**Methods:** mothers2mothers implement KMMP at 20 high volume facilities in Kenya. On first contact, MMs record client details in a longitudinal register which is updated each time the clients returns to the facility for priority PMTCT services up to 18 months post-delivery, when the final infant HIV test is done. Any time clients miss appointments; MMs relay a reminder through SMS or phone call, depending on the client's consent. When clients return, MMs enquire and record the reason for missing the appointment. We reviewed program data on missed priorities by randomly sampling 199 HIV positive clients who had defaulted for the period January - December 2014 to better understand the process.
**Results:** Results indicate that 99% of the sampled clients had given consent for follow up via telephone, 64% through SMS and 41% of the clients consented for home visit follow up. Most (74%) of the clients who defaulted returned to the facility after only one phone call. Sixty percent returned and took up the service, 22% relocated and reported accessing services elsewhere, while 8% declined and 3% were not traced. The health service associated with most defaulters was ARV/HAART refill at 24%, maternal CD4 Test uptake at 22% while the health services associated with the lowest numbers of defaulters were infant PCR test and infant cotrimoxazole uptake at 8% each. Reasons for missing appointment were as follows: 22% had travelled, 16% had transferred out and 9% cited fear of stigma and denial.
**Conclusions:** Close monitoring of the key priorities via a telephonic follow up is important to achieving the desired retention level within health facilities. More education and support need to be provided to clients initiating ART/HAART to decrease the defaulter rate.

## WEPEE487

### HIV KNOWLEDGE AMONG TEEN CLUB PARTICIPANTS IN LESOTHO

J. Sanders[1,2], T. Motseki[2], R. Elliott[2], T. Fritts[1,2]
[1]*Baylor College of Medicine, Pediatrics, Houston, United States,* [2]*Baylor College of Medicine Children's Foundation - Lesotho, Maseru, Lesotho*
*Presenting author email: tmotseki@baylorlesotho.org*

**Background:** Teen Club, a peer psychosocial support group for HIV-infected adolescents, was introduced at the Baylor College of Medicine Bristol-Myers Squibb Children's Clinical Center of Excellence-Lesotho (COE) in 2007. Due to an expanding population, there is younger group for those 11-14 years of age and an older group for those 14-18 years of age. Five Baylor College of Medicine Texas Children's Hospital Bristol-Myers Squibb Satellite Centers of Excellence (SCOEs) each have one group for those 11-18 years of age. The Teen Clubs at the SCOEs also invite HIV-infected adolescents receiving medical care at nearby facilities. In an effort to better quantify and improve the HIV-specific knowledge of Teen Club participants, a Health Knowledge Survey (survey) was developed.
**Methods:** Between February and May 2015, the survey was administered to 629 Teen Club participants at the COE and three SCOEs. The survey is a modified version of HIV-KQ-45, a comprehensive, validated survey. Forty questions were written in English with Sesotho translations included and with possible answers of True, False and Don't Know. All survey responses were entered into a database and then coded as correct, incorrect, don't know or excluded (no response or multiple answers selected).
**Results:** The older COE Teen Club demonstrated the highest level of HIV knowledge with 63% of questions answered correctly and the younger COE Teen Club the lowest level at 42% correct responses.
**Conclusions:** Administration of the survey has established a baseline for HIV knowledge among Teen Club participants. All groups show opportunities for increasing and improving the quality of HIV knowledge and practical application to life skills. Facilitators will use the results of the survey to develop new topics or improve existing curricula. An annual follow-up survey is planned to track learning over time in Teen Club participants.

| Group | Completed surveys | % Correct | % Incorrect | % Don't Know |
|---|---|---|---|---|
| COE, younger | 201 | 42% | 33% | 19% |
| COE, older | 202 | 63% | 25% | 10% |
| SCOE #1 | 100 | 52% | 29% | 15% |
| SCOE #2 | 74 | 59% | 23% | 16% |
| SCOE #3 | 52 | 55% | 25% | 16% |

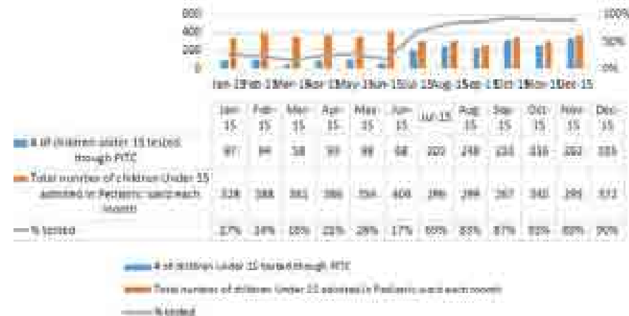
*[Survey results by support group]*

## WEPEE488

### PROVIDER-INITIATED TESTING AND COUNSELING FOR CHILDREN UNDER 15 YEARS AT INPATIENT WARD, QUALITY IMPROVEMENT EXPERIENCE FROM MOROGORO REGIONAL HOSPITAL, TANZANIA (JANUARY-DECEMBER 2015)

R. Kisanga[1], M. Rwechungura[1], A. Leonard[1], P. Mzonge[2], B. Kilama[3], P. Swai[4], J. Eshun[3], M. Njelekela[3]
[1]*Christian Social Services Commission, Health, Dar es Salaam, Tanzania, United Republic of,* [2]*Morogoro Municipal Council, Health, Morogoro, Tanzania, United Republic of,* [3]*Deloitte, TUNAJALI II Program, Dar es Salaam, Tanzania, United Republic of,* [4]*USAID Tanzania Mission, Health, Dar es Salaam, Tanzania, United Republic of*
*Presenting author email: kisangarf@gmail.com*

**Background:** In 2015, WHO released a Consolidated Guideline for HIV Testing Services (HTS). One of the approaches advocated in high burdened countries is Provider Initiated HIV testing and counseling - PITC. According to the Tanzania Third Health Sector HIV and AIDS Strategic Plan (2013 - 2017), PITC should be offered to 80 % of patients attending health facilities. However, assessment conducted at our facility in February 2015 revealed that, only 27% of children under 15yrs were tested in January 2015.This is a missed opportunity for identification of HIV infected children. This is a write up to document the quality improvement work done to increase number of children below 15 years admitted in pediatric wards who are tested through PITC.
**Methods:** At the inception, facility staffs were assisted to analyze PITC performance, identity reasons for low uptake of HIV test and set facility PITC improvement goal and target. Then the facility staffs were supported by team of quality improvement coaches to form quality improvement teams. The QI team was supported to document the improvement plan in monitoring journals every month. Through PDSA cycle, improvement teams tested changes to improve staff performances, availability of HIV test kits and acceptability of HIV test to parents.
**Results:** HIV Counseling and testing among children less than 15 years admitted in pediatric wards increased from 27 % in January 2015 peeking to 93 %, in October and 90% in December 2015. A total of 2095 children were tested in 2015 from inpatient ward, 75 among them were positive resulting to 4% positivity rate.
**Conclusions:** QI approach improved uptake of HTC among children less than 15yrs admitted in Pediatric wards. However, efforts to ensure matching demand and supply of test kits with facility PITC targets is important to avoid missed opportunities.



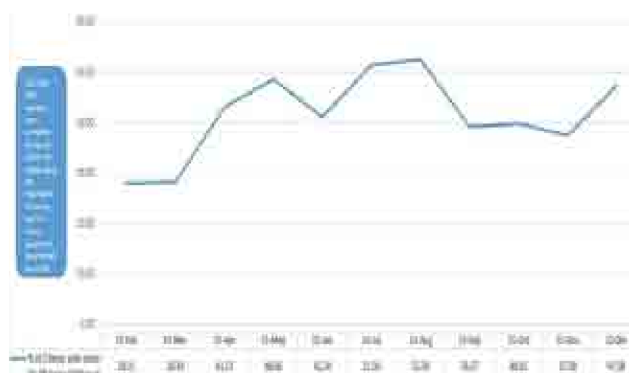
*[Figure. Annual profile inpatient pediatrics tested for HIV at Morogoro Regional Hospital - 2015]*

## WEPEE489

### IMPROVING CLIENT FOLLOW-UP IN VOLUNTARY MEDICAL MALE CIRCUMCISION (VMMC) PROGRAMS THROUGH CONTINUOUS QUALITY IMPROVEMENT CQI: EXPERIENCES FROM SOUTH AFRICA

D. Masina[1], J. Ndirangu[2], C. Bonnecwe[3], D. Loyikissoon[3], E. Njeuhmeli[4], I. Choge[5], D. Jacobs[2]
[1]*University Research Co., LLC, USAID ASSIST Project, Pretoria, South Africa,* [2]*University Research Co., LLC, Quality & Performance Institute, Pretoria, South Africa,* [3]*Medical Male Circumcision Unit, National Department of Health, Pretoria, South Africa,* [4]*USAID, Office of HIV/AIDS, Washington, United States,* [5]*USAID Southern Africa, Pretoria, South Africa*
*Presenting author email: thembam@urc-sa.com*

**Background:** Continuous Quality Improvement (CQI) in health care is a systematic approach to making changes that lead to better patient outcomes and stronger health system performance. This approach involves the application of CQI, which provides robust structure, tools and processes to assess and accelerate efforts to test, implement and scale up. CQI is the complete process of identifying, describing and analyzing strengths and problems and then testing, implementing, learning from and revising solutions and spreading good practices. The USAID ASSIST project has been implementing CQI for VMMC programs in South Africa since June 2014.
**Description:** Over 100 VMMC sites received baseline CQI assessments to determine the existing service delivery levels. The quality gaps identified formed a basis for introducing CQI methodology (identify, analyze, develop and test and implement and PDSA cycles). At all sites, CQI teams were set up, comprising site-level staff. Monthly and quarterly CQI mentoring and coaching visits were conducted by ASSIST staff at sites, according to performance. CQI site teams were mentored on analyzing, reviewing data, documenting program performance and problem solving.



*[Percentage of 48 hour follow up of VMMC clients in 83 CQI facilities]*

Wednesday 20 July Poster Exhibition
Thursday 21 July
Friday 22 July
Late Breaker Posters
Author Index

**Lessons learned:** Using CQI methodology and tools, all site teams started documenting programmatic data, compiling common quality indicators, analyzing quality gaps and discussing possible interventions. All sites are seeing an improvement in documentation of their client follow-up rate since they began plotting indicator changes on the graphs. Eighty three sites showed significant improvement in 48 hour client follow up, from 28.1% to 47.5% between February - December 2015.
**Conclusions/Next steps:** Since the onset of CQI support, it has been noted that site level CQI teams have gained a positive attitude and are motivated to develop interventions and site-level action plans. While shown to be effective within the VMMC program, CQI tools and methodologies can be applied to all health programs as teams can implement skills gained and lessons learnt across board.

## WEPEE490

### HEALTHCARE PROVIDERS GO BEYOND THEIR CALL OF DUTY IN AN ART PROGRAMME IN RURAL KWAZULU-NATAL

N.Z. Chimbindi[1,2], R. Lessells[1,3], M.-L. Newell[4], L. Reynolds[5,6], T. Bärnighausen[7,8]
*[1]Africa Centre for Population Health, Research, Scientific, Mtubatuba, South Africa, [2]University of Witwatersrand, School of Public Health, Johannesburg, South Africa, [3]London School of Hygiene and Tropical Medicine, Department of Clinical Research, London, United Kingdom, [4]University of Southampton, Faculty of Medicine, Southampton, United Kingdom, [5]Africa Centre for Population Health, Research, Mtubatuiba, South Africa, [6]Brown University, Population Studies and Training Center, Providence, United States, [7]Africa Centre for Population Health, Research, Mtubatuba, South Africa, [8]Harvard T.H. Chan School of Public Health, Department of Global Health and Population, Boston, United States*
*Presenting author email: nchimbindi@africacentre.ac.za*

**Background:** Nurses and counsellors play an important role in HIV healthcare delivery and their behaviour likely influences the success of antiretroviral therapy (ART) scale-up and quality care provision. Providing patient satisfaction feedback as way of initiating discussion may give healthcare providers a better understanding of patient perceptions regarding the care they receive and reflection space to respond or change behaviour.
**Methods:** In 2012 we carried out a qualitative study with nurses and counsellors in eight (of 17) randomly-selected primary healthcare (PHC) clinics in a rural district in KwaZulu-Natal, South Africa. Twenty-five ART healthcare providers (16 nurses and 9 counsellors) were engaged in a discussion about challenges faced by them and their patients, to inform understanding of factors affecting provision of quality care. Discussions were based around aspects of satisfaction reported by patients in a previous survey in the same setting (overall satisfaction, communication, contact time, respect, privacy, cleanliness, and waiting times). Discussions were recorded and transcribed; all data were managed using Nvivo 10 and thematic analysis used to identify emerging themes and patterns from the data.
**Results:** Two broad theoretical constructs emerged: healthcare providers' empathy and responsiveness to individual patient's challenges; and feelings of helplessness and inability to address structural barriers within the system. Lessons learnt included healthcare providers feeling unable to respond to issues of staff attitude, respect and the long waiting times for individuals, in a system where many logistical challenges to delivering high quality care existed. Further, healthcare providers felt they had limited capacity to bring about change because of limited resources. However, lessons on resilience emerged as healthcare providers described their adopted solutions to deal with these issues including working longer hours and using personal resources to support patient needs.
**Conclusions:** Broad lessons learnt are that using results from a patient exit survey to engage nurses and counsellors works well. The healthcare providers' responses show a commitment to providing quality care and their profession. There is need to strengthen human resources for health especially in light of the new ART initiation guidelines for universal treatment to support healthcare provider's efforts.

## WEPEE491

### LONGITUDINAL NORTH-SOUTH PARTNERSHIP IN PEDIATRICS TO IMPROVE HIV/AIDS CARE AND TREATMENT: A MODEL FOR SUSTAINABILITY IN ETHIOPIA

M.B. Mizwa[1,2,3], D.M. Gordon[4], G. Workneh[1,5], Z. Tigabu[6], W. Lakew[6], A. Girma[6], M. Kokeb[6], M. Abayneh[6], M.W. Kline[1,3,5]
*[1]Baylor College of Medicine, Pediatrics, Houston, United States, [2]Texas Children's Hospital, Global Health, Houston, United States, [3]Baylor College of Medicine International Pediatric AIDS Initiative, Houston, United States, [4]University of California, Medical Center, San Francisco, United States, [5]Texas Children's Hospital, Pediatrics, Houston, United States, [6]Gondar University Hospital, Pediatrics, Gondar, Ethiopia*
*Presenting author email: mmizwa@bcm.edu*

**Background:** Teaching hospitals in the global south confront a diminishing supply of physician-educators. In Ethiopia, this has adversely affected the quality of teaching, research, and patient care. Although north-south partnerships (NSPs) hold promise for bolstering under-staffed programs, to date few have done so sustainably.
**Description:** In 2008, a partnership was established between University of Gondar Hospital (GUH, Ethiopia), Baylor College of Medicine International Pediatric AIDS Initiative at Texas Children's Hospital (BIPAI), and the Jewish Joint Distribution Committee (JDC) to supplement the GUH teaching faculty with 3 American pediatricians. In 2010, the collaborating parties identified six objectives for the partnership: create a sustainable apparatus for pediatric training, especially HIV/AIDS, advance research in child health, improve patient care, institute a clinical outreach program, exchange knowledge and faculty between participating organizations, and procure medical supplies. To promote sustainability, the partnership created an accredited pediatrics residency program and trained the residents in teaching, research, quality improvement (QI), and outreach. In their second year, residents were mobilized to advance partnership objectives.
**Lessons learned:** From 2008 to 2013, mean examination scores among 5th year medical students remained stable (range 66%-71%) despite a 50% increase in student volume. Nine research publications were generated from 2012-2013, and the number of projects underway per year increased logarithmically (from zero to 16, 63% of which were resident-driven). Nine QI projects demonstrated improvements in process or outcome, and the number of projects underway per year increased logarithmically (from zero to 15, 60% of which were resident-driven). By 2013, a resident-driven outreach program was active in 18 schools and 3 regional health care centers. The faculty exchange and supply procurement objectives were poorly defined, limiting program evaluation. The first residency class graduated in December 2013 and replaced its expatriate mentors on faculty. By building local HCW capacity, expansion of pediatric HIV/AIDS prevention, care and treatment has been scaled upward.
**Conclusions/Next steps:** This NSP addressed intermediate-term staffing shortages in a resource-limited teaching hospital. The residency program advanced the department's medical education, research, patient care, and outreach objectives and ensures a continued focus on HIV/AIDS. This initiative is currently being replicated at the BIPAI Centre of Excellence in Mbabane, Swaziland.

## WEPEE492

### IMPROVING THE CHRONIC MEDICATION PRE-PACKING SYSTEM AT NOKUTHELA NGWENYA CHC

T. Kekana
*The Aurum Institute, Parktown, South Africa*
*Presenting author email: tkekana@auruminstitute.org*

**Background:** Nokhuthela Ngwenya CHC as part of the ideal clinic ICSM model uses a booking system for patient appointments. The facility was having problems with identifying the specific consulting rooms which patient pre-packed medication and pre-retrieved files should be allocated to before the patient arrives for their appointment. The objective of the quality improvement (QI) project was to develop an effective patient medication pre-packing system which will result in reduced waiting times for patients and confusion for staff.
**Methods:** Through the use of QI methodology, root cause analysis was performed to identify the causes. The results were:
- No proper system for allocating patients to rooms
- No system for correctly pairing medication with patients

The change idea bundle tested was:
- To pre retrieve booked patient files the day before
- To label all pre-retrieved patient files booked for an appointment with a consultation room number
- To attach the pre-packed medication to the pre-retrieved patient file on daily basis.
- To allocate the patient to the correct consulting room when they arrive for their appointment.

**Results:** The project was monitored consistently for a period of 12 weeks. We found that 90% of the patients were matched correctly to their consulting room and to their medication.
The waiting times were also reduced from 3-4 hours to 1Hr 45 min in the same period.
The project has also enabled clinicians to be able to track how many patients come to the facility without appointments and this enabled them to plan accordingly.
**Conclusions:** When designing our systems, we must consider our patients. Creating unnecessary waiting times can result in patients leaving the clinic prematurely. An efficient medication pre-packing system has resulted in an enhanced facility re-organization process and has enabled management to plan accordingly to ensure that the right resources are allocated correctly. This leaves ample time for clinicians to concentrate on managing patients' health as required.

## WEPEE493

### DISTRICT-LEVEL IMPLEMENTATION OF THE 90-90-90 STRATEGY IN A HIGH HIV- AND TB-PREVALENCE DISTRICT

H. Somaroo[1,2], S.M. Dhlomo[3], V. Mubaiwa[3], P. Msimango[3], T.P. Ngwenya[1,4]
*[1]eThekwini Health District Office, Durban, South Africa, [2]University of KwaZulu Natal, Durban, South Africa, [3]KwaZulu Natal Department of Health, Pietermaritzburg, South Africa, [4]MatCH, Durban, South Africa*

**Background:** South Africa has one of the highest burdens of human immunodeficiency virus (HIV) and tuberculosis (TB) diseases in the world. The country is currently implementing the 90-90-90 initiative, a bottom-up, outcome-based approach; aimed at reducing HIV and TB morbidity and mortality. We describe the strategic approach to implementation of the 90-90-90 strategy in the eThekwini district.
**Description:** Districts in KwaZulu-Natal were required to monitor three indicators for the financial year(FY)-2015/16, and to develop plans to monitor 12 indicators for the FY-2016/17. Firstly, provincial and municipal staff, and district partners were trained; and a district technical working group (TWG) was formed. Thereafter, all district facilities were divided into five training groups i.e. a priority group comprising provincial facilities that had the poorest performance for the FY-2014/15 (n=26), the remainder of provincial PHC facilities (n=28), provincial hospitals (n=17), and two groups for municipal PHC facilities (n=24 and n=28). Facilities were guided to develop quality improvement plans (QIPs) for improving performance on the FY-2015/16 indicators, and were required to graphically monitor progress. Additionally, facilities were trained to conduct bottleneck analyses (BNAs) and develop action-plans to address gaps in performance, for FY-2016/17 indicators. Implementation at facilities, and trends in indicator performance, were monitored from the district level.
**Lessons learned:** Monitoring of implementation revealed that the majority were compliant with graphically monitoring progress, though less so with monitoring action plans, for FY-2015/16. Similarly, more facilities had attempted BNAs for indicators, and devised plans to address gaps, though had not finalised their plans for FY-2016/17. Monitoring of district-level performance showed improvements in two of the three FY-2015/16 indicators. Cross-cutting issues identified, which impacted facility- and district-level performance, included: i. sub-optimal data management and blood result review processes, ii. incomplete coverage across all service delivery platforms, iii. lack of health educational materials, and iii. poor inter-sectoral coordination.
**Conclusions/Next steps:** It is important to closely monitor and support implementation at facility-level, in order to improve performance on indicators, and to ultimately improve HIV and TB outcomes in eThekwini. Monthly district TWG meetings will be convened to monitor district-level performance, and quarterly meetings with facilities have been proposed to supervise facility progress.

## WEPEE494

### OVERCOMING THE STRUCTURAL BARRIERS TO IMPROVING QUALITY HEALTHCARE SERVICE DELIVERY TO PLHIV: LESSONS FROM GENERAL HOSPITAL MINNA, NORTH CENTRAL NIGERIA

N. Onuaguluchi[1], M. Makumbi[1], N. Ndulue[1], G. Egesimba[1], A. Etsetowaghan[1], E. Nwabueze[1], F. Mairiga[1], F. Eluke[1], A. Atobatele[2]
*[1]Management Sciences for Health, Clinical, Abuja, Nigeria, [2]USAID, Monitoring & Evaluation, Abuja, Nigeria*
*Presenting author email: nonuaguluchi@msh.org*

**Background:** Provision of quality healthcare services to people living with HIV (PLHIV) remains a challenge in sub-Saharan Africa with challenges including delays in the initiation of eligible patients on anti-retroviral therapy (ART), poor clinical screening for tuberculosis (TB), and poor clinic attendance by HIV-positive pediatric patients. Management Sciences for Health (MSH) implements the USAID-funded ProACT Project which supports the provision of comprehensive HIV care and treatment services at General Hospital, Minna, Niger State, a public healthcare facility with a client load of over 7,000 HIV-positive patients. The study reviewed the effect of implementing an innovative facility-level Continuous Quality Improvement (CQI) program, on improving the quality healthcare service delivery to PLHIVs.
**Methods:** A baseline study of randomly selected folders of adult and pediatric patients with attendance at the HIV clinic between July and December 2013 was conducted to evaluate select performance indicators including the prompt initiation of eligible adult patients on ART, TB screening, and clinic attendance by pediatric patients. To address the noted gaps, a strategic quality plan was developed to provide guidance on delivering safe and quality care. This included the setup and capacity-building of a Quality Improvement Team to implement targeted Quality Improvement Projects, the conduct of an integrated capacity-building training on TB/HIV & adherence counselling and provision of technical assistance through targeted quarterly mentoring visits to the facility CQI team. A subsequent study of randomly selected folders of adult and pediatric client folders of patients with clinic attendances between January and June 2014 was conducted to reassess the same indicators.
**Results:** The initiation of eligible adult patients on ART increased from 0% to 100%; clinical screening for TB increased from 6.56% to 60.8%, and clinic attendance by HIV- positive children increased from 84.6% to 100%.
**Conclusions:** This study suggests that the use of CQI was feasible and acceptable. It required the collection and analysis of patient care data, and reduction of redundant or overly complex steps in caring for patients. Strong leadership support, stakeholder engagement, focus on strengthening systems and commitment to CQI are important in making and sustaining significant changes.

## WEPEE495

### BEST PRACTICES: IMPROVED VIRAL LOAD MONITORING THROUGH FACILITY-BASED INNOVATION AT THE SEKHUKHUNE DISTRICT OF THE LIMPOPO PROVINCE OF SOUTH AFRICA

V. Skiti[1], K. Makgato[2], M. Mogashoa[2], C. Senong[2], W. Motopela[2], E. Kobola[2], M. Ralefe[2], T. Kganyago[2], T. Kewane[2], M. Linah[2], J. Phashe[2]
*[1]SEAD, Polokwane, South Africa, [2]Limpopo Department of Health, Polokwane, South Africa*
*Presenting author email: kedibone.makgato@dhsd.limpopo.gov.za*

**Background:** South Africa (SA) has initiated over 3.1 million people on antiretroviral therapy (ART). Limpopo province contributes 251,427 (8.1%) of ART patients in the country with 45,445 (18.1%) resident in Sekhukhune district. Viral load (VL) analysis is imperative in monitoring the efficacy of antiretroviral therapy. The SA Antiretroviral treatment guidelines of 2010 advocate that VL analysis should be monitored at 6 months following ART initiation, repeated at 12 months and annually thereafter. In 2014, the SA VL completion rate ranged between 40-46% with Sekhukhune district being among the poor performing districts regarding this indicator (29%) performing even lower than the national average. The district embarked on implementing a simple strategy to improve Viral Load Completion Rate from 29% to 70% over a 1 year period by 30 June 2015.
**Description:** In July 2014 following site-level data interrogation, an action plan was derived to improve the performance of the VL completion indicator. The intervention included a district Data Quality Assessment (DQA) which highlighted gaps in clinical practice. Novel approaches were discerned in collaboration with facility managers and included Data Captures generating lists for patients due for blood draws on a daily basis, annotating patient files to indicate the need for a blood draw at the next patient visit, and a reminder system for phlebotomists by completing laboratory forms and placing them on patient files at the beginning of each month.
**Lessons learned:** Following these site-level interventions, cohort data showed a significant improvement in VL completion rate from 29% at baseline to 56% by June 2014. Over a 12 month period from June 2014 to June 2015 the VL completion rate was at 73%, exceeding the target by 3%. This site-level practice is simple to implement and easy to follow. It has been adopted by the Limpopo Province and is a recommended practice shown to improve VL completion rate on a cost-effective and efficient basis.
**Conclusions/Next steps:** Analysis, interpretation and utilization of data plays a major role in improving programme performance as it informs planning and decision making. The insights of local health systems are imperative in addressing challenges in an informed and context-relevant manner.

## WEPEE496

### USING A QUALITY IMPROVEMENT APPROACH TO BUILD THE CAPACITY OF HEALTH CENTERS TO RETAIN PEOPLE LIVING WITH HIV IN CARE

O. Abiodun[1], K. Ouattara[2], C. Nioblé[2], S. Stender[3], L. Coulibaly[2], M. Toure[2], K.A. Ekra[4]
*[1]Johns Hopkins Bloomberg School of Public Health, International Health, Baltimore, United States, [2]Jhpiego, Abidjan, Cote D'Ivoire, [3]Jhpiego, Cape Town, South Africa, [4]CDC, Abidjan, Cote D'Ivoire*
*Presenting author email: ouattara.kiyali@jhpiego.org*

**Background:** With an adult HIV prevalence rate of 3.7%, Cote d'Ivoire has the highest HIV prevalence in West Africa. The low retention rate of PLHIV on treatment after 12 months (67% in 2013) poses a great challenge to the aim of ending the AIDS epidemic. Cote d'Ivoire's Ministry of Health and Public Hygiene is actively seeking means to improve services for people living with HIV/AIDS (PLHIV). Through funding from CDC/PEPFAR, from 2013-14 Jhpiego implemented a quality improvement (QI) program in 10 health centers in Cote d'Ivoire, with the aim of improving HIV care & treatment services, including PMTCT.
**Description:** The QI intervention was implemented in two general hospitals and 8 primary health centers in northern Cote d'Ivoire from March 2014 to February 2015. Checklists of minimum performance standards and verification criteria (VC) in line with national and international guidelines for PMTCT and HIV care & treatment services were used to carry out periodical internal and external audits. All VC had to be met to consider attainment of the standard of care.
**Lessons learned:** Audits of HIV treatment services showed an improvement in adherence to the 5 performance standards (table 1) for the follow-up of PLHIV on treatment from baseline to endline, after 12 months of QI program implementation. Of the nine facilities with data at both time points, two maintained the minimum of 80% to be considered offering quality ART follow-up care, six improved to meet 80%, and one remained the same (table 2).

| Standard | | #VC | Sample Verification Criteria |
|---|---|---|---|
| 1 | Adequate welcome of patients | 5 | The provider greets the client; The provider introduces him/herself |
| 2 | Assessment of adherence to treatment | 12 | Ask if the client missed a few doses in the past few days and why; Evaluates the social conditions of the client; Set a date for the return visit |
| 3 | Clinical assessment of patient | 11 | Review all medications that the client takes; Ask about side effects relevant to the drugs the client is taking and manage appropriately; Determine nutritional status |
| 4 | Laboratory evaluation of patient | 5 | Order, interpret, and document in the client record routine investigations every 6 months: CD4, Hb, etc.; Order a viral load if suspect clinical or immunological failure |
| 5 | Adequate system to maintain patients in care | 3 | Verify if the facility has a system of home visits |

*[Table 1: Standards of care for follow up of clients on antiretroviral therapy]*

| | Facility | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| Percent of standards achieved for follow up of clients on antiretroviral therapy before and after QI intervention | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| Baseline | 60% | 40% | 80% | 20% | 60% | 60% | 60% | 60% | 80% |
| Endline | 100% | 100% | 80% | 80% | 80% | 80% | 60% | 80% | 80% |

*[Table 2: Percent of standards achieved for follow up of clients on antiretroviral therapy before and after QI intervention]*

**Conclusions/Next steps:** Results from the implementation of the QI program in Cote d'Ivoire show that the approach has the potential to improve the retention of PLHIV in care by improving the quality of services offered to patients via its positive effect on adherence to standards of care by health centers.

## WEPEE497

### QUALITY IMPROVEMENT OF DRIED BLOOD SPOT SPECIMENS SENT FOR HIV PCR TESTING

K. Govender, P. Moodley
*National Health Laboratory Service, Virology, Durban, South Africa*
*Presenting author email: govenderk7@ukzn.ac.za*

**Background:** Early diagnosis and treatment of HIV-positive infants significantly reduce HIV disease progression and mortality. Poor quality dried blood spot (DBS) specimens are usually rejected by virology laboratories, affecting early infant diagnosis of HIV. Laboratory specimen rejections can lead to abandonment of the test request, compromising the linkage of HIV-exposed infants to care. As a quality improvement plan, the department of Virology (DOV) at Inkosi Albert Luthuli Central Hospital in KwaZulu-Natal province, South Africa used various interventions to address the challenges with DBS specimens.
**Description:** The quality improvement plan targeted laboratories, nurses and doctors within the province. Monthly and weekly trend analyses of specimens and request forms aided the laboratory in identifying referring laboratories which sent poor quality specimens. Re-education of staff at these laboratories allowed them to recognize quality issues prior to specimen referral, preventing unnecessary delays and follow up visits. Trend analysis also allowed the generation of facility reports. These were crucial in informing strategic health programs run by the provincial department of health which provides intensive training to nurses on Prevention of Mother to Child Transmission, and can be focused according to needs in various locations. Interactions with doctors were both via structured training programs such as intern orientation to virological services, as well as telephonic consults regarding individual patients with electronic dissemination of surveys, training materials and posters. The quality improvement plan allowed a multi-disciplinary collaboration and helped improve awareness and knowledge of specimen quality in the province.
**Lessons learned:** Despite significant increases in workload (88 481 specimens received in 2014 and 142 027 received in 2015), there was a significant improvement in specimen quality in 2015, as shown in the table.

| Outcome | Number of specimens in 2014 (%) | Number of specimens in 2015 (%) | 2015 vs 2014 p-value |
|---|---|---|---|
| Total number of specimens sent to the laboratory | 88 481 (100.0%) | 142 027 (100.0%) | - |
| Number of specimens tested | 85 114 (96.2%) | 139 816 (98.4%) | <0.0001 |
| Specimens with no results due to analytical problems | 91 (0.1%) | 75 (0.05%) | <0.0001 |
| Total number of specimens rejected | 3 276 (3.7%) | 2 211 (1.6%) | <0.0001 |
| Rejected due to insufficient volume | 1 602 (1.8%) | 551 (0.4%) | <0.0001 |
| Rejected due to inadequate information | 794 (0.9%) | 478 (0.3%) | <0.0001 |
| Rejected due to incorrect clinical indication | 504 (0.6%) | 799 (0.6%) | 0.84 |
| Rejected due to poor specimen quality | 376 (0.4%) | 308 (0.2%) | <0.0001 |

*[Overview of specimens received in 2014 and 2015]*

**Conclusions/Next steps:** Analyzing laboratory trends and collaboration with referring laboratories, clinical colleagues and provincial health services can help to reduce specimen rejections, which may improve early infant diagnosis.

