trapence[2], C. Stanley[1], F. Kasende[3], B. Kaunda-Khangamwa[4], V. Kayoyo[1], M. van Lettow[3], N. Rosenberg[1], H. Tweya[2], V. Sampathkumar[5], E. Schouten[6], A. Kapito-Tembo[4], F. Cataldo[3], L. Chiwaula[3], S. Phiri[2], PURE Consortium Malawi
*[1]UNC Project, Lilongwe, Malawi, [2]Lighthouse Trust, Lilongwe, Malawi, [3]Dignitas International, Zomba, Malawi, [4]Malaria Alert Centre, College of Medicine, Blantyre, Malawi, [5]mothers2mothers, Lilongwe, Malawi, [6]Management Sciences for Health (MSH), Lilongwe, Malawi*
*Presenting author email: minach@med.unc.edu*

**Background:** In 2011, Malawi launched Option B+, a program of universal ART treatment for pregnant and lactating women to optimize maternal health and prevent pediatric HIV infection. For best results, women need to achieve HIVRNA suppres-

sion. The Malawi ART program supports HIVRNA testing at 6 months as a first assessment of treatment success. We report the 6 month HIVRNA results for women participating in the PURE study.

**Methods:** The PURE study is an ongoing cluster-randomized trial evaluating three strategies for promoting uptake and retention in the ART program;
Arm 1: Standard of Care,
Arm 2: Facility Based Mentor Mothers, and
Arm 3: Community based expert Mothers.
Pregnant and Breastfeeding mothers were enrolled at the time of HIV diagnosis in the ANC or post-partum clinics and followed according to Malawi ART guidelines. Dried Blood spots for HIVRNA testing were collected at the 6 month visit. HIVRNA < 1000 copies/ml was considered HIV suppression. We evaluated risk factors for HIV suppression using Chi-2 and t-tests as appropriate.

**Results:** We enrolled 1272 women across 21 sites in Southern and Central Malawi. The majority enrolled while pregnant (86%), were WHO Stage 1(95%), and the median age was 26 years (IQR 22-31). At 6 months, 833/1272 (65%) had HIVRNA testing conducted. Among those tested, 80.5% (671/833) were suppressed. By intent to treat analysis (missing HIVRNA= failure), the overall cohort suppression rate was 53% (671/1272) but this likely underestimates suppression. There was no statistical difference in HIV suppression according to age (< 25 vs. 25 and above), WHO stage (Stage 1 vs. Other), or Pregnancy vs. Breastfeeding status.

**Conclusions:** The virologic suppression rate of 80.5% seen in our study is comparable to national estimates but is below proposed targets of 90% suppression while on ART. High virologic testing rates must be achieved to accurately determine HIV suppression rates. Increased effort to promote adherence in the Option B+ program is necessary to achieve optimal outcomes.

## THPEE555

### A SHIFT IN FOCUS: THE ROLE OF EARLY INFANT DIAGNOSIS INTERVENTIONS TOWARDS ACHIEVING 90-90-90

T. Alwar[1], R. Wafula[2], L. Oyiengo[2], J. Wamicwe[2], I. Mukui[2], U. Gilbert-Nandra[1], M. Sirengo[2]
*[1]United Nations Children's Fund, Nairobi, Kenya, [2]National AIDS & STI Control Program, Nairobi, Kenya*
*Presenting author email: teresa.alwar@gmail.com*

**Background:** Early infant diagnosis is a critical component of prevention of mother to child transmission (PMTCT) services that ascertains outcomes of PMTCT interventions through early identification of HIV exposed infants for prevention services and timely linkage to care and treatment of HIV infected infants. As countries strive to attain global 90-90-90 targets, early identification of children living with HIV is urgently required. To improve EID services, the National AIDS & STI Control Programme (NASCOP) with support from partners developed an early infant diagnosis (EID) website that service providers and program managers can use to track EID results at facility, sub-county, county and national level.

**Description:** The EID website is a real-time online portal through which patient level and systems data on the follow up of EID and PMTCT interventions is collected. A programmatic review was done for the period January - December 2014 using the aggregated data as collected from Kenya's 47 counties in the EID website. Only data entries that had complete documentation in each variable were analysed in this process.

**Lessons learned:** Approximately 59,416 infants tested in this period with 38,434 (64%) having completed documentation on the system. There was a 1:1 ratio of males and females tested. A total of 2504 (6.5%) infants were identified as HIV positive. Majority of the infants identified as HIV infected accessed testing in PMTCT/MCH (62.5%) and comprehensive HIV care (19%) settings with the fewer accessing EID services in out-patient departments, maternity wards and in-patient departments (9%, 6%, < 1%). However, higher yields of HIV infection were observed in those tested in the IPD, OPD and other unspecified settings respectively (41%, 25%,15%).

**Conclusions/Next steps:** This web-based platform has guided the country to effect a policy shift. Kenya is increasing investments for EID to in and out-patient service delivery points in addition to traditional PMTCT settings. Analysis of the EID data has further enabled the country to improve linkages to HIV care and treatment among children.

## THPEE556

### MOBILE PHONE TEXT MESSAGE INTERVENTION FOR PROMOTING HIV TESTING OF INFANTS BORN TO HIV-POSITIVE WOMEN IN RURAL COMMUNITIES, OSUN STATE, NIGERIA

P. Omoregie[1], A. Adelekan[2]
*[1]Society for Family Health, Benin, Nigeria, [2]University of Ibadan, Health Promotion and Education, Ibadan, Nigeria*
*Presenting author email: philas4real@yahoo.com*

**Background:** Early diagnosis of HIV in infants provides a critical opportunity to strengthen follow-up of HIV-exposed children and assure early access to antiretroviral (ARV) treatment for infected children. Infants born to HIV infected mothers are exposed to the virus and if infected, have a 50 percent chance of dying before they reach the age of two. This intervention therefore designed to determine the effectiveness of using text messages to improve HIV testing rate of infants born to HIV-positive women in Osun State, Nigeria.

**Description:** This intervention was carried out among 132 HIV-positive women who were recruited after delivery. Health Belief Model was used for the development of discussion guides and crafting of text messages. Infant HIV prevention education were discussed with participants' through text message for promoting post natal clinic attendance. Participants' were followed up for 12 months and the intervention was evaluated at 6 and 12 months. Data were analyzed using descriptive statistics, Chi-square and t-test.

**Lessons learned:** Mean age of participants was 24.2 ± 6.1 years and 83.9% had secondary education. Participants' knowledge of HIV prevention among infants increased from 5.8% to 30.2% within 6 months and 91.1% at 12 months. Post natal clinic attendance increased from 21.2% to 59.4% within 6 months and 91.9% after 12 months. Number of children identified as HIV positive increased from 1.7% to 4.3% within 1 year and 2.2% of the children died before the return of their DNA PCR results. Lack of information, fear of HIV testing, religious beliefs and transportation cost were identified as important barriers to postnatal clinic attendance. Most participants felt the study text messages were brief, caring, polite, encouraging and educative for promoting women bringing their children to clinic after delivery. Participants generally suggested that text messages should not mention HIV.

**Conclusions/Next steps:** Information and education are important to encourage and remind women to attend postnatal clinic, facilitate early infant HIV testing. Text message could be a useful tool to disseminate information and promote postnatal clinic attendance but such messages should not mention HIV/AIDS.

## THPEE557

### IMPROVED CLINICAL OUTCOMES AND REDUCED LOSS TO FOLLOW-UP AMONG PEOPLE LIVING WITH HIV (PLH) EXPOSED TO THE *NAMWEZA* INTERVENTION IN DAR ES SALAAM, TANZANIA

H. Siril[1], S. Kaaya[1], M.C.S. Fawzi[2], J. Kilewo[3], E. Mtisi[4], F. Mugusi[5], J. Todd[6]
*[1]Muhimbili University of Health and Allied Sciences, Mental Health and Psychiatry, Dar es Salaam, Tanzania, United Republic of, [2]Harvard Medical School, Global Health and Population, Boston, United States, [3]Muhimbili University of Health and Allied Sciences, Epidemiology, Dar es Salaam, Tanzania, United Republic of, [4]Afican Academy for Public Health (AAPH), Dar es Salaam, Tanzania, United Republic of, [5]Muhimbili University of Health and Allied Sciences, Internal Medicine, Dar es Salaam, Tanzania, United Republic of, [6]National Institute of Medical Research (NIMR), Mwanza, Tanzania, United Republic of*
*Presenting author email: neemasiril@gmail.com*

**Background:** Psychosocial factors have been linked with significant loss to follow-up among people living with HIV (PLH), and there is substantial evidence that psychoeducation improves clinical outcomes. However little has been reported on the effect of psychoeducation on retention of PLH to care. We describe results of the *NAMWEZA ("*Yes I Can") intervention on clinical outcomes and retention to care among PLH. *NAMWEZA* is based a novel program using an "appreciative inquiry" approach that promotes positive psychology and hope for PLH.

**Methods:** From 2010 to 2014, PLH participating in the *NAMWEZA* intervention in HIV care clinics in Dar es Salaam, Tanzania were matched with controls using a routine clinic electronic database and followed longitudinally for 24 months. Baseline sociodemographic, CD4, HBG, BMI and loss to follow-up information were collected with clinical outcomes measured every eight months. Changes over time for the clinical outcomes and loss to follow-up were calculated and compared through multivariate random affects models. Matching by age and stratified analysis were used to address confounding.

**Results:** Among 418 intervention and 406 control participants, 23% and 28% were severely immune suppressed (CD4 <200cells/mm$^3$), 5% and 11% had severe anemia (HGB< 8 mg/dl), 5% and 18% had severe malnutrition, respectively, at baseline. At the end of 24 months the mean CD4 count and hemoglobin increased significantly in the intervention group (p=0.009 and <0.0001, respectively). Obesity decreased

Wednesday 20 July
Thursday 21 July Poster Exhibition
Friday 22 July
Late Breaker Posters
Author Index

with time in the intervention group but was not significant at the end of 24 months (P=0.186). Loss to follow-up (LTFU) was three times higher in the control group as compared to the intervention.
**Conclusions:** PLH in the intervention group had improved clinical outcomes over time and very minimal LTFU during their active participation in the intervention. The results suggest the need for additional engagement of and support of PLH through psychoeducation programs such as *NAMWEZA* to supplement the current routine counseling in order to improve clinical outcomes and reduce LTFU in the long-term.

## THPEE558

### Option B/B+ strategy improves access to ART for pregnant women in South Africa

D. Moodley[1], T. Moodley[1], N. Maharaj[2], A. Hussain[2], B. Sartorius[3]
*[1]University of KwaZulu-Natal, Obstetrics and Gynaecology, Durban, South Africa, [2]Prince Mshiyeni Hospital, Department of Health, Durban, South Africa, [3]University of KwaZulu-Natal, Discipline of Public Health Medicine, Durban, South Africa*
*Presenting author email: moodleyd1@ukzn.ac.za*

**Background:** Universal multi-drug antiretroviral treatment in a fixed dose combination in pregnancy (Option B/B+) is a global strategy to eliminate mother-to-child transmission of HIV and to ensure that women requiring ART are initiated in pregnancy. The study aims were to assess whether change in ART guidelines increases the number of women accessing ART treatment and assess other benefits of universal triple drug treatment for HIV positive pregnant women in South Africa.
**Description:** We conducted a maternity audit at a large regional hospital in KwaZulu Natal, South Africa during July-December 2011 and January-June 2014. During 2011, women received either ZDV/sdNVP or D4T/3TC/NVP if their CD4+ count was < 350 cells/ml (Option A). During 2014, all HIV positive pregnant women were eligible for a fixed dose combination (FDC) of triple ARVs (TDF/FTC/EFV) (Option B/B+).
**Lessons learned:**

| Indicators | Jul-Dec 2011 | Jan-Jun 2014 |
|---|---|---|
| Number of Deliveries | 4644 | 5738 |
| Number of HIV Positive Women | 1732 | 2219 |
| Antenatal HIV Prevalence % (95%CI) | 37.3 (35.9-38.7) | 38.7 (37.4-39.9) |
| Women with CD4 Results Available | 879 (50.7%) | 394 (17.8%) |
| women with CD4<350 | 374 (42.5%) | 172 (43.9%) |
| Women eligible for ART and Initiated Triple ART in Pregnancy | 225 (60%) D4T/3TC/NVP | 148 (88.2%) FDC-TDF/FTC/EFV |
| Overall HIV+Pregnant Women Initiated Triple ART in Pregnancy n (%; 95%CI) | 225 (35.9%; 33.6-38.2) | 2104 (94.8%; 93.8-95.7) |
| Stillbirths >20 weeks gestation - HIV + Women | 59 (3.7%) | 57 (2.7%) |
| Preterm Births <37 weeks gestation - HIV + Women | 369 (22.8%) | 461 (21.9%) |

*[Policy Change and Women on ART and Birth Outcomes]*

**Conclusions/Next steps:** A universal strategy of a fixed dose combination of 3 antiretrovirals for all HIV positive pregnant women (Option B/B+) resulted in a significant improvement in the number of women who needed ART being initiated on therapy. An improvement in birth outcomes is also likely associated with the increased coverage of triple antiretroviral treatment amongst pregnant women. Postnatal followup would be needed to monitor maternal adherence to ART.

## THPEE559

### IYCF services integration into PMTCT services: processes and outcomes

F.E. Ssebiryo[1], R. Nakiwala[2]
*[1]SPRING, SI, Kampala, Uganda, [2]SPRING, Program, Kampala, Uganda*

**Background:** PEPFAR and other technical partners rolled out a campaign-Partnership for HIV Free Survival (PHFS) to test to provide optimal nutrition for infants and to protect those infants from HIV infection. PHFS postulated that HIV-free survival of infants born to HIV-infected mothers would greatly improve amidst effective antiretroviral drugs (ARV) services and recommended IYCF practices to reduce deaths due to malnutrition, diarrhea and pneumonia.
**Description:** SPRING worked with partners and MoH to roll-out the initiative in 3 districts of high HIV and Malnutrition prevalence working with HIV/AIDS care partners (STAR-EC/SW) to build capacity of district health staff to integrate IYCF services into on-going PMPCT services (Option B+). Through QI approaches, SPRING with partner USAID-ASSIST built structures of district quality improvement team (DQI) to conduct coaching of health workers in documentation, provision of standard care package to ensure early identification of HIV+ mothers, initiation and retention of mother baby pairs into ART care.
**Lessons learned:** The initiatives improved HIV cares services for HIV+ mothers and the exposed infants (HEI), through improved QI approach to service delivery by health workers, participation at district and national level through support supervision and learning sessions for cross learning. From FY13 third quarter to FY15 third quarter; antenatal HIV testing improved from 28% to 91%, initiation to ART form 75% to optimal (100%), testing HEI at 6 weeks (1st PCR) improved from 28% to 68%, IYCF counselling from 58% to optimal, nutrition assessment from a half to optimal, malnutrition from 8% to 1 percent. In addition, retention of mother-baby pairs improved form 41% to 99%, and HIV sero-conversation from 25% to 4 percent in FY15 first quarter.
**Conclusions/Next steps:** The integration of IYCF practices and HIV care services has potential to improve access to early HIV care for pregnant and lactating mothers, retention in care, reduce malnutrition and sero-conversion, and the health facility -community linkages facilitates uptake of health services. The QI approach to integration of IYCF and HIV care services encouraged participation of health workers besides coaching and learning sessions creates a platform for continuous learning for health workers and VHTs.

## THPEE560

### Evaluation of a cost effective tracking mechanism of HIV positive pregnant mothers until the baby is tested at 18 months, during 2015, India

A.S. Hegde[1], T. Mulik[2], R.S. Gupta[2], M. Ali[2]
*[1]WHO, National AIDS Control Organisation, Thane, India, [2]National AIDS Control Organisation, Basic Service Division, Delhi, India*
*Presenting author email: drashahegde@gmail.com*

**Background:** In India, out of the estimated nearly 28 million annual pregnancies, nearly 40% are accessing antenatal care services in the private sector . Out of the pregnant women availing ante natal care services in public sector, the coverage for HIV testing has increased steadily, from 40 per cent in 2004 to 85 per cent in 2015.
Prevention of mother to child transmission services are being scaled up but the monitoring of outcomes - whether new-born are free of HIV or require initiation of anti retro viral treatment - is not yet systematic or comprehensive. This results in largely unknown outcomes after years of gearing up the health system to prevent mother-to-child transmission. Operationally, the lack of systematic recording and data collection at facilities underpins a high rate of losses of mothers and new-born at various points of the referral chain.
**Description:** A format for tracking the pregnant women detected HIV positive in the HIV testing facility and followed up until the baby is 18 months was designed in 2013. All the 33 provincial functionaries involved were trained on the importance of correct and consistent date entry in the tracking format so that the gaps could be identified and corrective action taken at the earliest.
**Lessons learned:** Data generated from the format were analyzed for important PMTCT indicators, 94% of the positive pregnant mothers accessed care and support services and 95 % of the pregnant women were initiated on ART, as compared to 63% earlier. Spouse testing improved to 85% in 2015 from 50% earlier. ARV prophylaxis was given to 94% of HIV exposed babies in 2015. 85% of the Babies were tested for DNA PCR at 6 weeks in 2015 as compared to only 21% earlier. 67% of the HIV exposed babies were tested at 18 months of age.
**Conclusions/Next steps:** Proper documentation and strong tracking mechanism ensured 67% of HIV exposed babies were tested at 18 months of age by minimizing loss of follow up of HIV-exposed infants in the postnatal period. Improving the indicators of PMTCT cascade, has facilitated toward planning for elimination of new HIV infections in children in the country.

## THPEE561

### Mother-infant pair clinic and SMS messaging as strategies to improve retention for HIV+ pregnant women and mothers in Malawi: a cluster randomized control trial (the PRIME study)

J. Joseph[1], T. Tchereni[2], A. Jousset[2], A. Gunda[2], V. Mwapasa[3]
*[1]Clinton Health Access Initiative, Boston, United States, [2]Clinton Health Access Initiative, Lilongwe, Malawi, [3]University of Malawi College of Medicine, Blantyre, Malawi*
*Presenting author email: jjoseph@clintonhealthaccess.org*

**Background:** In 2011, Malawi's Ministry of Health adopted the Option B+ strategy, defined as immediate initiation of all HIV+ pregnant women on lifelong antiretroviral therapy (ART), in a step to combat mother-to-child transmission of HIV. However,

retention of pregnant women, especially through the end of the breastfeeding period, remains a significant problem. The Promoting Retention among Infants and Mothers Effectively (PRIME) study aims to evaluate the effectiveness of two innovative strategies: mother-infant pair (MIP) clinics and MIP plus SMS technology compared to the standard of care (SOC). MIP clinics combine HIV and routine maternal and child health services in the same place and same time while the third arm includes text messages to follow-up women who miss scheduled appointments (MIP+SMS).
**Methods:** PRIME is a three-arm stratified cluster randomized control trial conducted in 30 facilities across two districts. All HIV+ pregnant women attending antenatal care (ANC), regardless of ART status were eligible for enrolment. Subject enrolment and informed consent were conducted by facility staff while follow-up data were collected retrospectively by the study team from ANC and ART registers. The primary outcome of the study is retention in care 12 months post-partum. This abstract shows preliminary results on ART initiation, using generalized estimated equations accounting for clustering to examine any differences between study arms.
**Results:** 1,365 women were enrolled between May 2013 and December 2014 (SOC n=399; MIP n=469; MIP+SMS n=497). We compared ART initiations among ART-naïve women across arms (n=928). 88% in SOC compared to 91% and 93% in the MIP and MIP+SMS arms, respectively, initiated on ART. ART initiations on the first ANC visit date were also compared: 55%, 48%, and 53% in the SOC, MIP and MIP+SMS arms, respectively. No statistically significant differences were found between any two arms.
**Conclusions:** Intermediate results show similar ART initiation rates for ART-naïve women between all study arms. These rates for women were high, yet programmatic concerns arise as all women should be initiated at their first ANC visit under Option B+. This ongoing study will be completed in July 2016, at which point the impact of the interventions on retention in care will be examined.

## THPEE562

### COMPARISON OF HIV TESTING YIELD RATES FOR PREGNANT AND LACTATING WOMEN TOWARDS ZERO NEW PAEDIATRIC HIV INFECTION: EXPERIENCES FROM BWAILA DISTRICT HOSPITAL, LILONGWE, MALAWI

S. Phiri[1,2], E. Manda[1], H. Tweya[1], N. Rosenberg[3], S. Gugsa[1], J. Chiwoko[1], J. Chikonda[4], T. Chaweza[1], E. Kananji[1], E. Rambiki[4], C. Speight[1], The Lighthouse Group
*[1]Lighthouse Trust, Lilongwe, Malawi, [2]University of North Carolina, Medicine, Chapel Hill, United States, [3]University of North Carolina Project, Lilongwe, Malawi, [4]Lilongwe District Health Office, Lilongwe, Malawi*
*Presenting author email: samphiri@lighthouse.org.mw*

**Background:** In 2011, Malawi adapted Option B+, program in which all HIV-infected pregnant and lactating women are initiated on lifelong antiretroviral therapy regardless of WHO clinical stage or CD4 cell count threshold. This program has led to dramatic reductions in mother-to-child transmission (MTCT) among those diagnosed during pregnancy. However, MTCT may still occur in mothers who acquire HIV during the pregnancy period. We implemented an initiative to identify women who were newly diagnosed with HIV during labour and delivery.
**Methods:** We aimed at estimating proportion of women who were newly diagnosed with HIV during labour and delivery and estimate incidence in this population at Bwaila District Hospital. Bwaila is a large maternity hospital in Lilongwe, Malawi with 20,000 deliveries annually. All women in labour and delivery wards were tested for HIV following national protocol, regardless of past HIV testing history from Feb 2015 to December 2015. We calculated HIV incidence by assuming that each newly diagnosed HIV infected woman had been tested 4.5 months earlier with a range of 3.5 to 5.5 months earlier.
**Results:** A total of 4900 and 14322 women registered in labour & delivery ward during targeted and universal HTS, respectively. Referrals were 12.8% and 10% during targeted and universal HTS, respectively. Among 1,488 (30%) tested during targeted HTS, 20% pregnant, 10 were confirmatory tests, 17 (1%) were new HIV positive and incidence was estimated at 3.1 women per 100 per year (Range 2.5 - 3.9). Of 11,547 (81%) tested during universal HTS, 23% pregnant, 1025 (9.1%) were confirmatory tests, 66 (0.6%) were new HIV positive and the incidence was estimated at 1.4 women per year (range 1.4-2.2).
**Conclusions:** Universal testing was essential in establishing confirmatory results, in order to provide women with treatment packages for mother infant pair. However, targeted testing had a higher yield rate when compared to universal testing. A combination of routine third trimester testing during antenatal follow up, along with targeted testing focused on women that have not been tested within 3 months at time of delivery may be appropriate in resource limited settings where testing efforts could focus on other high yield points of care.

# INTERVENTIONS AT LARGE SCALE (COMMUNITY, DISTRICT, PROVINCIAL, REGIONAL, COUNTRY LEVELS) TO INCREASE UPTAKE OF AND RETENTION IN HIV SERVICES

## THPEE563

### ASSESSING THE IMPACT OF ADHERENCE FOR FACILITY-BASED, CLIENT-LED, AND COMMUNITY DRUG DISTRIBUTION POINTS ON ADHERENCE ACROSS THESE MODELS OF ART DELIVERY IN TASO-UGANDA

J. Mirembe[1], L. Ssali[1], T. Ayabo[2], S. Okoboi[3]
*[1]The AIDS Support Organization, Research and Evaluation, Kampala, Uganda, [2]Infectious Disease Research Collaboration, Research, Kampala, Uganda, [3]The AIDS Support Organization, Kampala, Uganda*
*Presenting author email: ayabo25@yahoo.co.uk*

**Background:** TASO offers three models for antiretroviral therapy (ART) delivery- facility-based, client-led ART (CLAD) and Community Drug Distribution points (CDDPs) in 11 centers throughout Uganda. In these models, patients are allocated based on their preferences, eligibility and elapsed time on antiretrovirals (ARVs). We assessed the impact of these three delivery models on ARV adherence across all the TASO centers.
**Methods:** We analyzed electronic adherence data of all patients who were active on ARV in each of the models of delivery between January 1, 2004 and March 31, 2014. We then computed adherence level for each model as the number of pills taken divided by the number of pills to take since last appointment. Adherence levels were categorized as poor adherence (< 85%), fair adherence (85-94%) and good adherence (>95%).
**Results:** We enrolled 62,129 patients, 37% were attending a TASO facility, 59% were attending CDDP and 4% were on CLAD. The adherence level was 87% for patients attending the facility and 88% in both patients at the CDDP and CLAD delivery models. Only 1% of the patients reported poor adherence across all the three models. Approximately 60% of TASO patients were on decentralized community model of ART delivery and achieved similar adherence levels compared to the facility model. Over a 12-month period of January -December, 2014, patient retention was measured at 78% in facility-based delivery compared to 88% in either community models.
**Conclusions:** The majority of TASO patients were attending a community model and reported comparable adherence levels across all the models. These results could be because of a clearly defined eligibility and exclusion criteria for being enrolled on each models.

## THPEE564

### TASK SHIFTING INCREASING ACCESS TO ART AND SUSTAINING TREATMENT SUCCESS IN A PERI-URBAN PRIMARY HEALTH CARE SETTING IN SOUTH AFRICA

M.M. Nzimande
*Cato Manor Clinic, Kzn Health, Mayville, South Africa*
*Presenting author email: mathombi@vodamail.co.za*

**Background:** The eThekwini District, in Kwa-Zulu Natal South Africa, has a high HIV prevalence, exceeding 40% among pregnant women. To scale-up anti-retroviral therapy (ART) to all those who require treatment, the South African Government implemented a task shifting strategy known as NIMART to enable nurses to initiate and manage ART. The purpose of this analysis was to demonstrate the impact that NIMART has had on access to ART and HIV treatment outcomes in peri-urban primary health care centre in the eThekwini District.
**Description:** Over 900 nurses have been trained on NIMART programme in the eThekwini District. In the Cato Manor Community Health Centre (CHC), 19 nurses and one master mentor (a nurse coaching NIMART nurses) were trained. Fourteen of these nurses have been independently initiating patients on ART since 2012. Patients with complications are referred to the two doctors based at the facility, but all the other cases are seen by nurses. Data on the number of people on ART and those retained in care from 2008 was compared to data from 2015 to determine the impact of NIMART.
**Lessons learned:** Between 2008 and 2012 before the introduction of the NIMART programme, about 3000 patients were receiving ART at the Cato Manor CHC,all initiated by doctors. Between 2012 and 2015, a further 6000 patients have been initiated on ART at Cato Manor CHC, with 66% of new initiations done by nurses. Importantly nurses have integrated HIV testing and ART initiation services in all departments within the clinic in contrast to referring AIDS patients to a dedicated vertical ART clinic. Nurses have gained a lot of experience and skills through NIMART mentorship and their skills in ART management continue to improve. Viral load suppression of patients in this facility is currently about 85%. Patients who are virally suppressed are provided with 3 months ART supply, reducing the number of visits in the facility.

**Conclusions/Next steps:** Treatment coverage in this community has increased substantially since 2012. The introduction of NIMART programme at the Cato Manor Clinic has shown that nurse initiated ART is feasible and sustainable and does not compromise treatment outcomes.

## THPEE565

### MULTI-DISEASE APPROACH TO HIV TESTING AND COUNSELING (HTC) OUTREACHES IN THE COMMUNITIES IMPROVES UPTAKE IN NIGERIA

E. Okey-Uchendu, S.S. Wakdok, Y. Olaifa, B. Olakunde
*National Agency for the Control of AIDS (NACA), Abuja, Nigeria*
*Presenting author email: ezinne41@yahoo.com*

**Background:** HIV Testing and Counseling (HTC) outreach is a critical service delivery approach that can improve coverage of HTC. It eliminates the barriers of access to facility based HTC and provides opportunity to serve different populations. Based on these benefits, the National Agency for the Control of AIDS (NACA), Nigeria coordinates HTC outreaches across the nation annually. However, community uptake of HTC gradually dwindles if other health needs are not addressed.
**Description:** In 2013, NACA adopted a strategic methodology to improve uptake of HTC during outreaches. A multi-disease approach was implemented for the outreaches in place of the single disease approach (HIV focused). In addition to HTC, blood pressure and sugar level checks were added to the package. Free medical consultations were also included and free drugs provided for treatment of minor ailments. Depending on what the community has identified as a need, items such as mosquito nets and water guard were also distributed.
**Lessons learned:** The implementation of multi-disease approach has improved uptake of HTC services. A four day HTC outreach as a single disease intervention applied in 3 states achieved an average coverage of 1458 persons per Local Government Area (LGA). A multi-disease approach to the delivery HTC services over four days in 20 states achieved an average coverage of 5022 persons per LGA. The screening for other medical conditions, free consultation and medications meets other health needs of the community. Collaboration with relevant health agencies and other programme partners is crucial for implementation of an efficient multi-disease approach.
**Conclusions/Next steps:** In addition to what NACA is already doing, there is a need to identify an effective strategy for successful linkage of positive clients at outreaches to HIV care and treatment.

## THPEE566

### PSYCHOSOCIAL SUPPORT INTERVENTIONS TO IMPROVE RETENTION ON ART IN PEOPLE WITH HIV IN LOW- AND MIDDLE-INCOME COUNTRIES: A SYSTEMATIC REVIEW

A. Penn[1], H. Azman[1], H. Horvath[1], K. Taylor[1], M. Hickey[2], J. Rajan[2], E. Negussie[3], M. Doherty[3], G. Rutherford[1]
*[1]University of California, Global Health Sciences, San Francisco, United States, [2]University of California, School of Medicine, San Francisco, United States, [3]World Health Organization, Geneva, Switzerland*
*Presenting author email: george.rutherford@ucsf.edu*

**Background:** In low- and middle-income countries (LMIC), better access to antiretroviral therapy (ART) has benefited people living with HIV (PLHIV) clinically and has decreased transmission. However, retention on ART can be a challenge for many patients. Psychosocial support interventions may help to improve retention in care and HIV clinical outcomes.
**Methods:** We used Cochrane Collaboration methods to search a range of databases for studies published between 1996-2015. Eligible studies could be in any language. Randomized controlled trials (RCTs) and observational studies with comparators conducted in LMIC were eligible for inclusion. We defined psychosocial support as patient support provided by non-physicians (including laypeople) to improve retention in ART care, after ART initiation. Our principal outcome of interest was retention as reported, or the combined outcome of lost-to-follow-up (LTFU) and death as reported in the studies. We considered lost to follow-up or death outcomes as the inverse of retention. We calculated relative risk (RR) with 95% confidence intervals and conducted meta-analysis when appropriate. We used the GRADE approach to assess evidence quality (EQ) across the literature for each outcome.
**Results:** One RCT from Mozambique and five cohort studies from Kenya, Mozambique, Peru, Rwanda and South Africa met inclusion criteria.
We identified three types of interventions:
1) community-based, multi-faceted treatment supporter programs;
2) facility-based adherence clubs; and
3) additional nursing care for high-risk patients.
One treatment supporter intervention was in caregivers of children with HIV; all other studies were in adults.

| Intervention | Studies | Outcomes and Duration | RR (95% CI) | Quality of Evidence |
|---|---|---|---|---|
| Community-based treatment supporter (adults) | 1 Cohort | Retention (60 months) | 1.07 (1.07 to 1.08) | Low |
| Community-based treatment supporter (adults) | 1 RCT | Retention (12 months) | 1.14 (1.02 to 1.27) | Moderate |
| Community-based treatment supporter (adults) | 2 Cohorts | Retention (12 months) | 1.10 (1.04 to 1.16) | Low |
| Community-based treatment supporter (children) | 1 Cohort | Retention (36 months) | 1.07 (1.03 to 1.11) | Low |
| Community-based treatment supporter (children) | 1 Cohort | Retention (24 months) | 1.05 (1.02 to 1.09) | Low |
| Community-based treatment supporter (children) | 1 Cohort | Retention (12 months) | 1.05 (1.02 to 1.07) | Low |
| Facility-based adherence clubs | 1 Cohort | LTFU or death (40 months) | 0.20 (0.12 to 0.33) | Moderate |
| Additional nursing care (adults) | 1 Cohort | LTFU or death (12 months) | 0.76 (0.66 to 0.87) | Low |

*[Summary Table of Included Studies]*

**Conclusions:** Multi-faceted, psychosocial support interventions are associated with increased likelihood of retention of ART patients in care, but evidence quality is generally low to moderate.

## THPEE567

### RAPID PROGRAM EVALUATION ON DETERMINANTS OF POOR RETENTION AMONG PLHIV ACCESSING CARE IN PERIPHERAL HIV CLINICS IN NIGER STATE, NORTH CENTRAL NIGERIA

C. Ogar[1], N. Nwokedi[1], A. Okafor[1], M. Dibor[1], Y. James[2], M. Dauda[3]
*[1]Management Sciences for Health, Programs-Community Care Services, Abuja, Nigeria, [2]Management Sciences for Health, Programs-Community Care Services, Minna, Nigeria, [3]Management Sciences for Health, Programs-Community Care Services, Ilorin, Nigeria*
*Presenting author email: oduchris2002@gmail.com*

**Background:** Retaining both pre- and current antiretroviral therapy (ART) patient population in care is a serious challenge for treatment programs in sub-Saharan African countries such as Nigeria. A retention analysis conducted showed poor retention rates across selected facilities. This Rapid Program Evaluation was aimed at identifying the underlying causes of this challenge, through a direct involvement of clients on ART in a programmatic survey and use findings to improve program interventions.
**Methods:** Two health facilities with retention rates lower than 50% out of sixteen health facilities supported by the USAID funded Pro ACT project implemented by MSH in Niger State, North Central Nigeria were selected for the survey. A short questionnaire was developed and administered to 55 clients (37 females and 18 males) currently on treatment who have defaulted in HIV clinic attendance in the last 6 months (between March and September 2015) and were tracked back to care. Data was analyzed using Microsoft Excel.
**Results:**
- Of the 54 clients interviewed, 50% clients had missed appointments at least once in the last three months. Raw data showed a higher female to male ratio (58% to 44%) of missed appointments.
- Findings showed that 75% of clients who missed appointments came from a distance less than 10km to the facility, making distance from the clinic a non-determinant for missing appointments.
- None of the clients who had missed appointments in the last three months reported being a member of a support group for people living with HIV (PLHIV).
- 33% of clients interviewed identified stigma as a reason for defaulting, 25% cited distance to health facilities, 17% stated lack of transportation, 17% other reasons and 8% refused to answer the question.

**Conclusions:** Although, the survey population is small, findings suggest a key reason for clients' defaults to be associated more with stigma than distance from HIV Clinic and lack of transport fare. Also, they offer some critical insight into programming gaps in Niger State, North Central Nigeria. Key to these programming gaps is the need to strengthen support groups for PLHIV and interventions that address stigma.

## THPEE568

### FORMATIVE RESEARCH TO DEVELOP HIV SELF-TESTING INTERVENTION AMONG NETWORKS OF MEN IN DAR ES SALAAM, TANZANIA: A MIXED METHODS APPROACH

D. Conserve[1], L. Kajula[2], T. Yamanis[3], S. Maman[4]
*[1]University of North Carolina, Health Behavior, Chapel Hill, United States, [2]Muhimbili of Health and Allied Sciences, Dar es Salaam, Tanzania, United Republic of, [3]American University, Disctrict of Columbia, United States, [4]University of North Carolina at Chapel Hill, Chapel Hill, United States*
*Presenting author email: sajokm@gmail.com*

**Background:** HIV testing serves as the gateway to HIV prevention and treatment but remains underused among men in Sub-Saharan Africa. HIV self-testing may reach men who do not use current HIV testing services. The purpose of this mixed methods study was to assess factors associated with HIV self-testing willingness among networks of men in Tanzania and the acceptability of an HIV self-testing intervention.

**Methods:** Data are from a midpoint survey of a cluster randomized controlled trial consisting of 989 men recruited from networks called "camps" in Dar es Salaam and 24 qualitative follow-up interviews conducted with men who have and have not tested for HIV. Binary logistic regression were performed to examine correlates of willingness to self-test. Participants' characteristics included were socio-demographics, HIV testing history, number of sexual partners, condom use, HIV risk perception, and network influence of two friends in the camp. For the qualitative data, we developed a codebook of a priori and emergent themes.

**Results:** 51% of the men had not tested for HIV in the past 12 months and 66% of those who had not tested were interested in self-testing. Logistic regression analyses showed that having a close friend in the camp who encouraged HIV testing was the only factor associated with men's willingness to self-test (OR: 2.07: 95% CI= 1.47 - 2.92). In the qualitative findings, participants provided more information on how their friends encouraged them by engaging in conversations about previous HIV testing experience and advising each other to test. Despite the network influence, participants reported they do not test for HIV for several reasons including lack of confidentiality and privacy. Participants believed that self-testing can overcome these barriers but expressed concerns regarding the lack of post-test counseling associated with self-testing. Recommendations for implementation included a campaign to raise awareness about HIV self-testing and provision of pre-and-post-test counseling via mobile cell phones for men with positive self-test results.

**Conclusions:** Findings from this study suggest that HIV self-testing is acceptable and interventions need to promote discussion about HIV testing among networks of men. Addressing men's concerns by offering post-test counseling and assistance with linkage to care is also necessary.

## THPEE569

### REFERRAL SYSTEM STRENGTHENING IN BOTSWANA: A STRATEGY FOR IMPROVING ACCESS TO CARE

T. Kaisara[1], O. Serufho[1], B. Mudanga[1], J. Irige[1], B. Segwabanyane[1], L. Daniel[2], M. Merrigan[1]
*[1]FHI 360, Maatla Project, Gaborone, Botswana, [2]Botswana Christian AIDS Intervention Programme, Prevention, Gaborone, Botswana*
*Presenting author email: logisticsix@gmail.com*

**Background:** FHI 360, through the USAID-supported Maatla Project, aimed to strengthen the capacity of civil society organizations (CSOs) to effectively address the HIV and AIDS epidemic in Botswana. Evidence indicates that weak referrals contribute to people defaulting treatment and high TB/HIV co-infection rates. Maatla partners including the Botswana Christian AIDS Intervention Program (BOCAIP), the Botswana Network of People Living with HIV and AIDS (BONEPWA+) and Kuru Health, were tasked with complementing the Ministry of Health's response through community based activities.

**Description:** A new two-way referral system linking CSOs and health facilities was implemented to strengthen the referral process within HIV care and treatment. Community workers promoted client retention in treatment through pre-antiretroviral therapy and adherence counseling, and community follow up of those late for treatment or lost to follow-up. Project strategies included: defining roles and referral linkages for each partner, developing district referral directories, developing community maps with referral sites, conducting district referral system workshops to build understanding of roles and working relationships in the referral network, developing referral standard operating procedures and harmonized referral tools, and an analysis framework. The project supported site-level referral network meetings where active referrals were verified with CSOs and Health facilities, allowing for individuals not completing referrals to be followed up.

**Lessons learned:** Strengthened collaboration among partners promoted a greater awareness of available referral services, improved client linkages and quality of care. Site-level referral meetings provided an opportunity to exchange feedback between CSOs and Health facilities, thus resulting in strengthened referral and improved quality of services. USAID SIMS visits revealed improved referral completion rate for individuals testing positive at partner testing sites and registering for care at government health facilities between 2014 and 2015 from 50% to 90%.

**Conclusions/Next steps:** Strong collaboration between CSOs and health facilities is critical for an effective referral system between the two. Community workers can be effective partners in HIV and AIDS referral systems by offering complementary services to government, and helping to ensure individuals are retained on treatment through peer support and community-based follow up.

## THPEE570

### USE OF BIOMETRIC MANAGEMENT SYSTEM: KEY TO ENHANCEMENT OF PERFORMANCE OF ANTIRETROVIRAL THERAPY CENTRES IN TAMILNADU, INDIA - A PIONEERING STEP

S. Bubby[1], S. Nagarajan[1], N. Sinnamuthu[2]
*[1]Tamilnadu State AIDS Control Society, Health & Family Welfare, Chennai, India, [2]Tamilnadu State AIDS Control Society, Health & Family Welfare Department, Chennai, India*
*Presenting author email: bubby.cst@gmail.com*

**Background:** Good adherence to antiretroviral (ARV) drugs is key to optimal viral-suppression and better treatment outcome. Factors like accessibility, job related hurdles, side-effects, sense of well-being, stigma & discrimination determine drug-adherence. In order to address this issue and improve programme performance, Tamilnadu State AIDS Control Society piloted Biometric Patient Management System in December 2015 in one center.

**Description:** 55 treatment units have been setup at government health facilities across 32 districts in Tamilnadu. As a pilot initiative, Biometric system has been implemented at Karur District's ART centre. Each patient's details along with thumbprint were recorded. Patients were contacted over phone to visit centre for registration irrespective of their due date. Proxy registration (by spouse/close relative) was permitted for bed-ridden/out-station patients with subsequent registry-updation of concerned patient after recovery/return.

**Lessons learned:** In 5 days, all patients enrolled at Karur District's ART Centre were registered in biometry with no difficulty.
The system found 2 duplicate registrations, lost-to-follow-up, gave benefit of pill-collection from other centers as per patient's convenience. It also alerted staff on patients who were due but have missed. SMS alerts are sent to patients for CD4 test & pill-collection.

| Category | Male | Female | Transgender | Male Child | Female Child | Total Registration |
|---|---|---|---|---|---|---|
| Pre ART | 30 | 75 | 0 | 0 | 0 | 105 |
| On ART | 769 | 942 | 2 | 19 | 10 | 1742 |

*[Registration Details]*

**Conclusions/Next steps:** By march 2016, all ART facilities in the State will be linked to biometry & all patients'-information will be available at State. Patients will have convenience of availing service from any Centre in the State, if need arises. All duplications can be segregated and actual HIV burden in the State ascertained.
Proxy registration is beneficial to bed-ridden patients & those on long-distance travel. Defaulters' number will reduce drastically. These pave way to improvement in drug-adherence leading to sustained viral suppression for longer duration. Opportunistic infection episodes will decline.
1st line failure cases will reduce thereby reducing demand for more costly 2nd line drugs. Thus financial burden on the government will be lessened.

## THPEE571

### ACHIEVING THE FIRST 90 OF THE 90-90-90 TARGET: EFFECT OF HIV TESTING DEDICATED CADRE IN MALAWI

Z. Chirwa[1], L. Oseni[2], F. Kayambo[1], A. Mtimuni[2], A. Ngosi[2], T. Kalua[3]
*[1]Jhpiego Malawi, SSDI HIV Expansion Program, Lilongwe, Malawi, [2]Jhpiego Malawi, Monitoring & Evaluation, Lilongwe, Malawi, [3]Ministry of Health, Malawi, HIV & AIDS Department, Lilongwe, Malawi*
*Presenting author email: czenga@hotmail.com*

**Background:** Malawi adopted the UNAIDS 90-90-90 treatment target towards ending the AIDS epidemic. A major bottleneck impeding achievement of the first 90 (90% of all people living with HIV know their status) is inadequate Human Resources for HIV Testing and Counselling (HTC). The Health Surveillance Assistants (HSAs) in charge of HTC have primary tasks in the communities, hence their contribution to HTC in the facilities is suboptimal.

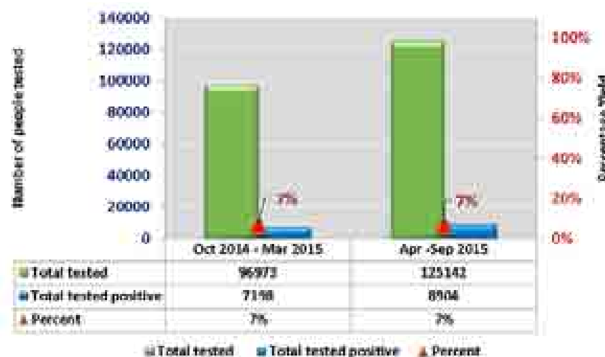
**Description:** To increase access to HIV-diagnosis, the Ministry of Health recommended establishment of a dedicated HIV-testing cadre - HIV Diagnostic Assistants (HDAs) - to be responsible for HTC, viral load testing, and early infant diagnosis. Jhpiego recruited 106 HTC volunteers as HDAs in April 2015, and deployed them to its four focus districts following intensive training. One to four HDAs were deployed to each of 52 facilities, depending on client volume and service delivery points. Monthly HTC data were tracked for a 12-month period (October 2014 - September 2015). Mean HTC uptake was computed for 2 periods: 6 months before and after HDA deployment. Two mean t-test was used to test for difference between the means for the 2 periods.
**Lessons learned:** A total of 208,067 clients were tested in the one-year period exceeding the annual target (183,172) by 27%. Monthly HTC uptake continuously increased as more HDAs were recruited. There was a statistically significant 20% increase in mean HTC uptake between the pre-HDA (15,755) and since-HDA period (18,923), p=0.041. Although deployment of HDAs increased numbers tested, the HIV positive yield remained the same at 7%.



[Figure 1: HIV Testing and Yield Before and After HDA Deployment]

**Conclusions/Next steps:** Establishing a dedicated HIV-diagnostic personnel increased the number of people tested and consequently diagnosed, thus increasing Malawi's potential to achieve the first 90-target. To increase the positive yield, HDAs will also conduct targeted testing among key populations, through outreach services and moonlight testing in their hubs and hot spots.

## THPEE572

### COMMUNITY CLIENT-LED ART DELIVERY MODEL AS A TOOL FOR IMPROVING TREATMENT OUTCOMES AMONG HIV-POSITIVE CLIENTS TASO SOROTI EXPERIENCE, UGANDA

P. Anoku[1,2], S. Okoboi[3]
*[1]The AIDS Support Organization, Medical, Soroti, Uganda, [2]TASO Kampala, Program Management, Kampala, Uganda, [3]TASO, Research, Kampala, Uganda*
*Presenting author email: paddyanoku@gmail.com*

**Background:** Studies indicate that keeping HIV positive individual in care improves ART outcomes, however most programs suffer with the issue client retention in care, TASO Soroti adopted a community Client ART Distribution Model increase sustainability of ART delivery, decongest facility clinics to enable trained staff to effectively support the novices on ART and involve clients in their monitoring to maximize retention in care.
**Description:** In TASO the CCLAD model started by identifying leaders from the existing Community Drug Distribution Points (CDDPs) who were trained in ART Basics, using a criteria based on CD4≥500, groups of 10 clients coming from the same village were formed in the community, TASO counselor delivers drugs to the CDDP nearest to the clients, the CCLAD leader receives the drugs and transports them to an agreed nearest point in the village, clients contribute a fee of 2,000 UGX for the service, 25% of which is used by their leader as transport cost. If a client does not come for his/her refills the leader follows up with the client, fills a report and returns to TASO for action at the same point the client conduct peer counseling. The CCLAD leaders are support by the expert clients, this model enables clients networks draw synergies for prevention care and support at community level.
**Lessons learned:** Task shifting and capacity building of clients in leadership, has increased clients ownership of the model.
Good adherence levels of as 97% of clients on ART had viral suppression to less than 5000 copies per mil in period of evaluation, over 80% of the none suppressing clients are found at the facility, 97% (4/138) of infants born to HIV positive Mothers tested negative for HIV at 18 months, 90% of the clients interviewed have a great sense of ownership, retention in to care at 96.6%.
**Conclusions/Next steps:** The Community Client ART Delivery model is a sustainable, affordable and cost effective model for improving retention and achieving viral load suppression among clients on ART while promoting ownership of HIV/AIDS interventions by People Living with HIV and AIDS.

## THPEE573

### PANGAEA GLOBAL AIDS AND THE CLINTON HEALTH ACCESS INITIATIVE (CHAI) BEST PRACTICES CASE STUDY SERIES: THE ACADEMIC MODEL PROVIDING ACCESS TO HEALTHCARE (AMPATH): PERPETUAL HIV COUNSELING AND TESTING (PHCT) PROGRAM

M. Rejbrand[1], S. Phanitsiri[2], S.K. Ndege[3], P. Braitstein[4], I. Mahaka[5], C. Duncombe[1]
*[1]Pangaea Global AIDS, Oakland, United States, [2]Clinton Health Access Initiative (CHAI), New York, United States, [3]Moi University, College of Health Sciences, School of Public Health, Department of Epidemiology, Eldoret, Kenya, [4]University of Toronto, Dalla Lana School of Public Health, Toronto, Canada, [5]Pangaea Global AIDS, Harare, Zimbabwe*
*Presenting author email: mrejbrand@pangaeaglobal.org*

**Background:** In partnership with the Kenya Ministry of Health, AMPATH provides HIV care and treatment in eight counties in Western Kenya with a catchment population of 3.5 million people. The Pangaea/CHAI project team visited AMPATH in May 2014 to perform an in depth review and costing analysis on AMPATH's Perpetual HIV Counseling and Testing (PHCT) and Find, Link, & Treat, & Retain (FTLR) programs in Kosirai & Bunyala, Kenya. The site visit included meetings with representatives from the Ministry of Health, AMPATH and Moi University Hospital staff, and field visits to interview counselors and clients. The team also reviewed routine PHCT monitoring & evaluation data, and commodity data to better understand resource needs for the program.
**Description:** AMPATH's PHCT program is a component of its FLTR model. This program assigns a PHCT counselor to a set location for two years and tasks them to go door-to-door to counsel and test for HIV, link to treatment, perform screenings for diabetes, tuberculosis, blood pressure, treat children for intestinal worms, malaria education and check childhood vaccination records. The PHCT counselors use smart phones to capture individual and household information that is uploaded to the AMPATH Electronic Medical Record Systems.
**Lessons learned:**

| Statistics-at-a-Glance | 2013 Kosirai Patient Numbers | 2013 Bunyala Patient Numbers |
|---|---|---|
| 2013 Total Catchment Population & HIV Prevalence | 68,000 / HIV Prevalence: >1% | 67,669 / HIV Prevalence: 8.3% |
| Number of Households Reached | 967 | 2,778 |
| Number of Individuals Reached | 3,223 | 11,640 |
| Number of Counselors | 5 | 7 |
| Number of Individuals Tested for HIV | 1,981 (715 New Testers) | 7,102 |
| Number of HIV+ Individuals Identified | 32 | 788 |
| % Linked to Care | 56% | 87% |
| Cost Per Person Tested | $15.41 | $5.46 |
| Cost per HIV positive Individual Identified * Costs in Kosirai were higher due to low HIV prevalence and fewer individuals tested. | $955 | $50 |

[Statistics-At-A-Glance]

**Conclusions/Next steps:** AMPATH has implemented an innovative approach of using the home setting as an entry point for the identification and provision of health care needs and services. This model successfully integrates HIV testing and counseling with testing for Non Communicable Diseases, thus increasing the value of the client interaction and 'normalizing' HIV testing, care, and support. Another success of this model is that through the use of handheld devices the ability to track real-time progress of individuals' medical needs and linkage to care is improved.

## THPEE574

### FAST-TRACK CITIES INITIATIVE TECHNICAL IMPLEMENTATION: USING A FIVE POINT TECHNICAL STRATEGY AS PART OF EFFORTS TO ACHIEVE 90-90-90 AND ZERO DISCRIMINATION

R.M. Granich[1], S. Ravishankar[2], S. Gupta[3], I. Sidibe[2], S. Karmaly[4], B. Audoin[5], B. Young[6], J.M. Zuniga[2]
*[1]IAPAC, Chief Technical Officer, Washington, United States, [2]IAPAC, Washington, United States, [3]IAPAC, Delhi, India, [4]IAPAC, Paris, United States, [5]IAPAC, Geneva, United States, [6]International Association of Providers of AIDS Care, Denver, United States*
*Presenting author email: sravishankar@iapac.org*

**Background:** An increasing number of people live in urban settings with a large proportion of the global HIV burden. Launched on December 1 2014, the Fast Track Cities Initiative (FTCI) involves 61 Cities from all regions and is focused on achieving

the 90-90-90 targets and zero stigma by 2020. FTCI is a global partnership between the International Association of Providers of AIDS Care (IAPAC), Joint United Nations Programme on HIV/AIDS (UNAIDS), United Nations Human Settlements Programme (UN-Habitat), and the City of Paris, in collaboration with local, national, regional, and international partners and stakeholders.
**Description:** IAPAC has developed a 5 point technical implementation strategy focused on the following areas: process and oversight, program interventions, monitoring and evaluation, communications, and resource mobilization (Figure 1). The strategy serves as the framework for City driven strategies, will be cloud-based as part of the FTCI web portal and dashboards, and will improve through "wiki" contributions from individual Cities as they gain and contribute their implementation experience. The FTCI Implementation plan includes a strong monitoring and evaluation component focused on 90-90-90 and other objectives, and includes a global software platform with individual city dashboards that will allow Cities and their citizens to communicate and measure implementation progress.
**Lessons learned:** Having a clear implementation strategy with a limited number of domains has provided a strong framework for the Initiative. While many Cities already have an HIV response plan, the FTCI implementation strategy provides a common language and objectives. Web-based monitoring and evaluation provides a platform to measure global and individual city progress towards 90-90-90 and other objectives.
**Conclusions/Next steps:** FTCI now has 61 Cities and through technical support for the Cities, the Initiative is benchmarking and guiding the HIV response across the network of Cities. Many Cities have already made significant strides toward realizing the FTCI objectives.