## WEPEE498

### INDEX TRACKING MODEL AS A STRATEGY IN FINDING CHILDREN AND ADOLESCENTS, AND IMPROVING EFFECTIVE REFERRALS

M. Jubilee[1], D. Dixon[1], N. Lebona[2], M. Mohale[2], N. Taruberekera[3]
*[1]Population Services International, Technical Services, Maseru, Lesotho, [2]Population Services International, Maseru, Lesotho, [3]Population Services International, Johannesburg, South Africa*
*Presenting author email: mjubilee@psi.co.ls*

**Background:** The prevalence of HIV in Lesotho is 23% among adults, and it is estimated that around 15,000 infants are born to HIV-infected women annually. While 57% of HIV-positive adults receive ART, only 43% of children and adolescents do. Many young people may not even be aware of their HIV status. Therefore, finding undiagnosed HIV-positive children and adolescents, and linking all to treatment, is imperative. One approach is a targeted community-based approach of tracking index family members at risk.
**Methods:** PSI/Lesotho introduced the index tracking model in April 2015 and community testing started in May 2015. Mapping of high volume facilities in relation to high ART uptake, and sensitization of District Health Management Teams (DHMTs) were conducted. HIV-positive patients from seven facilities in Maseru, Berea and Leribe districts were identified, and considered index patients. Counsellors requested consent from index patients to test their family members who were unaware of their status. Then counsellors followed an index patient's household to provide testing to their family members. Routine data gathered between May and December 2015 was analysed to assess the feasibility of this approach to finding HIV-positive children and adolescents.
**Results:** The households of 992 index patients were visited, and 2,604 family members were tested. Among those tested, 71.1% were children (2-14 years) and 8.8% were adolescents (15-19 years). The intervention led to a 2% yield of HIV-positive children and adolescents (2% among children and 3% in adolescents), comparable with the national figure of 2.4%. The 2% positive yield was from biological children

and adolescents of index patients. All those testing positive were referred to the health facilities for follow-up, and 88% went.
**Conclusions:** Results indicate that the index tracking model can be a viable method for reaching children who are HIV-positive. Referral uptake is high and will contribute towards high ART coverage among children and adolescents. This model has the potential for community adaptation and scale-up by increasing coverage to other districts not currently covered.

## Quality improvement (QI) collaboratives

### WEPEE499

#### Improving early infant diagnosis for HIV exposed infants: a quality improvement approach in Kaabong hospital

J. Izudi[1], A. Akot[2], A. Inadi[2], G. Kisitu[3], P. Amuge[3], A. Kekitiinwa[4]
*[1]Baylor College of Medicine Children's' Foundation-Uganda, Medical and Psychosocial Department, Kampala, Uganda, [2]Kaabong District Local Government, Nursing Department, Kaabong, Uganda, [3]Baylor College of Medicine Children's Foundation Uganda, Center of Clinical Excellence, Research, Kampala, Uganda, [4]Baylor College of Medicine Children's Foundation Uganda, Center of Clinical Excellence, Planning, Information and Strategic Department, Kampala, Uganda*
*Presenting author email: jonahzd@gmail.com*

**Background:** Early infant diagnosis (EID) is critical for the survival of HIV exposed infants (HEIs) as subsequent care and management depend on dry blood spot (DBS) outcomes. In Kaabong hospital, located in Karamoja region in North Eastern Uganda, access to DNA-PCR testing for HEIs was low with only 20% of HEIs tested at six weeks of age, by June 2014. Baylor-Uganda supported Kaabong hospital staff in developing quality improvement (QI) strategies to improve DNA-PCR testing for HEIs at six weeks of age.
**Description:** 24 health facility staff were trained and mentored in EID continuous QI approaches. Facility QI team was constituted and prioritized to improve DNA-PCR testing for HEI's at six weeks. The QI team analyzed data to determine the magnitude of the problem and brainstormed possible root causes of low testing rates for HEIs. Possible root causes identified included lack of awareness among mothers about EID services, loss of mothers between service points (mother baby care point (MBCP) and laboratory), loss of mother/infant pairs in the communities, absence of tracking systems for lost mother/baby pairs and absence of Work Improvement Teams at the EID service point. To address the root causes, the QI team created awareness on EID for mothers through health education, conducted continuous medical education (CME's) for health facility staff, integrated laboratory and EID services in the MBCP, identified expert clients and peer mothers to track and link lost mother/baby pairs to the MBCP and introduced performance monitoring at the MBCP for DNA-PCR testing.
**Lessons learned:** Overall, DNA-PCR testing at 6 weeks increased from 20% to 100% between June 2014 and July 2015 and was sustained at 100% thereafter until January 2016. However, there were two dips recorded in DNA-PCR testing trend (67% in September 2014 and 75% in June 2015) which were addressed by use of expert clients and peer mothers respectively at those time points.
**Conclusions/Next steps:** Similar set of interventions will be replicated to improve and sustain 1st DNA-PCR testing for HEI's in health facilities within Karamoja having low rates of DNA-PCR testing.

### WEPEE500

#### The results of the HIV, AIDS, STI and TB audit, trends over time 2013-2015 for quality improvement within the Western Cape Province in South Africa

R. Vallie[1], B. Harley[2], R. Govender[3]
*[1]Department of Health, Cape Town, South Africa, [2]City of Cape Town, Health, Cape Town, South Africa, [3]Kheth'Impilo, Cape Town, South Africa*
*Presenting author email: razia.vallie@westerncape.gov.za*

**Background:** The Western Cape Province continuously aims to improve and strengthen the quality of services it offers to patients accessing its health care facilities. The Integrated HIV, AIDS, STI and TB (HAST) Audit Tool further enhance this process, as it aligns to the WHO suggested key TB/HIV package using the 'Conditions for Effective Framework' and incorporating the domains of: Availability, Access, Quality, Integration and Continuity of care.
**Methods:** The Integrated HAST Audit is conducted annually within the July-September period. The data collection method is a 10 folder review per HAST tool, which equates to roughly 90 folders audited per facility. These HAST tools are for each of the HAST programmes: HCT, HIV, STI, ART, TB, DR TB, PMTCT Labour Ward, PMTCT ANC and PMTCT PNC. The audit tool also includes a consultation room audit and the facility manager questionnaire.
**Results:** The findings include the following:
- On average 80% of clients accessing HCT were screened for TB and consent for HCT was taken 97% of the time.
- A significant improvement in Medical Male Circumcisions discussed from 9% in 2013 to 62% in 2015.
- An improvement in the prescribing of TB medication with a valid script from 47%-68% as well as TB contacts investigated from 58%- 65%.
- A steady improvement of DR TB commencement times, more patients commenced on treatment in < 5 days in 2015 as compared to 2013.
- Nutritional Therapy offered to patients still a huge gap between TB, DR TB and ART programmes.
- Action plans implemented has improved from 68% to 81% respectively.

**Conclusions:** Although there is room for improvement, there has been evident year on year progress across all the domains and indicators for each of the HAST programmes.
The HAST Audit is dynamic and subjected to annual review to ensure alignment with policy. It has found its rightful place in evaluating quality, availability, access, integration and continuity of care.

## Engaging clients and communities in quality improvement (QI) activities

### WEPEE501

#### Mitigating opportunistic infections aggravated by biomass fuel indoor pollution in PLWHA in poor rural households in Sub-Saharan Africa: a case study of Kisumu County, Kenya

N. Samba Otieno-Omumbo, J. Anyango-Otieno, J. Anyango Otieno
*Youths for Sustainable Development (YUSUD), Head Office, Kisumu, Kenya*
*Presenting author email: yusudkisumu@gmail.com*

**Background:** More than a third of the global population burn Biomass Fuel (BMF) for cooking, heating and lighting. In humans, HIV infection causes increased bacterial infections, pneumonia and TB. HIV infection has been associated with mild airway obstruction and loss of gas transfer, with severe impairment occurring in the presence of Pneumocystis jiroveci infection. HIV has also accelerate the development of COPD in humans. PLWHA are at greater risk of pulmonary complications caused by BMF indoor pollution
The health effects of BMF indoor pollution may arise after a single exposure and/or long or repeated exposure. The levels of exposure to pollutants are often 100 times greater than recommended maximums in poor households.
**Description:** YUSUD launched a project to investigate the health effects in poor rural households of PLWHA in Kisumu County when switching traditional BMF sources to simple low cost Green Energy Solutions, including solar, bio-diesel, biomass, and biogas, over a period of 12 month. The data collected analysed the general changes in health indicators and household management.
**Lessons learned:** 95% of the PLWHA reported reduced incidences of respiratory Tract infections within 21days. There was a significant deceleration in the development of COPD, ALRI and heart diseases amongst PLWHIV after just 6months. More than 95% of the PLWHIV recorded over 70% reduction in the short-term effects of BMF indoor pollution which includes irritation of eyes, nose and throat, headaches, dizziness, and fatigue.. Overally, due to a 50-80% reduction in household energy expenditures, the savings resulted in increased access to better nutrition, personal development, and medical services, thus enhancing quality of care and health outcomes for PLWHA.
**Conclusions/Next steps:** BMF indoor pollution is responsible for the deaths of 1.6million people annually, with PLWHA as increased risk. Improved indoor air quality using alternative green energy could lower the health risks associated with BMF indoor air pollution, decreasing the risk of opportunistic infections in PLWHA. New, innovative approaches to accessing green energy within communities at risk with necessary to improve health outcomes, and will require involvement between public and private entities to ensure success.

## WEPEE502

### COMMUNITY-DRIVEN ACCOUNTABILITY THROUGH ADVOCACY COMMITTEES: A VEHICLE FOR IMPROVING HIV AND REPRODUCTIVE HEALTH SERVICES FOR WOMEN LIVING WITH HIV

N. Westerhof[1], S. Iphani[2], M. Dzowela[3], K. Dovel[4], N. Mulauzi[5], E. Banda[6], J. Chikonda[7]
*[1]STOP AIDS NOW!, Amsterdam, Netherlands, [2]The Coalition of Women Living with HIV/AIDS (COWLHA), Lilongwe, Malawi, [3]ICCO Cooperation, Lilongwe, Malawi, [4]University of California - Los Angeles, David Geffen School of Medicine, Los Angeles, United States, [5]Invest in Knowledge, Zomba, Malawi, [6]MANET+, Lilongwe, Malawi, [7]Ministry of Health, Lilongwe, Malawi*
*Presenting author email: nwesterhof@stopaidsnow.nl*

**Background:** Women living with HIV experience more rights violations in HIV and reproductive health services than HIV negative women. This discourages women from seeking services and compromises the health of women and children. To address poor quality care, 12 community-based Women's Rights Protection Committees (WRPCs) were established in Lilongwe, Malawi.
**Description:** WRPCs have the following responsibilities: sensitize women living with HIV to the importance of HIV and reproductive health services; identify cases of unmet needs and poor quality care; and coordinate with health facilities to facilitate quality service delivery. Committees were established after sensitizing local facilities to the importance of public accountability. Committee members are comprised of women living with HIV who were chosen by local HIV support groups. Committees were trained and have a working relationship with local health facilities.
**Lessons learned:** An initial evaluation was conducted 5 months after WRPCs were established using observational data from committee meetings, meeting minutes, and 12 focus groups. Data provide an initial assessment of the feasibility and potential impact of community-based accountability groups in low-resource settings.
WRPCs reported identifying and addressing unmet needs and poor quality care for women's health on a regular basis. The most commonly reported complaints received from women were rude behaviour by providers and delayed services. The most commonly reported needs addressed were antenatal services, neonatal HIV testing, and family planning services for women living with HIV.
Committees also acted as a bridge between facilities and communities, providing a platform where concerns about health services were discussed and mutual understandings were established. Based on committee successes, health facilities are increasingly seeking collaboration with WRPCs to respond to loss to follow-up and improve the quality of services.
Committees who regularly met with health facilities reported more motivation for and capacity to complete their work. Having facility personnel regularly visit WRPCs improved WRPCs' ability to address poor quality care and increased community buy-in for committee activities.
**Conclusions/Next steps:** Community-driven accountability led by women living with HIV is a viable option to address poor quality of and poor access to HIV and reproductive health services. Regular engagement with local health facilities is essential for committee success.

## WEPEE503

### THE PERCEIVED ABILITY OF WOMEN LIVING WITH HIV TO INFLUENCE POOR QUALITY CARE: THE ROLE OF HEALTH FACILITIES IN CLIENTS' EMPOWERMENT

K. Dovel[1], N. Westerhof[2], M. Dzowela[3], S. Lungu[4], J. Mkandawire[4]
*[1]University of California - Los Angeles, David Geffen School of Medicine, Los Angeles, United States, [2]Stop AIDS Now!, Amsterdam, Netherlands, [3]ICCO Cooperation, Lilongwe, Malawi, [4]Invest in Knowledge, Zomba, Malawi*
*Presenting author email: kldovel@gmail.com*

**Background:** Poor quality care remains a major concern for people living with HIV, especially women who have less agency than men. Public accountability through direct involvement of clients is one way to improve quality care; however, many female clients do not feel able to take action against poor services, limiting the feasibility of public accountability strategies. We conducted a mixed-methods study to examine predictors of women's perceived ability to influence quality care in Malawi.
**Methods:** We conducted 225 surveys with women living with HIV who attended HIV support groups and 25 exit interviews with women living with HIV who accessed health services from three major health facilities in Lilongwe, Malawi. Ordered logistic regression models and constant thematic analysis were used to identify predictors of women's perceived ability to influence quality care.
**Results:** Only 42% of survey respondents believed they were able to influence the quality of care provided. Perceived influence was positively associated with reporting poor services in the past year (AOR 1.61, 95% CI 1.17-2.21). Respondent's primary health facility for HIV services (AOR 1.98, 95% CI 1.04-3.74) and length of time attending a HIV support group were both associated with respondents perceived influence on services - time in a support group was positively associated with the outcome (AOR 1.14, 95% CI 1.04-1.24).
The organization of health services in local facilities impacted respondents' perceived influence on quality care. Five facility-based factors that promoted women's perceived ability to engage in public accountability strategies were identified: the facility had an active quality care committee comprised of women living with HIV; clients knew where to report poor services; facility personnel quickly responded to reported cases; medical consultations were conducted in a private manner; and providers actively solicited feedback from clients.
**Conclusions:** Clients' perceived ability to influence health services is an important component of implementing public accountability strategies. The organization of health services influences these perceptions. Importantly, facility-based facilitators that can improve women's engagement in public accountability are easy to implement and could improve quality of care for all clients, not only women living with HIV.

## WEPEE504

### IMPROVING ENGAGEMENT TO CARE AND TREATMENT IN THE HIV COMPREHENSIVE CARE CLINIC AT ISIOLO DISTRICT HOSPITAL USING WELTEL KENYA 2 SHORT MESSAGE SERVICE (SMS)

V. Olago[1], A. Muliro[2], R. Lester[3,4], S. Karanja[5], K. Kinagwi[6], S. Muhula[5], D. Ali[7], M. Abdikir[8], S. Wanyama[8], K. Smillie[9]
*[1]WelTel MHealth International, Monitoring and Evaluation, Nairobi, Kenya, [2]WelTel MHealth International, Cordinator, Isiolo, Kenya, [3]WelTel MHealth International, PI, Isiolo, Kenya, [4]UBC, Professor, British Colombia, Canada, [5]AMREF Health Africa, Ethics and Review, Nairobi, Kenya, [6]AMREF Health Africa, Chief of Party, Nairobi, Kenya, [7]AMREF Health Africa, Cordinator, Nairobi, Kenya, [8]Isiolo District Hospital, Isiolo, Kenya, [9]UBC, British Colombia, Canada*
*Presenting author email: victor@weltel.org*

**Background:** Despite high uptake to care and treatment for HIV patients in Kenya, there are still challenges in retention in care, especially in the Northern Arid Lands (NAL). These are as a result of poor communication/transport, poor access to medical facilities and community cultures. The study aims to analyze the effect of WelTel SMS service in improving client engagement to care and treatment.
**Methods:** HIV patients are routinely scheduled 3 monthly clinic appointments. Registered clients in the Weltel SMS platform receive weekly SMS to check in on their status, the clients are expected to respond within 48 hours. Four months data on appointment status of WelTel and Non-WelTel clients was obtained from Electronic Medical Record, daily attendance charts and WelTel platform. The appointments were classified as Attended - client attends the clinic on the scheduled day of appointment, Delayed - client attends the clinic not on the appointment day but came within 30 days from the appointment day and Defaulted - clients who do not appear at the clinic after 30 days of their missed appointment.
**Results:** As at October 2015 WelTel SMS platform had enrolled 510 clients out of the 1236 active clients at the HIV Comprehensive Care Clinic (CCC). In the months of July, August, September and October these were the results; 68 (53.54%), 125 (64.1%), 75 (60.0%) and 78 (63.93%) clients respectively enrolled on WelTel SMS platform attended their appointments on time as compared to 94 (44.34%), 219 (61.17%), 141 (52.03%) and 100 (51.81%) clients respectively, who were not enrolled on WelTel SMS platform (p-0.0806) While 55(43.31%), 62(31.79%), 43(34.4%) and 28(22.95%) clients respectively enrolled on WelTel SMS platform delayed on attending their appointments as compared to 93(43.87%), 123(34.36%), 96(35.42%) and 49(35.42%) respectively of non-WelTel clients(p-0.0806). Only 4 (3.15%), 8 (4.1%), 7 (5.6%) and 16 (3.11%) clients respectively enrolled on WelTel SMS platform defaulted as compared to 25 (11.79%), 16(4.47%), 34(12.55%) and 44(22.8%) respectively of non-WelTel (p- 0.0099).
**Conclusions:** The CCC Clients who received weekly SMS check-ins via the WelTel service were more likely to attend their appointments on time and less likely to default HIV care and treatment.

## WEPEE505

### THE IMPACT OF NIMART (NURSE INITIATED MANAGEMENT OF ANTIRETROVIRAL TREATMENT) AND CCMDD (CENTRALIZED CHRONIC MEDICINE DISPENSING AND DISTRIBUTION) IN DECONGESTING PRIMARY HEALTH CARE FACILITIES

L. Nyembe[1,2], G. Ganes[3], S.S. Ramthol[4], Uthukela DM Study Group
*[1]Department of Health, Ladysmith, South Africa, [2]Uthukela District Municipality, Ladysmith, South Africa, [3]Injisuthi Clinic, Estcourt, South Africa, [4]FORDERVILLE CLINIC ESTCOURT HOSPITAL, Estcourt, South Africa*
*Presenting author email: maceautozone@telkomsa.net*

**Background:** There are about 6.3 million people living with HIV in South Africa. One innovative strategy that has been introduced in South Africa to scale up treatment to all clients in need is the introduction of task shifting approach that allows nurses to initiate and manage ART (NIMART). Although the NIMART strategy has significantly increased access to ART, it has resulted in congestion at the facilities due to large numbers of clients accessing treatment. A Centralized Chronic Medicine Dispensing and Distribution (CCMDD) intervention was implemented to streamline processes in ART treatment facilities.
**Description:** CCMDD was implemented on the 5th May 2015 at Fordaville Clinic. NIMART-trained nurses identified stable clients who had been on treatment for a year to be referred to CCMDD program. The treatment is pre-packed while ensuring adherence to good pharmacy practices. The pre-packed treatment is then delivered to the pick-up points by pharmacy assistants at a community level, where clients will access the treatment with ease on appointment system which involves a given date and time. Data capture captures all the visits in their clinical charts.
**Lessons learned:** Prior to the introduction of the CCMDD initiative in 2014, 1039 were visiting the facility per year. One year after the introduction of the CCMDD, the number of patients accessing the facility had dropped by 35% to 480 per quarter. The defaulter rate was reduced from 5 (0.04%) to 4 (0.03%) per month as clients were allowed to send treatment buddies to collect treatment on their behalf. The proportion of clients collecting medication from pick up points has increased by 76% to 92%. Clients were referred to pick-up points thus reducing waiting times from 4 hours to 2 hours in the facility. NIMART training has increased initiation skills and competency levels.
**Conclusions/Next steps:** Introduction of CCMDD initiative at Fordeville clinic has resulted in reduction of waiting times from 4 hours to 2 hours, resulting in direct impact to quality care given to clients.
Thus it is recommended that whilst the program progresses, outreach teams distribute medication to chronic clubs and households to improve quality of care.

## WEPEE506

### IMPACT OF NIMART (NURSE INITIATED MANAGEMENT OF ANTIRETROVIRAL TREATMENT) ON EMTCT (ELIMINATION OF MOTHER TO CHILD TRANSMISSION)

L. Nyembe[1,2], C. Dunn[3], G. Ganes[4]
*[1]Department of Health, Ladysmith, South Africa, [2]Uthukela District Municipality, Ladysmith, South Africa, [3]Department of Health KZN, Ladysmith, South Africa, [4]Injisuthi Clinic, escourt, South Africa*
*Presenting author email: ranoosh.ganes@kznhealth.gov.za*

**Background:** Great progress has been made in the (MTCT) prevention of Mother to Child Transmission with rates decreasing from 5.9% in 2014 to 5.2% in 2015. Part of the success of the programme has been due to task- shifting to nurses through the NIMART programme and trained nurses are able to now initiate ART in all pregnant women on the same day that she is identified as being HIV positive at the health facility. This analysis / project reports on the impact of the NIMART programme towards the elimination of MTCT in the Injisuthi Clinic.
**Description:** According to PMTCT guideline commencement of FDC (Fixed Dose Combination) was issued by the midwife attending pregnant women at Ante Natal Care (ANC) Room. In 2014 Injisuthi Clinic linked NIMART nurse to ANC Room. NIMART nurse is specifically skilled to interpret, analyze viral load test results, monitor treatment response, counsel on adherence and manage side effects thus ensuring EMTCT. NIMART nurses are confident and knowledgeable in initiating treatment to ANC clients and managing exposed infants from HIV positive mothers than midwives. A NIMART nurse was allocated to an ANC room to initiate pregnant women on FDC. In case where there is no NIMART nurse allocated to ANC room, ANC client will be initiated by midwife on FDC while ensuring referal to NIMART nurse before leaving the facility.

**Lessons learned:**

| YEAR | PCR TEST + | YEAR | PCR + |
|---|---|---|---|
| January to June 2013 | 9/150 (6.0%) | July to December 2013 | 4/153 (2.6%) |
| January to June 2014 | 6/115 (5.2%) | July to December 2014 | 1/126 (0.7%) |
| January to June 2015 | 5/111 (2.9%) | July to December 2015 | 2/86 (2.3%) |

*[6 Week PCR Testing]*

Due to the linkage of NIMART nurse to ANC clients, pregnant women initiated on FDC improved from 90.2% in 2013 and 92.8% in 2014 to 100% in 2015.
**Conclusions/Next steps:** From the above it becomes clear that linking NIMART trained nurse to ANC improves clients initiated on ART consequently reducing mother to child transmission.

## WEPEE507

### COMMUNITY QUALITY IMPROVEMENT TEAMS; A VEHICLE FOR IMPROVING RETENTION OF HIV PATIENTS ON ANTIRETROVIRAL TREATMENT: EXPERIENCE FROM EAST CENTRAL UGANDA

E. Tibenderana[1,2], S. Mashate[1,2], M. Ndifuna[1], A. Mugume[1], F. Herbert Kazibwe[1], H. Ndagire[1], M. Nabisere[3], M. Namwabira[3]
*[1]JSI Research & Training Institute, Inc. (JSI) / Strengthening TB and HIV&AIDS Responses in East Central Uganda (STAR-EC), Jinja, Uganda, [2]AIDS Healthcare Foundation (AHF) / Uganda Cares, Kampala, Uganda, [3]USAID Applying Science to Strengthen and Improve Systems (USAID/ASSIST), Kampala, Uganda*
*Presenting author email: etibenderana@starecuganda.org*

**Background:** Retention in care is critical to the health of people who are on antiretroviral treatment (ART). The contribution of community quality improvement (QI) teams in promoting facility-community linkages and retention on ART is considerable and should not be underestimated. STAR-EC, an eight-year district-based project funded by USAID and implemented by JSI and its partners, in collaboration with the USAID/ASSIST project, cognizant of this unexploited contribution, implemented community QI interventions to support health facility care and treatment outcomes between Oct 2013 and Sept 2015.
**Description:** The project selected 14 villages near served by two high-volume, poorly performing health facilities that had retention rates of less than 85% and kept clinic appointments of less than 70%. Eight health workers and 70 village health team members, including persons living with HIV (PLHIV), were trained in basic HIV chronic care and QI principles. Those trained were supported through monthly onsite mentorship meetings on data collection, monitoring improvement changes, effective use of referral tools, educating clients about patient self-management and quarterly learning session to promote sharing of best practices. The teams monitored three indicators: rate of clinic appointment-keeping; number of PLHIV linked to community support structures; and retention on ART over a period of two years.
**Lessons learned:** During the implementation period, the rate of clinic appointment-keeping improved from 85% in October 2013 to 96% in September 2015. The program saw the percentage of PLHIV linked to community support structures increase from 50% to 87%, and retention on ART from 70% to 90% during the same period.
**Conclusions/Next steps:** Community QI teams are very important in promoting community-health facility linkages and HIV-client ART retention. These community structures should be used by health care systems because they can be implemented with minimal financial and zero additional human resources. Community QI teams have potential of helping HIV&AIDS programs achieve the last '90' of the UNAIDS 90-90-90 target.

### IMPACT OF THE CHILDREN AND ADOLESCENTS HIV QUALITY CARE NETWORK (CAN) ON HIV VIRAL LOAD TESTING AND VIROLOGIC SUPPRESSION AMONG HIV-INFECTED CHILDREN, THAILAND, 2014

C. Lertpiriyasuwat[1], R. Lolekha[2], W. Petdachai[3], P. Kosalaraksa[4], R. Hansudewechakul[5], T. Borkird[6], T. Naiwatanakul[2], M. Yentang[3], S. Rattanamanee[4], R. Saksawad[6], U. Sukhaphan[6], P. Pavaputanondh[1], W. Faikratok[2], M. Martin[2,7], S. Bhakeecheep[8], S. Ongwandee[1]
*[1]Ministry of Public Health, Bureau of AIDS, TB and STIs, Nonthaburi, Thailand, [2]Global AIDS Program Thailand/Asia Regional Office, Thailand Ministry of Public Health-U.S. CDC Collaboration, Nonthaburi, Thailand, [3]Phrachomklao Hospital, Petchburi, Thailand, [4]Srinagarind Hospital, Khonkaen, Thailand, [5]Chiangrai Prachanukroh Hospital, Chiang Rai, Thailand, [6]Hatyai Hospital, Songkla, Thailand, [7]Centers for Disease Control and Prevention, Center for Global Health, Division of Global HIV/AIDS, Atlanta, United States, [8]National Health Security Office (NHSO) Region 1, Chiang Mai, Thailand*
*Presenting author email: cheewananl@gmail.com*

**Background:** The Children and Adolescents HIV Quality Care Network (CAN) aims to improve the care and treatment of HIV-infected children and adolescents in Thailand. The CAN supports and provides activities to establish multidisciplinary pediatric HIV care teams in HIV clinics, conduct regular performance measurement and quality improvement (QI) activities, conduct provincial CAN trainings, and create and sustain provincial referral and consultation networks. CAN trainings were expanded to 76 of Thailand's 77 provinces during 2011-2013. Four regional trainers conducted the trainings for provincial and large community hospitals. Once trained, provincial trainers conducted CAN trainings for community hospitals in their provinces. We compared the viral load (VL) testing coverage, virologic suppression rate, and the death rate of children receiving care in hospitals receiving CAN training by regional trainers (directly participating hospital, DP), by provincial trainers (indirectly participating hospitals, IP), and non-participating hospital (NP).
**Methods:** We analyzed data from HIV-infected children < 15 years old in the National AIDS Program database in 2014. Hospitals with >5 HIV-infected children were selected for analysis. We compared the proportion of HIV-infected children and adolescents who had viral load testing, virologic suppression (< 50 copies/mL), and death rate of DP, IP, and NP hospitals using Kruskal-Wallis test.
**Results:** From October 2013-September 2014, 6,372 HIV-infected children from 471 hospitals in 76 provinces were included in the analysis; 3,570 (56.0%) children receiving care in 149 (31.6%) DP hospitals, 1,832 (28.8%) in 288 (61.1%) IP hospitals, and 970 (15.2%) in 34 (7.2%) NP hospitals. A total of 4,894 (83.5%) of 5,860 ART eligible children received antiretroviral treatment (ART). Median annual VL testing rate of children receiving ART for >6 months was higher in DP (92%) and IP (100%) than NP (76%) (p< 0.01). Median virologic suppression rates were higher among children in CAN participating hospital (82%) than NP (75%) hospitals (p= 0.04). The mean death rates among children were lower in IP (0.08%) compared to NP (0.29%) and DP (0.25%) (P< 0.001).
**Conclusions:** Coverage of VL testing and the virologic suppression rate was higher in CAN participating hospitals than non-participating hospitals. Network activities should continue and be expanded to all hospitals in Thailand.

## WEPEE509

### EVALUATING THE IMPACT OF INNOVATIVE STATE QUALITY IMPROVEMENT PROJECT IN HIV PROGRAM: EXPERIENCE FROM NORTH-WESTERN NIGERIA

V.A. Adepoju[1], N.A. Ndulue[2], E. Ginika[3], B. Okoye[4], N.M. Onuaguluchi[5], A. Etsetowaghan[6], J. Inegbeboh[7], U. Kangiwa[8]
*[1]Management Sciences for Health, HIV/TB Clinical Services, Birnin Kebbi, Nigeria, [2]Management Sciences for Health, Deputy Project Director,USAID Funded ProACT Project, Abuja, Nigeria, [3]Management Sciences for Health, Senior Clinical Advisor (TB/HIV&Quality Improvement), Abuja, Nigeria, [4]Management Sciences for Health, State Team Leader (Health Systems Strengthening), Birnin Kebbi, Nigeria, [5]Management Sciences for Health, HIV Quality Improvement, Abuja, Nigeria, [6]Management Sciences for Health, PMTCT, Pediatrics HIV, Abuja, Nigeria, [7]UNICEF, Maternal Newborn and Child Health, Birth Registration Consultant, Birnin Kebbi, Nigeria, [8]Federal Medical Center, Birnin Kebbi, Consultant Hematologist/Quality improvement Lead(HIV/AIDS), Birnin Kebbi, Nigeria*
*Presenting author email: nndulue@msh.org*

**Background:** Driving competition among health facilities and staff through regional or state quality improvement (QI) projects could solve the problem of improving quality of HIV services. This study evaluated the impact of state QI project compared with hospital-specific project developed based on identified gaps from biannual National Quality program (NigeriaQual) between 2014-2015 in USAID-funded ProACT project implemented by MSH in Kebbi state, Nigeria.
**Methods:** A baseline study was conducted between Jan-June 2014 using NigeriaQual data abstraction questionnaires to extract information on the quality of care provided for 1200 randomly selected patients who assessed HIV care across 6 hospitals between July-December 2013. Each hospital then developed hospital-specific QI projects based on indicators needing improvement. A similar subsequent study was conducted between Jan-June 2015 on 1200 randomly selected patients who assessed HIV services across the same hospitals between July-December 2014 to evaluate cross-cutting lowest performing indicators. These indicators were scored and ranked resulting in three indicators with highest priority scores that formed Kebbi regional QI projects: to improve access to CD4 for adult and pediatric people living with HIV (PLHIV) from 53.5% to 90%; dried blood spot (DBS) access for exposed infants from 32.1% to 90% and access to rapid test at 18 months from 34% to 90% all between July-December 2015. The state Technical Working Group provided technical assistance and a progress report of individual hospital and state average performance was shared with hospital QI committee members every 2 months.
**Results:** By December 2015, access to DBS collection for exposed infants increased from Kebbi state average of 32.1% to 90%, access to CD4 for PLHIV improved from state average of 53.5% to 86% while rapid testing at 18 months improved from 34% to 38% with 4 of the 6 facilities achieving more than state average. Hospitals achieved greater improvement in similar quality indicators with state QI than hospital-specific QI project.
**Conclusions:** Regional or state-wide quality improvement projects developed based on HIV quality indicators needing improvement across board has been shown to yield better results. The study will help stakeholders to know how best to stimulate competition for better quality of HIV services.