*[Figure 1: FTCI technical implementation plan and objectives]*

## THPEE575

### EFFECTIVENESS OF COMMUNITY HEALTH EXTENSION WORKERS (CHEWS) IN CONTRIBUTING TO THE OVERALL UNAIDS GOAL OF 90-90-90: A PILOT PROJECT IN SOUTH-WESTERN UGANDA

S. Asiimwe[1,2], A. Arinaitwe[1], O. Tumusiime[2], B. Turyamureeba[1]
[1]*Integrated Community Based Initiatives (ICOBI), Kabwohe-Itendero, Uganda,*
[2]*Kabwohe Clinical Research Center (KCRC), Kabwohe-Itendero, Uganda*
*Presenting author email: asiimwes@icobi.or.ug*

**Background:** Low levels of HCT uptake have predominantly been attributed to structural and service barriers, including limited choices to HIV Counselling and Testing (HCT) approaches. The goal of this pilot is to evaluate the effectiveness of lay Community Health Extension Workers (CHEWs) in accelerating community access to integrated testing for HIV/AIDS, Malaria and Hepatitis B. We report on the HIV results, 3 months into this 6 month pilot.
**Methods:** Working with the Sheema District Health Office, we identified and provided 5 day training to a team of 62 lay persons (CHEWS) from 31 parishes of Sheema District, South-Western Uganda in September 2015. Training covered basics of HIV/AIDS, testing using rapid tests, reporting and referral (linkage for the HIV positives) as well as key prevention messages. CHEWS were each provided a $30 monthly stipend; a field testing kit that included: a bag, umbrella, gumboots, bicycle, reporting booklet, HIV testing kits and other appropriate biosafety materials. Supplies were replenished monthly. Home based HCT began October 1, 2015 and still ongoing. Routine HCT is provided at the 8 district health facilities in the area (1 Hospital, 2 health center level IV, and 5 heath center level IIIs).
**Results:** From October - December 2015, District health facilities in Sheema have tested 3,884 clients with 1,486 (38%) males and 2,398 (62%) females. Of these 217 (9.0%) tested HIV positive and 31(14.2%) were linked to HIV care services. CHEWs in the same period covering the same area tested a total 23,940 people of whom 11,292 (47%) were males and 12,648 (53%) female. 498 (2.1%) of the people tested by CHEWS were HIV positive and 316 (63.1%) were linked to care.
**Conclusions:** Findings demonstrate the high utility of CHEWs in accelerating access to integrated testing, including HCT. CHEWs can be a great support to the health care system in Uganda to enhance attainment of UNAIDS goals of testing the majority of the people and link them to care timely at a relatively low cost. CHEWs are able to reach more men and also link most people tested to care than routine HCT at public health facilities.

## THPEE576

### USING INTERPERSONAL COMMUNICATION APPROACHES TO PROMOTE EMTCT: LESSONS FROM UGANDA

A.M. Mukundane[1], E. Kassenyi[1], R. Mwagale[2]
[1]*FHI 360, Communication for Healthy Communities, Kampala, Uganda,* [2]*Uganda Health Marketing Group, Communication for Healthy Communities, Kampala, Uganda*
*Presenting author email: amstromuk@yahoo.com*

**Background:** Most of the recent studies indicate that a considerable number of new HIV infections in sub Saharan Africa occur within stable relationships. In Uganda HIV prevalence among the married is estimated at 7.4% (UAIS, 2011) of which a significant proportion are sero-discordant and in reproductive age group. This therefore means that more couples are grappling with the challenge of having HIV free babies. Although elimination of mother to child transmission of HIV programs have shown considerable potential, couple HCT uptake for elimination of mother to child transmission of HIV (eMTCT remains very low.
This paper describes undertaken by Communication for Healthy communities (CHC) a USAID supported project in promoting couple HCT for eMTCT.
**Description:** In 2015, a campaign promoting eMTCT was launched in western Uganda under the theme; Test. Know Disclose together. CHC used a two pronged approach consisting of interpersonal communication (IPC) for behavioral change. Community champions that included Village Health Teams, media, cultural and religious leaders were trained and equipped with tools to conduct discussions to promote eMTCT. These discussions were supplemented with edutainment activations at community level as they received services.
**Lessons learned:** Within one month of intense IPC activities in the communities, there was an increase in the uptake of eMTCT services by about 30%. For instance at Kigorobya HCIV couple HCT for eMTCT rose from 48 to 137, Kisiita HCIII from 27 to 49 within a month growing steadily over a year compared to previous years. From these interventions it was established that IPC can be effective if the messaging is focused and specific to a particular audience. Secondly, the intensity of the message is critical and that community resources need to provide standardized and accurate information on available services.
**Conclusions/Next steps:** Based on the positive outcomes of these interventions, there is need to consolidate on the gains while expanding on the reach and scope using region specific data. The capacity of the community resource persons needs to strengthened to monitor and document outcomes but also use data to focus their IPC interventions.

## THPEE577

### NEW HEIGHTS FOR DIFFERENTIATED CARE: 3 YEARS OF COMMUNITY ART GROUPS IN THE MOUNTAINS OF RURAL LESOTHO

M. Vandendyck, A. Nyibizi, M. Motsamai, G. Van Cutsem, A. Shroufi, H. Duvivier, M. Kuleile, T. Decroo
*Médecins Sans Frontières, Cape Town, South Africa*
*Presenting author email: amir.shroufi@doctors.org.uk*

**Background:** Lesotho, a mountainous country with approximately 2,171,000 inhabitants, has the third highest HIV prevalence in the world. The Lesotho ART programme suffers from high loss to follow up and treatment scale up has been plagued by chronic understaffing, medicines shortages and patient access challenges. Community ART groups (CAGs) allow stable patients take turns to collect antiretroviral therapy (ART) for fellow group members who only attend clinics once per year, allowing for VL measurement. We present outcomes from 3 years of CAG implementation in rural Lesotho.
**Methods:** In this retrospective cohort study, we compare outcomes among CAG members with stable adult patients on ART at 9 clinics in rural Lesotho. Patients eligible to join CAGs were those retained in care after > 6 months on ART with a CD4 above 350 cells/µl. Outcomes of CAG members were analysed using survival analysis. Loss to follow-up (LTFU) was defined as missing a scheduled appointment by three or more months. A semi structured interview was used to explore perceptions of CAGs among a purposeful sample of patients and nurses.

Late Breaker Posters

Author Index

**Results:** Between September 2012 and September 2015, 888 stable ART patients enrolled in a CAG at the sites of interest. There were 2,326 comparable stable ART patients in conventional care during this period. Retention at 12 months for CAG participants was 85% compared to 62% among non CAG patients. Virological suppression among those retained in CAGs at 1 year was 79%. Qualitative data show how CAG membership reduced the time and money spent by patients, and enhanced adherence, allowing patients to remain on ART. Clinicians working in the study area also reported a workload reduction following CAG introduction.
**Conclusions:** Patients in CAGs had a higher retention in care than patients in conventional care and good virological suppression. In Lesotho where almost 60% of people live below the poverty line and access to clinics is particularly challenging, CAGs have the potential to remove barriers to access ART and thus facilitate ART scale up in this very constrained healthcare system.

## THPEE578

### UPTAKE OF HIV COUNSELING AND TESTING IN A MOBILE CLINIC PROGRAMME WITHIN THE INNER CITY OF JOHANNESBURG: A CROSS-SECTIONAL STUDY

P. Ngassa Piotie[1], M. Meyer[2], M. Nkwanyana[2], S. Malungwene[2], P. Mapako[2], J. Mwansa[2]
*[1]Wits Reproductive Health and HIV Institute, Implementation Science, Johannesburg, South Africa, [2]Wits Reproductive Health and HIV Institute, Johannesburg, South Africa*
*Presenting author email: pngassa@wrhi.ac.za*

**Background:** The success of the newly adopted UNAIDS 90-90-90 strategy relies heavily on accessible HIV counselling and testing (HCT) services. Numerous studies conducted in sub-Saharan Africa have shown that mobile services increase uptake of HCT when compared to fixed clinics and are able to access hard-to-reach populations. The aim of this study was to describe the service delivery model implemented by the Wits Reproductive Health and HIV Institute (RHI) Mobile Clinic Programme, the populations served and the characteristics of the clients who accessed the service.
**Methods:** This was a retrospective cross-sectional study in the inner City of Johannesburg (CoJ). The Mobile Clinic Programme utilised two vans that were dispatched to highly populated areas including Hillbrow, Berea, Braamfontein, Mayfair, Rosettenville, and Newtown in the inner-city. HCT was offered to clients along with other services including tuberculosis (TB), diabetes, hypertension and STI screening and management. Demographic and service utilisation data were routinely collected from clients who visited the mobile clinics between January 2013 and December 2015. Descriptive statistics were calculated.
**Results:** Between January 2013 and December 2015, 4557 clients accessed the mobile clinic within the inner City. Clients were predominantly males (55%) and black (83%). The mean age was 31.2 (±10.3) years old, ranging between 13 and 85. Adolescents (13-19 years) and young adults (18-32 years) represented 63.7% of the study population. HCT was offered to 94% of clients with 7% (273/3857) testing HIV-positive. Approximately 39% of clients were either first time testers or had their last HIV test more than 12 months ago. Linkage to care was facilitated for patients requiring antiretroviral treatment; however poorly documented.
**Conclusions:** The Wits RHI mobile clinics provides a great opportunity to increase HCT uptake, to find first-time testers and to access those populations who do not typically access services at fixed clinics i.e. males, adolescents and young adults. In order to meet the UNAIDS 90-90-90 targets, strategies adopting mobile outreach should be tested and scaled. To ensure continuity of care, linkage to care systems within this service delivery model must be strengthened.

## THPEE579

### UPTAKE OF DIFFERENTIATED MODELS OF ART DELIVERY IN UTHUNGULU KWAZULU-NATAL

H. Duvivier[1], R. Uenishi[2], T. Solomon[3], S.J. Steele[4], A. Shroufi[5], G. Van Cutsem[5], G. Arellano[3], L. Dlamini[6], S. Baert[7]
*[1]Médecins Sans Frontières, Patient Support, Cape Town, South Africa, [2]MSF, Patient and Community Support, Eshowe, South Africa, [3]MSF, Eshowe, South Africa, [4]MSF, Epidemiology, Cape Town, South Africa, [5]MSF, Cape Town, South Africa, [6]Department of Health KZN, Pietermaritzburg, South Africa, [7]Médecins Sans Frontières, Southern Africa Medical Unit, Cape Town, South Africa*
*Presenting author email: msfocb-eshowe-htc@brussels.msf.org*

**Background:** In 2012, Kwazulu-Natal Department of Health supported by Médecins Sans Frontières implemented differentiated models of ART delivery aiming to decongest health facilities and support adherence and retention in care for stable patients on ART in uThungulu district. A mix of ART delivery strategies were offered: standard care (2-monthly clinical consultation and ART collection), facility (FC) and community clubs (CC, lay counsellor-led groups of up to 30 patients meeting 2-monthly for ART collection and yearly for clinical consultation) and/or Community ART groups (CAG, patient-lead groups of 3 to 8 patients rotating 2-monthly for ART collection for all members and yearly clinical consultation).
By 2015, FC were implemented in 8 clinics, CC in 2 clinics and CAGs in 4 clinics.
In order to further adapt the roll-out of these models, we assessed the uptake of patients per model.
**Methods:** Routine data was abstracted from national electronic database (Tier.net) and models' specific registers, marking the choice per patient per model.
**Results:** Out of 7267 stable patients on ART, 1512 (21%) opted for a grouped model of ART delivery.
In the 3 urban clinics, out of 4743 stable patients, 897 patients (19%) enrolled in grouped model of ART delivery. Amongst them, 864 (96.3%) opted for FC, 20 (2.2%) for CC and 13 (1.4%) for CAG.
In the 5 rural clinics, out of 2524 stable patients, 616 patients (24.4%) opted for a grouped model of ART delivery. Amongst them, 417 (67.7%) opted for FC, 91 patients (14.8%) for CC and 108 (17.5%) for CAG.
**Conclusions:** The high uptake of differentiated models of ART delivery shows they can decrease the burden on the health system and patients. Preferences for certain models depend on the setting; more patients in rural settings opted for models of ART delivery in the community. Not all patients want to join a group, hence the need to develop improved individual ART delivery strategies such as fast lane spaced appointment systems.

## THPEE580

### ACCESSING IMPACT OF NURSES IN ART INITIATION IN RURAL KWAZULU-NATAL PROVINCE, SOUTH AFRICA: A PILOT STUDY

M.E. Zuma[1], A. Malaza[2], I. Maina[3]
*[1]KZN Department of Health, Pietermaritzburg, South Africa, [2]Health Systems Trust, Pietermaritzburg, South Africa, [3]UNAIDS South Africa, Pietermaritzburg, South Africa*
*Presenting author email: makhozum31@gmail.com*

**Background:** Studies have proven that antiretroviral therapy (ART) reduce chances of transmission, improves longevity of people living with HIV and is cost-effective. It is important to put in place strategies to promote timely ART initiation. The purpose of this study was to assess the impact of nurses initiating and managing ART on access to ART services in rural KwaZulu-Natal.
**Description:** The pilot study was undertaken at a rural primary health facility in Umgungundlovu District in Kwazulu-Natal South Africa between 2009 and 2012. A retrospective review of HCT and CD4 count registers for the past quarter, and data analysis of ART initiation pre and post Nurses Initiated Management of ART. In-depth interviews were conducted using an open ended questionnaire between August - December 2008, administered on clients selected at random at the ART clinic. The questionnaire included assessed time taken between HIV test and CD4 count and location of both services in the clinic. Data were analysed using content analysis and common themes identified were validated through an independent review of the interview transcripts. Following the responses, a Quality Improvement team was formed and HCT was integrated into the ARV clinic where CD4 count, clinical staging and ART initiation is done. Community health education on benefits of treatment was carried out in partnership with traditional healers and community care givers.
**Lessons learned:** Stigma and discrimination and consultation with tradition healers when sick were identified as reasons for low service uptake. Data analysis revealed that with the clinics and nurses accredited to provide ART, the overall number of people initiated on treatment by one nurse steadily increased from 51 in 2009 to 227 in 2012. In 2008, all initiated clients were women. Immediately after the community health education, uptake by men increased to 51.4% in 2009 then declined to 44.4% in 2012. Average waiting time for clients at the clinic was reduced from 3 hours to 1 hour.
**Conclusions/Next steps:** While preliminary, this pilot study showed that integrating services, using nurses to initiate ART treatment and community health education can improve ART initiation. Partnership with traditional healers is also important in getting men to initiate on treatment.

## THPEE581

### IMPROVING ACCESS TO CHRONIC MEDICATION USING THE CENTRAL CHRONIC MEDICINE DISPENSING AND DISTRIBUTION (CCMDD) IN UMZINYATHI DISTRICT, KWAZULU-NATAL

S. Mazibuko[1], R. Sibiya[1], Z. Ntombela[1], R. Rampal[2], H. Zeeman[2], T. Mkandawire[3], S. Putter[3]
*[1]uMzinyathi District Health, Dundee, South Africa, [2]Health Systems Trust, Midrand, South Africa, [3]Systems for Improved Access to Pharmaceuticals and Services, Pretoria, South Africa*

**Background:** Umzinyathi, a rural district in KwaZulu-Natal, is one of ten districts piloting the National Health Insurance (NHI) in South Africa. As of December 2015, uMzinyathi Health District had over 46 000 people accessing antiretroviral therapy (ART) through the public sector. Providing services to these clients and others on medicine for chronic diseases places considerable strain on public health facilities in the district which has high staff shortages and sub-optimal infrastructure. With an aim to reduce the burden on public health facilities and improve access to ART and other chronic medicine, the Department of Health launched the Central Chronic Medicine Dispensing and Distribution (CCMDD) program.
**Description:** Through the CCMDD, patients have an option to collect their medicine from locations other than primary healthcare clinics (PHC) which were facing high headcounts. Alternate collection points include community pharmacies and general practitioners. The district, however, also emphasized the use of community based pick up points (PUPs). PUPs which met the requisite criteria were appointed by the National Department of Health.
**Lessons learned:** Since the launch of the CCMDD in uMzinyathi in February 2014, 29 832 patients from 56 PHCs have enrolled on the program. The district has maintained a retention rate over 61%. By January 2016, patients had an option of collect their medicine from three community pharmacies, eight GP rooms as well as two community based collection points. Some PHCs have reported a reduction in patient waiting times of over 30%.
Several factors have contributed to the success of the program:
- Leveraging existing sites used for other community based interventions such as the war room and Phila Mtwana sites as collection points;
- Development, dissemination and implementation of standard operating procedures for facility level processes for enrolling and managing patients on the CCMDD;
- Effective engagement of stakeholders including dispensing service providers, community clinic committees and local non-governmental organisations.

**Conclusions/Next steps:** Implementation of the CCMDD presents a viable and effective opportunity for improving access to ART and other chronic medicine. Reduction of patient waiting times also has the potential to contribute to the overall patient experience in public health facilities.

## THPEE582

### BEST PRACTICES IN CLINICAL EDUCATION: A CASE STUDY IN ENDING THE EPIDEMIC IN NEW YORK STATE

T. Wilder, N. Harris, A. Urbina
*Mt. Sinai Health System, Mt. Sinai Institute for Advanced Medicine, New York, United States*

**Background:** New York State (NYS) has been an epicenter of the HIV epidemic in the United States. In 2014, the Governor of New York announced a Plan to End AIDS by 2020 with the goal to reduce new HIV infections from an estimated 3,000 to 750. This Plan seeks to identify persons with HIV who remain undiagnosed, link and retain persons diagnosed with HIV to health care, and facilitate access to PrEP for high-risk persons to keep them HIV negative. As enthusiasm unfolds, clinician buy-in plays a vital role in its implementation. Quality clinical education provides the opportunity for medical providers to stay abreast of emerging issues and implement practice change that ultimately benefits patients.
**Description:** Clinical education trainings and tools have been launched by the Mt. Sinai Institute for Advanced Medicine (IAM) to accelerate the implementation of the Governor's Plan. This presentation will highlight the Center's debut of a series of conferences aimed at increasing clinician knowledge and practice change intentions as it relates to the Plan. The conference held in Staten Island will serve as a case study. Curricula development, marketing, speaker selection, government collaboration, the dissemination of clinical tools, as well as barriers and challenges will be discussed.
**Lessons learned:** Twenty-nine clinicians were present at the Staten Island conference. Qualitative feedback indicated a positive response to quality of content covered. Two attendees signed up to be PrEP providers during this meeting and local providers were able network and hear experiences in providing HIV services in Staten Island. With these successes, concerns still remained on finding creative ways to engage clinicians who don't provide HIV services or may not consider HIV as a priority.
**Conclusions/Next steps:** In resource limited communities, identifying current community assets such as funding and local champions who are advocates for HIV prevention and care were crucial in making such conferences a success. While the focus of the conference was to increase clinician HIV knowledge, several attendees expressed interest in implementing what they learned into their own practice. We seek to continue with this momentum and offer additional training assistance to increase provider knowledge and practice change intention.

# INPATIENT AND OUTPATIENT SERVICES FOR HIV CARE AND TREATMENT

## THPEE583

### INTEGRATION OF HIV/TB TESTING AND SCREENING BY VCT COUNSELORS IN URBAN SLUMS IN NAIROBI, KENYA

S. Kegoli[1], J. Motoko[2], C. Muriithi[3], A. Njoroge[4], M. Muchiri[2]
*[1]Eastern Deanery AIDS Relief Program, HIV Prevention and Nutrition, Nairobi, Kenya, [2]Eastern Deanery AIDS Relief Program, Care and Treatment, Nairobi, Kenya, [3]Eastern Deanery AIDS Relief Program, Monitoring and Evaluations, Nairobi, Kenya, [4]Eastern Deanery AIDS Relief Program, Nairobi, Kenya*
*Presenting author email: skegoli@gmail.com*

**Background:** Case identification is the first step of bringing HIV and or tuberculosis (TB) infected persons into care. There are high rates of TB/HIV co-infection as such, TB/HIV collaborative activities are essential in decreasing TB burden among people living with HIV (PLHIV). Urban slums dwellers are classified among high risk sub-populations for undetected TB, poor access to health and TB transmission. Kenya national guidelines recommend intensified TB case finding among PLHIV and universal HIV testing among TB cases.
**Description:** Eastern Deanery AIDS Relief Program (EDARP) provides integrated TB/HIV services in Nairobi and serves 95 urban slum settlements. To address the high demand of TB screening in Nairobi's urban slums, the program trained 64 voluntary counselling and testing (VCT) counsellors to provide integrated TB screening and HIV testing services. On average 13,034 clients are screened for TB/month; 54% at facility and 46% at community, VCT counselors refer presumptive TB cases to clinicians for confirmatory tests.
**Lessons learned:** Between April 2013 and March 2015, a total of 288,820 received HIV testing 38% in VCT, 16% provider initiated testing and counselling (PITC), and 46% community with Positivity rate of 3%(8359). Of the 288,820 clients screened for TB, 29,986 were identified as presumptive TB cases. Of these, 5%(1512) were confirmed though genxpert, chest x-ray or smears to have TB; 2% at VCT and 11% at PITC. Out of 1512 TB cases, 165(31%) at VCT and 277(28%) at PITC were TB/HIV co-infection. All TB patients were initiated on TB treatment at EDARP facilities.
Trained Non clinical VCT counselors carried out TB screening and referred presumptive TB cases to clinicians for confirmatory diagnosis. This strategy enhanced TB screening and treatment acceleration ensuring there were no missed opportunities for TB/HIV treatment and prevention. Integration of TB/HIV screening services using VCT counselors may be embraced to Eliminate TB by 2050.
**Conclusions/Next steps:** Integrated TB-HIV accelerated screening and treatment could be adopted with minimal additional resources. TB intensive case finding by VCT counselors at clinic and community setting may lead to increased early TB case detection, treatment and improved outcomes.

## THPEE584

### PRIORITIZING HIGH YIELD ENTRY POINTS IN MOVE TOWARDS 'TEST ALL' IN LOW-RESOURCE SETTINGS: EVIDENCE FROM MANICALAND PROVINCE, ZIMBABWE

K. Webb[1], V. Chitiyo[1], T. Mukotekwa[1], D. Patel[1], P. Mafaune[2], C. Nzande[2], T. Maphosa[1], B. Engelsmann[1], S. Page-Mtongwiza[1]
*[1]Organisation for Public Health Interventions and Development (OPHID) Trust, Harare, Zimbabwe, [2]Ministry of Health and Child Care, Manicaland Province, Mutare, Zimbabwe*
*Presenting author email: spage@ophid.co.zw*

**Background:** With an estimated adult HIV prevalence of 16.7%, reaching ambitious 90-90-90 targets in Zimbabwe will require strengthening access to HIV testing and counselling (HTC) at all health care entry points as well as ensuring effective linkages to treatment and care for all people diagnosed with HIV. The objective of our assessment was to establish current HIV test yields and documented linkage of HIV positive individuals to treatment and care from different health care entry points.
**Methods:** We selected 11 health facilities in Makoni and Mutare Districts using a simplified probability proportional to size technique. In October 2015, we conduct-

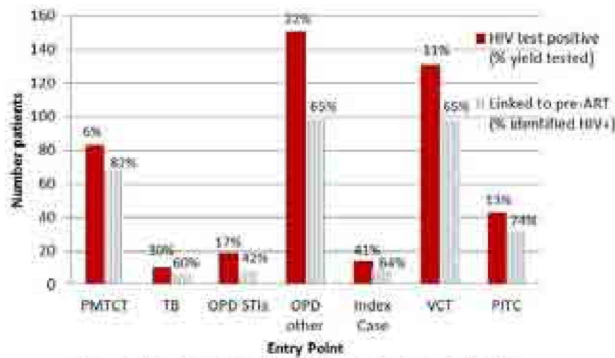
ed a retrospective cohort analysis, tracing all individuals testing HIV positive from Jan-Mar 2015 through registers to document testing entry point and access to care and treatment services among those testing HIV positive. De-identified data was entered into MSExcel and analysed descriptively using StataV12.
**Results:** From Jan-Mar 2015, 4,398 individuals were HIV tested at selected sites, 10.6%(n=467) were HIV positive. Entry points with highest test yield were those in which patients were seeking care for other illnesses (TB:30%, OPD 'other':27%) and index cases (41%). Linkage rates to pre-ART care were highest in PMTCT (82%) and lowest in OPD for STI treatment (42%).



*[HIV test yield, and linkage to pre-ART by entry point (N=4,398)]*

Process evaluation data indicated variability in documentation of entry point codes by site.
**Conclusions:** Our assessment demonstrated high HIV test yields and low rates of linkage to pre-ART care in outpatient departments in which patients were seeking care for other illnesses. Expanding 'test all' strategies should begin with prioritizing HTC for all in and out-patients with unknown status and index case finding, while strengthening linkages to HIV care and treatment between departments. Enhanced health information systems are required to enable accurate documentation of HIV services provided and patient outcomes within integrated service environments.

## THPEE585

### HIV CLINICAL BASELINE RESULTS PRIOR TO HIV HEALTH SERVICE DELIVERY INTEGRATION IN A LARGE URBAN HIV CLINIC IN GABORONE, BOTSWANA

A. Avalos[1], V. Letsatsi[2], H. Phillips[3], M. Haverkamp[4], J. Jarvis[4], W. Mosime[1], B. Buti[1], P. Solomon[1], D. Ramaabya[5], T. Gaolathe[6], S. El-Halabi[7]
*[1]Careena Centre for Health, Gaborone, Botswana, [2]Botswana Ministry of Health, Princess Marina Hospital, Gaborone, Botswana, [3]UNAIDS, Strategic Intervention, Gaborone, Botswana, [4]Botswana U Penn Partnership, Gaborone, Botswana, [5]Botswana Ministry of Health, DHAPC, Gaborone, Botswana, [6]Botswana-Harvard Partnership, Gaborone, Botswana, [7]Botswana Ministry of Health, Gaborone, Botswana*
*Presenting author email: avaavalos@gmail.com*

**Background:** By the end of 2015, Botswana had initiated over 270,000 people on ART using a variety of highly medicalized service delivery models. Looking towards the future, facing the financial realities of growing global economic uncertainty, decreases of diamond revenues and international donor support and critical shortages of health care workers, Botswana must now take action to ensure the long-term sustainability of their HIV Response. To this end, Botswana is improving efficiencies in HIV health system delivery by integrating comprehensive health services into stand alone infectious disease clinics (IDCCs), task shifting clinical care for stable patients to nurses trained in ART prescribing and dispensing, creating express pharmacy stops to decrease monthly pharmacy visits to bimonthly, and improving M&E mechanisms. To determine whether these integration efforts are successful, clinical baseline line data was collected and analyzed.
**Methods:** Beginning in June 2015 through December, patient level data was extracted from a series of random sampling of individual medical records from a total of 19,774 patients initiated after 2002. "Stable" patients were defined as those who were fully suppressed (VL< 400 copies mL) and on ART for 2 years without co-morbidities. "Lost-to Follow Up" was defined as not returning for pharmacy pickup for >90days. Prevalence data on TB, HTN, DM and SRH information were also collected for descriptive analysis.
**Results:** Cumulative Deaths (n=19,774): 10%, Cumulative LTFU 14.5%. Active Patients: 33%. Cervical CA screening (n=824): 67.2%, Contraceptive use recorded: 20%. Co-morbidities (n=777): Ever had TB 19.8%, Current HTN 20.2% (25% with BP readings >140/90), Dyslipidemia 9.5%, DM 1.3%. Total stable patients (n=514): 65%.

**Conclusions:** Baseline data reveal that integration of health care services into IDCCs may greatly improve service delivery quality and clinical outcomes by fast tracking care for stable patients. Triage of stable patients to nurses may decongest IDCCs by 65%, decrease time spent in facilities and optimize adherence. Providing routine SRH services such as contraception and cervical CA screening are currently lacking and would greatly improve quality of care for women. The 35% of patients with co-morbidities would also receive a higher level of care and improved clinical monitoring.

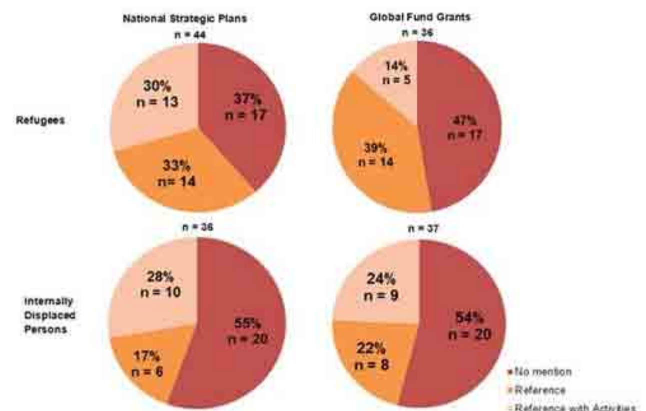
# MIGRATION AND MOBILITY AND HIV PROGRAMMING

## THPEE586

### CONFLICT-AFFECTED DISPLACED PERSONS NEED TO BENEFIT MORE FROM INCLUSION INTO HIV NATIONAL STRATEGIC PLANS AND APPROVED GLOBAL FUND GRANTS WITH AN HIV COMPONENT

H. Hering[1], M. Schuber[2], E. Tarney[3], P. Spiegel[1], M. Schilperoord[2], A. Das[4]
*[1]United Nations High Commissioner for Refugees, Public Health and HIV Section, Geneva, Switzerland, [2]UNHCR, Geneva, Switzerland, [3]UNHCR, Public Health, Geneva, Switzerland, [4]UNHCR, Public Health, Pretoria, South Africa*
*Presenting author email: tarney@unhcr.org*

**Background:** Access to HIV programmes for refugees and internally displaced persons (IDPs) is an equity and human rights issue and a public health priority. We conducted an analysis on HIV National Strategic Plans (NSPs) and Global Fund approved proposals with an HIV component for countries hosting populations ≥10,000 refugees and/or IDPs to document their inclusion in 2014.
**Methods:** Inclusion criteria were countries with refugee and/or IDP populations of ≥10,000 persons. NSPs were retrieved from primary and secondary sources. Approved Global Fund proposals were obtained from the organisation's website. Refugee figures were obtained from UNHCR's database and IDP figures from the Internal Displacement Monitoring Centre. Inclusion of refugees and IDPs in plans and approved proposals was classified into three categories:
1) no reference;
2) reference; and
3) reference with specific activities.
**Results:** There were 62 countries with ≥10,000 refugees and 47 countries with ≥10,000 IDPs. We analysed 44 NSPs for refugees and 36 NSPs for IDPs; 15 countries had no NSPs and 6 could not be retrieved. Comparing similar data from a 2010 study on African countries, more NSPs referenced/listed activities for refugees and IDPS in 2014 (52% vs 60% and 43% vs 56%, respectively); similarly for approved Global Fund proposals (38% vs 56% and 38 vs 54%, respectively).
**Conclusions:** There have been improvements in the inclusion of refugees and IDPs in NSPs and approved Global Fund proposals in African countries. However, stronger advocacy at global, regional and country levels needs to occur to ensure displaced populations are systematically included in these plans and proposals. Such integration is essential if we are to reach the 90-90-90 treatment targets and end AIDS as a public health threat by 2030.



*[Inclusion of ≥10,000 refugees and/or IDPs in HIV National Strategic Plans and Global Fund approved proposals, 2014]*

| | | NSPs | | | Global Fund Grants | | |
|---|---|---|---|---|---|---|---|
| | | No mention | Mention | Activities | No Mention | Mention | Activities |
| Refugees | 2010 | 10 (47.6%) | 5 (23.8%) | 6 (28.6%) | 43 (61.4%) | 19 (27.1%) | 8 (11.1%) |
| | 2014 | 10 (40%) | 7 (28%) | 8 (32%) | 11 (46.8%) | 10 (42.7%) | 3 (13.5%) |

### TARGETED INTERVENTION FOR MIGRANTS AT DESTINATION: A SUCCESS IN CONTAINING HIV/AIDS EPIDEMIC AMONG MIGRANTS IN INDIA

S. Purohit, M. Gopal, N. Dhingra, K. Meriyapan, A. Tiwari
*National AIDS Control Organisation, Health, New Delhi, India*
*Presenting author email: spnaconmu@gmail.com*

**Background:** Prevalence of HIV amongst Migrants is highest in any group, after High Risk Groups of FSW, MSM and IDUs. Further, importance of migration/mobility in the spread of HIV infection in India is evidenced. Considering this, NACO has revised the destination migrant intervention which focus on high risk migrants (both male & female) unlike the single male migrants covered earlier. Interventions are focused in the towns and cities having high migrant population spread out across the city, engaged in construction works, hotel services, seasonal labourers hired for agricultural work, labourer working in the heavy industries, small and medium enterprises.
**Description:** The revised migrant strategy came into force in 2011. With involvement of labour contractor, peers from the originating states the programme has been designed to focus on outreach in work place of migrants, congregation points and at places where they resides. Migrants are covered through health camps, interpersonal communications by outreach staffs, mid media activities, counselling. For impact analysis programme data has been taken for three year from 2012 to 2015 as programme streamlined since 2012.The data has been analysed on major indicator like total migrant population covered across TIs in the states, total STI cases treated, HIV positivity found & total linked to the ART centre.
**Lessons learned:** Migrant coverage with HIV services increased from 2.8 million in 2012 to 3.1 million in 2015 with an increase in number of Intervention from 251 in 2012 to 311 in 2015. HIV testing increased from 0.1 Million to 0.5 million and HIV positivity decreased from 0.77% to 0.27%. Linking of HIV positive migrants to ART centre increased from 40% to 84% in 2015. STI cases treated has reduced from 8.81% in 2012 to 6.47% in 2015.
**Conclusions/Next steps:** The existing govt health facilities in the urban area and private hospitals to be roped into to provide free medical services to the migrants and increase in HIV testing facilities and ART linkages.

# MULTI-SECTORAL RESPONSES, INCLUDING FOR KEY POPULATIONS

## THPEE588

### ENGAGEMENT OF LAW ENFORCEMENT AGENCIES (LEAS) AND CIVIL SOCIETY ORGANIZATIONS (CSOS) FOR HIV PREVENTION AMONG PEOPLE WHO INJECT DRUGS (PWID) IN NIGERIA

E. Okey-Uchendu[1], G. Rengaswamy[2]
*[1]National Agency for the Control of AIDS (NACA), Programme Coordination, Abuja, Nigeria, [2]United Nations Office on Drugs and Crime UNODC, Country Office for Nigeria, Abuja, Nigeria*
*Presenting author email: ezinne41@yahoo.com*

**Background:** The HIV prevalence among PWIDs is 4.2% and they contribute about 9% of the annual new HIV infection in Nigeria. Over the years, efforts made to reach PWIDs with HIV/AIDS prevention, treatment, care and support have recorded minimal results. Some actions of the LEAs, stigma and discrimination drive the activities of this group underground thereby making them difficult to be identified and access HIV services. In order to create an enabling environment and scale-up access of these services among PWIDs, LEAs and CSOs in Nigeria were sensitized and engage to address issues related to PWIDs in the context HIV infection.
**Description:** The National Agency for the Control of AIDS (NACA) in collaboration with the United Nations Office on Drug and Crime (UNODC) held two workshops to Enhance Partnerships between LEAs and CSOs to support HIV Interventions among PWIDs. Participants include LEAs, CSOs, PWIDs and other partners that work with PWIDs. This workshop sensitized the LEAs and CSOs on access to the comprehensive HIV/AIDS services available for PWIDs in Nigeria. The engagement also provided the opportunity for PWIDs to share their experiences and identify areas of collaboration between LEAs and CSOs. Participants were equipped with skills to assume key roles as collaborative partners in HIV prevention and care services for PWIDs.
**Lessons learned:** The workshops provided a better understanding of harm reduction among the LEAs and CSOs thereby changing their mindsets and attitudes toward the PWIDs. LEAs are willing to partner with CSOs to provide enabling environments for access to harm reduction interventions for PWIDs. With adequate knowledge, Law Enforcement officials and Civil Society Organizations can effectively complement each other, share information, identify issues and also prevent HIV.
**Conclusions/Next steps:** Initiation of advocacy with the heads of LEAs, the media and state level trainings will foster partnerships for HIV/AIDS prevention and increase access to harm reduction services for PWIDs. Regular stakeholders meetings to ensure support from the stakeholders for PWID programming in Nigeria.

## THPEE589

### DEVELOPMENT AND IMPLEMENTATION OF A GENDER-BASED VIOLENCE CASE MANAGEMENT SYSTEM FOR MULTIPLE USERS AT RAPE CLINICS

R.E. Schoeman, W. Swanepoel, R. Martin
*Foundation for Professional Development, GBV Projects, Pretoria, South Africa*

**Background:** One of the responsibilities of the Foundation for Professional Development (FPD) is the development and implementation of infrastructure at Thuthuzela Care Centres (TCCs) to improve capacity to support the survivors of rape and sexual abuse, and to reduce the risk of secondary victimisation. TCCs are linked to sexual offences courts, which are staffed by prosecutors, social workers, magistrates, NGOs and police.
**Description:** The statistics contained in reports of the TCCs are processed and compiled manually from hardcopy case reports. This is not a sustainable or accurate method for the processing and collation of information as evidence-based statistics, which is why the implementation of an automated information processing and reporting IT solution is required. The objectives and outputs of the project are:
1) To design, develop and implement a data gathering and processing software system for the capturing and processing of Case Information from Case Documentation, pertaining to survivors of rape and sexual abuse and,
2) To design, develop and implement a sustainable Case Information reporting dashboard and solution for the structured reporting of Case Information pertaining to survivors of rape and sexual abuse. It is the responsibility of the TCC and its staff to ensure that the Case Information contained in the Case Documentation is valid, accurate and complete. Information pertaining to the survivor as well as the case of rape or sexual abuse is manually captured on a number of forms and serves as supporting evidence for the National Prosecuting Authority (NPA) as well as for reporting purposes to project principles.
**Lessons learned:**
• Automated application controls at input level ensures the completeness, accuracy and validity of Case Information,
• A real-time web-based dashboard displays Information that is easy to interpret, understand and assimilate,
• A standard printable and downloadable document exported.
**Conclusions/Next steps:** The GBV case management system is an action research project, operating in a multi-sectoral, multi-level environment. Case management ranges from rape kits, HIV tests, PEP, medication, emergency medicine, counselling, feeding and clothing. Lessons learnt will be incorporated as the project advances. Initially the system is installed into four TCCs, but it will be rolled out to all 52 TCCs nationally.

## TARGETED INTERVENTIONS IN GEOGRAPHIC HOTSPOTS

### THPEE590

### USING PROGRAMMATIC MAPPING TO IDENTIFY LOCATIONS WHERE PEOPLE WHO INJECT DRUGS CONGREGATE AND TO ESTIMATE THEIR POPULATION SIZES IN THREE SOUTH AFRICAN CITIES

A. Scheibe[1,2], A. Lambert[1], A. Schneider[1], S. Shelly[1], R. Basson[1], N. Medeiros[3], D. Nel[3], K. Padayachee[1], R. Ogle[1], C. Williams[1], H. Savva[4], H. Hausler[1]
*[1]TB/HIV Care Association, Cape Town, South Africa, [2]Desmond Tutu HIV Centre, Cape Town, South Africa, [3]OUT LGBT Wellbeing, Pretoria, South Africa, [4]United States Centers for Disease Control and Prevention, Pretoria, South Africa*
*Presenting author email: andrew.scheibe@gmail.com*

**Background:** The criminalisation of drug use and associated stigma results in the "invisibility" of people who inject drugs (PWID) and presents challenges for HIV-related service provision. We aimed to confirm locations where PWID congregate in Cape Town, Durban and Pretoria (South Africa) and to estimate PWID population sizes within selected electoral wards to inform the outreach strategy for South Africa's first HIV prevention project for PWID.
**Methods:** PWID and other stakeholders were engaged to select wards to be mapped. Community informants were interviewed to identify locations where drug use and injecting was suspected. Project team members visited locations where injecting was suspected and interviewed PWID about accessibility of sterile injecting equipment and PWID mobility. Location coordinates were also recorded. PWID population size estimates for the mapped wards were developed using wisdom of the crowd estimates from PWID interviews. Estimates were adjusted for movement and compared with the literature and early programmatic data. The Delphi method was used to reach consensus on population sizes.
**Results:** Forty-five wards were mapped between January and April 2015. In Pretoria, 39 PWID were interviewed at different locations and the PWID population in the 12 mapped wards was estimated between 568 and 1 431. In Durban, 40 PWID were interviewed at different locations, and 184 to 350 PWID were estimated to be accessible in the 15 mapped wards. In Cape Town, 61 PWID were interviewed at different locations and the PWID population in the 18 mapped wards was estimated between 398 and 503. Sterile needles were only seen at one location. Almost all were bought from pharmacies. Between 80% - 86% of PWID frequented more than one location per day. PWID who moved visited a median of 3 locations a day.
**Conclusions:** PWID can be reached using peer-based methods in locations where PWID services do not exist or are nascent. The limited visibility and reported access to injecting equipment in these cities highlights an important HIV prevention need. Outreach programmes should take the mobile nature of PWID populations into account. The population size estimates can be used to set service delivery targets and as baseline measures.

### THPEE591

### FAST TRACKING MUNICIPAL HIV RESPONSES TO ADDRESS THE DISPROPORTIONATE BURDEN OF HIV AMONG KEY POPULATIONS

M.G. Haileyesus[1], T. Sellers[1], I. Milimo[2], S. Merique[3]
*[1]UNDP, RSCA, Addis Ababa, Ethiopia, [2]UNDP Zambia, Lusaka, Zambia, [3]UNDP Mozambique, Maputo, Mozambique*
*Presenting author email: mesfin.getahun@undp.org*

**Background:** A 2012 epidemiological analysis by UNAIDS indicated that the thirty biggest city epidemics in Eastern and Southern Africa hosted a total of 4.2 million PLHIV - nearly a quarter of the epidemic in the sub-region . A related programmatic review undertaken by UNDP further revealed that most cities lacked appropriate and adequate strategies to reach key population (KP) groups - who due to complex legal, social and economic factors, are at higher risk of HIV infection. This includes men who have sex with men, sex workers, people who use drugs and transgender people. The 'African Cities and HIV Initiative' launched by UNDP and partners in 2011 aimed at addressing this critical gap in the African HIV response.
**Description:** By the end of 2015 the initiative was implemented in more than fourteen cities in Africa, including Lagos, Douala, Kigali, Kampala, Dar es Salam, Lusaka and Maputo, to review their responses and develop specific HIV prevention, treatment and care strategies for KPs. The project activities also strengthened the capacity of KP groups including regional KP networks such as the African Men for Sexual Health and Rights (AMSHeR) to engage with municipalities. KP groups are directly involved in the planning, implementation and monitoring of the initiative.
**Lessons learned:** A dashboard has been developed to track the progress of each city using different criteria that look at the situation analysis and data generation, identification of activities, budget allocation, setting specific indicators and ensuring participation of KPs in the cities HIV response. The dashboard showed that despite some progress, several challenges remain, including lack of city level data on KPs, no direct budget allocation for KP interventions, and lack of indicators to measure progress. It is also observed from the dashboard that the challenges differ between different KP groups and different cities.
**Conclusions/Next steps:** Given Africa's rapid urbanization rate, HIV will continue to be a crucial public health issue for municipal authorities. Hence, the planning and implementation of municipal HIV responses must ensure that KP focused interventions are based on detailed analysis and adequate data, include clear operational plan with targets and indicators and make direct resource allocation for KPs.

### THPEE592

### MEETING THE SEXUAL AND REPRODUCTIVE HEALTH, INCLUDING HIV NEEDS, OF SOUTH SUDANESE REFUGEES IN GAMBELLA, ETHIOPIA

M. Wachira, M. Migombano
*International Planned Parenthood Federation Africa Region, Programmes and Technical Support, Nairobi, Kenya*
*Presenting author email: mmigombano@ippfaro.org*

**Background:** Sexual and Reproductive Health services are more often than not perceived as low in the hierarchy of needs during humanitarian crisis yet populations in crisis need and have a right to reproductive health; affected populations at the very least need and must be provided for an enabling environment to access these services whether inform of a minimum package or comprehensive service depending on context of crisis. To meet the sexual health needs of populations in crisis and post crisis, a project has been designed to address gaps in the provision of Minimum Initial Service Package (MISP) implementation for reproductive health.
**Description:** UNHCR estimates over 190,000 people displaced into Ethiopia during the 2013/2014 South Sudan crisis. While the government opened refugee camps in Gambella region in Ethiopia in 2014, IPPF through its partnership with IMC implemented an SRH emergency response. The response was guided by the five MISP objectives; coordination, prevention of sexual violence, reduction of HIV transmission, prevention of excess maternal and neonatal mortality and morbidity and provision of comprehensive RH services. The project targeted 57,861 (5,413 men, 30,852 women, 21,596 adolescents) and reached 88,869 people. At the end of the project, a post emergency review (PER) was conducted to assess the performance of the project.
**Lessons learned:** Timely and speedy implementation of MISP at the onset of crisis and sustaining it throughout the crisis is critical as it saves lives. A transitioning plan to ensure continuum of care was needed for this intervention. Availability of RH friendly services for both young people and adults was another key component to compliment demand created for comprehensive SRH services after crisis. Meaningful engagement and collaboration with partners is important in implementing and sustaining a project of this nature; a multifaceted and multi-sectoral approach effectively addresses the vulnerabilities and needs in crisis settings.
**Conclusions/Next steps:** On commencement, it is necessary to conduct a rapid assessment to establish the baseline. Provision of HIV services as part of the integrated package was not well covered largely due to stigma attached to the disease and ignorance, a better understanding of the same would have achieved a meaningful intervention.

### THPEE593

### A QUALITATIVE EXPLORATION OF BARRIERS TO "TEST AND TREAT" FOR HIV, IN GEOGRAPHICALLY-ISOLATED FISHING COMMUNITIES OF RAKAI, UGANDA

R. Ssekubugu
*Rakai Health Sciences Program, Qualitative Research Department, Kampala, Uganda*
*Presenting author email: rssekubugu@rhsp.org*

**Background:** The "test and treat" strategy is now recommended for key populations in Uganda, including fishing communities in Rakai south-west Uganda, where adult HIV prevalence is around 40% and incidence estimated at 3.9 per 100 person-years. Delivery of "test and treat" should occur through the Ministry of Health and PERFAR-supported district-led programming whose tenets include structuring HIV care around the traditional formal health facilities. As part of a broader comparative study being undertaken by the ALPHA Network to explore bottlenecks in accessing HIV care services, we aimed to document the HIV care-seeking experiences of patients along the treatment cascade in the context of "test and treat" roll-out.
**Methods:** Fisher folk were purposively sampled from HIV counselling, ART clinics and Rakai Cohort Study databases. Eighteen in-depth interviews were conducted using semi-structured topic guides iteratively developed and covered individual, community and programmatic factors that influence HIV care-seeking. Using a framework analysis, with a thematic approach we coded and mapped barriers to

accessing HIV services and examined their influence on implementation of "test and treat" in this setting. The study was approved by local and international institutional review boards.
**Results:** Lack of affordable transport, distance from health services, perceived stigma and reluctance to start ART because of beliefs that `treatment' is for people who are sick, shape the health care seeking behaviour of HIV positive patients. We found that these barriers delay patients' decision-making in respect of care-seeking, meaning they subsequently reach health facilities when they are ill rather than 'promptly', as per the "test and treat" strategy.
**Conclusions:** Despite introduction of "test and treat", trajectories of HIV care in this setting remain characterised by delays in reaching services due to social-cultural and logistical barriers. Service decentralisation will be essential to reduce distances that patients are expected to travel if "test and treat" strategies are to be successful in this setting.

## THPEE594

### Accessing gay men: transitioning from physical venues to online spaces

T. Munro, L. Rabie, J. Gray
*ACON Health, Sydney, Australia*
*Presenting author email: tmunro@acon.org.au*

**Background:** Gay men and other MSM are increasingly using geolocational mobile applications (such as Grindr) to meet each other, talk and build community. The use of mobile apps is the primary way men meet other men in Sydney, Australia, increasing from 23% in 2011 to 42% in 2014. There is a need to utilise mobile apps to communicate about HIV and other health messages that targets key populations (KP) and 'goes to them', accessing them where they are geographically.
**Description:** ACON's Peer Education project has successfully trialled an outreach strategy on Grindr, targeting gay men and other MSM in Sydney. This involved creating a profile that invites other Grindr users to "Ask me anything!" It uses a passive approach, waiting for men to message the profile and then provides a response in line with ACON's health promotion objectives.
This project has been trialled in the geographical hotspot of inner-city Sydney where a high proportion of gay men live. Following a decline in men attending bars and other traditional meeting places.
**Lessons learned:** ACON runs a program called Sexperts that deploys volunteers in SOPVs to answer questions about HIV and sexual health. This model has been adapted for mobile apps, with questions received online being similar to the sorts of questions being asked in physical venues.
Of those who asked questions about sexual health 38.2% asked about PrEP, 29.4% about testing, 23.5% asked about HIV risk while others praised ACON for providing the service or asked about STIs or health related concerns.
However, communicating online brings some additional challenges to peer education. Some respondents asked how they could trust that the profile was legitimate as the profile picture didn't show a person's face.
**Conclusions/Next steps:** Strategies are being explored to increase the number of people who are comfortable discussing HIV with the profile. Volunteer 'Sexperts' are being trained to respond to people's questions through the app, so that they can then conduct health promotion from their own homes in their local area, or while travelling. While this initial phase has been trialled on Grindr, this can also be expanded to other geolocational apps relevant to local populations.

## THPEE595

### Effectively reaching female sex workers with HIV prevention and testing services through mobile outreach services in Cape Town and Durban, South Africa

A. Lambert[1], A. Scheibe[1], M. Mcingana[1], H. Mhlope[1], R. Ogle[1], P. Modikoe[1], A. Satira[1], H. Hausler[1,2]
[1]*TB/HIV Care Association, Cape Town, South Africa,* [2]*University of the Western Cape, Faculty of Community and Health Sciences, Cape Town, South Africa*
*Presenting author email: andy@tbhivcare.org*

**Background:** In 2011, an HIV prevention programme for female sex workers (FSWs) in Cape Town and Durban, South Africa began. Tailored peer-based mobile service delivery was used to provide services at sex work locations. The programme used unique participant identification codes (PICs) to protect the identity of FSWs and to enable monitoring. FSWs were asked their HIV status and a rapid HIV test was done on consenting FSWs who did not know their status or who identified as HIV negative.. HIV prevention commodities were provided and FSWs who were HIV positive were linked to care. The project aimed to quantify the number of FSWs reached, and understand the burden of HIV and need for linkage to care among FSWs who accessed the programme between July 2012 and June 2015.
**Methods:** PICs were used to identify FSWs who accessed the programme for the first time. Frequencies and proportions were calculated for HIV status, access to care among those who were reported to be HIV infected, and results from HIV testing.
**Results:** Overall, 7240 individual FSWs were HIV screened and counted when first accessing services. In Durban, 24.9% (992/3 980) of FSWs reported HIV infection, among whom 75.6% (750/992) were not in care. Eighty five percent (2784/3267) of FSWs consented to HIV testing and 34.3% (989/2784) were HIV infected. In Cape Town, 1.7% (55/3260) of FSWs reported HIV infection, among whom 67.3% (37/55) were not in care. Ninety eight per cent (3204/ 3260) of FSWs consented to HIV testing and 5.7% (183/3204) were HIV infected.
**Conclusions:** PICs are useful to maintain confidentiality while allowing programme reach to be monitored. The programme reached large numbers of FSWs with HIV testing services in these cities, highlighting the effectiveness of tailored peer-based mobile service delivery. The programme identified a high burden of HIV among FSWs in Durban, confirming the need to include a tailored HIV response for this key population. Over 3/4 of Durban FSWs who reported to be HIV infected were not in care, underscoring the need for programmes for FSW to include interventions to support linkage to care.

## THPEE596

### Women economic empowerment: a vehicle to reduce HIV vulnerability, access education, nutrition and health services for women and their children in Malawi: the Mponela women experience

P. Makondesa[1], J. Ajakaye[2], S. Mabhele[2], R. Ameur[3]
[1]*ILO, Lilongwe, Malawi,* [2]*ILO, Pretoria, South Africa,* [3]*International Labour Organisation, Pretoria, South Africa*

**Background:** Women economic empowerment does not only reduce vulnerability to HIV risks but also promotes rights to education, health and good nutrition. In a country with 65% of the population living in absolute poverty, subsisting on less than $1 per day, and with 61 % women living with HIV out of the total adult HIV population according to the Malawi NSP 2011-2016, ILO has targeted women and girls (80% of the beneficiaries) and has introduced an integrated package that combines the provision of HIV and AIDS services, entrepreneurial skills and the establishment of an innovative micro-finance system which is managed by the beneficiaries in collaboration with a locally-identified financial institution.
**Description:** The program supported about 12,000 women and girls beneficiaries located in 19 associations and cooperatives in the 12 hotspots of the transport corridors in Malawi, with interventions aimed at reducing HIV risk vulnerabilities through economic empowerment initiatives. Mponela women, a group of 150 members were among the targeted group. It comprised of widows, young women, women living with HIV and elderly women taking care of orphans. They were provided with a combination of skills on group formation, entrepreneurship skills, and business mentorship and on HIV risk-reduction strategies.
**Lessons learned:** Through a 3 year period of the interventions, 70 children were withdrawn from the street and are being supported with their education and food through the proceeds from their businesses, 20 elderly women living with HIV are supported with nutritional supplements, and over 100 businesses were established by women, creating about 1000 jobs, and a community garden has been developed to support the needy with food supplements and income for the group.
**Conclusions/Next steps:** The concept of economic empowerment model can be adopted by many key players in the sub Saharan region where poverty is one of the key drivers of the epidemic, as it does not only address HIV vulnerabilities but also promotes access to other key services (education and nutrition) that affect the HIV response.

## THPEE597

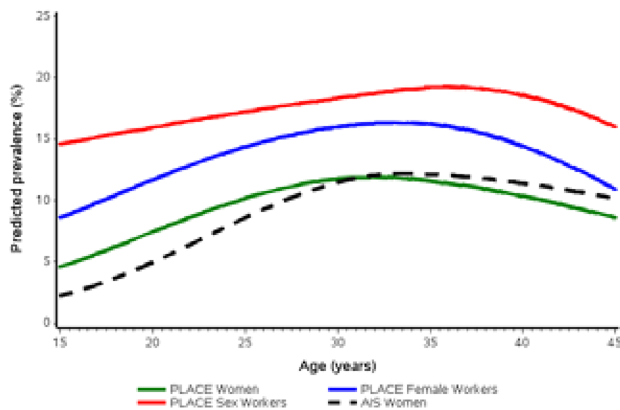
### Results from the national PLACE study in Uganda: addressing the need for local evidence to tailor prevention programs for those most likely to acquire and transmit HIV

S. Weir[1], F. Ssengooba[2], L. Atuyambe[2], M. Nattimba[2], G. Mulholland[1], Z. Karyabakabo[3], S. Kasasa[2], S. Babirye[2], J. Mwangi[4], S. Ssendagire[2]
[1]*University of North Carolina, Epidemiology, School of Public Health, Chapel Hill, North Carolina, United States,* [2]*Makerere University, Kampala, Uganda,* [3]*Uganda AIDS Commission, Kampala, Uganda,* [4]*USAID, Kampala, Uganda*

**Background:** Information on local HIV epidemics among high-risk populations is needed to tailor local prevention. In Uganda, national leaders identified a gap in strategic information at the district level.

**Methods:** 113 districts were categorized into 3 risk strata. A stratified random sample of 30 districts was selected. Local district stakeholders identified 3 high risk areas/district such as fishing villages or trading centers. Interviewers asked community informants to identify sites where people meet new sexual partners. A stratified random sample of 100 sites were visited, characterized and mapped. District samples of 600 site staff and patrons were interviewed and tested for HIV onsite using moonlight outreach HCT teams. Testing and referral for treatment followed national guidelines.

**Results:** 7,587 community informants identified 7688 sites unique sites across 30 districts. The most common type of informant was a boda-boda cyclist. Most of the sites served alcohol but less than a third had condoms. Almost half reported sex onsite. 18,553 patrons and workers were interviewed and tested. Approximately 12% of young men and women age 15-24 reported having 2+ sex partners in the past 4 weeks. 17% of young women reported exchanging sex for cash in the past 4 weeks. Prevalence varied by district but was higher among women who reported exchanging sex for cash and among women who worked at sites than among the general population (AIS survey). Over 800 respondents who had a positive HIV test reported that they did not know of their infection. Districts discussed their findings with broad group of stakeholders and prepared district level action plans.



*[HIV Prevalence By Age]*
*Restricted quadratic spline model used for age with knots at 17, 34 and 49]*

**Conclusions:** Relative to nationally representative surveys, district-level evidence on the HIV epidemic enabled sub-national stakeholders to generate local action plans for HIV prevention. Moonlight testing and condom distribution at social venues was acceptable and priority groups and venues for HIV prevention interventions were identified for effective programming.

## HIV PROGRAMMING FOR PEOPLE LIVING WITH DISABILITIES

### THPEE598

### OVERCOMING COMMUNICATION BARRIERS IN HIV PREVENTION AMONG IN-SCHOOL PEOPLE WITH DISABILITY (PWD) IN EKITI STATE: A CASE OF THE HEARING IMPAIRED AND VISUALLY IMPAIRED POPULATION

C. Doherty[1], R. Ajayi[2], Y. Ajumobi[3]
*[1]Ekiti State AIDS Control Agency, Project Management, Ado-Ekiti, Nigeria, [2]Ekiti State AIDS Control Agency, Community Mobilization Unit, Ado-Ekiti, Nigeria, [3]Ekiti State AIDS Control Agency, M and E Unit, Ado-Ekiti, Nigeria*
*Presenting author email: ooluwabamigbe@yahoo.com*

**Background:** PWD are at significant risk of becoming HIV infected due to so many factors including lack of education, resources to ensure safer sex, risk of violence and rape, stigma and lack of legal protection amongst others. Situation analysis of HIV prevention intervention amongst in-school PWD in the three specials schools in the state show that 48% of the total population in these schools is hearing impaired, 16% visually impaired and 6% intellectually impaired. To this end, Ekiti State AIDS Control Agency with the funding of the World Bank and in collaboration with some Community Based Organizations carried out a two year intervention programme targeted at reaching the PWD population with HIV prevention services.

**Description:** Entry phase activities were carried out to relevant stakeholders to ensure community participation, the programme made use of the situation analysis report as baseline for intervention. Peer Education manual (200 copies) and IEC materials (1747) were reproduced in Braille and sign language (1,000 copies of Signing to HIV Prevention), Bill Boards with messages that address disability and stigma were produced and erected. Thirty five able teachers (12 males 23 females) with specialization in Braille (10) and sign languages (20) were selected and trained as peer educator trainers (TOT) amongst the special students (hearing and visually impaired), 25 Peer Educators (13 males and 12 females) were selected and trained by the trained teachers to carry out peer education using the Braille and sign language manuals. Anti HIV/AIDS club was formed in the schools and health workers in the school health centers were trained on effective communication with PWDs for HIV/AIDS service provision.

**Lessons learned:**

| A total of 514 PWD were reached with MPPI between February 2013 -October 2015 as highlighted | Male | Female | Total |
|---|---|---|---|
| Number of visually impaired in-school youth reached with MPPI | 34 | 20 | 54 |
| Number of hearing impaired in-school youth reached with MPPI | 253 | 207 | 460 |

*[A total of 514 PWD were reached with MPPI between February 2013 -October 2015 as highlighted]*

**Conclusions/Next steps:** The use of Braille and Sign language HIV specific materials to communicate with PWD in service delivery improved their understanding and knowledge of HIV/AIDS, HCT uptake and participation in all structural interventions including community dialogues and Anti-AIDS club. However, the intellectually impaired, who are highly sexually active and at risk of HIV remain a neglected population due to communication challenge.

## COUNTRY INVOLVEMENT IN DESIGN AND IMPLEMENTATION OF PROGRAMMES

### THPEE599

### NOVEL ORIENTATION PACKAGE FOR NEW GLOBAL FUND TO IGHT AIDS, TUBERCULOSIS AND MALARIA COUNTRY COORDINATING MECHANISM (CCM) MEMBERS AND SECRETARIAT STAFF

J. Wright[1], K. Lassner[2], E. Ros[1], L. de le Peza[3], R. Ward[4]
*[1]Management Sciences for Health (MSH), Washington, United States, [2]Management Sciences for Health (MSH), Rio de Janeiro, Brazil, [3]Management Sciences for Health (MSH), Mexico City, Mexico, [4]Q Partnership, Harare, Zimbabwe*
*Presenting author email: jwright@msh.org*

**Background:** The USAID-funded Leadership, Management, and Governance (LMG) Project implemented by Management Sciences for Health (MSH) developed a Global Fund CCM orientation program for Zambia in 2014 and 2015. The orientation program prepares new CCM members and Secretariat staff to fulfill their responsibilities in CCM governance and grant oversight. With support from the Global Fund Secretariat, the LMG Project is building upon this orientation program to develop an orientation package for CCMs worldwide in late 2015 and early 2016. The orientation package combines the best of self-learning and adult-peer-learning techniques to inform new CCM members and Secretariat staff in an engaging way.

**Description:** The orientation of new CCM members and Secretariat over the first 2-3 months of their terms has five tiers:

1. Under the Mango Tree (2 hours) - basic introduction to CCM and its roles by CCM Chair and/or CCM Secretary
2. Self-Drive Orientation (4 hours) - virtual orientation on Global Fund, CCM, CCM committees, and country grant portfolio across three diseases
3. Face-to-Face Orientation (18 hours) - in-person orientation with other CCM members and Secretariat staff
4. CCM Committee Training (16 hours) - in-person training with other committee members
5. Coaching and Mentoring (16 hours) - ongoing one-on-one support

The learning modules include:

- Global Fund value chain: Country Dialogue, multi-stakeholder involvement, national strategic planning, needs assessment and gap analysis, Concept Note development, grant making, and grant signature
- Global Fund grant considerations: health systems strengthening (HSS), human rights, gender, key populations, and climate change and health
- CCM structures and functions
- Governance principles
- Oversight practices

**Lessons learned:** The orientation package combines self-learning and adult-peer-learning techniques because new CCM members and Secretariat staff:

- Need a structured approach to orientation without information overload
- Learn in different ways and at different speeds
- Learn more thoroughly with and from peers in “learning in action”
- Need training to understand the technical functions of the CCM committees
- Need ongoing one-on-one support through coaching and mentoring

The LMG Project is developing facilitator guides, participant guides, and evaluation guides.
**Conclusions/Next steps:** The orientation package will be available in English and French in mid-2016 on the Global Fund website and through digital media. The Global Fund Secretariat will develop a strategy to strongly encourage CCM members to complete the orientation package.

## THPEE600

### A PARTNERSHIP OF STRENGTHS: A MODEL COLLABORATION BETWEEN GOVERNMENT, NGOS AND THE PLHIV COMMUNITY FOR COMPREHENSIVE CARE AND SUPPORT: EXPERIENCE FROM THE VIHAAN PROGRAMME IN INDIA

H. Rosenara[1], V. Arumugam[1], J. Jose[2], M. Pardesi[3], S. Mehta[1], A.S. Rathore[2], B.B. Rewari[2], J. Robertson[1]
*[1]India HIV/AIDS Alliance, New Delhi, India, [2]National AIDS Control Organization, New Delhi, India, [3]National Coalition of People Living with HIV in India (NCPI+), New Delhi, India*
*Presenting author email: rhuidrom@allianceindia.org*

**Background:** There are an estimated 2.12 million PLHIV in India (NACO, 2015), of whom 1.17 million are registered with the ART centres across India. These facilities are the primary Government service delivery sites for ART and associated treatment linkages. Complementing the Government HIV programme, the Global Fund-supported Vihaan Care & Support programme, implemented by India HIV/AIDS Alliance and partner, promotes care & support for PLHIV to improve uptake and efficacy of treatment. A core component of India's national HIV strategy, Vihaan offers community-based outreach, follow-up, counselling, and referral services for PLHIV to strengthen treatment adherence and increase retention in care, and improve the overall quality of life for PLHIV.
**Description:** Vihaan was initiated on April 1, 2013. A total of 350 Care & Support Centres (CSCs) have been established, implemented by PLHIV networks (80%) and other civil society organisations (20%). CSCs promote treatment adherence, enhance positive living and create an enabling environment for an effective HIV response in India. CSCs are linked to all 520 ART Centres across India and foster PLHIV retention in HIV care, as well as educating, supporting and linking them with other health services and social welfare schemes.
**Lessons learned:** Effective coordination and active involvement of all stakeholders - including the National AIDS Control Organisation, State AIDS Control Societies, state and district PLHIV networks, NGOs, and Alliance India - throughout the project cycle (planning, implementation and monitoring) has enabled Vihaan to provide effective care and support services to 904,104 PLHIV, representing 77% of the PLHIV registered in the national ART programme. In addition, 146,361 Lost-to-Follow-Up PLHIV have been tracked and returned to ART services, and 306,955 PLHIV have been linked with various social protection schemes, through December 2015.
**Conclusions/Next steps:** Effective partnership between Government, NGOs and the PLHIV community takes commitment from all. It is imperative that such partnerships are actively supported to bridge existing gaps in care, support and treatment services and complement the important work done by each stakeholder to collectively enhance the national HIV response.

## THPEE601

### ADVOCATING FOR GOVERNMENT TO INTRODUCE HIV PREVENTION IN SCHOOLS AS A CORE SUBJECT

T. Earnshaw
*Bantwana Initiative, Mbabane, Swaziland*
*Presenting author email: thulani_earnshaw@bantwana.org*

**Background:** With an HIV prevalence rate of 28% among adults, Swaziland leads with the world's highest HIV rate. Devastatingly, 35-45% of the country's children are orphans. These are astounding statistics, yet, until recently, no national HIV education curricula existed to provide youth with the information needed for them to remain HIV-free. The Bantwana Initiative of World Education (WEI/B) identified this as a critical prevention gap, and, in 2011, began advocacy work with the Ministry of Education & Training (MoET) and UNICEF to formalize HIV education across all secondary school classrooms.
**Description:** With funding support from UNICEF, WEI/B worked closely with the National Curricula Committee to develop a national Guidance & Counseling Curricula and a Teacher's Handbook for levels 1-5, which includes core HIV education prevention lessons. The MoET recently endorsed and launched the new Guidance and Counseling curriculum nationally, and WEI/B is rolling out the program in all secondary school classrooms across the country, monitoring impact through a KAP study.
**Lessons learned:** The establishment of this HIV program on behalf of all secondary school students in Swaziland is a milestone achievement, and a testament to the underestimated role and paramount importance of advocacy, close engagement, and support of key interventions with government ministries. The success in the development and launching of this national program underscores the value of strong government partnerships, and the need for a long-term vision for addressing prevention gaps within national frameworks.
**Conclusions/Next steps:** Whereas in 2011 there was no HIV education in public schools amidst a devastating epidemic, today, WEI/B is supporting the MoET to reach approximately 80,000 young people with key information about how to prevent HIV infection. WEI/B has helped to shift outcomes for a generation of young people by helping the government to bridge a critical prevention gap, bringing critically-needed HIV prevention and life skills education to young people - a cornerstone of the aggressive attempts to curb the disease, and reach 90-90-90 goals.

# CROSS-BORDER COLLABORATION (BETWEEN COUNTRIES) TO SCALE UP ACCESS TO HIV TREATMENT AND SERVICES FOR MIGRANTS AND MOBILE POPULATIONS

## THPEE602

### HIV, MOBILITY AND CROSS BORDER AREA: STRATEGY FOR BETTER ACCESS TO HEALTH AND SERVICES FOR KP AND PLHA. THE EXAMPLE OF FEVE/SÉNÉGAL PROJECT (BORDERS AND VULNERABILITY)

P.D. Ndoye[1], D. Diouf[2], H. Goedertz[3], F.M. Dramé[4]
*[1]Enda Sante, HIV/AIDS, Social and Economic Empowerment, Dakar, Senegal, [2]Enda Sante, Dakar, Senegal, [3]SAN Acces, Luxembourg, Luxembourg, [4]Enda Santé, Dakar, Senegal*
*Presenting author email: papedjibril@endatiersmonde.org*

**Background:** The cross borders and mobility areas request specific strategies for an efficient response to HIV. Each country has his strategic plan to fight HIV based in his context and the nature of the epidemic as promoted by UNAIDS « know your epidemic,know your response ».
However, the border areas present generally a different context due to the lack of qualified health structures, the important mobility and difficulties to follow up the HIV patients specially key populations (KP) from one country to an other.
The FEVE project ( Borders and vulnerability to HIV) implemented in 8 countries in west Africa by Enda Sante in partnership with the Luxembourg cooperation and SAN access is the only regional project in west Africa targeting KP and PLHA for a better access to health services.
**Description:** The cross border activities are implemented between Senegal, Guinee Bissau, Guinee Conakry, Mali and the Gambia from 2011 to 2015.
The main interventions undertaken are

- Linking health providers and other actors in a cross border task force
- Elaboration and implementation of a multi language cross border referral tool.
- Elaboration of a directory of the main health centers and services available along the borders.
- Capacity building and experience exchange.
- Joined awareness / VCT campaigns in the mobility points

**Lessons learned:** A global strategy is necessary for a better response in cross border areas. Health providers must have a discussion framework to evaluate the actives together and familiarize.
The availability of the map of health structures along the borders and a referral tool facilitate the follow up of HIV patients from one country to an other.
Capacity building and reinforcement of cross border health structures are needed for a good quality of services delivered.
**Conclusions/Next steps:** The FEVE project is a relevant experience in managing HIV in the border areas. His achievements permitted the implementation of new project like KPCF ( key population challenge fund) and initiative like the link of the CNLS ( National Aids Services) of Senegal, the Gambia and Guinee Bissau to fight the HIV epidemic. It can be a base of building new joined strategies to end the epidemic in west Africa.

## COMMUNITY COORDINATING MECHANISMS

### THPEE603

#### COMMUNITY ENGAGEMENT IN RESEARCH UNEARTHS COMMUNITY HEALTH NEEDS

E.M. Moseki[1], M.O. Mmalane[1], V. Ndaba[1], K. Powis[1], M. Pretorius Holme[2], M.M. Essex[2]
*[1]Botswana-Harvard AIDS Institute Partnership, Clinical Trials Unit, Gaborone, Botswana, [2]Harvard T S Chan School of Public Health, School of Public Health, Boston, United States*
*Presenting author email: ernestooramoseki@gmail.com*

**Background:** Biomedical studies require active and rigorous community engagement (CE), especially if it is community based study. Researchers conduct CE to sensitize a community about an impending study, seek input from community members on the best methods of conducting a study within their community, obtain acceptance from the community of study, understand socio-cultural aspects of the community that may influence study conduct, and to educate community members on health-related aspects of the proposed study. However, often non-study-specific health-related questions are encountered during CE activities, identifying health care gaps or specific community needs that will not be addressed by the planned research.
**Description:** Botswana Harvard AIDS Institute (BHP) is collaboratively conducting a community-based study, the Botswana Combination Prevention Project (BCPP), investigating the impact of combination of HIV prevention services in reducing HIV incidence over 36 months in 16-64 year old residents of Botswana. Participants are enrolled from 30 communities throughout Botswana. The BCPP CE team held introductory meetings with the leadership in each of the 30 communities, followed by a community residents meeting. Community leadership included Kgosi (Chief), headmen, heads of church-based and non-governmental organizations, community development structures (i.e. Village Development Committees) and government departments. Audience comments and questions often included health or development issues outside the scope of the project (i.e. other diseases, drug/alcohol abuse, resources), some of which affect a subset of the community's population, such as youth.
**Lessons learned:** As much as BCPP communities have actively embraced BCPP, they have other health-related issues that they prioritise and wish to bring to the attention of those in leadership positions whenever the opportunity arises. CE forums, such as the meetings held for BCPP, offered them such opportunity.
**Conclusions/Next steps:** Understanding that communities may have health priorities beyond scope of BCPP, we established a practice of routine debriefings with key Botswana Ministry of Health personnel after CE campaign. However, when conducting CE for HIV-specific study, CE plans should include strategies to effectively respond to, and/or bring to the attention of relevant authorities, community health needs that are beyond the scope of the research, but for which, the community requires response.

## CREATING DEMAND FOR HIV-RELATED CARE AND SERVICES

### THPEE604

#### LESSONS LEARNED FROM LAUNCHING PLEASEPREPME.ORG, A CROWD-SOURCED, LOCATION-BASED, SEARCHABLE STATEWIDE CALIFORNIA PREP PROVIDER DIRECTORY TO CONNECT CONSUMERS INTERESTED IN PREP TO PREP-FRIENDLY PROVIDERS

S. Weber[1], K. Oza[2], C. Watson[3], J. Gaeta[4], M. Canon[5]
*[1]University of California, Family & Community Medicine, San Francisco, United States, [2]HIVE/UCSF, San Francisco, United States, [3]HIVE, San Francisco, United States, [4]PleasePrEPMe.org, San Franciaco, United States, [5]PleasePrEPMe.org, San Francisco, United States*
*Presenting author email: shannon.weber@ucsf.edu*

**Background:** According to the U.S. Centers of Disease Control and Prevention, one in three primary care doctors and nurses have not heard about pre-exposure prophylaxis (PrEP). While efforts are underway to train providers and develop policies to increase PrEP access, there is increasing demand by consumers to find PrEP-friendly providers.
**Description:** PleasePrEPMe.org, a crowd-sourced, location-based, searchable statewide California PrEP Provider Directory, launched November 2015 connecting consumers interested in PrEP to willing providers. The website was developed in collaboration with regional partners in the San Francisco Bay Area, Los Angeles and San Diego. From the homepage, users enter their location by city or zip code. The website scans the up-to-date directory of 200 clinics mapping the nearest within a customizable mile radius. Consumers can find a provider that fits their sexual health needs. For providers, PleasePrEPme.org offers a portal to promote their services. The website also offers resources to empower consumers and providers to better access PrEP.
**Lessons learned:** We solicited user input using heuristic reviews and surveys throughout the development process to ensure the website's look, feel and messaging were consumer-oriented. In doing so, we invested significant skill, time and resources for building the searchable database and website design to meet consumer desire for a simple search process and information structured in a user-friendly format. To date, more than 6,500 visitors have visited PleasePrEPMe.org with more than 17,000 page views. We credit much of the website's success to this consumer-driven approach.
Separately, willingness from providers to join PleasePrEPMe.org depended on PrEP awareness, which varied. Having readily available capacity building assistance tools for providers not aware and/or comfortable prescribing PrEP was helpful. For counties with rural populations, low HIV incidence and/or low HIV prevalence, we found partnering with major influencers, like the State Office of AIDS, along with targeted outreach was key in our recruitment efforts.
**Conclusions/Next steps:** PleasePrEPMe.org fills the demand of consumers seeking a willing PrEP provider and supports providers to become more PrEP-friendly. It is our intent to expand PleasePrEPMe.org into a multi-state or national effort. As PrEP uptake continues to increase, our lessons learned may be useful to others developing PrEP provider directories.

### THPEE605

#### COMMUNITY MOBILIZATION AS KEY TO THE SCALE UP OF VIRAL LOAD MONITORING IN RESOURCE-LIMITED SETTINGS: LESSONS FROM UGANDA

K. Mwehonge
*Coalition for Health Promotion and Social Development (HEPS Uganda), Health, Kampala, Uganda*
*Presenting author email: kmwehonge@heps.or.ug*

**Background:** Viral load (VL) testing is increasingly recognized as an important tool for the management of ART in resource-limited settings. However, VL testing has been cost-prohibitive, lacking community demand in many countries, and not widely understood or discussed.
**Description:** Civil society (CS) in Uganda, led by HEPS, mobilized to improve access to VL monitoring. The campaign for prioritization and scale-up of VL testing engaged CSOs and constituencies of people living with HIV (PLHIV), the Ministry of Health and development partners such as PEPFAR. Advocates also conducted a baseline survey of VL monitoring services in four regions of Uganda, capacity building workshops with over 30 CS organizations and others including health journalists, radio and TV talk shows and print media.
**Lessons learned:** The survey found that out of the 56 public facilities visited, only five, and a handful of private facilities, offered VL services. It also found low levels of awareness of the importance of VL, confusion about the difference between CD4 count and VL and sporadic ARV stock outs in most facilities.
Largely as a result of HEPS' survey and community engagement, CS was able to inform and shape the VL rollout process supported by Uganda's HIV/AIDS National Priority Action Plan 2015-2018 and funded by PEPFAR. Specifically, HEPS raised awareness empowering PLHIV to increase demand for and uptake of VL services, helped foster robust community systems that follow up and support people with a high VL; used mass media to communicate the delicate shift from CD4 count as a monitoring tool to VL; ensured that the ART program works in harmony with the VL program and called for and enabled a stable and sustained supply of ARVs to achieve viral suppression.
**Conclusions/Next steps:** Universal access to VL monitoring is feasible however experience from HEPS' VL advocacy project shows that it is important to involve CS and PLHIV for successful rollout of the program. The project is currently identifying and recruiting community champions to monitor the rollout of the program guided by a VL quality checklist.

## COMMUNITY-LED PROGRAMMES AND ORGANIZATIONS, INCLUDING FOR KEY POPULATIONS

### THPEE606

#### ASSESSMENT OF PEER-LED, COMMUNITY-BASED-ORGANIZATIONS PROMOTING SAFE SEX AND EMPOWERMENT AMONG STREET SEX WORKERS IN VIETNAM

H.H. Nguyen[1], T.H.O. Khuat[2], D. Belanger[3], T.H.G. Khuat[2]
*[1]Center for Supporting Community Development Initiatives (SCDI), Community Development, Hanoi, Vietnam, [2]Center for Supporting Community Development Initiatives (SCDI), Hanoi, Vietnam, [3]Université Laval, Québec, Canada*
*Presenting author email: huongnguyen2@scdi.org.vn*

**Background:** In Vietnam, prevalence of HIV is estimated at 0.3% among the general population, but at 16% to 23% among street-based sex workers (SWs) in some provinces. Sex work in Vietnam is illegal and sex workers are vulnerable to stigma, social exclusion, violence, harassment and detention.
**Description:** This paper examines the experiences of Vietnamese sex workers who participated in peer-led sex workers' community-based organizations (CBOs). Sex workers' CBOs were implemented by the Vietnamese NGO Supporting Community Development Initiative (SCDI) using a harm reduction intervention model designed and implemented within the framework of the Bridging the Gap program (Aidsfonds, Netherlands). The objective of the study is to assess the effectiveness of SWs' participation in the CBO organization. The study uses a participatory qualitative research method. Nine focus group discussions and 20 individual in-depth interviews were conducted between October 2014 and February 2015, reaching a total of 107 sex workers-CBO members (85 women and 22 men).
**Lessons learned:** The CBO was assessed very positively by study participants who felt the CBO yielded positive results with respect to the adoption of safe sex practices, including regular condom use and health testing, and, therefore, reduced sexual health risks. Participation in a CBO promoted feelings of empowerment, which enhanced the ability to negotiate safe sex with clients and to contest abusive and violent client or police behavior.
**Conclusions/Next steps:** We discuss the implications of our findings for planning a national intervention program that would maximize benefits for sex workers, clients and the general population.

### THPEE607

#### "NOTHING FOR US WITHOUT US". SCALING ACCESS TO SERVICES THROUGH COMMUNITY INVOLVEMENT IN RUNNING OF PROGRAMS: A REVIEW OF THE SEX WORKERS LEARNING SITE IN MOMBASA, KENYA

J. Musimbi[1], J. Anthony[2], B.E. Ogwang[1], J. Kioko[1], P. Gichangi[3], H. Musyoki[4], P. Bhattacharjee[2]
*[1]Partners for Health and Development in Africa (PHDA), Technical Support Unit for Key Populations, Nairobi, Kenya, [2]University of Manitoba, Nairobi, Kenya, [3]International Centre for Reproductive Health, Mombasa, Kenya, [4]National AIDS and STI Control Program, Government of Kenya, Nairobi, Kenya*
*Presenting author email: jmusimbi@gmail.com*

**Background:** Sex Workers (SWs) are particularly vulnerable to HIV and STIs. The vulnerabilities faced by SWs relate not only to their individual risk behaviors but also to broader societal and community factors. National AIDS Control Council (NACC) and National AIDS and STI Control Programme (NASCOP) has prioritised SWs in the Kenya AIDS Strategic Framework (2014-2019) and has recommended a combination prevention strategy to scale up interventions. In 2013, NASCOP selected Mombasa to establish a model program to serve as demonstration site for building and disseminating knowledge about efficient and effective comprehensive programming with key populations. The outreach component was spearheaded by SWs.
**Description:** Mombasa County has an estimated number of 9,289 Female Sex Workers (FSW) and 682 Male Sex Workers (MSW) who operate mostly in venues. Through consultation with the SW community, it was agreed that the Learning Site (LS) would target SWs in two locations whose estimated number of FSW was 5,809 and MSW 600. The main objective of the LS was to implement a comprehensive SWs model program which focuses on reducing HIV transmission among SW by strengthening behavioral and structural interventions.
**Lessons learned:** At the end of the period July 2015, a total of 6,698 FSW and 1000 MSW were enrolled through the outreach program. Out of those enrolled, 60% of the FSW and 95% of the MSW were also enrolled at the clinic. SWs who reported consistent condom use increased from 84% to 92% and 49% to 52% for FSW and MSW respectively during the period 2014 to 2015.
Access to HIV testing and Counselling also increased from 62% to 89% for FSW and 71% to 74% from the period 2014 to 2015 with 92% of those positive enrolled into a HIV care and treatment program.
**Conclusions/Next steps:** The project is a community owned comprehensive project. SWs are in the centre of the project and are part of the decision making. Services are comprehensive and have expanded over time addressing the needs of the community such as flexi opening hours. Overall the project shows that even in a short period of time a community owned comprehensive programme can result in positive outcomes.

### THPEE608

#### CURRENT SITUATION AND CHALLENGES FOR NON-PROFIT ORGANIZATIONS INVOLVING IN HIV/AIDS RESPONSE IN CHINA

H. Li[1], W. Yang[2], P. Liu[3], S. Sha[3], P. Wang[2]
*[1]Chinese Academy for Preventive Medicine, China AIDS fund for No-profit Organizations Program Management Office, Beijing, China, [2]Chinese Academy for Preventive Medicine, Beijing, China, [3]Chinese Association for STD/AIDS Prevention and Control, Beijing, China*
*Presenting author email: chenqingyubj@163.com*

**Background:** To analysis current situation for non-profit organization (NPO) participating in fighting HIV/AIDS in China, and to inform policy making in term of CBOs' participation in future HIV response in China.
**Methods:** We employed a mixed method including policy and literature review, cross-sectional questionnaire survey across 29 provinces, as well qualitative interview of the key informants. A total of more than 700 organizations enrolled in the survey. The institutional information and profile, services delivery over last 5 years, staffing and capacity and future development plan and challenges ahead et.al were collected and analyzed.
**Results:** In total, there were more than 1000 NPOs supported by international cooperation programs, such as the Global Fund and Gates Foundation in 2013, and more than 700 projects are supported by China AIDS Fund for NPOs, which is fund by Chinese central government, in 2015. Among them, more than 80 percent of surveyed NPOs are unregistered(without obtaining legal status in China). Staff member varied from 0 to 42 full-time staffs per organization and less than two persons on average. Around 60 percent of NPOs had leased office venue and more than 90 percent secure financial support from international organizations over the past two years. The NPOs fulfilled their role in targeted intervention, care and support for people living with HIV/AIDS, capacity building, and even participating in operational researches, etc. As a matter of fact, NPOs' participation in combating HIV arena was irreplaceable partnership, however, they still faced outstanding barriers and challenges for participation. Legal status obtained from Civil Affairs Department was one of most significant. The remaining challenges like financial support and capacity building only took time.
**Conclusions:** Registration certification, financial support and capacity building are needed to ensure NPOs' effective participating in fighting HIV/AIDS. Government at each level may use contracted service from NPOs and project-based management to ensure sustainable financial support to NPOs in terms of channeling their effort and monitoring performance efficiently.

### THPEE609

#### THE ISEAN-HIVOS EXPERIENCE: STRENGTHENING CAPACITIES OF COMMUNITY-BASED ORGANIZATIONS (CBOS) THROUGH ORGANIZATIONAL DEVELOPMENT (OD) APPROACH FOR SUSTAINABILITY OF COMMUNITY-LED HIV, SOGIE AND RIGHTS-BASED INTERVENTIONS IN THE PHILIPPINES

R.N. Cortes[1,2]
*[1]Philippine NGO Council on Population, Health and Welfare, Inc, ISEAN-Hivos Program, Pasay City, Philippines, [2]ISEAN Secretariat, ISEAN-Hivos Program, Jakarta, Indonesia*

**Background:** The ISEAN-Hivos Program (IHP) is a regional Global Fund AIDS grant focused on community systems strengthening (CSS) among males having sex with males (MSM) and transgender (TG) organizations in Indonesia, Malaysia, Philippines and Timor Leste. The program in the Philippines is implemented by the Philippine NGO Council on Population, Health and Welfare, Inc. since October 2011, providing various OD-focused capacity building trainings/mentoring to more than 40 MSM/TG CBOs. This includes program/financial management, monitoring/evaluation, research/documentation, leadership/governance, strategic planning, advocacy/networking, resource mobilization and proposal writing, among others.
**Description:** The capacity building series has contributed to strengthening the CBOs' organizational systems/procedures. This is more evident for more than 20 CBOs whose proposals on innovative HIV, SOGIE and rights-based interventions for MSM and TGs were granted by IHP through small fund grants ranging from Php

50,000 to Php 250,000. Interventions varied from conducting HIV and SOGIE-related awareness caravans and campaigns; using theatre as medium for LGBT awareness; establishing a male wellness center, mobile testing van and BCC-awareness mobile, that contributed to existing community-led peer education and HIV counselling and testing (HCT) services.
**Lessons learned:** Two of the most noteworthy CBO beneficiaries are LoveYouself in Metro Manila and Cebuplus Association in Cebu City. LoveYourself's IHP-funded proposal for an IEC video on HIV awareness ("Fly Love Yourself") and BCC-awareness mobile ("LoveCar") has contributed in promoting their testing services in their community clinics. For Cebuplus, their proposal for mobile testing vans and a male wellness center, has increased the number of MSM/TG clients reached by their HIV prevention services, and undergone HCT. Both have contributed to more than 50% of the total number of people who have undergone HCT in Metro Manila and Metro Cebu, respectively. This has also translated into sustainable partnerships with their local government units and private foundations.
**Conclusions/Next steps:** Given this model, such OD-approach on capacity building for CBOs should continuously be monitored, evaluated, and foster linkage with local government partners and/or private institutions. This kind of CSS intervention has a long-term perspective because it is geared towards the sustainable development of the CBOs to continuously advocate and implement community-led HIV, SOGIE and rights-based interventions in the Philippines.

## THPEE610

### DEMONSTRATING THE VALUE OF COMMUNITY-CONTROL IN AUSTRALIA'S RESPONSE TO HIV

D. O'Donnell[1], S. Ruth[2], A. Burry[3], R. Lake[1], J. Kolstee[4], R. Griew[5,6], M. Jackson[5], S. Schulz[5]
*[1]Australian Federation of AIDS Organisations, Sydney, Australia, [2]Victorian AIDS Council, Melbourne, Australia, [3]Western Australian AIDS Council, Perth, Australia, [4]ACON, Sydney, Australia, [5]Nous Group, Sydney, Australia, [6]University of Melbourne, Melbourne, Australia*
*Presenting author email: dodonnell@acon.org.au*

**Background:** Australia's gay communities mobilised early in response to HIV, establishing community-controlled, peer-based organisations which governments later funded for education, campaign, outreach and other programs. In recent years, Australian governments have been developing new models to fund health and other social services. This includes competitive tendering that is open a wider range of providers including other not-for-profit, for-profit and public sector providers.
**Methods:** Australia's community-controlled AIDS Councils and their national peak, the Australian Federation of AIDS Organisations (AFAO), commissioned research to demonstrate how community-controlled HIV organisations create, deliver and capture value and to analyse the costs of community-controlled HIV programs relative to other providers. The analysis was informed by financial and activity data and case studies contributed by Australian AIDS Councils and AFAO.
**Results:** Community-controlled HIV organisations have unique and valuable capacities and qualities that distinguish them from other potential providers of HIV programs. In Australian HIV community organisations, these qualities are historically derived, deeply embedded and continuously reproduced. They include community-control through democratic, open governance processes, as well as connectedness and accountability to and existence within gay communities. The participation of gay men, including those with HIV, is evident at all levels of the community HIV response. This provides for 'community knowing' that is trusted by and responsive to communities in the creation of effective HIV prevention and education programs. The essential, inherent nature of these qualities creates challenges for their full articulation and valuing in government procurement processes. In this analysis, community-controlled HIV programs - specifically, peer-led HIV and STI testing and community-level education programs - were delivered more cost-effectively when these qualities were included and costed, and greater target group reach and impact was achieved.
**Conclusions:** Governments and other program funders are increasingly seeking the best value for their investments in HIV and other programs through stringent evaluation of funding proposals. The value generated by HIV community-controlled organisations has historically lacked clear expression. This can result in funders failing to reflect these qualities and capabilities in their purchasing specifications. Likewise, community-controlled HIV organisations must better describe and cost this value in their representations and proposals to funders.

## THPEE611

### FROM SELF-EMPOWERMENT TO BUILDING COMMUNITY: EVIDENCE OF POSITIVE IMPACT OF A CROSS CULTURAL TREATMENT LITERACY AND PEER SUPPORT SKILL DEVELOPMENT PROGRAM IN CANADA

A.T.-W. Li[1], R. Jagwani[2], D.-M. Chuang[3], K. Wong[2], L. Soje[2], J.P.-H. Wong[4]
*[1]Regent Park Community Health Centre, Clinical, Toronto, Canada, [2]Committee for Accessible AIDS Treatment, Toronto, Canada, [3]University of Toronto, Factor-inwentash Faculty of Social Work, Toronto, Canada, [4]Ryerson University, Daphne Cockwell School of Nursing, Toronto, Canada*
*Presenting author email: dengmin.chuang@mail.utoronto.ca*

**Background:** Racialized and newcomer communities living with HIV/AIDS in Canada face challenges in accessing treatment and support due to barriers in treatment literacy, service access, and social exclusion. To address these barriers several front-line ethno-specific AIDS service agencies in Toronto, Canada collaborated to develop a cross-cultural treatment support program - the Ethno-racial Treatment Support Network. (ETSN)
Since 2003, ETSN has trained over 150 PLHIV from five cultural communities including African, Caribbean, East Asian, South Asian and Hispanic communities. This program involves 3 levels of skill building program. Level 1 focuses on treatment literacy and health care access skills.Level 2 focuses on peer counselling and support skills. Level 3 provides mentored practice to supportETSN graduates to co-deliver training to new peer participants.
**Description:** In 2013 we undertook an evaluation study to capture the real-life impact of the ETSN training. The aim was to engage past participants to identify relevant and meaningful indicators of changes attributable to the training. Based on the study's findings, a questionnaire with validated scales was developed to measure domains of:
(1) self health management efficacy (SHME);
(2) health literacy (HL);
(3) social connection and support (SC);
(4) empowerment;
(5) community engagement (CE); and
(6) treatment adherence.
**Lessons learned:** 18 PLHIV from 5 ethno-racial communities in Toronto completed the ETSN level 1 training between 2014-2015. A self-administered questionnaire was completed by all participants before and immediately after the training. In addition, a one-year follow up survey was sent to participants to track their changes in the above areas.
Paired sample-test revealed significant improvements in the domains of SHME ($t = -3.88$, $p < 0.01$), CE ($t = -2.25$, $p < 0.05$), and HL ($t = -2.25$, $p < 0.05$). In addition, over 50% participants reported significant and sustained engagement with community service agencies and peer networks formed through their training experience a year later.
**Conclusions/Next steps:** Holistic peer-based learning that facilitates treatment literacy and mutual peer support are effective in enhancing self health management, treatment adherence and formation of lasting social support networks amongst PLHIV. This cross-cultural program model is transferrable to PLHIV communities from diverse backgrounds and internationally.

## THPEE612

### IMMIGRATION SYSTEM LITERACY AND SERVICE ACCESS TRAINING TO FACILITATE NEWCOMER PEOPLE LIVING WITH HIV (PLHIV) IN OBTAINING LEGAL STATUS AND SETTLEMENT IN CANADA

R. Jagwani[1], M. Owino[1], A.T.-W. Li[2]
*[1]Committee for Accessible AIDS Treatment (CAAT), Toronto, Canada, [2]Regent Park Community Health Centre, Toronto, Canada*
*Presenting author email: maureeno@regentparkchc.org*

**Background:** Immigrants and refugees living with HIV/AIDS (IR-PLHIV) have accounted for 12-18% of new HIV cases annually in Canada since 2002. The Canadian immigration and refugee system is very complex and has undergone multiple changes in recent years. This led to confusion, fear and access barriers for newcomers and their service providers.
The lack of legal status also directly limited access to health care, treatment and support. In response, the Committee for Accessible AIDS Treatment (CAAT) in Toronto developed a training module on HIV and Immigration issues to promote awareness of immigration policies and corresponding service eligibility amongst IR-PLHIV and service providers.
**Description:** Since 2008, 7 series of HIV and Immigration trainings have been conducted in Toronto attended by 148 participants, including 91 IR-PLHIV and 57 service providers. Amongst the PLHIV participants, 79(86.8%) have had successful immigration hearings with positive outcomes; 3 (3.3%) had negative immigration

outcome, while 6 (6.6%) people's immigration hearing dates are still pending. The outcome of 3 (3.3%) of the participants were unknown.
**Lessons learned:** The vast majority of participants found the training helpful with relevant and important information on how to access legal support and navigate the immigration system. They credited the training with assisting them in making informed decisions on their legal options on which immigration application stream to apply; how to prepare relevant supporting documentation for their application; and how to work effectively with their legal service providers. It also reduced fear of the unknown and gave the people confidence and tools to advocate for themselves. In addition, the training enabled participants' knowledge on the eligibility criteria for various health and social services along the immigration refugee status continuum. The co-learning environment also enabled direct contact and promoted connection between IR-PLHIV and service providers.
**Conclusions/Next steps:** Knowledge and skills in navigating the immigration system has direct impact on the access to legal status and access to health care coverage, treatment and support services for all newcomer PLHIV. Countries and regions with migrant PLHIV would benefit from similar training to improve immigration system literacy to ensure the health and well being of IR-PLHIV.

## THPEE613

### IMPROVING PROGRAM QUALITY FOR HIV PREVENTION AMONG MAN WHO HAVE SEX WITH MAN(MSM) IN CHALLENGING AND HOSTILE ENVIRONMENTS: PEER EDUCATOR PERSPECTIVES FROM KARACHI, PAKISTAN

A. Asghar
*Parwaz Male Health Society, Program Director, Karachi, Pakistan*
*Presenting author email: ali.asghar@parwaz.org.pk*

**Background:** Peer-education for HIV prevention increases HIV related knowledge and safer sex practices, however, peer-led HIV prevention, especially among MSMs, in hostile environments such as Pakistan is challenging and has implications for program quality and outputs.
**Description:** Parwaz Male Health Society (PMHS) provides voluntary counseling and testing (VCT) for HIV, referral for HIV management, and provision of condoms/lubricant to MSMs through peer educators and a service delivery center in Karachi, Pakistan. These field workers face particular challenges which exact a toll on their physical, mental and social well-being and affect overall program quality. To understand these challenges and improve program outreach quality and efficiency, written and verbal peer educator field reports were subjected to manual qualitative analysis.
Key challenges that were reported included harassment by police, local politically affiliated gangs and clients who mistake peer educators for commercial sex workers. Instances of rape by the police were also described. Peer educators reported emotional stress brought on by concealing the nature of their job from their families and wives, and break-ups due to suspicions regarding their HIV status resulting from negotiating condom use with their partners. In order to meet the pressure of program targets, they often had to pay for transport and refreshment while engaging with clients in local cafes. They are suspected of being foreign agents, trying to promote homosexuality, and spread HIV under the guise of HIV testing. They also reported deficiencies in their knowledge and skills for behavior change communication.
**Lessons learned:** PMHS needs to liaise with security agencies to ensure the safety of peer educators, position its peer educators as government endorsed lay health workers and provide them with regular psychosocial counseling. Improvements in health education skills and increased financial support for field work are also needed to improve program efficiency.
**Conclusions/Next steps:** Programs in challenging and hostile environments need stronger collaboration with the state, especially with the police and with state-owned lay health worker programs. Funding agencies need to take into account financial pressures on peer educators and increase investment in capacity building for behavior change communication skills around HIV prevention in MSMs.

## THPEE614

### EVALUATION OF THE WARD DOOR TO DOOR ADIS PROGRAM IN GAUTENG PROVINCE

T. Motholo[1], L. Floyd[2], Gauteng AIDS Council Secretariat Team
*[1]Gauteng Department of Health, Gauteng AIDS Council Secretariat, Johannesburg, South Africa, [2]Gauteng Department of Health, Johannesburg, South Africa*
*Presenting author email: tsietsi.motholo@gauteng.gov.za*

**Background:** The Ward door to door AIDS program reaches 8 million people (cumulative) with education through 4 million household visits (cumulative) with a quarter of a million referrals per year. It is implemented in over 70% of Wards (local area of government) by five Municipalities, prioritizing HIV prevention in informal settlements and other high risk settings. Ward educators provide peer education on safe sex, motivate HIV testing, make referrals and follow up TB and ART defaulters. Mobile health, social and poverty relief services are taken to high risk wards. A service guideline and monitoring system are in place.
**Methods:** The program evaluation was tendered by the secretariat of the Gauteng AIDS Council. Methods include a survey of 2 100 beneficiaries (a stratified random sample), focus groups of 50 implementers and interviews with 30 stakeholders across five Municipalities. The questionnaire addresses key indicators from the logical framework for HIV prevention.
**Results:** The program achieves high coverage of informal settlements and townships and includes taverns and sex workers.
The pilot of 10% of beneficiaries shows very high preference for and influence of ward educators at 90%. 97% liked the interactive nature of the education and over 75% of educators met the minimum standards for the educational method. 56% reported regular condom use (all partners) and 21% reported sex without condoms. 38% were referred, 89% of those referred followed through and 82% of referrals were followed up by ward educators. Referrals are made for the following services: social grants, poverty relief, social services, orphans and vulnerable children, housing and health care.
The program supports expansion of the Ntirhisano Service Delivery War Rooms on the Operation Sukhuma Sakhe model from Kwazulu Natal.
**Conclusions:**
· The program achieves high coverage of the higher risk areas in the province.
· High coverage and good quality education is necessary to achieve positive outcomes.
· Good local management of community workers is essential for their effectiveness.
· The monitoring and reporting system includes random back checks to verify reports plus observation of the quality of the service.
· Periodic evaluation is required to ensure the program achieves its objectives.

## THPEE615

### ACCESS TO HIV TREATMENT AND CARE FOR SYRIAN REFUGEES IN LEBANON

M. Woodman[1], A. Wimmer[1], M. Akiki Abi Safi[1], A. Das[2]
*[1]UNHCR, Beirut, Lebanon, [2]UNHCR, Pretoria, South Africa*
*Presenting author email: dasa@unhcr.org*

**Background:** Lebanon has experienced an unprecedented influx of nearly 1.1 million Syrian refugees since the onset of the Syrian crisis. Refugees are scattered throughout Lebanon, living mainly in urban settings. 70% are living below the poverty line and rely on aid to meet their basic needs including access to healthcare. Refugees often face stigma and discrimination due to their status as refugees and a common misconception that the prevalence of HIV is higher than in the host community. Both Lebanon and Syria are countries of low HIV prevalence. UNHCR sought to ensure access to comprehensive treatment and care for refugees whilst protecting their rights.
**Description:** Early in the crisis, UNHCR engaged with the National AIDS Programme (NAP) of Lebanon and civil society to ensure integration of Syrian refugees within the existing HIV programme. This included confidential access to VCT services, PMTCT and ART treatment provided free of charge by the NAP. However, UNHCR and partners are required to support physician consultation fees, laboratory investigations and hospitalisation costs when indicated, which are not covered by the NAP. To date, approximately 20 Syrian refugees registered with UNHCR are receiving ART with effective follow-up.
**Lessons learned:** Integration of Syrian refugees within the NAP in Lebanon has been possible through early constructive dialogue. However, HIV services are fragmented in this complex, mostly privatised and costly health system. Thus, additional support has been required to ensure access to comprehensive services.
**Conclusions/Next steps:** Lebanon adopted an early position of integration of refugees within the existing national HIV programme that has reduced the risk of further stigmatisation. This benefited refugees and was an important public health measure to reduce transmission of HIV in Lebanon. It is important to sustain this approach through ongoing advocacy to maintain non-discriminatory laws, policies and strategies related to HIV that are inclusive of refugees. In addition, the package of HIV prevention, treatment, care and support services should be further integrated and adequately funded to ensure access to an efficient and effective programme beyond VCT, PMTCT and ART.

### PMTCT ACTIVITIES IN HARD-TO-REACH AREAS WITH SECURITY CHALLENGES: A CASE STUDY FROM ZAMFARA STATE, NIGERIA

R.M. Mathew[1], M.I. Ezekwe[2], N.Z. Usman[3], M. Benedetti[4]
*[1]Pathfinder International, HIV/AIDS, Abuja, Nigeria, [2]National Agency for the Control of AIDS (NACA), Policy & Strategy Department, Abuja, Nigeria, [3]Pathfinder International, Zamfara, Nigeria, [4]Pathfinder International, Watertown, United States*
*Presenting author email: mbenedetti@pathfinder.org*

**Background:** The Global Fund supports PMTCT services in five Primary Health Centres (PHCs) and one Secondary Health Centre (SHC) in Maru Local Government Area (LGA), Zamfara state, Nigeria with the aim of increasing uptake and quality of PMTCT services to support HIV-positive pregnant women and mothers, and to reduce mother-to-child-transmission of HIV (MTCT).
**Description:** In addition to poor quality, stigma, and other cultural factors that deter women from accessing PMTCT services, two of the focal PHCs—Dangulbi and Dankurmi—have faced serious security challenges, including armed bandit raids and sexual violence perpetrated against providers. In order to overcome these challenges and to simultaneously improve the quality of services for increased utilization of PMTCT services, we developed a case study synthesizing lessons learned and the model used to mitigate risk. The model comprised: sensitization visits to community leaders for increased vigilance against perpetrators; use of community leaders' residences as alternative 'ANC centers' for the first visit; organization of community policing; state deployment of troops and repair of roads for easier and safer access to PHCs; and utilizing male peer educators to encourage partners of HIV-positive women to support and accompany them to ANC.
**Lessons learned:** Through community involvement and mapping, identifying and addressing sociocultural factors influencing access to PMTCT at focal PHCs, and using the 'security model,' significantly higher numbers of HIV-positive pregnant women accessed PMTCT services.
**Conclusions/Next steps:** This model could be used by other implementers to increase uptake of PMTCT services by overcoming cultural and other serious barriers, including increasing security challenges prevalent in Nigeria and other countries.

## THPEE618

### ESTIMATES OF THE GLOBAL HIV BURDEN AND THE TREATMENT GAP IN EMERGENCIES

P. Spiegel[1], S. Karmin[2], S. Doraiswamy[3], R. Bennett[4], A. Kobayashi[5], M. Mahy[6], A. Das[7]
*[1]United Nations High Commissioner for Refugees, Public Health and HIV Section, Geneva, Switzerland, [2]UNICEF, New York City, United States, [3]UNHCR, Geneva, Switzerland, [4]Hexor, Cambridge, United Kingdom, [5]Columbia University, New York City, United States, [6]UNAIDS, Geneva, Switzerland, [7]UNHCR, Public Health, Pretoria, South Africa*
*Presenting author email: dasa@unhcr.org*

**Background:** Ambitious global targets for HIV testing and treatment require concerted efforts to reach marginalised persons living in challenging environments. Emergencies often disrupt existing health and HIV services, creating circumstances that may cause interruption of HIV prevention, treatment and care programmes. The objective of this study was to quantify the proportion of PLHIV who were affected by emergencies in 2013 and the treatment gap.
**Methods:** Emergencies were defined as conflict, natural disaster and/or displacement. Country estimates for 2013 were based on eight public databases (EM-DAT, Reliefweb, IDP-db, HIIK, UNHCR, UNRWA, CE-DAT and CAP). We compiled a single dataset with differences among databases providing low and high estimates. Estimates were calculated based on aggregated low/high numbers multiplied against UNAIDS 2013 national prevalence and treatment coverage rates. Global population data were used to establish the proportion between 15-49 years and to calculate PLHIV numbers. Pregnant women were calculated using UNAIDS 2014 estimates.
**Results:** 314 million (295 million-333 million) people were affected by emergencies in 127 countries representing 4.3% of global population; 67 million (61 million-73 million; 21%) were displaced. Floods (75 countries), conflicts (57), and storms (36) were the most common types of emergencies. 1.7 million (1.4 million-2.1 million) PLHIV were affected by emergencies translating into 1 of 19 PLHIV (1 in 16 to 1 in 23); 174,000 (148,000 - 200,000) were children (0-14 years), 81,000 (77,000 - 85,000) were pregnant women, and 193,000 (169,000 - 217,000) were adolescents (10-19 years). 1.4 million (1.3 million-1.6 million) of 1.7 million PLHIV (82%) affected by emergencies lived in Sub-Saharan Africa. Globally, 1.3 million (934,000-1.4 million) PLHIV in emergencies did not have ART access.
**Conclusions:** Although these estimates are not static due to large variations of numbers and types of emergencies, hundreds of millions of people are affected by emergencies annually, and a significant proportion of these are PLHIV. As HIV testing, prevention and treatment is scaled-up, emergency-affected populations, often the most vulnerable, cannot be neglected. Flexible programmes and donors that can adapt to and respond to shocks are critical to ensure PLHIV affected by emergencies are not left behind and ambitious global targets are reached.

## THPEE619

### HIV SERVICES AND RISK IN AN EMERGENCY RESPONSE IN MALAWI

J. Sherman[1], J. Chipeta[1], E. Saka[1], S. Sikwese[2], K. Nindi[1], J. Chinkonde[1]
*[1]UNICEF, Lilongwe, Malawi, [2]Pakachere Institute for Health and Development Communication, Blantyre, Malawi*
*Presenting author email: jsherman@unicef.org*

**Background:** In January 2015 Malawi experienced devastating flooding, displacing 230,000 people. In the three most flood-affected districts, an estimated 52,137 people living with HIV were in need of ART, including 9,215 pregnant women and 842 children. Ensuring continued access to HIV services and reducing risk of HIV transmission required a coordinated, integrated response.
**Description:** Ensuring continuation on ART was the first priority. All health facilities in flood-affected districts had adequate stock of ARVs due to purposeful distribution prior to the rainy season. In most districts, treatment continuation rates showed little change during the emergency response period, however, in the district with the heaviest flooding, the percentage of PMTCT defaulters increased by 10%--from 24% to 34%. Data from the three most affected districts from the first quarter of 2015 showed similar uptake of HTC during the response period as compared to non-emergency periods. ART initiation decreased, though not a marked decline.
During the response, integrated services offered by mobile clinics improved the efficiency and effectiveness of services, and created opportunities for synergies, such as screening malnourished children for HIV. Between January - June 2015, 77% of 757 children admitted to nutrition rehabilitation units in the 3 most affected districts were tested for HIV; 26% (n=151) tested positive and 61% (n=92) were initiated on ART.
A post-disaster assessment of 192 adolescents (10-19 years) indicated high rates of sexual exploitation and transactional sex, particularly among girls, during the emergency response period, including in exchange for relief items.
**Lessons learned:**
· Proactive planning and flexible delivery ensured continued access to HIV services.
· Sufficient stocks of ARVs in facilities is not enough; additional efforts are required to support HIV-positive displaced persons to stay on treatment.
· Offering integrated services creates opportunities for better health outcomes.
· An emergency situation can increase vulnerability and put some key populations at increased risk of HIV.
**Conclusions/Next steps:** In 2016 Malawi has seen widespread drought and food insecurity; an estimated 28 million people require food assistance. Drawing upon the lessons learned, it is critical to implement multi-sectoral interventions based on integrated approaches that also consider the increased vulnerability of adolescent girls.

# ADAPTING HIV PROGRAMMES TO SYSTEMS WITH LIMITED HEALTH CARE PERSONNEL

## THPEE620

### THE EFFECT OF POINT-OF-CARE CD4 ANALYSIS, PILOTED IN AMAJUBA DISTRICT SOUTH AFRICA, ON THE MANAGEMENT OF CLIENTS BEING INITIATED ON ANTIRETROVIRAL THERAPY BY NIMART PRACTITIONERS

G.D. Howard, C. Howard
*Niemeyer Memorial Hospital, Department of Health, Utrecht, South Africa*

**Background:** The launch of the recent 90-90-90 targets for HIV testing, initiation of ART and achieving viral suppression in HIV positive clients prompted the need to explore new ways to optimize ART provision. CD4 analyzers were introduced in Amajuba District as a pilot project to determine whether access to ART could be accelerated without compromising quality of care. The effect of point of care CD4 count testing on ART initiation was assessed in a rural primary care clinic in Kwazulu-Natal.
**Description:** A retrospective chart review was undertaken between November-December 2014 and November-December 2015 to compare numbers of eligible patients initiated on ART prior to the introduction of the POC CD4 analyzer. The duration from enrollment into HIV care to initiation of ART therapy was measured and the initiation of Isoniazid and Cotrimoxazole prophylaxis to prevent opportunistic infections was also evaluated.