## WEPEE510

### APPLYING CONTINUOUS QUALITY IMPROVEMENT (CQI) IN VOLUNTARY MEDICAL MALE CIRCUMCISION PROGRAMS IN SOUTH AFRICA

T. Maartens[1], J. Ndirangu[2], J. Littlefield[3], D. Loyikissoon[4], C. Bonnecwe[4], E. Njeuhmeli[5], D. Jacobs[2]
*[1]University Research Co., LLC, USAID ASSIST Project, Pretoria, South Africa, [2]University Research Co., LLC, Quality & Performance Institute, Pretoria, South Africa, [3]USAID Southern Africa, Pretoria, South Africa, [4]National Department of Health, Medical Male Circumcision Unit, Pretoria, South Africa, [5]USAID, Office of HIV/AIDS, Washington, United States*
*Presenting author email: tinam@urc-sa.com*

**Background:** South Africa (SA) is home to 6.4 million people living with HIV, with an estimated HIV prevalence of 18.9% amongst 15-49 year old adults. The National Department of Health (NDOH), in partnership with PEPFAR, rolled out Voluntary Medical Male Circumcision (VMMC) services as a key HIV prevention strategy. With programmatic expansion, quality issues were noted. In June 2014, the USAID ASSIST project was funded to implement Continuous Quality Improvement at 134 PEPFAR-supported sites to improve the quality and safety of VMMC services.
**Description:** Baseline CQI assessments in 134 facilities, across 9 provinces demonstrated quality gaps in compliance with 8 key VMMC Quality standards (Leadership and planning, management systems, monitoring and evaluation, registration, group education and counselling, individual counselling and HIV testing, infrastructure, equipment and supplies, surgical procedure and infection prevention and control). Based on performance, sites were classified for intense (monthly), light (quarterly) or collaborative (annual) support by the ASSIST team. During CQI support visits, facility-level CQI teams were established, quality gaps identified, analyzed and improvement interventions tested, adapted and scaled up to address these gaps. Implementing partners (IPs) played an important role in implementation. Additionally, Four CQI trainings were conducted, attended by 6 provinces. Basic CQI concepts, methodology and tools were discussed and applied during group work. Three CQI learning sessions were conducted, where provinces, DOH facilities, IPs and private providers shared lessons on best practices as well as what did not work. During learning sessions, individuals and groups were given the opportunity to learn from colleagues. Quarterly site re-assessments were conducted.
**Lessons learned: Lessons learned:** Within a 12-month period, provision of CQI by ASSIST staff led to improved overall compliance with all 8 VMMC Quality standards. This resulted in improved quality of VMMC services and better collaboration between DOH and VMMC implementing partners.
**Conclusions/Next steps:** Implementation of CQI has yielded tangible results in VMMC service delivery in South Africa.

## WEPEE511

### CAPTURING OF 'EXPERIENTIAL KNOWLEDGE' BY NATIONAL AIDS CONTROL ORGANISATION OF INDIA TO REPLICATE ACROSS INDIAN STATES AND GLOBALLY

J. Kirubakaran[1], U. Das[1], J. Sachdev[2], K. Pramod[3], G. Sharma[1], J. Williams[3], N. Dhingra[1]
[1]*NACO, New Delhi, India,* [2]*The World Bank, New Delhi, India,* [3]*VHS, Chennai, India*
*Presenting author email: jimreevesk@yahoo.com*

**Background:** The Experiential Knowledge is unwritten, unspoken, and vast storehouse of knowledge held by the implementers of HIV/AIDS programme within their mind and is based on day to day experiences, insights and observations. With the support of the World Bank (WB), National AIDS Control Organisation (NACO) attempted to identify and capture these experiential knowledge and innovations for strengthening the HIV prevention and control services and to cater to the demands of some of the Asian and African Countries.
**Description:** With support from the WB, NACO has trained over 150 implementers of the HIV/AIDS programme in India on the art of capturing experiential knowledge since May 2015. Using a prescribed check-list of the World Bank, NACO has identified good practices across its programmes. A total of 98 good practices including 29 on Prevention; 10 in Basic Services; 11 in Care, Support & Treatment; 22 in Country Ownership & Stewardship and PPP; 25 Program Support systems & MIS, etc were identified. In the prevention, 20 best practices were captured and documented. These 'knowledge assets' are being recorded systematically in the form of a video document, and textual formats, which was developed using the standard templates of the World Bank. The template enabled to capture the 'how' aspects of the good practices.
**Lessons learned:** Capturing of experiential knowledge is an effective and efficient way to meet the implementation challenges. Motivating implementers to capture their own experiences was a challenge, since knowledge capturing initiative is not institutionalized. It required hand-holding support from S2S Knowledge Sharing Secretariat.
**Conclusions/Next steps:** It is therefore essential to capture, share experiential knowledge and promote peer to peer learning. The captured knowledge will be shared within NACO, between states and other countries through systematic knowledge sharing methods. NACO is in the process of building a resource pool as well as an online interactive knowledge sharing system where anyone can access these documented experiential knowledge.

# PROGRAMMATIC DATA ON QUALITY OF HIV PREVENTION AND CARE CONTINUA

## WEPEE512

### "WE ARE PART OF A FAMILY". BENEFITS AND LIMITS OF COMMUNITY ART GROUPS IN THYOLO DISTRICT, MALAWI: A QUALITATIVE STUDY

U. Pellecchia[1], S. Nundwe[1], A. Bwanali[1], B. Zamadenga[1], C. Metcalf[2], S. Daho[1], O. Jalon[3], H. Bygrave[2], B. Chiwandira[4], K. Kanyimbo[4], A. Shigayeva[3], S. Baert[2]
[1]*Médecins Sans Frontières, Thyolo, Malawi,* [2]*Médecins Sans Frontières, Southern Africa Medical Unit, Cape Town, South Africa,* [3]*Médecins Sans Frontières, Blantyre, Malawi,* [4]*Ministry of Health, District Health Office, Thyolo, Malawi*
*Presenting author email: msfocb-blantyre-opr@brussels.msf.org*

**Background:** In 2012 Community ART Groups (CAGs) were piloted in Thyolo District, Malawi as a community-based model of ART delivery to overcome patients' barriers in accessing treatment and decrease health care workers' workload. CAGs are self-formed groups of patients on ART who rotate at the health facility for drug pick up for all group members. We conducted a qualitative study to assess the benefits and challenges of CAGs from the patients' and health care workers' (HCWs) perspective.
**Methods:** Fifteen focus group discussions, 15 individual in-depth interviews and 2 days of participant observation were performed in 2 health centres. The 94 study participants included CAG members, ART patients eligible for CAGs but in conventional care, former CAG members who returned to conventional care and HCWs. They were purposefully selected from ART registers considering their socio-demographic characteristics. Narratives were audio-recorded, transcribed, and translated from Chichewa to English. Data was analysed through a thematic analysis. The study was approved by the National Health Sciences Research Committee of Malawi.
**Results:** Patients as well as HCWs highly appreciated the practical benefits of CAGs in reducing frequent clinic visits, resulting in fewer transportation and occupational costs for patients and a reduced workload for HCWs. Additionally peer support was perceived as an added value of the groups allowing not only sharing of the logistical constraints of drugs refills, but also enhanced emotional support, with the group acting as a forum for understanding and support to adhere to ART. Barriers to join a CAG were a lack of information on CAGs, unwillingness to disclose ones HIV status, mobility and group conflicts. HIV related stigma persists and CAGs were perceived as an effective strategy to minimize exposure to discriminatory labelling by community members.
**Conclusions:** CAGs are an acceptable model for ART delivery for PLHIV and HCWs. The CAGs addressed patient's practical barriers to accessing ART and improved peer support, a factor patients considered fundamental to their wellbeing. CAGs had a limited impact on reducing HIV-related stigma. Further expansion of this model of ART delivery should be considered in similar settings.

## WEPEE513

### TACKLING THE FIRST 2 90S IN ZIMBABWE: HIV TEST YIELDS AND LINKAGE TO CARE IN MAKONI AND MUTARE DISTRICTS, MANICALAND PROVINCE

K. Webb[1], V. Chitiyo[1], T. Mukotekwa[1], D. Patel[1], P. Mafaune[2], C. Nzande[2], S. Page-Mtongwiza[1], T. Maphosa[1], B. Engelsmann[1]
[1]*Organisation for Public Health Interventions and Development (OPHID) Trust, Harare, Zimbabwe,* [2]*Ministry of Health and Child Care, Manicaland Province, Mutare, Zimbabwe*
*Presenting author email: tmaphosa@ophid.co.zw*

**Background:** Reaching ambitious 90-90-90 targets will require increasing the proportion of people living with HIV who know their status and strengthening linkages to care and treatment. In Zimbabwe, with an estimated adult HIV prevalence of 16.7%, health information in paper-based registers precludes routine reporting of entry point disaggregated or individual outcomes in the HIV Care and Treatment program. Objective of our targeted assessment was to establish current rates of HIV test yields and linkage of HIV positive (HIV+) individuals to care and treatment from different healthcare entry points.
**Methods:** Eleven (11) health facilities in Makoni and Mutare Districts were selected using a simplified probability proportional to size technique. In October 2015, we conducted a retrospective cohort analysis tracing all individuals testing HIV positive from January to March 2015 through facility registers. De-identified, age and sex disaggregated data on HIV testing entry point and linkage to care and treatment was entered into MSExcel and analyzed descriptively using StataV12.
**Results:** Among 3,816 HIV tests conducted, only 34.5% (n=1,318) were among men. Overall, women testing in PMTCT settings accounted for over 1/3 of all HIV tests (n=1,374). Observed prevalence was 10.7% in adults (15-45+) and 6.9% in children tested. The majority of individuals testing HIV+ were tested for the first time (64%; n= 2,815). Among age and sex disaggregated groups, males age 45+ (17%) had highest positivity rate. Entry points with highest positivity rates included TB (30%), index cases (24%) and outpatient departments (22%). Linkage to care and treatment was recorded in 64% of all individuals testing HIV+. Highest linkage rates were observed in PMTCT (82%) and lowest among young people aged 15-24 (49%). Higher volume sites serving 1500+ patients on ART had lower linkage rates (range 44-59%) than those serving between 200-1500 ART clients (range 53-100%).
**Conclusions:** Findings demonstrate there are groups in need of enhanced support to increase HIV test rates (men) and linkages to care and treatment (young people) to reach the first 2 90s in Zimbabwe. Evidence on effective differentiated models of care for increasing test rates in low testing, high yield sub populations and providing support for linkage and retention are required.

## WEPEE514

### ACCEPTABILITY OF OPTION B+ AMONG PREGNANT AND BREASTFEEDING WOMEN IN SELECT DISTRICTS IN ZIMBABWE

A. Chadambuka[1], A. Muchedzi[1], L. Katirayi[2], E. Tumbare[3], R. Musarandega[3], A. Mahomva[3], G. Woelk[2]
[1]*Elizabeth Glaser Paediatric AIDS Foundation, Operations Research, Harare, Zimbabwe,* [2]*Elizabeth Glaser Paediatric AIDS Foundation, Washington DC, United States,* [3]*Elizabeth Glaser Paediatric AIDS Foundation, Technical, Harare, Zimbabwe*
*Presenting author email: achadambuka@pedaids.org*

**Background:** Zimbabwe's MOHCC adopted the 2013 World Health Organization (WHO) PMTCT guidelines recommending the initiation of HIV positive pregnant and breastfeeding women (PPBW) on lifelong antiretroviral treatment irrespective of their clinical or immunological stage (Option B+). Option B+ was officially launched in November 2013. . The acceptability and uptake of lifelong treatment by women accessing health care facilities was unknown. We explored the acceptability of and adherence to lifelong antiretroviral therapy among PPBW, and described experiences and perceptions regarding Option B+ service delivery in order to identify potential areas to improve service delivery and uptake.

Tuesday 19 July
Wednesday 20 July Poster Exhibition
Thursday 21 July
Friday 22 July
Late Breaker Posters
Author Index

**Methods:** A qualitative study was conducted at selected sites in Harare (urban) and Zvimba (rural) to explore Option B+ acceptability, barriers, and facilitators to ART adherence and service uptake. In-depth interviews (IDIs), focus group discussions (FGDs) and key informant interviews (KIIs) were conducted with PPBW, healthcare providers, and community members. Medical Research Council of Zimbabwe approved the study. All interviews were audio-recorded and then transcribed and translated. Data was coded and analyzed in MaxQDA.
**Results:** 43 IDIs, 22 FGDs, and five KIIs were conducted. The majority of women accepted lifelong therapy for the health of their babies. There was however, a fear of commitment to taking life-long medication because they were afraid of defaulting, especially after cessation of breastfeeding. There was confusion around dosage, and concern about fear of side effects, not having enough food to take drugs, and the lack of opportunities to ask questions about the new regimen. Participants reported that the time for counseling was less with the implementation of the Option B+ program. Facilitators were the low pill burden, ability to continue breastfeeding beyond six months like HIV negative women and partner, community and health worker support. Barriers were distance to health facility, non-disclosure of HIV status, knowing someone who had negative experience on ART.
**Conclusions:** PPBW in this setting are accepting of lifelong ART. However, continued counseling is essential to reduce fears and confusion around lifelong ART therapy. Counseling, including ongoing counseling after initial post-test session, needs to be strengthened to ensure that women receive the necessary information.

## HIV AND OTHER VERTICAL PROGRAMMES, E.G., TUBERCULOSIS, SEXUALLY TRANSMITTED INFECTIONS, DRUG TREATMENT, FAMILY PLANNING

### WEPEE515

#### INTEGRATION OF HIV TESTING, CARE AND TREATMENT SERVICES INTO TB CLINIC IN NORTHERN NAMIBIA HAS DRAMATICALLY IMPROVED QUALITY OF HIV SERVICES: A REAL WORLD EXPERIENCE

T. Mekonen[1], L. Haindongo[2], S. Mpinda[2], S. Nakangombe[2], G. Magweta[2], R. Shoopala[2], K. Kambonde[2], N. Hamunime[1]
*[1]Ministry of Health and Social Services of Namibia, Sub-division HIV and STI Control, Windhoek, Namibia, [2]Ministry of Health and Social Services of Namibia, Oshakati Intermediate Hospital, TB Clinic, Oshakati, Namibia*

**Background:** Nearly half of TB patients in Namibia have HIV co-infection. HIV and TB services are not integrated. This affects HIV testing, linkage-to-care, anti-retroviral therapy (ART) initiation, retention and TB infection control (TB IC). We integrated HIV testing, care and treatment services into TB clinic in Oshakati hospital to improve HIV testing uptake, linkage-to-care and ART initiation.
**Description:** We trained healthcare workers (HCWs) on HIV testing, care and treatment; optimized minimum available resources and introduced the integrated model. In this model, TB patients access point-of-care HIV testing and counseling, linkage-to-care and start ART in TB clinic without referral to HIV clinic setting. Prescription and dispensing of anti-retrovirals is also done in TB clinic. Upon completion of TB treatment, patients are transferred to HIV clinics for continued care and treatment.
**Lessons learned:** HCWs and patients welcomed the model. In 12 months, 338 patients received TB treatment. All with unknown HIV status were tested. HIV positivity was 42.6%. We conducted cohort analysis to measure time from HIV testing-to-enrollment into care and TB diagnosis to ART initiation. Thirty patients who started ART in HIV clinic during the year before integration were taken as historic controls and 59 who started ART in the integrated model as intervention group. We compared average time-to-enrollment into care and time-to-ART initiation. Average time, from testing to enrollment was 71.8 and 3.2 days (T=2.61, P=0.01) and TB treatment initiation to ART was 44.0 and 18.3 days (T= 2.75, P=0.008) among the control and intervention groups, respectively. We used Cox Proportional Hazards Regression for time-to-event analyses. After integration, there were 82% [HR= 0.18 (95% CI=0.09-0.37, P< 0.0001)] and 53% [HR= 0.47 (95% CI=0.27-0.82, P< 0.007)] reductions in time-to-enrollment into care and time-to-ART initiation, respectively. No patient in the intervention and 6.8% in the control group received inappropriate ART regimens. Following experience-sharing visits to this facility, four other hospitals adapted the model.
**Conclusions/Next steps:** Facilities can provide integrated HIV and TB services with minimum resources. Integration enhances HIV testing uptake, strengthens linkage-to-care and significantly reduces time-to-enrollment and time-to-ART initiation. It improves patient safety and TB IC. Programs may progressively adapt integrated model of TB/HIV services.

### WEPEE516

#### KEY POPULATION-FRIENDLY SEXUALLY TRANSMITTED INFECTION MANAGEMENT IN NIGERIA

O. Oyedeji[1], G. Omoregie[2], E. Ogbe[2], A. Odulaja[3]
*[1]Society for Family Health, FCT, Abuja, Nigeria, [2]Society for Family Health, FCT Abuja, Nigeria, [3]Society for Family Health, Ibadan, Nigeria*
*Presenting author email: segunoyedeji@gmail.com*

**Background:** Sexually-transmitted-infections-(STI) is known to increase the potential for HIV-transmission particularly for key-populations (KP).Despite the dire-need for STI-programming, the country had no standardized-protocol, tools and systems for STI-management.Society-for-Family-Health, a-principal-recipient of The-Global-Fund, piloted a one-year STI-syndromic-management-services as against etiological-management in two-states of Lagos and FCT-Abuja with the objective of providing KP-friendly-STI-management-services as one of the strategies for reducing the spread of HIV-infection, minimising missed-opportunities and high-cost of laboratory-investigations.
**Description:** The programme adopted a three-prong-approach of Institutional-support, Service-provision, and Strengthening-of-monitoring-and-evaluation. The implementation process involved the-assessment of gaps in training-protocol, manual and Health-system for KPs. Training of 120 health-care-workers from 40 health-facilities made up of primary, secondary and private-healthcare-facilities using a revised national-STI-Syndromic-management-guideline, provision of STI-drugs and consumables to the selected health-facilities, referral of KPs for STI-treatment by community-mobilizers, data-management by 40 trained officers in the facilities and effective primary-prevention of STIs to KPs through promotion of appropriate-STIs-care-seeking-behavior, provision of HIV-testing-services and provision of condoms.
**Lessons learned:** A technical review of the programme by an independent consultant revealed that the use of the flow charts simplified diagnosis by the health-workers and reduced time spent in health-facilities by KPs, every flow-chart represents a compromise between diagnostic accuracy, technical and financial realities, improved mutual-trust between the health-workers and KPs, commitment of pharmacists to the programme was low in terms of tracking drugs because they were not trained, there was no formal-structure or curriculum for stepping-down the training to other members of staff in the facility thereby limiting-capacity-building of other staff in the facilities, integration of Syndromic-management-of-STIs into the entire hospital-clients' management varied thus operated like a parallel programme in some facilities, drug-logistic-management was more effective in the private and primary-health-facilities than secondary facilities.
**Conclusions/Next steps:** The Syndromic-management-of-STI made treatment accessible-and-affordable to a large-majority of the key-population. Data-collection and collation on syndromic-management commenced for the first time with the successful implementation of this pilot project which will be scaled up in the new funding model of The-Global-Fund. On a medium and long-term, syndromic-management of STIs for KPs should be included in the pre-service training-curricula for health-care-workers and incorporated into the community-health-services-programmes.

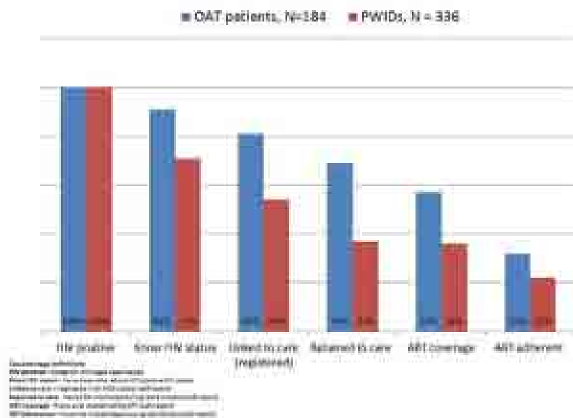
### WEPEE517

#### USING MIXED-METHODS TO UNDERSTAND HIV TREATMENT CASCADE AMONG OPIOID AGONIST THERAPY (OAT) PATIENTS AND PEOPLE WHO INJECT DRUGS (PWIDS) IN FIVE UKRAINIAN CITIES

A. Mazhnaya[1], R. Marcus[2], I. Pykalo[3], I. Makarenko[1], M.J. Bojko[2], S. Filippovych[1], S. Dvoriak[3], F.L. Altice[4]
*[1]ICF Alliance for Public Health, Treatment, Kyiv, Ukraine, [2]Yale University School of Medicine, AIDS Program, New Haven, United States, [3]Ukrainian Institute for Public Health Policy, Kyiv, Ukraine, [4]Yale University School of Medicine, AIDS Program, Kyiv, Ukraine*
*Presenting author email: hmazhnaya@gmail.com*

**Background:** It is estimated that among 310 000 PWIDs in Ukraine, 61 070 are HIV infected. OAT is effective for engaging and retaining PWIDs in HIV treatment and care, however, multilevel barriers hinders its effective implementation in Ukraine. It is necessary to explore HIV treatment cascade to inform the decision-makers about OAT scale-up and its integration with HIV services.
**Methods:** During 2013-2014 within the NIH-funded project "Expanding medication assisted therapies in Ukraine" mixed-methods study was conducted using focus group discussions followed by participant-led structured on-line survey and HIV rapid testing. We analyzed a sub-sample of HIV-positive participants recruited through random sampling from OAT sites (N=184) and respondent-driven sampling (N=336) of PWIDs in 5 major Ukrainian cities representing distinctive geographical regions. We compared proportions at each stage of HIV treatment cascade for

OAT patients and PWIDs accounting for the sampling strategy (sampling weights). We further explored qualitative data for possible explanations of differences in HIV treatment cascades.
**Results:** HIV treatment cascades indicate the differences between OAT patients and PWIDs in levels of HIV diagnosis (91% vs. 71%), linkage (81% vs. 54%) and retention in care (69% vs. 37%). Data demonstrates the positive effect of OAT on linking HIV positive PWIDs to HIV care. Cascade indicates an important general gap between those who started taking ART and are adherent.



*[HIV treatment cascade for OAT patients and PWIDs in 5 major Ukrainian cities]*

For OAT patients this gap is representing poly-pharmacy and pharmacokinetic interactions between ART and OAT which was voiced during focus groups. There were no major differences in treatment cascades between genders for OAT patients, however, female PWID reported higher proportions at all the stages of the cascade.
**Conclusions:** These results support the importance of OAT for linking HIV positive patients to HIV care in resource constraint settings. Findings support international recommendations to scale-up OAT and integrate it with HIV services to improve ART adherence.

## WEPEE518

### COMMUNITY ADVOCACY AND EDUCATION TO END STIGMATIZING LANGUAGE IN TB AND HIV RESEARCH AND PRACTICE

C. Lee[1], R. Campbell[2], M. Frick[3], R. Siskind[4], N. Morar[5], J. Schouten[2]
*[1]Tuberculosis Trials Consortium, Community Research Advisors Group (CRAG), New York, United States, [2]Fred Hutchinson Cancer Research Center, Office of HIV/AIDS Network Coordination, Seattle, United States, [3]Treatment Action Group, New York, United States, [4]Division of AIDS, NIAID, NIH, Workforce Operations, Communication and Reporting Branch, Bethesda, United States, [5]South African Medical Research Council, HIV Prevention Research Unit, Westville, South Africa*

**Background:** Research has shown that stigma impacts on the willingness of people with TB and HIV to undergo screening, seek treatment and remain in care. Stigma is multidimensional, and one source of stigma is the incriminating terminology used to describe people with TB and TB/HIV. Stigmatizing terms like "suspect" and "defaulter" remain widespread in TB/HIV research and clinical care despite the guidance from the Stop TB Partnership on patient-centered language and Community calls to discontinue these terms.
**Description:** The Community Research Advisors Group (CRAG), the community advisory board (CAB) to the Tuberculosis Trials Consortium (TBTC), and Community Partners (CP), a group of community representatives working across the 5 National Institutes of Health HIV/AIDS clinical trials networks, formed a collaboration to end the use of stigmatizing terminology in TB/HIV research. Advocacy strategies included sign-on petitions to professional societies and academic publishers; internal memos addressed to investigators at research networks; community participation in guidelines development; and education on stigma for TB/HIV programs.
**Lessons learned:** Advocates and CABs have worked with public health and scientific stakeholders to replace stigmatizing terminology with language that maintains clarity required for clear clinical discourse while respecting the dignity of people with TB and TB/HIV. Eliminating stigmatizing language requires interventions at multiple levels including community education; research planning and conduct; research results communication and publication; and the translation of research into policy and practice. Community advocacy and education is effective in reducing stigmatizing language in TB and HIV research and practice as shown in the Table.

| Research planning and conduct | Research communication and publication | Translation of research into practice |
|---|---|---|
| ACTG memo to replace „research subjects" with „research participants" | Letter to the International Union Against Tuberculosis and Lung Disease requesting action to provide guidance on avoiding stigmatizing language in conference abstracts and journal articles | Intervention by CP member replaced „mother to child transmission" with „perinatal transmission" on DHHS pediatric ARV guidelines panel |
| CRAG memo to TBTC leadership outlining non-stigmatizing terms | | Development of education and marketing materials on TB stigma by CRAG member presented to US TB programs |

*[Community engagement interventions to end the use of stigmatizing language]*

**Conclusions/Next steps:** The collaborative advocacy by CRAG, CP and CABs adds to the growing body of TB/HIV work that may offer a model for patient and community groups seeking to combat stigma in clinical research and care. Eliminating stigmatizing language may help to reduce the stigma of TB or HIV infection and the dual stigma of co-infection by improving the terms through which people engage with medical research and public health.

## WEPEE519

### CHALLENGES TO THE INTEGRATION OF HIV AND M/XDR-TB SERVICES IN SOUTH AFRICA: A QUALITATIVE STUDY OF FRONTLINE HEALTH PROVIDERS

A. Daftary[1,2,3], N. Padayatchi[2]
*[1]McGill University Health Center, McGill International TB Centre, Montreal, Canada, [2]Centre for the AIDS Programme of Research in South Africa (CAPRISA), University of KwaZulu Natal, Nelson R. Mandela School of Medicine, Durban, South Africa, [3]University of Toronto, Dalla Lana School of Public Health, Toronto, Canada*
*Presenting author email: amrita.daftary@mail.mcgill.ca*

**Background:** One-fifth of all MDR-TB cases occur in South Africa; 60-80% are HIV-positive. Fewer than half of MDR-TB patients successfully complete treatment, and outcomes are significantly worse among patients with XDR-TB and those coinfected with HIV. Decentralization of M/XDR-TB treatment and integration of HIV and M/XDR-TB services are thus crucial components of the national TB agenda. A better understanding of frontline challenges is needed to ensure that strategies under development are not only efficacious but also acceptable to patients and providers.
**Methods:** In 2013, we conducted a qualitative study to highlight personal, professional, and programmatic factors underlying health care providers' capacity to deliver optimal care for M/XDR-TB and HIV. Focus groups and individual interviews were completed with a purposive sample of 17 providers at a tertiary TB facility in KwaZulu Natal. A grounded theory analytic framework yielded several themes that were contextualized to enhance their applicability to other high-burden settings.
**Results:** Participants included four doctors, eleven nurses, and two allied health providers, with median 4.5 years' experience treating HIV and/or M/XDR-TB (range, 0.5-20); 9 participants were primarily responsible for providing M/XDR-TB care and 8 for HIV care. Their personal infection control practices, specifically face-mask use, were weakened by a workplace culture characterized by low motivation, disparate risk-perceptions and practices in the workforce hierarchy, physical discomfort, and difficulties managing patients with treatment-induced hearing loss. Patient-provider interactions were stronger among nurses, compared to doctors, and in the delivery of HIV, compared to M/XDR-TB, care due to a greater focus on patient empowerment, empathy, and support. The stigma associated with M/XDR-TB was considered worse than with HIV, and perpetuated by the health system, particularly within primary health care facilities with little/no exposure to cases of M/XDR-TB. Providers struggled with the daily tedium of M/XDR-TB treatment supervision, and supported treatment literacy and self-administration. Administrative restrictions, clinic norms, and vertical provider mindsets impeded the effective integration of HIV and M/XDR-TB care.
**Conclusions:** The comprehensive, decentralized management of M/XDR-TB/HIV coinfection mandates greater attention to patient-provider trust, treatment literacy, and traditional workplace norms that continue to perpetuate fragmented service delivery and exposure to nosocomial infection.

## WEPEE520

### COMMUNITY-LED TUBERCULOSIS SCREENING OF PEOPLE LIVING WITH HIV FOR EARLY DIAGNOSIS AND LINKAGE: A CASE STUDY FROM INDIA

J. Jose[1], R. Deshmukh[2], M. Balani[3], B.B. Rewari[4], A.S. Rathore[1], R. Huidrom[3]
*[1]National AIDS Control Organisation, Care Support and Treatment Division, Delhi, India, [2]WHO Country Office for India, HIV/TB, Delhi, India, [3]India HIV/AIDS Alliance, Care and Support, Delhi, India, [4]WHO Country Office for India, HIV/AIDS, Delhi, India*
*Presenting author email: jisjose86@gmail.com*

**Background:** Care and Support Centres (CSCs) under Vihaan project in India work closely with NACO ART centers and provide expanded and holistic care and support services for People Living with HIV (PLHIV) through a community led model. Community-based outreach is the backbone of CSC, serving as a comprehensive approach to provide support for retention in treatment, adherence, positive living, referrals to other health services, linkages to social welfare schemes, and strengthening enabling environment for PLHIV. There are 350 CSCs implemented by PLHIV networks, community-based organizations, and Non-Government Organizations. Tuberculosis (TB) and HIV services were integrated in CSC services to address dual infection.

**Description:** Through an integrated approach HIV-TB services were included into CSCs. Tuberculosis screening among PLHIV based on four symptom screening, linkage to ART for those diagnosed with TB, counseling for treatment adherence of HIV-TB co-infected clients, referral and contacts screening for TB were the activities integrated to CSC services. Trainings were conducted for all CSC staff and monitoring indicators were defined. The findings and lessons learned from these activities implemented during October to December 2015 are presented in this paper.

**Lessons learned:** Total 55,582 PLHIV were screened for TB, among them 1,354 (2.43 %) were from HRG groups. 9,494 PLHIV were referred by CSCs for TB testing among whom 762 (8 %) were diagnosed with TB and linked for starting TB treatment. 334 family members who were TB symptomatic were also referred to TB diagnostic centers. The table of results is attached:

| Indicators | Male | Female | Trans-gender | Male Children (<15 Years) | Female Children (<15 Years) | Total |
|---|---|---|---|---|---|---|
| Number of PLHIV screened for TB symptoms (4S) through ICF | 25629 | 26756 | 117 | 1756 | 1324 | 55582 |
| Number of TB symptomatic PLHIV referred to nearest TB diagnostic centres | 4589 | 4483 | 12 | 216 | 199 | 9499 |
| Number of Key Population (HRG) among PLHIV screened for TB through ICF | 687 | 565 | 79 | 12 | 11 | 1354 |
| Number of Key Population (HRG) among PLHIV referred for TB testing | 245 | 173 | 35 | 2 | 1 | 456 |
| Number of referred PLHIV got tested and detected TB positive | 451 | 277 | 7 | 7 | 20 | 762 |
| Number of TB symptomatic family members / partner of registered PLHIV referred to TB testing facility | 151 | 153 | 0 | 9 | 21 | 334 |

*[Result of Community led Tuberculosis screening of People Living with HIV]*

**Conclusions/Next steps:** The findings of intervention suggests that community based care and support centres involvement in TB/HIV are effective supplement in efforts to diagnose TB early and thereby add to the ongoing efforts of national program to collaborate HIV-TB activities aimed at improving outcomes of those co infected with HIV and TB.

## WEPEE521

### HARM REDUCTION: LIMITATION OF HIV PREVENTION INTERVENTION FOR INJECTION DRUG USERS IN NIGERIA

B. Oguche[1], E. Evbomenya[2], S. Iwuagwu[1]
*[1]Centre for the Right to Health, Programs, Port Harcourt, Nigeria, [2]Centre for the Right to Health, Port Harcourt, Nigeria*
*Presenting author email: boniface.oguche@gmail.com*

**Background:** Strengthening HIV Prevention Services for Most at Risk Populations (SHIPS for MARPs), a USAID-funded project implemented by Center for the Right to Health (CRH) aims to reduce HIV prevalence among Injection Drug Users (IDUs) despite limitations in providing Drug-User-Specific interventions such as needle syringe program. The prevalence of HIV among IDUs in Nigeria is 4.2% (IBBSS 2010) which is greater than the National Prevalence of 4.1% (ANC 2010) with prevalence among female IDUs about 7 times higher than among male IDUs (IBBSS, 2010).