**Lessons learned:** After the introduction of POC CD4 tests, the number of clients eligible for ART increased from 29 to 51(-51 0f 78 CD4< 500cells/mm³-). Twenty two of the 51 eligible clients enrolled received Cotrimoxazole prophylaxis (CD4< 200 and clinically stage 1), on the same day and initiated on ART within 5 days. The average number of clients initiated on ART per week increased from 13 in 2014 to 28 in 2015. The screening of clients for TB also improved. Twenty seven of 78 clients were enrolled on the preART and wellness programme and were initiated on Isoniazid therapy. POC CD4 used with the active tracing of patients follow up blood results resulted in a reduction in the number of clinic visits for a client in the run up to ART initiation from 10 days to 3-5 days.
**Conclusions/Next steps:** POC CD4 analysis enabled NIMART nurses to better manage clients accessing HIV services. This technology used in conjunction with active tracing of baseline results reduced the average time to initiating patients on ART. The introduction of POC also improved the nurses independence in the management of HIV positive clients. POC technology has the potential of accelerating management of clients without compromising quality of care.

## Innovative approaches to track patients, track pre-ART care and other programme data (including connectivity and other mHealth solutions)

### THPEE621

### Simplifying data management for household-level combination prevention research in resource-limited settings with reusable open-source software: developing and deploying an electronic research data system for the Botswana Combination Prevention Project

E. van Widenfelt[1], O. Pharatlhatlhe[1], C. Kgathi[1], T. Setsiba[1], T. Mokane[1], U. Chakalisa[1], E. Kadima[1], S. Moyo[1], M. Tafila[1], F. Chilisa[1], L. Kepaletswe[1], G. Rasenyai[1], T. Gaolathe[1], J. Makhema[1], M. Essex[1,2], K. Powis[1,2,3]
*[1]Botswana-Harvard AIDS Institute Partnership, Gaborone, Botswana, [2]Harvard T. H. Chan School of Public Health, Boston, United States, [3]Massachusetts General Hospital, Boston, United States*
*Presenting author email: ew2789@gmail.com*

**Background:** The Botswana Combination Prevention Project (BCPP) is ongoing in remote resource-limited locations in Botswana where ~25% of adult residents are HIV-infected. BCPP will allow for impact quantification of multiple programmatic interventions on HIV incidence. A baseline household survey (BHS) was conducted using a novel electronic research data system (EDC) in ~20% of households from 30 communities lacking reliable power or internet by two teams of 16-18 research assistants (RAs) with limited supervision. The EDC simplified household location, enumeration, contact management, subject eligibility determination, consent verification, enrollment, and questionnaire completion. RAs were guided through each step of the household survey by the EDC to securely gather auditable research-grade human subjects data, conduct HIV testing and counseling, and collect specimens at point-of-contact while maintaining protocol and regulatory compliance.
**Description:** Using the EDC, RAs located 11,582 households, targeted from satellite images, where 10,306 were regularly occupied and 7,696 enumerated. Of 28,174 residents enumerated, 15,475 were potentially eligible and 12,610 enrolled. The EDC validated responses and employed adaptive data-entry in real-time by referencing data-types, allowable ranges, participant criteria, previous responses, and protocol and regulatory requirements. Community-based staff accessed data within 4 hours of collection for specimen processing, consent verification, and operational planning. Centrally- and internationally-based project leaders, laboratory and data staff accessed and analyzed combined data from all communities within 1-3 days of collection.
**Lessons learned:** Developed by the Botswana-Harvard AIDS Institute Partnership (BHP), the EDC is a suite of open-sourced python modules adding clinical, laboratory, regulatory and survey research functionality to the *Django* framework. BHP local software developers were responsible for design, development and deployment resulting in solutions best suited for the local setting. Developers worked closely with research staff and followed a test-driven approach, included user-acceptance testing, maintained version control, and scripted deployments. In response to user issues and protocol changes, developers supported and upgraded remote EDC deployments reliably over inexpensive low-bandwidth connections without disruption to the ongoing surveys.
**Conclusions/Next steps:** The BCPP demonstrated how the collection of complex research-grade participant-level longitudinal data from households in multiple communities lacking reliable power and internet can be simplified through the use of locally developed electronic research data systems.

### THPEE622

### Stand-alone health data systems in remote ART clinics in Botswana can be centralized over inexpensive low-bandwidth connections: the example of the Botswana Combination Prevention Project research data network

E. van Widenfelt[1], R. Ransom[2], S. Tekie[3], G. Ussery[4], W. Abrams[2], A. Desta[2], T. Mokane[1], G. Rasenyai[1], J.A. Miller[4], O. Pharatlhatlhe[1], T. Chebani[1], T. Togara[1], J. Makhema[1], M. Essex[1,5], T. Gaolathe[1]
*[1]Botswana-Harvard AIDS Institute Partnership, Gaborone, Botswana, [2]Centers for Disease Control and Prevention, Atlanta, United States, [3]Microteck, Gaborone, Botswana, [4]Northrop Grumman Corporation, Atlanta, United States, [5]Harvard T. H. Chan School of Public Health, Boston, United States*
*Presenting author email: ew2789@gmail.com*

**Background:** The Botswana Combination Prevention Project (BCPP) is an ongoing community randomized trail operating in 30 remote resource-limited communities in Botswana designed to quantify the impact of multiple programmatic interventions on HIV incidence. BCPP leverages the success of Botswana's national program, MASA, started in 2001. MASA decentralized care where ~95% of HIV+ individuals are within 5km of one of 674 facilities, 44 have an online electronic medical record (EMR) with centrally available data and 314 are offline and use a stand-alone locally developed EMR, the Patient Information Management System (PIMS). PIMS data are centralized manually each quarter. Data quality and completeness issues are not retroactively addressed at source except through future training and software changes. A help-desk is available but the 314 off-line facilities are responsible for the quality and completeness of the EMR and its integration into clinical services.
**Description:** BCPP, requiring access to PIMS data and project specific data sources, built a research data network (RDN) connecting 30 MASA facilities. Connectivity enabled remote system support for data systems and nightly data updates from PIMS and project specific data sources. Centralized PIMS data and BCPP household survey data was used to confirm ART status and uniquely link patients across data sources. The RDN was established in three phases with connectivity verified in advance of each baseline household survey (BHS). Existing land-based networks and new network infrastructure were utilized to connect the facilities. The RDN construction cost was, on average, USD15500 per community, an annual maintenance cost of USD1170 per community, and recurring bandwidth cost of USD194/month per community for 1-2Mbps.
**Lessons learned:** Continuous network monitoring revealed connections at sites not purpose built often degraded during peak hours limiting usage options but nightly data transfers and system updates were conducted reliably. The RDN segregated traffic for multiple stakeholders and ensured simplicity of use at the network level.
**Conclusions/Next steps:** BCPP demonstrated how PIMS and project data was centralized routinely from 30 communities over inexpensive low-bandwidth connections. By following BCPP's model, other offline facilities using PIMS could also centralize data routinely to simplify clinic operational support and improve both patient care and program monitoring and evaluation.

### THPEE623

### Demonstrating regulatory compliance of a novel electronic data management system in large scale community-based HIV prevention trial in Botswana

T. Sekoto[1], E. Van Widenfelt[1], U. Chakalisa[1], K.M. Powis[1,2], S. Moyo[1], E. Kadima[1], O. Pharatlhatlhe[1], C. Kgathi[1], K. Manyake[1], R. Letlhogile[1], V.S. Simon[1], A. Mbikiwa[1], N. Seonyatseng[1], L. Okui[1], T. Gaolathe[1], M. Mmalane[1], J.M. Makhema[1], S. Lockman[2], M.E. Essex[2], M. Pretorius-Holme[2]
*[1]Botswana Harvard AIDS Institute Partnership, Gaborone, Botswana, [2]Harvard T. H. Chan School of Public Health, Boston, United States*
*Presenting author email: tsekoto@bhp.org.bw*

**Background:** Regulatory compliance in human research requires robust manual or electronic systems to enhance study credibility and protect research participants from harm. A mobile electronic research data system (EDC), developed by Botswana Harvard AIDS Institute Partnership (BHP), was utilized by the Botswana Combination Prevention Project (BCPP), a large community-randomized trial conducted in 30 remote communities. Guided by the EDC, well-trained, minimally supervised Research Assistants (RAs) were able to collect at point-of-contact complex and sensitive research-grade electronic data, conduct HIV counseling and testing, and collect specimens per IRB-approved protocol.
**Description:** Two survey teams of 16-18 RAs were deployed to two communities at a time conducting household surveys lasting 3-6 weeks per community. RAs enumerated 7,696 randomly selected households and identified 15,475 potentially eligible subjects, of which 12,610 were consented. Source data was captured asynchronously at point-of-contact and evaluated in real-time for regulatory and protocol compliance. The EDC tracked the authenticated user, date of record creation/

modification, created a sequential computer-generated audit trail and encrypted personally identifiable information. The EDC guided RAs through subject eligibility processes. It also enforced additional protections for special populations, requiring guardians for minors and witnesses for illiterate participants. The signed consent, the only paper document, was verified against the electronic record daily at the community level.

**Lessons learned:** Conducting research in remote households can be unpredictable and is not amenable to constant oversight. The EDC effectively supported RAs through the household visit workflow and data collection with particular emphasis on eligibility screening and consent verification resulting in high regulatory compliance. The EDC complemented existing regulatory and protocol training, simplified data collection and eliminated common human errors that plague paper-based systems. The EDC protected data from access and modification by unauthorized users. RA's operated independently with little supervision and systems audits found no eligibility or consent violations.

**Conclusions/Next steps:** Robust electronic data systems designed with regulatory features can substantially reduce potential for human errors, ensuring optimal Good Clinical Practise and Human Subjects research practices.

## THPEE624

### USING BIG DATA TO LOCATE VULNERABLE HIV-INFECTED IINDIVIDUALS ACROSS THE HEALTHCARE SYSTEM: A ROADMAP TO IMPROVE ENGAGEMENT IN CARE

D. Feller[1], P. Gordon[2], E. Camhi[3], B. Agins[4]
*[1]New York State Department of Health, New York, United States, [2]Columbia University Medical Center, New York, United States, [3]Visiting Nurse Service of New York, New York, United States, [4]New York State Department of Health, AIDS Institute, New York, United States*
*Presenting author email: danieljfeller@gmail.com*

**Background:** More than a quarter of HIV-infected individuals in the United States lack access to antiretroviral therapy (ART). Without engagement in care, people living with HIV (PLWH) are at risk of AIDS-related morbidity, mortality and forward transmission. An understanding of non-HIV medical service use among this vulnerable population could serve as the basis of jurisdiction-wide activities to return individuals who have been lost to care. We sought to identify locations from which previously diagnosed PLWH to HIV primary care can be re-engaged in care.

**Methods:** Administrative claims from the New York State Medicaid Program were used to examine health service utilization among beneficiaries with known HIV infection, who account for 70% of PLWH living in NYS. Individuals were designated as 'out of care' if they lacked evidence of both primary care (CPT codes 99211-99215) and ART during calendar year 2014. Encounters with health services were classified by location type using addresses and standardized fields.

**Results:** 6,971 HIV-infected Medicaid beneficiaries had no evidence of HIV care in 2014, yet 54.2% of them had an encounter with health services during the same year. Commonly visited services included emergency departments, hospital inpatient units, dental clinics, and mental health and addiction treatment centers. Individuals with evidence of a behavioral health disorder had elevated rates of utilization ($p < 0.05$).

**Conclusions:** The use of non-HIV medical services is common among unengaged PLWH in NYS. Linkage programs should target emergency rooms and outpatient locations including dental and mental health clinics. Health Information Exchange can play a vital role by notifying providers of patients who require interventions that feature enhanced personal contact to successfully reengage them in HIV care.

## THPEE625

### RETENTION OF MOTHER BABY PAIRS IN CARE AT PMTCT SITES IN ZIMBABWE, APRIL TO DECEMBER 2014

A. Chadambuka[1], E. Muchenje[2], C. Muchuchuti[3], E. Tachiwenyika[3], R. Musarandega[3], A. Muchedzi[1], T. Nyamundaya[3], A. Mahomva[3], M. Mungati[2], M. Tshimanga[2]
*[1]Elizabeth Glaser Paediatric AIDS Foundation, Operations Research, Harare, Zimbabwe, [2]University of Zimbabwe, Community Medicine, Harare, Zimbabwe, [3]Elizabeth Glaser Paediatric AIDS Foundation, Technical, Harare, Zimbabwe*
*Presenting author email: achadambuka@pedaids.org*

**Background:** The Zimbabwe Ministry of Health and Child Care (MOHCC) and the Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) jointly introduced an electronic patient-tracking database (EDB) for the prevention of mother-to-child transmission (PMTCT) program in 2011. The database was implemented in 36 sites from five districts purposively selected to represent women of different demographic characteristics in the country. Purpose of the database was to monitor retention of mother-baby pairs in PMTCT on sentinel surveillance basis.

**Methods:** We conducted a secondary analysis for a cohort of women in the EDB to determine retention of rural and urban mother-baby pairs on ART in PMTCT and proportion of HIV-exposed infants tested and received HIV results. A cohort of HIV positive mothers booked for ANC between April and June 2014 along with babies born to this cohort were longitudinally tracked through December 2014.

**Results:** A total of 457 HIV positive women and 36 babies born to them were included in the analysis. Median age at ANC booking was 29 years ($Q_1$=26yrs; $Q_3$=34yrs), median parity was 2 ($Q_1$ = 1; $Q_3$ = 3), and median gestational age at booking was 22 weeks ($Q_1$=17; $Q_3$=27weeks). Only 5.2% of the 457 HIV positive women booked before 12 weeks. Among the 457 women, antiretroviral treatment (ART) drug pick-up rate declined from 90% at three months after ART initiation to 55% at six months. Of the 457, 28.0% rural and 26.9% urban women were still on ART at 6 months. Dried blood spot (DBS) specimens were collected from 47% (n=36) of HIV exposed babies and 35% had received test results after 6 months, with one being HIV positive.

**Conclusions:** The PMTCT program has challenges with retention of mother-baby pairs. Retention of infants in PNC for DBS collection and retention of pregnant and lactating women on ART is low. We recommend strengthening systems for tracking and tracing mother-baby pairs to improve early diagnosis of HIV exposed infants and retention of pregnant and lactating women on ART.

## THPEE626

### FEASIBILITY AND ACCEPTABILITY OF A BIOMETRIC IDENTIFICATION SYSTEM USING IRIS RECOGNITION IN ROUTINE HIV SERVICES IN KENYA

A. Njoroge[1,2], M. Dunbar[3], F. Abuna[2], P. Simpson[4], P. Macharia[5], B. Betz[1], P. Cherutich[6], D. Bukusi[7], C. Farquhar[1,8,9]
*[1]University of Washington, Department of Global Health, Seattle, United States, [2]Kenyatta National Hospital, Research & Programs, Nairobi, Kenya, [3]University of Washington, Centre for Demography and Ecology, Seattle, United States, [4]iRespond ®, Seattle, United States, [5]Ministry of Health, Nairobi, Kenya, [6]National AIDS & STI Control Program, MOH, Nairobi, Kenya, [7]Kenyatta National Hospital, VCT and HIV Prevention/ Youth Centre, Nairobi, Kenya, [8]University of Washington, Department of Medicine, Seattle, United States, [9]University of Washington, Department of Epidemiology, Seattle, United States*

**Background:** Unique patient identification within health services can improve surveillance and follow-up within routine programs but may be challenging to operationalize. With biometric use expanding within and outside of healthcare settings, we assessed the feasibility and acceptability of integrating an iris recognition biometric identification system into routine HIV testing and counselling (HTC) at 4 sites in Kenya.

**Methods:** Patients who had recently or previously tested HIV-positive in two urban and two rural health facilities were enrolled. An electronic version of the national HTC intake form assessing patient risk factors and reasons for testing was administered. Images of the iris were captured using a dual-iris camera connected to a laptop. A pilot iris biometric identification system software networked across the sites, analysed the iris patterns; created a template from those patterns; and generated a 12-digit ID number based on the template, which was used as the unique patient identifier. During subsequent visits, patients' irises were rescanned and each pattern was matched to stored templates to retrieve the unique ID number.

**Results:** Over 35 weeks, 8,256 (89.5%) of 9,223 new patients were assigned a unique ID on their first visit. Among 5,236 return visits, the system correctly re-identified patients' IDs 4,177 times (79.7%). The false accept rate (a patient given the ID of another patient) was 1.2% while the false reject rate (re-scans assigned a new ID) was 17.5%. As the biometric software was tuned to the study population over the course of the study, false accept and reject rates declined and were 0.2% and 3.8% respectively during the last 6 weeks. Overall, 95 (1%) among 9,318 patients approached declined to enrol in the study and 15 (0.1%) agreed to enrol but declined to have an iris scan. The most common reasons cited for declining an iris scan were concerns about privacy and confidentiality.

**Conclusions:** Integration of an iris recognition biometric patient identification system into routine health information systems was feasible and highly acceptable in these Kenyan HIV programs. Scale-up could improve unique patient identification and tracking, and could enhance disease surveillance activities.

*Funding: NIH/NIAID # A1099974 S1*

### AN ANALYSIS OF ATTRITION ALONG THE PREVENTION OF MOTHER TO CHILD TRANSMISSION OF HIV (PMTCT) CASCADE IN KENYA: THE CASE OF 17,432 MISSED WOMEN

R.N. Wafula[1], J. Wamicwe[1], S. Oduor Muga[2], D. Kennedy Otieno[2], L. Oyiengo Bonareri[1], L. Muthoni[1], J. Odhiambo[1], T. Alwar[3], B. Chikombo[4], M. Sirengo[1], N. Putta[5]
*[1]Ministry of Health, National AIDS and STI Control Program, Nairobi, Kenya, [2]Ministry of Health, National AIDS and STI Control Programme, Born Free, Nairobi, Kenya, [3]UNICEF Kenya, Nairobi, Kenya, [4]The World Health Organization, Nairobi, Kenya, [5]UNICEF/IATT HQ, New York, United States*
*Presenting author email: rosewafula@yahoo.com*

**Background:** Kenya has made significant progress toward elimination of mother-to-child transmission of HIV (eMTCT). Over 90% of PMTCT facilities in Kenya were offering antiretroviral therapy (ART) for all pregnant and lactating women by July 2015 following the adaptation of the 2013 WHO ART Guidelines in June 2014. Maternal efficacious antiretroviral (ARV) coverage has increased from 52% in 2009 to 67% in 2014, and new HIV infections among children have reduced by 29% since 2009.[1]
[1] HIV/AIDS Estimates, NASCOP; 2015 Progress Report on the Global Plan
**Methods:** In April 2015, the Ministry of Health held a national eMTCT stocktaking meeting to identify best practices, challenges and opportunities for acceleration. The key challenge noted was high rates of attrition in 2014 due to 17,432 missed opportunities- (identified HIV positive pregnant woman who did not receive maternal ARVs).[1] From June to December 2015 a campaign called “Bring back the Women and Children” to audit and trace the missed opportunities was conducted. Facilities accounting for 75% of the 17,432 women were prioritized. The audit reviewed and compared data of the District Health Information System (DHIS2) with facility PMTCT service, summary and pharmacy records. Follow up by community outreach was initiated to trace and return missed women into care. Specific tools and Standard Operating Procedures (SOPs) for data verification, client tracking and reporting were developed and used. Verified data errors were corrected in DHIS2. Confidentiality was upheld. Findings from 21 counties accounting for 9752 (56%) of 17,432 missed opportunities were reviewed, validated and analysed.
[1] Kenya Draft 2015 eMTCT Stock Taking Report
**Results:** Of the 9752 missed opportunities, 6,935 (71%) were data transcription errors between primary tools and DHIS2. Of the remaining 2817, 1093 (39%) had received ART but were only documented in the pharmacy records. Out of the 9752, true missed opportunities were 1724 (17%). Of these, 681 (40%) were traced in the community and 449 (70%) of them were initiated on maternal ART.
**Conclusions:** Data errors considerably overestimated the numbers of women who missed ARVs for PMTCT. Kenya is currently focussing on investment in data triangulation, audit, validation and use - a critical component of eMTCT.

## THPEE628

### EFFECTIVENESS OF AN ELECTRONIC DASHBOARD FOR SUPERVISING AND MONITORING COMMUNITY HEALTH WORKERS (CHWS) TO SCALE UP VOLUNTARY MEDICAL MALE CIRCUMCISION (VMMC) IN ZAMBIA

B. Thurston[1], N. Chintu[1,2], A. Machinda[2], N. Sindano[1], T. Ndhlema[1]
*[1]Society for Family Health, Lusaka, Zambia, [2]Population Services International, Washington DC, United States*
*Presenting author email: brittthurston@gmail.com*

**Background:** The use of CHWs is a proven method for creating demand and promoting best practices for health services [1]; however while effective, supervision of CHWs has also proven to be the most challenging program element to implement [2].To address this gap, Society for Family Health (SFH) designed and implemented an electronic dashboard tool with the aim to better evaluate, monitor and provide feedback on the performance of CHWs at health facilities under the Gates VMMC Project.
**Description:** Between February and December 2015, 232 CHWs were deployed to 107 health facilities in three provinces. Key indicators were defined in order to measure the monthly performance of each CHW as well as inform effective program decisions. Tableau® reader software was used to import Excel spreadsheets containing CHW performance, segregated the information by creating a dashboard and presented data in graphical form. Reports generated provide information on CHWs and clients. Based on the data captured, we were able to determine the proportion of men who successfully came for VMMC services.
**Lessons learned:** During the first half of the year 11,732 clients were booked by 65 CHWs, 6,111 (52%) of whom came for MC services; whilst in the later months when the dashboard was fully operational, 43,835 clients were booked by 232 CHWs and 20,555 (47%) came for MC services. Each CWH worked an average of 19 days in each month, and made an average of 53 bookings per month. An average of 25 clients turned up per CHW per month.
**Conclusions/Next steps:** The electronic dashboard is an efficient tool for supervising CHW performance, assuring adherence to quality standards and promoting fluid information sharing between community and organization. The application of robust M&E systems for monitoring demand creation activities should be in place at genesis of programs, particularly for improving supervision and feedback to CHWs. Based on our observations, improvements are underway to employ a more sophisticated data validation system on the backend in order allow for real time data collection and more accurate analysis of program data.

# GENDER ISSUES AND GENDERED RELATIONSHIPS

## THPED629

### STRATEGIES FOR IMPROVING SERVICES AND PROGRAMS TO ADDRESS GENDER BASED VIOLENCE AGAINST MEN WHO HAVE SEX WITH MEN AND TRANSGENDER PEOPLE IN DHAKA, BANGLADESH

M.U. Ahmed
*Bandhu Social Welfare Society, Training, Dhaka, Bangladesh*
*Presenting author email: masbahnatore@yahoo.com*

**Background:** Gender based violence (GBV) is a public health problem linked to HIV and human rights violations. Although data on GBV against men who have sex with men (MSM), and transgender persons (TG) in Bangladesh is limited, existing data indicate high levels of GBV towards MSM and TGs. A better understanding of GBV and relatedservices and programs is needed to develop recommendations for future interventions to improve health in MSM and TG populations.
**Description:** A qualitative study was conducted with nine focus groups (five MSM and four TG) and 14 in-depth interviews with key informants including stakeholders from the community, government and donors. Participants were asked to describe GBV experiences, current and past interventions and recommendations for future interventions. Study findings were disseminated at a workshop comprising 29 stakeholders from government and non-governmental organizations to develop strategies on addressing GBV. Discussions were documented in reports.
**Lessons learned:** MSM and TG face a variety of physical, sexual and verbal abuses ranging from being teased by people on the streets to rape and murder. Two key sources of violence were police officers and healthcare providers, thus creating barriers to accessing legal and healthcare services.Participants reported current programs do not address their needs. Recommendations for future interventions included: a national GBV committee; improved coordination between CBOs and government; monitoring system for GBV; safe havens for victims; sensitizing providers to reduce stigma and discrimination; and better policies/laws.
**Conclusions/Next steps:** Our findings will allow program planners to make appropriately-informed decisions on programs to address GBV.

### EVALUATING LIFTING BARRIERS TO UNIVERSAL ACCESS PROJECT: A STEP-BY-STEP TRANSFORMATIVE PROCESS FOR INCREASED ACCESS TO HIV PREVENTION AND TREATMENT SERVICES FOR SEXUAL MINORITIES IN 2 COMMUNITIES IN ZIMBABWE

N. Chibukire
*SAfAIDS, Leadership, Gender and Human Rights, Harare, Zimbabwe*
*Presenting author email: ngoni@safaids.net*

**Background:** In partnership with GALZ, Simbarashe network of PLHIV and ZWAAPV, SAfAIDS implemented Lifting Barriers to Universal Access Project: A Step By Step Transformative Process for Increased Access to HIV Prevention and Treatment Services for the Sexual Minorities in 2 Communities in Zimbabwe. The purpose was to increase access to HIV prevention, treatment, care and support services for key populations.

Tuesday 19 July
Wednesday 20 July
Thursday 21 July Poster Exhibition
Friday 22 July
Late Breaker Posters
Author Index

**Methods:** Data was collected from the two intervention sites and one control site through focus group discussions with 12 key population representatives, 24 community leaders, and 26 community volunteers. In-depth key informant interviews were done with 24 service providers. Review of project reports and key documents was done.
**Results:** The project strengthened the capacity of implementing partners, traditional leaders and community volunteers to engage communities in addressing homophobia. GALZ capacity to work with non LGBTI communities was enhanced. Community leaders from Mhondoro-Ngezi were knowledgeable on the matter pointing out the need to embrace people irrespective of their sexuality diversity. There was improvement in knowledge levels in the communities on sexual and reproductive health rights. Through breaking the barrier of homophobia, the project realised increased access to HIV prevention, treatment and care services by general community members and LGBTI individuals.
**Conclusions:** It was learnt that it is possible to engage communities in discussions on sexual diversity. With appropriate skills and approaches, it is possible to conduct dialogues on sensitive topics in the communities. Advocacy for sexual rights of key population groups cannot be a stand-alone agenda, but should rather be embedded into aspect of HIV prevention strategies especially at community level. The project can be replicated and scaled up. There is need for assessment of other organizations whose core business is not LGBTI on their willingness to partake in advocacy for access to services by LGBTI individuals. Finally there is need to have a protection plan for the champions and service providers who actively advocate for LGBTI issues in view of the hostile environment they operate in.

## GENDER ISSUES AND GENDERED RELATIONSHIPS

### THPED631

### IMPROVING MATERNAL HEALTH IN NORTH-CENTRAL NIGERIA THROUGH PLHIV DRIVEN GENDER NORMS INTERVENTIONS: LESSONS FROM THE DENGI COMMUNITY PRESENTED BY UGBA A. EDWARD

U. Aondona Edward[1], E. Joseph[2], O. Iyaji-Paul[3], O. Akinmade[2], O. Olaiya[2], C. Okoli[4], S. Enejo[5]
*[1]Pro Health International, Community Services, Makurdi, Nigeria, [2]Pro Health International, Clinicals, Abuja, Nigeria, [3]Pro Health International, Community Services, Abuja, Nigeria, [4]Pro Health International, Laboratory Services, Abuja, Nigeria, [5]Pro Health International, Strategic Information, Abuja, Nigeria*
*Presenting author email: eugba@phint.org*

**Background:** Cultural, religious and socio-economic factors are known barriers to health care access amongst women in North-central Nigeria. Culture requires a woman obtains permission from her husband before accessing healthcare services including HIV counselling and testing services. Furthermore women are economically dependent on their husbands and not empowered to either demand safe sex nor allowed to question an unfaithful partner.
Pro-Health International (PHI) through the USG/CDC IPSAN project promotes Gender Norms that encourage good sexual decision-making for women and girls, while discouraging norms that limit health seeking behaviours as well as access to education and economic resources among females. We sought to evaluate the effect of these interventions on the PLHIV community in Dengi community of North central Nigeria.
**Methods:** In 2014, PHI identified and trained PLHIV/ Community volunteers to provide Gender norms education through contact sessions for up to ten hours per group before graduation in Dengi community. Traditional social structures were then used in carrying out community sensitization campaign on male involvement in women' access to health care services and understanding the influence of gender norms on HIV transmission. The number of women who accessed HIV counselling and testing in the one year period prior to and post intervention were compared.
**Results:** Between October, 2013 and September, 2014, 1,948 (28%) out of 6,852 women had opportunity of knowing their HIV status among who 231 tested positive (11.8%). Following the intervention between October, 2014 to September,2015, 5325 (72.7%) of 7,321 women knew their HIV status with 190 testing positive (3.6%). The post intervention yield demonstrated a 3,377 increase in number of women accessing HIV service representing a 73% increase in yield.
**Conclusions:** The use of PLHIV and other community volunteers in providing Gender norms education services targeting men and other traditional leaders to allow women access to Health services proved to be very effective in increasing the number of women reached with HTC services thereby reducing risk of HIV infection.

## SPECIFIC PRACTICES, IMPACTS AND RESPONSES FOR DISTINCT SUBSTANCES AND MODES OF ADMINISTRATION (INCLUDING ALCOHOL USE, INJECTING DRUG USE AND NON-INJECTING DRUG USE)

### THPED632

### A QUALITATIVE STUDY ON PERCEIVED BARRIERS AND FACILITATORS TO REDUCE ALCOHOL USE AND IMPROVE ANTIRETROVIRAL TREATMENT (ART) ADHERENCE AMONG HAZARDOUS ALCOHOL USERS LIVING WITH HIV IN THAI NGUYEN, VIETNAM

R.B. Hershow[1], D.S. Zuskov[1], N.V.T. Mai[1], G. Chander[2], H.E. Hutton[3], C. Latkin[4], N.D. Vuong[5], T. Sripaipan[1], T.V. Ha[1], V.F. Go[1]
*[1]University of North Carolina Gillings School of Global Public Health, Department of Health Behavior, Chapel Hill, United States, [2]Johns Hopkins Bloomberg School of Public Health, Department of Epidemiology, Baltimore, United States, [3]Johns Hopkins School of Medicine, Department of Psychiatry and Behavioral Sciences, Baltimore, United States, [4]Johns Hopkins Bloomberg School of Public Health, Department of Epidemiology and Health, Behavior and Society, Baltimore, United States, [5]Pho Yen District Health Center, Ba Hang Town, Vietnam*
*Presenting author email: rhershow@live.unc.edu*

**Background:** The Vietnam Administration for AIDS Control has made significant progress in controlling the HIV epidemic by focusing its attention on risk behaviors, including injection drug use and unprotected sex. However, alcohol use, a highly normative behavior in Vietnam that is associated with high rates of HIV infection and lower antiretroviral treatment (ART) adherence, has been overlooked. To develop effective alcohol reduction programs for HIV-infected clients, research is needed to understand the clinical and sociocultural experience of hazardous alcohol users living with HIV in Vietnam.
**Methods:** We conducted in-depth interviews with 30 HIV-infected hazardous drinkers in northern Vietnam to explore perceived barriers and facilitators to reduce alcohol use and improve ART adherence. Eighteen men and 12 women with scores of >=8 on the Alcohol Use Disorders Identification Test (AUDIT) were recruited from an outpatient ART clinic. Semi-structured interviews were transcribed, translated, and analyzed to identify themes.
**Results:** The mean AUDIT score was 11.5 (10.8=women; 11.9=men), indicating a strong likelihood of hazardous or harmful alcohol consumption. The majority of participants reported a spike in alcohol consumption at the time of HIV diagnosis. While about half reported gradually reducing their alcohol use over the course of a year post-diagnosis, the other half reported maintaining or increasing their alcohol consumption after their initial spike. The main barriers to reducing alcohol use were: availability of inexpensive alcohol; perceived inability to refuse alcohol in context of social norms; alcohol use to cope with depressive symptoms often related to being HIV-infected; compensatory behaviors when attempting to reduce injection drug use; lack of alcohol treatment programs. Family and HIV provider support played a major role for those who reported reducing their alcohol use and maintaining good ART adherence.
**Conclusions:** Findings demonstrate that hazardous alcohol users who are HIV-infected are faced with trying to avoid a highly normative behavior with few resources. Programs started at initial HIV diagnosis to create or enhance social support may help reduce hazardous drinking among HIV-infected clients. However, this may not be sufficient for some hazardous drinkers who need more intensive mental health counseling. Trials to assess effective counseling interventions are needed.

## VIOLENCE, WELLBEING AND SEX WORK

### THPED633

### FAILURES OF JUSTICE: STATE AND NON-STATE VIOLENCE AGAINST SEX WORKERS AND SEARCH FOR SAFETY AND REDRESS COMMUNITY RESEARCH PROJECT OF SWAN IN CENTRAL/EASTERN EUROPE AND CENTRAL ASIA

K. Ordek, A. Petrova
*SWAN Foundation for the Rights of Sex Workers in CEECA, Budapest, Hungary*
*Presenting author email: kirmizisemsiye.csihd@gmail.com*

**Background:** In 2007, SWAN undertook regional, sex worker-led research on police raids, detention, and the level of physical, sexual, psychological violence against sex workers. In 2015 SWAN decided to follow up with another community based research, focusing on how police violence alters the working conditions of sex workers, what blocks redress and access to justice, what are the dynamics between state and non-state violence and HIV implications.

**Methods:** The research was undertaken in 16 countries from Central and Eastern Europe and Central Asia. The research team included main author and research coordinator, both sex workers, a sex worker advisory group who reviewed the whole process, and local research teams of sex workers and allies, who conducted the interviews. 320 semi-structured and 9 in-depth qualitative interviews were held with women, men and trans sex workers.
**Results:** Forty percent of respondents have been arrested in the last twelve months, one in five experienced physical violence and one in seven experienced sexual violence by police. Twenty percent reported extortion. Many experienced more than two incidents of physical and sexual violence by non-state actors.
The survey showed that condoms and syringes are routinely confiscated, destroyed or used by police as "evidence of crime", and sex workers are displaced from their work location as a consequence of arrests, extortion and fines. Social and racial profiling for repression based on gender, drug use or Roma ethnicity is identified, and cases of forced HIV/STI testing are documented.
**Conclusions:** Police repression of sex workers and clients create HIV risks for sex workers by displacing them to dangerous environments, reducing ability to screen and negotiate with clients and reducing ability of protection by confiscation or destruction of condoms and syringes.
Police repression fracture the longer-term ties of sex workers, services and access to drug, HIV or HCV treatment and care. Arrests and detention lead to treatment interruptions, fines and extortion make it difficult to have sufficient money for transportation, access to care or securing adequate nutrition. Fears that one's drug use or sex work might be reported to police or child welfare authorities discourage sex workers from seeking testing, treatment and care.

## FEMALE, MALE AND TRANSGENDER SEX WORKERS

### THPED634

### ENABLING FINANCIAL SECURITY THROUGH LITERACY, ACCESS AND SERVICES FOR HIV VULNERABLE COMMUNITIES IN 5 STATES OF INDIA

T. Narendran, N. Raghunathan, S. Balakrishnan
*Vrutti, Bangalore, India*
*Presenting author email: narendran31@gmail.com*

**Background:** One of the key situations that forces communities to resort to unsafe behaviors and make them vulnerable to HIV is the constant financial needs and inadequate levels of fall back mechanisms at individual and family levels. There are a number of community experiences that have demonstrated that having a secured financial status helps them to negotiate and adopt safe behaviours.
**Methods:** Catalyst Group (Swasti, Vrutti and CMS) manages the Avahan Phase III initiative (2014-2017), funded by BMGF, supports 84 Community Organizations (COs) on reducing economic vulnerabilities of key populations (KPs) to enable practice safe behaviours among the communities vulnerable to HIV infection. The project covers a total of about 161,000 key populations (FSW, MSM, TG) across 5 states of India. The project aims at reducing the financial vulnerabilities of KPs by helping them to acquire adequate financial literacy and capability, plan her their short and long-term financial needs based on her/his vulnerability and key needs, and ensure access critical financial services through a variety of community institutional mechanisms like SHGs, state-specific co-operatives, business correspondent/ facilitator and multi state co-operative.
**Results:** A financially secure KP, with access and control over her/his financial resources will be able to negotiate for safe sex behaviours and safe coping mechanisms. Financial security becomes a fall back mechanism for her/him when faced with a crisis (illness, violence, death of a member and other shocks), ensuring that she/he does not resort to any risky behaviour.
**Conclusions:** Between April 2014 and December 2015 ,
- 1,02,000 KPs obtained high level of financial literacy
- 30,900 bank accounts and 12,910 deposit accounts opened
- 3,062 KPs have been facilitated access to life insurance, 4,190 KPs to accident insurance; 3,400 KPs to health insurance
- Additionally, 223 members have also enrolled themselves for pension. 867 loans have also been facilitated to the members during the period
- The trend of HIV prevalence and the number of new infections detected continues its downward trend during the reporting period

By March 2017, at least 1,31,000 community members will improve their financial behaviours by learning about the role of financial security in reducing HIV vulnerability, the financial products available and learning to access them.

### THPEC635

### NEEDLE SHARING AND RISKY SEXUAL BEHAVIOR AMONGST INJECTING DRUG USERS (IDU) IN LAGOS, NIGERIA

C. Ekerete-Udofia
*Center for the Right to Health, Lagos, Nigeria*

**Background:** Needle sharing and risky sexual behavior amongst IDUs have been reported to be related to high incidence of HIV and other STIs (IBBSS 2010). About 10% of new HIV infections are as a result of injecting drug use (UNAIDS 2007). This situation is further worsened by social discrimination and poverty in many developing countries, leading to increase in prevalence of both STI and HIV. This study is aimed at describing the burden and key factors associated with high rate of needle sharing and risky sexual practices among IDU in Lagos State.
**Description:** A multistage stratified random sampling method was used to recruit 125 IDU respondents in five selected Local Government Areas (LGAs) of Lagos State. Information on socio-demographic characteristics, risk perception and needle sharing was collected using a semi-structured questionnaire. Analysis was done using Statistical Package for Social Sciences (SPSS) version 16. Description analysis was done for categorical variables to identify prevalence while chi-square tests were used to test for association between variables. A binary logistic regression analysis was also done to identify factors associated with needle sharing and high sexual risk activities by IDU.
**Lessons learned:** About 92% of respondents have lived in the drug community for more than 12 months. 88.8% injected drugs daily, 50% of IDU shared needles in 5 Local government Areas (LGAs). These 5 LGAs combined contributed. 71.7% of total number of IDU that reported needle sharing in Lagos. Majority (92.4%) said they 'hustle' including commercial sex work (78.0%), to get money daily for drug purchase. Condom use was 70.1% and 48.3% among IDU who engage in commercial sex work and multiple sex partnering. Needle sharing was higher among respondents who inject drugs daily (72.6%), compared to those who injected drugs once weekly (33.3%) P 0.045. IDUs who are bunk based are 0.029 times more likely to share needle than those who dwell in their own house. IDUs whose risk perception was low is 0.246 times more likely to engage in sexual risk activities than those with high risk perception.
**Conclusions/Next steps:** .There is need for more innovative IDU targeted intervention to address high prevalence of needle sharing among IDUs.

### ENHANCED INFECTION PROPHYLAXIS REDUCES MORTALITY IN SEVERELY IMMUNOSUPPRESSED HIV-INFECTED ADULTS AND OLDER CHILDREN INITIATING ANTIRETROVIRAL THERAPY IN KENYA, MALAWI, UGANDA AND ZIMBABWE: THE REALITY TRIAL

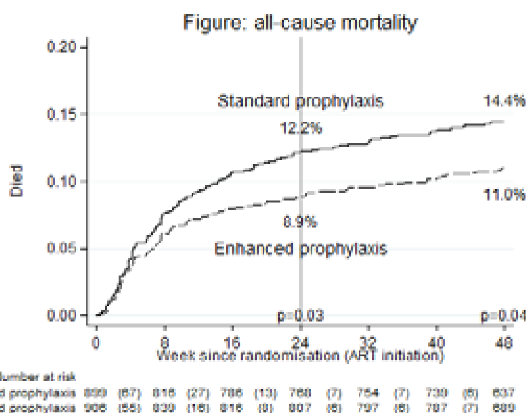
J. Hakim[1], V. Musiime[2], A.J. Szubert[3], A. Siika[4], J. Mallewa[5], C. Agutu[6], S.L. Pett[3], M. Bwakura-Dangarembizi[1], A. Lugemwa[7], S. Kaunda[5], M. Karoney[4], K. Maitland[6], A. Griffiths[3], C. Kityo[2], P. Mugyenyi[2], A.J. Prendergast[3,8], A.S. Walker[3], D.M. Gibb[3], REALITY Trial Team

*[1]University of Zimbabwe Clinical Research Centre, Harare, Zimbabwe, [2]Joint Clinical Research Centre, Kampala, Uganda, [3]MRC Clinical Trials Unit at UCL, London, United Kingdom, [4]Moi University School of Medicine, Eldoret, Kenya, [5]Department/College of Medicine and Malawi-Liverpool-Wellcome Trust Clinical Research Programme, Blantyre, Malawi, [6]KEMRI Wellcome Trust Research Programme, Kilifi, Kenya, [7]Joint Clinical Research Centre, Mbarara, Uganda, [8]Queen Mary University of London, London, United Kingdom*

**Background:** Mortality from infections is high in the first 6 months of antiretroviral therapy (ART) among HIV-infected adults and children with advanced disease in sub-Saharan Africa. Whether an enhanced package of infection prophylaxis at ART initiation would reduce mortality is unknown.

**Methods:** The REALITY 2x2x2 factorial open-label trial (ISRCTN43622374) randomised ART-naïve HIV-infected adults and children >5 years with CD4< 100 cells/mm³. This randomisation compared initiating ART with enhanced prophylaxis (continuous cotrimoxazole plus 12 weeks isoniazid/pyridoxine (anti-tuberculosis) and fluconazole (anti-cryptococcal/candida), 5 days azithromycin (anti-bacterial/protozoal) and single-dose albendazole (anti-helminth)), versus standard-of-care cotrimoxazole. Isoniazid/pyridoxine/cotrimoxazole was formulated as a scored fixed-dose-combination. Two other randomisations investigated 12-week adjunctive raltegravir or supplementary food. The primary endpoint was 24-week mortality.

**Results:** 1805 eligible adults (n=1733;96.0%) and children/adolescents (n=72;4.0%) (median 36 years; 53.2% male) were randomised to enhanced (n=906) or standard prophylaxis (n=899) and followed for 48 weeks (3.8% loss-to-follow-up). Median baseline CD4 was 36 cells/mm³ (IQR 16-62) but 47.3% were WHO stage 1/2. 80(8.9%) enhanced versus 108(12.2%) standard prophylaxis died before 24 weeks (adjusted hazard ratio[aHR]=0.73 (95% CI 0.54-0.97) p=0.03; Figure) and 98(11.0%) versus 127(14.4%) respectively died before 48 weeks (aHR=0.75 (0.58-0.98) p=0.04), with no evidence of interaction with the two other randomisations (p>0.8). Enhanced prophylaxis significantly reduced incidence of tuberculosis (p=0.02), cryptococcal disease (p=0.01), oral/oesophageal candidiasis (p=0.02), deaths of unknown cause (p=0.02), and (marginally) hospitalisations (p=0.06) but not presumed severe bacterial infections (p=0.38). Serious and grade 4 adverse events were marginally less common with enhanced prophylaxis (p=0.06). CD4 increases and VL suppression were similar between groups (p>0.2).



*[All-cause mortality]*

**Conclusions:** Enhanced infection prophylaxis at ART initiation reduces early mortality by 25% among HIV-infected adults and children with advanced disease. The pill burden did not adversely affect VL suppression. Policy-makers should consider adopting and implementing this low-cost broad infection prevention package which could save 3.3 lives for every 100 individuals treated.

### FRAB0102LB

### 12-WEEK RALTEGRAVIR-INTENSIFIED QUADRUPLE THERAPY VERSUS TRIPLE FIRST-LINE ART REDUCES VIRAL LOAD MORE RAPIDLY BUT DOES NOT REDUCE MORTALITY IN SEVERELY IMMUNOSUPPRESSED AFRICAN HIV-INFECTED ADULTS AND OLDER CHILDREN: THE REALITY TRIAL

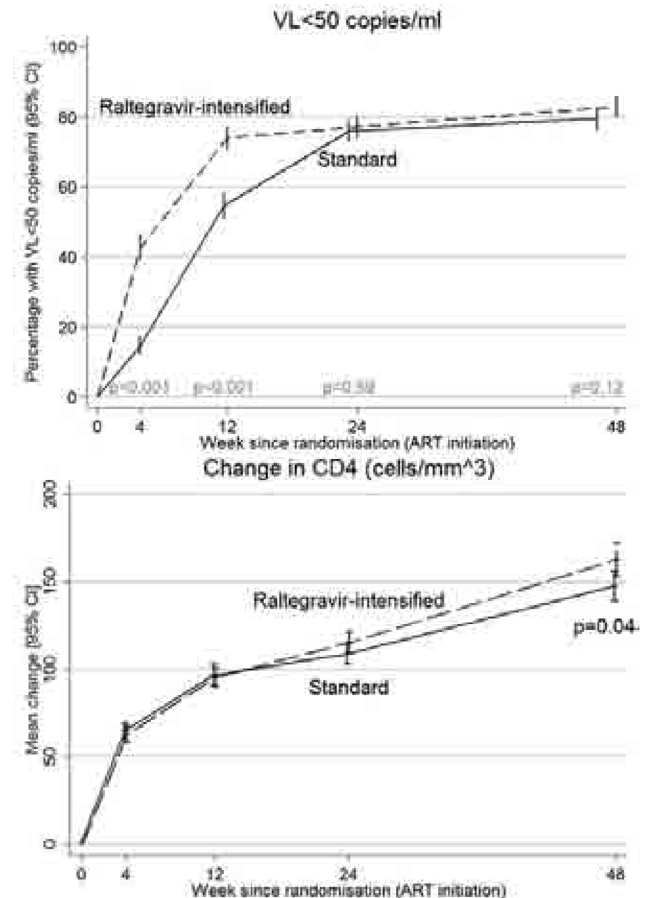
C. Kityo[1], A. Siika[2], A.J. Szubert[3], J. Mallewa[4], M. Bwakura-Dangarembizi[5], S. Kabahenda[6], S. Mwaringa[7], S.L. Pett[3], A. Griffiths[3], A. Lugemwa[8], S. Wachira[2], G. Musoro[5], C. Rajapakse[3], T. Etyang[7], J. Abach[9], P. Wavamunno[1], L. Nyondo-Mipando[4], A. Reid[5], K. Nathoo[5], J. Hakim[5], D.M. Gibb[3], A.S. Walker[3], REALITY trial team

*[1]Joint Clinical Research Centre, Kampala, Uganda, [2]Moi University School of Medicine, Eldoret, Kenya, [3]MRC Clinical Trials Unit at UCL, London, United Kingdom, [4]Department/College of Medicine and Malawi-Liverpool-Wellcome Trust Clinical Research Programme, Blantyre, Malawi, [5]University of Zimbabwe Clinical Research Centre, Harare, Zimbabwe, [6]Joint Clinical Research Centre, Fort Portal, Uganda, [7]KEMRI Wellcome Trust Research Programme, Kilifi, Kenya, [8]Joint Clinical Research Centre, Mbarara, Uganda, [9]Joint Clinical Research Centre, Gulu, Uganda*

**Background:** Early mortality after initiating antiretroviral therapy (ART) is high among HIV-infected adults and children with advanced disease in Sub-Saharan Africa. Intensifying ART with an integrase inhibitor should reduce viral load (VL) faster, but whether this reduces early mortality is unknown.

**Methods:** The REALITY 2x2x2 factorial open-label trial (ISRCTN43622374) randomised ART-naïve HIV-infected adults and children >5 years with CD4 <100 cells/mm³ from Kenya, Malawi, Uganda and Zimbabwe. This randomisation compared initiating ART with 2NRTI+NNRTI with or without 12-week raltegravir intensification. Two other randomisations investigated 12-week enhanced infection prophylaxis or supplementary food. The primary endpoint was 24-week mortality.

**Results:** 1805 eligible adults (n=1733;96.0%) and children/adolescents (n=72;4.0%) (median 36 years; 53.2% male) were randomised to raltegravir-intensified (n=903) or standard (n=902) ART and followed for 48 weeks (3.8% loss-to-follow-up). Median baseline CD4 was 36 cells/mm³ (IQR 16-62) and VL 230,000 c/ml (72.5%≥100,000 c/ml). At 4, 12, 24 and 48 weeks, VL was <50 c/ml in 42.8%, 74.1%, 77.2% and 82.9% in 12-week raltegravir-intensified versus 14.5%, 54.6%, 76.0% and 79.5% standard ART (p<0.001, <0.001, 0.59, 0.12, respectively) (Figure).



*[VL and CD4]*

CD4 increases through 24 weeks were similar (p=0.82), although a small difference became apparent at 48 weeks (+163 cells/mm³ intensified versus +148 cells/mm³ standard, p=0.04). 97(10.9%) intensified versus 91(10.2%) standard ART died

before 24 weeks (adjusted hazard-ratio[aHR]=1.09 (95% CI 0.82-1.46) p=0.54); 110(12.4%) versus 115(13.0%) respectively died before 48 weeks (aHR=0.98 (0.75-1.27) p=0.86), with no evidence of interaction with the two other randomisations (p>0.7). There was no difference in time to first WHO 3/4 event or death (p=0.31). Serious adverse events (AEs), grade 3/4 AEs and drug-related AEs (adjudicated blind to randomisation) were similar in both groups (p>0.3).
**Conclusions:** 12-week raltegravir-intensified ART was well tolerated, resulted in faster VL reduction through 24 weeks and increased CD4 at 48 weeks, but did not reduce mortality or WHO 3/4 events.

## FRAB0103LB

### RALTEGRAVIR (RAL) 1200 MG ONCE DAILY (QD) IS NON-INFERIOR TO RAL 400 MG TWICE DAILY (BID), IN COMBINATION WITH TENOFOVIR/EMTRICITABINE, IN TREATMENT-NAÏVE HIV-1-INFECTED SUBJECTS: WEEK 48 RESULTS

*[1]Fundacion Huesped, Buenos Aires, Argentina, [2]Desmond Tutu HIV Foundation, Cape Town, South Africa, [3]Brigham & Women's Hospital, Harvard Medical School, Boston, United States, [4]Thomas Jefferson University, Philadelphia, United States, [5]Hopital Saint-Louis, Paris, France, [6]HIV-NAT Research Collaboration, Bangkok, Thailand, [7]Faculty of Medicine Siriraj Hospital, Mahidol University, Bangkok, Thailand, [8]Cericap Multiclinicas, Guatemala City, Guatemala, [9]University of Witwatersrand, Helen Joseph Hospital, Johannesburg, South Africa, [10]Merck & Co., Inc., Kenilworth, United States*

**Background:** The investigational reformulated RAL 600mg tablet for QD use at 1200mg dose could provide a more convenient option for treatment of HIV-1 infection.
**Methods:** ONCEMRK is a phase 3, multicenter, double-blind, randomized, controlled trial to evaluate if reformulated RAL 1200mg QD is non-inferior to RAL 400mg BID. Treatment-naïve HIV-1-infected subjects were assigned (2:1) to reformulated RAL 2x600mg QD or RAL 400mg BID, both with tenofovir/emtricitabine, for up to 96 weeks. Randomization was stratified by screening HIV-1 RNA (vRNA) and chronic hepatitis B/C status. The primary efficacy endpoint was the proportion of subjects with vRNA < 40 copies/mL at Week 48 (Non-Completer=Failure).
**Results:** Of 802 subjects randomized, 797 received study therapy and were included in the analyses; 732 (92%) completed 48 weeks of treatment. The study population was 85% male, 59% white, mean age 35.9 years, mean CD4 count 415/mm$^3$, mean plasma vRNA 4.6 $\log_{10}$ copies/mL, 28.4% had baseline vRNA >100,000 copies/mL, 2.9% had hepatitis B and/or C co-infection. Subjects in both groups achieved a rapid decline in vRNA (>50% reaching vRNA < 40 copies/mL by Week 4). At Week 48, RAL 1200mg QD was non-inferior to RAL 400mg BID (vRNA < 40 copies/mL in 88.9% and 88.3%, respectively, Δ(QD-BID)=0.5%, 95% CI [-4.2,5.2]). Study results did not differ significantly by baseline vRNA or hepatitis co-infection status. RAL 1200mg QD also had comparable immunologic efficacy, as measured by change from baseline in CD4 cell counts. Both treatment regimens were well-tolerated with comparable incidence of clinical adverse events (table) and laboratory values exceeding predefined limits of change (based on DAIDS toxicity criteria).
**Conclusions:** In HIV-1-infected treatment-naïve subjects receiving tenofovir/emtricitabine, reformulated RAL 1200mg QD demonstrated potent and non-inferior efficacy compared to RAL 400mg BID at Week 48. RAL 1200mg QD was safe and well tolerated with a safety profile similar to RAL 400mg BID.

| Endpoint | RAL 1200mg QD (N=531) | RAL 400mg BID (N=266) | Δ QD-BID (95% CI) |
|---|---|---|---|
| HIV RNA <40 copies/mL | | | |
| All subjects (NC=F) | 88.9 % | 88.3 % | 0.5 (-4.2, 5.2) |
| Baseline vRNA >100,000 copies/mL (OF) | 86.7 % | 83.8 % | 2.9 (-6.5, 14.1) |
| Baseline CD4 ≤200 cells/mm$^3$ (OF)[†] | 85.1 % | 87.9 % | -2.8 (-16.0, 14.0) |
| Hepatitis B and/or C co-infection (OF) | 100 % | 85.7 % | 14.3 (-11.7, 52.2) |
| HIV RNA <200 copies/mL (NC=F) | 91.1 % | 91.4 % | -0.2 (-4.4, 4.0) |
| Mean CD4 Change (95% CI), cells/mm$^3$ (OF) | 232 (215, 249) | 234 (213, 255) | -2.1 (-31, 27) |
| One or more clinical adverse events | 82.7 % | 86.8 % | -4.2 (-9.2, 1.3) |
| Drug-related[‡] adverse events | 24.5 % | 25.6 % | -1.1 (-7.6, 5.1) |
| Serious adverse events | 5.8 % | 9.4 % | -3.6 (-8.0, 0.2) |
| Serious drug-related adverse events | 0.2 % | 0.8 % | -0.6 (-2.5, 0.4) |
| Discontinued[§] due to adverse event | 0.8 % | 2.3 % | -1.5 (-4.1, 0.1) |

All subjects also received tenofovir/emtricitabine.
[†]Combination of two pre-specified groups (≤50 and >50 to ≤200 cells/mm$^3$).
[‡]Determined by the investigator to be related to study drug.
[§]Study medication withdrawn.
NC=F: Non-Completer=Failure, as defined by FDA snapshot approach (all missing data treated as failures); OF: Observed Failure approach.

## FRAB0104LB

### DOLUTEGRAVIR-LAMIVUDINE AS INITIAL THERAPY IN HIV-INFECTED, ARV NAIVE PATIENTS: 48 WEEK RESULTS OF THE PADDLE TRIAL

P. Cahn[1], M.J. Rolón[1], M.I. Figueroa[1], A. Gun[2], P. Patterson[1], O. Sued[1]
*[1]Fundacion Huesped, Clinical Research, Ciudad de Buenos Aires, Argentina,*
*[2]Fundacion Huesped, Clinical Research lab, Ciudad de Buenos Aires, Argentina*

**Background:** Based on the results of the GARDEL trial, we designed a proof of concept study to evaluate the antiviral efficacy, safety and tolerability of a dual therapy regimen with Dolutegravir (DTG) 50m mg QD plus Lamivudine (3TC) 300 mg QD as initial HAART among ARV-naïve patients.
**Methods:** Pilot study including 20 HIV-infected ARV-naïve adults. Eligible participants had no IAS-USA defined NRTI resistance, HIV-1 RNA < 100.000 copies/mL at screening and negative HBsAg. Viral load (pVL) was measured at baseline, on days 2, 4, 7, 10, 14, 21, 28 and on weeks 6, 8, 12, and thereafter every 12 months up to 96 weeks. Primary endpoint was the proportion of patients with HIV-1 RNA< 50 copies/mL in an ITT-exposed analysis at 48 weeks. (FDA-snapshot algorithm). Week 24 interim analysis was already presented at EACS 2015. Week 48 results are reported here.
**Results:** Median HIV-1 RNA at baseline was 24,128 copies/mL (IQR: 11,686-36,794). Albeit as per protocol, all patients had pVL< 100,000 copies/mL at screening, four patients had ≥100,000 copies/mL at baseline. Median CD4+ T-cell count was 507 per cubic millimeter (IQR 296-517). A rapid antiviral response was observed. (Median VL decay baseline-to week 12 was 2.74 logs) All participants had pVL < 50 copies from week 8 onwards up to week 24. At week 48, 90% (18/20) reached the primary end point of a pVL < 50 copies/mL. No major tolerability/toxicity issues were observed. Eighteen patients completed 48 weeks of the study, one patient (with undetectable viral load at last visit) committed suicide, in the context of a severe stress and emotional trauma deemed unrelated to study medication. One patient presented a low level protocol-defined confirmed virological failure at week 36., being the only observed failure. This patient resuppressed to pVL < 50 copies/mL prior to treatment intensification. Resistance tests revealed: RT:no emergent substitutions; Integrase: Not amplified.
**Conclusions:** Dual therapy with DTG/lamivudine produced rapid virologic suppression with a favorable safety/tolerability profile in HIV-infected, treatment-naive individuals. Observed failure rate was 5%. This is the first report of a successful InSTI/lamivudine-based dual therapy in ARV-naïve patients after 48 weeks of treatment.

# FRAC01 TESTING TIMES-INTERVENTIONS TO IMPROVE RATES OF HIV TESTING

## FRAC0101

### CHALO! A SOCIAL MEDIA BASED PEER-DELIVERED INTERVENTION INCREASES HIV TESTING IN MEN WHO HAVE SEX WITH MEN IN MUMBAI, INDIA: A RANDOMIZED TRIAL

V.V. Patel[1], S. Rawat[2], C. Lelutiu-Weinberger[3], A. Dange[2], C. Kamath[2], R. Poojary[2], M. Bisht[2], S.A. Golub[3]
*[1]Montefiore Medical Center, Medicine, Bronx, United States, [2]Humsafar Trust, Mumbai, India, [3]Hunter College, City University of New York, Psychology, New York City, United States*
*Presenting author email: vpatel@montefiore.org*

**Background:** Social media can provide effective delivery of HIV prevention messages to men who have sex with men (MSM). This study is the first to engage MSM in India in an online intervention to investigate the efficacy of two types of HIV prevention message framing: Approach (i.e., a good outcome to be achieved) versus Avoidance (a bad outcome to be avoided).
**Methods:** Using participatory processes, we developed messages targeting HIV testing to fit either approach- or avoidance frames. Using social media, we recruited MSM ages 18 or older living in Mumbai. After completing a screener and baseline survey online, participants were randomized to receive either 16 approach- or 16 avoidance-framed messages via their preferred modality: private Facebook group, individual Whatsapp messaging, or email. Peers delivered messages 2/week for 12 weeks (February-May 2015), and participants completed a post-intervention survey. Primary outcomes were
1) recent HIV test (past 6 months) and
2) intention to test in the next month.
**Results:** Over 82% of participants (n=200) were retained, and 53% (n=130) completed follow-up ; there were no baseline differences by messaging arm or follow-up completion. Participants were primarily between 18-29 years old (64%), identified as gay (67%) or bisexual (26%), had an average of 4 male partners in the past 3 months, and 39% reported inconsistent condom use. There was a significant in-

crease in recent HIV testing from baseline to follow-up (32% to 44%; $p < 0.05$). Among those who did not report recent HIV testing (n=50), intentions to test increased significantly as well (32% to 56%; p=.01). Participants reported liking approach messages more, but believing that avoidance messages were more effective. A significantly higher proportion of participants in the avoidance condition reported recent testing or intention to test (82%), compared to those in the approach condition (65%), p =.03.
**Conclusions:** This first study of a social media-based HIV intervention in India demonstrates preliminary evidence for increasing HIV testing in an urban online sample of MSM, with potential for wide national reach. Further work is needed to better understand how message-framing impacts HIV testing and risk behaviors in Indian MSM for future tailored online interventions.

## FRAC0102

### ACCESS TO HIV SELF-TESTING DOUBLES THE FREQUENCY OF HIV TESTING AMONG GAY AND BISEXUAL MEN AT HIGHER RISK OF INFECTION: A RANDOMISED CONTROLLED TRIAL

M.S. Jamil[1], G. Prestage[1,2], C.K. Fairley[3,4], A.E. Grulich[1], K.S. Smith[1], M. Chen[3,4], M. Holt[5], A.M. McNulty[6], B.R. Bavinton[1], D.P. Conway[1], H. Wand[1], P. Keen[1], J. Bradley[1], J. Kolstee[7], C. Batrouney[8], D. Russell[9,10], M. Law[1], J.M. Kaldor[1], R.J. Guy[1]
*[1]University of New South Wales (UNSW), The Kirby Institute, Sydney, Australia, [2]Australian Research Centre in Sex, Health and Society, La Trobe University, Melbourne, Australia, [3]Central Clinical School, Monash University, Melbourne, Australia, [4]Melbourne Sexual Health Centre, Alfred Health, Melbourne, Australia, [5]Centre for Social Research in Health, UNSW Australia, Sydney, Australia, [6]Sydney Sexual Health Centre, Sydney Hospital, Sydney, Australia, [7]ACON, Sydney, Australia, [8]Victorian AIDS Council, Gay Men's Health Centre, Melbourne, Australia, [9]Cairns Sexual Health Service, Cairns North, Australia, [10]James Cook University, Townsville, Australia*
*Presenting author email: mjamil@kirby.unsw.edu.au*

**Background:** Frequent testing of gay and bisexual men (GBM) at higher-risk of HIV is central to current prevention strategies. We conducted the first randomised trial to determine if access to HIV self-testing would increase testing frequency in two groups of higher-risk GBM; those who had tested within the past two years and those who had not.
**Methods:** In this wait-list control randomised trial, HIV-negative higher-risk GBM reporting condomless anal intercourse or >5 male sexual partners in the past 3 months were recruited at three clinical and two community-based sites in Australia. Enrolled participants were randomly assigned (1:1) via computer-generated randomisation codes to have free access to HIV self-testing (intervention) or not (standard-care). Participants completed 3-monthly online questionnaires. The primary outcome was the number of HIV tests over 12 months, analysed by intention-to-treat. The study was designed to evaluate the primary outcome overall and in two strata: frequent (last HIV test ≤2 years ago) and infrequent (>2 years ago or never tested) testers.
**Results:** Between Dec-2013, and Nov-2014, 180 men were randomised to self-testing and 179 to standard-care. The intention-to-treat analysis included men who completed any follow-up questionnaire: 179 (98%) in self-testing; and 164 (92%) in standard-care. The mean number of HIV tests over 12 months in the self-testing and standard-care arms was 3.9 and 1.6 per-person overall (rate ratio (RR):2.39, 95% CI: 2.08-2.76,$p< 0.001$), 4.0 and 1.8 among frequent testers (RR:2.23, 1.93-2.59,$p< 0.001$), and 3.2 and 0.6 among infrequent testers (RR:5.54, 3.15-9.74,$p< 0.001$), respectively. There was no statistical difference between the two arms in the mean number of facility-based HIV tests (1.4 vs 1.6, RR:0.89, 0.75-1.06) and any STI test (1.6 vs 1.7, RR:0.93, 0.79-1.10).

| Type of test | Overall | | | Frequent testers | | | Infrequent testers | | |
|---|---|---|---|---|---|---|---|---|---|
| | Self-testing (n=177) | Standard-care (n=164) | Rate-ratio (95%CI) | Self-testing (n=147) | Standard-care (n=140) | Rate-ratio (95%CI) | Self-testing (n=30) | Standard-care (n=24) | Rate-ratio (95%CI) |
| **Self/ facility-based HIV** | 3.9 (0.2) | 1.6 (0.1) | **2.39 (2.08-2.76)** | 4.0 (0.2) | 1.8 (0.1) | **2.23 (1.93-2.59)** | 3.2 (0.5) | 0.6 (0.2) | **5.54 (3.15-9.74)** |
| **Facility-based HIV** | 1.4 (0.1) | 1.6 (0.1) | 0.89 (0.75-1.06) | 1.6 (0.1) | 1.8 (0.2) | 0.88 (0.73-1.05) | 0.8 (0.3) | 0.6 (0.2) | 1.41 (0.73-2.73) |
| **Any STI** | 1.6 (0.1) | 1.7 (0.2) | 0.93 (0.79-1.10) | 1.8 (0.1) | 1.9 (0.2) | 0.92 (0.77-1.09) | 0.9 (0.3) | 0.7 (0.2) | 1.35 (0.73-2.49) |
| **Chlamydia/ Gonorrhoea** | 1.5 (0.1) | 1.6 (0.1) | 0.94 (0.80-1.12) | 1.6 (0.1) | 1.8 (0.2) | 0.93 (0.78-1.11) | 0.9 (0.3) | 0.6 (0.2) | 1.33 (0.71-2.50) |
| **Syphilis** | 1.4 (0.1) | 1.5 (0.1) | 0.90 (0.76-1.08) | 1.5 (0.1) | 1.7 (0.1) | 0.89 (0.74-1.07) | 0.8 (0.3) | 0.6 (0.2) | 1.41 (0.72-2.76) |

*[Mean number of HIV and sexually transmitted infection (STI) tests over 12 months in intention-to-treat population. Mean(SD) unless otherwise specified]*

**Conclusions:** HIV self-testing among higher-risk GBM increased HIV testing frequency by more than two-fold overall, and more than five-fold among infrequent testers, without reducing facility-based HIV/STI testing frequency. Self-testing should be provided more widely to achieve public health goals of increasing HIV testing frequency.

## FRAC0103

### COMMUNITY-BASED VOLUNTARY COUNSELLING AND TESTING SUCCESSFULLY IDENTIFIES HIV-POSITIVE ART ELIGIBLE INDIVIDUALS IN RURAL SOUTH AFRICA

S. Shenoi[1], A. Moll[2], J. Madi[3], V. Guddera[3], T. Madondo[3], D. Turner[4], R. Brooks[5], T. Kyriakides[6], L. Andrews[5], G. Friedland[5]
*[1]Yale University, School of Medicine, Infectious Diseases, New Haven, United States, [2]Church of Scotland Hospital, Tugela Ferry, South Africa, [3]Philanjalo NGO, Tugela Ferry, South Africa, [4]Umvoti AIDS Centre, Greytown, South Africa, [5]Yale University School of Medicine, New Haven, United States, [6]Yale Center for Analytical Sciences, New Haven, United States*
*Presenting author email: sheela.shenoi@yale.edu*

**Background:** Community-based voluntary counseling and testing (CBVCT) is a validated strategy to increase HIV awareness and testing. South Africa has the largest global epidemic of HIV, and a substantial proportion is unaware of being infected. New testing strategies are needed. We describe a successful CBVCT strategy in rural South Africa.
**Methods:** A team of nurses and community health workers provided health education, rapid HIV testing and concurrent TB screening in congregate community settings in rural KwaZulu Natal from 2010-2015. Those identified with HIV were offered confirmatory testing, CD4 staging, individual counseling based on CD4 count and referral to care and antiretroviral treatment (ART) according to national guidelines.
**Results:** CBVCT was performed at 849 community sites including municipality events, pension pay points, and taxi ranks. Among 13,278 screened, the median age was 41(IQR 23-57), 8099 (70.8%) were women, and 11,435 (86.1%) accepted HIV testing. Twelve hundred and forty-four (9.4%) individuals were identified as HIV-infected. Among 720 (57.9%) accepting phlebotomy, the median CD4 count was 424 (IQR 270-583); 447 (62%) qualified for antiretroviral therapy (ART).
A substantial proportion of participants (4510, 39.4%) reported first-time HIV testing. Preliminary analysis identifies correlates of HIV-positive test result including young age ($p< 0.001$), contact with a TB patient ($p< 0.001$), chronic diarrhea ($p< 0.001$), recurrent pneumonia ($p< 0.001$), and type of community site of HIV testing ($p< 0.001$). Taxi ranks yielded the greatest proportion of community members (176/1123, 15.7%) with HIV-positive test result. Among all HIV-positive men, the greatest proportion (74, 25%) was identified at municipality events.
**Conclusions:** Community members accept HIV testing outside of health care facilities and by non-clinical personnel. Utilizing a variety of community testing sites reaches different demographic groups, including high-priority young men and women. CBVCT can detect a large number of HIV infected individuals, the majority of whom are eligible for ART. Scale-up of CBVCT may provide needed increase in levels of HIV awareness, testing and diagnoses in rural areas.

## FRAC0104

### PROMOTING MALE PARTNER AND COUPLES HIV TESTING THROUGH SECONDARY DISTRIBUTION HIV SELF-TESTS: A RANDOMIZED TRIAL

H. Thirumurthy[1], S. Masters[1], B. Obonyo[2], S. Napierala Mavedzenge[3], S. Maman[4], E. Omanga[2], K. Agot[2]
*[1]University of North Carolina at Chapel Hill, Department of Health Policy and Management, Chapel Hill, NC, United States, [2]Impact Research and Development Organization, Kisumu, Kenya, [3]RTI International, San Francisco, United States, [4]University of North Carolina at Chapel Hill, Department of Health Behavior, Chapel Hill, NC, United States*
*Presenting author email: mamagifto@yahoo.com*

**Background:** There is a vital need to achieve higher uptake of HIV testing among men and couples in sub-Saharan Africa. Providing multiple HIV self-tests to individuals for distribution to their sexual partners, i.e. 'secondary distribution', is a promising strategy with potential to increase awareness of HIV status. This strategy may be particularly useful for promoting male partner testing and couples testing in antenatal and postpartum settings.
**Methods:** We conducted a randomized trial at 3 clinics in Kisumu, Kenya (NCT02386215). Women seeking antenatal and postpartum care, aged 18-39 years, and reporting their primary partner was not known to be HIV-infected, were randomized to an HIV self-testing (HIVST) group or a comparison group. In the HIVST group, women were provided 2 OraQuick self-tests, a demonstration and instructions on how to use the self-tests, and encouragement to distribute a self-test to

their partner. In the comparison group, women were provided invitation cards for their partner to seek counselor-administered HIV testing at the clinics. Follow-up interviews were conducted with women after they reported their partner had tested, and all women were interviewed at 3 months. The primary outcome was HIV testing by the male partner within 3 months and the secondary outcome was couples testing within 3 months. Chi-squared tests were used to compare outcomes in the intervention and comparison group.
**Results:** Between June 11, 2015 and October 16, 2015, 600 women were randomly assigned to the HIVST group (n=297) or the control group (n=303). Follow-up was completed for 570 (95.0%) women. Male partner testing uptake was 90.5% (257/284) in the HIVST group and 51.7% (148/286) in the comparison group (difference=38.7%, 95% CI 31.9%-45.5%, $P < 0.001$). Couples testing was also significantly higher in the HIVST group than the comparison group (75.0% vs. 33.2%, difference=41.7%, 95% CI 34.3%-49.2%, $P < 0.001$). One adverse event was reported in the HIVST group and none were reported in the comparison group.
**Conclusions:** Secondary distribution of HIV self-tests by pregnant and postpartum women was highly effective in promoting male partner and couples testing. As countries scale-up HIVST, further implementation of secondary distribution interventions can help increase HIV testing uptake among hard-to-reach populations.

## FRAC0105LB

### The impact of universal test and treat on HIV incidence in a rural South African population: ANRS 12249 TasP trial, 2012-2016

Barnighausen[1,7], S. Boyer[8,9], T. De Oliveira[1], C. Rekacewicz[10], B. Bazin[10], M.-L. Newell[11], D. Pillay[1,12], F. Dabis[3], for the ANRS 12249 TasP Study Group
*[1]Africa Centre for Population Studies, Somkhele, South Africa, [2]University College London, Research Department of Infection and Population Health, London, United Kingdom, [3]Universite de Bordeaux, INSERM U1219 Bordeaux Population Health, Bordeaux, France, [4]IRD, Centre Population & Développement (UMR 196 Paris Descartes IRD), Paris, France, [5]University of KwaZulu-Natal, School of Nursing and Public Health, Durban, South Africa, [6]University of Southampton, Faculty of Medicine and Faculty of Human, Social and Mathematical Sciences, Southampton, United Kingdom, [7]Harvard University, Department of Global Health & Population, Harvard School of Public Health, Boston, United States, [8]INSERM, UMR912 (SESSTIM), Marseille, France, [9]Université Aix Marseille, UMR S_912, IRD, Marseille, France, [10]Agence Nationale de Recherches sur le Sida et les hépatites virales, Paris, France, [11]University of Southampton, Faculty of Medicine and Global Health Research Institute, Southampton, United Kingdom, [12]University College London, Faculty of Medical Sciences, London, United Kingdom*
*Presenting author email: francois.dabis@isped.u-bordeaux2.fr*

**Background:** The population impact of universal test and treat (UTT) on HIV transmission has not yet been evaluated.
**Methods:** A cluster-randomized trial was implemented in 2x11 rural communities in KwaZulu-Natal, South Africa. All residents ≥16 years were offered rapid HIV testing and provided dried blood spots (DBS) during 6-monthly home-based survey rounds. HIV-positive participants were referred to cluster-based trial clinics to receive ART regardless of CD4 count (intervention arm) or according to national guidelines (control arm). Standard of care ART was also available in the Department of Health clinics. HIV incidence was estimated on repeat DBS using cluster-adjusted Poisson regression.
**Results:** Between 03/2012 and 04/2016, 13,239 and 14,916 individuals (63% women, median age 30 years) were registered in the intervention and control arms. Contact frequency per round among registered individuals ranged from 64% to 83%, HIV ascertainment from 74% to 85%. Baseline HIV prevalence was 29.4%(95%CI 28.8-30.0), with 7,578 individuals identified as HIV-positive. 1,513(36%) of 4,172 HIV-positive individuals not previously in care linked to trial clinics within 6 months of referral. ART initiation in trial clinics at 3 months was 90.9%(576/634) and 52.3%(332/635) in the intervention and control arms; viral suppression (< 400 copies/mL) 12 months after ART initiation was 94.9%(300/316) and 94.2%(194/206), respectively. Overall ART coverage at entry was 31% and 36% in the intervention and control arms, reaching 41% in both arms by closing date. Repeat DBS tests were available for 13,693 individuals HIV-negative at baseline, yielding 461 seroconversions in 20,833 person-years (PY). HIV incidence was 2.16 per 100 PY (1.88-2.45) in the intervention arm and 2.26 (1.98-2.54) in the control arm (adjusted relative risk: 0.95 [0.82-1.10]). Severe adverse events rates were 3.4%(45/1,323) and 3.5%(57/1,604) in the intervention and control arms. Follow-up will be completed by 06/2016.
**Conclusions:** Our trial shows high acceptance of home-based HIV testing and high levels of viral suppression among individuals on ART. However overall linkage to care remains poor. No reduction in HIV incidence was demonstrated. Several factors are being investigated, including determinants of poor linkage, change in national ART guidelines, migration and geography of sexual networks.
(Funded by ANRS, GiZ and 3ie; Clinical Trials registration NCT00332878).

# FRAD01 Policies, policing and public morality

## FRAD0101

### "One shouldn't convict people for hypothetical risks": frustratingly slow incorporation of the prevention impact of antiretroviral therapy into criminal law and policy

E.J. Bernard[1], P. Eba[2], C. Kazatchkine[3]
*[1]HIV Justice Network, Brighton, United Kingdom, [2]UNAIDS, Human Rights and Law Division, Geneva, Switzerland, [3]Canadian HIV/AIDS Legal Network, Toronto, Canada*
*Presenting author email: edwin@hivjustice.net*

**Background:** The prevention impact of antiretroviral therapy (ART) is now established as a key component of the HIV response. But despite this remarkable scientific advancement, many people living with HIV around the world remain vulnerable to the risk of unjust prosecutions for alleged HIV non-disclosure, potential or perceived exposure or non-intentional transmission because up-to-date science on HIV risk has not been recognised in criminal law and policy.
**Description:** We undertook a desk review of criminal proceedings, policy documents and newspaper reports collated on the HIV Justice Network website to better understand the implications of increased knowledge and awareness of the prevention benefit of ART as they relate to HIV non-disclosure, exposure and/or transmission laws, policies and prosecutions.
**Lessons learned:** Despite recognition by WHO and other normative agencies of the impact of ART on the risks of HIV transmission, criminal justice actors and lawmakers have been frustratingly slow to incorporate up-to-date HIV science into criminal law and policy. The key component of recognising the prevention impact of ART on HIV risk has been collaboration between scientists, clinicians, lawyers and advocates. This is as true in the Netherlands, the first country to consider low viral load as a factor in assessing HIV risk in 2005, as it has been in, for example, the US Court of Appeals for the Armed Forces (2015) and the Czech Republic (2015). Without this co-ordinated effort higher courts and lawmakers generally ignore up-to-date science even if lower courts occasionally make more rational, informed decisions, for example, in Austria, Canada and Germany.
**Conclusions/Next steps:** It is vitally important that criminal justice system actors and law- and policymakers are educated so that HIV-related criminal laws and policies are applied rationally and fairly. Scientists and clinicians must, therefore, work more closely with HIV and human rights activists, advocates and lawyers in jurisdictions where the prevention impact of ART is not currently legally recognised, in order to prevent miscarriages of justice and to ensure that the prevention benefit of ART is correctly understood by criminal justice actors, policymakers, and the media as well people living with HIV and people likely to make a criminal complaint.

## FRAD0102

### Inconsistencies in legal frameworks on adolescent HIV and sexual and reproductive health services in five Southern African countries

A. Müller, K. Daskilewicz, S. Spencer, T. Meer, L. Artz
*University of Cape Town, Gender Health and Justice Research Unit, Cape Town, South Africa*
*Presenting author email: alexandra.muller@uct.ac.za*

**Background:** While specific disaggregated HIV prevalence data for adolescents (aged 12 to 18) does not exist, young people (aged 15-24) account for 39% of all HIV infections globally, most of which occur in Sub-Saharan Africa (SSA). Conflicting laws surrounding the age of consent, sexual activity between adolescents and mandatory reporting - which in some instances criminalise certain sexual activities between adolescents - have a deleterious impact on the extent to which adolescents can access and, by extension, receive HIV counselling and testing and other sexual and reproductive health (HCT/SRH) services. The legal frameworks around HCT/SRH service provision in Malawi, Mozambique, Namibia, Zambia and Zimbabwe, five SSA countries with high adolescent HIV prevalence rates, were analysed for their impact on adolescents' access to HCT/SRH services.
**Methods:** Following desktop-based analyses of legal and policy frameworks, we conducted in-depth interviews with representatives of organisations providing adolescent HCT/SRH services, as well as academics, advocates, and policy makers, in the five countries. Interview data were analysed thematically and compared across specific issues and countries.
**Results:** Laws regulating adolescent HCT, SRH and sexual activity are inconsistent and differentially interpreted within and across the five countries analysed. Conflicts exist between laws regulating age of consent to HCT and other SRH services, with the effect that adolescents have more barriers to preventative than diagnostic and curative services. Where consent to sex is regulated at a higher age than consent to HCT/SRH services, adolescents in effect need to disclose illegal sexual activ-

Author Index

ity when accessing HCT/SRH services. Laws that criminalise homosexuality (in Malawi, Zambia and Zimbabwe) put lesbian, gay, bisexual and transgender adolescents at risk when attempting to openly access services. As a result, reporting obligations for healthcare providers with regards to teenage sexuality impede confidential service provision, and providers often use their discretion in deciding to whom and how to provide services.
**Conclusions:** Laws and policies regulating HCT/SRH are often in conflict with HCT policies and create additional barriers for adolescents. National law and policy reforms need to be harmonised and aligned to the principles of adolescent-friendly HCT/ SRH services. Healthcare providers need to receive training on the legal frameworks and their obligations.

## FRAD0103

### SENSITISING JUDGES ON HIV, HUMAN RIGHTS AND THE LAW: THE REGIONAL JUDGES' FORUM IN AFRICA

A. Saha[1], C. Grant[2], P. Patel[3], M. Getahun[4], T. Sellers[5]
*[1]UNDP, HIV, Health & Development (BPPS), Addis Ababa, Ethiopia, [2]UNDP Consultant, Regional Centre for Africa, Johannesburg, South Africa, [3]UNDP Regional Consultant for Africa, Rolleston, New Zealand, [4]UNDP Regional Centre for Africa Addis Ababa, HIV, Health & Development, Addis Ababa, Ethiopia, [5]UNDP Regional Service Centre for Africa, HIV, Health & Development, Addis Ababa, Ethiopia*
*Presenting author email: amitrajit.saha@undp.org*

**Background:** Sub-Saharan Africa accounts for 69% of people living with HIV. In many African jurisdictions, people living with or affected by HIV encounter stigma, discrimination and violations of rights that increase the impact of HIV on their lives and create barriers to services. Protecting human rights is essential for access to services. The judiciary can play a critical role in upholding the rights of people infected and affected by HIV. In 2014, African judges requested support to form a regional judges' forum to learn about new developments in HIV-related jurisprudence and to share challenges they face.
**Description:** UNDP supported two meetings of the Africa Regional Judges' Forum in 2014 and 2015. Judges chaired sessions on HIV science, key populations, HIV laws, human rights, case law related to PLHIV, MSM, sex workers, access to medicines, etc. Expert resource people, including HIV science and legal experts, and key population experts provided up to date information for the judges' deliberations in these sessions.
**Lessons learned:** The Forum was based on issues raised by Judges, and provided a collegial space for them to identify participants, themes, and the agenda. Judges who have made ground-breaking rulings acted as resource persons, complemented by thematic and key population experts. Twenty-six judges from 16 African countries participated in these two meetings and discussed HIV science, human rights of key populations (sex workers, transgender people, MSM and prisoners) and access to anti-retroviral therapy. Mock trials and case law discussions focused on issues like forced sterilisation of women with HIV, discrimination against PLHIV in workplace, HIV treatment for prisoners and registration of LGBTI organisations. An online database on HIV laws/bills, case law, regional and international treaties and covenants, was launched.
**Conclusions/Next steps:** Results (2014-2015): Participants of the Forum were resource persons at a training of court users in Kenya. Kenya High Court ruled criminalising HIV transmission in law as unconstitutional; Botswana HC ruled that foreign prisoners were entitled to ART - a ruling that was upheld by the Court of Appeals; the South African Chapter of International Association of Women Judges developed a Strategic Plan that incorporated HIV, Law, Gender and Human Rights, and Transgender issues.

## FRAD0104

### ENFORCING THE LAWS ON PUBLIC MORALITY AGAINST KEY POPULATIONS: THE DILEMMA OF THE GHANA POLICE SERVICE

T.S. Ndeogo[1], J. Blantari[2], E. Awotwi[3]
*[1]Ghana Police Hospital, Public Health Unit, Accra, Ghana, [2]Ghana Police Hospital, Accra, Ghana, [3]United Nations Population Fund, Accra, Ghana*
*Presenting author email: tsndeogo@gmail.com*

**Background:** Ghana has recorded significant progress in the fight against HIV over the last decade with current infection rates plateauing around the prevalence of 1.47% among the general population aged 15-49 years.
However, significant challenges exist amongst Key Populations (KPs) with prevalence of 11% (FSW) and 17% (MSM), which plays a key role in the HIV transmission dynamics. Laws criminalizing KP activities stand in the way of progress in addressing HIV. Application of the law is often based on prejudice, and not science/evidence. Lack of enforcement of protective laws is problematic, with increased intolerance and rights violations of sex workers.
**Description:** To promote rights-based policing approaches towards KPs, the Ghana Police Service AIDS Control Program with support from UNFPA implemented orientation sessions in 6 Police Regions. The program targeted 611 police personnel from senior officer (SPO), inspectorate/middle and the operational levels. Sessions were organized through focus group discussions (FGD) to a) solicit information on how the police would identify a Sexual Minority, b) define laws that classify KPs, and c) understand what constitutes causation of sexual offences against public morals. Sensitization sessions immediately followed to address issues arising from the FGDs.
**Lessons learned:** FDGs revealed respondents' appropriate interpretation of the laws ranged from 77% (SPO) to 70% (Inspectorate/Middle) and 38% (operational). Participants could not state key aspects of the law in the Criminal Offences Act. Discussants dwelt on perceptions (including the way of dressing) rather than facts regarding the causation of sexual offence; with appropriateness of responses ranging from 63% (Inspectorate/middle) to 59% (SPO) and 41% (operational). After sensitization sessions, participants accepted the need for reform and observed:
a) senior officers who protect rights of KPs are compelled to arrest them due to political/societal pressure,
b) morality should be decoupled from law enforcement,
c) police must constantly dialogue with the judiciary to protect KP rights.
**Conclusions/Next steps:** Acceptance of misconduct is a major breakthrough to reform. This program, with approval of the Police hierarchy is taking steps to punish subsequent perpetrators of abuse of KPs. Consensus building among the police and efficient use of available resources will help to sustain the program.

## FRAD0105

### NOTHING ABOUT US WITHOUT US: COMMUNITY-BASED ACTION RESEARCH TO ENSURE HIV POLICY IN THE U.S. REFLECTS THE EXPERIENCES AND NEEDS OF SEX WORKERS

P. Saunders[1], S. Outlaw[2], D. Demeri[3], J. McCracken[4]
*[1]Best Practices Policy Project, Morristown, NJ, United States, [2]Best Practices Policy Project, Washington, United States, [3]New Jersey Red Umbrella Alliance, Atlantic City, United States, [4]University of South Florida, St Petersberg, United States*

**Background:** The project includes advocacy and organizing efforts led by US sex workers and the production of a series of reports to reveal how current HIV policies impact sex workers. An overarching goal of the project is to ensure that sex workers are acknowledged in the National AIDS Strategy as essential partners in ending HIV and to consider the impact of US policy on sex work worldwide.
**Description:** The project is multi-pronged involving community building, documentation and advocacy. In 2015 a community based research team was established with key partner organization of sex worker lead groups. A survey was implemented with 25 US respondents about transgender people's experiences related to HIV. The emerging issues were explored with 40 respondents in open-ended interviews in person, phone, or email, ranging from 30 minutes to two hours. The team used statistical and thematic analysis of the qualitative data. Throughout 2015 team members built their capacity to engage in policy and media advocacy, developing a letter to the Office of National AIDS Strategy in partnership with other groups and created statement that were distributed widely in the media and the HIV sector.
**Lessons learned:** The project findings include:
- that sex workers are not mentioned in the National AIDS Strategy of the United States, a silence that has contributed to a profound health and rights crisis for sex workers and people profiled as sex workers (such as transgender people)
- the criminalization of the lives of sex workers is the central barrier to health and rights
- the movement for sex worker rights in the United States is incrementally developing its capacity to effectively shift policy discourse and to publicize best practice initiatives via media interventions
- ongoing resources are required to begin to establish employment opportunities in sex worker-led organizations in the United States for sex workers and transgender people to build for change in the HIV sector

**Conclusions/Next steps:** This project is a milestone releasing the first US national report ever created by sex workers to confront the impact of outmoded and restrictive HIV policies. The project continues documenting the experiences of sex workers to guide our future work.

## FRAD0106LB

### INTERIM OUTCOMES OF THE NEW YORK PLAN TO END THE AIDS EPIDEMIC BY THE END OF 2020: ASSESSING A FAST TRACK MODEL

K. Hagos[1], C. King[2], V. Shubert[3], D. Daskalakis[4], D. Tietz[1], M. Harrington[5], K. Smith[6], C. Ferrusi[7]
*[1]New York State Department of Health, AIDS Institute, Albany, United States, [2]Housing Works, Inc., Executive Management, Brooklyn, United States, [3]Housing Works, Inc., Department: Research and Public Policy, Brooklyn, United States, [4]New York City Department of Health and Mental Hygiene, Bureau of HIV/AIDS Prevention and Control, Long Island City, United States, [5]Treatment Action Group (TAG), New York, United States, [6]Callen-Lorde Community Health Center, Administration, New York, United States, [7]New York State Department of Health, AIDS Institute, Office of Grants and Data Management, New York, United States*
*Presenting author email: karen.hagos@health.ny.gov*

**Background:** In 2014 a coalition of government and civil society representatives secured a commitment by New York State's (NYS) Governor to end AIDS as an epidemic by the end of 2020. NYS has defined the end of the epidemic as reducing the number of new HIV infections to just 750 [from an estimated 3,000] by the end of 2020. Once the number of new infections has fallen below all-cause mortality among people with HIV, NYS will achieve the first ever decrease in HIV prevalence in New York State.
**Methods:** A state-appointed Task Force of government and community stakeholders developed a detailed Ending the Epidemic (ETE) Blueprint to: identify persons who remain undiagnosed; link and retain diagnosed persons in care to maximize viral suppression; and broaden access to Pre-Exposure Prophylaxis (PrEP). The Blueprint builds upon a unique NYS HIV response that includes housing and nutrition supports, harm reduction programming, and social marketing to address stigma and promote testing, treatment and prevention. Public health agencies work closely with civil society to implement this Fast Track agenda, and an online "ETE Dashboard" tracks key metrics for accountability and planning.
**Results:** In NYC, which represents 80% of new diagnoses and persons living with HIV in NYS, HIV surveillance data indicate that 72% of an estimated 87,000 persons infected with HIV are virally suppressed (≤200 copies/ml), and findings from a multi-year survey of men who have sex with men (MSM) show PrEP awareness at 86% in 2015 (up from 34% in 2012) and PrEP use among MSM at 16% (up from 1.6% in 2012 and 2.8% in 2014). NYS has documented a 40% reduction in new HIV infections over the last decade, and preliminary data shows NYS recently went 17-months with no new cases of mother to child transmission for the first time since the outbreak of the disease.
**Conclusions:** Recent analyses indicate significant ongoing improvements in HIV treatment effectiveness and in comprehensive prevention awareness and use, putting New York on a path to end its HIV epidemic by the end of 2020 via replicable strategies to dramatically reduce new HIV infections and end AIDS deaths.

# FRAD02 CHALLENGING INTELLECTUAL PROPERTY REGIMES IN HIV AND HCV

## FRAD0201

### EMPIRICAL IMPACT OF CONSTITUTIONAL RIGHTS PROTECTIONS ON HIV-RELATED HEALTH SYSTEMS AND AVAILABILITY OF ESSENTIAL MEDICINES

M. Kavanagh
*University of Pennsylvania, Political Science & Leonard Davis Institute of Health Econonomics, Philadephia, United States*
*Presenting author email: matthewmk@gmail.com*

**Background:** While there is much support among ethicists for a "rights based" approach to HIV treatment, care and prevention, there is also significant social science debate about the real-world effects of enshrining health as a right within national legal frameworks. Rights protection might empower populations to demand quality access to critical HIV services. Or, as critics argue, engaging law and courts might have no real impact or, at worst, distort policy away from public health goals toward individual club-goods for those with access to lawyers. This research empirically tests the hypothesis that protecting health as a right improves access to HIV treatment and quality of service provision in the public health setting.
**Methods:** This study uses a mixed-methods political economy approach with two nested stages based on a large-N dataset and 125 in-depth interviews conducted in South Africa, India, and Thailand. A dataset coding all written constitutions in the world from 1970-2010 for an enforceable right to health was analyzed as a variable in a multi-level regression (OLS, FGLS, and ADL models) against variables capturing the common social, economic, and political explanations for cross-national variation in mortality and public goods provision. The results of this analysis were then tested against data gathered in "process tracing" interviews and archival research to identify causal mechanisms for the impact of rights on health services.
**Results:** This study finds an empirically visible, significant, positive impact of protecting health as a constitutional right on the level, quality, and accessibility of HIV-related health services including access to antiretroviral therapy. A small, but statistically significant impact can be quantified on the availability of HIV- and non-HIV-related essential medicines, out of pocket expenses, and health workforce. Qualitative evidence shows that constitutionalizing health shifts the political economy of HIV by providing an avenue to challenge failures in health governance at the national and local level and, contrary to worries of upper/middle-class capture, has been largely utilized to improve quality and accessibility of public services.
**Conclusions:** Protecting health as a right and building the institutional capacity to enforce that right should be understood as an important HIV and health-system strengthening intervention.

## FRAD0202

### THE FREE TRADE AGREEMENT THAT WILL ADVERSELY IMPACT ACCESS TO GENERIC MEDICINES IN THE ASIA-PACIFIC...AND NO, IT'S NOT THE TPP!

K. Bhardwaj
*Independent Lawyer, HIV, Health and Human Rights, New Delhi, India*

**Background:** Regional Comprehensive Partnership (RCEP) Agreement is between 16 countries in Asia-Pacific: developed countries (Japan,Australia,NewZealand,Singapore,South Korea), developing countries (China,India,Malaysia,Indonesia,Philippines,Thailand,Vietnam,BruneiDarussalam) & LDCs (Myanmar,Cambodia,Laos). Scale-up of HIV treatment was only possible due to affordable generic medicines which have been adversely impacted by the WTO-mandated patent-regime. Developing&leastdeveloped countries are advised to use TRIPS flexibilities to ensure continued generic production/import. TRIPS-plus measures that are included in FTA negotiations require patent protection far in excess of that required by the WTO regime.
**Methods:** The study examined 4 leaked texts of the IP proposals of Japan, South Korea, India &ASEAN to identify TRIPS-plus demands. It also compiled the use of TRIPS flexibilities by countries in the region &analysed the changes that would be required as a result of TRIPS-plus demands and their potential impact on access to generic medicines in the region and beyond.
**Results:** The Study found multiple TRIPS-plus demands in the RCEP negotiations including: (a)Substantive demands requiring governments patent news uses/forms of old medicines (evergreening); (b)Enforcement demands that would impact the export and transit of generic medicines; (c)Demands limiting the ability of patent offices to require crucial information from patent holders; (d)Demands impacting LDCs. TRIPS-plus demands prevent countries from using TRIPS flexibilities. In the region, Malaysia(2003), Indonesia(2004,2007,2012),Thailand(2006,2008), India(2012) have issued compulsory licenses for HIV, heart disease, cancer medicines. India, Philippines &Thailand restrict evergreening patents. RCEP countries feature some of the most important generic producers that the world relies on like China(API) &India(API, finished formulations) while Thailand has government production of medicines. If TRIPS-plus in RCEP is accepted, repercussions will be felt far beyond Asia-Pacific.
**Conclusions:** 1-in-3 PLHIV have access to treatment in Asia-Pacific. HIV-positive pregnant women in South Asia have the world's lowest rate of access to ARVs needed for PMTCT. In several countries (China,Indonesia,Philippines) rates of new infections & AIDS-related deaths are increasing. As middle-income, developing countries are facing severe funding cuts from Global Fund, MNC pharma is withdrawing lower prices/excluding from voluntary licenses. RCEP will make a bad situation worse and TRIPS-plus demands should be rejected outright &countries should pro-actively make greater use of TRIPS-flexibilities to ensure access to generic HIV, hepatitisC and TB treatment.

### ACCESS TO ARVS AND SOUTH AFRICAN PATENT LAW REFORM: REFLECTION AND WAYS FORWARD FOR THE FIX THE PATENT LAW CAMPAIGN

C. Tomlinson[1], Y. Hu[2], C. Waterhouse[3], L. Rutter[4]
*[1]Fix the Patent Law Campaign, Cape Town, South Africa, [2]Médecins Sans Frontières, Access Campaign, Geneva, Switzerland, [3]Médecins Sans Frontières, Access Campaign, Johannesburg, South Africa, [4]Treatment Action Campaign, Johannesburg, South Africa*
*Presenting author email: crtomlinson@gmail.com*

**Background:** Over the past 15 years, South Africa has been a pioneer of expanding generic medicine access, with constant battles led by civil society advocates to challenge patent monopolies of pharmaceutical companies that block sustainable access to affordable ARVs. Yet, in South Africa, many access challenges for newer ARVs and other medicines needed by people living with HIV remain, while ongoing patent law reform has triggered intensive debates and advocacy.
**Description:** This research will examine strategies pursued by civil society organisations in South Africa over the past 15 years, their impact on medicines access and lessons learned. It will further review the ongoing reform of South Africa's intellectual property (IP) system, and the opportunities and challenges to adopting pro-public health patent laws.
**Lessons learned:** Over the past 15 years, significant victories have been won through strategies employed by civil society organisations to secure access to generic ARVs in South Africa, including filing competition commission cases and calling for the granting of compulsory licenses. Today, a first line ARV regimen is 96% cheaper than in 2000, supporting the scale-up of treatment.
However, fighting access battles drug-by-drug on an *ad hoc* basis has not changed systemic problems, such as current patent law lacking accommodation of public health needs. Seeking to adopt a more systemic approach to improve accessibility of medicine for all, the Fix the Patent Laws Coalition was founded in 2011, with 18 patient groups joining to date. During 2013, the South African government released a draft policy committing to pro-public health reform of the country's intellectual property laws. Pharmaceutical companies have responded with various attempts to derail such reform.
**Conclusions/Next steps:** South Africa is at a critical stage in the ongoing battle for access to medicine versus expanding intellectual property protection. While there is opportunity for broad legislative reform to facilitate access to newer ARVs and all medicines there is significant push back from pharmaceutical companies. Fix the Patent Laws Coalition's experience demonstrates the need for greater international solidary and coordination with adequate technical and political support in reforming the national patent laws for public health and pushing back on pharmaceutical companies' effort to thwart reform.

## FRAD0204

### REMOVING GLOBAL PATENT BARRIERS TO THE NEW GENERATION OF HEPATITIS C DRUGS

T. Amin[1], P. Radhakrishnan[1], O. Mellouk[2], L. Di Giano[3]
*[1]Initiative for Medicines, Access, & Knowledge (I-MAK), Lewes, United States, [2]ITPC, Marrakesh, Morocco, [3]Fundacion GEP, Mara Del Plata, Argentina*
*Presenting author email: priti@i-mak.org*

**Background:** Globally, at least 4-5 million people living with HIV (PLHIV) are co-infected with the hepatitis C virus (HCV). As other AIDS-related deaths decrease with increased ART use, the burden of HCV-related morbidity and mortality in PLHIV has become the leading cause of death. HCV can be cured in 12 weeks or less by combinations of highly effective direct-acting antivirals (DAAs), but access to these drugs is virtually non-existent in low- and middle-income countries (LMICs).
Non-sub Saharan African (non-SSA) MICs are excluded from discount programs and voluntary licenses, resulting in prices significantly higher than generics. Patent laws often do not have sufficient safeguards to enable generic access. DAA/ARV voluntary licenses restrict generic suppliers from providing treatment to over 40 MICs, including those with the highest number of people living with HCV. With the branded company as the only option, lack of competition keeps DAA prices out of reach for non-SSA MICs, whose governments are unable to fund treatment at the high branded prices.
**Description:** This presentation will discuss the coordinated global legal effort to challenge patents on key DAAs, with a special focus on Sovaldi, known by its generic name sofosbuvir. This case study will share the scientific and legal basis for patent challenges, raise important questions about innovation and access, explain civil society's rationale and process for challenging patents, showcase new impact analysis and conclude with recommendations for the way forward.
**Lessons learned:**
1) Utilizing patent challenges as strategy to address treatment gap has proven successful
2) Community networks have significant capacity to take patent work forward
3) Government intervention is a necessary parallel strategy to curtailing the problem of drug pricing in developed and developing countries
**Conclusions/Next steps:**
1) Simultaneous coordinated patent challenges is the most effective strategy to combat the exclusion of MICs from access programs and voluntary licenses, which increases pressure on pharmaceutical companies, but also strengthens the position of country patent offices and governments in addressing patents and public health.
2) Only by challenging these patents, through stronger patent examination and patent challenges, can there be real change in addressing the challenges facing the current patent system and public health.

## FRAD0205

### ACCESS TO ANTIVIRAL DRUGS FOR TREATING HCV FOR HIV-POSITIVE PATIENTS IN RUSSIA: RESULTS AND RECOMMENDATIONS OF THE REGISTRATION, POLICY AND PROCUREMENT ANALYSIS

K. Babikhina[1], S. Golovin[2]
*[1]Treatment Preparedness Coalition, Moscow, Russian Federation, [2]Treatment Preparedness Coalition, St. Petersburg, Russian Federation*
*Presenting author email: kbabihina@gmail.com*

**Background:** The number of people with HCV in Russia is 5 million based on expert estimates. At least 200,000 people are co-infected with HIV and HCV. Treatment of chronic hepatitis C should be provided free of charge for the HIV/HCV co-infected patients within the framework of the national programme for HIV, HCV and HBV. "Treatment Preparedness Coalition" analyzed the regulatory framework and data on the procurement of HCV drugs to understand the scope and nature of HCV treatment provided for HIV/HCV coinfected people.
**Methods:** We used the data of the website grls.rosminzdrav.ru to identify HCV drugs registered in Russia (December 2015). Then, we compared the results with the list of drugs in the decree on financing the procurement of HIV/HCV/HBV drugs (Decree No 1438). Then, we analyzed 850 contracts for HCV drugs concluded in 2015. The analysis included 3 non-proprietary names of pegylated interferon (PEG-IFN) and 4 non-proprietary names of antiviral drugs (DAAs).The number of patients was calculated by diving the total amount of items purchased by the recommended daily dose and treatment duration.
**Results:** In 2015, the following DAAs were registered in Russia: simeprevir; daclatasvir; asunaprevir; paritaprevir/ritonavir, dasabuvir, ombitasvir; telaprevir; and boceprevir. 3 international non-proprietary names of PEG-IFN were registered (December 2015): PEG-IFN alpha-2a, PEG-IFN alpha-2b and Ce-PEG-IFN alpha-2b. The list of drugs in Decree No 1438 included only the three pegylated interferons. The other drugs were purchased using funds allocated for other groups of patients, including monoinfected patients.
In total, approximately 600 patients could receive interferon-free therapy. The total number of patients who could receive DAA-based therapy with interferon, including interferon-free therapy, is approximately 1000. The price for the treatment course of DAAs is in the range of 10,000 - 12,000 USD. The number of patients receiving pegylated interferon is in the range of 4500-9000 (depending on the treatment duration).
**Conclusions:** the majority of HIV/HCV coinfected patients still receive PEG-IFN-based therapy. In our opinion, this is mostly due to high price of DAAs. Some preferred options for treating HCV are still not registered in Russia, including sofosbuvir and sofosbuvir/ledipasvir. None of the DAAs are included in Decree No 1438.

## FRAD0206

### COMPULSORY LICENSING AS AN ONGOING ALTERNATIVE: COMPARING PRICE NEGOTIATIONS FOR LOPINAVIR/RITONAVIR (LOP/R) AND EFAVIRENZ (EFV) IN BRAZIL

E. Fonseca[1], F. Bastos[2]
*[1]Sao Paulo Business School, Fundacao Getulio Vargas, Sao Paulo, Brazil, [2]Fundacao Oswaldo Cruz, Rio de Janeiro, Brazil*
*Presenting author email: emassard@gmail.com*

**Background:** Brazil's AIDS response has been cited as the developing world's largest and most innovative AIDS treatment program, but has been facing challenges due to budget cuts and political instability in recent years. In the 2000s, Brazil took controversial decisions to reduce the cost of providing free access to ARVs, such as price negotiations of patented drugs with multinational pharmaceutical companies and, for the first time in Latin America, launched compulsory licensing (CL). This study compares the price negotiations of LOP/r and EFV, as well as the underlying mechanisms that may explain the decision to grant CL for EFV but not for LOP/r.
**Methods:** We used a chronological policy-analysis narrative. This study profits from first-hand empirical data collected in 2012/15, including governmental documents (e.g. legislation, congressional speeches and debates, etc.), newspaper articles, and 20 interviews with key informants.
**Results:** In 2003, LOP/r and EFV, represented 37% of total ARVs expenditure in Brazil. Between 2001 and 2005, procurement of LOP/r surpassed EFV in terms of costs and purchase volume. LOP/r was crucial for 2nd line treatment as it reduces the number of pills/per day and side effects. Given the costs associated with LOP/r and EFV and the failed negotiations with their producers, the MoH declared both medicines "of public interest" in 2005 and 2007, respectively. However, CL was issued just for EFV. The negotiations of LOP/r were conducted with little participation of civil society and public laboratories, and in a context of institutional transition in the MoH. On the other hand, the negotiation of EFV was coordinated by MoH industrial policy experts, by the then newly created Secretary of Science, Technology and Strategic Health Inputs, in close collaboration with civil society and local producers. After importing generic copies of EFV, Brazil developed an innovative public-private partnership to produce EFV domestically.
**Conclusions:** The generalizability of these findings depend on other countries' intellectual property regimes and differing capacities for local drug production. Lessons from Brazil's experience shows that civil society support has been key in price negotiations and that cooperation between local manufactures may foster new opportunities for generic ARVs development.

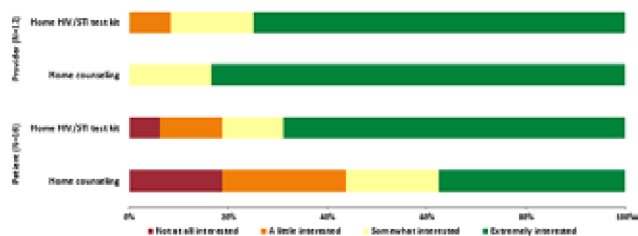
## FRAE01 PREPPED FOR PREP

## FRAE0101

### AN EXPLORATORY ASSESSMENT OF THE FEASIBILITY AND ACCEPTABILITY OF HOME-BASED SUPPORT TO STREAMLINE HIV PRE-EXPOSURE PROPHYLAXIS (PREP) DELIVERY

A. Siegler[1], A. Liu[2], K. Mayer[3], K. Thure[1], R. Fish[3], E. Andrew[2], M. Gelman[3], P. Sullivan[1]
*[1]Emory University, Epidemiology, Atlanta, United States, [2]San Francisco Department of Public Health, Bridge HIV, San Francisco, United States, [3]The Fenway Institute, Boston, United States*
*Presenting author email: asiegle@emory.edu*

**Background:** PrEP is highly efficacious in preventing HIV transmission. The US Centers for Disease Control and Prevention, the Southern African HIV Clinicians Society, and the European AIDS Clinical Society recommend quarterly HIV and periodic STI screening for those on PrEP. The burden of indefinite PrEP follow-up visits is high for providers, patients, and the healthcare system. A home-based testing system could greatly streamline PrEP delivery and facilitate rapid scale-up.
**Methods:** We conducted in-depth interviews and exit surveys in San Francisco, Boston, and Atlanta with 12 medical providers and 16 participants, exploring the acceptability of a PrEP home care system that would be used in lieu of 1-3 of the quarterly provider visits per year. Participants were shown kit mock-ups and self-collected all specimens. Providers were shown laboratory and behavioral results from mock-ups. We discussed with all their interest in, willingness to use, and concerns regarding a home care kit for PrEP. We also conducted a brief exit survey.
**Results:** Participants and providers had favorable reactions to the kit, with some participants less enthusiastic about home counseling because they felt it unnecessary (Figure). 15/16 participants were able to self-collect all specimens necessary to conduct standard tests for HIV, STI, and renal function. Across specimen collection methods, only 2/16 participants rated any as "difficult" or "very difficult." One representative participant noted, "I would highly encourage this to be out in the world" and a provider noted, "I think it's great ... we have to decentralize (care)."
**Conclusions:** There is strong interest in a PrEP home care system from both MSM on PrEP and providers prescribing PrEP. With a mocked-up kit, specimen collection was feasible and largely acceptable. Future research is needed to pilot test the home care kit in an unsupervised setting to determine adequacy of sample collection and acceptability of the overall home care system.