**Description:** CRH is currently implementing HIV Prevention intervention for Injection Drug Users in 4 States in Nigeria (Lagos, Rivers, Akwa Ibom and Cross Rivers). The Minimum Prevention Package Intervention (MPPI) strategies were developed to address key challenges identified during a baseline survey conducted prior to the project commencement. Procedure for implementing strategy for intervention include Peer education which involves targeted messages to address issues related to behavioral change and healthy living interactively discussed in modules.
Between January 2015 and December 2015 a total of 1063 IDUs have been reached with these strategies. IDUs reached across States reported Reduction in needle & syringe sharing, Reduction in unprotected sexual activity, Access to safer sex products.

**Limitations include:**
· Other interventions, in particular access to ART, Hepatitis and Tuberculosis diagnosis, prevention and treatment, are not documented or lacking, including the evidence.
· The concept of harm reduction is not fully accepted yet in Nigeria, including among the stakeholders.
Drug detoxification and rehabilitation services are limited in the country

**Lessons learned:**
- Intervention for IDUs requires holistic approach.
- Building capacity of target beneficiaries promotes sustainability
- Lack of harm reduction component often results in relapse and ineffective outcome in HIV prevention intervention program.
- Income Generating Activities should also be incorporated along side HIV prevention Intervention program

**Conclusions/Next steps:** There is urgent need to provide intervention for IDUs through holistic approach of harm reduction.
Policies regarding harm reduction must be changed to create enabling environment for such programs in Nigeria.
Increased rate of unemployment and poverty contributes to increasing numbers of IDUs. Thus the need incorporate IGAs in HIV programming.

## WEPEE522

### INTEGRATED TB AND HIV SERVICES FOR PREGNANT WOMEN LIVING WITH HIV IN MASHONALAND EAST PROVINCE, ZIMBABWE: OPPORTUNITIES AND CHALLENGES IN LOW-RESOURCES SETTINGS

V. Chitiyo[1], K. Webb[1], T. Ndoro[1], S. Page-Mtongwiza[1], A. Mushavi[2], B. Engelsmann[1]
*[1]Organisation for Public Health Interventions and Development, Operational Research, Harare, Zimbabwe, [2]Ministry of Health and Child Care, PMTCT and Pediatric HIV Care and Treatment, Harare, Zimbabwe*
*Presenting author email: vchitiyo@ophid.co.zw*

**Background:** HIV prevalence has been followed by increases in tuberculosis morbidity and mortality in PLHIV. In Zimbabwe approximately 69% of TB cases are co-infected with HIV. With pregnant women accessing antenatal care (ANC) services reporting 15.9% HIV prevalence, an integrated approach for TB/HIV services is required for good maternal health outcomes and elimination of new HIV and TB infections among children. in partnership with the Ministry of Health and Child Care, Mashonaland East Province assessed opportunities and challenges to integration of TB/ HIV services for pregnant women in ANC.

**Description:** In November-December 2014, the PEPFAR/USAID funded OPHID Families and Communities for the Elimination of HIV (FACE) program supported an assessment of integration of TB/HIV services for pregnant women. A total of 10 health facilities (four hospitals and six primary health facilities) in two of 56 districts supported by OPHID were randomly selected for assessment using routinely collected program data and interviews with nurse-in-charge at each facility.

**Lessons learned:** Between October 2013 - September 2014, 15.9% of 3,477 pregnant women who accessed ANC services were HIV positive. Although, 99% of the HIV positive women were symptom screened for TB, only 1% (4/554) successfully received TB diagnosis and care services. The large number of women accessing ANC services reflects an important opportunity for integrating TB/HIV services particularly early detection of TB in high risk PLHIV prior to presentation of symptoms. However, challenges were presented in offering integrated TB/HIV services: lack of documentation of the screening outcomes; weak or poor communication and sharing of information systems between services, specifically in referral based model of integration at hospital level; and inconsistency of sputum sample collection at primary healthcare facilities.

**Conclusions/Next steps:** Strengthening integration of TB/HIV services for pregnant women in ANC in Zimbabwe has potential to significantly contribute to the reduction of TB morbidity and mortality in PLHIV and prevent secondary infections in infants. Addressing the structural challenges affecting provision of integrated services at both primary and hospital levels through coordinated monitoring and documentation of services provided can support active follow-up of patients by healthcare providers and hence minimise lost opportunities along the TB/HIV continuum of care.

## WEPEE523

### A FRAMEWORK FOR PROVISION OF INTEGRATED MATERNAL AND CHILD HEALTH (MCH) AND HIV SERVICES IN PRIMARY HEALTH CARE (PHC) CLINICS IN ONE DISTRICT OF KWAZULU-NATAL, SOUTH AFRICA

L. Haskins[1], S. Phakathi[1], S. Bhardwaj[2], M. Grant[1], C. Horwood[1]
*[1]University of KwaZulu-Natal, Centre for Rural Health, Durban, South Africa, [2]UNICEF, Pretoria, South Africa*

**Background:** Post-natal follow up of HIV infected mothers and their infant's remains challenging despite high immunisation coverage over the same time period; many HIV-infected mothers and their babies leave well-child/immunisation clinics without receiving ongoing HIV care. Co-delivery of services is one approach to improve accessibility and uptake of services. Our project aimed to develop a replicable framework for implementation of integrated MCH/HIV services for mothers and babies attending well-child clinics.
**Description:** A multipronged quality improvement intervention was implemented in five PHC clinics from October 2013- September 2014. A minimum package of care for mother-baby pairs was defined in partnership with the clinic team, as well as roles and responsibilities for all health workers providing MCH services. Using a patient-centred approach the care pathway for mother-baby pairs through the clinic was re-organised, and staff and equipment re-deployed to provide comprehensive care efficiently and effectively. A skills audit identified skills gaps and relevant training was provided. The community was empowered to demand integrated MCH and HIV services through engagement with community health workers (CHWs).
These changes were achieved through two-weekly mentoring visits with clinic teams, including CHWs, over the one-year intervention period, and quarterly peer-to-peer learning sessions. Formal training was provided for enrolled nurses and CHWs.
**Lessons learned:** The intervention was supported by a framework comprising strong leadership and vision at all levels, supportive policy framework, and monitoring and evaluation. Three pillars underpinned the programme: community engagement; teamwork; patient-centred approach. Integrated MCH/HIV services were successfully implemented leading to improvements in uptake of HIV services. Different cadres of health workers worked together in one consulting room to provide a full range of care, improving teamwork in the clinic and facilitating peer-to-peer learning. Checklists were used to ensure mother-baby pairs received all essential services. CHWs successfully created demand for integrated services among mothers in the community.
**Conclusions/Next steps:** We present a framework for implementation of integrated MCH and HIV services to increase accessibility, uptake of services and retention in care for HIV infected mothers and their infants. This approach is currently being tested in preparation for large scale roll out.

## WEPEE524

### SCALING UP ART UPTAKE IN CO-INFECTED PATIENTS CAN IMPROVE TB OUTCOMES

M.N. Mbatha
*KwaZulu Natal Department of Health, Department of Health, Empangeni, South Africa*
*Presenting author email: sigodomsm@gmail.com*

**Background:** In Uthungulu district, KwaZulu-Natal, South Africa TB/HIV co-infection ranges from 70% up to 80%. The incidence of TB was 893/100,000 in 2014 and according to the 2012 ANC Survey the HIV prevalence was 38.4% among pregnant women. The high burden of TB and HIV is coupled with poor TB/HIV programme integration and poor socio-economic conditions that the majority of clients live under. Public health policies have recently stressed the need for integrated TB/HIV services to mitigate the effect HIV has on the already heavy TB burden in the country.
**Description:** The target for ART initiation/uptake for co-infected patients is 90% and the ART uptake was at 56% in Q1/2014 which was well below the target. We sought to improve TB/HIV integration in the district to address this gap. The TB control program devised a sticker system to be used on the patient files of TB/HIV co-infected patients. For all TB patients who have a positive HIV status a red sticker is put on the TB patient folders. The file will remain with a red sticker until the patient is initiated on ART. Once the patient is initiated then a white sticker is put on the folder to indicate that the patient has received the full integrated service. Clinical staff was then in-serviced on the new system and the roll out took place across the district.
**Lessons learned:** fter a 12-month period (Q1/2014 to Q1/2015) the ART uptake increased from 56% up to 91% among TB/HIV co-infected patients. Improved treatment completion, cure rates and TB death rates indicate that this project did not just improve TB/HIV integration but TB outcomes as well.
**Conclusions/Next steps:** TB/HIV integration coupled with the use of a sticker system is an effective management approach to improve TB outcomes among co-infected patients. This strategy was simple to implement and very practical and can therefore be adapted to any situation irrespective of resource constraints.

## WEPEE525

### LESSON FOR HIV MANAGEMENT FROM AN INTEGRATED TREATMENT FOR OPIOID ADDICTION IN VIETNAM

C.M. Denis[1], D.S. Metzger[2], T. Doan[3], L. Huang[4], V. Trias[3], T. Nguyen[3], M. Auriacombe[5], G. Raguin[6], S. Mai Thi Hoai[7], J.-P. Daulouede[8], G. Le Truong[7], C.P. O'Brien[2]
*[1]University of Pennsylvania, Center for Studies of Addiction, Philadelphia, United States, [2]University of Pennsylvania, Philadelphia, United States, [3]Expertise France, Ho Chi Minh City, Vietnam, [4]Expertise France, Hanoi, Vietnam, [5]University of Bordeaux, Bordeaux, France, [6]Expertise France, Paris, France, [7]HCMC AIDS Committee, Ho Chi Minh City, Vietnam, [8]Bizia Addiction Clinic, Bayonne, France*
*Presenting author email: jeanpierredaulouede@gmail.com*

**Background:** Since November 2013, we have implemented an integrated treatment program consisted in opiate maintenance medication (methadone and buprenorphine/naloxone), structured counseling sessions focused on substance use and risk-taking behavior, systematic screening for HIV and HCV, and HIV treatment if needed, within an HIV treatment setting in Ho Chi Minh City, Vietnam.
**Methods:** The aim of this study was to evaluate the impact of the integrated treatment program on HIV treatment adherence, HIV incidence and risk-taking behavior. At baseline and every 6 months, HIV and HCV screening were performed; HIV risk-taking behavior was assessed with Risk Assessment Battery.
**Results:** Since December-01-2013, 396 daily opioids (heroin) users were enrolled. They were mainly males (96.4%), 32.4 y.o. (SD= 5.2), leaving with family (81%). The retention rate was very high (92.7% at 6 months). At 6-month follow-up, there was a significant decrease of injection (100% vs. 63.4%), and a significant decrease of sharing needle/paraphernalia (47.2% vs. 31.7%). Among those who still injected at 6-month follow-up, there was a significant decrease of injection-related risk taking behavior ($F(1,15)=7.567$, $p= .015$). There was no difference in change of sex-related risk-taking behavior, which still concerned 61% of the subjects. One hundred twenty-nine were HIV-positive (32.6%), with six not previously known to be positive. All HIV-positive participants were linked to HIV care, and 96.1% received ARV. Although HIV-positive patients stated they were taking their ARV medication daily, only 69% had a suppressed viral load at 6 months. The viral load suppression was not linked to opiate maintenance treatment adherence neither persistency of drug use.
**Conclusions:** Treatment settings that integrate HIV, substance-use and harm reduction care are more effective. However, there is a need to improve ARV treatment response to suppress viral load and thus reduce the reservoir by a better monitoring of treatment efficiency, drug regimen modification and a better treatment adherence.

## WEPEE526

### IMPROVING MANAGEMENT OF TUBERCULOSIS IN PEOPLE LIVING WITH HIV IN SOUTH AFRICA THROUGH INTEGRATION OF HIV AND TUBERCULOSIS SERVICES: A PROOF OF CONCEPT STUDY

I. Sinai[1], H. Kinkle[2], N. Nzama[1]
*[1]Palladium, Washington, United States, [2]University of Pretoria, Family Medicine, Pretoria, South Africa*
*Presenting author email: nomsa595@gmail.com*

**Background:** South Africa's tuberculosis (TB) burden is the third highest in the world. The country has made enormous progress in testing TB patients for HIV. WHO reports that as of 2012, 84% of TB patients had been tested for HIV. However, as TB and HIV services in the public sector in South Africa are usually provided by different sets of health providers, effective screening and testing of persons living with HIV for TB lags behind testing TB patients for HIV. This operational proof of concept study tests an approach to improve the management of TB in persons living with HIV in South Africa by integrating TB management into HIV services.
**Methods:** The intervention was implemented in July 2015 in three primary health care facilities in Gert Sibande district, Mpumalanga Province. All health personnel who provide services to persons living with HIV were trained to test their patients who exhibit one or more TB symptoms for the disease, and initiate and monitor treatment as indicated. This is in contrast with the usual practice of referring patients to the TB providers for testing and treatment. The records of persons living with HIV who tested positive for TB between July and December 2015 are reviewed through the six-month treatment period to assess treatment outcome.
**Results:** Between July and December 2015, 1658 patients were tested for TB at the three facilities; 394 (23.8%) by HIV providers and 1,264 (76.2%) by TB providers. The percentage of patients who tested positive for TB was similar for both providers (HIV: 8.9%, n=35; TB: 9.6%, n=156), as was the proportion who completed the two-months intensive phase of treatment (6.3% and 6.9% for HIV and TB providers, respectively). Preliminary results indicate that HIV providers are willing and able to provide TB treatment to their patients.

**Conclusions:** This simple shift in workplace responsibilities seams feasible and acceptable to health personnel and patients in health facilities in South Africa. Larger scale research is required to evaluate the impact of the intervention on health outcomes.

## COMMUNITY CARE WITH HEALTH FACILITY SERVICES

### WEPEE527

### CHRONIC CARE IN AFRICA: HOW THE EXPERIENCE WITH EXPANDING ANTIRETROVIRAL TREATMENT PROGRAMMES FOR HIV CAN SERVE PATIENTS WITH OTHER CHRONIC CONDITIONS

C.J. Aantjes[1], T.K.C. Quinlan[2], J.F.G. Bunders[3]
*[1]VU University, Faculty of Earth and Life Sciences, Athena Institute, Amsterdam, Netherlands, [2]Kwa-Zulu Natal University, HEARD, Durban, South Africa, [3]VU University, Faculty of Earth and Life Sciences, Athena institute, Amsterdam, Netherlands*
*Presenting author email: c.j.aantjes@vu.nl*

**Background:** Countries in sub-Saharan Africa face the daunting task of providing anti-retroviral treatment (ART) to millions of HIV-infected patients and responding to the increase of chronic, non-communicable diseases (NCDs). The aim of this research was to examine how HIV care had transformed, since ART was introduced, and to what extent these experiences could be used to serve patients with other chronic conditions.
**Methods:** A mixed methods study was conducted in Ethiopia, Malawi, South-Africa and Zambia between 2011-2014, focusing on adaptations in primary care. Per country, three community home based care programmes (CHBC) served as study sites, incorporating primary health clinics. Methods consisted of semi-structured/structured interviews, focus groups, service observations, and a questionnaire survey. Interviews were held with 49 informants from national level, 71 informants from CHBC sites, 98 clients and 99 family caregivers. 17 programme staff and 65 community caregivers participated in focus groups. Further in-depth exploration in Zambia on health policy and service changes entailed interviews with 18 national and 17 district level informants, and group discussions with 36 caregivers. Questionnaires were disseminated to 46 CHBC programmes. SPSS and Atlas.ti software were used in the data analysis.
**Results:** The study found many innovations which facilitated the expansion of ART and provision of chronic care at primary levels. Examples include treatment simplification, task delegation, diversification of CHBC services and mentoring by caregivers and peers to support patient 'self-management', a key principle of chronic care. CHBC programmes started serving patients with NCDs and, in three of the four countries, the governments were seeking to formally integrate CHBC into primary health services. Our findings revealed the emergence of an 'African chronic care model', in which community involvement and linkages between health and social welfare services featured prominently.
**Conclusions:** The large scale introduction of ART in sub-Saharan Africa spurred the development of chronic care, implicating a wide range of actors. This provides a strong base for addressing the region's epidemiological changes as well as maintain millions of HIV patients on treatment. CHBC programmes are critical as they not only expand the reach of clinical services but also promote patient and family participation in managing chronic conditions.

### WEPEE528

### INTEGRATING COMMUNITY HEALTH SERVICES AND HEALTH FACILITY PMTCT PROGRAM: LESSONS FROM THE FEEDING BUDDIES WINDOW OF OPPORTUNITY PROJECT, KWAZULU-NATAL

H. Mabasa
*PATH, Johannesburg, South Africa*
*Presenting author email: hmabasa@path.org*

**Background:** PMTCT services have been routinely available for more than 10 years in South Africa. Despite the availability of effective treatment protocols and infant feeding guidelines, adherence remains a challenge.
**Description:** The Feeding Buddies intervention provides peer-based support for pregnant and post-partum women. Pregnant women and 'buddies' of their choice were trained on essential PMTCT and health behaviors and skills, including of antenatal care, birth preparedness, adherence PMTCT behaviors, exclusive breastfeeding, and postnatal care. The project was implemented and evaluated in 8 sites in two sub-districts, KwaZulu-Natal through the Window of Opportunity (WinOp) project, 2014-2015. Data obtained from 135 participants showed the following:
**Lessons learned:**

| | |
|---|---|
| Women's selection of known buddy (friend, family member, and partner) showed more consistent and greater levels of support than community health workers. | Despite a growing trend to utilize CHWs for community mobilization, leveraging intimate connections resulted in greater follow up, adherence, and reduced potential stigma. |
| More mothers were trained at community level than facilities and extended kin members often attended training. | Community-based and socially networked intervention created broader platform to address societal issues, beliefs, and stigma within the community, potentially reducing pressure women might feel at home. |
| Messaging on exclusive breastfeeding overshadowed messaging around continued breastfeeding. | Balanced and consistent messaging on both exclusive and continued breastfeeding need to be stressed in materials and campaigns |
| Enrolment of women and buddies was time and labor intensive though greater integration of nursing staff reduced added time and improved harmonization of services | Integration of the intervention recruitment and encouragement into facility services increased enrolment and high retention of women and buddies was high and resulted in gains within the PMTCT programme. |

*[Feeding Buddies Findings & lessons learned]*

**Conclusions/Next steps:** Expanding and integrating existing intimate social networks in the community into health services highlighted the importance of moving beyond the basic reliance on community-level volunteers, and provided additional coverage that traditional health care cannot provide.

## INTEGRATION OF HIV AND NON-COMMUNICABLE DISEASES (NCD) SERVICES

### WEPEE529

### INTEGRATING HIV AND NCD PATIENTS IN ADHERENCE CLUBS IN KIBERA, KENYA: A QUALITATIVE STUDY

E. Venables[1], J. Edwards[1], S. Baert[2], W. Etienne[1], H. Ritter[1], K. Khabala[3], W. Kizito[3], H. Bygrave[4]
*[1]Médecins Sans Frontières, Brussels, Belgium, [2]Medecins Sans Frontieres, Southern Africa Medical Unit (SAMU), Cape Town, South Africa, [3]Médecins Sans Frontières, Nairobi, Kenya, [4]Médecins Sans Frontières, Southern Africa Medical Unit, Cape Town, South Africa*

**Background:** The number of people on antiretroviral therapy (ART) for the long-term management of HIV in low- and middle-income countries (LMICs) is continuing to increase, along with those suffering from Non-Communicable Disease (NCDs). The need to provide large volumes of HIV patients with ART has led to significant adaptations in medication delivery (including facility clubs and community adherence groups), but access to NCD care remains limited, particularly in resource-poor settings. In 2013, Medication Adherence Clubs (MACs) were introduced as an alternative to standard care for stable NCD and HIV patients in the urban slum of Kibera, Nairobi, Kenya. MACs enable combined groups of up to 30 HIV/NCD patients to collect medication refills every three months, rather than through individual appointments.
**Methods:** In 2015, we conducted qualitative research to assess patient and health-care worker perceptions and experiences of MACs. A total of 106 MAC and non-MAC patients and health-care workers participated, and 19 in-depth interviews, 10 focus group discussions and participant observation were conducted. Data were translated and transcribed and a coding framework developed before analysis using NVivo (version 10, 2012). Routine data were also analysed to determine the characteristics of MAC patients and the number of MAC meetings held.
**Results:** During the first year of implementation, 109 MAC meetings took place, representing 2208 individual refills. Most (64%) MAC members were female; 71% were HIV-positive. MACs were perceived as acceptable, time-saving, and a valuable source of information about chronic diseases and peer-support by HIV-positive and NCD patients. Implementation challenges included recruitment, patients' understanding of MACs, and the timing of clubs. A small number of HIV-positive patients felt integrated groups affected disclosure.
**Conclusions:** Applying lessons learned from large-scale HIV drug rollout can aid the provision of medication and peer-support to large numbers of stable patients with chronic illness. Through MACs, we have demonstrated that an innovative, integrated approach to repeat prescribing for chronic diseases including HIV can be implemented in resource-poor settings. Extending models of care previously only offered to HIV-positive cohorts to NCD patients allows for the efficient management of co-morbidities and enables patients to benefit from faster refills, health education and peer support.

## WEPEE530

### INTEGRATION OF CARDIOVASCULAR DISEASE RISK FACTOR (CVDRF) SCREENING INTO HIV SERVICES: A TIME-MOTION STUDY OF CVDRF SCREENING AMONGST PATIENTS ON HIV TREATMENT AT AN URBAN HEALTH FACILITY IN SWAZILAND

A. Palma[1], M. Rabkin[2], A.B. Gachuhi[2], S. Simelane[3], M. McNairy[2,4], H. Nuwagaba-Biribonwoha[3], P. Bongomin[3], V. Okello[5], R.A. Bitchong[6], W.M. El-Sadr[2]
*[1]Columbia University, Epidemiology, New York, United States, [2]ICAP at Columbia University, New York, United States, [3]ICAP at Columbia University, Mbabane, Swaziland, [4]Weill-Cornell Medical College, Medicine, New York, United States, [5]Swaziland Ministry of Health, Mbabane, Swaziland, [6]Raleigh Fitkin Memorial Hospital, Manzini, Swaziland*
*Presenting author email: ap3223@cumc.columbia.edu*

**Background:** In sub-Saharan Africa, the burden of cardiovascular disease (CVD) amongst persons living with HIV (PLWH) is high and rising rapidly. Screening and management of modifiable CVD risk factors (CVDRF) including diabetes, dyslipidemia, hypertension and tobacco smoking are recommended for PLWH but are not routinely provided in low-resource settings, where concerns about feasibility are often cited. We conducted a time-motion study of CVDRF screening in a large urban antiretroviral treatment (ART) clinic in Swaziland to assess the feasibility of integrating CVDRF screening into HIV care by assessing its impact on patient flow and HIV service delivery.
**Methods:** A convenience sample of PLWH ≥40 years attending routine ART clinic visits at Raleigh Fitkin Memorial Hospital was screened for CVDRF, including: hypertension using two blood pressure (BP) measurements; cigarette smoking using patient interview; and diabetes and dyslipidemia using point-of-care (POC) blood tests. We used validated time-motion study methodology to measure visit time spent receiving HIV care and CVDRF screening. Using Wilcoxon rank-sum tests, we compared screened and unscreened patients to assess total visit time and time spent receiving HIV-specific services.
**Results:** To date, we have observed 143 patient visits (93 including CVDRF screening and 50 without). Visits including CVDRF screening took significantly more time than visits without screening (median [range]: 15 [10-30] minutes *vs.* 4 [2-11] minutes, $p< 0.001$). No difference was detected in the amount of time spent providing HIV-specific services (median [range]: 5 [3-12] *vs.* 5 [3-11] minutes, $p=0.389$). The median (range) number of minutes spent on the most time-consuming components of CVDRF screening were: 12 (6-22) minutes obtaining finger-stick samples and performing POC analyses, 3 (1-4) minutes measuring BP, and 2 (2-4) minutes providing behavioral counseling. Nurses were able to "multitask" during POC analysis, providing ART refills and behavioral counseling and documenting screening results in patient medical records while waiting for POC test results.
**Conclusions:** Provision of CVDRF screening more than tripled the length of routine ART appointments but did not reduce the time spent on HIV services. Program managers need to take into account longer visit duration in order to integrate periodic CVDRF screening and counseling into HIV programs.

## WEPEE531

### CAN HIV/AIDS INFRASTRUCTURE BE LEVERAGED TO IMPROVE RHEUMATIC HEART DISEASE CARE IN UGANDA?

V. Musiime[1,2], E. Okello[3], T. Aliku[4], J. Rwebembera[5], P. Lwabi[3], G. Mirembe[1], C. Kityo[1], P. Mugyenyi[1], M. Costa[6,7], D. Simon[6,7], R. Salata[6,7], A. Webel[6], A. Beaton[8], M. Kamya[2], C. Longenecker[6,7]
*[1]Joint Clinical Research Centre, Kampala, Uganda, [2]Makerere University College of Health Sciences, Kampala, Uganda, [3]Uganda Heart Institute, Kampala, Uganda, [4]Gulu University School of Medicine, Gulu, Uganda, [5]Mbarara University of Science and Technology, Mbarara, Uganda, [6]Case Western Reserve University School of Medicine, Cleveland, United States, [7]University Hospitals Case Medicine Center, Cleveland, United States, [8]Children's National Health System, Washington, United States*
*Presenting author email: musiimev@yahoo.co.uk*

**Background:** Substantial investment over the past 15 years has successfully scaled-up HIV/AIDS healthcare infrastructure in sub-Saharan Africa; however, spending on HIV/AIDS has overshadowed spending on endemic non-communicable diseases such as rheumatic heart disease (RHD). Translating infrastructure gains in HIV/AIDS to other chronic diseases is a priority for health systems in the region.
**Description:** As a founding country partner of the RHD Action Alliance (rhdaction.org), we aim to leverage existing HIV/AIDS infrastructure and longstanding USA-Uganda collaborations to create a RHD surveillance and treatment program in Uganda. Case Western Reserve University has collaborated with the Joint Clinical Research Centre (JCRC, a national network of HIV clinics), the Uganda Heart Institute (UHI), Makerere University and other Ugandan and global partners to:
1) create a national RHD registry to monitor disease progression and adherence to treatment,
2) decentralize cardiovascular care from Kampala to regional centers,
3) train a cardiovascular workforce in Kampala to provide interventions such as percutaneous valvuloplasty,
4) conduct epidemiologic surveillance with echocardiographic screening for RHD,
5) utilize lessons learned from HIV/AIDS to raise RHD awareness and improve adherence to RHD therapies,
6) assure program sustainability through close partnership with the Ugandan Ministry of Health.
**Lessons learned:** Since February 2013, over 1300 patients with RHD have been enrolled in a secure online registry. Regional RHD/cardiac clinics have been established at Lubowa, Gulu, Mbarara, and Lira, where JCRC staff work with local cardiovascular experts to provide care. Two interventional cardiologists and two heart failure specialists have received advanced training in Cleveland, USA. Over 13,000 children have been screened for subclinical disease, and we have learned that HIV-infected children may have lower rates of RHD due to improved engagement in care. We have adapted "Treatment Cascade" metrics from HIV/AIDS to evaluate retention and quality of care. We are working with the Ministry of Health to improve the penicillin supply chain and develop a policy roadmap for RHD.
**Conclusions/Next steps:** We present a model for the management of other chronic non-communicable diseases in resource limited settings where infrastructure for HIV/AIDS is robust, but other health infrastructure is lacking.

## WEPEE532

### ENHANCING THE HIV CHRONIC CARE PLATFORM TO ADDRESS NON-COMMUNICABLE DISEASES IN LOW- AND MIDDLE-INCOME COUNTRIES

L. Kupfer[1], S. Vorkoper[1], P. Patel[2], R. Ferris[3], N. Anand[1], M. Rabkin[4], W. Tierney[5], W. El-Sadr[4], R. Glass[1]
*[1]US National Institutes of Health, Fogarty International Center, Bethesda, United States, [2]US Centers for Disease Control, Atlanta, United States, [3]U.S. Agency for International Development, Washington, DC, United States, [4]Columbia University, New York City, United States, [5]University of Texas, Austin, United States*
*Presenting author email: linda.kupfer@nih.gov*

**Background:** Persons living with HIV (PLWH) in low- and middle-income countries (LMICs) are living longer and developing noncommunicable diseases (NCDs) due to the successful treatment of HIV, now a chronic communicable disease. Establishing an evidence-base for affordable, effective interventions to address NCDs among PLWH in LMICs should be a priority.
**Methods:** Participants of the NIH PEPFAR-NCD project examined over 500 peer-reviewed and grey literature to assess currently available evidence regarding HIV and four selected, high burden NCDs in sub-Saharan Africa (SSA): cardiovascular disease, cervical cancer, depression, and diabetes. Subject matter experts engaged in the project reviewed these findings and developed a consensus on the gaps in knowledge and priority research questions.
**Results:** Based on the findings from the literature review, NIH PEPFAR-NCD project participants identified substantial gaps in knowledge and significant opportunities for future research which could form the evidence-base for integrating NCD care into existing HIV platforms. Specifically, the review identified three key findings: 1) there is a paucity of data on the burden of NCDs amongst PLWH in SSA; 2) there is a need for screening and management approaches that are contextually appropriate for resource-limited settings and will enhance HIV programs; and 3) there are several, evidence-based pilot programs that integrate NCD prevention and care into HIV programs which could provide lessons learned for possible scale-up. To address these findings, the project identified a number of research areas around data, health promotion, and NCD care in PLWH. Specifically, the priority research areas are:
*Data*
1) Document NCD burden for PLWH
2) Develop NCD electronic medical records
*Health Promotion*
1) Develop methods to reach marginalized populations
2) Train health workforce in NCDs
3) Establish community of practice platforms
4) Evaluate integrated care campaigns
*NCD care for PLWH*
1) Develop,assess,scale-up integration models
2) Strengthen supply chain
3) Develop innovative NCD diagnostics
4) Investigate NCD treatment for PLWH
5) Investigate integration effect on care
**Conclusions:** As countries and funding agencies strive to offer quality care to PLWH, addressing these priority research questions will provide an evidence-base and generate practical approaches that can successfully enhance HIV platforms to deliver more comprehensive care to PLWH.

## WEPEE533

### FROM PILOT TO NATIONAL SCALE UP: THE LEGACY OF PATHFINDER INTERNATIONAL-ETHIOPIA'S SINGLE VISIT APPROACH FOR CERVICAL CANCER PREVENTION AMONG HIV-POSITIVE WOMEN

K. Kassahun[1], N. Shiferaw[2], Y. Tilahun[2], C. Lew[3], C. Osakwe[3], M. Kifle[4], K. Lulu[2], M. Ansake[2]
*[1]Pathfinder International, Cervical Cancer Prevention Project, Addis Ababa, Ethiopia, [2]Pathfinder International, Adis Ababa, Ethiopia, [3]Pathfinder International, Watertown, United States, [4]Federal Ministry of Health, Adis Ababa, Ethiopia*
*Presenting author email: kkassahun@pathfinder.org*

**Background:** Although highly preventable, cervical cancer (CC) remains a leading cause of cancer-related deaths for women in low- and middle-income countries. This is the case in Ethiopia, where access to effective preventive services is often absent or inadequate. Furthermore, CC disproportionately affects women living with HIV.
In 2009, Pathfinder International, in collaboration with the Federal Ministry of Health (FMOH) of Ethiopia, launched Ethiopia's first pilot single visit approach (SVA) project for cervical cancer prevention (CCP) among HIV positive (HIV+) women.
**Methods:** The pilot project included competency-based training for health care workers on the SVA for CCP. Training included the visual inspection of the cervix with acetic acid wash (VIA) screening method and immediate cryotherapy or Loop Electrosurgical Excision Procedure (LEEP) treatment of cervical precancerous lesions. From October 2010 to September 2014, educational materials were distributed, training curricula adapted, and services made available to HIV+ women in 14 selected public hospitals, including 5 centers of excellence hospitals. Project facilities' aggregated client data is used for the description of services offered.
**Results:** While the project's original target was to screen 5,000 HIV+ women for CC, ultimately 18,193 HIV+ women were screened. Of those, 1,879 (10.3%) were found to be VIA positive. Ninety-four percent of VIA positive women received cryotherapy or LEEP treatment. Among those treated, 805 (56.2%) returned for a follow-up visit the next year. During that follow-up visit, 92% of patients were found to be VIA negative. One hundred and ten women (0.6%) suspected of having CC were referred for further treatment.
With the pilot project's guidance and technical support, the FMOH of Ethiopia developed its national CCP and control program guidelines. The FMOH also adopted the project's educational materials. Using the project-established facilities as training and referral centers, the FMOH is currently scaling-up the program to 118 facilities with plans to expand to all national facilities.
**Conclusions:** The CCP pilot project has provided a comprehensive foundation for CC screening and has made a significant contribution to the scale-up of Ethiopia's national CCP program, as well as to the global body of evidence supporting this strategy.