*[Provider and patient interest in a PrEP home testing system and home counseling system]*

## FRAE0102

### GOOD ADHERENCE IN TRIAL OF TOPICAL PRE-EXPOSURE PROPHYLAXIS INTEGRATED INTO FAMILY PLANNING SERVICES

L.E. Mansoor[1], Q. Abdool Karim[1], K.T. Mngadi[1], C. Montague[1], N. Yende-Zuma[1], H. Dawood[1], T.N. Gengiah[1], N. Samsunder[1], C. Baxter[1], J.L. Schwartz[2], G.F. Doncel[2], F. Ntombela[1], A. Grobler[1], S.S. Abdool Karim[1]
*[1]Centre for the AIDS Programme of Research in South Africa (CAPRISA), Durban, South Africa, [2]CONRAD, Arlington, United States*
*Presenting author email: leila.mansoor@caprisa.org*

**Background:** Evidence guiding scale-up of pre-exposure prophylaxis (PrEP) in African women is required for implementation of new WHO guidelines. The CAPRISA 008 trial, which provided participants from CAPRISA 004 with post-trial access to tenofovir gel, assessed adherence and effectiveness of PrEP provision integrated into family planning (FP) services.
**Methods:** CAPRISA 008 was a 36-month, two-arm, open-label, randomized controlled, non-inferiority trial. Eligible women (n=372) were randomly assigned to receive tenofovir gel at clinical trial clinics (n=183) or at FP clinics (n=189). Adherence, retention, HIV incidence and service preference were assessed.
**Results:** At baseline, women assigned to trial and FP clinics were similar and study retention rates were 92.3% and 92.1% respectively. Adherence (% reported sex acts covered by 2 gel doses) was 73.9% (95% confidence interval (CI): 70.7-77.1) in trial clinics and 79.9% (CI: 76.7-83.2) in FP clinics. Higher adherence (mean difference=6.0% [CI: 1.5-10.6]) in FP clinics met the pre-defined non-inferiority criteria. Mean monthly sex acts and returned empty applicators were 4.5 (CI: 4.0-5.0) and 6.0 (CI: 5.5-6.5) in trial clinics compared to 3.6 (CI: 3.2-4.1) and 5.2 (CI: 4.7-5.7) in FP clinics respectively. Genital tenofovir was detected at one year in 68/156 women (43.6%; CI: 36.1-51.4) at trial clinics and 62/157 women (39.5%; CI: 32.2-47.3) at FP clinics (p=0.492). Adjusting for peri-coital gel use, genital tenofovir was detected in 58.3% of 139 women reporting sex within 7 days but only in 28.2% of 174 women reporting no recent sex. HIV incidence was 3.6 per 100 women years (wy) (CI: 1.9-6.3) in trial clinics and 3.5 per 100 wy (CI: 1.8-6.0) in FP clinics (p=0.928). Overall HIV incidence rate was 44% lower than in an age-comparable historical CAPRISA 004 placebo control group (3.5 vs 6.2 per 100 wy). At study exit 75.1% and 80.3% of women from trial and FP clinics expressed preference for receiving PrEP from FP clinics.
**Conclusions:** Integration of topical PrEP into FP services for African women is feasible, acceptable and achieves adherence equivalent to a clinical trial setting, providing evidence for PrEP scale-up using this strategy for this challenging high-priority population.

## FRAE0103

### EXPERIENCES OF PREP DISCONTINUATION IN AFRICAN HIV SERODISCORDANT COUPLES: QUALITATIVE RESULTS FROM THE PARTNERS DEMONSTRATION PROJECT

M.A. Wyatt[1,2], E.E. Pisarski[1], M. Tam[1], E. Nakku-Joloba[3,4], T.R. Muwonge[5], E. Katabira[6], N.C. Ware[1]
*[1]Harvard University, Medical School, Global Health and Social Medicine, Boston, United States, [2]Harvard Global, Cambridge, United States, [3]Makerere University College of Health Sciences, School of Public Health, Epidemiology and Biostatistics, Kampala, Uganda, [4]Mulago Hospital, STD Clinic/ Ward 12, Kampala, Uganda, [5]Infectious Diseases Institute, Kampala, Uganda, [6]Makerere University College of Health Sciences, School of Medicine, Medicine, Kampala, Uganda*
*Presenting author email: monique_wyatt@hms.harvard.edu*

**Background:** Public health programs worldwide are considering new WHO guidelines recommending antiretrovirals (ART) as pre-exposure prophylaxis (PrEP) for all individuals at substantial risk for HIV. Unlike ART, PrEP is taken by uninfected individuals during limited periods of high risk exposure, and discontinued when transmission risk is reduced. Understanding user experiences of PrEP uptake and discontinuation will inform future implementation efforts. Using qualitative data from the Kampala, Uganda site of the Partners Demonstration Project, we describe user preferences for PrEP use and discontinuation.
**Methods:** The Partners Demonstration Project was a prospective implementation study that evaluated an integrated strategy for delivering PrEP and ART to HIV serodiscordant couples. HIV-uninfected partners discontinued PrEP when ART had been taken by infected partners for six months. In-depth interviews were conducted with 48 serodiscordant couples from the Project. Interview topics included understandings of PrEP, adherence, and experiences of PrEP use and discontinuation. Interviews were inductively analyzed to identify themes reflecting PrEP use and discontinuation. Categories representing themes were developed and organized sequentially to describe user preferences for discontinuing PrEP.
**Results:** Initially, participants expressed doubts about taking PrEP. However, as PrEP use became routine, users gained confidence in PrEP's capacity to protect them against HIV infection. PrEP gave uninfected individuals a newfound sense of control over their prevention methods, and ultimately, their health. When PrEP was discontinued, some users felt once again vulnerable to HIV acquisition. Reasons for this heightened sense of risk included lack of confidence in ART to prevent transmission, doubts about partners' adherence to ART and fear of risk through unprotected sex outside the partnered relationship. Most users preferred to remain on PrEP or be given the opportunity to reinitiate PrEP in the future.
**Conclusions:** Uninfected partners in HIV serodiscordant relationships offered PrEP as part of an integrated PrEP and ART delivery strategy preferred to exercise control over their prevention choices. Resistance to discontinuing PrEP may present a challenge to efficient and effective implementation of PrEP in public health settings of resource scarcity. Messaging about PrEP discontinuation should include explanations of how ART prevents HIV transmission after PrEP is discontinued, while also addressing user concerns about risk.

## FRAE0104

### ELIMINATING BARRIERS TO INCREASE UPTAKE OF PREP IN A COMMUNITY-BASED CLINIC IN SAN FRANCISCO

S. Gibson[1], P.-C. Crouch[1], J. Hecht[1], J. Gagliano[1], T. Patriarca[1], J. Auerbach[2], R. Grant[1], W. Lyon[1], C. Hall[1]
*[1]San Francisco AIDS Foundation, San Francisco, United States, [2]University of California, San Francisco, United States*
*Presenting author email: pcrouch@sfaf.org*

**Background:** The US Food and Drug Administration approved Pre-Exposure Prophylaxis (PrEP) for HIV prevention in July 2012. As demand for PrEP increased in San Francisco, barriers to access surfaced: lack of provider knowledge of PrEP, finding a culturally competent provider, issuance of same-day prescriptions, and coverage of laboratory and medication costs. San Francisco AIDS Foundation (SFAF) launched a PrEP program in 2014 to address barriers, increase access, and reduce new HIV infections among MSM.
**Description:** The program, led by Nurse Practitioners, leverages Registered Nurses and volunteer HIV test counselors (HTC) trained to provide culturally competent care. Clients self-refer or are referred by HTC. NPs perform a full medical evaluation and PrEP counseling, addressing adherence and stigma. Utilizing point-of-care HIV and chemistry testing, clients initiate PrEP the same-day. Follow-up visits are conducted by RNs, providing ongoing PrEP and adherence counseling. Abnormal lab results are referred to the NP for evaluation. MDs are available for consultation as needed.
Benefits Navigators work with medically eligible clients to access PrEP through applying for full-assistance programs, activating copay cards, and initiating health insurance. Navigators interface with insurance companies when clients are met with barriers. There is no cost for the lab work and evaluation services. With the available benefit programs, most clients obtain PrEP at no or very low cost.
**Lessons learned:** Between November 2014 and January 2016, 797 participants enrolled in the program and 95% received a prescription for Truvada. 89% reported condomless anal sex in the past 12-months. 69% were Caucasian, 22% Latino/Hispanic, 6% African-American, and 11% Asian/Pacific Islander. Mean age was 34.4 years. 25% were treated for an STI at enrollment.
There were no new HIV infections among participants in the PrEP program. Comparatively, the clinic diagnosed 54 new HIV infections among men not enrolled in the program during the same time period.
**Conclusions/Next steps:** A community-based organization, led by NPs, RNs, benefits navigators, and HTCs can determine if clients are medically eligible to begin PrEP, assist with identifying and addressing barriers to accessing PrEP so clients can safely initiate medication the same-day, contributing to fewer HIV diagnoses among MSM in San Francisco.

## FRAE0105

### EXPANDED PREP IMPLEMENTATION IN COMMUNITIES IN NSW, AUSTRALIA (EPIC-NSW): EVIDENCE-BASED IMPLEMENTATION STUDY

I. Zablotska[1], A.E. Grulich[1], R. Guy[1], J. Amin[1], C. Selvey[2], H.-M. Schmidt[2], K. Price[3], D. Cooper[1], EPIC-NSW Study Group
*[1]University of New South Wales (UNSW), The Kirby Institute, Sydney, Australia, [2]NSW Ministry of Health, North Sydney, Australia, [3]ACON, Sydney, Australia*
*Presenting author email: izablotska@kirby.unsw.edu.au*

**Background:** In New South Wales (NSW) Australia, the new HIV Strategy 2016-20 aims to virtually eliminate HIV transmission by 2020 and HIV pre-exposure prophylaxis (PrEP) is identified as a key tool. A partnership of key NSW government, community, medical and research organisations has taken an innovative approach to rapid scale-out of PrEP implementation and evaluating the strategy. We describe PrEP implementation issues, innovative solutions and evidence-based design of the NSW PrEP implementation study.
**Description:** The number of people meeting the PrEP-eligibility risk criteria, defined in the existing NSW PrEP guidelines, was estimated using data from previous Australian studies to be 3700. Calculations of HIV transmission probability by behavioural risk factor estimated that new HIV diagnoses in NSW would be reduced by ~50% in 12 months by preventing infection in these people with PrEP. The NSW partnership designed the Expanded PrEP Implementation in Communities in NSW (EPIC-NSW) study which aims to provide PrEP to all 3700 people and evaluate PrEP implementation within the new HIV strategy. The study features:
1) large-scale, rapid roll-out (March-September 2016);
2) real-life implementation (service procedures per guidelines);
3) innovative data collection with minimal burden on health services (extraction and ongoing linkage of data from clinical data collection systems);
4) cumulative follow-up of 7400 person-years, and
5) assessment of the trial impact on HIV incidence in the cohort and the general population.
We will report on EPIC-NSW design features and roll-out and estimated impact on HIV incidence.
**Lessons learned:** Mobilisation and partnership of the entire HIV sector is crucial for rapid PrEP roll-out and beneficial for establishing access to PrEP. An evidence-based approach, community mobilisation and creative use of available data sources enable efficient and effective implementation and evaluation of public health strategies.
**Conclusions/Next steps:** EPIC-NSW is the only PrEP implementation trial internationally aimed at monitoring PrEP impact at the population level. Data from this study will evaluate the state HIV prevention strategy and PrEP contribution in reaching the goal of virtually eliminating HIV by 2020. The design and results of this trial will inform policy, investment, community education and interventions in other similar settings internationally.

## FRAE0106LB

### OPTIMIZING THE FREQUENCY OF KIDNEY SAFETY MONITORING IN HIV-UNINFECTED PERSONS USING DAILY ORAL TENOFOVIR DISOPROXIL FUMARATE PRE-EXPOSURE PROPHYLAXIS

K. Mugwanya[1], R. Heffron[1], C. Wyatt[2], N. Mugo[3], C. Celum[1], J. Kiarie[4], E. Katabira[5], A. Ronald[6], J. Baeten[1], for the Partners PrEP Study and Partners Demonstration Project Teams
*[1]University of Washington, Global Health, Seattle, United States, [2]Icahn School of Medicine at Mount Sinai, Medicine, New York, United States, [3]Kenya Medical Research Institute, Nairobi, Kenya, [4]University of Nairobi, Obstetrics and Gynecology, Nairobi, Kenya, [5]Makerere University, Medicine, Kampala, Uganda, [6]University of Manitoba, Winnipeg, Canada*

**Background:** Optimal kidney safety monitoring is a key knowledge gap for wide-scale implementation of tenofovir-based pre-exposure prophylaxis (PrEP) for HIV prevention. We compared 6-monthly to 3-monthly kidney monitoring for the occurrence of clinically relevant decline in creatinine clearance (CrCl; < 60 mL/minute).
**Methods:** Data were from two prospective PrEP studies in Kenya and Uganda: the Partners Demonstration Project (n=955), a recently completed open-label study that used 6-monthly serum creatinine monitoring to estimate creatinine clearance, and the Partners PrEP Study, a placebo-controlled trial that used 3-monthly monitoring (n=4404 receiving PrEP, n=1573 receiving placebo). CrCl ≥60 mL/minute was required for enrollment in both studies.
**Results:** With 6-monthly monitoring, the cumulative proportion of participants with unconfirmed CrCl < 60 mL/minute was 0.7% at Month 6 and 1.1% at Month 12, affecting 10 (1%) participants; 2 of these (0.2% overall) had CrCl < 60 mL/minute confirmed on repeat testing, both at Month 6. With quarterly monitoring, the cumulative proportion of participants with unconfirmed CrCl < 60 mL/minute was 1.4% at Month 3, 2.0% at Month 6, and 2.7% at Month 12, affecting 120 (2.7%) participants; 29 of these (0.7%, overall) had CrCl < 60 mL/minute confirmed on repeat testing [cumulative proportion: 16 (0.4%), 21 (0.5%), and (0.7%) at Months 3, 6, and 12, respectively]. The corresponding cumulative frequency of confirmed CrCl < 60 mL/minute in the placebo group was 0.3% at Month 3 and 0.3% at Month 6. Of the 29 participants experiencing confirmed declines in the Partners PrEP Study, 28 (97%) had baseline CrCl 60-90 mL/minute, 19 (66%) were aged ≥45-years, and 16(55%) had baseline weight ≤55 kg (adjusted p< 0.05).
**Conclusions:** In these two large cohorts of HIV-uninfected persons using PrEP, the occurrence and pattern of clinically relevant decline in CrCl were not qualitatively different based on quarterly or 6-monthly CrCl monitoring. Most measurements of CrCl < 60 mL/minute did not confirm on repeat testing. These data suggest that 6-monthly CrCl monitoring could be equally safe and require fewer resources for a majority of persons receiving PrEP, with more frequent monitoring potentially indicated for those with specific risk factors (older age, lower baseline CrCl, lower weight).

### SIX-MONTHLY APPOINTMENTS AS A STRATEGY FOR STABLE ANTIRETROVIRAL THERAPY PATIENTS: EVIDENCE OF ITS EFFECTIVENESS FROM SEVEN YEARS OF EXPERIENCE IN A MÉDECINS SANS FRONTIÈRES SUPPORTED PROGRAMME IN CHIRADZULU DISTRICT, MALAWI

C. Cawley[1], S. Nicholas[2], E. Szumilin[3], S. Perry[4], I. Amoros Quiles[4], C. Masiku[4], A. Wringe[1]
*[1]London School of Hygiene & Tropical Medicine, London, United Kingdom, [2]Epicentre (Médecins Sans Frontières), Paris, France, [3]Médecins Sans Frontières, Paris, France, [4]Médecins Sans Frontières, Lilongwe, Malawi*
*Presenting author email: alison.wringe@lshtm.ac.uk*

**Background:** HIV clinics are struggling to absorb new patients in Malawi, and over-burdened health-workers and long waiting times can be detrimental to adherence. We evaluated a strategy of six-monthly appointments (SMA) for stable ART patients in Chiradzulu District, Malawi, where Medecins sans Frontieres is supporting the Ministry of Health's HIV programme.
**Methods:** Stable patients (aged ≥15, on first-line ART ≥12 months, CD4 count ≥300 and without opportunistic infections or ART intolerance, not pregnant or breast-feeding) were eligible for clinical assessments every 6 months instead of 1-2 months at 11 HIV clinics. Early SMA enrolees were defined as patients who started SMA within 6 months of eligibility, late SMA enrolees were those starting >6 months after eligibility.
Kaplan-Meier methods were used to calculate cumulative probabilities of death and loss to follow-up (LTFU) among those eligible for SMA, stratifying by SMA enrolment status and baseline characteristics. Cox regression, using SMA enrolment as a time-dependent variable, was used to estimate crude and adjusted hazard ratios for the association between SMA and death or LTFU.
**Results:** Between 2008 and 2015, 18,957 individuals were eligible for SMA (contributing 43,888 person-years of observation), of whom 15,308 (80.8%) ever enrolled. Median time from SMA eligibility to enrolment was 6 months (interquartile range 0-17 months). The cumulative probability of death or loss to follow-up five years after first SMA eligibility was 56.3% (95% CI: 52.4-60.2%) among those never SMA enrolled; 13.9% (95% CI: 12.5-15.6%) among early SMA enrolees and 8.1% (95% CI 7.2-9.0%) among late SMA enrolees.
After adjusting for age, gender, year of first SMA eligibility, and other baseline variables (CD4 count, months on ART and in cohort), a significantly higher rate of death or LTFU was observed among patients during non-SMA periods compared to those during SMA periods (adjusted rate ratio: 1.87, 95% CI 1.68-2.08, p< 0.001).
**Conclusions:** SMA represents a promising strategy for managing stable ART patients and should be rolled out, particularly with "test and treat" on the horizon, which will further stretch HIV clinics. However, further implementation research is needed, and selection biases which may explain poor retention among those eligible but never SMA-enrolled should be investigated.

## FRAE0202

### IMPROVED SURVIVAL AND RETENTION IN HIV TREATMENT AND CARE: THE VALUE OF COMMUNITY ART GROUPS FOR HIV PATIENTS ON ART IN RURAL NORTHERN MOZAMBIQUE

L.F. Jefferys[1], J. Hector[1], M.A. Hobbins[2], J. Ehmer[2], N. Anderegg[3]
*[1]SolidarMed, Pemba, Mozambique, [2]SolidarMed, Lucern, Switzerland, [3]University of Bern, Institute of Social and Preventive Medicine, Bern, Switzerland*
*Presenting author email: l.jefferys@solidarmed.ch*

**Background:** Community ART Groups (CAG) allow patients to pick up medication on a rotational basis and have been implemented as a strategy to improve adherence of HIV-positive patients on combination antiretroviral therapy (ART) in Mozambique. Participation in a CAG is voluntary but guided by inclusion criteria. The purpose of this analysis was to review the association between baseline characteristics and joining a CAG, and to examine the benefit of CAGs on mortality and lost to follow-up (LTFU).
**Methods:** This observational study was conducted in Ancuabe, Mozambique. We included all HIV-positive adults (≥15 years) starting ART 2010-2015, that met the CAG eligibility criteria (non-pregnant, follow-up ≥6 months). Multivariable logistic regression was used to examine associations between joining a CAG and the baseline characteristics sex, age, WHO stage and CD4 cell count at baseline as well as the total days late for appointments within the first six months before being eligible for CAG-participation. Mortality rates and the risk of being LTFU between CAG-participants and non-participants were examined using cox proportional hazards regression, adjusted for all baseline covariates.
**Results:** 1306 patients were included (62.9% female) with a median CD4 cell count of 257 cells/µL (interquartile range [IQR] 149-352), a median age of 33.1 years (IQR 26.2-41.3) and a median of 23 days late within first six months (IQR 6-49). During 2866 person-years, 10.5% of patients died, 22.6% were LTFU and 13.8% joined a CAG. The odds of joining a CAG were increased by female sex (odds ratio [OR] 1.73, 95%-confidence interval [CI] 1.21-2.46) and an older age (OR 1.02 95%CI 1.01-1.03); no other baseline covariate showed a significant association with CAG-participation. CAG-participation reduced the mortality rate by 55.1% (adjusted hazard ratio [aHR] 0.449, 95%CI 0.264-0.762), and the risk of being LTFU by 84.3% (aHR 0.157, 95%CI 0.086-0.288).
**Conclusions:** Patients that were in a CAG did not have significantly different baseline CD4 cell count or adherence to appointments in the first 6 months of treatment than those not entering a CAG, however despite this CAG-participation remarkably lowered the risk of both being LTFU and dying. These results support the implementation of CAGs in rural settings.

### SEARCH STREAMLINED HIV CARE IS ASSOCIATED WITH SHORTER WAIT TIMES BEFORE AND DURING PATIENT VISITS IN UGANDAN AND KENYAN HIV CLINICS

S.B. Shade[1], W. Chang[2], J.G. Kahn[2], D. Mwai[3], F. Mwangwa[4], D. Kwarisiima[5], A. Owaraganise[4], J. Ayieko[6], D.V. Havlir[7], M.R. Kamya[4,5], E.D. Charlebois[1], M.L. Petersen[8], T.D. Clark[7], E.A. Bukusi[6], C.R. Cohen[9], V. Jain[7]
*[1]University of California, San Francisco, Center for AIDS Prevention Studies, San Francisco, United States, [2]University of California, Institute for Health Policy Studies, San Francisco, United States, [3]University of Nairobi, School of Economics, Health Economics Unit, Nairobi, Kenya, [4]Infectious Diseases Research Collaboration, Kampala, Uganda, [5]Makerere University, Kampala, Uganda, [6]Kenya Medical Research Institute, Nairobi, Kenya, [7]University of California, HIV, ID and Global Medicine, San Francisco, United States, [8]University of California, Berkeley, United States, [9]University of California, Bixby Center for Global Reproductive Health, Department of Obstetrics, Gynecology & Reproductive Sciences, San Francisco, United States*
*Presenting author email: starley.shade@ucsf.edu*

**Background:** Long patient wait time is reported as an operational barrier to retention in HIV care in resource limited settings. Patients may perceive waiting several hours to see a clinician for only a few minutes as an unacceptable opportunity cost. The SEARCH HIV test-and-treat cluster randomized trial (NCT:01864603) in 32 rural Ugandan and Kenyan communities is implementing a “streamlined” HIV care delivery model in government supported clinics that aims to reduce wait times to address this problem.

**Methods:** We examined differences in patient wait time before and during clinical visits conducted under “streamlined” and standard government HIV clinic care. Components of streamlined HIV care aimed at reducing wait time included:
(1) nurse-driven triage for patient evaluation;
(2) 3-month ART refills (vs. 1 or 2 month) for stable patients; and
(3) consolidation of services at encounter (ART, phlebotomy, medication dispensing).
We conducted a time-and-motion study of patient clinical visits. We compared mean patient wait time before and during clinical visits among SEARCH study patients with CD4 >500 cells/uL (n=119), SEARCH patients with CD4 < 500 cells/uL (n=234) and other government clinic patients (n=745).

**Results:** Mean visit length was over one hour shorter among SEARCH patients with CD4 >500 cells/uL and SEARCH patients with CD4 < 500 cells/ uL compared to other government clinic patients, even though mean time with providers was similar between groups (see Table). This difference was due to wait times that were >30 minutes shorter both before and during visits. Time spent receiving health education, HIV care, laboratory services, medication dispensing and other services did not differ between patient groups.

| | SEARCH Patients CD4>=500 (hours: minutes) mean (SD) | SEARCH Patients CD4<500 (hours: minutes) mean (SD) | Other government clinic patients (hours: minutes) mean (SD) |
|---|---|---|---|
| Total visit length | 1:08 (1:02) | 1:13 (1:03) | 2:35 (1:33) |
| **Wait time before visit** | **0:21 (0:36)** | **0:28 (0:43)** | **1:13 (1:13)** |
| **Wait time during visit** | **0:19 (0:30)** | **0:23 (0:35)** | **0:58 (1:00)** |
| **Time receiving services** | **0:27 (0:24)** | **0:22 (0:20)** | **0:24 (0:29)** |
| --Health education | <0:01 (0:03) | 0:01 (0:07) | 0:08 (0:21) |
| --HIV care | 0:18 (0:18) | 0:12 (0:11) | 0:08 (0:13) |
| --Laboratory services | 0:03 (0:09) | 0:01 (0:08) | 0:01 (0:08) |
| --Medication dispensing | 0:01 (0:02) | 0:03 (0:07) | 0:04 (0:10) |
| --Other | 0:03 (0:09) | 0:03 (0:09) | <0:01 (0:05) |

*[Mean wait time and time receiving services by patient types]*

**Conclusions:** Streamlined HIV care delivery led to shortened wait times both before and during HIV clinic visits. These efficiency improvements may contribute towards improved retention in HIV care.

## FRAE0204

### IMPLEMENTATION OF COMBINATION ART REFILLS MODELS IN RURAL SWAZILAND

L. Pasipamire[1], B. Kerschberger[1], I. Zabsonre[1], S. Ndlovu[1], G. Sibanda[2], S. Mamba[3], S. Mazibuko[4], N. Lukhele[4], S.M. Kabore[5], B. Rusch[6]
*[1]Médecins Sans Frontières (MSF), Nhlangano, Swaziland, [2]Médecins Sans Frontières (MSF), Matsanjeni, Swaziland, [3]Médecins Sans Frontières (MSF), Hlatikulu, Swaziland, [4]Swaziland National AIDS Programme, Mbabane, Swaziland, [5]Médecins Sans Frontières (MSF), Mbabane, Swaziland, [6]Médecins Sans Frontières (MSF), Geneva, Switzerland*
*Presenting author email: msfch-nhlangano-datamanager@geneva.msf.org*

**Background:** The WHO advocates for differentiated HIV care and considers a broad range of community-based care models for patients stable on anti-retroviral therapy (ART). These care models aim to better respond to patient needs and to alleviate pressure on health systems caused by rapidly growing patient numbers. Most settings, however, utilized a single community-based care model only. We operationalize a combination of community ART care models in public health sector and assessed early outcomes.

**Methods:** Three community ART delivery care models were deployed in the rural Shiselweni region (Swaziland), from 02/2015 to 12/2015. First, Treatment Clubs (TC) are groups of 30 patients stable on ART who meet every 3 months at a secondary health facility for patient education and drug-refills. Second, Community ART Groups (CAG) comprise a maximum of 6 patients who alternate to attend the primary health clinic for consultation and pick up drugs for the other group members. Third, Comprehensive Outreach Care (COC) integrates drug refills into existing mobile clinic outreach activities for geographically isolated communities. We described baseline factors at enrolment,and 6 month retention in community care models and proportion of patients transferred back to routine clinical care.

**Results:** On average, 47 patients enrolled into community-ART care each month: 51.1% into TC
(242 patients in 8 groups), 34.0% in CAG (164 patients in 38 groups) and 14.9% in COC (65 patients in 2 remote communities). All patients had a VL< 1,000 copies/ml, the median CD4 was 512 (TC), 528 (CAG) and 657 (COC) cells/µl (p=0.27), the median age was 40, 40 and 45 years (p=0.11), and 74.8%, 66.5% and 64.6% were females (p=0.03). Retention in care after 6 months was highest in TC (97.5%) when compared to CAG (79.2%) and COC (78.4%) (p< 0.01). 53/471 patients (11.3%) returned back to and were retained in routine clinic care and one (0.21%) was recorded as death in COC.

**Conclusions:** Concurrent implementation of three community ART care models was feasible. Although a proportion of patients returned back to clinic care, overall ART retention was high and should encourage program managers to apply differentiated care models adapted to their specific setting.

## FRAE0205

### PROVISION OF STREAMLINED HIV CARE ASSOCIATED WITH REDUCED ECONOMIC BURDEN OF CARE-SEEKING AMONG HIV-INFECTED ADULTS

A. Jakubowski[1], J. Kabami[2], D. Mwai[3], K. Snyman[4], T. Clark[4], J. Ayieko[5], A. Owaraganise[6], F. Mwangwa[6], M. Petersen[7], C. Cohen[4], E. Bukusi[5], M. Kamya[8], D. Havlir[4], E. Charlebois[4], H. Thirumurthy[1]
*[1]University of North Carolina at Chapel Hill, Department of Health Policy and Management, Chapel Hill, NC, United States, [2]Infectious Diseases Research Collaboration, Mbarara, Uganda, [3]University of Nairobi, Nairobi, Kenya, [4]University of California, San Francisco, United States, [5]Kenya Medical Research Institute, Nairobi, Kenya, [6]Infectious Diseases Research Collaboration, Kampala, Uganda, [7]University of California, Berkeley, United States, [8]Makerere University College of Health Sciences, Kampala, Uganda*
*Presenting author email: harsha@unc.edu*

**Background:** HIV-infected adults and their households often face a large economic burden stemming from out-of-pocket health expenditures, clinic transportation costs, and lost from work or usual household activities. In Kenyan and Ugandan communities that began receiving streamlined HIV care (appointment reminders, quarterly visits with patient-centered care providing reduced waiting and overall visit duration) as part of the SEARCH test-and-treat trial, we examined changes in costs incurred by HIV-infected adults over a one year period.

**Methods:** Data were obtained through household surveys administered to a random sample of HIV-infected adults in 32 communities participating in the SEARCH trial (NCT01864603). In the 16 SEARCH intervention communities employing streamlined HIV care, we compared out-of-pocket costs (in US$) and time costs incurred by HIV-infected patients receiving antiretroviral therapy (ART) under standard HIV care at baseline (n=1,230) to costs incurred by a larger sample of patients receiving ART, including those with high CD4 cell counts, under streamlined HIV care one year later (n=1,589). We also examined changes in these costs separately in the three regions of Kenya and Uganda where the SEARCH trial is occurring. Comparison of means was performed using two-sided *t*-tests.

**Results:** Patients receiving ART under streamlined care spent less than half the time seeking and receiving healthcare than adults receiving ART under standard care (4.40 hours per month at baseline vs. 1.78 hours per month at follow-up, p< 0.001). Time spent away from employment or usual activities was also significantly reduced, from 13.0 hours per month at baseline to 8.17 hours at follow-up (p< 0.01). The reductions in time costs were largest in SEARCH intervention communities in Uganda compared to Kenya. Out-of-pocket healthcare and transportation costs incurred by patients did not differ significantly between baseline and one year later ($2.98 and $2.46 in past month at baseline and one year, respectively).
**Conclusions:** Following the introduction of streamlined care for HIV-infected individuals, there was a significant reduction in time spent seeking healthcare and being away from employment and other usual activities. Streamlined care provision may partially reduce the economic burden faced by individuals receiving HIV care and contribute to improvements in patients' employment outcomes and economic well-being.

### DISCONTINUATION FROM COMMUNITY-BASED ANTIRETROVIRAL ADHERENCE CLUBS IN GUGULETHU, CAPE TOWN, SOUTH AFRICA

A. Nofemela[1,2], C. Kalombo[3], C. Orrell[4], L. Myer[1,2]
*[1]University of Cape Town, Department of Epidemiology and Biostatistics, Cape Town, South Africa, [2]University of Cape Town, Centre for Infectious Diseases Epidemiology & Research, Cape Town, South Africa, [3]Western Cape Government, Department of Health, Cape Town, South Africa, [4]Desmond Tutu HIV Foundation, Cape Town, South Africa*
*Presenting author email: andile48@gmail.com*

**Background:** Community-based adherence clubs are an attractive model of care for the growing number of stable patients on antiretroviral therapy (ART) in high-burden settings, but little is known about the reasons patients exit these clubs over time.
**Methods:** We used routinely-collected club data linked to a large primary health-care (PHC) clinic. These clubs enrol stable ART patients (>6-12 months on ART with viral suppression and CD4>200) into a lay-counsellor-led programme of 2-4 monthly ART collection, with adherence support, at a community venue. Viral load (VL) monitoring is conducted annually. In analysis, we examined reasons for discontinuation from clubs over time, while proportional hazards models were used to examine risk factors for lost to follow-up (LTF), defined as >6 months without a club visit before the end of November 2015 without an alternate outcome.
**Results:** Between June 2012 and October 2015, 3359 patients entered a club (median age, 37 years; 71% female; median duration of ART use, 3.5 years). 4% of all club visits resulted in a referral of patients by counsellors back to the PHC for review by a nurse or doctor; these were usually due to a clinical comorbidity (primarily TB, diabetes or hypertension), defaulting ART, or elevated VL. Rates of death, transfer out, and LTF from the clubs were 0.3, 0.9, and 9.4 per 100 person-years in the clubs, respectively. After three years of club operations, 26% of patients were LTF; independent of gender, LTF was increased in patients < 25 years of age (hazard ratio, 1.7; 95% CI: 1.2-2.5). In the subset of patients who had VL monitoring, prior raised VL in the clubs was strongly predictive of subsequent LTF (HR, 4.4; 95% CI: 2.9-6.7). There was no association between time on ART before entry into clubs and either referral back to clinic or LTF (p=0.921).
**Conclusions:** Referrals of stable ART patients from counsellor-led, community-based adherence clubs back to PHC are an important feature of community-based care, and expanding this model of care to include common co-morbidities may reduce these referrals. While the majority of patients are retained effectively in clubs, LTF is an ongoing concern.

### WHOLE-BODY SPECT IN VIVO IMAGING REVEALS DELAYED RECONSTITUTION OF LYMPH-NODES, BUT NOT SPLEEN, CD4 POOLS IN LONG-TERM CART TREATED ANIMALS

M. Di Mascio[1], S. Srinivasula[2], I. Kim[3], P. DeGrange[4], A. St. Claire[1], E. Gabriel[1], C. Paik[5], H.C. Lane[6]
*[1]Division of Clinical Research, NIAID, NIH, Bethesda, United States, [2]Biostatistics Research Branch, Leidos Biomedical Research, Inc., FNLCR, Frederick, United States, [3]Applied/ Developmental Research Directorate, Frederick National Laboratory, Frederick, United States, [4]Integrated Research Facility, NIAID, NIH, Frederick, United States, [5]Radiopharmaceutical Laboratory, Nuclear Medicine, Radiology and Imaging Sciences, Clinical Center, NIH, Bethesda, United States, [6]Laboratory of Immunoregulation, NIAID, NIH, Bethesda, United States*
*Presenting author email: mdimascio@niaid.nih.gov*

**Background:** Fewer than 2% of the total-body-pool of CD4+ T lymphocytes reside in the peripheral-blood (PB) highlighting the need for techniques that provide a more comprehensive evaluation of the immune system. In previous work we demonstrated the feasibility of imaging the total-body-CD4-pool in nonhuman-primates and noted that the CD4-pool of splenic lymphocytes may increase or decrease by up to 30% within 4 weeks of initiation or interruption of cART, respectively. The present study was designed to more carefully delineate the relationships between viremia, PB CD4-count and total-body-CD4+ pool.
**Methods:** A group of 30 rhesus macaques (uninfected and SIV/SHIV infected with PB-CD4 count range (7-1718) cells/µl) were subjected to a total of 59 SPECT imaging studies, using the F(ab')2 fragment of anti-CD4 labeled with Tc-99m. Six of the SIV-infected animals had been treated with cART for more than 5 months with SIV RNA levels < 30 copies/ml in 5 animals and 950 copies in the other. Linear mixed-effect models with random intercepts were used for longitudinal analyses.
**Results:** A repeated measurements univariate analysis of all animals revealed that both PB-CD4-count and plasma-viral-load were significantly associated with the size of the splenic CD4 pool (P< 0.001). The PB-CD4-count was also univariately associated with the size of the CD4-pool of the axillary, inguinal and sub-mandibular lymph-nodes (all P< 0.01). Only the size of the sub-mandibular pool was also associated with plasma-viral-load (P=0.046). In a multivariate analysis, adjusting for the PB-CD4-count, only the size of the splenic CD4-pool remained associated with the plasma-viral-load (P=0.01).
Compared to healthy controls (n=11, mean PB-CD4 count 962 95%C.I. (773-1151) cells/µl), long-term cART-treated animals (n=6, 691 95%C.I. (235-1147) cells/µl) had smaller axillary (P< 0.05) and inguinal (P< 0.05) lymph-nodes CD4-pools but similar levels of sub-mandibular and splenic CD4-pools. Of note the anti-CD4 radiotracer uptakes of the axillary and inguinal lymph-nodes of an animal with a long-term non-progressor phenotype were observed to be two-fold higher than the average of healthy-controls.
**Conclusions:** Despite similar sizes of splenic CD4 pools, the sizes of the pools of CD4 cells in the peripheral lymph nodes of treated animals were smaller than those in healthy controls

## LBPE002

### A NONHUMAN PRIMATE MODEL OF FULLY MHC-MATCHED ALLOGENEIC STEM CELL TRANSPLANTATION TO STUDY HIV RESERVOIR CLEARANCE

B. Burwitz[1], J. Stanton[2], C. Shriver-Munsch[2], T. Swanson[2], A. Legasse[2], K. Hammond[1], S. Abdulhaqq[1], H. Wu[1], R. Macallister[2], M. Axthelm[2], T. Hobbs[2], L. Martin[2], R. Ducore[2], A. Lewis[2], L. Colgin[2], A. Panoskaltsis-Mortari[3], G. Meyers[4], R. Maziarz[4], J. Sacha[1,2]
*[1]Oregon Health and Science University, Vaccine & Gene Therapy Institute, Beaverton, United States, [2]Oregon Health and Science University, Oregon National Primate Research Center, Beaverton, United States, [3]University of Minnesota, Blood and Marrow Transplantation, Minneapolis, United States, [4]Oregon Health and Science University, Hematology and Medical Oncology, Portland, United States*
*Presenting author email: burwitz@ohsu.edu*

**Background:** Timothy Brown remains in full HIV remission following an allogeneic hematopoietic stem cell transplant (HSCT). Three potential reservoir-clearing mechanisms exist which may explain this remission:
1) myeloablative immune-conditioning chemotherapy
2) graft-versus-host immunity, or;
3) the *ccr5*$^{\Delta32/\Delta32}$ stem cell graft.
Attempts to repeat Mr. Brown's HSCT-mediated cure in the clinic have failed, necessitating a clinically relevant animal model to understand the mechanisms of his cure. The complex immunogenetics of rhesus macaques (*Macaca mulatta*) precludes their use as a fully MHC-matched HSCT model. Here, we present a nonhuman primate model of fully MHC-matched allogeneic HSCT to define the mechanisms of Timothy Brown's functional HIV cure.
**Methods:** Fully MHC-matched Mauritian cynomolgus macaques (MCM - *Macaca fascicularis*) donor-recipient pairs were used to perform HSCT. Mobilized peripheral stem cells were collected from donors by leukopheresis and transplanted into recipients following chemotherapy and total body irradiation. Donor engraftment was monitored by Illumina deep sequencing across 12 single nucleotide polymorphisms to distinguish donor cells. Immune subset reconstitution was assessed longitudinally using multiple flow cytometric phenotyping panels.
**Results:** We performed seven HSCT between MCM with four distinct outcomes (listed in chronological order): 1) engraftment failure (N=1), 2) graft rejection (N=2), 3) lethal acute GVHD (N=2), and 4) long-term stable chimerism (N=2). We observed strong engraftment in all immune subsets, including T cells, in our long-term stable chimeras. Importantly, with our improved GVHD prophylaxis we have observed no evidence of pathologic acute GVHD despite full donor engraftment for over 100 days.
**Conclusions:** We have built a physiologically relevant model of fully MHC-matched allogeneic HSCT to elucidate the mechanisms contributing to the full HIV remission seen in Timothy Brown. We have achieved high frequencies of CD3+ T cell donor chimerism using this model, which will be a crucial component of any studies looking at SIV reservoir clearance. We are generating CCR5-null transgenic MCM for use as donors, and allogeneic HSCT are now underway in fully combination antiretroviral therapy-suppressed MCM.

## LBPE003

### NON-HUMAN TRIM5 VARIANTS ENHANCE RECOGNITION OF HIV-1-INFECTED CELLS BY CD8+ T CELLS

E. Jimenez[1], A. Ruiz[1], H. Kloverpris[2], M.T. Rodriguez-Plata[3], R. Peña[1], C. Blondeau[4], D. Sellwood[5], A. Moris[6], N. Izquierdo-Useros[1], B. Clotet[1], P. Goulder[4], G. Towers[3], J. G Prado[1]
*[1]AIDS Research Insitute Irsicaixa, Badalona, Barcelona, Spain, [2]KwaZulu-Natal Research Institute for TB and HIV, Durban, South Africa, [3]University College of London, London, United Kingdom, [4]University of Oxford, Oxford, United Kingdom, [5]Wolfson Institute for Biomedical Research, London, United Kingdom, [6]AP-HP, Hôpital Pitié-Salpêtière, Paris, France*
*Presenting author email: jgarciaprado@irsicaixa.es*

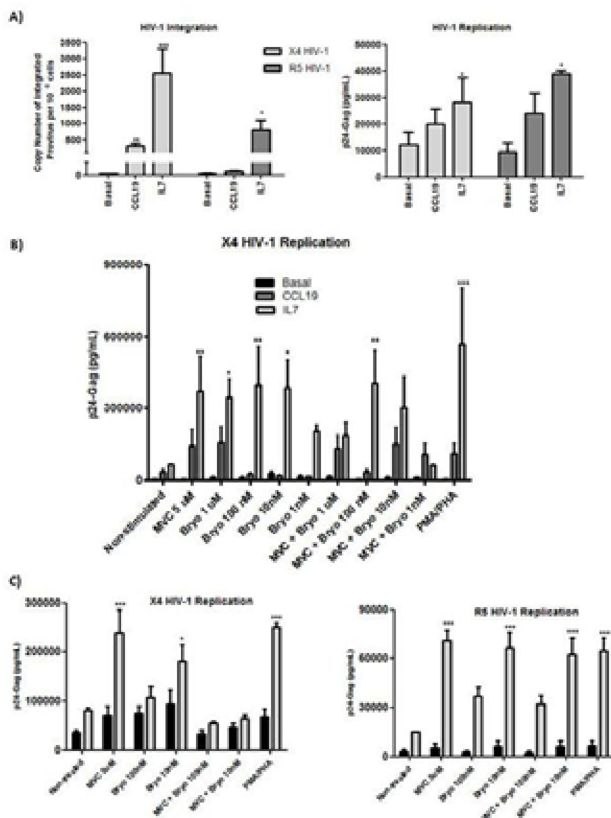
**Background:** TRIM5 restricts Human Immunodeficiency Virus type-1 (HIV-1) in a species-specific manner by uncoating viral particles while activating innate responses. The interactions of TRIM5 with the incoming viral capsid and the cellular proteasome led us to hypothesize a role for TRIM5 in the modulation of CD8+ T-cell recognition of HIV-1 infected cells. In this study, we analyse whether the expression of non-human TRIM5 orthologs, Rhesus TRIM5a (RhT5) and TRIM-Cyclophilin A (TCyp), potent restrictors of HIV-1, could enhance immune recognition of infected cells by CD8+ T cells.
**Methods:** We developed a model of RhT5 and TCyp expressing cells in the U937-B*2705 cell line. We co-culture RhT5, TCyp expressing cells infected with HIV-1 with HLA-matched virus specific-CD8+ T-cells. After 20h of co-culture, we measured CD8+ T-cell mediated inhibition and killing of HIV-1 infected cells. We performed similar co-culture experiments in the presence or absence of a TRIM5 antagonist and quantified CD107a/MIP1B secretion in CD8+ T-cells a marker of antigen recognition of HIV-1 infected cells. In addition, we determine viral uptake by p24 intracellular staining and virus-proteasome contacts by immunofluorescence in RhT5 and TCyp expressing cells infected with HIV-1.
**Results:** Our data reveal that TRIM5 enhance CD8+ T-cell antiviral activity (TCyp; p=0.003 and RhT5; p=0.003) and killing (TCyp; p=0.013 and RhT5; p=0.0007) of HIV-1 infected cells. In addition, TRIM5 blocking experiments show a reduction of HIV-1 specific CD8+ T-cell activation (RhT5; p=0.002 and TCyp; p=0.018) that indicates the direct effect of TRIM5 expression in HIV-1 infected cells on CD8+ T-cell activation. Moreover, the induction of CD8+ T-cell responses in HIV-1 infected cells was stronger for the RhT5 variants and those CD8+ T-cells recognizing the viral capsid. RhT5 and TCyp expressing cells infected with HIV-1 increase viral uptake and the frequency of virus in contact with the proteasome.
**Conclusions:** These data show that RhT5 and TCyp orthologs can couple viral restriction and CD8+ T-cell activation to improve immune recognition of HIV-1 infected cells, favouring capture of the incoming virus and increasing HIV-1 contacts with the cellular proteasome. This novel mechanism could be exploited to implement future therapeutics to control HIV-1 infection.

## LBPE004

### REVERSAL OF HIV-1 LATENCY WITH MARAVIROC ALONE OR IN COMBINATION WITH BRYOSTATIN-1

M.R. Lopez Huertas, N. Madrid-Elena, C. Guiterrez, S. Moreno
*Hospital Universitario Ramón y Cajal, Madrid, Spain*

**Background:** A potential strategy to cure HIV-1 infection is to use latency-reversing agents (LRAs) to eliminate latent reservoirs established in memory resting CD4+ T cells (TCM). As no LRA is completely effective so far, LRA combinations are of increasing importance. Our objective is to study Maraviroc (MVC), a CCR5 inhibitor that activates the expression of NF-kB related genes, as a potential LRA in vitro and to evaluate the combination with Bryostatin-1 (Bryo), a PKC agonist known to be a potent LRA.
**Methods:** Latently models are based on CCL19 (29nM) or IL7 (1nM) treatment before HIV-1 infection with X4-NL4.3 or R5-BaL strains. Resting primary CD4+ T cell or central memory T cells were used. Integrated HIV-1 DNA was quantified by ALU-gag PCR. Cells were then stimulated with MVC alone (0.25-100uM) or with MVC (5uM) together with Bryo (1uM-1nM). HIV-1 replication was assessed by quantifying p24 antigen in the culture supernatant 18h post-stimulation.
**Results:** Latency models fulfil the criterion of increasing HIV-1 integration with minimal viral replication in the absence of stimulation (Figure 1A). Stimulation with several concentrations of MVC increased HIV-1 replication from latency and 5uM was chosen for further studies. Cells were then stimulated with MVC and/or increasing concentrations of Bryo (Figure 1B). MVC was as efficient as Bryo (100nM or 10 nM) in reactivating HIV-1 although synergy could not be. Finally, MVC re-activated X4 and R5-HIV-1 latency in TCM with a potency similar to Bryo (Figure 1C). The combination of MVC and Bryo was antagonistic rather than synergetic in X4 infected TCM. HIV-1 reactivation reached statistical significance in IL7 but not in CCL19-based model.



*[Maraviroc as latency reversing drug]*

**Conclusions:** MVC significantly activates HIV-1 replication from in vitro latently infected TCM. MVC should be regarded as a new LRA with similar efficacy to other described agents such as Bryo but a synergetic action was not found.

## LBPE005

### CENTRAL NERVOUS SYSTEM IMPACT OF VORINOSTAT, HYDROXYCHLOROQUINE AND MARAVIROC COMBINATION THERAPY FOLLOWED BY TREATMENT INTERRUPTION IN INDIVIDUALS TREATED DURING ACUTE HIV INFECTION

E. Kroon[1], J. Ananworanich[1,2,3], L. Le[4], J. Intasan[1], K. Benjapornpong[1], S. Pinyakorn[2,3], P. Karnsomlap[1], S. Tipsuk[1], S. Rattanamanee[1], J. Hellmuth[5], P. Eamyoung[1], K. Eubanks[6], H. Yang[6], N. Phanuphak[1], M. de Souza[6], V. Valcour[5], S. Spudich[4], SEARCH 019 & SEARCH 026 Study Groups
*[1]SEARCH, The Thai Red Cross AIDS Research Centre, Bangkok, Thailand, [2]US Military HIV Research Program, Walter Reed Army Institute of Research, Bethesda, United States, [3]Henry M. Jackson Foundation for the Advancement of Military Medicine, Bethesda, United States, [4]Yale University, New Haven, United States, [5]University of California, San Francisco, United States, [6]Cooper Human Systems, Nashua, United States*

**Background:** Strategies to reactivate the HIV reservoir and analytic treatment interruption (ATI) could each have adverse consequences on the central nervous system (CNS) through induction of neuroinflammation or viral escape. We performed a CNS study in parallel with a systemic study of vorinostat/hydroxychloroquine/maraviroc (VHM) followed by ATI.
**Methods:** Acutely treated participants with >48 weeks viral suppression and CD4 ≥450 cells/mm$^3$ were randomized to 10 weeks of oral VHM (400mg/day hydroxychloroquine + 1200mg/day maraviroc + three 14 day cycles on and off of 400mg/day vorinostat) + ART vs. ART, followed by ATI after wk10 with ART resumption at plasma VL>1,000 copies/ml. CNS measures included cerebrospinal fluid (CSF) sampling at baseline prior to intervention, at wk10, and during ATI at first plasma VL>20 copies/ml; neuropsychological testing at baseline, wk10, during ATI, and after resuming ART; and 3T brain magnetic resonance spectroscopy(MRS) at baseline and 6-8 weeks after ART resumption.
**Results:** Ten participants who had started ART in Fiebig III/IV enrolled (VHM+ART=8, ART=2, 8 men, median age 30 and ART duration 4 years); one withdrew due to adverse VHM effects. In all participants, CSF VLs were < 20 copies/ml at baseline and wk10. Two VHM participants had detectable CSF VL (25 and 42 copies/ml) at plasma rebound (corresponding plasma 35,796 and 329 copies/ml) 3-4 weeks after ATI. CSF protein, a blood-brain-barrier disruption biomarker, rose above the upper limit of normal (45 mg/dL) in one participant during VHM (baseline: 34 mg/dL, wk10: 52 mg/dL, after ATI: 33 mg/dL). IP-10/CXCL10, a lymphocyte chemokine, rose in CSF after ATI (p=0.017). Global neuropsychological performance improved with repeated testing in all but one VHM participant whose z scores declined from -0.53 at baseline to -1.04 at wk10. Brain MRS in 6 participants at baseline and after ART resumption revealed no significant changes in neuronal or inflammatory measures.
**Conclusions:** VHM, a latency reactivating intervention, did not lead to detectable CSF HIV RNA by standard assays nor evidence of persistent adverse outcomes based on CSF protein, neuropsychological testing performance, and brain MRS. Monitored ATI was associated with CNS immune activation; CSF HIV rebound occurred in 2 participants, at levels lower than in blood.

## LBPE006

### DISTINCTIVE GENITAL MUCOSAL IMMUNE MILIEU IN HESN NAIROBI COMMERCIAL SEX WORKERS

N. Dil[1,2,3], J. Kimani[4], F. Plummer[2], B.T. Ball[2,3]
*[1]University of Central Florida, College of Medicine, Orlando, United States, [2]University of Manitoba, Medical Microbiology, Winnipeg, Canada, [3]Public Health Agency of Canada, Winnipeg, Canada, [4]University of Nairobi, Nairobi, Kenya*
*Presenting author email: nyla.dil@ucf.edu*

**Background:** Women makeup roughly half of the current global HIV-1 infected population. Most human HIV infections are acquired through heterosexual transmission across female genital mucosal surfaces. Given the strategic anatomical location of genital mucosal epithelial cells (GEC) immune milieu orchestrated by TLR mediated activation of GECs can be a critical determinant of HIV-1 resistance or susceptibility. HIV-1-exposed seronegative (HESN) women have been shown to have a distinct pattern of cytokines, chemokines and antiproteases as measured in CVL samples. In this study we investigated the role that genital mucosal inflammation might be playing in imparting HIV resistance and/or susceptibility in HESN and HIV infected women.
**Methods:** Endoervical cytobrsuh samples were obtained from Pumwani CSWs cohort in Nairobi, Kenya. HESN (n=22), HIV- (n=24) and HIV+ (n=23).Cervical epithelial cells (CECs) were purified through a series of nylon membrane filtrations. Purity and viability of CECs was assessed by Ber-EP4 expression and MTS assay, respectively. CECs were cultured with or without Pan TLR ligands for 24 h. Cytokine and chemokine levels in the supernatants were determined using the Milliplex MAP multiplex kits and analyzed on the BioPlex-200 according to manufacturer's protocol.

Antiprotease measurements were carried out using commercially available human Alpha 1-Antitrypsin and Alpha 1-Antichymotrypsin ELISA kits. Toll-like receptor expression was determined by real time RT-PCR.

**Results:** We tested 22 cytokines and chemokines (EGF, GM-CSF, IFNa2, IFNgamma, IL-1b, IL-2, IL-6, IL-7, IL-8, IL-10, IL-12 (p40), IL-12(p70), IL-15, IL-17, IP-10, MCP-1, MCP-3, MDC, MIP-1a, MIP-1b, RANTES, and TNFa). GEC from HESN women expressed significantly lower levels of proinflammatory and immune activating cytokines and chemokines upon pan TLR stimulation compared to HIV infected women. Conversely, HESN genital epithelial cells expressed significantly higher amounts of HIV-1 inhibiting chemokines (RANTES and MDC) and antiproteases. Toll-like receptor expression levels were found to be significantly lower in HESN mucosa.

**Conclusions:** These results highlight the role of genital inflammation in imparting HIV resistance and/or susceptibility. Data presented here support the immune quiescence model of HIV-1 protection, whereby lower target and inflammatory cell recruitment at the genital mucosal compartment reduces HIV-1 target cell numbers.

## LBPE007

### THE EFFECT OF TYPE OF PROGESTIN-ONLY CONTRACEPTION (DMPA VERSUS LEVONORGESTREL IMPLANT) ON HIV VIRAL SHEDDING IN THE GENITAL TRACT OF HIV-INFECTED WOMEN ON ANTIRETROVIRAL THERAPY

L. Chinula[1,2,3], J. Wiener[4], J. Tang[1,2,3], J.A.E. Nelson[5], S. Hurst[4], G. Tegha[1], A. Msika[1], S. Ellington[6], M. Hosseinipour[1,7], R. Mataya[8], L.B. Haddad[9], A.P. Kourtis[10]

*[1]UNC Project-Malawi, Lilongwe, Malawi, [2]University of North Carolina at Chapel Hill, Department of Obstetrics and Gynecology, Chapel Hill, United States, [3]Malawi College of Medicine, Department of Obstetrics and Gynecology, Blantyre, Malawi, [4]U.S. Centers for Disease Control and Prevention, Division of Reproductive Health, Atlanta, United States, [5]University of North Carolina at Chapel Hill, Department of Microbiology and Immunology, Chapel Hill, United States, [6]U.S. Centers for Disease Control and Prevention, Divisio, Atlanta, United States, [7]University of North Carolina at Chapel Hill, Department of Infectious Diseases, Chapel Hill, United States, [8]Loma Linda School of Public Health, Loma Linda, United States, [9]Emory University, Department of Obstetrics and Gynecology, Atlanta, United States, [10]U.S. Centers for Disease Control and Prevention, Atlanta, United States*

*Presenting author email: jennifer_tang@med.unc.edu*

**Background:** Hormonal contraception, particularly injectable, has been linked in some studies to higher genital HIV shedding and risk of HIV transmission to partners. There is very limited information about this association in the context of antiretroviral therapy (ART). We assessed the effect and compared the impact of two progestin-containing contraceptives, the Depot Medroxyprogesterone Acetate (DMPA) injectable and the 5-year Levonorgestrel (LNG) implant, on HIV shedding in the genital tract of HIV-infected women.