## WEPEE534

### THE NEED FOR INTEGRATED CARE IN SOUTH AFRICA: PRELIMINARY LESSONS FROM THE HEALTHRISE PROGRAMME

R. Gabert[1], A. Wollum[1], B. Phillips[1], M. Reitsma[1], S. Wilson[1], A. Nyembezi[2], Z. Petersen[2], H. Duber[1], J. Daly[3], G. Roth[1], M. Ng[1], P. Reddy[2,4], P. Naidoo[2,4], E. Gakidou[1]
*[1]Institute for Health Metrics and Evaluation, Seattle, United States, [2]Health Sciences Research Council, Cape Town, South Africa, [3]Medtronic Philanthropy, St Paul, United States, [4]University of the Western Cape, Cape Town, South Africa*

**Background:** Deaths due to non-communicable diseases (NCDs) are expected to increase by 17% over the next 10 years with the largest increase of 24% expected to be in Africa. In South Africa (SA) this rise in NCDs is exacerbated by the existing burden of HIV and TB. In 2013, cerebrovascular disease was the second leading cause of death after HIV.
Given the epidemiological pattern of NCDs and HIV/TB in SA, it is evident that the country is facing a multiple burden of disease requiring integrated health care solutions.
**Methods:** Needs assessments of NCD knowledge, risk factors, prevalence, and service delivery were conducted in two districts of South Africa: PixleykaSeme (Northern Cape) and uMgungundlovu (KwaZulu-Natal). Data collection included household surveys, clinical examinations, health facility assessments, interviews and focus groups with community members, NCD patients, health professionals, and policy makers.
**Results:** Data on prevalence of hypertension, diabetes, high cholesterol, and HIV are presented in Table 1 and the proportion of patients with disease that have been diagnosed, received treatment, and are measured to be controlling their condition within recommended clinical levels in Table 2.

| | Umgungundlovu (% of population) | Pixley ka Seme (% of population) |
|---|---|---|
| Hypertension | 46 | 49 |
| Diabetes | 9 | 8 |
| High Cholesterol | 9 | 14 |
| HIV | 41 | 18 |

*[Table 1. Disease prevalence as a percent of total population]*

| | Hypertension (% of patients) | | Diabetes (% of patients) | | High Cholesterol (% of patients) | |
|---|---|---|---|---|---|---|
| | Umgungundlovu | Pixley ka Seme | Umgungundlovu | Pixley ka Seme | Umgungundlovu | Pixley ka Seme |
| Diagnosed | 48 | 46 | 85 | 79 | 25 | 36 |
| Treated | 33 | 35 | 82 | 77 | 9 | 15 |
| Controlled | 10 | 11 | 42 | 38 | 7 | 14 |

*[Table 2. Diagnosis, treatment, control as a percent of total population with disease]*

Prevalence of disease was comparable in men and women, though risk factors for disease differed: men were more likely to use alcohol or tobacco and women more likely to be overweight or obese. In qualitative interviews, providers and patients reported prioritization of HIV/AIDS services and lack of coordination between NCD and HIV/AIDS programming. Health facilities lacked essential medicines and diagnostic capacity for common NCDs.
**Conclusions:** Patients and providers called for the integration of NCD services into community-based HIV services, particularly regarding community health workers, screening, and proximal access to pharmaceuticals. As chronic diseases, NCDs are similar to HIV, requiring lifelong monitoring and management. This creates an opportunity for the health system to leverage existing infrastructure and processes to address emerging health issues.

## WEPEE535

### HIGH HIV PREVALENCE AMONG PATIENTS WITH NON-AIDS-DEFINING CANCERS AT A NATIONAL REFERRAL HOSPITAL, KENYA

A. Njoroge[1,2], M. Mugo[3], M. Mudenyo[3], L. Muchiri[4], C. Kigondu[4], J. Rajab[4], J. Kinuthia[1]
*[1]Kenyatta National Hospital, Research & Programs, Nairobi, Kenya, [2]University of Washington, Department of Global Health, Seattle, United States, [3]Kenyatta National Hospital, Health & Information Systems, Nairobi, Kenya, [4]University of Nairobi, Department of Human Pathology, Nairobi, Kenya*
*Presenting author email: anjoroge7@gmail.com*

**Background:** HIV has been associated with an increased risk of cancer. Despite adoption of provider-initiated counselling and testing guidelines, HIV testing is not routinely offered to patients diagnosed with cancer; missing an opportunity to identify those who are infected and provision of integrated HIV and cancer care.
**Methods:** Cancer patients whose diagnosis was confirmed by histology/cytology and enrolled for cancer care at Kenyatta National Hospital between April 2014 and July 2015 were included. Patient demographics, HIV testing history, diagnosis and treatment records were collected from medical files, laboratory and autopsy records. Cancer diagnoses were classified using ICD-10 codes. Categorical variables were summarized using proportions and an F-test to compare testing rates across age groups. Only primary tumors were included.
**Results:** Of 6603 cancer patients reviewed, only 1653 (25.03%) had a HIV status indicated. The median age was 46years (IQR 36, 56) and 1094 (66%) were female. Children and older adults were less likely to be tested. [below 15 years (5%), 15-34 years (19%), 35-54 years (50%), 55-75 years (24%) and above 75 years (2%) ($p<0.001$)].
The cancer types with the highest proportion of people tested were Kaposi's sarcoma (73%), non-Hodgkin's lymphoma (48%) and cervical cancer (41%), all AIDS-defining cancers (ADCs). Among non-AIDS defining cancers (non-ADCs), the highest proportion of testing was observed in vulvar cancer (ICD -10 code C51) at 57%, C56-ovarian cancer (27%) and C69-cancer of the eye and adnexa (26%). Only 17% of breast cancer patients were tested.
Among those who were tested for HIV, 556 (33.6%) tested HIV positive. Of these, the proportion who tested positive among non-ADCs was 75% in vulvar cancer, 72% in cancer of the eye and adnexa, 29% in oesophageal cancer, 28% in breast cancer and 25% in ovarian cancer.
**Conclusions:** Overall HIV testing rate was low with slightly higher testing rates among ADCs. HIV prevalence was high even among people with non-ADCs. HIV testing should be offered to all cancer patients to identify those who are infected and facilitate integrated care for both HIV and cancer for improved outcomes in both conditions.

## WEPEE536

### TOWARDS INTEGRATING HIV AND NCDS: FEASIBILITY OF COMBINED HIV AND HYPERTENSION SCREENING AMONG PREGNANT WOMEN IN RURAL INDIA

P. Sharma[1], A. Sarkar[1], G. Mburu[2], J. Behera[1], R. Durgan[1], P. Bhandarkar[1], S.K. Mishra[1], S. Mehra[1]
*[1]MAMTA Health Institute for Mother & Child, New Delhi, India, [2]International HIV/AIDS Alliance, Brighton, United Kingdom*
*Presenting author email: pankhuri@mamtahimc.org*

**Background:** There is a double burden of HIV and hypertensive diseases among pregnant women in low and middle income countries. In India, hypertension in pregnancy is a leading cause of maternal deaths. In addition, only a third of pregnant women get tested for HIV in India. This study assessed the feasibility of integrating HIV and hypertension screening among pregnant women by community health workers (CHW) known as frontline functionaries in rural India.

**Methods:** Between Jan and April 2015, 144 consenting pregnant women (aged 19-35 years) in rural Maharashtra and Telangana were offered combined HIV screening using OraQuick® kits and hypertension screening using portable digital Microlife AS1-2, a semi-automated oscillometric blood pressure by CHWs. This machine fulfils the WHO requirements for use in low-resource settings. Semi-structured interviews were used to obtain information from pregnant women and CHWs on feasibility of these integrated screening services. All analyses were performed using IBM SPSS Statistics V.22.

**Results:** Overall, 94% pregnant women received integrated HIV and hypertension screening at their village sub-center. Both the screening tests were completed under 40 minutes in 96% of the women. A total of 72 CHWs were trained on these techniques. Few women reported apprehension related to the accuracy of HIV oral test and positive HIV test result. Nearly 97% of pregnant women believed that integrated screening could encourage more women to test for HIV, reduce travel time and cost. 66% of CHWs indicated that their workload has reduced because of these new screening tools and 93.3% believed that their skills had increased. Overall 90% reported that it is feasible to conduct integrated services near their home or sub-centers

**Conclusions:** Community-based and CHW-led integration of HIV and hypertension screening using OraQuick® kits and portable digital Microlife AS1-2® respectively for pregnant women is feasible within the public health system of rural India.

## WEPEE537

### EFFECTIVENESS OF AN INTEGRATED CHRONIC DISEASE MANAGEMENT MODEL IN IMPROVING PATIENTS' CD4 COUNT AND BLOOD PRESSURE IN A RURAL SOUTH AFRICAN SETTING: CONTROLLED INTERRUPTED TIME SERIES ANALYSIS

S. Ameh[1,2], K. Klipstein-Grobusch[3,4], E. Musenge[4], K. Kahn[2,5,6], S. Tollman[2,5,6], F. Gómez-Olivé[2,5]
*[1]University of Calabar, Department of Community Medicine, Calabar, Nigeria, [2]University of the Witwatersrand, Medical Research Council/Wits University Rural Public Health and Health Transitions Research Unit, Johannesburg, South Africa, [3]University Medical Center, Julius Center for Health Sciences and Primary Care, Utrecht, Netherlands, [4]University of the Witwatersrand, Division of Epidemiology and Biostatistics, Johannesburg, South Africa, [5]International Network for the Demographic Evaluation of Populations and Their Health in Developing Countries (INDEPTH), Accra, Ghana, [6]Umeå University, Umeå Centre for Global Health Research, Epidemiology and Global Health, Umea, Sweden*
*Presenting author email: sote_ameh@yahoo.com*

**Background:** South Africa faces a dual burden of HIV/AIDS and chronic non-communicable diseases (NCDs). In 2011, a pilot Integrated Chronic Disease Management (ICDM) model was introduced by the national health department into selected Primary Health Care (PHC) facilities, one of the first of such efforts by an African ministry of health. The aim of the ICDM model is to leverage an established HIV treatment programme for NCDs for better health outcomes. This study assessed the effectiveness of the ICDM model in controlling key health indicators, blood pressure (BP) and CD4 counts, of patients treated in PHC facilities in the rural Bushbuckridge municipality of Mpumalanga province.

**Methods:** A controlled interrupted time series study was conducted for 30 months beginning from January 2011 to June 2013. Patients ≥ 18 years were recruited by proportionate sampling from the ICDM pilot (n=435) and comparison (n=443) facilities. Health outcome data for each patient were retrieved from health facility records six months before the initiation of the ICDM model and 24 months during implementation of the model. Control of BP and CD4 counts were defined as BP <140/90 mmHg and CD4 counts >350 cells/mm$^3$, respectively. Two-level segmented analytical approaches were used to determine the effect of the ICDM model over the two specified time periods: first, the autoregressive moving average time series model, and secondly, controlled segmented linear regression analysis.

**Results:** The pilot facilities had a 5.7% (coef=0.057; 95% CI: 0.056,0.058; *P*< 0.001) and 1.0% (coef=0.010; 95% CI: 0.003,0.016; *P*=0.002) greater likelihood than the comparison facilities to control patients' CD4 counts and BP, respectively. The decreasing probabilities of controlling CD4 counts and BP observed before the implementation of the ICDM model in the pilot facilities were respectively reduced by 0.23% (coef = -0.0023; 95% CI: -0.0026,-0.0021; *P*< 0.001) and 1.5% (Coef= -0.015; 95% CI: -0.016,-0.014; *P*< 0.001).

**Conclusions:** Application of the ICDM model appeared effective in reducing the decreasing trend in controlling patients' CD4 counts and blood pressure; hence, the HIV programme should be more extensively leveraged for hypertension treatment in health facilities in South Africa and other low- and middle-income countries.

## WEPEE538

### EARLY EXPERIENCES OF INTEGRATING NON-COMMUNICABLE DISEASE SCREENING AND TREATMENT IN A LARGE ART CLINIC IN ZOMBA, MALAWI

C. Pfaff[1], V. Singano[1], H. Akello[1], A. Amberbir[1], D. Garone[1], J. Berman[1], A. Kwekwesa[1], A. Matengeni[1], J. van Oosterhout[1,2]
*[1]Dignitas International, Zomba, Malawi, [2]College of Medicine, Department of Medicine, Blantyre, Malawi*
*Presenting author email: colinpfaff@yahoo.co.uk*

**Background:** ART programs represent the first large scale chronic disease systems in Africa and can be leveraged to manage the growing burden of non-communicable disease (NCD). This offers the opportunity for integrated HIV-NCD care, which may reduce HIV stigma, increase access to NCD care and improve adherence through reduced travel to clinics.

**Description:** Tisungane HIV clinic at Zomba Central Hospital has 6550 patients receiving treatment. In October 2015 a model of integrated HIV-NCD care was developed. Clinical protocols for hypertension and diabetes screening and treatment were developed combining international literature and National Treatment Guidelines. All HIV clinic staff (n=27) were trained during 2 two-day sessions. Blood pressure was measured on adults at every visit and random blood glucose every two years. If initial blood pressure was raised, it was repeated at that visit and confirmed on a subsequent visit before hypertension was diagnosed. Only patients with stage 2 hypertension (systolic>160 and/or diastolic>100) or those with stage I hypertension and cardiovascular risk factors were given antihypertensive drug treatment. If random glucose was high, it was confirmed with a fasting glucose, using WHO thresholds. All measurements were done by lay health workers and expert clients who received stipends. Combined ART-NCD treatment was provided by clinical officers, uncomplicated ART-only care by nurses.

**Lessons learned:** In the first three months >9,000 adults and children attended HIV care, of whom >4,300 had ≥ 1 blood pressure recorded and >3,100 had ≥1 glucose reading measured. Five expert clients/lay health workers were employed for the additional care burden. This was manageable as the prevalence rates of stage 2 hypertension and diabetes were low (7.2% and 0.8 % respectively). The less-flexible vertical nature of the ART system made the design of integrated tools including electronic data capture challenging. Process mapping and patient flow were utilized to decrease missed screening opportunities. Integration of NCD care increased workload and consultation time.

**Conclusions/Next steps:** Screening and treatment of hypertension and diabetes in single "one-stop" HIV-NCD clinic appears feasible. Prioritizing pharmacological hypertension treatment to those with the largest benefit contributed to feasibility of integrated treatment.

## WEPEE539

### HIV AND STROKE IN ZIMBABWE: A CROSS SECTIONAL STUDY

F. Kaseke[1], V. Chikwasha[2], L. Gwanzura[3], J. Hakim[4], A. Stewart[5]
*[1]University of Zimbabwe, Rehabilitation, Harare, Zimbabwe, [2]University of Zimbabwe, Community Medicine, Harare, Zimbabwe, [3]University of Zimbabwe, Medical Laboratory Sciences, Harare, Zimbabwe, [4]University of Zimbabwe, Medicine, Harare, Zimbabwe, [5]University of the Witwatersrand, School of Therapeutic Sciences, Johannesburg, South Africa*
*Presenting author email: farayi.kaseke@gmail.com*

**Background:** Stroke occurence now epidemic due to non-communicable diseases and HIV. HIV now thought to be a direct cause of stroke. Incidence of HIV in Zimbabwe has decreased but there are still many people living with HIV who are prone to suffer stroke. Being HIV positive and suffering a stroke may increase disability in those affected and result in double caregiver strain in those who look after the stroke survivors. Study aimed to determine the proportion of stroke survivors tested for HIV and found positive and willing to disclose status to caregivers. The study also aimed to determine the severity of disability and postulate on the burden of care.

**Methods:** This was a cross sectional study. Patients with stroke admitted at three hospitals in Harare participated. Recruitment was done in the wards 48 hours after admission between April 2015 and January 2016. A researcher administered questionnaire was used to collect information. Disability severity was assessed using the Functional Independence Measure (FIM). Informed consent or assent was obtained from the patients or their relatives. Ethical approval was sought and obtained from relevant ethical review boards. Data was entered into Excel and exported to Stata 13.0 for analysis to generate means and standard deviations, medians and Inter quartile ranges (IQR), frequencies and percentages.

**Results:** A total 149 patients participated. Most patients were female (62%). Group mean age was 58.9±16.7 years with no significant difference in mean age between males 59.8±16.0 years and females 58.3±17.1 years, p=0.586. Proportion of survivors ever tested for HIV (n=142) was 55.6% . Those who reported a positive HIV result among the tested (n=79) was 19%. Willingness to disclose the HIV status among patients (n= 18) was 77.8%. Median FIM score was 41.5 (IQR; 20-68). Median Motor score was 59(IQR; 33-104) and median cognitive score: 21(IQR; 7-32).

**Conclusions:** Stroke affects more middle aged women who are traditionally caregivers. A high HIV prevalence topped with severe disability increases burden of care. There seems to be a reduction in the fear of stigma. Routine HIV testing in stroke and inclusion of HIV care in available programs is recommended.

## WEPEE540

### QUALITY OF CHRONIC DISEASE CARE IN RURAL SOUTH AFRICA: USER AND PROVIDER PERSPECTIVES

S. Ameh[1,2], K. Klipstein-Grobusch[3,4], L. D'Ambruoso[5], K. Kahn[2,6,7], S. Tollman[2,6,7], F. Gómez-Olivé[2,6]

*[1]University of Calabar, Department of Community Medicine, Calabar, Nigeria, [2]University of the Witwatersrand, Medical Research Council/ Wits University Rural Public Health and Health Transitions Research Unit, Johannesburg, South Africa, [3]University Medical Center, Julius Center for Health Sciences and Primary Care, Utrecht, Netherlands, [4]University of the Witwatersrand, Division of Epidemiology and Biostatistics, Johannesburg, South Africa, [5]University of Aberdeen, Institute of Applied Health Sciences and Centre for Sustainable International Development, Aberdeen, United Kingdom, [6]International Network for the Demographic Evaluation of Populations and Their Health in Developing Countries (INDEPTH), Accra, Ghana, [7]Umeå University, Umeå Centre for Global Health Research, Epidemiology and Global Health, Umea, Sweden*

*Presenting author email: sote_ameh@yahoo.com*

**Background:** The integrated chronic disease management (ICDM) model was introduced as a response to the dual burden of HIV/AIDS and non-communicable diseases (NCDs) in South Africa, one of the first of such efforts by an African ministry of health. The aim of the ICDM model is to leverage HIV programme innovations to improve the quality of chronic disease care. There is a dearth of literature on the perspectives of healthcare providers and users on the quality of care in the novel ICDM model. This paper describes the viewpoints of operational managers and patients regarding quality of care in the ICDM model.

**Methods:** We conducted a case study of the seven PHC facilities in the rural Agincourt sub-district in northeast South Africa from September to November 2013. Focus group discussions (n=8) were used to obtain data from 56 purposively selected patients ≥18 years. In-depth interviews were conducted with operational managers of each facility and the sub-district health manager. Donabedian's *structure*, *process* and *outcome* theory for service evaluation underpinned the conceptual framework in this study. Qualitative data were analysed, with MAXQDA 2 software, to identify 17 a priori dimensions of care and emerging themes.

**Results:** Manager and patient narratives showed inadequacies in *structure* (malfunctioning blood pressure machines and staff shortage); *process* (irregular prepacking of drugs); and *outcome* (long waiting times). Patients reported anti-hypertension drug stock-outs; sub-optimal defaulter-tracing; and rigid clinic appointments. Managers thought there was reduced HIV stigma because HIV and NCD patients attended the same clinic.

**Conclusions:** Leveraging elements of HIV programmes for NCDs, specifically hypertension management, is yet to be achieved in the study setting in part because of malfunctioning blood pressure machines and anti-hypertension drug stock-outs. This has implications for the nationwide scale up of the ICDM model in South Africa and planning of an integrated chronic disease care in other low- and middle-income countries.

## WEPEE541

### HIV RISK REDUCTION PROGRAMS FOR PEOPLE IN PUBLIC PSYCHIATRIC CARE IN BRAZIL: TREATMENT AS USUAL?

K. McKinnon[1], M. Wainberg[2], C. Gruber Mann[3], D. Pinto[4], P. Mattos[5], A. Norcini-Pala[1], O. Hughes[6], M. Crosland Guimarães[7], F. Cournos[8], P. Kweza[9]

*[1]Columbia University/NYSPI, Psychiatry, New York, United States, [2]Columbia University College of Physicians and Surgeons, Psychiatry, New York, United States, [3]Fiocruz, Rio de Janeiro, Brazil, [4]UNIRIO, Rio de Janeiro, Brazil, [5]Univesidade Federal do Rio de Janeiro/IPUB, Psychiatry, Rio de Janeiro, Brazil, [6]Boston University, Psychology, Boston, United States, [7]Federal University of Minas Gerais, Epidemiology, Belo Horizonte, Brazil, [8]Mailman School of Public Health, Columbia University, New York, United States, [9]Foundation for Professional Development - FPD, Research Unit, Pretoria, South Africa*

*Presenting author email: patiencek@foundation.co.za*

**Background:** The reasons that people with severe mental illness (SMI) have higher rates of HIV infection than the general population in most countries where rates have been ascertained are complex and not fully elucidated. A critical lack of data leaves policy-makers and practitioners with scant basis for planning programs to reduce the dramatic health effects of these co-occurring conditions. Most people with SMI do not receive HIV-related services in their mental health treatment settings due to significant barriers including lack of funds and inadequately trained staff. This is the first report of effects of treatment-as-usual risk-reduction program participation on sexual protective behaviors by people in care in the public mental health treatment system in Brazil.

**Methods:** Participants were 641 consenting adults attending public outpatient psychiatric clinics or day-hospitals in one of nine settings in Rio de Janeiro. As part of standard clinical care, informal sexual health drop-in group education sessions are offered throughout the system but are not a routine component of care. Participants were assessed for program participation, HIV testing history and knowledge, psychiatric diagnoses (Mini International Neuropsychiatric Interview-PLUS), and sexual protective behaviors (Sexual Risk Behavior Assessment Schedule) in the last three months.

**Results:** Participants were female (58.0%), with a mean age of 42.5 years; multiracial (47.7%), white (32.8%), or black (19.5%); and 46.8% were married/in a long-term relationship. Most participants (72.8%) had diagnoses consistent with SMI; 1.4% had comorbid substance use disorder. Prior risk-reduction program participation was reported by 58 (9.0%) study participants. Those with this experience were more likely to have higher HIV knowledge (p=.04) and to have been HIV tested in the last three months (p=.02) than those who had not received risk-reduction programming.

Participants who did not receive this programming were more likely to have described themselves as black or multiracial than white (p=.001). No associations were found between risk-reduction program participation and gender, education, marital status, psychiatric diagnosis, or any sexual risk-reduction behaviors.

**Conclusions:** Benefits accrued to the few mental health service users who received clinical HIV risk-reduction programming; however, more inclusive intervention is needed to enhance sexual protective behaviors among those in public psychiatric treatment.

## WEPEE542

### CANCER CARE IN HIV PATIENTS: FOR HOW LONG WILL WE NEGLECT?

G. Manirakiza Mberyo[1], A. Bikié[1], T. Mbarga[2], N. Massaha[1], E. Nke[1], F. Essomba[1], P. Mbouyap[1], H. Abessolo Abessolo[3], R. Toby[3], L. Ciaffi[4]

*[1]Agence Nationale de Recherche sur le Sida et les Hépatites Virales, Site Cameroun, Yaounde, Cameroon, [2]Hôpital Militaire, CTA, Hôpital Militaire, Yaounde, Cameroon, [3]Hôpital Central de Yaoundé, Maladies Infectieuses, Yaounde, Cameroon, [4]Inserm/IRD, UMI 233, Yaounde, Cameroon*

**Background:** Access to combined antiretroviral therapy (cART) reduced HIV-related morbidity and mortality in low-resources countries. New morbidities are expected to increase, notably cancers, which could hinder recent advances in patient care. We report our experience on structural, cultural and economic barriers that hinder optimal care.

**Description:** In Cameroon since 2010, 304 patients are enrolled in two second line cART clinical trials (ANRS12169 and ANRS 12286) and have been followed over 5 years. We registered 10 cancer cases (1 anal, 2 vulvar, 1 cervical, 2 ovarian, 2 gastric, 1 hepatic and 1 ORL). The research team was involved in the follow up of these patients from the diagnosis to recovery (4) or death (6).

Barriers were encountered at different stages: lack of diagnostic tools and high costs limit access to rapid diagnosis and staging (anatomopathology, neoplastic markers, CT scan). Therapeutic interventions are scanty: drugs for chemotherapy are unavailable and expensive; radiotherapy is restricted to big urban areas. Knowledge about cancer by patients and their families is limited to its possible fatal outcome con-

sequently denial, withdrawal and faith in miracle solutions replace adherence to medical interventions. The patient-carer relations can be blocked by unspoken fears delaying practical organization of nursing.
In case of untreatable conditions, access to palliative care is difficult for lack of services. Pain management is nearly inexistent because of limited knowledge and skills by care providers. Opioid use is hindered by unnecessary country restrictions.
**Lessons learned:** Information and education about cancer prevention, screening and care should be integrated in communication with HIV patients. Preventive validated interventions and active screening have their role in patients' management. *Ad hoc* contacts with specialized services, if existing, should be established in advance to provide rapid response in case of suspect and diagnosis. Palliative care and in particular access to opioid have to be implemented rapidly.
**Conclusions/Next steps:** Training of health care providers on cancer management from prevention to follow up of untreatable cases is important in HIV care and the essential package for cancer care should be introduced in HIV services. If we continue to neglect, we will be failing comprehensive care.

## WEPEE543

### ACCEPTABILITY OF INTEGRATED HOME-BASED SCREENING FOR HIV, TB AND NON-COMMUNICABLE DISEASES IN RURAL SOUTH AFRICA

A. Beeson[1], L. Shezi[2], A.P. Moll[3], J. Madi[2], N. Nkomo[2], V. Guddera[2], L. Andrews[4], R. Brooks[4], G. Friedland[4], S. Shenoi[4]
*[1]University of Colorado School of Medicine, Denver, United States, [2]Philanjalo Care Centre, Tugela Ferry, South Africa, [3]Church of Scotland Hospital, Tugela Ferry, South Africa, [4]Yale University School of Medicine, Yale AIDS Program, New Haven, United States*
*Presenting author email: beeson.amy@gmail.com*

**Background:** The formal health system in South Africa is inadequate to meet primary care needs in rural areas, where rates of HIV/AIDS and tuberculosis are among the highest in the world and rates of non-communicable diseases (NCDs) are rising. One promising strategy to address this dual burden is decentralization of healthcare roles to community health workers (CHWs). However, the health system in South Africa has incorporated CHWs in a fragmented manner, with the majority of CHWs trained in just one disease or program.
**Description:** We seek to evaluate acceptability of CHW-led, home-based, integrated screening in traditional Zulu households in rural KwaZulu-Natal. Eleven CHWs were trained to provide integrated counseling and household screening for hypertension, diabetes, TB, and HIV. CHWs screened 2898 individuals between February and December, 2015. Forty-eight community members then participated in a detailed questionnaire in Zulu.
**Lessons learned:** Screening participants were 82% women and had a median age of 42 (IQR 27-60). Fifty-one percent of participants accepted HIV counseling and testing (HCT), while 62% screened for TB symptoms, 91% tested random glucose, and 96% screened for hypertension.
Among questionnaire respondents (n=48), 32 (69%) had not previously interacted with a CHW. Though most participants did not know the CHW prior to her visit (n=29, 60%), they nonetheless believed that CHWs can be trusted with private issues (n=35, 73%) and reported confidence in CHWs' knowledge of the tests (n=35, 73%).
Thirty-six (75%) stated that they seek care first at a clinic when they become ill; however, 31 (64%) stated a preference for home-based screening. Factors influencing their preference included transport expenses (79%), transport time (74%), clinic queues (47%), privacy concerns (37%), and concerns about being treated with respect (13%), while cost of care, quality concerns, advice from others, and childcare were infrequently cited.
**Conclusions/Next steps:** Community members—especially women—welcomed CHWs into their homes to perform integrated screening. Trust and confidence in CHWs was high overall. Packaging HCT with NCD screening in homes may enhance acceptability of HCT. In an area where the health system maintains a tenuous alliance with marginalized citizens, an integrated, CHW-driven model has potential to overcome geographic and psychosocial barriers to primary health care.

## WEPEE544

### DOES ENROLLMENT IN HIV TREATMENT PROGRAMS LEAD TO A COMPARATIVE ADVANTAGE IN ACCESS TO CARE FOR CARDIOVASCULAR DISEASES? DATA FROM KWAZULU NATAL, SOUTH AFRICA

A. Kintu, T. Baernighausen
*Harvard University, Global Health and Population, Boston, United States*

**Background:** Access to services for Non-Communicable Diseases (NCDs) is limited in most of Sub-Saharan Africa. Being enrolled in an HIV treatment program may offer some advantages in accessing these services due to regular exposure to healthcare.
**Methods:** We linked population survey data on measured blood pressures in KwaZulu Natal to records from HIV treatment programs in the same region for the years 2003 and 2010. We used logistic models to estimate the determinants of being on treatment for hypertension in 4464 individuals.
**Results:** Holding other factors constant, women, married individuals and those living in urban or peri-urban areas had a higher likelihood of being on treatment for hypertension [adjusted odds ratios (aOR): 3.22, 95% Confidence Interval (CI): 2.70-3.84, aOR: 1.26, 95% CI: 1.07-1.48, and aOR: 1.26, 95% CI: 1.06-1.51respectively]. Household wealth was not associated with likelihood being on treatment (*P* for trend = 0.3). HIV positive individuals on antiretroviral therapy and those in HIV general care were not more likely to be on treatment for hypertension when compared to hypertensive individuals in the general population (aOR: 0.96, 95% CI: 0.72-1.28, and aOR: 1.06, 95% CI: 0.76-1.48).
**Conclusions:** Access to treatment for hypertension is influenced by individual characteristics and by health system-related factors. Whereas priority should first be given to broader health system factors that affect access to health services for all NCDs, emphasis should also be put on harnessing the existing opportunities of integrating NCD services into regular HIV treatment and care.

# INTEGRATING HIV SERVICES WITH THOSE ADDRESSING SOCIAL DETERMINANTS OF HEALTH (E.G., POVERTY, EDUCATION, SANITATION, HOUSING, CLEAN WATER), INCLUDING ECONOMIC STRENGTHENING AND SOCIAL PROTECTION PROGRAMMES.

## WEPEE545

### INTEGRATING WATER, SANITATION AND HYGIENE INTERVENTIONS INTO HIV PROGRAMME FOR PREVENTION OF WATER-BORNE ILLNESSES IN KIAMBU AND MURANGA COUNTIES OF KENYA

M.J. Akulima[1], R. Ikamati[2], M. Mungai[2], S. Karanja[3], S. Muhula[3]
*[1]Amref Health Africa in Kenya, HIV/TB/Malaria Programme, Nairobi, Kenya, [2]Amref Health Africa in Kenya, HIV/TB/Malaria, Nairobi, Kenya, [3]Amref Health Africa in Kenya, Monitoring, Evaluation and Research, Nairobi, Kenya*
*Presenting author email: muhamed.akulima@amref.org*

**Background:** People living with HIV (PLHIV) and children born to HIV positive mothers are more susceptible to Water Sanitation and Hygiene (WASH) related illnesses than those not infected. Preventing these illnesses still remain a challenge. An estimated 78,137people were living with HIV in Kiambu and Murang'a counties of Kenya in 2014 , 9% being children < 14 years. Amref Health Africa in Kenya with funding from USAID PEPFAR through APHIAplus KAMILI project (2011-15), targets 10,979 PLHIV (8,555 adults, 2424 children) to enhance their access to quality HIV care and address social determinants of health including WASH services.
**Description:** In 2013, the Ministry of Health in Kenya (MoH) partnered with USAID WASHPlus to roll out WASH-HIV integration model to partners and MoH to prevent WASH related illness. Amref Health Africa targeted 9,654 households with Small Doable Actions (SDAs) in WASH-HIV services. Households with PLHIV were 75% (7,215) and had 10,979 PLHIV (m=38%, f= 62%). By mid-2014, through community units and Community Quality Improvement teams, 9,505 households were using pit latrines, 8,276 were practising hand-washing while 8,682 were practising safe water storage and purification.
**Lessons learned:** A retrospective review of WASH related illnesses was conducted in November 2015 covering the period 2012-2015. Main focus was on diarrhoea, typhoid, dysentery and intestinal worms cases. Routine data from 9,654 households recorded in Community Health Volunteers and Home Based Care diaries in 8 Local Implementing Partners databases and District Health Information System databases for Kiambu and Muranga Counties were utilized and compared. Between 2012 and 2015, among the targeted households, diarrhoea reduced by 41.9% (*n*=1560) vs 51.1 % (n=96,673) increase in counties cases. Dysentery cases among targeted households increased by 38.8 %( n=67) compared to 74 %(n=1160) increase for

Tuesday 19 July
Wednesday 20 July Poster Exhibition
Thursday 21 July
Friday 22 July
Late Breaker Posters
Author Index

counties. Intestinal worms cases reduced by 1.2 %(n=163) for households but increased by 17.3% (n=32,626) for counties, while typhoid case remained constant for households but increased by 15.3%(n=1024 for the counties.