**Methods:** This analysis is from a randomized clinical trial evaluating the effects of progestin-based contraception in the genital tract of HIV-infected and uninfected women. Women aged 18-45 years were randomly assigned to DMPA or LNG Implant from May 2014-April 2015 in Lilongwe, Malawi, and followed until 6 months post-randomization. HIV-1 RNA viral load was measured in cervicovaginal lavage using the Abbott RealTime assay. We compared the frequency and magnitude of genital HIV shedding at multiple study visits before and after initiation of progestin contraception and between study arms using repeated measurements models fit by generalized estimating equations.

**Results:** We randomized 73 HIV-infected women; 37 to DMPA and 36 to LNG implant. 89% (n=33) of DMPA users and 97% (n=35) of LNG implant users were on ART during the study period. Among women on ART, there was no difference in the frequency of genital HIV shedding or the genital HIV viral load before and after contraceptive initiation [RR = 1.01 (95% CI = 0.98-1.04); mean difference = -0.03 (95% CI = -0.12-0.06); respectively)] or between the two study arms [RR = 1.01 (95% CI = 0.98-1.04); mean difference = -0.01 (95% CI = -0.08-0.07); respectively]. Genital HIV shedding was uncommon (less than 10% at any time point) and of low magnitude (maximum = 3,478 copies/ml).

**Conclusions:** Neither DMPA nor the LNG implant were associated with increased genital HIV shedding during the first 6 months of use in women on ART. These findings are consistent with growing evidence that progestin-only contraception is not associated with increased HIV transmission risk to partners in the context of ART.

*Presenting author email: sergio.carmona@nhls.ac.za*

**Background:** The expansion of prevention of mother-to-child transmission programmes has resulted in a reduction in paediatric HIV infections. However, HIV transmissions still occur requiring accurate early infant diagnosis (EID) and early treatment initiation. Evaluations of new technologies for EID are essential to inform national regulatory approval and implementation, but the low HIV incidence in infants limits timely, adequately sized evaluation studies. The EID Consortium is helping to accelerate the evaluation and subsequent implementation of EID point-of-care (POC) diagnostics across Africa; here we report on field performance of HIV qualitative assays from Alere and Cepheid in exposed infants < 18 months of age.

**Methods:** Data from 9 independent field evaluations of Alere q HIV-1/2 Detect and Cepheid Xpert HIV-1 qual assays were pooled from on-going studies in Kenya, Malawi, Mozambique, Tanzania, South Africa and Zimbabwe. A range of health professionals from nurses, laboratory technicians to medical doctors operated the devices.

**Results:** Specimens from HIV-exposed infants < 18 months old, were analysed on Alere q HIV-1/2 Detect (n=1884) or Cepheid Xpert HIV-1 qual (n=2598) and compared to Roche HIV CAPCTM at all sites with the exception of Malawi which compared to Abbott HIV m2000. Alere q achieved a sensitivity of 99,07% (95% CI, 95,48-99,95%) and specificity of 99,94% (95% CI, 99,72-100,00%) with an overall error rate of 6,4%. Cepheid yielded a sensitivity of 96,88% (95% CI, 91,73-99,20%) and specificity of 99,92% (95% CI, 99,74-99,99%) with an overall error rate of 4,3% **(table 1)**

**Conclusions:** The EID Consortium has been able to aggregate data from multiple centres quickly and thus accelerating notable progress in the field evaluations of POC testing for EID. The analysis shows good performance of both the Alere q HIV-1/2 Detect and Cepheid Xpert HIV-1 qual assays, suggesting that POC devices have the potential to complement the expansion of EID in the region.

### SOCIAL AND EMOTIONAL IMPAIRMENT IN PERINATALLY HIV-INFECTED ADOLESCENTS IN CAPE TOWN, SOUTH AFRICA

A. Perez[1], K. Brittain[2], J. Hoare[3], L. Frigati[4], J. Nuttall[5], L.-G. Bekker[6], H. Rabie[7], P. Roux[5], H.J. Zar[5,8], L. Myer[1]
*[1]University of Cape Town, Division of Biostatistics and Epidemiology, Cape Town, South Africa, [2]University of Cape Town, Division of Epidemiology and Biostatistics, Cape Town, South Africa, [3]University of Cape Town, Department of Psychiatry and Mental Health, Cape Town, South Africa, [4]Tygerberg Academic Hospital and Stellenbosch University, Department of Psychiatry and Child Health, Cape Town, South Africa, [5]University of Cape Town, Department of Paediatrics and Child Health, Cape Town, South Africa, [6]University of Cape Town, Desmond Tutu HIV Centre, Institute of Infectious Diseases and Molecular Medicine, Cape Town, South Africa, [7]Tygerberg Academic Hospital and Stellenbosch University, Department of Paediatrics and Child Health, Cape Town, South Africa, [8]Medical Research Council, Unit on Child and Adolescent Health, Cape Town, South Africa*
*Presenting author email: przale002@myuct.ac.za*

**Background:** There are growing numbers of perinatally HIV-infected (PHIV+) adolescents across Africa and widespread concern regarding their psychosocial well-being. Few studies have investigated mental health and social/emotional impairment in African PHIV+ adolescents, and fewer studies have included local HIV-uninfected comparator groups. We examined these constructs in the Cape Town Adolescent Antiretroviral Cohort (CTAAC).
**Methods:** This cross-sectional analysis included 474 PHIV+ adolescents (eligibility: ages 9-14 years, on ART for >6 months) and 103 HIV- controls. The Beck Youth Inventory (BYI-II), assessing Depression, Anxiety, Anger, Disruptive Behavior, and Self-Concept was administered. Scores were standardized using age- and sex-adjusted norms. Wilcoxon rank sum tests were used to compare scores between PHIV+ and HIV- adolescents; linear regression was used to investigate variables associated with higher scores on each subscale.
**Results:** The mean age was 12.5 and 12.3 years in PHIV+ and HIV- adolescents, with 50% and 46% being male, respectively. The median age at ART initiation was 4.4 years [IQR, 2.0-7.6]. The reliability of the BYI-II was high across subscales (Cronbach's alphas, 0.86-0.91). Mean scores for PHIV+ vs HIV- groups were 40.6 vs 42.5 for depression (p=0.039); 42.3 vs 45.6 for anxiety (p=0.003); and 37.1 vs 38.4 for anger (p=0.107); no differences were observed for disruptive behavior and self-concept. After adjusting for demographic factors, PHIV+ adolescents scored lower, on average, on subscales for depression (β: -2.27; 95%CI: -4.11, -0.44), anxiety (β: -4.05; 95%CI: -6.29, -1.82), and anger (β: -1.87; 95%CI: -3.52, -0.22), compared with HIV- controls; the associations with depression and anxiety persisted when restricted to older children (ages 12-15). There was little variation in scores by age at ART initiation or current use of protease inhibitors; however, current use of efavirenz was weakly associated with disruptive behavior scores after adjustment for demographic and clinical factors. Higher current grade in school was strongly predictive of poorer disruptive behavior scores
**Conclusions:** Overall, PHIV+ adolescents do not appear to have poorer social/emotional functioning than their HIV- counterparts in this setting. The absence of associations with clinical factors suggests that social/emotional outcomes may be more influenced by contextual factors. The implications and consistency of these findings into adulthood require ongoing attention.

## LBPE010

### QUALITY OF LIFE AMONG INDIVIDUALS FAILING FIRST-LINE ANTIRETROVIRAL THERAPY (ART) IN RESOURCE-LIMITED SETTINGS (RLS)

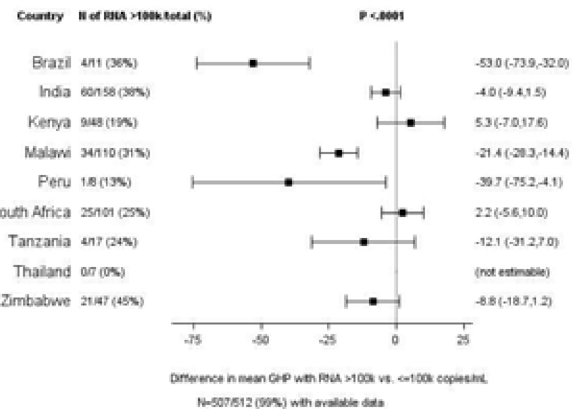
T.S. Torres[1,2], L.J. Harrison[1], A.M. La Rosa[3], J. Lavenberg[1], L. Zheng[1], S. Safren[4], M. Ngongondo[1,5], S. Poongulali[6], M. Matoga[5], W. Samaneka[7], A.C. Collier[8], M. Hughes[1], ACTG A5273 Study Group
*[1]Harvard T. H. Chan School of Public Health, Center for Biostatistics in AIDS Research (CBAR), Boston, United States, [2]Instituto Nacional de Infectologia (INI-FIOCRUZ), LAPCLIN-AIDS, Rio de Janeiro, Brazil, [3]Asociación Civil Impacta Salud y Educación, Lima, Peru, [4]University of Miami, Miami, United States, [5]UNC Project Lilongwe, Lilongwe, Malawi, [6]YRGCARE Medical Centre, VHS, Chennai, India, [7]Harare site, Harare, Zimbabwe, [8]University of Washington, Seattle, United States*
*Presenting author email: ttorres@sdac.harvard.edu*

**Background:** Health-related quality of life (QoL) is poor among HIV-infected people with lower CD4 counts and higher HIV-1 RNA viral loads (VLs), though this topic is understudied in RLS, where individuals may start or switch ART later than in resource rich settings. This study evaluated QoL in people experiencing virologic failure (VF) on first-line ART in RLS.
**Methods:** ACTG A5273 was a prospective clinical trial of second-line ART in participants failing (two consecutive measurements of VL≥1,000 copies/mL) a NNRTI-containing regimen at 15 sites in 9 RLS. Participants completed the ACTG SF-21 at study entry which has 8 domains: general health perceptions (GHP), physical functioning (PF), role functioning (RF), social functioning (SF), cognitive functioning (CF), pain (P), mental health (MH), and energy/fatigue (E/F), with a standard score ranging from 0 (worst) to 100 (best). Multivariable linear regression models were used to evaluate associations of QoL domains with country, CD4 count and VL.
**Results:** 512 participants were enrolled; 51% female and 64% black. Median CD4 count was 135cells/mm³ and VL33,360copies/mL. Mean QoL score for each domain was: GHP(67), PF(91), RF(80), SF(91), CF(91), P(83), MH(85), E/F(80). Multivariable modeling showed that participants with higher VL and lower CD4 had lower QoL.

| | General Health Perceptions (GHP) | Physical Functioning (PF) | Role Functioning (RF) | Social Functioning (SF) | Cognitive Functioning (CF) | Pain (P) | Mental Health (MH) | Energy / Fatigue (E/F) |
|---|---|---|---|---|---|---|---|---|
| VL (copies/mL) >100K vs. ≤100K | -7.9 (-11.5; -4.4) p<.0001 | -5.4 (-8.7; -2.0) p=0.002 | -7.4 (-12.3; -2.4) p=0.004 | -2.6 (-5.6; 0.3) p=0.081 | -2.7 (-5.7; 0.3) p=0.080 | -5.5 (-9.6; -1.4) p=0.009 | -2.9 (-5.8; -0.0) p=0.047 | -5.6 (-9.3; -1.9) p=0.003 |
| CD4 (cells/mm3) <50 vs. ≥50 | -9.4 (-5.4; -13.3) p<.0001 | -5.5 (-1.7; -9.2) p=0.004 | -3.6 (1.8; -9.1) p=0.193 | -7.0 (-3.8; -10.3) p<.0001 | -2.7 (0.6; -6.1) p=0.111 | -4.5 (0.0; -9.1) p=0.050 | -5.7 (-2.5; -8.9) p=0.001 | -6.4 (-2.4; -10.5) p=0.002 |

*[Adjusted differences in mean QoL scores by VL or CD4 categories (95% Confidence Interval)]*

Country was associated with QoL in all domains(p< .0001); lower QoL was observed for Malawi and India in most domains. Relationships between QoL and VL varied among countries for GHP(p< .0001), PF(p=0.001), SF(p< .0001), P(p=0.009) and E/F(p=0.014).



*[Difference in mean GHP with RNA >100k vs. <=100k copies/mL]*

**Conclusions:** Worse QoL scores at VF on first-line ART are associated with worse disease status as measured by higher VL and lower CD4. This might reflect low QoL when ART was initiated and/or its deterioration during VF. Differences in VL monitoring availability may explain why VL was important for some QoL domains in certain countries.

## LBPE011

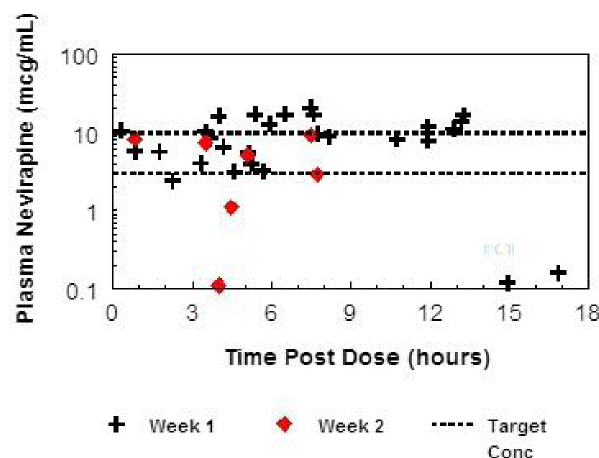
### ESTABLISHING A TREATMENT DOSE OF NEVIRAPINE (NVP) FOR FULL-TERM NEONATES WITH PERINATAL HIV INFECTION: IMPAACT P1115

E.G. Chadwick[1], M. Qin[2], Y. Bryson[3], M. Mirochnick[4], T.D. Ruel[5], A. Zadzilka[6], A. Coletti[7], B. Zimmer[6], C. Tierney[2], D. Persaud[8], M. Cotton[9], P. Jean-Philippe[10], R. Hazra[11], C. Jennings[12], E.V. Capparelli[13], IMPAACT P1115 Team
*[1]Northwestern University Feinberg School of Medicine, Pediatric Infectious Diseases, Chicago, United States, [2]Harvard T. H. Chan School of Public Health, Center for Biostatistics in AIDS Research in the Department of Biostatistics, Boston, United States, [3]UCLA School of Medicine, Global Pediatric Infectious Diseases, Los Angeles, United States, [4]Boston Medical Center, Neonatal Medicine, Boston, United States, [5]University of California, San Francisco, Pediatrics, San Francisco, United States, [6]Frontier Science and Technology Research Foundation, Amherst, United States, [7]FHI 360, IMPAACT Operations Center, Durham, United States, [8]Johns Hopkins University, Pediatric Infectious Diseases, Baltimore, United States, [9]Stellenbosch University, Pediatrics and Child Health, Tygerberg, South Africa, [10]National Institute of Allergy and Infectious Diseases, National Institutes of Health, Division of AIDS, Bethesda, United States, [11]Eunice Kennedy Shriver National Institute of Child Health and Human Development, Bethesda, United States, [12]Rush University Medical School, Laboratory Medicine, Chicago, United States, [13]University of California, San Diego, Pediatric Pharmacology, San Diego, United States*
*Presenting author email: theodore.ruel@ucsf.edu*

**Background:** Very early treatment of HIV-infected neonates may sufficiently limit HIV reservoirs to enable HIV remission after cessation of combination antiretroviral therapy (cART). However, there are limited data on therapeutic concentrations of antiretroviral drugs approved for neonatal use.

**Methods:** IMPAACT P1115 is an ongoing multinational trial investigating very early cART and HIV remission in infected neonates. Pharmacokinetic (PK) modeling from prior neonatal NVP prophylaxis data suggested that NVP dosing of 6 mg/kg/dose twice daily (BID) would maintain concentrations between 3-10 mcg/mL, the established therapeutic range. Zidovudine+lamivudine+NVP were initiated at < 48 hours of age in neonates of HIV-infected mothers untreated during pregnancy, before determination of infant infection status. Single PK samples from 1 +/- 2 weeks on study were assayed for NVP concentrations using high performance liquid chromatography. Plasma NVP exposures and safety were examined among enrolled neonates ≥37 weeks gestational age.

**Results:** 30 neonates (median gestation 38 weeks) were studied; 20 boys/10 girls from Africa(n=24), South America(3), North America(2) and Asia(1). cART started on the day of birth in 19, and 2/30 were HIV-infected. Four participants had toxicities ≥Grade 2 at least possibly related to cART: 1 Grade 2 ANC; 1 Grade 2 and 1 Grade 4 hemoglobin; 1 Grade 2 ANC + hemoglobin. No rashes or elevated transaminases occurred. Mean (SD) plasma NVP concentration was 9.2 (5.6) mcg/mL at Week 1 (n=28) and 4.9 (3.6) at Week 2 (n=7). (Figure) Overall, 83% of samples were >3.0 mcg/ml; while 43% of Week 1 NVP levels were >10mcg/mL, most were ≤15 mcg/mL.



*[Figure. NVP PK P1115]*

**Conclusions:** Therapeutic NVP dosing of 6 mg/kg/dose BID in full-term newborns appears to be safe and maintains NVP concentrations >3 mcg/ml during the first 2 weeks of life in the majority of infants. These data support the continued study of this NVP dosing regimen to treat neonates.

## LBPE012

### EXTENDED-RELEASE NALTREXONE IS ASSOCIATED WITH SUSTAINED VIROLOGIC SUPPRESSION AMONG HIV+ PRISONERS WITH ALCOHOL USE DISORDERS AFTER RELEASE TO THE COMMUNITY

S. Springer[1], M. Azar[2], R. Barbour[3], F. Altice[2], A. Di Paola[1]
*[1]Yale School of Medicine, Infectious Disease, New Haven, United States, [2]Yale School of Medicine, Section of Infectious Disease/ Yale AIDS Program, New Haven, United States, [3]Yale University School of Medicine, Center for Interdisciplinary Research on AIDS, New Haven, United States*
*Presenting author email: sandra.springer@yale.edu*

**Background:** For people living with HIV (PLH), alcohol use disorders (AUDs) are associated with poor immunologic and virologic outcomes. Prisoners with HIV lose HIV VL suppression they gained while incarcerated within 3 months post-release. We aimed to see if the use of extended-release naltrexone (XR-NTX), an effective treatment for AUDs, could maintain and/ or improve rates of VLS for PLH with AUDs after they are released from prison.

**Methods:** This is a double-blind placebo-controlled randomized trial of XR-NTX (randomized 2:1, XR-NTX: placebo) conducted among HIV+ prisoners with AUDs who were released to the community in Connecticut, U.S.A. Participants were administered 6 monthly injections given 1-2 weeks prior to release and monthly thereafter for 5 months post-release. The primary outcome was sustained virologic suppression at 6 months at < 400 copies/mL with additional secondary outcomes of proportion with VLS at < 200 and < 50.

**Results:** A total of 100 participants were randomized 2:1 (N=67 XR-NTX; N=33 Placebo). Baseline demographics were: 21% women, 37% homeless, 65% Black/ African American, mean incarceration time period of 13 months, 50% with chronic HCV, 86% prescribed ART, and 90% with a CD4 ≥200. There was a statistically significant greater mean proportion of persons who had a VL UD at baseline who maintained a VL UD at 6 months in the XR-NTX group as compared to the placebo group at < 50 copies/ ML and < 200 copies/mL value, but not at the < 400 copies/ mL value (see Table 1).

| Viral Load (Copies/ml) by Treatment Arm | Baseline (%) (XR-NTX, PLC) | 6 months (%) (XR-NTX, PLC) | Mean of the Differences | 95% Confidence Interval | P value |
|---|---|---|---|---|---|
| <50 XR-NTX, Placebo | 36,48 | 50, 34 | 0.212 | 0.740, 0.349 | 0.003* |
| <200 XR-NTX, Placebo | 53, 72 | 55, 34 | 0.176 | 0.043,0.31 | 0.013* |
| <400 XR-NTX, Placebo | 70, 72 | 63, 41 | 0.11 | -0.027, 0.239 | 0.118 |

*[Table 1: Comparisons of Percentages of VL suppression from baseline to 6 months by treatment arm based on Results of T Test analyses]*

**Conclusions:** Preliminary results from this RCT show that XR-NTX may help maintain VL suppression and/ or improve to achieve VL suppression as HIV+ prisoners transition to the community, thus a potential intervention to improve the HIV continuum of care for PLH with AUDs involved in the CJS.

## LBPEO13

### COMPARING MATERNAL TRIPLE ANTIRETROVIRALS (MART) AND INFANT NEVIRAPINE (INVP) PROPHYLAXIS FOR THE PREVENTION OF MOTHER TO CHILD TRANSMISSION (MTCT) OF HIV DURING BREASTFEEDING (BF)

Chan School of Public Health, Center for Biostatistics in AIDS Research, Boston, United States, [4]Johns Hopkins University School of Medicine, Department of Pathology, Baltimore, United States, [5]Elisabeth Glaser Pediatric AIDS Foundation, Washington, DC, United States, [6]Makerere University - Johns Hopkins University Research Collaboration, Kampala, Uganda, [7]University of North Carolina School of Medicine, Department of Microbiology and Immunology, Chapel Hill, United States, [8]College of Health Sciences, University of Zimbabwe, Department of Paediatrics and Child Health, Harare, Zimbabwe, [9]University of KwaZulu-Natal, Department of Pediatrics and Child Health, Durban, South Africa, [10]National Institutes of Health, Division of AIDS, National Institute of Allergy and Immunology, Bethesda, United States, [11]National Institutes of Health, Maternal and Pediatric Infectious Disease Branch, Eunice Kennedy Shriver Institute of Child Health and Human Development, Rockville, United States, [12]FHI360, Durham, United States, [13]University of North Carolina - Lilongwe, Lilongwe, Malawi, [14]Johns Hopkins, College of Medicine Research Project, Blantyre, Malawi, [15]Nelson Mandela School of Medicine, CAPRISA - Umlazi Clinical Research Site, Durban, South Africa, [16]University of Zimbabwe-University of California, San Francisco, Harare, Zimbabwe, [17]B. J. Medical College, Pune, India, [18]Univerisity of Zimbabwe, Harare, Zimbabwe, [19]Nelson R. Mandela School of Medicine, University of KwaZulu-Natal, Durban, South Africa, [20]Kilimanjaro Christian Medical Centre, Moshi, Tanzania, United Republic of, [21]Wits Reproductive Health and HIV Institute, Johannesburg, South Africa, [22]Perinatal HIV Research Unit, Johannesburg, South Africa, [23]Stellenbosch University, Obstetrics and Gynaecology, Tygerberg, South Africa, [24]Centre for Infectious Diseases Research in Zambia, Lusaka, Zambia*

**Background:** BF is crucial to reducing infant morbidity and mortality but may result in HIV transmission if the mother is HIV-infected. Both mART and iNVP are effective in preventing postnatal HIV transmssion. PROMISE is the first randomized trial designed to directly compare the efficacy/safety of these two strategies during extended BF.

**Methods:** PROMISE was conducted in sub-Saharan Africa (13 sites) and India (1 site). HIV-infected women with CD4+ counts >350 cells/mm$^3$ (or > country-specific threshold for therapy if higher) and their HIV-uninfected newborns were randomized at 6 - 14 days postpartum to mART or iNVP. These regimens were continued until 18 months post-delivery unless there was cessation of BF, infant HIV infection, or toxicity. Kaplan-Meier (K-M) probabilities and incidence rates per 100 person-years were used in primary analyses of efficacy/safety.

**Results:** 2431 mother-infant pairs were enrolled between June 2011 and October 2014. Women were asymptomatic (median CD4 count - 686; 97% WHO Clinical Stage I) with median age of 26 years. Infant's median gestational age and birthweight were 39 weeks and 2.9 kg, respectively. Baseline characteristics were comparable by study arm. Median duration of BF was 15 months and not significantly different by study arm (p=0.85). K-M estimates of MTCT of HIV at ages 6, 9 and 12 months were 0.3% (95% CI 0.1-0.6), 0.5% (95% CI 0.2-0.8) and 0.6% (95% CI 0.4-1.1), respectively, and not significantly different between the two arms. Infant 12-month survival rate was extremely high (98.9%) and not significantly different by regimen. Incidence rates of maternal/infant safety outcomes did not differ significantly by regimen (Table).

| | mART N=1220 | iNVP N=1211 | P-value, K-M log-rank test |
|---|---|---|---|
| Composite maternal Grade 3/4 signs/symptoms; Grade 2-4 lab events; or maternal death (2 deaths in mART arm and 1 in iNVP arm) | 14.8 (95% CI 12.7-17.3) | 14.6 (95% CI 12.5-16.9) | 0.99 |
| Composite severe maternal safety outcomes (same as row 1 but excludes Grade 2 lab events) | 5.1 (95% CI 4.3-6.1) | 5.6 (95% CI 4.8-6.6) | 0.61 |
| Composite infant Grade 3/4 signs/symptoms; Grade 3/4 lab event; or infant death | 44.1 (95% CI 39.2-49.5) | 43.5 (95% CI 38.7-48.8) | 0.95 |
| Infant death (16 in mART arm and 14 in iNVP arm) | 1.2 (95% CI 1.0-1.5) | 1.1 (95% CI 0.9-1.3) | 0.72 |

*[Safety outcome incidence rates (per 100 person years) by study arm]*

**Conclusions:** Both mART and iNVP were safe and were associated with very low MTCT rates during extended BF and high infant survival rates. For mothers who do not adhere to or tolerate ART, iNVP throughout BF offers a safe efficacious alternative.

## LBPEO14

### LONG-TERM OUTCOMES IN THE SOUTH AFRICAN ART PROGRAMME

M. Cornell[1,2], R. Wood[3], F. Tanser[4], M.P. Fox[5], H. Prozesky[6,7], L.F. Johnson[1], M. Egger[1,8], M.-A. Davies[1], A. Boulle[1]

*[1]University of Cape Town, Centre for Infectious Disease Epidemiology, School of Public Health & Family Medicine, Cape Town, South Africa, [2]University of Cape Town, Division of Epidemiology & Biostatistics, School of Public Health & Family Medicine, Cape Town, South Africa, [3]University of Cape Town, Desmond Tutu HIV Centre, Institute of Infectious Disease & Molecular Medicine, Cape Town, South Africa, [4]University of KwaZulu-Natal, Wellcome Trust Africa Centre for Health and Population Studies, Mtubatuba, South Africa, [5]University of the Witwatersrand, Health Economics and Epidemiology Research Office, Department of Internal Medicine, Johannesburg, South Africa, [6]University of Stellenbosch, Division of Infectious Diseases, Department of Medicine, Cape Town, South Africa, [7]Tygerberg Academic Hospital, Cape Town, South Africa, [8]University of Bern, Division of International & Environmental Health, Institute of Social & Preventive Medicine, Bern, Switzerland*

*Presenting author email: morna.cornell@uct.ac.za*

**Background:** Universal antiretroviral therapy (ART) could simplify treatment provision, reduce morbidity and mortality and prevent HIV transmission, but long-term outcomes are not well-described in resource-limited settings.

**Methods:** Routinely-collected cohort data from five large South African public sector ART programmes were linked to the National Population Register to verify vital status using civil identification numbers. Patients were ART-naïve adults (16-85 years old) starting ART 2004-2015. All-cause mortality was analysed using Kaplan-Meier and Cox regression methods.

| | Time since ART initiation (months) | | | | | |
|---|---|---|---|---|---|---|
| Year | 12 | 36 | 60 | 84 | 108 | 120 |
| 2004-2006 | 7.4 (6.9-7.9) | 12.3 (11.7-13.0) | 16.3 (15.7-17.0) | 19.4 (18.6-20.1) | 22.2 (21.5-23.0) | 23.5 (22.8-24.3) |
| 2007-2009 | 8.5 (8.2-8.9) | 13.5 (13.0-14.0) | 17.2 (16.6-17.7) | 20.2 (19.6-20.8) | 22.5 (21.8-23.2) | |
| 2010-2012 | 6.5 (6.2-6.8) | 10.4 (10.1-10.8) | 13.3 (12.8-13.7) | 14.8 (14.1.15.6) | | |
| 2013-2015 | 4.2 (3.9-4.6) | 7.6 (7.0-8.3) | | | | |

*[Table 1: Cumulative mortality by year enrolled and time since ART initiation]*

**Results:** 73,288 adults were followed for 351,795 person-years (pyrs), with a median of 4.5 (IQR 2.4-7.0) pyrs. The median CD4 count increased between 2004 and 2015, from 86 (40-144) to 246 (119-355) cells/µL, and the proportion starting ART with CD4< 50 cells/µL dropped from 25% to 7%. Overall 10,851 (15%) patients died, for a mortality rate of 3.1 (95% CI 3.0-3.1)/100 pyrs. At 10 years, cumulative mortality was 23.5% (Table 1). Mortality peaked in 2007-2009 and decreased through to 2015: from 8.5% to 4.2% (12-month) and 13.5% to 7.6% (36-month). Adjustment for CD4 count and ART initiation site removed the effect of year of enrolment (2014-15 vs 2004: aHR 1.06, 95% CI 0.92-1.24). Among patients with viral loads in the last year of cohort follow-up, 88% were virologically suppressed (< 400 copies/mL).

**Conclusions:** Nearly 80% of patients in these well-ascertained cohorts were still alive after ten years of national ART provision. Earlier initiation of ART reduced mortality. After adjustment for baseline characteristics, mortality was stable over time despite the challenges of increasing enrolment; and high levels of virologic suppression were sustained. These findings provide substantial reassurance as to the effectiveness of the largest ART programme worldwide.

## LBPE015

### HIV TESTING AND ART ARE ASSOCIATED WITH LOWER HIV INCIDENCE AMONG PWID IN UKRAINE

K. Dumchev[1], M. Samko[2], J. Barska[2], T. Salyuk[3]
*[1]Ukrainian Institute on Public Health Policy, Kyiv, Ukraine, [2]Independent Consultant, Kyiv, Ukraine, [3]Alliance for Public Health, Kyiv, Ukraine*
*Presenting author email: dumchev@uiphp.org.ua*

**Background:** PWID remain to be in the epicenter of HIV epidemic in Ukraine, one of the most affected countries in Eastern Europe. Majority of the estimated 11,000 new annual HIV cases are occurring among PWID and their sexual partners. Large-scale HIV prevention program supported by The Global Fund and PEPFAR grew rapidly since 2004 to reach more than 210,000 PWIDs in 2014. Provision of all prevention services is recorded in the national SYREX database; records are linked by a unique client identifier.
**Methods:** For this analysis we compared results from two cohort studies - retrospective and prospective. The retrospective cohort included all PWID who received prevention services in 2011-2014; HIV seroconversion defined as a SYREX record of positive HIV test after a negative one. To address limited testing coverage, a prospective cohort of prevention clients was recruited in 2013 in 11 cities; HIV seroconversion measured by rapid testing at 6, 12, 18 months. For both studies, data on prevention services were extracted from SYREX database. City-level epidemiological and clinical service coverage variables were added to analysis. "Time-to-event" methods were used to determine impact of prevention on HIV incidence.
**Results:** Of all 366,786 unique PWID prevention clients, 50,586 (13.8%) had at least two HIV test records with first negative result, and 1,012 seroconverted (1.54%/year incidence). Of 2,157 PWID in prospective cohort, 2,052 (95.1%) completed at least one follow-up with 52 seroconversions (1.81%/year incidence).
Provision of syringes, condoms, information, or counseling did not have significant and consistent effect in both studies. Each additional HIV test received in lifetime, controlling for the effect of age, sex, other service use, was decreasing the risk of seroconversion by up to 88.4% (aHR(retrospective)=0.216, p<0.001, aHR(prospective)=0.414, p<0.001).
Several city-level variables had consistent significant effect, most importantly the level of ART coverage appeared to be a very strong protective factor while controlling for other variables (aHR(retrospective)=0.440, p=0.002, aHR(prospective)=0.006, p=0.001).
**Conclusions:** Consistency of findings on effects of ART coverage and HIV testing in both cohorts strongly supports the recommendation to further expand these interventions in order to minimize transmission in Ukraine and other countries with HIV epidemics driven by PWID.

## LBPE016

### MOTHER TO CHILD TRANSMISSION (MTCT) OF HIV IN NEW YORK STATE (NYS): FROM EPIDEMIC TO ELIMINATION

K. Hagos[1], B. Warren[2], L. Haskin[2], W. Miranda[2], M. Scully[2], B. Agins[2], D. O'Connell[2]
*[1]New York State Department of Health, AIDS Institute, Office of Planning and Community Affairs, Albany, United States, [2]New York State Department of Health, AIDS Institute, Albany, United States*
*Presenting author email: bruce.agins@health.ny.gov*

**Background:** NYS, once the epicenter of pediatric AIDS epidemic in the United States, has eliminated MTCT as defined by the Centers for Disease Control and Prevention (CDC). NYS began to target MTCT prevention in the early 1990s. Statewide data is now available through 2015, indicating no cases of MTCT in 2015.
**Description:** The NYS Department of Health's AIDS Institute (AI) implemented a multi-pronged approach involving consumers, health/social services providers, birth facilities and state/local agencies. This initiative, data-driven and supported by laws/regulations/ standards of care, evolved in alignment with emerging science. A comprehensive monitoring program includes routine provision of facility-specific data to all birth facilities and on-site technical support. NYS MTCT guidelines were widely disseminated and promoted through the AI's statewide guidelines and education programs.
**Lessons learned:** Statewide implementation of voluntary prenatal HIV testing began in 1996 after regulations were adopted to require offering of prenatal HIV testing. In 1997, a law was implemented requiring routine HIV screening of all newborns using the blood spots obtained via NYS' Newborn Screening Program. Antiretroviral (ARV) regimens for maternal health/MTCT prevention were quickly implemented, with 98% of exposed infants having received ARV prophylaxis in one or more periods (prenatal, intrapartum, newborn) by 2001.
In 1990, 1,898 HIV-positive women gave birth. An estimated 475 (25%) to 760 (40%) of their infants were born with HIV. In 2015, 25 years later, 391 positive women gave birth. Data for 2015, to be verified by July, indicate that no infants were born with HIV. These data represent a 79% decline in number of positive women delivering and a 100% decline in number of newborns with HIV. NYS has satisfied CDC criteria for elimination. An analysis of return on investment for preventing MTCT demonstrated for every $1 invested, NYS saved almost $4 in HIV-related health care expenses for infected children.
**Conclusions/Next steps:** With consistent collaborative effort, statewide regulations, implementation/monitoring strategies and efficient use of resources focused on prenatal HIV testing for all pregnant women and ARV medications for all HIV-positive pregnant women and exposed infants, MTCT can be eliminated in high prevalence jurisdictions and is cost effective. Sustaining elimination will be an ongoing challenge.

## LBPE017

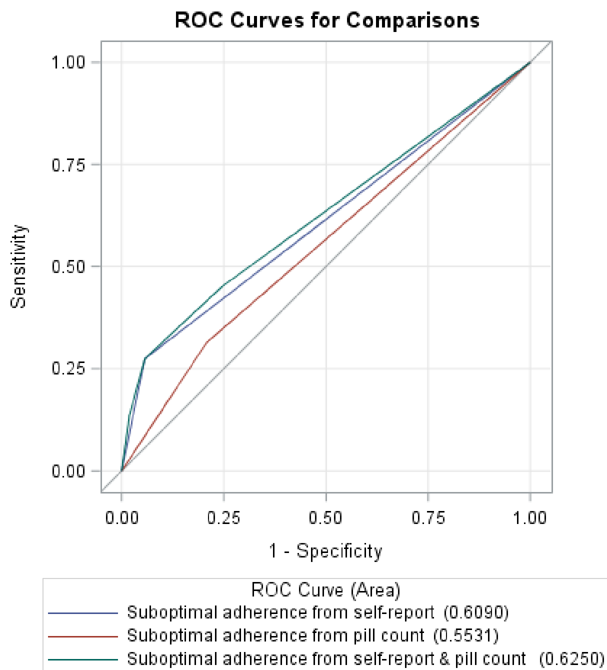
### COMPARING REAL-TIME ADHERENCE MEASUREMENTS TO TENOFOVIR BLOOD CONCENTRATIONS IN MSM AND TRANSWOMEN PREP USERS IN CAPE TOWN, SOUTH AFRICA

R. Kearns[1], K. Dominguez[2], S. Baral[3], N. Phaswana-Mafuya[4,5], T. Sanchez[1], P. Sullivan[1], R. Zahn[1], L.-G. Bekker[2]
*[1]Department of Epidemiology, Emory University Rollins School of Public Health, Atlanta, United States, [2]The Desmond Tutu HIV Centre, University of Cape Town, Cape Town, South Africa, [3]Department of Epidemiology, Johns Hopkins University Bloomberg School of Public Health, Baltimore, United States, [4]Nelson Mandela Metropolitan University, Port Elizabeth, South Africa, [5]Human Sciences Research Council (HSRC) of South Africa, Port Elizabeth, South Africa*
*Presenting author email: rkearns@emory.edu*

**Background:** Pre-exposure prophylaxis (PrEP) in an effective intervention to prevent HIV transmission in men who have sex with men (MSM) and transgender women (transwomen). With approval in South Africa (SA) late 2015, scale up is expected soon. Understanding optimal adherence measurements in implementation settings is critical to successfully scaling up PrEP.
**Methods:** The Sibanye Health Project is a one-year cohort study of MSM/transwomen in Cape Town, SA. HIV-uninfected, eligible participants were offered PrEP. One and two months after PrEP initiation, and three monthly thereafter, self-reported missed doses in the last week, pill counts, and dried blood spots (DBS) were collected. DBS were tested for tenofovir concentrations. Self-report and pill counts were used in real time to identify suboptimal adherence and intervene with counseling. Tenofovir results were received in bulk and incorporated into counseling as available. This analysis compared suboptimal adherence based on the three measures. Receiver operating characteristic (ROC) curves were created to compare real-time measures of suboptimal adherence to the "gold standard" of tenofovir concentration.
**Results:** Of 115 enrolled participants, 80 were HIV-uninfected, 66 were PrEP-eligible, and 45 initiated PrEP. Data on all three adherence measures were available for 40 participants during 101 patient-visits (Table). Self-report and pill counts have low sensitivity in identifying suboptimal adherence (Figure). Tenofovir concentrations identified 28 additional patient-visits requiring increased counseling.

| | Suboptimally adherent (tenofovir ≤ 40 ng/ml) n=48 patient-visits | Adherent (tenofovir > 40 ng/ml) n=53 patient-visits |
|---|---|---|
| | n (%) | n (%) |
| Identified by self-report & pill count* | 5 (10%) | 40 (75%) |
| Identified by self-report only | 6 (13%) | 10 (19%) |
| Identified by pill count only | 9 (19%) | 2 (4%) |
| Identified by neither | 28 (58%) | 1 (2%) |
| *Suboptimal adherence defined via self-report as missing 3 or more pills in the last week and via pill count as having a raw adherence score based on pill count of less than 0.80 (pills dispensed-pills returned /days since last refill) | | |

*[Comparisons of suboptimal adherence on PrEP using tenofovir blood concentrations, self-report, and pill counts]*



*[Receiver operating characteristic (ROC) curves for detecting suboptimal adherence based on "gold standard" tenofovir blood concentrations]*

**Conclusions:** While viral load is an accepted measure of treatment adherence, there is limited consensus on appropriate PrEP adherence measures. These data suggest that drug concentrations are useful in measuring PrEP adherence for MSM in SA, at least early after initiation. Tenofovir-diphosphate testing is planned to clarify the utility of biomedical measures.

## LBPE018

### AN ANALYSIS OF BASELINE AND EARLY DATA FROM THE PLUS PILLS STUDY: AN OPEN-LABEL TRIAL OF PRE-EXPOSURE PROPHYLAXIS FOR SOUTH AFRICAN ADOLESCENTS

K. Gill[1], R. Marcus[1], J. Dietrich[2], T. Bennie[1], S. Hosek[3], G. Gray[4,5], L.-G. Bekker[1]
*[1]Desmond Tutu HIV Centre, University of Cape Town, Cape Town, South Africa, [2]Perinatal Research Unit, University of the Witwatersrand, Johannesburg, South Africa, [3]Division of Child and Adolescent Psychiatry, John Stroger Hospital of Cook County, Chicago, United States, [4]Perinatal HIV Research Unit, University of the Witwaterstrand, Johannesburg, South Africa, [5]South African Medical Research Council, Cape Town, South Africa*
*Presenting author email: katherine.gill@hiv-research.org.za*

**Background:** The use of pre-exposure prophylaxis (PrEP) to reduce sexual acquisition of HIV in adults is well established. Young people in sub-Saharan Africa face amongst the highest HIV incidence globally, yet there are few prevention interventions on offer.
We present baseline and early data from an ongoing, demonstration study examining the use of oral PrEP in an adolescent population.
**Methods:** PlusPills is an open-label study to explore the acceptability, safety, and use of oral PrEP (tenofovir-emtricitabine) for sexually active, HIV-negative adolescents (15-19 years old) in Soweto and Cape Town as part of a combination HIV prevention package. PrEP was administered from community-based, adolescent-specific health services. Although participants were required to take daily PrEP for the first 12 weeks, they were allowed to opt out of PrEP at 3 months and at 3 monthly intervals thereafter for 12 months. Demographic, behavioural, clinical and adherence data including plasma and dried blood spot drug levels were collected. Drug levels were available at subsequent visits. Adherence support was offered through counselling, SMS messaging and monthly adherence clubs.
**Results:** 148 adolescents were enrolled (98 female, 50 male), with a median age of 18 (IQR: 17-19). Median age at sexual debut was 15 years (IQR: 14-16). At enrolment, participants reported an average of 1.5 sex acts per week, 30% had 2 or more partners in the past 12 months, 43% reported infrequent condom use, and 38% tested positive for sexually transmitted infections. There were no HIV incident infections. At 12 weeks, 72% reported good adherence to product (>6 pills/week) and 76% had tenofovir plasma levels >40 ng/ml. Mild headache and gastrointestinal side effects were most frequently reported with no significant laboratory adverse events. 15% of participants chose to opt out of PrEP at week 12.
**Conclusions:** PlusPills is the first Southern African adolescent study to explore PrEP use. Baseline data indicated that this study attracted an adolescent population at risk for HIV acquisition. Early data suggested side effects were minimal and early adherence reasonable. The majority of adolescents persisted with PrEP. Follow up is continuing to understand use patterns and appropriate support measures for this important population.

## LBPE019

### UNEXPECTED BENEFITS AND HEIGHTENED DISCLOSURE RISKS: ADOLESCENTS' EXPERIENCES IN A PREP TRIAL

A. Knopf[1], M. Ott[2], N. Liu[3], B. Kapogiannis[4], G. Zimet[2], D. Fortenberry[2], S. Hosek[5], Adolescent Medicine Trials Network for HIV/AIDS Interventions (ATN)
*[1]Indiana University, Nursing, Indianapolis, United States, [2]Indiana University, School of Medicine, Department of Pediatrics, Adolescent Medicine Section, Indianapolis, United States, [3]Westat, Rockville, United States, [4]Eunice Kennedy Shriver National Institute of Health and Human Development, Maternal and Pediatric Infectious Diseases Branch, Bethesda, United States, [5]Stroger Hospital of Cook County, Department of Psychiatry, Chicago, United States*
*Presenting author email: asknopf@iu.edu*

**Background:** Parental permission is a cornerstone of research protections for minors. However, in HIV prevention trials, parental permission may deter participation because of disclosure concerns. Research is needed to understand the best approach to balance protections for minors with equitable access to biomedical HIV prevention studies.
We describe the perspectives of young men who have sex with men (YMSM) regarding research decision-making and disclosure in a PrEP trial.
**Methods:** Project PrEPare (ATN trials 110/113) were open-label safety and demonstration trials for YMSM ages 15-22. They were the first US PrEP trials for adolescents, and allowed participants under 18 years to consent for themselves. Qualitative phone interviews were conducted 0-24 months after study completion. We examined disclosure, autonomous and supported decision-making, and perceptions of harms and benefits of study participation. Interviews were recorded, transcribed and analyzed using qualitative content analysis.
**Results:** Of 25 participants interviewed, 5 (20%) were younger than 18 at enrollment. At week 4, 16 (64%) had TFV-DP levels consistent with at least 4 doses of PrEP per week. Participants described research staff as strong sources of social support, and many suggested staff served as surrogate family. Only 2 discussed the trial with parents prior to enrollment. Among the rest, 9 disclosed participation after enrollment, 13 never disclosed, and one had lost both parents. Participants most often disclosed participation to friends, a few to partners, and one never disclosed. Participants identified three disclosure-related barriers to parental permission: 1) risk of social harm with disclosing sexual minority status, 2) discomfort disclosing sexual activity, and 3) fear that parents would assume they were promiscuous or sexually irresponsible. Four participants would have approached parents for permission if required. Many discussed concern about PrEP-related stigma (e.g. being labeled a "PrEP whore") and for some this prevented disclosure to friends and partners.
**Conclusions:** This group of high-risk YMSM had an overall positive experience as research participants. They identified unanticipated benefits and heightened concerns about disclosure, in particular, PrEP-related stigma, which may impact PrEP adherence. Attention to these barriers in the design of consent processes for future trials will facilitate appropriate access to biomedical HIV prevention research for adolescents.

## LBPE020

### VARIATION IN INCIDENCE, TYPE AND SEVERITY OF AE BY CIRCUMCISION METHOD IN VMMC CLIENTS AGED 10-14 IN MOZAMBIQUE

M. Mahomed[1], J. Come[2], D. Bossemeyer[1], E. Necochea[3], H. Muquingue[1], L. Nhambi[1], K. Curran[3], T. Ashengo[3], J. Reed[3]
*[1]Jhpiego, Maputo, Mozambique, [2]MOH, Maputo, Mozambique, [3]Jhpiego, Baltimore, United States*
*Presenting author email: mehebub.mahomed@jhpiego.org*

**Background:** Mozambique MOH introduced VMMC as part of HIV prevention strategies in 2009. The surgical circumcision method originally chosen was forceps guided (FG). Glans injuries were reported to WHO among younger adolescents circumcised using FG method throughout 14 VMMC priority countries. In August 2014, MOH recommended that dorsal slit (DS) be used in VMMC clients aged 10-14 years, consistent with WHO guidance. Since then, VMMC clinical providers have been trained to attain proficiency in both methods.

The authors assessed the frequency and characteristics of adverse events (AEs) among VMMC clients aged 10-14 years by circumcision method (FG&DS), including glans injuries.

**Methods:** AE data were abstracted from circumcised clients aged 10-14 from November 2009 to December 2015 in 40 facilities in six provinces. By convention, only moderate and severe AEs/rates were included. Analysis was done to characterize AEs diagnosed and quantify AE rates, and compared by FG vs. DS method for statistical significance using Chi-square.

**Results:** Total of 447,289 VMMC procedures were conducted in the period, 235,527 (52.7%) among males aged 10-14 years. Of these, 198,242 (84.1%) through FG and 37,285 (15.8%) by DS. With FG the AE rate was 0.3% (341/112,997) and 0.14% (30/21,252) with DS. Chi-square revealed statistical differences between frequencies of AE in FG and DS (p=0.001), though 43% of clients failed to follow-up on day 7, and AEs are unknown among these. Only clients returning for follow-up visit were considered. No glans injuries occurred with DS, while with FG, there were 6 (5.9%). For both methods, bleeding/hematoma was the most frequently diagnosed AE, 23% with FG and 43% with DS, a difference of proportions t test revealed statistical differences (p=0.000). Infection and pain were similar across both methods.

**Conclusions:** The DS VMMC method reduced the risk of glans injuries among clients aged 10-14 years. Overall rate of AE was lower with DS than FG, with statically significant differences, except for bleeding/hematoma. Ongoing training in FG and DS surgical techniques should continue to ensure proficiency in both methods and further expand availability of appropriate VMMC methods to meet demand for VMMC, which is particularly high among adolescents.

## LBPE021

### THE SOCIAL CONTEXT OF HIV SELF-TESTING: A GLOBAL QUALITATIVE EVIDENCE SYNTHESIS

Y. Qin[1,2], A. Babitt[1], L. Han[1], J.S. Walker[3], F. Liu[4], W. Tang[1], J.D. Tucker[1,5]
*[1]UNC Project China, Guangzhou, China, [2]Case Western Reserve University, Cleveland Clinic Lerner College of Medicine, Cleveland, United States, [3]University of North Carolina at Chapel Hill, Health Sciences Library, Chapel Hill, United States, [4]Guangdong Provincial Center for Skin Diseases and STI Control & Prevention, Guangzhou, China, [5]University of North Carolina at Chapel Hill, School of Medicine, Chapel Hill, United States*
*Presenting author email: ylqin458@gmail.com*

**Background:** HIV self-testing (HIVST) has the potential to expand HIV testing due to its confidential nature and accessibility, but substantial ethical concerns remain. Quantitative studies suggest widespread acceptability, but provide limited evidence on the social context of HIVST. We synthesized qualitative evidence on implementing HIVST.

**Methods:** We searched ten databases for studies reporting qualitative evidence on HIVST. All studies included individuals who self-tested or stakeholders who had organized an HIVST program. Data extraction and thematic analysis were used to synthesize findings. Quality was assessed using the CASP tool and certainty of evidence was evaluated using the CERQual approach.

**Results:** Fourteen studies from six countries focused on adults (12 studies), adolescents (2 studies), couples (2 studies), men who have sex with men (5 studies), transgender individuals (1 study), and health care workers (4 studies). Six studies were conducted in low and middle-income countries and eight in high-income countries. Fourteen studies included perspectives on individual experiences with self-testing, but no studies reported on stakeholder experiences with organizing self-testing programs. We identified 6 themes. HIVST was preferred to facility-based testing because of improved accessibility, feasibility, and confidentiality (high quality of evidence). HIVST provided a more personalized testing experience that increases agency, moving testing away from the clinic and into people's homes and lives (high quality of evidence). HIVST expanded partner-testing among both casual and long-term partners, with implications for partner services (high quality of evidence). Adverse outcomes such as psychological distress, coercive testing, and violence during partner testing were investigated and only mild anxiety was reported (low quality of evidence). HIVST initiation was associated with less overall test-associated stigma compared to facility-based testing, although stigma persisted and was associated with discovery of the self-test kit (moderate quality of evidence). HIVST increased awareness of the link between sexual risk and HIV testing, decreasing barriers to knowing one's serostatus (moderate quality of evidence).

**Conclusions:** HIV self-testing increases agency and broadens the context in which testing occurs. Our findings have implications for developing national and global guidelines on HIV self-testing. Further implementation research on scaling up self-testing is needed.

## LBPE022

### GENERATION UBUNTU COMPREHENSIVE CARE MODEL

J. Kuhn[1], N. Khonkwane[2], Z. Zantsi[3]
*[1]Generation Ubuntu, Programme Management, Cape Town, South Africa, [2]Generation Ubuntu, Health, Cape Town, South Africa, [3]Generation Ubuntu, Education, Cape Town, South Africa*
*Presenting author email: nomzikayise@genubuntu.org*

**Background:** Generation Ubuntu (GenU) offers a Comprehensive Care Model to children ages 4-18 living with HIV in Khayelitsha, South Africa. GenU aims to provide the gold standard of care to 140 regularly attending children from the Khayelitsha area. The programme runs Monday-Friday year round. The objectives of the programme are 1) Increase BMI from Initial Health Assessment, 2) Increase Adherence to ARV medication, and 3) Promote healthy living (measured by the above) and acceptance of HIV status.

**Description:** GenU was founded in 2006 and has worked with more than 340. GenU is an afterschool programme based in Site B of Khayelitsha. Children are cared for under the 4 Departments of the Comprehensive Care Model outlined in the Department Descriptions Table.

| | Health & Nutrition | HIV Education & Life Skills | Psycho-Social Support | Community Engagement |
|---|---|---|---|---|
| Deliverables | • Nutritious meals • Health education • Monthly Health Assessments and adherence counseling • Quarterly Health Packages | • Tailor-made HIV & Life Skills curriculum • Physical activities & games • Education outings and guest speakers | • Individual & group counseling • Health disclosure support • Case management and home visits • Individual treatment plans | • Caregiver workshops • Community outreach, and advocacy • Scholar-led community service projects |

*[Department Descriptions]*

GenU will present its findings through a specific example of a student, Simbulele. Simbulele had her initial health assessment at the age of 15 in January 2015. Simbulele had ulcers covering her trunk, sacral region, and legs. Her BMI revealed she was "Underweight", as classified by the CDC, at 13.17 (Weight 22.6 kg & Height 131 cm). Her viral load was 152572. Her caregivers did not understand the importance of adherence to ARV's and the severity of her health.

**Lessons learned:** The below table explains how GenU's Comprehensive Care Model positively impacted Simbulele's health over a 6 month period from January to July 2015.

| | Health & Nutrition | HIV Education & Life Skills | Psycho-Social Support | Community Engagement |
|---|---|---|---|---|
| Outcome | • Suppressed viral load to 1304 in July 2015 and 576 in March 2016 • BMI of 17.99 „Healthy Weight" (32.3 kg, 134 cm) • 10.1 kg weight gain | • Simbulele's facilitator delivered GenU curriculum increasing knowledge and understanding of her HIV status | • 3 home visits & caregiver counseling sessions • 9 Case Management meetings • 1-on-1 counseling sessions with a Social Worker | • Community outreach events increased Simbulele's acceptance & understanding of her status |

*[Department Outcomes]*

Simbulele's most recent Health Assessment (March 2016) reveals she is at a BMI of 24.48 kg/m$^2$, a "Healthy Weight".

**Conclusions/Next steps:** The crosscutting of departments, which comprise GenU's Comprehensive Care Model, yields similar results to Simbulele's constantly. The GenU programme is effective and life changing. We have learned the importance of tracking Health Assessments and departmental interventions. Improving policies and procedures to better document successes like that of Simbulele will offer more accurate statistics as we continue to benchmark our program. Next steps include finalizing and disseminating the Programme Handbook. This will be offered as an open-source document available online to organizations that wish to implement our Comprehensive Care Model.