**Conclusions/Next steps:** A reduction in the cases of WASH related illness at household levels was documented. Integrating WASH and HIV services can contribute to prevention of WASH-related illness among PLHIV.PLHIV households should be targeted and prioritized for promotion of WASH practices.

## WEPEE546

### CLINICAL CARE ALONE IS NOT ENOUGH. ADDRESSING ECONOMIC AND SOCIAL VULNERABILITY IMPROVES CLINICAL HIV OUTCOMES: LESSONS FROM THE BHAVISHYA PROJECT IN PUNE, INDIA

P. Raj Kumar[1,2], T. Colton[3], D. Lewis[1,4,5], D. Guru Rajan[6], A. Hairston[3]
*[1]Keep a Child Alive, Pune, India, [2]Rainbow Academy, Nagpur, India, [3]Keep a Child Alive, New York, United States, [4]Sahara Aalhad Centre for Residential Care and Rehabilitation, Pune, India, [5]Duke University, Center for Health Policy and Inequalities Research, Chapel Hill, United States, [6]Duke University, Chapel Hill, United States*
*Presenting author email: alana@keepachildalive.org*

**Background:** Stigma, poverty, gender inequities, and poor healthcare access fuel the HIV epidemic in India. The Bhavishya (Sanskrit for 'future') Project improves the health and wellbeing of women, children, and families affected by HIV, TB, and poverty in Pune, Maharashtra. The objectives include increased access to government testing and treatment, support lifelong retention and adherence, and promote economic empowerment - ultimately moving clients from poor health, isolation, and vulnerability to improved health, social integration, and inclusion. The project is implemented by Keep a Child Alive, with local partners Sahara Aalhad, Saahasee, and Prayas. Over 5,000 people have accessed services through a residential care home, outreach clinics, and skill training centres.

**Description:** The Bhavishya Vulnerability Index (BVI) was developed to quantify clients' physical, economic, and social vulnerability. Data were collected in two rounds using client records and interviews. Baseline included 501 adult PLHIV (69% female), of which 463 completed follow-up assessment. Differences in baseline (pre-Bhavishya) and follow up (2+ years into the project) were analyzed using Kruskal Wallis and other non-parametric statistical measures.

Findings indicate clients' reduced levels of vulnerability in the follow-up comparison (baseline 48.9, follow-up 28.6; a 42% reduction in overall vulnerability). Statistically significant declines in specific vulnerability categories were found. Clients with low CD4 and HIV/TB comorbidity were more likely to have poor ART adherence. Clients with anemia, low CD4, and HIV/TB comorbidity were more likely to have strained family relationships and less support group participation. Anemia, low CD4, and HIV/TB comorbidity were associated with being in financial debt.

**Lessons learned:** Physical, economical, and social vulnerability are strongly related. Statistically significant differences in baseline and follow-up measures of vulnerability underscore the need to integrate economic and social interventions as critical to client-centered HIV care.

**Conclusions/Next steps:** The BVI is useful to measure the impact of the Bhavishya (or similar) models of care, and to advocate for comprehensive approaches that address key HIV drivers, including poverty. Further work is required to validate the BVI and adapt it for use in other settings. The BVI is currently being adapted by the project as a case management tool.

## WEPEE547

### COMMUNITY REFERRAL SYSTEM LINKING AND SUPPORTING HIV-POSITIVE CHILDREN TO SERVICES

P. Muwoni
*World Education, Bantwana Initiative, Boston, United States*
*Presenting author email: pmuwoni@zw.worlded.org*

**Background:** Despite the decline in adult HIV and AIDS prevalence, Zimbabwe continues to experience some of the worst effects of HIV and AIDS in the world, and its children are often underserved casualties of the disease.. With an estimated 1 million children orphaned to AIDS, the Bantwana Initiative of World Education (WEI/B) has supported the Department of Social Welfare to develop and implement an HIV-sensitive, National Case Management System (NCMS) that reaches the most vulnerable with HTC, referrals, support and adherence to treatment.

**Description:** Since, 2010, WEI/B and its partners have worked with over a thousand Community Childcare Workers (CCWs) -the frontline cadres in the care and protection of vulnerable children - to bring community-based social welfare and child protection to the most vulnerable households . In 2015, the program expanded the case management system to include an HIV sensitive training component for CCWS, with the goal of identifying vulnerable children impacted by HIV/AIDS and linking them to care and treatment.. Using welfare and protection issues as an entry point, CCWs were trained to carry-out community based profiling to identify and encourage OVC to be tested and put on care, with CCW's providing follow up support for adherence to treatment.

**Lessons learned:** Incorporating HIV into the NCMS was a huge shift, as CCWs previously focused solely on child protection issues. Combining child protection with exposure to HIV/AIDS was both cost effective, and has led to a 20% increase in the uptake of HIV related services for children. Additionally, children have been increasingly supported to adhere to their medication. There is evidence that integrating HIV-sensitive approaches into child protection systems can enhance early detection and testing of HIV-positive children, and improve their access to care.

**Conclusions/Next steps:** The HIV-sensitive NCMS is currently being scaled up to all 65 districts across Zimbabwe, increasing the opportunity of reaching many more children with integrated child protection resources and HIV care and treatment.

## WEPEE548

### EVALUATION OF THE IMPACT OF MULTI-SECTOR INTEGRATED PROGRAMS ON UPTAKE OF HIV PROGRAMS FOR RURAL COMMUNITIES IN ZAMBEZIA PROVINCE OF MOZAMBIQUE: EXPERIENCE FROM SCIP OGUMANIHA PROJECT

G. Ekpo[1], M. Lopez[2], O. Olupona[3]
*[1]World Vision, United States, Health and HIV, Washington DC, United States, [2]World Vision, United States, Health and HIV, Federal Way, Washington State, United States, [3]World Vision, Mozambique, Health, Quelimane, Mozambique*
*Presenting author email: gekpo@worldvision.org*

**Background:** Strengthening Communities through Integrated Programming (SCIP) project funded by USAID and implemented by a consortium of partners led by World Vision, aimed to improve the health and livelihoods of women, children and families in Zambézia Province through integrated, innovative, and sustainable community-based program across multi-sector including HIV, maternal and child health (MCH), nutrition and water, sanitation and hygiene (WASH) activities.

**Description:** HIV intervention outcomes were compared at baseline and at endline along with MCH, nutrition, and WASH activities. HIV and AIDS intervention focused on 1) HIV prevention through community education, messages and dialogue; 2) linkages to HIV care and treatment through referral to the health facility; and 3) follow up care through home visits through Home Based Care volunteers in the health committees.

**Lessons learned:** Approximately 134,000 persons were counseled, tested and received their HIV results during the first five years of the project. Only 43% of respondents had ever heard of HIV counseling and testing (CT) services at baseline compared to 50% at endline. Of those who had knowledge of CT, 96.2% could correctly identify where to receive services at endline compared to 84% at baseline; and 48.8% had been tested at endline, an increase from 34% at Baseline. Of those tested, 92.7% received their HIV test results, up from 76.2% at baseline. There were significant improvements in child immunization, hospital delivery, sleeping under a bednet, stigma reduction, and access to safe water and decreases in food insecurity and severe underweight children in intervention districts.

| Indicator | Unit | OR (95% CI) | P-value |
|---|---|---|---|
| Severe Underweight (-3 SD) | Child 6-23 months | 0.18 (0.08, 0.41) | < 0.001 |
| Full immunization (by card) | Child 12-59 months | 1.73 (1.12, 2.68) | 0.013 |
| Health facility delivery | Household with < 5 years old | 1.50 (1.24, 1.81) | < 0.001 |
| Ever received HIV testing | Household | 1.48 (1.14, 1.93) | 0.003 |
| Antenatal HIV Testing | Household | 2.40 (1.94, 2.98) | < 0.001 |
| Bed net use | Child < 5 years | 3.48 (2.80, 4.33) | < 0.001 |
| Bed net use | Household | 7.67 (6.43, 9.16) | < 0.001 |
| HIV Stigma -Social exclusion | Household | -4.50 pts (-6.58, -2.41) | < 0.001 |
| Access to safe water | Household | 0.50 (0.41, 0.62) | < 0.001 |

*[Endline and Baseline Comparison of Household enumerated in three districts in SCIP Project in Mozambique]*

**Conclusions/Next steps:** A well-coordinated, comprehensive and integrated multisector health and HIV services can improve access to quality services not just to HIV services only but to other MCH, nutrition, malaria and WASH services and improve quality of life of beneficiaries.

## INTEGRATION OF HIV SERVICES WITH OTHER HEALTH AND DEVELOPMENT PROGRAMMES

### WEPEE549

### METHADONE PROGRAM INTEGRATED WITH HIV CARE: WHAT IS ITS UTILITY WITH CHANGING HIV EPIDEMIC IN POLAND

J.D. Kowalska[1,2], E. Pietraszkiewicz[1,2], E. Grycner[2], E. Firlag-Burkacka[2], A. Horban[1,2]
*[1]Medical University of Warsaw, Department for Adults' Infectious Diseases, Warsaw, Poland, [2]Hospital for Infectious Diseases, HIV Out-Patient Clinic, Warsaw, Poland*
*Presenting author email: jdkowalska@gmail.com*

**Background:** Methadone program integrated into HIV clinic was started in 1995 as an interventions to increase uptake and retention in HIV care in Central Poland. Here we evaluate the utilization of program and its suitability with changing HIV epidemic.

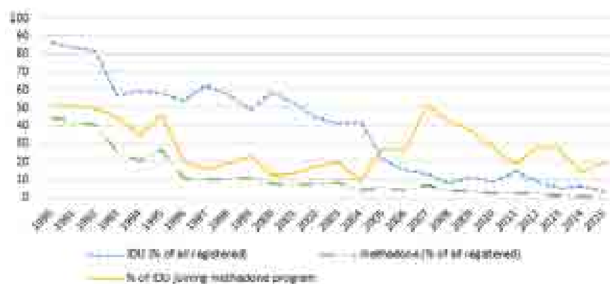
**Methods:** This is retrospective analysis of observational database cohort of cART naïve, HIV-infected adults established 1994 in HIV Out-Patient Clinic, Hospital for Infectious Diseases in Warsaw. Data collected include demographic characteristics, history of clinical visits, cART and all laboratory results. In statistical analyses Chi-squared and Kruskal-Wallis tests were used for group comparisons, tests of significance were two-sided, CI of 95% was accepted.

**Results:** In total 267 (6.6%) of 4062 HIV-positive patients registered in HIV Out-Patient Clinic started methadone program (MET). In MET 77.6% were infected through injecting drug use (IDU), 31.1% were women and 76.4% anti-HCV (+). 30% of MET patients died as compared to non-MET patients. The comparison of baseline characteristics between MET and non-MET patients is presented in Table1

| Characteristic | Methadone program N=267 | Other patients N=3795 | P value |
|---|---|---|---|
| | Number (%) | | |
| IDU mode | 218 (81.6) | 772 (20.4) | <.0001 |
| Heterosexual | 24 (9.0) | 694 (18.3) | |
| Homosexual | 6 (2.2) | 1807 (47.6) | |
| Other / unknown | 19 (7.1) | 519 (13.7) | |
| Women | 83 (31.1) | 641 (16.9) | <.0001 |
| Anti-HCV Ab positive | 204 (76.4) | 762 (20.1) | <.0001 |
| Anti-HBc total Ab positive | 123 (46.1) | 827 (21.8) | <.0001 |
| On ARV | 251 (94.0) | 3179 (83.8) | <.0001 |
| Died | 83 (31.1) | 275 (7.2) | <.0001 |
| | Median (IQR) | | |
| Age at registration | 30.24 (25.9 - 35.5) | 31.23 (26.5 - 37.7) | 0.015 |
| Age at starting ARV | 35.24 (30.3 - 41.2) | 33.27 (28.5 - 40.0) | 0.004 |
| Age at last clinical visit | 43.55 (36.6 - 49.6) | 37.87 (32.0 - 45.4) | <.0001 |
| Baseline CD4 count cells/uL | 440 (255 - 619) | 370 (211 - 531) | <.0001 |
| Baseline HIV RNA log copies/ml | 4.16 (3.22 - 4.80) | 4.31 (3.39 - 4.93) | 0.012 |

*[Table 1]*

The proportion of patients infected through IDU decreased from 86.2% to 3.6%, proportion of MET patients decreased from 44.8% to 0.7% (p for trend < .0001 for both). The proportion of MET among IDU dropped from 52% to 20% in 2015 (Figure1)



*[Figure1. Proportion of IDU, methadone program participants among newly registered HIV patients (stratified by year of registration)]*

**Conclusions:** The proportion of patients infected through IDU dropped twenty times during observed period, reflecting the changing face of HIV epidemic in Poland. However the utilization of integrated methadone program remained substantial with one in five IDU patients choosing the program. Integrated methadone program remains frequent choice of HIV-positive IDU patients.

### WEPEE550

### THE USAID SCORE PROJECT APPROACH RESULTS IN INCREASED HIV TESTING AND DECREASED VULNERABILITY AMONG ENROLLED HOUSEHOLDS IN UGANDA

E. Mediate, A. Agaba, R. Larok, J.P. Nyeko
*Association of Volunteers in International Service (AVSI), SCORE Project, Kampala, Uganda*
*Presenting author email: emediate@alumni.nd.edu*

**Background:** The five-year USAID Sustainable Comprehensive Responses for Vulnerable Children and their Households (SCORE) project aims to decrease the vulnerability of critically vulnerable children and their households (VCHH) in 35 districts of Uganda. Vulnerability is measured using the SCORE-developed Vulnerability Assessment Tool (VAT), which consists of 32 questions about child protection, food security, economic strengthening, and critical services and is scored from zero to 132.

**Description:** SCORE involves household-tailored development plans, a graduation system, and 27 activities under four objectives. Using an extensive database of 37,125 VCCH members, SCORE undertook a quantitative assessment of how the project addresses HIV/AIDS, a common driver of vulnerability.

**Lessons learned:** The family-centered, household-specific approach of SCORE increased the likelihood that VCCH members would go for HIV testing. The percentage of SCORE VCCH members that did not know their HIV status decreased from 65% to 27% over four years. All HIV negative VCCH members remained negative under SCORE. In year four, 6.9% of VCCH members were HIV positive and 66.1% were negative.

Logistic regression analysis revealed that VCCH members that participated in the following activities were more likely to go for HIV testing:

· community dialogue on psychosocial wellbeing
· nutrition dialogue
· parenting skills training

This finding suggests that community-based education interventions were the most significant* in encouraging VCCH members to go for HIV testing. *at 95% confidence interval, against 22 activities.

Altogether, VCCH members saw an average decreased vulnerability of 24.4 (measured by the VAT) over four years. 47.2% of VCCH members are male and 52.8% are female. There was no significant difference between the vulnerability gains of males and females. 11.3% of VCCH members are 0-5 years, 43.8% are 6-17 years, and 44.9% are over 18 years. There was no significant difference in vulnerability gains by age category. These findings suggest that the benefit of decreased vulnerability from the SCORE project is consistent.

**Conclusions/Next steps:** SCORE decreased the vulnerability of VCCH members and three specific interventions encouraged HIV testing. To guide HIV programming in its two-year extension, SCORE will target sub-counties and activities that are "hotspots" for HIV positive and HIV status unknown VCCH members.

### WEPEE551

### LEVERAGING HIV AND AIDS FUNDING TO STRENGTHEN HEALTH SYSTEMS BEYOND HIV PROGRAMS IN HARD-TO-REACH COMMUNITIES: THE CASE OF BIWIHI A LOCAL CSO, NAMAYINGO DISTRICT, UGANDA

P. Utera Jacamunga
*JSI, Finance, Kampala, Uganda*
*Presenting author email: pjacamunga@starecuganda.org*

**Background:** Money is the life blood of any organization; however, being scarce in nature, it has increasingly become difficult for community service organizations (CSOs) to raise funds to support HIV and AIDS and other health programs.

Dolwe Islands are habitable islands for fisher folks and female sex workers on Lake Victoria in Uganda in Namayingo District. In 2009, its community was found to lack functioning government health facility yet the HIV&AIDS rate in the area was at 28% compared to the national prevalence of 6.8%. The only functional health facility on the island was BIWIHI; a local CSO that had only one roomed structure managed by a nursing assistant and an enrolled nurse to provide HIV and AIDS and other health services to a population of over 500 people. Services were provided at a cost. Community members would travel 5 to 6 hours on the lake to government health facilities on the main land to receive free HIV and AIDS and other health services.

**Description:** In 2009, the Strengthening TB and HIV and AIDS responses in East Central Uganda (STAR-EC) with funding from USAID identified and partnered with BIWIHI, a CSO based in Dolwe Islands to improve and increase community access to HIV and AIDS services. STAR-EC provided funding, technical capacity building, maternity coaches, medical equipment like microscopes, motorcycles, and other logistical support for medical supplies.

In addition, STAR-EC facilitated a district health team comprising clinicians, counselors, nurses, and laboratory staff to conduct regular integrated clinical outreach

to the islands. Clinical services provided during the outreaches included HIV testing and counseling, voluntary medical male circumcision, HIV and AIDS risk reduction counseling, condom promotion, antiretroviral therapy provision, and financial performance reviews.
**Lessons learned:**
- HIV and AIDS prevalence in Dolwe Islands dropped from 28% in 2009 to 4.8% in 2015.
- 100 village health teams and peer educators were trained
- The CSO financial capacity was strengthened; local revenue is raised to fund its activities.
- Increased patient load of the facility from 1,401 in 2011 to 4,168 in 2015
- Infrastructure improvement from one to ten rooms.

**Conclusions/Next steps:**
- Capacity building is key in resource mobilization.

## WEPEE552

### Regaining lost ground in preventing mother to child transmission of HIV: immunization clinic as an entry point in a semi-rural setting

U. Ene[1], V. Isiramen[1], M. Ashikeni[2], D. Mbori-Ngacha[1]
*[1]UNICEF, Abuja, Nigeria, [2]Federal Capital Territory Primary Health Care Development Board, Abuja, Nigeria*
*Presenting author email: uene@unicef.org*

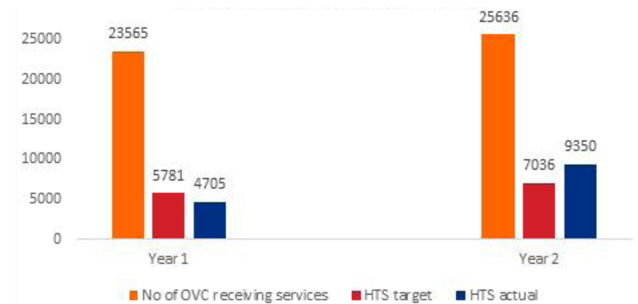
**Background:** Low antenatal care (ANC) attendance, postnatal care attendance and facility delivery rates; coupled with high drop-out rates from programs for prevention of mother to child transmission of HIV (PMTCT) have impacted negatively on HIV services scale-up for women and children in Nigeria, especially in rural and semirural areas.
**Description:** UNICEF supported the implementation of a 12-month project in FCT aimed at identifying HIV positive mothers and their children during routine immunization and linking them to HIV services. FCT has an estimated HIV prevalence of 5.8% and total fertility rate of 4 births/woman. Routine service data indicates that first ANC attendance is much lower than utilization of routine immunization services (first ANC: 40,711; OPV3:91,264). The project which was implemented at Dutsen Alhaji Primary Health Centre, a semirural facility in FCT with a catchment population of 28,700, supported the integration of HIV Testing and Counselling (HTC) and routine immunization services from December 2014 to November 2015. Immunization clinic staff were trained to routinely offer HTC to mothers accompanying infants and young children to the immunization clinic, while applying defined exclusion criteria. Dried blood spot samples for virological testing were collected from HIV-exposed children, and HIV positive mothers and children linked to treatment and care on-site.
**Lessons learned:** 1382 pregnant women attended the facility ANC clinic during the December 2014 - November 2015 period. Of these 1287 received HTC and 52 tested positive. 7198 mothers attended the immunization clinic during the same period. After excluding those with known HIV-positive status or who had previously tested negative within the preceding 3-month period, HTC was received by 3125 women and 27 additional HIV positive mothers and HIV-exposed children (all aged less than 18 months) were identified
In the context of low ANC attendance and high fertility rate, the immunization clinic presents a second chance to identify additional HIV positive women and intervene to prevent HIV transmission during breastfeeding and subsequent pregnancies using minimal additional resources.
**Conclusions/Next steps:** As Nigeria considers adopting lifelong antiretroviral therapy for all pregnant and breastfeeding women, this entry point should be considered for women missed during pregnancy and delivery.

## WEPEE553

### Adjusting the lens: integrating HIV testing services (HTS) into support programmes for orphans and vulnerable children (OVC) in South Africa

C. Wills[1], M. Stewart[1], M. Myburgh[2], T. Mahlobo[3], S. Clarke[4], L. Baerecke[4]
*[1]Networking HIV, AIDS Community of South Africa (NACOSA), Cape Town, South Africa, [2]National Religious Association for Social Development (NRASD), Stellenbosch, South Africa, [3]Department of Social Development, Pretoria, South Africa, [4]Creative Consulting and Development Works, Cape Town, South Africa*
*Presenting author email: caroline@nacosa.org.za*

**Background:** South Africa have adopted the Global 90-90-90 strategy and the National Department of Health has recommended *"testing all children accessing services for orphans and vulnerable children"* (2015). In response to global and national shifts in policy, the Global Fund supported NACOSA and NRASD to implement a 2.5-year programme integrating HIV Testing Services (HTS) into existing OVC services.
**Description:** The programme supported 73 community-based organisations in nine South African provinces to integrate HIV programmes into their existing OVC services from October 2013-March 2016. HTS was one of a range of services offered. The organisations were provided with: intensive training on HTS and Procurement and Supply Management (PSM); on-site mentoring; Rapid Diagnostic Tests where needed; and limited financial resources.
**Lessons learned:** Between October 2013-September 2015 (to be updated to March 2016), the programme cumulatively enrolled 25636 children, of which 14055 were provided with an HIV test.



*[Figure 1: Number of OVC reached by programme services and OVC who received HIV test]*

Organisations encountered and overcame diverse challenges including: procurement and supply management; organisations' internal concerns about offering HIV testing to children; stigma; internal stigma and discrimination; and forging close working relationships with local health facilities - with which they had limited links prior to the programme. Once organisations had overcome their challenges in offering HTS, they were able to recognise the enormous value of HIV testing for their beneficiaries, especially as a gateway to the continuum of care for children living with HIV.
**Conclusions/Next steps:** Organisations have been able to extend their HTS beyond the children enrolled in the programme to the rest of the community which provides community members with an alternative space in which to access HIV testing and organisations are promoting a culture of regular annual HIV testing. It is likely that the organisations will be able to offer HTS beyond the end of the grant because the health facility provides HIV Rapid Diagnostic Tests free of charge.

## WEPEE554

### Family planning needs among women at the Baylor Clinical Centre of Excellence (COE) in Constanta, Romania

V. Cindea, A.-M. Schweitzer, S. Mihale, R. Mihai
*Baylor Black Sea Foundation, Infectious Diseases, Constanta, Romania*
*Presenting author email: vcindea@baylor-romania.ro*

**Background:** With an aging HIV-infected young adult population of about 850, the COE noticed a rising trend of repeated abortions and multiparity among the HIV+ women (estimated to be at least 40% in the past 4 years). A baseline needs assessment was set up in order to guide the format of the family planning (FP) services.
**Description:** More than 80% of the patients are young adults, sexually active, engaged in both HIV sero-concordant and discordant relationships. An assessment tool was used to collect data (obstetrical history, fertility intentions, partner's HIV status, contraceptive methods used) from 175 women (94% HIV+ and 6% HIV).
**Lessons learned:** Analyzing data revealed unmet needs among the target group: specialized FP counseling and access to modern high efficient contraceptive methods. Avoiding pregnancies is important for our patients (87% of women intend to avoid pregnancy) and half of them report using condoms. Abortion is common: 26% of women that use condoms had at least one such event, and from the women that wanted to limit pregnancies, 51% reported at least one abortion (average 2.3). Using condoms helps prevent HIV transmission (likely corroborated with ARV adherence and other possible factors) but it is less efficient in pregnancy prevention among our cohort; e.g. among 76 HIV positive women in sero-discordant couples who want to space pregnancies, almost 80% were using condoms and almost 60% had already had an abortion. For HIV infected persons who want to delay, space or limit births, using condoms simultaneously with an efficient contraceptive method will ensure dual protection for HIV transmission and pregnancy prevention.
**Conclusions/Next steps:** The family planning program needs to be built on three pillars:
a) the procurement and distribution of a diversified range of free of charge contraceptive methods (IUDs, oral and injectable contraceptives, emergency contraception, and condoms);

b) on the job training of nurses on contraceptive technology and client family planning counselling;
c) behavior change communication activities for promoting available FP services and increasing demand for efficient contraceptives use among our beneficiaries.

## WEPEE555

### TB GUARD PROGRAM: A CASCADE OF CARE FOR TB PROPHYLAXIS AT BAYLOR CLINICAL CENTRE OF EXCELLENCE IN CONSTANTA (COE), ROMANIA

S. Mihale[1], E. Vasiliu[1], A.-M. Schweitzer[1], A. Butuc[1], V. Cindea[2]
*[1]Baylor Black Sea Foundation, Infectious Diseases, Constanta, Romania, [2]Baylor Black Sea Foundation, Medical, Constanta, Romania*
*Presenting author email: vcindea@baylor-romania.ro*

**Background:** TB Guard's goal is to ensure timely access to TB prophylactic treatment (CSS) for people affected by HIV that are at high risk of contracting TB (TB-HIV-P). In the first year of implementation, the project aimed to ensure that at least 50% of the eligible high risk patients receive CSS.
**Description:** The program is implemented by two health professionals at a HIV clinic caring for about 750 patients/quarter. The cascade of care includes a 4 item self-reported symptom screening, evaluating patients' TB knowledge level , informing patients about their risks to develop TB, initiating CSS for those at high risk (with CD4< 200, pregnant women, patients with exposure to TB, etc.). Finally, the program connects those with TB symptoms for diagnosis and curative treatment at the local referral centre.
**Lessons learned:** The TB-Guard program in the HIV clinic translates into practice the HIV-TB guideline recommendations. Every quarter, around 47% (362 patients) of those that access the COE accepted to complete the self-report. Another 35% (268 patients) were selected for TB evaluation through direct assignment (based on CD4 values and exposure risk). 13,25% (48 patients) responded with "yes" at a least one screening question and were further referred for medical evaluation. 92% (239 patients) were referred for consultation through direct selection by healthcare team. Finally, 197 unduplicated patients presented themselves for consultation, and 18 were initiated on CSS. During the year 2015 the COE was the only center in the region that enrolled patients on CSS (126 persons, i.e. 49% of the eligible TB-HIV-P with CD4< 200, 69% of eligible pregnant HIV infected women and 54% of children exposed to HIV aged 0-2 years old).
**Conclusions/Next steps:** The program managed to successfully initiate on CSS about 15% of the total active population during the year 2015, but had a broader educational impact since 53% of all patients were informed about TB. In the future, the program will focus on increasing self-referral rates and overcoming barriers related with accepting the self-report screening.

## WEPEE556

### INTEGRATION OF FAMILY PLANNING IN HIV SERVICES FOR SEX WORKERS LEADS TO REDUCTION OF ABORTIONS AMONG SEX WORKERS IN UGANDA

D. Bakomeza
*Reproductive Health Uganda, HIV, Kampala, Uganda*
*Presenting author email: dbakomeza@rhu.or.ug*

**Background:** Integration of Reproductive Health services in HIV programs for sex workers contributes to increased condom use and reduction in unwanted pregnancies among female sex workers. Despite this mutual dependence, HIV and reproductive Health programs programmes are largely implemented in a vertical fashion. As part of a three years project implemented among the sex workers in the slum areas of Kampala capital city, (Uganda) and funded by GIZ through IPPF, Reproductive Health Uganda implemented a three year project aimed at integrating SRH and SRH services among Sex works.
**Description:** The project supported the training of peers among sex workers; Cells based integrated community outreaches, male and female condoms distribution and provision of family planning services among others. This was done in 10 sites in the Bwaise slum areas of Kampala city from November 2012 to October 2015. The program raised awareness and ownership through sensitization activities at community level; facilitated bi-directional linkages and referral systems, peer to peer support, supervised and mentored the quality of integrated service provision using specifically defined integration indicators.
**Lessons learned:** For the time period November 2012 to October 2015, the program cumulatively enrolled 23,162 key populations including 22,279 sex workers (22,012 females and the rest males) of which 37.5% HIV positive. The provision of integrated services progressively reduced the number of female sex workers who came with post abortion complications and complaints.
**Conclusions/Next steps:** The concept of SRH/HIV integration can be adopted by health care workers with minimal additional resources. Indicators monitoring the integration of service provision, although more complex by virtue of measuring the association of two services, can be an important tool to sensitize and motivate HCWs to provide the desired services in a linked manner. Female sex workers benefit more from integration to get better quality services. More attention will need to be given to national routine monitoring and evaluation tools to include measures of integration.

## WEPEE557

### INTEGRATION OF HIV CARE WITH WELL-CHILD SERVICES: IS THIS THE SOLUTION TO IMPROVING FOLLOW-UP CARE FOR HIV INFECTED MOTHERS AND THEIR INFANTS IN RESOURCE-LIMITED, HIGH HIV PREVALENCE SETTINGS?

C. Horwood, S. Phakathi, L. Haskins, M. Grant
*University of KwaZulu-Natal, Centre for Rural Health, Durban, South Africa*
*Presenting author email: horwoodc@ukzn.ac.za*

**Background:** Integration of prevention of mother-to-child transmission (PMTCT) interventions with routine antenatal care has resulted in substantial reductions in perinatal HIV transmission in South Africa (SA). PMTCT guidelines now recommend lifelong antiretroviral therapy (ART) for all HIV positive pregnant women, creating a need for strategies to improve retention in care for these mothers and their babies post-delivery. We evaluated a multi-pronged, systems strengthening intervention to provide a comprehensive integrated package of maternal, child and HIV/PMTCT services in the well-child/immunisation setting in five clinics in KwaZulu-Natal.
**Methods:** Exit interviews and reviews of the Road-to-Health-Book (RTHB) were conducted with mothers of babies aged under one year attending for well child services to determine the services received at baseline (T1) and after completion of the one-year intervention period (T2).
**Results:** Interviews were conducted with 123 mothers at T1 (September-October 2013) and 290 mothers at T2 (September-November 2014). Participants' demographic characteristics were similar at both time points.
Most mothers reported having had a previous HIV test: 114/123 (92.7%) at T1; 289/290 (99.7%) at T2. Among mothers with a RTHB 96/113 (85.0%) had their most recent HIV status recorded in the RTHB at T1, this was significantly higher at T2 (281/289; 97.2%: P< 0.001).
Of 76 mothers reporting themselves HIV negative at T1, seven (9.2%) were offered a HIV test at this visit versus 40/177 mothers at T2 (22.6%: p=0.047). However, mothers who actually had an HIV test on the day of the visit was not significantly different: 1/76 (1.3%) at T1 vs 20/177 (11.3%) at T2 (p=0.092).
Among HIV positive breastfeeding mothers at T1, 6/35 (17.1%) were not currently taking ART versus 6/107 (5.6%) at T2 (p=0.051). Significantly more HIV positive mothers received their ART on the day of the well child visit at T2 compared to T1 (3.7% vs 35.5%: p=0.01). Coverage of infant HIV PCR testing was similar at T1 and T2 (97.2% vs 95.8%).
**Conclusions:** Although coverage of infant PCR testing was similar at both time points, provision of an integrated maternal and child health service in the well-child clinic resulted in significant improvements in coverage and uptake of maternal HIV interventions.

## WEPEE558

### INTEGRATION OF ART PROGRAM INTO HEALTH SYSTEM: A CASE STUDY IN JAKARTA AND MAKASSAR, INDONESIA

I. Perwira[1], I. Praptoraharjo[1], M. Suharni[1], I. Hersumpana[1], S. Sempulur[1], E. Hapsari[1], S. Nasir[2], S. Riskiyani[2], K. Rachmadi[3], F. Hudayani[3]
*[1]Center for Health Policy and Management (CHPM) University of Gajahmada, HIV/AIDS Policy Research, Jogjakarta, Indonesia, [2]Hassanuddin University, Public Health, Makassar, Indonesia, [3]University of Indonesia, UPT HIV RSCM, Jakarta Pusat, Indonesia*
*Presenting author email: iperwira@me.com*

**Background:** Integration of AIDS reponse into health system is one of strategies to strengthen effectiveness and sustainability of AIDS response which have recommended by previous research and programs. Current study aims to asses level of integration for ART services into Indonesia' decentralized health system in city of Jakarta and Makassar.
**Methods:** A case study design using a standard policy analysis method was applied to have a deeper understanding on the integration of ART program into health system. seventy-one informants consisting of local government officials, NGOs and KAPs were interviewed using semi-structured interview guide which focused on

Tuesday 19 July

Wednesday 20 July Poster Exhibition

Thursday 21 July

Friday 22 July

Late Breaker Posters

Author Index

the health system functions either at system or program level. Data were analyzed based on thematic codes to map out variations of the themes from different informants.

**Results:** ART program implemented in the two cities showed significant coverage where the program covered 80.9% of 35,903 people who meet requirements for ART (CD4< 350). PLHIV who accessed the program reported that they satisfied with ART services provided by health facilities in the cities. In terms of governance, however, implementation of the program was not integrated into health care system in the cities. The program was still planned, funded, monitored and evaluated by the national government. The vertical nature of the program may have implication on its sustainablity given the limited capacity of national government to provide budget due to the increasing number of PLHIV in the future. Additionally, limited role of the local government in the program is not consistent with the decentralized health system and it will be a significant barrier to govern the program in the future.

**Conclusions:** ART program in Indonesia has not been integrated into provincial and district health care system. As integration is one of strategies for sustainability and effectiveness of the program, Ministry of Health should share responsibilities in governing ART program to provincial and district health office under the new decentralization law which assign the local government as the principal in providing health care for the people.

## WEPEE559

### HOW SATISFIED ARE CLIENTS WITH INTEGRATED SRH AND HIV SERVICES? A CROSS-SECTIONAL STUDY IN BOTSWANA, 2015

L. Mashimbye[1], K. Koogotsitse[2], J. Shongwe[2], A. Andersson[3]
*[1]UNAIDS, RST ESA, Johannesburg, South Africa, [2]UNFPA, Gaborone, Botswana, [3]UNFPA, Johannesburg, South Africa*
*Presenting author email: shongwe@unfpa.org*

**Background:** There is a global consensus on integration of sexual and reproductive health (SRH) and HIV services. However, integration of SRH/HIV has not been widely implemented, and there is limited knowledge of client's satisfaction with integrated SRH and HIV services. In Southern Africa, 7 countries piloted integration of SRHR and HIV between 2011 and 2015. We present data of client satisfaction collected through a survey in health facilities in Botswana.

**Methods:** A cross-sectional study was conducted with women and men who accessed SRH and HIV services in Botswana between April and September 2015. A sample of 225 clients and 22 service providers across 9 nine health facilities participated in the study. The questionnaire was comprised of SRH/HIV integrated services available, benefits and disadvantages of provision of SRH and HIV integrated services, and client satisfaction - confidentiality, privacy and trust. Data was captured in Microsoft excel, and imported into Epi Info™ version 7 for analysis. Results of descriptive analysis are presented.

**Results:** Over 80% were female and mean age 36 years (19-77 years). Over one-third (73%) preferred integrated SRH and HIV services; citing benefits on reduction on number of trips to health facility (57%), and an opportunity to access other services which were not primary reason for consultation (41%). Clients mentioned long waiting times (27%) and poor quality of service (10%) as disadvantages of SRH/HIV integration. Whereas; 89% of health service providers mentioned shortage of drugs and supplies and 83% an increase in workload. Over 80% of clients were completely satisfied with integrated SRH and HIV services.

**Conclusions:** Clients were satisfied with integrated SRH and HIV services. Integration provides multiple entry points for services, and reduces return visits to health facilities. However, integration needs well resources facilities - human, and drugs and supplies. This study has implications for health systems strengthening, for scale-up of SRH and HIV programmes through integrated approach, in developing countries.

## WEPEE560

### ENGAGING TRANSGENDER COMMUNITIES TO ADDRESS GENDER REASSIGNMENT HEALTH SERVICES RESULTS IN UPTAKE OF HIV PREVENTION SERVICES

N.J. Poojary[1], P. Saraf[2], M. Basha[3], G. Rekha[4], K. Apte[5]
*[1]Family Planning Assocation of India, IPPF-South Asia, HIV, Mumbai, India, [2]FPA India-Hyderabad, HIV, Hyderabad, India, [3]FPA India-Chennai, HIV, Chennai, India, [4]FPA India-Bengaluru, HIV, Bengaluru, India, [5]FPA India-Headquarter, Programs, Mumbai, India*
*Presenting author email: nisha@fpaindia.org*

**Background:** In April 2014, India's Supreme Court recognized transgender people as **the "third gender"** in a judgment that also observed that this community faces "large and pronounced discrimination" in healthcare. National AIDS Control Annual Report 2015 shows reduction of HIV infections among general adult population. However, the infection rate among Transgender is increasing considerably (8.82%). Discrimination in healthcare system against TG remains rife despite new laws and the community continues face double stigma if they are living with HIV.

**Description:** FPA India initiated a three year project from 2013-2015 to work with Transgender to scale up targeted interventions for transgender women supported by German Initiatives Backup (GIZ) at Chennai, Bangalore, Mumbai and Hyderabad. FPAI service providers were trained to address special needs of the community and to provide stigma free SRH-HIV services. Due to stigma and discrimination in the health care settings, the community member do not access services making them vulnerable to HIV and other STIs.

**Lessons learned:** Strengthen service providers to address the gender feminization health services of TG. Recruit staff from community who will be well received and placed to identify the needs and demands of their community. Develop partnership with other healthcare providers to help in addressing feminization procedures, increase awareness of the services available for referrals from partner organizations. Total 3,455 TG were registered and provided 13,832 counseling services on gender reassignment. 1,335 TG consulted trained provider and 284 initiated hormone therapy. Referral service for SRS was provided to 499 and laser treatment for 923 TG. 38% accessed HIV testing, 25% treated for STI and 27% were screened & vaccinated for Hepatitis B. The community appreciated the efforts made by the project to address the special needs of the community which was not addressed even by its own organization.

**Conclusions/Next steps:** Transgender are more interested in gender reassignment health services than HIV prevention hence increase access to these services. Train service providers to be sensitive to their needs and to provide stigma free service. Effective counseling to empower members to decide about their gender identity indirectly result in uptake of HIV services.

## WEPEE561

### WHERE ARE WE WITH ELIMINATION OF NEW HIV INFECTIONS AMONG CHILDREN?

C. Luo, P. Idele, T. Porth, S. Romano, B. Rogers, C. McClure
*UNICEF, HIV, New York, United States*
*Presenting author email: cluo@unicef.org*

**Background:** Despite significant progress made, coverage of PMTCT interventions in some priority countries was still below that needed to reach the goal for elimination of new HIV infections among children. In some of the countries, many women are still not reached and, when reached, retention in care is poor. Overall, low performing countries are characterized by persistent regional disparities in geographic coverage of PMTCT services due to system constraints.

**Methods:** Country data from UNAIDS 2014 estimates and 2015 Global AIDS Response Progress Reporting were analysed over time to determine trends, unmet need and future forecasts intervention performance. . In-country assessments and bottleneck analyses were conducted to supplement and corroborate national findings and determine geographic disparities within countries.

**Results:** In 2014, 73% of 1.5 million pregnant women living with HIV in low- and middle-income countries (LMICs) received the effective PMTCT ARVs compared to 77% in the 21 priority countries in SSA. At this rate of scale-up, however, the 90% PMTCT HIV treatment target by 2015 may be achieved in 2017. There were 220,000 new HIV infections among children in 2014 globally; nearly a 60% reduction since 2000, 24% reduction between2000-2009 and 45% between 2009-2014. At this rate of decline, the 90% decline 2015 target may not be achieved until 2029. Between 2000 and 2014, an estimated 1.3 million new HIV infections were averted by PMTCT LMICs. Of the 220,000 new child HIV infectionsglobally in 2014, 50% were in 6 countries (Nigeria, Kenya, India, Malawi, Uganda and South Africa). Since 2000 there has been a shift in the countries contributing to 50% of new infections, except for Nigeria. Bottleneck analyses conducted show that slow progress is associated with policy and systemic factors weak human resource capacity and policies that do not support task shifting, inadequate supervision of staff, poor quality of services, including laboratory capacity; weak referral and follow-up care systems, inadequate community engagement and supply chain constraints.

**Conclusions:** Despite the progress in PMTCT, many children continue to be infected. Addressing the remaining policy and systemic factors is needed to meet the new Fast Track global 90 90 90 2020 treatment to end AIDS among children.

## CAPACITY BUILDING INITIATIVES

### WEPEE562

### CHANGES, OPPORTUNITIES AND STANDARDS, A RETROSPECTIVE REVIEW OF NOVEL PRACTICES IN HEALTH SYSTEMS INVESTMENTS. TASO UGANDA EXPERIENCE

D. Kagimu, M. Tibyasa, S. Okoboi, L. Oucul
*The AIDS Support Organisation (TASO), Program Management, Kampala, Uganda*
*Presenting author email: kagimudavid@yahoo.com*

**Background:** Globally, there is a call for efficient investments in health care systems if the benefits of high yield impacts are to be achieved. Uganda, which is among the high HIV prevalent countries affected by the scourge of the HIV epidemic, has had PEPFAR support for HIV programs rationalized. TASO received a grant to strengthen government health systems to implement the six pillars of health system strengthening in 54 public health facilities but changes had to be made to realize opportunities for success.
**Description:** Key milestones had to be achieved in the areas of health financing, logistic chain supply and health workforce. TASO activated each health facility bank account with the in charge and the district health officer (DHO) as separate signatories. Funds disbursements required that requests are reviewed by the district sub accountant, TASO center accountant and finally by TASO headquarter financial team. TASO supported the recruitment of Human resources for health in three districts to fill vacant positions. A multi skilled TASO team seconded to this HSS project together with the district supervision teams conducted routine support supervision to each facility to assess performance on all program indicators to identify gaps and opportunities for improvement. TASO also facilitated Tororo Hub to support the lower health unit laboratories.
**Lessons learned:** In a year, over 114 staff were recruited. Over 36 Joint support supervisions conducted. TB screening increased from 50 % to 80%. Retention on ART also increased from 67% to 70%. Retention in care of HIV exposed infants improved from 32% to 72% and PITC at outpatients increased by 50%. Facility reporting improved from 60% to 95%. Drug stock outs and the need for buffers reduced significantly. The supported Hub achieved 3* status from 0*and was ranked among the best performing Hubs in the country.
**Conclusions/Next steps:** To improve the health system in any country, health financing mechanisms with accountability, and sufficient logistical, mentorship and timely supervision are key to achieving the objectives of HSS.
Any project improving health systems should utilize multidisciplinary teams in providing support supervision, and introduce financial mechanisms for easy funds access but with efficient accountability.

### WEPEE563

### INSTITUTIONALIZING HIV/AIDS, TB AND MALARIA IN-SERVICE TRAININGS: MSH NIGERIA EXPERIENCE

E. Atuma[1], O. Omitayo[1], B. Addulmumin[2], B. Okoye[3], S. Akande[1], D. Akila[1], M. Salami[1]
*[1]Management Sciences for Health, Health Program, Abuja, Nigeria, [2]Management Sciences for Health, Health Program, Minna, Nigeria, [3]Management Sciences for Health, Health Program, Bernin Kebbi, Nigeria*
*Presenting author email: atumaemma@yahoo.com*

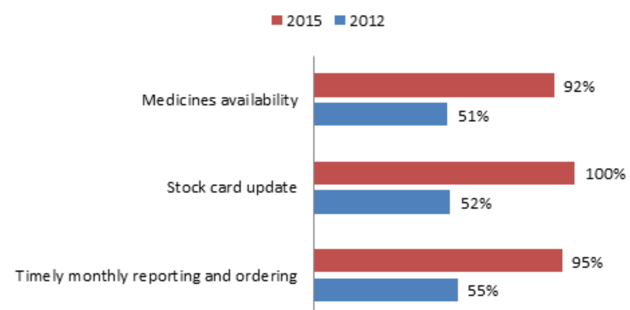
**Background:** In-service training of health care workers plays an important role in improving the quality of HIV/AIDS services. In Nigeria, HIV/AIDS, TB and Malaria trainings have been largely donor-funded and directed at health care workers in supported facilities, covering a small fraction of the overall state health workforce.
The planning, coordination, and implementation of these trainings happen with minimal state involvement and without a framework at the state ministry to ensure that these donor-funded trainings cut across all the state facilities. Hence, creating a need to institutionalize and sustain these in-service trainings through appropriate government agencies.
**Description:** USAID through the MSH-ProACT project developed a model to strengthen, standardize, and institutionalize in-service trainings across five supported states. Using a participatory approach that brought together professional health associations and State Ministry of Health; the Centers for Health Professionals Continuing Education (CHPCE) were established. The CHPCE is endorsed by 3 professional health councils to award Continuing Professional Development (CPD) credits. The CHPCE comprises a multi-disciplinary faculty of health personnel, who serve as state-based master trainers that provide integrated trainings on HIV/AIDS, TB and Malaria based on national guidelines.
Training needs assessments were conducted and findings used to develop and implement a series of calendared trainings for the state health work force.
**Lessons learned:** Within one year of implementation, the CHPCE has provided trainings and awarded CPD points to health professionals across supported and non-supported facilities in the states which ensured that a larger percentage of the health workforce was reached. The multi-disciplinary approach employed encouraged ownership and participation by all the state professional associations.
Awarding of nationally recognized CPD points served as motivation for health workers to attend the trainings especially for non-donor supported sites.
**Conclusions/Next steps:** The CHPCE approach provides a sustainable Government owned structure for institutionalizing robust in-service training of Health Workers. However, continued success of the approach will depend on funding provisions for the Centers and evaluation component should be built into all in-service training programs and budgets to evaluate their relevance, effectiveness, efficiency, sustainability.

### WEPEE564

### IMPROVING AVAILABILITY OF ANTIRETROVIRALS THROUGH SUPPORTIVE SUPERVISION IN HEALTH FACILITIES IN SWAZILAND

A. Chinhenzva[1], K. Shongwe[1], K. Kunene[1], K. Masthotyana[1], F. Fakudze[2]
*[1]Systems for Improved Access to Pharmaceuticals and Services, Mbabane, Swaziland, [2]Ministry of Health, Mbabane, Swaziland*
*Presenting author email: achinhenzva@msh.org*

**Background:** Universal access to antiretroviral (ARV) therapy is one of the goals of the response to HIV and AIDS epidemic in Swaziland. By the end of September 2010, 64.1% of people with HIV or AIDS were actively on treatment in the country. To improve availability and support of HIV services decentralization activities, the USAID-funded SIAPS Program has supported the Swaziland Ministry of Health (MOH) in building capacity of health care workers (HCWs) in ARV inventory and pharmaceutical services management.
**Description:** In 2012, SIAPS conducted a baseline assessment of 131 health facilities to assess pharmaceutical services. Based on the results, SIAPS assigned a technical advisor in each of the four regions to mentor HCWs on inventory and pharmaceutical management. Twelve annual supportive supervision reports from four regions were analyzed from September 2012 to September 2015 to review medicines availability.
**Lessons learned:** The average ARV availability in health facilities improved from 51% in 2012 to 92% in 2015. The percentage of facilities using appropriate tools for inventory management (stock cards) improved from 52% in 2012 to 100% in 2015. Timely and accurate monthly reporting and ordering improved from 55% in 2012 to 95% in 2015.



*[Medicines Availability Performance Cascade]*

**Conclusions/Next steps:** The results demonstrate the effectiveness of capacity building and supportive supervision, making ARVs more accessible to patients for improved health outcomes through the following:
· Increased patient confidence in the health system.
· Fewer stock outs.
· Reduced frequent hospital visits meaning patients don't miss as much time from work.
· Fewer opportunistic infections because patients are stable on their ART.

### WEPEE565

### ORGANIZATIONAL DEVELOPMENT AS AN ENTRY POINT FOR EFFECTIVE COMMUNITY HIV PROGRAMMING: LESSONS FROM ZIMBABWE

P.T. Ngwerume, L. Chingandu, R. Eghtessadi
*SAfAIDS, Harare, Zimbabwe*
*Presenting author email: percy@safaids.net*

**Background:** SAfAIDS implemented a 9-month (January-September 2015) institutional capacity building project for 2 Irish Aid Zimbabwe local partner organizations: FACT Chiredzi and Diocese of Mutare Community Care Programme (DOMCCP). The

Author
Index

main objective of the project was to: Provide institutional strengthening and technical capacity building for 2 local partners to deliver effectively on their mandates and report efficiently to Irish Aid Zimbabwe.

**Description:** Delivery of the project actions was guided by an organizational development framework that had five key components:

i) field based partner capacity needs assessment;

ii) conducting a project inception meeting to get buy in from the project partners and create a shared understanding of the organizational development process;

iii) participatory development of a capacity building framework unique to each partner's capacity needs;

iv) delivery of multi-action capacity building actions; and

v) evaluation of the interventions.

Capacity building was done through a combination of skills building workshops and hands on mentoring. Mentorship was provided face to face and through distance support.

**Lessons learned:** There were contributory and limiting factors that influenced achievement of project objectives. At DOMCCP a success factor was receptiveness of staff in embracing new changes introduced from the capacity building plan. FACT Chiredzi was experiencing low staff morale and policies that hadn't been reviewed in a long time. Capacity building interventions helped address organizational challenges. Strength of the approach was the emphasis on competency building using both instructive training and follow-up mentorship; and participation of the Board, management and staff in the capacity building process. Success of capacity building is premised on the posture of learning in any organisation. If only management is motivated to learn and the staff are not, then it will be difficult to translate capacity building into tangible results. At DOMCCP the positive posture of learning was evident in successful adoption of change interventions.

**Conclusions/Next steps:** Institutional capacity building is an effective entry point in removing operational and structural bottlenecks that hinder quality project implementation. The intervention has improved the quality of programmes for the 2 partners. SAfAIDS is internalizing the lessons learnt to scale up organizational development work in Zimbabwe.

## WEPEE566

### EECA REGIONAL PLATFORM: BUILDING REGIONAL CIVIL SOCIETY PARTNERSHIP FOR BETTER DECISION MAKING IN HIV/TB RESPONSE

K. Maksymenko[1], Y. Ivakhnina[2], A. Dovbakh[3]

*[1]Alliance for Public Health, Kyiv, Ukraine, [2]ICO East Europe and Central Asia Union of PLWH, Kyiv, Ukraine, [3]Eurasian Harm Reduction Network (EHRN), Vilnius, Lithuania*

*Presenting author email: maksymenko@aph.org.ua*

**Background:** Strong communities, rights protection, and gender equality (CRG) are important components of response to HIV/TB epidemics. Establishment of *Regional Civil Society and Community Support, Coordination and Communication Platforms* is an initiative of Global Fund to fight ATM to support and strengthen civil society and community engagement at all levels of Global Fund processes. Regional Platforms were established in 6 regions all over the world.

**Description:** In Eastern Europe and Central Asia (EECA) Regional Platform was created through consortium of key partners: Alliance for Public Health, Eurasian Harm Reduction Network, and Eastern-European and Central-Asian Union of PLHA organizations. The main Technical Partners supporting and collaborating with Consortium include community networks Eurasian Network of People who Use Drugs, Sex Workers' Rights Advocacy Network, Eurasian Coalition on Male Health, as well as TB Europe Coalition. This is a unique initiative when key Technical Assistance providers are not competing with each other, but unite resources for better synergy of HIV response in the EECA region, involve community networks into scaled up regional coordination, and integrate HIV and TB issues in decision making processes.

**Lessons learned:** On the regional level Civil society cooperation covers important needs in resource savings through coordination on planning stage of regional projects related to CRG. This is also applicable for mid-term and final evaluations of such projects. What is more, every regional project has budgets for coordination, which also can be saved and reallocated with the help of such partnership.

**Conclusions/Next steps:** Success of EECA Regional Platform Consortium demonstrates its further potential for the Region in strategic planning and efforts coordination for better synergy in HIV/TB response in the Region. On the basis of EECA Platform Regional Coordination Mechanism is being created to make the voice of civil society legitimate to form regional agenda, to enhance coordination through oversight of regional projects, and to allocate resources of donors in most effective way covering gaps and avoiding duplication of activities. Regional Coordination Mechanism is to be an advisory entity for regional GF ATM projects and initiatives, as well as for other interested donors.

## WEPEE567

### HIV/AIDS NATIONAL DISTANCE-LEARNING SEMINAR SERIES: A USEFUL AND EFFECTIVE STRATEGY TO COMPLEMENT CONVENTIONAL TRAINING PROGRAMMES IN INDIA'S NATIONAL AIDS CONTROL PROGRAMME

S. Anwar Parvez[1], S. Kandaswamy[1], V. Purohit[1], A. Beri[2], P. Singh[1], B.B. Rewari[3], T. Perdue[4], P. Harvey[2]

*[1]International Training and Education Center for Health, Global Health, New Delhi, India, [2]Centres for Disease Control and Prevention, Division of Global HIV and TB, New Delhi, India, [3]World Health Organisation, New Delhi, India, [4]International Training and Education Center for Health, Global Health, University of Washington, Seattle, United States*

*Presenting author email: anwarparvezsayed@gmail.com*

**Background:** HIV/AIDS epidemic has, over the past decade, evolved into a more complex one necessitating high quality of care, treatment and support to People Living with HIV (PLHIV). Complex treatment schedules and patient management require constant training and upgrading of skills among providers. Distance Learning is an innovative strategy to train and bridge the skills and knowledge gap of health care professionals (HCP).

**Description:** The Centres for Disease Control and Prevention (CDC) and the International Training and Education Center for Health (I-TECH), initiated the HIV/AIDS National Distance Learning Seminar Series (NDLS) in September 2010 to support to National AIDS Control Organisation (NACO). The series is aimed at HCP treating HIV/AIDS in Anti-Retroviral Treatment (ART) centers and other government and private institutions. Experts from across the country deal with a variety of topics on advanced care, comprehensive management, and treatment via synchronous live sessions across several states and districts in India using Adobe Connect software. These bi-monthly 60-minute sessions are conducted in English. Participant feedback is collected after each session through e-poll. Access to archived sessions via streaming video link is also made available. I-TECH India along with NACO manages the entire process including identifying current and relevant topics, speakers, development of slides, and technical support to deliver the sessions.

**Lessons learned:** From September 2010 to December 2015, 112 NDLS sessions were attended by 17,423 HCP from across the country. On average, 830 HCP, most from 395 ART centres, participate in each session. Over 90% of the participants continue to find the sessions and its content 'useful', when asked over e-poll. The sessions were also watched through 2000 logins in offline mode, reflecting that the distance seminars were perceived as useful by the end users.

**Conclusions/Next steps:** NDLS allows health care professionals to continue to work at their health facilities while they enhance their competencies, though it cannot be a replacement for conventional trainings. Distance learning offers an attractive mechanism for ongoing program and clinical mentoring while alleviating expenditures on travel, accommodation and per diem, thereby reducing the burden of growing expenses on health programmes.

## WEPEE568

### FAST-TRACKING A COMPREHENSIVE, INTEGRATED AND SUSTAINABLE RESPONSE TO HIV AMONG PEOPLE WHO INJECT DRUGS IN UKRAINE

S. Rudyi[1], Z. Kosmukhamedova[2], N. Salabai[1]

*[1]United Nations Office on Drugs and Crime, HIV/AIDS Section, Kiyiv, Ukraine, [2]United Nations Office on Drugs and Crimes, HIV/AIDS Section, Vienna, Austria*

*Presenting author email: sergii.rudyi@unodc.org*

**Background:** Ukraine is facing second severe HIV epidemics in Europe, with an estimated 218,000 people living with HIV. People who inject drugs remain most affected by the epidemic. There are 331,000 people who inject drugs estimated in Ukraine, 85,000 of them are women, with HIV prevalence is 19.7%. The country acknowledges the challenges they face. With support of the UNODC project, the country established three pilot networks of drug dependence treatment clinics (DDT) in Poltava, Kiev, and Kharkiv. The integrated drug and HIV services were exactly tailored for the needs of people who use drugs (PWUD). The project was implemented one year during the period of June 2014 -July 2015.

**Description:** The project provided opportunity to integrate the evidence informed and gender and human rights based HIV services based on the "one-window approach". That was achieved through developed standard of treatment procedures (SOP) for HIV testing and counselling, antiretroviral treatment, TB and STI screening, opioid substitution treatment in three DDT. The project helped to build a strong mutisectoral partnership between local administration, health and NGO service providers. Based on the capacity and needs assessment of medical staff and NGO to provide high quality and human rights based HIV services, UNODC built capacity for medical staffs and selected local CSOs. The coordination mechanism of AIDS, TB, STI services and NGO service providers was developed in closed collaboration with the municipal authorities. The schemes of integrated services are sustained and require no additional funds in future.

**Lessons learned:** The pilot schemes have showed improved diagnostic of HIV, TB and STI, guaranteed referral to AIDS clinic for engagement in treatment, and increased confidence of PWID to DDT. Over 2300 clients were reached with comprehensive and gender responsive HIV prevention and treatment services, which is 3 times higher than before in all three pilot localities. Thus, male clients reached by services were: Kiev-388, Poltava-888, and Kharkiv - 479 people. The number of women who use drugs and reached by services were 563.
**Conclusions/Next steps:** Sharing this experience over the country will allow to fast-track the comprehensive, integrated and sustainable response to HIV among people who inject drugs in Ukraine.

## WEPEE569

### EMPOWERING LAY COUNSELORS WITH TECHNOLOGY: MASIVUKENI, A STANDARDIZED MULTIMEDIA COUNSELING SUPPORT TOOL TO DELIVER ART COUNSELING

H. Gouse[1], R. Robbins[2], C. Mellins[2], A. Pearson[3], A. Kingon[3], M. Henry[1], J. Rowe[3], D. Stein[1], R. Remien[3], J. Joska[1]
*[1]University of Cape Town, Psychiatry and Mental Health, Cape Town, South Africa, [2]New York State Psychiatric Institute and Columbia University, Psychiatry, New York, United States, [3]Columbia University, Center for Teaching and Learning, New York, United States*
*Presenting author email: hetta.gouse@uct.ac.za*

**Background:** South Africa (SA) has 6.3 million people living with HIV, and 4.68 million eligible for antiretroviral treatment (ART). Under current SA ART guidelines all patients with a CD4 count ≤500 are initiated on ART, with the expectation that it will soon be extended to all HIV-positive people. There is a gap between HIV-related treatment needs and health staff resources. Task shifting, delegating tasks to less specialized health care workers, has been used successfully to bridge this gap in many low-to-middle-income countries, with lay counselors successfully administering ART counselling. There are however challenges, including varying education levels and skills of counselors, non-standard implementation of counseling, and variabilty in clinic support and capacity for counselor supervision.
**Description:** Masivukeni is an easy-to-use, multimedia laptop-based platform to engage counselors with patients in the delivery of ART adherence counseling. Masivukeni provides counselors with scaffolding to deliver standardized ART counseling. Tool use training is brief and previous computer experience is not a prerequisite. The platform ensures consistent administration of counseling curriculum and that all critical health information and messaging is delivered. Masivukeni engages counselors and patients through interactive tasks and videos that address complex biological processes (e.g., how CD4 count and viral load affect health). Masivukeni's back-end design captures the length of time counselors spent on each activity, and which sessions and activities were completed - allowing for continuous quality assurance supervision.
**Lessons learned:** Through Masivukeni counselor interviews and a focus group, we learned that counselors found the platform's scaffolding helpful (i.e., keeping them on track with the curriculum), and increased their confidence in delivering complex health information. The counselors also reported that using the videos and interactive tasks enhanced their relationships with patients. Because the tool can easily retrieve data on previous counseling sessions when a patient returns to the clinic for further treatment, counselors reported that this fostered improved patient-counselor relationships. Importantly, counselors felt Masivukeni empowered them to provide high quality counseling to patients. Counselors reported that session length could be shortened.
**Conclusions/Next steps:** The next anticipated step is implementation and dissemination in partnership with clinics across health districts measuring counselor performances, patient engagement, and patient health outcomes.

## WEPEE570

### BUILDING DISTRICT-LEVEL CAPACITY FOR HIV SURVEILLANCE AND LOCALIZATION OF HIV PREVENTION PROGRAMS: A CASE OF PLACE UGANDA

S. Babirye[1], S. Ssendagire[1], M. Nattimba[2], S. Kasasa[3], L. Atuyambe[4], F. Ssengooba[1]
*[1]Makerere University School of Public Health, Health Policy, Planning and Management, Kampala, Uganda, [2]Makerere College of Health Sciences, Communications, Kampala, Uganda, [3]Makerere University School of Public Health, Epidemiology and Biostatistics, Kampala, Uganda, [4]Makerere University School of Public Health, Community Health, Kampala, Uganda*
*Presenting author email: babiryes2004@gmail.com*

**Background:** To improve prevention interventions, a better understanding of the determinants of HIV infection is required. Despite this, local governments often lack local evidence to tailor their HIV prevention efforts to the local drivers and key populations. The purpose of Priority for Local AIDS Control Efforts (PLACE) Uganda was to build district-level capacity for HIV surveillance and use of local evidence for HIV prevention planning.
**Description:** Using the Priority for Local AIDS Control Efforts (PLACE) research methodology http://www.cpc.unc.edu/measure/resources/publications/ms-05-13 , district-based teams were trained in conducting PLACE rapid assessments as a means of building their capacity to generate local data to inform HIV prevention programming. The training and district surveys were conducted in 30 districts of Uganda between 2013 and 2014 and the data generated was used to develop district HIV prevention plans. The process also involved a systematic engagement of national and district level HIV/AIDS stakeholders. The engagement processes were hypothesized to democratize participation in learning about HIV prevention gaps and strengthen collaborative learning, generate a common vision for district HIV prevention and to strengthen distributed actions for district HIV program implementation.
**Lessons learned:** Capacity building and PLACE assessments generate information on priority groups and social venues for prevention interventions within districts. On the other hand, stakeholder engagement meetings were useful avenues for broadening the discussions about the prevailing HIV prevention gaps and utilization of findings for HIV prevention planning. Although there was vast participation and collaboration among district actors, the challenge remains for districts to put in use the capacity (trained teams) to routinely HIV prevention planning. The decision space for district-level actors is relatively small due to less flexible financial resources.
**Conclusions/Next steps:** PLACE is a rapid, cost-effective methodology well suited to empower lower level governments with capacity to generate contextually relevant HIV prevention indicators - often not available to support programming and monitoring of district-level programs.

## WEPEE571

### THE INCREMENTAL EFFECT OF CLINICAL ATTACHMENT AND CLINICAL MENTORSHIP ON NURSES' CONFIDENCE IN ART INITIATION: AN ELIZABETH GLASER PEDIATRIC AIDS FOUNDATION-SUPPORTED CAPACITY BUILDING PROGRAM FOR NURSES IN ZIMBABWE, 2015

A. Muchedzi[1], R. Musarandega[1], B. Mutede[1], A. Chadambuka[2], E. Tachiwenyika[1], C. Muchuchuti[1], T. Nyamundaya[1], C. Zinyemba[1], A. Mahomva[1]
*[1]Elizabeth Glaser Paediatric AIDS Foundation, Harare, Zimbabwe, [2]Elizabeth Glaser Paediatric AIDS Foundation, Operations Research, Harare, Zimbabwe*
*Presenting author email: achadambuka@pedaids.org*

**Background:** EGPAF provides technical support to the Ministry of Health and Child Care (MOHCC) for the implementation of HIV programs in Zimbabwe. From January 2013 to March 2014, EGPAF conducted a capacity building program (CCP) including clinical-attachment and clinical-mentorship involving 414 nurses in 207 health facilities across seven provinces to address lack of confidence, a barrier to ART initiation among nurses.
**Methods:** An analytical cross-sectional study was conducted in 56 multistage-randomly-sampled sites of the mentorship program. Semi-structured interviews were conducted with nurse-mentees to determine changes in confidence and ability to manage HIV-infected pregnant women including ART initiations at pre, during and post-CCP. The CCP included a 2 week clinical-attachment at an ART initiating site and at least 6 on site clinical-mentorship sessions, including ART initiation, with an accredited clinical mentor. Confidence in performing 15 aspects of HIV management was measured through three-point-Likert scales (1=not confident; 2=not sure 3=confident). The proportion of HIV-infected pregnant women initiated on ART by the mentees in the pre, during and post-CCP periods was obtained from facility registers. Data were analyzed using Epi-Info-7.0. This study has ethical approval.
**Results:** Overall, 98 nurse-mentees were interviewed, all of whom had received at least one didactic HIV management training prior to the CCP. Overall HIV management competencies and confidence of nurse mentees significantly increased between the pre, during and the post-CCP[p value=< 0.01 in all cases]. The mean-score for confidence in performing the 15 aspects for HIV management increased with each additional capacity building component of ART training. Didactic training alone was 1.97; didactic training and clinical-attachment was 2.61; and didactic training, clinical-attachment, and clinical-mentorship was 3.00. ART initiation at the participating sites increased from 193(6.2%) before to 758(30.3%)[p=< 0.01] during the CCP. The change of guidelines to initiate all HIV-infected pregnant women on ART occurred in the interim and the nurses were able to initiate 2091(99.6 %) post CCP-[p value=< 0.01].
**Conclusions:** Nurse confidence to initiate ART increased significantly during the implementation of a clinical-mentorship and attachment program. Implementation of a nurse mentorship program can be an effective strategy to increase ART initiation in HIV-infected pregnant women towards ending AIDS by 2030.