## LBPE023

### HIV PREVENTION TRIALS NETWORK'S (HPTN) UTILIZATION OF GOOD PARTICIPATORY PRACTICE GUIDELINES DURING THE DEVELOPMENT OF A FEASIBILITY STUDY AMONG MEN WHO HAVE SEX WITH MEN (MSM) IN SUB-SAHARAN AFRICA

J. Lucas[1], M. Fawzy[1], N. Yola[2], D. Gondwe[3], F. Zulu[3], R. Panchia[4], B. Kanyemba[2], A. Ogendo[5], T. Sandfort[6], The HPTN 075 Protocol Team
*[1]FHI 360, Durham, United States, [2]Desmond Tutu HIV Foundation, Cape Town, South Africa, [3]Johns Hopkins Research Project, Blantyre, Malawi, [4]University of the Witwatersrand, Perinatal HIV Research Unit (PHRU), Chris Hani Baragwanath Academic Hospital, Johannesburg, South Africa, [5]KEMRI/CDC, Kisumu, Kenya, [6]HIV Center for Clinical and Behavioral Studies, Ndw York State Psychiatric Institute and Columbia University, Department of Psychiatry, New York, United States*
*Presenting author email: jlucas@fhi360.org*

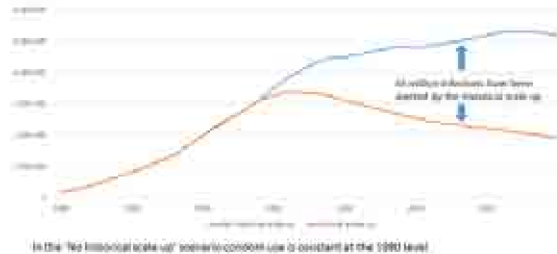
**Background:** HPTN 075 is a vanguard study designed to assess the feasibility of recruitment and retention of MSM in Sub-Saharan Africa (SSA). Given stigma, discrimination, and criminalization of homosexuality in SSA, innovative community involvement approaches were needed to proactively address concerns related to social harms, strengthen community rapport, and plan for community engagement. Robust community involvement during study design, preparation, and implementation is of critical importance for successful study completion.
**Description:** UNAIDS/AVAC Good Participatory Practice Guidelines (GPP) outline effective community engagement strategies for designing and conducting biomedical HIV prevention research. From March 2013 to April 2016 the HPTN Community Working Group (CWG) utilized GPP to provide substantive input into the HPTN 075 study design, on-going contribution to site implementation plans, communications plans, and crisis management plans. Additionally, community representatives at four clinical research sites (CRS) in three countries (Kenya, Malawi, and South Africa) conducted on-going MSM sensitivity trainings with community advisory board (CAB) representatives and all site staff who interacted with study participants. Attendees (n= 97) were provided overviews of homosexuality, global MSM research, HPTN 075 study design, and the SSA HIV epidemic among MSM.
**Lessons learned:** Six African HPTN CWG representatives received training on protocol review and clinical research essentials. Protocol feedback from the CWG representatives resulted in practical operationalization of the proposed study design, improved community engagement efforts, and supported efficient participant enrollment and retention systems. MSM sensitivity training increased site staff's (n=49) and CAB representatives' (n=48) understanding of MSM lived experiences and behavior, decreased stigma, and enhanced site staff's ability to provide culturally appropriate care to MSM. Participants identified potential barriers that might hinder accrual and retention and took steps to make clinics welcoming safe spaces for MSM.
**Conclusions/Next steps:** Engaging community members in resolving matters that affect their community is a fundamental principle of HIV prevention research. It is an important strategy for the conduct of studies in highly stigmatized environments. While GPP provides a comprehensive checklist it cannot be applied blindly in all research and consideration should to be given to context, research literacy levels, rights/legal status of study populations, and need for an ongoing engagement with key stakeholders.

## LBPE024

### THE IMPACT OF THE HISTORICAL SCALE UP OF CONDOMS ON THE HIV EPIDEMIC

J. Stover, Y. Teng
*Avenir Health, Center for Modeling and Analysis, Glastonbury, United States*
*Presenting author email: jstover@avenirhealth.org*

**Background:** Condom use rates increased dramatically from 1990 as people became aware of the HIV epidemic and the protection that condoms could provide. We investigated have estimated the number of HIV infections averted by condoms from 1990-2015.
**Methods:** We used a publicly available mathematical simulation model, the Goals model, to simulate the number of new HIV infections that would have occurred in 45 high burden countries if condoms use rates had remained at their 1990 levels and compared this result with UNAIDS' estimates of actual trends in new HV infections. The Goals model simulates HIV transmission among and between population groups on the basis of behavioral factors (number of partners, acts per partner, age at first sex, needle sharing behavior) and biomedical factors (stage of infections, presence of other STIs, male circumcision, ART and condom use). Results were reviewed at a meeting of condom experts in Geneva, March 21-23, 2016.
**Results:** According to UNAIDS the estimated number of new HIV infections globally peaked at about 3.5 million in the late 1990s and has since decreased to just under 2 million today. Without any increase in condom use the number of new HIV infections would have continued rising to a little over 5 million today. The difference indicates that condom scale-up averted 45 million new HIV infections from 1990-2015. Looking forward to 2020, achieving the UNAIDS condom targets would avert 3.4 million new infections. The cost per infection averted would be about $450, well below the lifetime cost of providing antiretroviral treatment.
**Conclusions:** Condoms have played an important role in controlling the HIV epidemic and are a key component of efforts to achieve the Fast-Track goals. We need to ensure that funding for condom procurement and programming is adequate in order to enhance the impact and cost-effectiveness of future efforts.



*[Number of new HIV infections with and without condoms in LMIC, 1990-2015]*

## LBPE025

### ESTIMATING CONDOM NEEDS AND GAPS FOR FAST-TRACKING PEOPLE-CENTRED CONDOM PROGRAMMING IN SUB-SAHARAN AFRICA

H. Van Renterghem[1], C. Benedikt[2], B. Deperthes[3], G. Dallabetta[4], C. Broxton[5], J. Stover[6], K. Dehne[1]
*[1]UNAIDS, Department of Rights, Gender, Prevention and Community Mobilization, Geneva, Switzerland, [2]Consultant, Innsbruck, Austria, [3]UNFPA, Technical Division Branch: HIV/AIDS, New York, United States, [4]Bill & Melinda Gates Foundation, Global Development Program / Integrated Delivery / HIV, Washington, United States, [5]USAID, US Agency for International Development, Global Health Bureau, Arlington, United States, [6]Avenir Health, Center for Analysis and Modeling, Glastonbury, United States*
*Presenting author email: vanrenterghemh@unaids.org*

**Background:** Despite condoms' major contribution to HIV incidence declines in various countries and their critical role in achieving the fast-track goals, investments have lagged since 2001. Condom use at last sex with a non-regular partner is less than 50% in several countries and sub-populations in sub-Saharan Africa. There is no agreed approach to estimate condom need, set targets and calculate gaps to inform comprehensive needs-based programming and resource mobilisation.
**Methods:** An MS-excel based tool was developed to generate national condom needs estimates by aggregating specific needs estimates for preventing HIV, STIs and unintended pregnancy for major sub-populations "at higher risk" including sex workers, MSM, people with non-regular partners, young people, PLHIV, and family planning clients who use condoms. For each sub-population need is calculated using published data on population size, HIV prevalence, sexual behaviour and condom use targets (80-95%). Overlap between estimates for sub-populations are corrected and assumptions for wastage included. The national condom gap is calculated using data on total annual male and female condom distribution.
**Results:** Total estimated condom need for the 46 countries was 6.4 billion ranging from 63 condoms per male age 15-64 in Botswana to 14 in Ethiopia. On average, condom needs for sex workers and their clients accounted for 35% of the total need, HIV affected couples for 22%, non-regular partners for 19%, MSM for 9% and other users of condoms for family planning for 16% of the total need. In 2015, an estimated 2.7 billion condoms were distributed in Africa, suggesting a potential gap of 3.7 billion against the total estimated need (6.35 billion) and that 58% of the condom need was not met. Country gaps ranged from 3% of total condom need in South Africa to >75% in several countries. 110 million US$/year is needed to close the procurement gap. Range: 24 million US$ (Nigeria) to ≤1.5 million US$ (25 countries).
**Conclusions:** Our estimate of total potential condom need suggests that there is a substantial condom programming gap in most sub-Saharan African countries. Increased investment in scale-up of comprehensive demand generation, procurement and people-centred programming is needed to ensure condoms' full contribution to combination HIV prevention.

## LBPE026

### SYSTEMATIC REVIEW OF THE BARRIERS AND FACILITATORS TO VOLUNTARY MALE MEDICAL CIRCUMCISION (VMMC) UPTAKE IN PRIORITY COUNTRIES AND RECOMMENDATIONS

M. Carrasco[1,2], J. Wilkinson[1], T. Mah[1]
*[1]United States Agency for International Development (USAID), Office of HIV/AIDS, Washington, United States, [2]Johns Hopkins Bloomberg School of Public Health, Health, Behavior and Society, Baltimore, United States*
*Presenting author email: tmah@usaid.gov*

**Background:** In 2007, the WHO called for scaling-up voluntary maedical male circumcision (VMMC) as an effective HIV prevention strategy, particularly in 14 priority countries with generalized HIV epidemics and low male circumcision prevalence. While millions have accessed VMMC since scale-up, demand has been lower than expected, compromising VMMC's HIV prevention benefits at population level. The purpose of this study is to systematically analyze the literature to understand barriers and facilitators to VMMC uptake across countries and offer recommendations.
**Methods:** PubMed, Embase, Web of Science, Scopus, and PsycINFO databases were searched for studies published in peer reviewed journals from 2007 through 2015. Reviewers assessed the eligibility of each study based on predefined inclusion criteria. Twenty three studies were selected: 16 qualitative, 4 quantitative, and 3 mixed methods studies. Data was extracted in a study summary table, and tables and conceptual maps summarizing VMMC barriers and facilitators across countries.
**Results:** The data revealed 17 barriers and 16 facilitators at community, individual, interpersonal, and service provision levels. Key barriers were: male circumcision perceived as being practiced by other or foreign cultures and religions; fear of pain caused by the procedure; and futility of VMMC because of low HIV risk behavior and still needing to use condoms. The main facilitators were: improved hygiene; family and peer support (especially for boys and young men); and enhanced sexual pleasure and sex appeal. VMMC was strongly preferred for younger than older men. Lost wages, cost associated with circumcision, and inconveniences around having to take time off for healing were not prominent barriers across countries.
**Conclusions:** VMMC programs should address barriers to VMMC uptake at various levels, particularly community level where community involvement seems neglected. Additionally, VMMC services should continue to be made fully accessible to boys among whom MC is becoming normative across countries. In the case of adults, offering VMMC information through individually-tailored counseling sessions may help to overcome VMMC-related stigma among adults and determine its appropriateness based on individual circumstances. Given that lost wages were not a prominent barrier, monetary incentives for uptake may not be justified across countries and they should be assessed also considering their psychosocial impact.

## LBPE027

### ASSOCIATIONS BETWEEN NEIGHBORHOOD PHYSICAL DISORDER, SEXUAL BEHAVIORS AND HIV INFECTION AMONG BLACK MEN WHO HAVE SEX WITH MEN IN THE DEEP SOUTH: THE MARI STUDY

D. Duncan[1], N. Crawford[2], R. Bennett[3], J. Gipson[4], S. Barber[5], D. Browne[6], D. Hickson[3,4]
*[1]New York University School of Medicine, New York, United States, [2]Emory University Rollins School of Public Health, Atlanta, United States, [3]Jackson State University School of Public Health, Jackson, United States, [4]My Brother's Keeper Inc, Jackson, United States, [5]Drexel University School of Public Health, Philadelphia, United States, [6]University of North Carolina Gillings School of Global Public Healt, Chapel Hill, United States*
*Presenting author email: dhickson@mbk-inc.org*

**Background:** Despite decades of research examining a broad range of behavioral factors, stark racial and geographic disparities in HIV persist among men who have sex with men (MSM). Moving beyond studies of individual-level factors, a focus on neighborhood contexts may help explain variations in HIV among subsets of MSM. The purpose of this study was to examine associations between neighborhood disorder, sexual behaviors and HIV infection among Black MSM in the Deep South, a population at high risk for HIV.
**Methods:** Data came from the MARI Study, including Black MSM ages 18-66 years recruited from the Jackson, MS and Atlanta, GA metropolitan areas (analytic sample *n*=373). Participants completed questions about neighborhood disorder (i.e., excessive noise, heavy traffic/speeding cars, lack of adequate food, parks and sidewalks, and trash/litter) and sexual behaviors (e.g. condomless sex) as well as underwent STI/HIV testing. We used logistic regression models to estimate the prevalence ratio [PR; 95% confidence intervals (CI)] of neighborhood disorder with sexual behaviors and HIV infection, after adjustment for socio-demographic characteristics.
**Results:** About a fourth of the sample reported neighborhood problems across the different aspects, with the highest (31.4%) being no/poorly maintained sidewalks. Multivariable models show that tertiles of neighborhood disorder was associated with any alcohol or drug use before or during sex (especially drug use before sex), condomless anal sex with a main partner during the last encounter and HIV infection as well as ≥2 main male partners in the past 12 months and exchange sex in the past 12 months (all $p< 0.05$). For example, compared to terile 1, those reporting more neighborhoods disorder in tertile 2 (PR=1.70, 95% C: 1.16, 2.48) and tertile 3 (PR=1.72, 95% C: 1.18, 2.53) reporting more drug use before or during sex ($p$ for trend=0.005). Individuals reporting more neighborhoods disorder in tertile 3, compared to tertile 1, were more likely to be HIV infected (PR=1.48, 95% C: 1.11, 1.96) ($p$ for trend=0.007).
**Conclusions:** Our findings suggest that policies and structural interventions to improve community infrastructure to reduce neighborhood problems (e.g. building quality sidewalks) may alleviate the burden of HIV among Black MSM in the Deep South.

## LBPE028

### CHALLENGES FACED BY HEALTH CARE PROVIDERS IN PROVIDING SERVICES TO KEY POPULATIONS AT RISK FOR HIV IN ZAMBIA

D. Mulenga[1], L. Banda[1], N. Pilgrim[1], M. Musheke[2], H.F. Raymond[3], R. Keating[4], H. Witola[5], J. Mulwanda[5], L. Phiri[1], S. Geibel[6], W. Tun[7]
*[1]Population Council, Lusaka, Zambia, [2]Population Council, Washington, DC, Zambia, [3]San Francisco Department of Health, San Francisco, United States, [4]Population Council, Maurice, United States, [5]National AIDS Council, Lusaka, Zambia, [6]Population Council, Wasington, United States, [7]Population Council, HIV and AIDS Program, Washington, United States*

**Background:** Health service utilization is essential for key populations (KPs) at high risk of HIV in order to reduce their risk of HIV acquisition and transmission and live positively (for HIV positives). Understanding how service providers (SPs) provide care to KPs is important to ensure the development of HIV prevention, care and treatment services tailored for KPs. We report on SPs experiences providing health services to these populations.
**Methods:** Seventy-one service providers participated in in-depth interviews conducted from July 2013 to September 2015 in nine districts in Zambia. Thirty-three (33) were from government institutions, 14 from private clinics, 15 from non-governmental organizations, 6 traditional healers, and 3 from faith-based organizations. Interviews gathered information on the providers' experiences and challenges with KPs' needs, and recommendations to improve HIV-related service utilization. Qualitative thematic content analysis was conducted.
**Results:** The mean age of SPs was 44.6 years and 53.2% were male. The average length of service at institutions ranged from 0-4 years (26%), 5-9 years (20.8%) and 10+ years (53.2%). The majority (84.4%) completed post-secondary school. Four overarching themes emerged from the data. *Legal barriers to care* - service providers in government facilities reported being limited by law and could not go beyond legal frameworks. *Need to provide patient-centered care* - SPs acknowledged lack of confidentiality and privacy, negative staff attitudes, and stigma and discrimination experienced by KPs served as barriers. *Need for more training* - SPs reported that lack of training on how to engage with and care for KPs made it difficult to handle and provide necessary health care to KPs. *Need for more resources* - inadequate human resources and money hindered the provision of necessary care to KPs. SPs noted that more financial help and HIV treatment centers are needed to provide appropriate care to KPs.
**Conclusions:** SPs face varied challenges in providing the necessary care to KPs. Therefore, it is essential to address these needs and challenges through trainings, capacity building, and values clarification and attitude transformation. Increased human resource and improved health infrastructure, and a flexible policy environment are critical in improving service delivery to KPs.

## LBPE029

### MITIGATING THE RISK OF SOCIAL HARMS IN MEN WHO HAVE SEX WITH MEN (MSM) IN SUB-SAHARAN AFRICA PARTICIPATING IN COHORT RESEARCH OF THE HIV PREVENTION TRIALS NETWORK (HPTN)

T. Sandfort[1], M. Fawzy[2], V. Elharrar[3], B. Kanyemba[4], N. Kayange[5], J.P. Lucas[2], A. Ogendo[6], R. Panchia[7], J. Sugarman[8], The HPTN 075 Protocol Team
*[1]HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute and Columbia University, Department of Psychiatry, New York, United States, [2]FHI 360, Durham, United States, [3]National Institutes of Health, Bethesda, United States, [4]Desmond Tutu HIV Foundation, Cape Town, South Africa, [5]Johns Hopkins Research Project, Blantyre, Malawi, [6]KEMRI/CDC, Kisumu, Kenya, [7]University of the Witwatersrand, Perinatal HIV Research Unit (PHRU), Chris Hani Baragwanath Academic Hospital, Johannesburg, South Africa, [8]Johns Hopkins University, Baltimore, United States*
*Presenting author email: tgs2001@cumc.columbia.edu*

**Background:** Participating in HIV prevention research exposes MSM in sub-Saharan Africa (SSA) to various social and cultural risks. In addition, there are risks to research staff and the integrity of the study. Risks to participants include insensitive treatment by study staff and disclosure of sexual practices, resulting in discrimination. There are potential legal repercussions in countries that criminalize homosexual activities because participation implies 'illegal' behavior.
Other risks include physical attacks on study sites and negative media coverage of the study or the MSM population. To safeguard overall safety, these risks need to be thoroughly assessed in advance, and procedures needed to be in place mitigate these risks.
**Description:** Four sites participating in a study designed to assess feasibility of recruitment and retention of MSM in SSA (HPTN 075) developed site-specific risk-mitigation plans (RMPs), informed by the AmFAR *Respect, Protect, Fulfil* guidance. RMPs included ongoing dynamic community consultation; establishing general and MSM community rapport and support; procedures for ensuring confidentiality; sensitizing relevant stakeholders, including the media and local police; procedures for responding to identified problems; an emergency committee; and systematic assessments of possible social harms at study visits. RMPs were reviewed by the study team and individuals with expertise in human subjects protection as well as legal and local implications. RMPs were further refined after visits to two sites where concern for harm was highest. Final plans were approved by the local IRBs.
**Lessons learned:** Five social harms were reported by three sites in the study's first 10 months and addressed according to the RMPs. These social harms included: indecent treatment of study participants (n=2), loss of confidentiality related to MSM status (n=2); and self-disclosure of a positive HIV status, negatively affecting family relationships (n=1). Confidentiality was breached through the discovery of informed consent forms, resulting in homophobic treatment by a manager at work and a decision not to participate in the study. Without RMPs we would have been caught off-guard and an unprepared response might have aggravated these social harms. An efficient and effective response was greatly facilitated by the development of RMPs.
**Conclusions/Next steps:** RMPs are a necessity when doing research with marginalized populations.

## LBPE030

### LESBIAN GAY BISEXUAL AND TRANSGENDER (LGBT) HEALTH NEEDS: KNOWLEDGE AND PRACTICES OF MEDICAL AND NURSING STUDENTS ATTENDING UNIVERSITY OF BOTSWANA

H. Chilongo[1], S. Aslam[2], P. Kgame[2], T. Masupe[3]
*[1]University of Bostwana, Faculty of Medicine, Gaborone, Botswana, [2]University of Botswana, Faculty of Medicine, Gaborone, Botswana, [3]University of Botswana, Department of Family Medicine and Public health, Gaborone, Botswana*
*Presenting author email: sama.aslam8@gmail.com*

**Background:** LGBTs are a key population disproportionately affected by STIs and HIV, with HIV prevalence in Botswana estimated at 13.1%, and Chlamydia 11.3%. Risk factors for HIV and STI transmission include limited access to water-based lubricants and a lack of awareness that anal sex increases HIV risk.Homosexuality is illegal in Botswana, perpetuating stigma against LGBTs.
The study assessed whether medical and nursing students have necessary knowledge and training on unique health needs of LGBTs,for effective medical consultations with LGBTs.
**Methods:** A descriptive cross sectional survey conducted in University of Botswana. A total of 196 medical and nursing students were randomly selected to participate and self-administered questionnaire used. Ethical approval was granted by the UB institutional review board. Epi Info software was used to analyse the data.

**Results:** The response rate was 87%

| RESPONDENT CHARACTERISTICS | TOTAL POPULATION (%) | | |
|---|---|---|---|
| Designation | student doctor- 54% | student nurse 46% | |
| Gender | male- 46% | female- 53% | other- 1% |
| Year of study | year 3- 50% | year 4- 42% | year 5- 8% |
| sexual orientation | heterosexual- 90% | homosexual- 2% | bisexual- 8% |
| Age | minimum- 20yrs | maximum- 26yrs | Mean- 22yrs |

*[Demographics of respondents]*

Although awareness on existence of LGBTs higher than 90%, only 35% reported awareness of unique health-needs of LGBTs with 38% unsure. Only 10% received formal training on consulting a LGBT patient. Knowledge on sexual protection devices was moderate for the condom (61%)very poor for sexual gloves (22%) dental dam (37%) and lubricants (42%). Knowledge on prevalent medical conditions among LGBTs was high for STIs (94%). Fistula formation and anal cancer (62%), suicide and depression (60%) poor for other cancers (40%). Provision of supportive environment during consultations was poor among those who had consulted a LGBT patient,57% of respondents never asking about sexual orientation,only 22% providing non-judgmental setting and 15% screening for relevant illnesses.
**Conclusions:** Awareness on the existence of the LGBT community is high but significantly low knowledge and poor practices on unique health-needs of LGBTs among future healthcare workers. This may be partially attributed to absent formal training on LGBT health needs for medical and nursing students. This is likely to negatively impact future HIV prevention efforts among LGBTs and larger population.

## LBPE031

### HIGHLY SUCCESSFUL ENGAGEMENT IN AN ACUTE HIV-INFECTION AWARENESS CAMPAIGN IN AMSTERDAM

U. Davidovich[1,2], A. van Bijnen[3], M. Dijkstra[2], E. Hoornenborg[4], G. de Bree[5], F. Verdult[6], W. Zuilhof[3], Hiv Transmission Elimination AMsterdam (H-TEAM)
*[1]Public Health Service of Amsterdam, Department of Research, Amsterdam, Netherlands, [2]University of Amsterdam, Academic Medical Centre, Amsterdam, Netherlands, [3]Soa Aids Nederland, Amsterdam, Netherlands, [4]Public Health Service of Amsterdam, Department of Research & STI Clinic, Amsterdam, Netherlands, [5]The Amsterdam Institute for Global Health and Development (AIGHD), Amsterdam, Netherlands, [6]Volle Maan Communications, Amsterdam, Netherlands*

**Background:** Acute HIV infection (AHI) is associated with increased infectiousness because of high levels of HIV viral load. Timely detection and treatment of AHI can contribute to a better HIV prognosis and help prevent onward transmission. Men who have sex with men (MSM) in the Netherlands are generally unaware of the symptomatology and the benefits of early detection and treatment of AHI.
**Methods:** We designed an online intervention to promote knowledge of AHI and skills to self-identify it among MSM, using interactive text, films, and testimonials. An (online) media campaign directed men to the intervention, at www.hebikhiv.nl, where visitors were trained in recognizing AHI-symptoms and subsequently offered an interactive risk-assessment questionnaire combining sexual risk behavior and AHI-related symptoms. If indicated at risk, men were referred to a specific point of care (POC) for rapid HIV RNA testing where AHI could be detected and immediate counseling and treatment could be offered. Intervention participation was monitored using web-statistics, and if presented at the POC, men were questioned regarding their referral source.
**Results:** From mid August 2015 to April 2016, the intervention was visited over 113,700 times by over 96,540 unique visitors. Of all visitors, 56% (53,627/96,540) completed the online risk-assessment tool. Of those, 10% (5,598/53,627) received the advice to test for AHI, and subsequently, 20% (1093/5,598) downloaded the referral letter to the POC. Preliminary results collected at the POC indicated that 142 men presented themselves for AHI testing, of which 65.5% (93/142) were confirmed to arrive through the campaign or website.
**Conclusions:** Despite the specialized theme, the AHI campaign succeeded in engaging a large number of MSM. The high percentage of participants who continued and completed the risk-assessment tool points at an in-depth engagement with the intervention's material. While most men were not found to be at risk for AHI at the moment of participation, their engagement with the intervention is meant to enable them to self-identify an AHI-infection in the future. The Amsterdam AHI campaign is still ongoing and after its completion (2017) the full data collected at the POC will be combined with the findings.

### RISING CD4 COUNTS AT CLINICAL PRESENTATION: EVIDENCE FROM A NOVEL NATIONAL DATABASE IN SOUTH AFRICA

J. Bor[1,2,3], C. Nattey[4], B. Maughan-Brown[5], W. MacLeod[1,3], M. Maskew[3], S. Carmona[6], M.P. Fox[1,2,3]
*[1]Boston University School of Public Health, Department of Global Health, Boston, United States, [2]Boston University School of Public Health, Department of Epidemiology, Boston, United States, [3]University of Witwatersrand, Health Economics and Epidemiology Research Office, Johannesburg, South Africa, [4]University of Witwatersrand, Health Economics and Epidemiology Research Office (HE2RO), Johannesburg, South Africa, [5]University of Cape Town, Southern African Labour and Development Research Unit, Cape Town, South Africa, [6]National Health Laboratory Service, Johannesburg, South Africa*
*Presenting author email: cnattey@heroza.org*

**Background:** Treatment as prevention requires earlier HIV-testing and linkage to care. Prior studies suggest that many patients only seek care once they are sick. Using novel record linkage of National Health Laboratory Services (NHLS) data, we identified - for the first time - the first CD4 specimen collected for all patients in South Africa's national HIV care, management and treatment program, a proxy for the date of clinical diagnosis. Monitoring entry into clinical HIV care is critical to guide resource allocation as test-and-treat is scaled up.
**Methods:** The NHLS database contains nearly all CD4 counts collected in South Africa's national HIV care and treatment program (2004-2015). KwaZulu-Natal joined NHLS in 2010. We constructed and validated a unique patient identifier, enabling identification of the first CD4 count specimen in patients who had never had a viral load (ART-naïve). We estimated the number of patients with a first CD4 specimen and the median value of these CD4 counts, quarterly from 2004-2015, stratifying by gender, province, and district.
**Results:** From April 2004-March 2015, there were 8.8 million first CD4 specimens nationwide. Numbers entering HIV care each quarter increased from 2004 through 2010, reaching over 350,000 per quarter during the 2010/2011 national testing campaign, and have since plateaued at 210,000 per quarter. Median first CD4 count has increased, from 178 cells/mm$^3$ in second quarter of 2004 (men=147; female=194) to 348 cells/mm$^3$ in first quarter of 2015 (men=280; female=386), with rapid increases occurring during the national testing campaign (Figure). However, there are large and persistent disparities in median CD4 by gender and province (Figure).
**Conclusions:** South Africans living with HIV are seeking care earlier than ever before. Geographic and gender heterogeneity suggests potential opportunities to learn from higher-performing regions and the need for targeted interventions in specific areas and among men to increase early engagement with HIV care.

*[Figure. Median CD4 counts in patients presenting for HIV care in South Africa, 2004-2015. Figure displays trends in the median value of first CD4 count specimens recorded, by province and nationally. The figure excludes KwaZulu-Natal, which joined NHLS in 2010. The shaded region denotes the April 2010 - December 2011 national HIV testing campaign]*

## LBPE033

### IMPLEMENTING THE PEPFAR PIVOT: EXPERIENCES FROM ZIMBABWE'S VOLUNTARY MEDICAL MALE CIRCUMCISION PROGRAM

B.J.L. Chikwinya[1], C. Feldacker[2], M. Holec[2], A. Bochner[2], V. Murenje[1], A. Stepaniak[2], L. Masimba[1], S. Xaba[3], S. Balachandra[4], M. Tshimanga[5], V. Chitimbire[6], S. Barnhart[2]
*[1]International Training & Education Center for Health, Harare, Zimbabwe, [2]International Training and Education Center for Health (I-TECH), Seattle, WA, Seattle, United States, [3]Ministry of Health and Child Care, Harare, Zimbabwe, [4]U.S. Centers for Disease Control and Prevention, Harare, Zimbabwe, [5]Zimbabwe Community Health Intervention Project, Harare, Zimbabwe, [6]Zimbabwe Association of Church-related Hospitals, Harare, Zimbabwe*
*Presenting author email: bmakunike@itech-zimbabwe.org*

**Background:** Since 2013, the ZAZIC Consortium implemented an integrated voluntary medical male circumcision (VMMC) program jointly with Ministry of Health and Child Care in 21 districts in Zimbabwe. ZAZIC's integrated VMMC approach used existing healthcare workers and MOHCC infrastructure. From October 2013 through September 2015, ZAZIC expanded from 2 to 36 static VMMC sites and performed a total of 84,708 VMMCs, averaging 3530 per month and exceeding donor targets. More than 85% of all VMMCs were completed independently by existing MOHCC staff in health facilities; approximately two-thirds occurred in outreach settings.
**Description:** In 2015, the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) 3.0 required a strategic *pivot* in Zimbabwe's VMMC program, transitioning from national coverage to focused scale-up in areas of highest disease burden. Under the pivot, ZAZIC's VMMC implementation was limited to 10 scale-up districts beginning in October 2015. Ambitious targets were maintained, translating to a 40% increase in circumcisions within these districts. By January 2016, implementation was discontinued outside of PEPFAR scale-up districts. From October 2015-March 2016, ZAZIC performed 20,241 VMMCs, a monthly average of 3374, demonstrating an impressive transition in accordance with the pivot requirements.

*[Male circumcisions in priority versus non priority districts, pre- and post-pivot]*

**Lessons learned:** The pivot necessitated immediate redirection from program breadth to depth. Due to MOHCC human resource constraints and the dramatic rise in targets, this mandate was accompanied by a rapid ZAZIC shift from integrated service delivery to a mixed implementation approach employing additional mobile teams using non-MOHCC staff.
**Conclusions/Next steps:** ZAZIC's locally-led consortium successfully transitioned its program to meet changing PEPFAR priorities. Momentum indicates continued future achievements. There is need to evaluate the implications of the pivot on VMMC cost, quality, population-level HIV reduction benefit, and impact on the health system as a whole.

## LBPE034

### EVALUATION OF A CONDITIONAL CASH TRANSFER PROGRAM FOR PREVENTING MOTHER TO CHILD TRANSMISSION (PMTCT) OF HIV IN NIGERIA

J. Liu[1], N. Wilson[2], N. Padian[3]
*[1]University of California, San Francisco, Institute for Health and Aging, San Francisco, United States, [2]Reed College, Department of Economics, Portland, United States, [3]University of California, Berkeley, Department of Epidemiology, Berkeley, United States*
*Presenting author email: nancy.padian@gmail.com*

**Background:** Nigeria suffers from the highest burden of MTCT worldwide. Although PMTCT services are widely available at public clinics, most HIV+ women do not complete the PMTCT cascade. To increase retention, a conditional cash transfer (CCT) program was piloted in Akwa Ibom in 2014 for HIV+ pregnant women. Through a

randomized control trial, we evaluate the effect of this program on two targeted health behaviors—delivering at a facility and getting an early infant diagnosis (EID) 6-8 weeks post-birth. Interim results (the study is on-going) became available in spring 2016.
**Methods:** From August 2015 to April 2016, HIV+ pregnant women at three public facilities in Akwa Ibom, Nigeria were randomized to be offered enrollment in the CCT program, where they received cash incentives for up to US$160; (determined with feedback from local stakeholders and patient-reported out-of-pocket medical expenditures) independently for: enrolling, delivering at the facility, and obtaining an EID, compared the standard course of care. Data on patient characteristics, delivery outcomes and infant testing were extracted from administrative records. Regression analysis was conducted to estimate the intent-to-treat (ITT) effects of the program.
**Results:** Of 473 pregnant women testing HIV+ so far, 238 (50.3%) were randomized to the control group and 235 (49.7%) to the treatment group. Compared to women in standard PMTCT care, women in the CCT program were significantly more likely to give birth at the facility (OR=2.28, p=0.001, n=300), representing a 18.4 percentage point difference in facility-based births (27.5% vs. 45.9%). Women in the CCT program were also significantly more likely to return for an EID test (OR=1.78, p=0.068, n=181) than those in standard PMTCT care, representing a 13.5 percentage point difference in EID testing (32.1% vs. 45.6%).
**Conclusions:** Preliminary results suggest that a CCT program can improve retention in PMTCT in Akwa Ibom, Nigeria. Through continued research we will assess: optimal cash amounts, better targeting of women most in need, reasons for non-compliance and self-reported survey data on care and treatment behaviors.

## LBPE035

### A NOVEL ONLINE-TO-OFFLINE (O2O) MODEL FOR PREP AND HIV TESTING SCALE UP

T. Anand[1,2], C. Nitpolprasert[1,2], D. Trachunthong[1,3], S. Janyam[4], D. Linjongrut[5], N.S. Wong[6], L.B. Hightow-Weidman[7], J. Ananworanich[2,8,9], P. Phanuphak[1,3], N. Phanuphak[1,2]
*[1]The Thai Red Cross AIDS Research Centre, Bangkok, Thailand, [2]SEARCH, The Thai Red Cross AIDS Research Centre, Bangkok, Thailand, [3]HIV-NAT, The Thai Red Cross AIDS Research Centre, Bangkok, Thailand, [4]Service Workers In Group Foundation, Bangkok, Thailand, [5]Rainbow Sky Association of Thailand, Bangkok, Thailand, [6]Institute for Global Health and Infectious Diseases, University of North Carolina at Chapel Hill, Chapel Hill, United States, [7]Behavior and Technology Lab, Institute for Global Health and Infectious Diseases, University of North Carolina at Chapel Hill, Chapel Hill, United States, [8]U.S. Military HIV Research Program, Walter Reed Army Institute of Research, Silver Spring, United States, [9]Henry M. Jackson Foundation for the Advancement of Military Medicine, Bethesda, United States*
*Presenting author email: tarandeepsinghanand@gmail.com*

**Background:** PrEP awareness and uptake among men who have sex with men (MSM) and transgender women (TG) in Thailand remains low. Finding ways to identify high-risk groups through innovative and scalable methodologies for increasing uptake of PrEP and HIV testing is a critical priority.
**Methods:** The Thai Red Cross AIDS Research Centre (TRCARC)'s Adam's Love (www.adamslove.org) launched a three-month program to enroll MSM and TG into free PrEP and HIV testing services using its novel Online-to-Offline (O2O) model at four sites in Bangkok including Adam's Love private clinic, TRCARC public clinic, and two community-based clinics. Adam's Love online staff provided real-time PrEP eCounseling to assess and enroll at-risk participants who made online bookings via free Eventbrite application and received auto-generated e-ticket and Quick Response (QR) code on their mobile devices that were scanned at check-in by the offline site staff.
**Results:** Between January 10th - April 11th, 2016, Adam's Love reached 272,568 people online via PrEP O2O campaign. 425 MSM and TG received eCounseling, made online bookings, and received QR codes. 325 (76.4%) actually checked-in at clinics, with 168 PrEP users (52%) and 148 HIV testers (48%). Median (IQR) time between receiving e-ticket and actual check-in was 2 (0-7) days for HIV testing and 3 (1-7) days for PrEP services. Clients of Adam's Love and TRCARC clinics had higher education (p< 0.001), higher income (p< 0.001), were less likely to be bisexual (p=0.007), and less aware of any HIV prevention methods (p=0.02), than those at community-based clinics. In a multivariate model, higher education (OR 2.17, 95%CI 1.06-4.45; p=0.03), seeking sex partners online (OR 2.17, 95%CI 1.19-3.61; p=0.01), being aware of sexual partners' HIV status (OR 2.42, 95%CI 1.31-4.48; p=0.008), ever used PEP (OR 2.39, 95%CI 1.15-4.96; p=0.02), and enrollment at Adam's Love clinic (OR 4.05, 95%CI 2.18-7.54; p< 0.001) were associated with PrEP uptake.
**Conclusions:** Adam's Love O2O model is highly effective in linking online at-risk people to actual PrEP and HIV testing services, using online eCounseling and booking as 'bridging steps'. The O2O model has high potential to be replicated and scaled up in other settings with high internet penetration among key populations.

### ESTIMATION OF TIMELY EID AND MORTALITY AMONG HIV-EXPOSED INFANTS IN MASHONALAND EAST PROVINCE, ZIMBABWE: A SAMPLING-BASED APPROACH

K. Webb[1], V. Chitiyo[1], T. Ndoro[1], S. Zizhou[2], N. Mahachi[3], W. Hartogensis[4], B. Engelsmann[1], E. Geng[4]
*[1]Organisation for Public Health Interventions and Development (OPHID) Trust, Harare, Zimbabwe, [2]Ministry of Health and Child Care, Marondera, Zimbabwe, [3]Ministry of Health and Child Care Zimbabwe, Harare, Zimbabwe, [4]University of California San Francisco, San Francisco, United States*
*Presenting author email: kwebb@ophid.co.zw*

**Background:** Estimates indicate 45% of HIV-exposed infants receive timely Early Infant Diagnosis (EID) in Zimbabwe. However, existing health information systems do not enable routine reporting of the individual proportion of exposed-infants that receive EID, creating uncertainty regarding the true fraction. We conducted a population-based survey in which individual HIV-infected mother-HIV-exposed infant pairs were followed through registers to identify and trace a sample of HIV-positive women with no documented EID for their infants to ascertain better estimates of timely EID completion.
**Methods:** A modified probability-proportional-to-size schema was used to select 45/193 health facilities in Mashonaland East Province. Outcomes of all HIV positive mothers enrolled in ANC from Apr-12 to May-13 were traced through facility registers to determine documented uptake of EID<3 months of age. A random sample of women with no documented EID for their infants were traced at household-level to determine true outcomes. We estimate cumulative incidence of timely EID and death by 3 months of age among the population of HIV-exposed infants.
**Results:** Among 18,065 women attending ANC, 2,651 were HIV positive (14.7%); 31.2% (n=828) had documented uptake of EID within three months (95%CI:29.5%-33.0%). From Mar-May 15, of 643/1,826 (35.3%) mothers of HIV-exposed infants with no documented EID, 256 (39.8%) were successfully traced at household level. The majority of infants (76.9%;n=190) traced had DNA PCR samples for EID, however only 38.4% (n=73) confirmed timely EID within 3 months of birth. We observed a high rate of HIV-exposed infant mortality (17.8%; 66/371) among infants for whom vital status outcomes could be ascertained and 'my child died' was the number one reason provided among the 'no EID' group. Weighted population estimates indicate cumulative incidence of infant death by 90 days at 3% (95%CI:3.4% - 4.4%) and an annual infant mortality rate of 7.7% (95%CI: 4.7%- 13.5%). Cumulative incidence of timely EID with death as a competing risk was 60% (95%CI: 58.7% to 61.3%).
**Conclusions:** Our findings indicate uptake of timely EID among HIV-exposed infants is currently underestimated. High, early mortality among HIV-exposed infants underscore need to identify HIV positive mother-HIV exposed infant pairs at high risk of adverse outcomes and loss-to-follow-up. Sampling-based approaches are valuable tools for providing a better picture of PMTCT program effectiveness.

## LBPE037

### DIFFERENTIATED MODELS FOR DELIVERY OF ANTIRETROVIRAL THERAPY TO HIV-INFECTED WOMEN IN THE POSTPARTUM PERIOD IN CAPE TOWN, SOUTH AFRICA

A. Zerbe[1], V.O. Iyun[2], M. Chihana[2], A. Nofemela[2], T. Phillips[2], K. Brittain[2], E.J. Abrams[1], L. Myer[2]
*[1]ICAP at Columbia University, Mailman School of Public Health, New York, United States, [2]School of Public Health & Family Medicine, University of Cape Town, Division of Epidemiology & Biostatistics and Centre for Infectious Disease Epidemiology & Research, Cape Town, South Africa*
*Presenting author email: eja1@cumc.columbia.edu*

**Background:** Concerns exist regarding delivery of antiretroviral therapy (ART) to HIV-infected women in the postpartum period, including low levels of retention in care and poor adherence. We piloted an innovative model of care for delivery of ART services to postpartum women.
**Methods:** We recruited a cohort of HIV-infected women who initiated ART in pregnancy making their first postpartum visit at a primary care facility in Cape Town, South Africa. Eligible women were asked to choose between two models of care for delivery of long-term ART services: (i) referral to existing system of community-based 'ART adherence clubs' (ACs), operated by lay counsellors with medication collection every 2-4mo; or (ii) referral to the local primary care clinic (PHC), with services provided by clinicians and medication collection every 1-2mo (standard of care). Women were followed through 6mo postpartum with study visits conducted separately from either ART service.
**Results:** Between February and September 2015, 129 postpartum women were enrolled (mean age, 28yrs; median time postpartum, 10 days); 65% (n=84) opted for ACs and 35% (n=45) for PHC. Reasons for choice included shorter wait times, ability to receive ART from lay counsellors and less frequent appointments among those choosing ACs; women opting for PHC cited proximity to their homes and/or infant health services and more frequent contact with clinicians. Among women choosing

Author Index

ACs, 64% were retained in ACs through 6mo postpartum; 14% never attended AC visits; 18% dropped out after at least one visit and 2% were referred out for clinical reasons. Of those who chose ACs, 61%, 26%, and 13% reported none, < 1, and 1+ missed doses, on average, per 30 days on ART up to 6mo postpartum, respectively. In this group, 87% (n=73) had 6mo viral load (VL) measure. Of these, 88% and 92% had VL< 50 and < 1000 copies/mL, respectively. Compared to women who were retained, women who disengaged from ACs were more likely to have VL≥50 (p=0.051) and VL≥1000 (p=0.001).

**Conclusions:** These data demonstrate that it is possible to refer HIV-infected women on ART to ACs immediately postpartum. However ongoing retention remains a concern and further research is needed to evaluate long-term outcomes.

## LBPE038

### HIGH RATES OF RETENTION AND VIRAL SUPPRESSION IN THE SCALE UP OF ANTIRETROVIRAL THERAPY ADHERENCE CLUBS IN CAPE TOWN, SOUTH AFRICA

P. Tsondai[1], L. Wilkinson[1,2], A. Grimsrud[3], P. Mdlalo[1], A. Trivino[1], A. Boulle[1,4]
*[1]University of Cape Town, School of Public Health and Family Medicine, Cape Town, South Africa, [2]Médecins Sans Frontières, Cape Town, South Africa, [3]International AIDS Society, Cape Town, South Africa, [4]Provincial Government of the Western Cape, Department of Health, Cape Town, South Africa*
*Presenting author email: priscilla.tsondai2@gmail.com*

**Background:** Increasingly there is health authority scale up of successfully piloted differentiated models of antiretroviral therapy (ART) delivery to stable patients. However, there is a paucity of evidence on system-wide outcomes after scale-up. In the Cape Town metropolitan district, stable patients (ART>6 months, supressed viral load) were referred to Adherence Clubs (ACs) - a group model of ART delivery with five visits per year. By the end of March 2016, approximately 32% of 142,000 ART patients were in an AC**.** We describe patient outcomes of a representative sample of AC patients during this scale-up.

**Methods:** Patients enrolled in an AC at non-research supported sites between 2011 and 2014 were eligible for analysis. We sampled 10% of ACs (n=100) in quintets proportional to the number of ACs at each facility, linking each patient to city-wide laboratory and service access data to validate retention and virologic outcomes. We digitised registers and used cross-sectional and Kaplan-Meier methods to estimate outcomes: lost to follow-up (LTFU), transfer (TFO) and viral load assessment and suppression (< =400 copies/mL).

**Results:** Of the 3,216 adults contributing 4,188 person years of follow-up (94% in an AC, median 13 months), 71% were women. The median time from ART initiation to AC enrolment was 2.3 [interquartile range (IQR) 1.5-3.6] years. Cross-sectional retention at study closure was 89%, with 4(0.1%) reported deaths and 104(3.2%) patients LTFU. Of 251 (7.8%) transfers, 174(69%) were originally classified as LTFU identified through data linkage. Cumulatively retention, LTFU and TFO were 94.9% (CI 92.9-94.8), 2.1% (CI 1.6-2.8) and 3.9% (CI 3.2-4.7) at 12 months and 83.7% (CI 81.5-85.6), 5.1% (CI 4.0-6.5) and 11.6% (CI 10.0-13.5) at 24 months after AC enrolment. After 12 and 24 months in an AC, 96.8% (CI 96.0-97.4) and 96.0% (CI 95.0-97.0) were virally supressed, with viral load completion in 87% and 84% of patients.

**Conclusions:** This is the first analysis reporting patient outcomes after health authorities scaled-up a differentiated care model across a high burden district. The findings provide substantial reassurance that stable patients on long-term ART can safely be offered care options, which are more convenient to patients and less burdensome to services.

## LBPE039

### ADVERSE EVENT PROFILE OF A MATURE VOLUNTARY MEDICAL MALE CIRCUMCISION PROGRAM

B.J.L. Chikwinya[1], A. Bochner[2], C. Feldacker[2], M. Holec[2], V. Murenje[1], S. Xaba[3], S. Balachandra[4], M. Tshimanga[5], V. Chitimbire[6], S. Barnhart[2]
*[1]International Training and Education Center for Health, Harare, Zimbabwe, [2]International Training and Education Center for Health (I-TECH), Seattle, Washington, Seattle, United States, [3]Ministry of Health and Child Care, Harare, Zimbabwe, [4]U.S. Centers for Disease Control and Prevention, Harare, Zimbabwe, [5]Zimbabwe Community Health Intervention Project, Harare, Zimbabwe, [6]Zimbabwe Association of Church-related Hospitals, Harare, Zimbabwe*
*Presenting author email: bmakunike@itech-zimbabwe.org*

**Background:** The frequency of adverse events (AEs) is a widely used indicator of voluntary medical male circumcision (VMMC) program quality. Though over 9 million male circumcisions (MCs) have been performed, little published data exists on the profile of AEs from mature, large-scale programs. No published data exists on routine implementation of PrePex, a device-based MC method that is being scaled up in the region.

**Methods:** The ZAZIC Consortium began implementing VMMC in Zimbabwe in 2013, supporting services at 36 facilities. Aggregate data on VMMC outputs are collected monthly from each facility. Detailed forms are completed describing the profile of each moderate and severe AE. Bivariate and multivariable analyses were conducted using log-binomial regression models.

**Results:** From October 2014 to September 2015, 44,868 clients were circumcised according to their VMMC method choice; 156 experienced a moderate or severe AE. AEs were uncommon: 0.28% (116/41,416) of surgical and 1.16% (40/3,452) of PrePex clients experiencing an AE. After adjusting across the 36 VMMC sites, we found that PrePex was associated with a 3.29-fold (95% CI, 2.04-5.30) increased risk of experiencing an AE compared to surgical procedures. Device displacements, when the PrePex device is intentionally or accidentally dislodged during the 7-day placement period, accounted for 70% of PrePex AEs. The majority of device displacements were intentional self-removals. Infection was the most common AE among VMMC clients. Compared to clients ages 20 and above, clients ages 10-14 were 3.07-fold (95% CI, 1.30-7.26) more likely to experience an infection and clients ages 15-19 were 1.80-fold (95% CI, 0.72-4.48) more likely to experience an infection, adjusted for site.

**Conclusions:** To the best of our knowledge, this exploratory analysis is the first to show that clients receiving a PrePex MC were more likely to experience an AE than surgical circumcision clients. This is largely attributable to the frequent occurrence of device displacements, most of which could be prevented if client behavior could be modified through counseling interventions. We are also the first to find that infection after MC is more common among younger clients. Young clients may benefit from additional counseling or increased parental involvement to reduce infections.

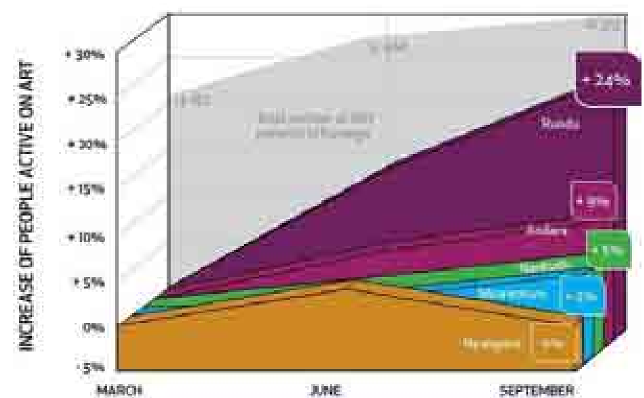
## LBPE040

### THE KAVANGO TREATMENT INITIATIVE: ENGENDERING MUTUAL EMPATHY TO CATALYZE ACTION TOWARD ACHIEVEMENT OF THE 90-90-90 TARGETS

S. Posner, A. Davis, P. Komu, J. Shityuwete, The Kavango Treatment Initiative Members
*Pact (Namibia), Windhoek, Namibia*
*Presenting author email: sposner@gmail.com*

**Background:** Namibia's Kavango Region had the second-highest HIV treatment gap in the country at almost 50% (PEPFAR analyses, 2015). As part of the PEPFAR-funded Namibian Institutional Strengthening project, the Kavango Treatment Initiative (KTI) was a highly successful, locally-driven platform that created the opportunity for local actors to focus on shared objectives and formulate innovative and collaborative solutions to address the local epidemic.

**Description:** Targeting Rundu District, the largest district in the region, KTI was a critical platform for improving the HIV cascade. After a careful recruitment process, the KTI merged local, easily understood data on service mapping, patient data and pharmaceutical data with innovative facilitation approaches to foster open interaction, trust, needed dialogue and idea exchanges between health care providers and PLWHA, along with critical experiential learning to develop clear, shared goals. The results were local solutions implemented by highly motivated and empowered members. Convening 6 times in less than 6 months, the KTI (1) improved data demand and systems which led to improvements in the management of client flows, waiting times, defaulter tracking and referrals, and reduced stock-outs, and (2) increased active ART clients by 24%.



*[Figure 1: Increase in active clients by 24% in Rundu District between March and Sept 2015]*

**Lessons learned:** As a forum that removed organizational and rank boundaries, the KTI broke through many constraints typical of coordination structures. The facilitated processes inspired empathy and solidarity/consensus, which was critical to

deepening local ownership and understanding of issues and motivated members to mobilize local resources rapidly to take action.

**Conclusions/Next steps:** Small investments in well-facilitated participatory processes that target joint understanding, trust, and empathy can dramatically motivate government and non-governmental actors to creatively take action. Opportunities for generating and sustaining high levels of motivation for catalyzing action are critical in places like Namibia where the HIV response is predominantly domestically funded, and where efficiencies in human resources and supporting systems are urgently required to deliver an effective response.

## LBPE041

### COMMUNITY-BASED DISTRIBUTION OF HIV SELF-TEST KITS: RESULTS FROM A PILOT OF DOOR-TO-DOOR DISTRIBUTION OF HIV SELF-TEST KITS IN ONE RURAL ZIMBABWEAN COMMUNITY

E.L. Sibanda[1], M. Mutseta[2], K. Hatzold[2], S. Gudukeya[2], A. Dhliwayo[2], C. Lopez[2], M. Tumushime[1], C. Watadzaushe[1], G. Maringwa[1], M. Mapingure[2], O. Mugurungi[3], G. Ncube[3], H. Weiss[4], M. Taegtmeyer[5], M. Neuman[4], E. Corbett[4], F.M. Cowan[1,6]
*[1]Centre for Sexual Health and HIV/AIDS Research, Harare, Zimbabwe, [2]Population Services International Zimbabwe, Harare, Zimbabwe, [3]Ministry of Health & Child Care, Harare, Zimbabwe, [4]London School of Hygiene & Tropical Medicine, London, United Kingdom, [5]Liverpool School of Tropical Medicine, Liverpool, United Kingdom, [6]University College London, Research Department of Infection & Population Health, London, United Kingdom*
*Presenting author email: euphemiasibanda@yahoo.co.uk*

**Background:** We piloted household distribution of HIV self-test (HIVST) kits in one rural district in Zimbabwe in preparation for a community randomised trial evaluating HIVST distribution models.

**Methods:** We briefly trained 81 paid community volunteers (CV) to distribute HIVST kits in four rural wards. Test-kits were distributed house-to-house to adults (≥16 years) with verbal consent. CV provided information on HIVST use and post-test referral. Demographic data were captured electronically from test acceptors who could opt to test alone or with CV assistance. Self-testers were asked to return used kits to locked drop-boxes in communities. Late read was then used to estimate HIV prevalence. At two and four weeks after kit distribution, PSI provided confirmatory testing, CD4 cell count/clinical staging/referral and non-HIV services through mobile outreach. Focus group discussions (FGD) explored views on HIVST and were analysed thematically. A follow-up household survey is underway providing population level estimates of uptake and linkage to services.

**Results:** Between 23Mar16 and 23Apr16, 79 CVs distributed 8,095 HIVST kits to 3,516 (51.8%) households across all four wards (estimated adult population 14,534 (males=5,849)) representing coverage of 61% in men and 52% in women. Electronic data are available for 7,510 individuals; 44% were male, 15% were adolescents (16-19 years). 85% tested without CV assistance and 5,521 (68.2%) returned their used HIVST kits as requested. On late read 0.4% kits were invalid and 0.4% were unused. Of the remaining kits 1153 (21.0%) of 5,479 were HIV+ve, representing a minimum yield of 1153/8095 (14.3%).

824 (10.2%) participants accessed PSI post-test services; some presented directly to public health facilities. A minimum of 48 HIV positive self-testers have been initiated on antiretroviral therapy to date.

In FGD self-testers stated that HIVST facilitated testing among individuals who would not test otherwise. Demand for HIVST exceeded supply.

**Conclusions:** Community-based distribution of HIVST is acceptable and results in high testing coverage, particularly among men and young people. The high testing yield suggests participation by high risk individuals with unknown status, although we cannot exclude use of kits to confirm known HIV+ve status. More precise estimates of uptake and linkage based on household surveys are currently being analysed.