### INTEGRATION OF HIV PREVENTION AND SEXUAL REPRODUCTIVE HEALTH SERVICES USING A QUALITY IMPROVEMENT INTERVENTION: EXPERIENCES FROM RURAL KWAZULU-NATAL, SOUTH AFRICA

N. Ngcobo[1], L. Mansoor[1], S. Mkhize[2], C. Montague[1], M. Tshabalala[3], S. Abdool Karim[1], Q. Abdool Karim[1]
*[1]CAPRISA, Research, Durban, South Africa, [2]Mafakatini Clinic, Department of Health, Pietermartzburg, South Africa, [3]IHI, Quality Improvement, Johannesburg, South Africa*

**Background:** As HIV prevention methods are being developed, there is an urgent need to strengthen sexual and reproductive health (SRH) services at primary healthcare (PHC) clinics to facilitate integration of pre-exposure prophylaxis (PrEP).
**Description:** Between September 2012 and February 2014 CAPRISA collaborated with the Mafakatini PHC clinic in rural KwaZulu-Natal, South Africa to strengthen SRH services and integrate tenofovir gel as PrEP for CAPRISA 008 participants, using a quality improvement model. Process mapping was undertaken with clinic staff. Visit flow systems and documentation were reviewed allowing gaps and system weaknesses to be identified. Client demographic profiles, services accessed, adequacy of provider skills and data collation/analysis were also reviewed. Clinic cards were used to document client arrival and departure times. The following priority goals were identified: 1) reduce waiting times; 2) increase number of clients accessing SRH services, and 3) every nurse to perform at least one Pap smear daily. Nurses were trained to provide a comprehensive package of services including: vital sign assessment, pregnancy testing, Pap smears, SRH method-mix discussion and HIV counselling and testing. Targets were set in accordance with Department of Health guidelines and progress was monitored monthly.
**Lessons learned:** Outcomes of the programme include:
· Reduction in SRH client waiting time from >3 hours to < 1 hour.
· Increase in average number of clients (222 in November 2012 to 345 in January 2015) utilizing SRH services per month
· Increase in Pap smears completed from a median of 5 to 35 per month.
· Increase in HIV test uptake from an average of 50% to 98% of eligible women, and maintenance above 88% per month.
· Provision of PrEP as part of SRH services was feasible and acceptable, with no negative impact on the provision of SRH services.
**Conclusions/Next steps:** Through the quality improvement model, the Mafakatini PHC clinic was able to improve documentation, reduce waiting times, expand SRH services and increase uptake of HIV counseling and testing. Scaling up SRH services for women at PHC clinics in South Africa allows for integrated service delivery and creates an environment for introducing a variety of multi-purpose HIV-prevention options for women.

## WEPEE573

### IMPLEMENTATION OF HIV AND AIDS PROGRAMMES IN THE HIGHER EDUCATION AND TRAINING SECTOR IN SOUTH AFRICA: BEST PRACTICES REFLECTED IN USING THE GLOBAL FUND GRANT SYSTEM

S. Sithole[1], R. Ahluwalia[2], A. Semba[2], M. Devos[3]
*[1]Universities South Africa, Higher Education HIV/AIDS Programme (HEAIDS), Pretoria, South Africa, [2]Universities South Africa, HEAIDS, Pretoria, South Africa, [3]NACOSA, Cape Town, South Africa*
*Presenting author email: sinikiwe@universitiessa.ac.za*

**Background:** The Higher Education and Training HIV and AIDS (HEAIDS) is the flagship HIV prevention programme of South Africa's National Department of Higher Education and Training (DHET). In 2013, HEAIDS was awarded a Global Fund Grant to strengthen the public universities'' responses to HIV, STIs/TB and general health and wellness services.
**Description:** This two-year grant was awarded to 23 Higher Education Institutions (HEIs) across South Africa. There were 6 priority areas which were key to granting the awards. These included universities ability to implement these programmes: HIV Counselling and Testing (HCT), Women Health Empowerment, Men Health Empowerment, Alcohol and Drug Abuse Prevention, Stigma and Discrimination & capacity building for TVETs.
**Lessons learned:** Of the 23 HEIs awarded the grant, 15 had successfully managed the grant in compliance with the Global Fund performance based requirements and the HEAIDS grant management systems. Successful management resulted in a 27% increase in the uptake of HIV testing. HEIs were able to provide testing for HIV and screening for STIs and TB, which saw an increase (63%) in the number of HIV campaigns. The sector had an opportunity to provide comprehensive package of health and wellness services for combination prevention, management, care and support. Increased partnerships with key stakeholders bringing services to the door steps of students and. A strengthened collaboration between the different, implementing partners and health stakeholders. Further to the successes, challenges were experienced such as late donor reporting processes and lack of synergy between programmatic and financial management systems.
**Conclusions/Next steps:** Stakeholder buy-in and support for grant and health care programmes by university leadership & stakeholders is vital to ensure that the grant holders perform well with their given mandate. The grants played a vital role in complementing existing HIV prevention, management, care and support programmes. Further resource mobilisation and allocation to the sector is supported.

## WEPEE574

### COLLABORATIVE PROCEDURE BETWEEN JANSSEN, WHO, EMA AND NATIONAL MEDICINES REGULATORY AUTHORITIES (NMRAS) FOR ACCELERATED REGISTRATION: EXPERIENCE FROM PILOT OF HIV DRUG IN AFRICA

M. Caturla[1], M. Smid[2]
*[1]Janssen Pharmaceutica NV, Global Regulatory Affairs / Global Public Health, Beerse, Belgium, [2]World Health Organization, Prequalification (PQT), Regulation of Medicines and other Health Technologies (RHT), Department of Essential Medicines and Health Products (EMP), Geneva, Switzerland*
*Presenting author email: mcaturla@its.jnj.com*

**Background:** Currently in Africa, it can take from six months to more than five years to register new medicines. To improve access to needed medicines, WHO together with the International Federation of Pharmaceutical Manufacturers & Associations (IFPMA) and interested NMRAs in Africa has put in place a pilot procedure by which national registration is targeted within 3 months of application. INTELENCE®, an HIV medicine from Janssen, was the first drug selected to be registered by this pilot procedure. This new procedure is an important development in the effort to accelerate access to medicines in Africa.
**Methods:** The piloted procedure is applicable to medicines approved by a Stringent Regulatory Authority (SRA), such as the European Medicines Agency (EMA). Full EMA assessment and site inspection reports are shared with the NMRAs. NMRAs benefit from EMA regulatory expertise and perform an accelerated review based on an adapted dossier and strive to provide approval within 3 months. WHO's role is to facilitate the process between all parties.
**Results:** 11 African countries participated in the first pilot with the pediatric INTELENCE® 25 mg tablet. Within a total time of 3-11 months, 8 countries received regulatory approval, which included time to respond to NMRAs questions. This result for the pilot is highly encouraging; with further refinement of the procedure, shorter timelines are targeted.
Factors that facilitated swifter reviews and approvals include: adopting a common dossier for all countries, one aligned set of health authorities questions; reliance on EMA assessment and site inspection reports, managing dossier reviews parallel with other processes. All these helped reducing the workload and resources needed from both NMRAs involved and Janssen. The generated experience was useful to streamline the next rounds of the pilot.
**Conclusions:** The success of this pilot demonstrates that accelerated registration procedures in Africa are possible. Thanks to this collaborative approach and effective information sharing between all involved parties, this procedure may become a useful tool to expedite access to SRA approved medicines for patients in need.

## WEPEE575

### ENHANCING MANAGEMENT AND GOVERNANCE AT REGIONAL AND LOCAL LEVEL TO REDUCE HEALTH FACILITY ARV STOCK-OUTS IN CAMEROON

G.T. Mumbari[1], B. Tarrafeta[1], C. Tadzong-Mentou[1], A. Kane[1], J.B. Elat[2]
*[1]Management Sciences for Health, Yaounde, Cameroon, [2]National AIDS Control Committee, Yaounde, Cameroon*
*Presenting author email: gmumbari@msh.org*

**Background:** In 2012, due to chronic antiretroviral medicines (ARV) shortages, health facilities (HF) in Cameroon issued on average only 10 days of ARVs to patients instead of a month's supply, necessitating more frequent visits and regimen changes to avoid treatment interruptions. After two years of technical assistance provided by the USAID-funded Systems for Improved Access to Pharmaceuticals and Services (SIAPS) program to improve forecasting, stock-outs at central level were eradicated for the six most used ARVs. Yet, the stock-outs persisted at HFs.
**Description:** Trainings provided by SIAPS on ARV management to dispensers and storekeepers at HFs and regional medical stores (RMS), along with centrally-organized quarterly supervisions in 104 priority HFs, yielded some improvements in stock availability., In December 2014, however, 41% of HFs still experienced stock-outs of six commonly used ARVs. In 2015, SIAPS seconded technical advisors to four RMS to build local capacity to manage the medicines. Through a continuous quality

improvement methodology, HIV program HF coordinators and regional managers were empowered to fulfill their leadership role and capacitated to interpret key logistics indicators, and use adapted supervision tools to help identify root causes of problems, agree on improvement interventions, and monitor results.
**Lessons learned:** Six most-prescribed ARVs were used to monitor the percentage of HF Experiencing Stock-Outs (HFESO). The decrease from 100% HFESO in January to 53% in July 2014 could be attributed to central stock availability improvements. By December 2014, although the overall percentage HFESO fell to 41%, facility stock-outs actually increased for four tracer ARVs. After the intervention in 2015, health facility stock-outs of all tracer ARVs decreased and HFESO dropped substantially to 18% by September 2015. This achievement was in part attributed to adapting the technical assistance provided by SIAPS seconded staff, to the different backgrounds and perceived competence gaps of HF coordinators and regional managers.
**Conclusions/Next steps:** In Cameroon, in addition to training and supervision, fostering management capacities of HIV local authorities is associated with reductions of HF ARVs stock-outs. These results can inform government strategy to plan sufficient allocation of human and financial resources to expand similar interventions in the rest of the country.

## WEPEE576

### IMPROVING ODDS OF SUCCESS: USING A COMMUNITY CAPACITY CHECKLIST TO IDENTIFY COMMUNITY GROUPS MOST LIKELY TO BENEFIT FROM CAPACITY BUILDING SUPPORT

D. Kemps, C. Davies, E. Miller
*ViiV Healthcare, Brentford, United Kingdom*
*Presenting author email: dominic.x.kemps@viivhealthcare.com*

**Background:** 'Building capacity' is overused jargon in development, yet its purpose is essential to ensure resources are optimised. However, not all groups benefit equally from capacity building support; through the PACF capacity building programme we have identified six characteristics which contribute to strong likelihood of capacity building programme success: deep understanding of local context, willingness to learn (including accepting external criticism and direction), focused programming objectives, accountable and communicative, sufficient organisational capacity to receive technical assistance and local credibility (either intrinsic or earned) to build relationships at a local level with health staff and district officials.
**Description:** The PACF review proposals based on the merit of each proposal. Following three rounds of internal and board review, CBOs are selected for funding. Small grantees with grants under £25,000 per year are automatically considered for capacity building support. A review of the partners within the technical assistance programme over 5 years, has identified over 120 community groups that were eligible for capacity building support in that time with 80 receiving technical assistance. Of those receiving technical assistance 70% (56) have performed well above expectations, 20 have seen little change in performance and eight groups have been unwilling or unable to take advantage of the capacity building support.
**Lessons learned:** PACF feedback from TA providers, in addition to the knowledge developed from management of grantee relationships have identified six needs in community capacity building: 1. Deep understanding of local context which gives each group a comparative advantage. 2. Willingness to learn and particularly the ability to take outside direction based on external best practice. 3. The ability and willingness to focus programming objectives and not try to address every issue in the community 4. Accountable and communicative in meeting requirements of funding/capacity building. 5. Sufficient organisational capacity to apply technical assistance in operations and (6.) local credibility (either intrinsic or earned) to build relationships at a local level with health staff and district officials.
**Conclusions/Next steps:** On the basis of the 6 characteristics for capacity building success, the PACF has developed a checklist for funders and capacity builders to identify organisations that will benefit from capacity building support.

## WEPEE577

### BRIDGING THE GAP IN IMPLEMENTATION SCIENCE: EVALUATING A CAPACITY BUILDING PROGRAM IN DATA MANAGEMENT, DISSEMINATION AND UTILIZATION AMONG HEALTH CARE PROVIDERS IN EAST AFRICA

P. Memiah[1], J. Mbizo[1], A. Igomu[2], C. Kingori[3], W. Mwangi[4], A. Hill[1], A. Phillips[1], C. Swain[1], J. Penner[5], K. Owour[6]
*[1]University of West Florida, Pensacola, United States, [2]Morgan State University School of Community Health and Policy, Department of Public Health Analysis, Baltimore, United States, [3]Ohio University, Social and Public Health, Athens, United States, [4]University of North Carolina, Charlotte, United States, [5]University of British Columbia, British Columbia, Canada, [6]USAID- FIRM Project, Nairobi, Kenya*
*Presenting author email: pmemiah@gmail.com*

**Background:** Building capacity in implementation science within health programs depends on several variables, including training in the theory and practice of basic research methods, epidemiology and statistical skills, continuing education experiences such as self-study and workshops, and high self-efficacy toward applying lessons learned to completing an abstract or a manuscript. Using these concepts, the purpose of our study was to determine the impact of training on building program capacity and self-efficacy on data management, analysis and dissemination among Health Care Professionals providing technical assistance to over 200 health facilities in Kenya and Tanzania.
**Description:** The specific questions were to determine if
1) the training changed participants' self-efficacy in regard to data analysis and understanding concepts and
2) if participants applied skills taught during the workshop for scientific dissemination .The training was conducted in three staggered sessions
1) concept development and manuscript outline
2) data analysis - basic concepts in research
3) manuscript writing and finalization.
Two months prior to the training (*N*=86) were emailed a pre-test for planning the content of the workshop. Twenty-four questions were asked using a Likert-type response. Questions included knowledge on data concepts eg "how confident are you in ___". Two months after the training a post-test survey was emailed to all participants (*N*=84). Qualitative data was also collected as part of the post-test survey.
**Lessons learned:** Post-test survey revealed that the participants had confidence in their ability to understand data analysis (collect, analyze, and report data);the survey results were significantly different from the pre-test results (0.05 alpha). The qualitative findings complemented the findings of the impact of the workshop. The participants reported that the workshop reinforced their abilities in different skills including logic modeling, writing effective questions, collecting quantitative and qualitative data, reading journals, reporting results, using scientific writing in reporting outcomes.
**Conclusions/Next steps:** While increasing self-efficacy is a necessary first step in developing skills educators should engage in continuing education for sustainable dissemination practices. There is an urgent need to determine the current infrastructure to promote scientific dissemination. This will assist countries to produce better evidence to support their programs, policies and overall health programs.

## WEPEE578

### INCREASING HCV ACCESS THROUGH CLINICAL EDUCATION: MEDICAL PROVIDER KNOWLEDGE AND PRACTICE CHANGE INTENTIONS

N. Harris[1], T. Wilder[1], K. McKinnon[2], S.H. Kim[2], A. Urbina[1]
*[1]Mount Sinai Health System, Mount Sinai Institute for Advanced Medicine, New York, United States, [2]Columbia University, College of Physicians and Surgeons, New York, United States*
*Presenting author email: naoharris@chpnet.org*

**Background:** Approximately 3.2 million people are living with Hepatitis C (HCV) in the US. However, nearly three-quarters of these people don't know they are infected. Recent advances in treatment have made HCV curable in most patients. While there is no reason to delay HCV treatment, a significant shortage of clinicians trained to diagnose and treat HCV has impacted patient access.
**Methods:** From July 2014 - December 2015, the Mt. Sinai Institute for Advanced Medicine provided HCV clinical trainings throughout New York State. Content included epidemiology, health policies, testing, and treatment updates. Trainees completed an anonymous survey eliciting (i) intentions to use knowledge/skills in clinical practice following the training (primary outcome) and (ii) level of knowledge of the training content before and after the training (5 levels from Novice to Expert). Analyses were restricted to physicians, nurse practitioners, advanced nurse practitioners, nurses, and pharmacists. Changes in knowledge levels after training were examined by paired t test. Associations with primary outcome were examined using Chi-squared tests for participant knowledge/skills and practice change intentions.

Author Index

**Results:** In total, 548 clinicians were trained. Nearly half (49.4%) were "novice" or "not very knowledgeable" before attending the training. After attending, the majority of attendees indicated being "knowledgeable" (58.9%) or "very knowledgeable" (33.1%). Over 40% planned to use the knowledge/ skills learned in their practice setting. Key changes included create/revise protocols, procedures, and patient management. Less than one-third (29.3%) wouldn't implement practice change due to training content validating their current practices. Knowledge change was significantly associated with practice change intentions (chi-square=40.48, df=4, p=0.000).
**Conclusions:** There is great interest among clinicians, especially those who treat HIV, to stay abreast of HCV treatment. While training increased knowledge, ongoing evaluation of actual clinical practice change and patient outcomes is recommended. Implementing HCV treatment protocols may require other stakeholders, such as clinic leadership, to be aware of new advances. Educational resources on HCV testing and treatment implementation barriers (e.g. treatment costs, infrastructure) may be the next step to increase HCV treatment access.

## WEPEE579

### GOOD PARTICIPATORY PRACTICE APPLICATION: EXPERIENCE OF STAKEHOLDER ENGAGEMENT IN PROTOCOL DEVELOPMENT AT KAVI INSTITUTE OF CLINICAL RESEARCH

J. Ng'ang'a, G. Mutua, M. Muriithi, O. Anzala
*KAVI-Institute of Clinical Research, Nairobi, Kenya*
*Presenting author email: jwairimu@kaviuon.org*

**Background:** Good Participatory Practice (GPP) implementation and Stakeholder engagement is considered key in HIV vaccine research. In preparation for future Phase 3 HIV Vaccine clinical trials, our project conducted a Simulated Vaccine Efficacy Trial to assess the ability to recruit and retain Key Populations in an actual Vaccine study
**Methods:** Study participants were selected from the key population's Community Advisory Board (CAB), National LGBT Research Advisory Committee (G10) peer leaders/educators and staffs to review the protocol for the aforementioned study on 1st and 2nd September 2015. Issues discussed varied from the recruitment and retention strategies, referrals, volunteer protection to end of study.
**Results:** The stakeholders raised issues about health care providers' attitudes which they had experienced in government-run clinics e.g. discrimination and homophobia and feared this would also occur at the study site. There were also study staffs who had never worked with key populations before and they expressed the need for sensitization on how to handle them. Recommendations made included; sensitization for team members and assurance for volunteers' safety and unconditional positive regard. Team members were sensitized and had an exchange program to familiarize themselves with key populations and security training was conducted with more recommendations arising which are in the process of implementation.
**Conclusions:** Having implemented the stakeholders' recommendations, the study commenced smoothly. This was an eye opener to the study team that stakeholders can give insight to potential issues which need to be nabbed in the bud before a trial commences.

## WEPEE580

### PARTNERING TO FILL BIOMEDICAL ENGINEER AND TECHNICIAN HUMAN RESOURCE GAPS IN ETHIOPIA: PEPFAR'S FIRST BIOMEDICAL TECHNOLOGY TRAINING PROGRAM IN SUB-SAHARAN AFRICA

A.G. Alemu[1], E. Alemayehu[2]
*[1]Addis Ababa Tegbare-id Polytechnic College, Biomedical Engineering, Addis Ababa, Ethiopia, [2]Jimma University, Institute of Technology, Jimma, Ethiopia*
*Presenting author email: getachew.alemu8@gmail.com*

**Background:** Current estimates indicate 37-48% of hematology, CD4, and microbiology lab machines in Ethiopia are not working at any given time. A large proportion of other integral biomedical equipment lies idle in healthcare facilities due to the absence of trained biomedical equipment technicians and engineers. In May 2015, Tegbare-id Polytechnic College conducted an assessment of medical equipment and equipment workshops at five Ethiopian hospitals. It revealed that 14-28% of equipment at these hospitals was not functioning at the time of the survey; workshops conducted limited preventative maintenance; and staff did not fully understand quality improvement practices.
**Description:** To address the critical shortage of trained biomedical engineers and technicians, the American International Health Alliance launched a partnership between Texas Children's Hospital and Rice University in the United States and Jimma University and Tegbare-Id Polytechnic College in 2012. Partners aimed to rapidly train and deploy highly-skilled biomedical engineers and technicians and provide ongoing in-service training for practicing biomedical technology professionals. Ultimately, the partnership's goal is to enhance HIV care and treatment services by decreasing the number of non-working lab machines and other critical HIV-related biomedical equipment. This partnership was the first PEPFAR-supported project to address biomedical technology in sub-Saharan Africa.
**Lessons learned:** Jimma University has graduated 181 biomedical engineers with 91% of them employed at Ethiopian health facilities. Tegbare-Id has graduated 132 biomedical technicians, with 95% similarly employed across the country. Partners conduct an annual survey to determine graduate skill gaps and have thus far provided training to fill said gaps for 181 BME graduates and 35 faculty members. Partners adapted the curricula over time, shifting from a more theoretical approach to problem-based learning, which better prepares graduates to perform required tasks. Faculty in-service training and providing skills laboratories have helped partners better integrate graduates into the healthcare system.
**Conclusions/Next steps:** Partners plan to enhance their advocacy to ensure graduates are fully integrated into the healthcare system. As focus shifts toward defining roles of biomedical engineers and technicians in preventative maintenance and repair, their integration will be essential to the long-term sustainability of the training program and provision of quality HIV-related services.

## WEPEE581

### A COOPERATIVE PROJECT BETWEEN THE SPANISH MINISTRY OF HEALTH AND THE SPANISH SOCIETY FOR PEDIATRIC INFECTIOUS DISEASES: THE ESTHER-SPAIN PROJECT FOR TRAINING IN PEDIATRIC HIV INFECTION IN RESOURCE LIMITED SETTINGS

T. Sainz[1], M.L. Navarro[2], L. Prieto[3], A. Holguin[4], J.T. Ramos[5], T. Noguera[6], P. Rojo[7], J. Couceiro[8], D. Moreno[9], R. Polo[10], M.J. Mellado[11], on behalf of CoRISpe (Spanish Network for HIV Infected Children and Adolescents) and the ESTHER-Spain Project
*[1]La Paz University Hospital and IdiPAZ, Pediatrics, Madrid, Spain, [2]HGU Gregorio Marañon, Madrid, Spain, [3]Hospital de Getafe, Madrid, Spain, [4]Hospital Universitario Ramon y Cajal, Madrid, Spain, [5]Hospital Clinico San Carlos, Madrid, Spain, [6]Hospital Sant Joan de Deu, Barcelona, Spain, [7]Hospital 12 de Octubre, Madrid, Spain, [8]Complejo Hospitalario de Pontevedra, Pontevedra, Spain, [9]Hospital de Málaga, Malaga, Spain, [10]Spanish Ministry of Health and Innovation, Madrid, Spain, [11]La Paz University Hospital, Madrid, Spain*
*Presenting author email: tsainzcosta@gmail.com*

**Background:** The ESTHER- Spain project was launched in 2007 as a collaborative initiative between the Spanish Ministry of Health and the Spanish Society for Pediatric Infectious Diseases (SEIP), integrated into the European ESTHER initiative. The main objective was to offer training in management of pediatric HIV infection to pediatricians in resource-limited-settings.
**Description:** The ESTHER- Spain project allowed to launch seven training teams, all of them including a Specialist in Pediatric Infectious Diseases, who travelled to different countries in Latin America in order to offer theoretical and practical training in secondary and tertiary care hospitals. Trainees would then complete their formation during a stay at the participating Spanish Hospitals. Simultaneously, an online Master degree was started and offered for free for all professionals, in collaboration with Rey Juan Carlos I University.
**Lessons learned:** To date, three editions of onsite training courses have taken place in each of the seven participating countries between 2007-2011. In 2011, 461 professionals attended the onsite courses, and 18 completed the trainer of trainers course. From 2009, the Master degree for distance learning is ongoing, with 1800 teaching hours including theory lessons, case rounds and a Research Project and Masters dissertation, with a mean of 180 students per year. On top of improving clinical management, the ESTHER initiative has generated a network of local trainers, has launched the creation of National Cohorts of HIV-infected children in many countries, and has pushed forward the implementation of PMTCT and National Guidelines.
**Conclusions/Next steps:** The ESTHER- Spain collaborative project has significantly improved the training of pediatricians in Latin America, decreasing MTCT and improving the management of ART and opportunistic infections. Training strategies in resource-limited-settings should be a priority for Medical Societies and European Institutions.

## WEPEE582

### LEVERAGING ONLINE CONTINUING EDUCATION TRAININGS TO IMPROVE NURSING AND MIDWIFERY HIV CARE DELIVERY IN AFRICA

K. Hosey[1,2], A. Kalula[3], J. Voss[1,4]
*[1]Afya Bora Consortium, University of Washington, Department of Global Health, Seattle, United States, [2]School of Nursing, University of Washington, Psychosocial and Community Health, Seattle, United States, [3]East, Central and Southern Africa College of Nursing, Arusha, Tanzania, United Republic of, [4]Case Western Reserve University, Cleveland, United States*

**Background:** The East, Central and Southern Africa College of Nursing (ECSACON) has been collaborating with the Afya Bora Consortium and the African Health Profession Regulatory Collaborative for Nurses and Midwives (ARC) to address the identified need for increased access to continuing and professional development (CPD) trainings for nurses and midwives in sub-Saharan Africa. With the support of ARC, 8 countries have developed national frameworks and requirements for CPD trainings by nurses and midwives in the last five years alone. To address this training gap an online CPD library was developed and launched to support national re-licensure requirements and to increase access to timely trainings for the over 300,000 nurses and midwives in the region.
**Description:** In a previous study we analyze a survey of nursing and midwifery leaders from 17 countries, and HIV topics were identified for inclusion into the CPD library. Modules were reviewed by experts in the region, approved and then added to the website. These modules provide a certificate of completion that can be presented for re-licensure purposes to nursing councils with the support of 15 nursing registrars of east, central and southern African nations. A monitoring and evaluation framework was incorporated into this library to track barriers and usage patterns of each training module that includes Google Analytics and online surveys of user satisfaction.
This presentation will provide a snapshot of the CPD library utilization by nurses and midwives since the website launch.
**Lessons learned:** There is a continued interest by nurses and midwives in the region for CPD trainings, but challenges exist in accessing in-person trainings. Online, mobile-friendly training is a stated need. However, sustainable funding has been a challenge, creating some delays in implementation and data collection on the effectiveness of this library as a capacity building intervention.
**Conclusions/Next steps:** Additional HIV modules will need to be added to the CPD library in order to support the over 300,000 nurses in the ECSA region. Sustainable funding will go a long way in ensuring continued use of this library and uptake of the most current information on HIV care.

# TRANSLATION, INCORPORATION AND USE OF KEY IMPLEMENTATION RESEARCH FINDINGS INTO PROGRAMMES AND PRACTICE

## WEPEE583

### REMOVAL OF USER FEES IMPROVED ACCESS TO QUALITY MATERNITY CARE AND DECREASED MATERNAL AND NEONATAL MORTALITY IN A DISTRICT HOSPITAL, LESOTHO

A. Shroufi, S. Sedlimaier, A. Mews, M. Kuleile, A. Aurore, G. Van Cutsem
*Médecins Sans Frontières, Cape Town, South Africa*
*Presenting author email: msfocb-capetown-hom@brussels.msf.urg*

**Background:** Lesotho has one of the highest maternal mortality rates in the world due to HIV and poor access to skilled maternal health services. Hospital fees for delivery cost represent a major barrier to maternal health service utilization. This study aims to examine the uptakes of obstetric services following introduction of Free Maternal Care (FMC) in a district hospital in Lesotho, a setting where up to 60% of maternal deaths are associated with HIV.
**Description:** A before and after study of the utilization of delivery services from July 2012 to December 2013 (pre FMC) compared with utilization during the period January 2014 to June 2015 (post FMC introduction). Information on baseline characteristics, deliveries, obstetric outcomes and referrals was collected from maternity registers. Proportions and stillbirth, maternal and neonatal mortality rates are compared before and after introduction of FMC.
**Lessons learned:** A total of 3782 women delivered during the study period, of whom 684 (18%) were less than 19 years old. HIV prevalence was 23.7%. After the introduction of FMC, the number of hospital deliveries increased by 55% (from 1484 to 2298). Referrals from primary care clinics doubled (from 38 to 79) and referrals from secondary to tertiary hospital increased 5-fold (from 5 to 27). Maternal mortality ratios, neonatal death rates and stillbirth rates dropped respectively from 146 to 89/100,000, 5.1 to 1.3/100,000 and 26 to 19/100,000 live births.
**Conclusions/Next steps:** Introduction of Free Maternity Care resulted in a 55% increase in hospital based deliveries, as well as increases in referral rates and a drop in maternal, neonatal and stillbirth rates. Hospital fees for maternal care in Lesotho are a barrier to accessing skilled birth attendants and should be urgently removed.

## WEPEE584

### HOW DOES PATIENT MOBILITY, INCLUDING MIGRATION AND MEDICAL TRAVEL INFLUENCE HIV TREATMENT AND CARE?

C.M. Chetty-Makkan[1], S. Charalambous[1,2], S. Shezi[1], N. Africa[1], H.L. Walls[3,4], J. Vearey[4], R. Walker[4], T. de Gruchy[4], T. Makandwa[4], S. Mahati[4], D. Ndlovu[4], D. Lakika[4], J. Hanefeld[3,4]
*[1]The Aurum Institute, Research, Gauteng, South Africa, [2]School of Public Health, University of Witwatersrand, Johannesburg, South Africa, [3]London School of Hygiene and Tropical Medicine, London, United Kingdom, [4]African Centre for Migration & Society, University of the Witwatersrand, Johannesburg, South Africa*
*Presenting author email: cchetty@auruminstitute.org*

**Background:** While levels of patient mobility, including medical travel and migration are increasing, little is known about how mobility affects access to services and health outcomes of mobile patients. Findings presented are from a wider study which focused on health and health systems effects of medical travel in South Africa.
**Methods:** Data collection took place in 2015 from six clinic facilities based in peri-urban and rural areas. A facility questionnaire (staff workload, essential services, pathways of care, referral and integration, adherence management and challenges) was administered to a clinic designee. Health outcomes for 2014 were accessed from the department of health's Electronic Tuberculosis Register (ETR) and District Health Integration Services (DHIS) systems. In-depth interviews were conducted with 77 staff. Descriptive statistics and thematic analysis were undertaken.
**Results:** While data varied between settings, trends in access to care and overall indicators of health systems performance were similar between facilities that had high volume of nationals versus non-nationals. However, clinic managers reported varied pathways of care for HIV treatment in nationals and non-nationals. From their perspective, lower adherence in nationals was due to work responsibilities, late arrival for clinic appointments, delayed start or completion of treatment and increased time spent at the clinic caused by staff shortages. In contrast they reported that while non-nationals appeared lost to follow-up, this was often due to them moving between facilities in search for 'better' or more easily accessible treatment, or other external factors. Concerns relating to HIV treatment in this context were not about defaulting or non-adherence rather discontinuation of medical records with lack of documentation on medication taken, raising the prospect of resistance. Other concerns included lack of continuous monitoring and related inability to detect treatment failure.
**Conclusions:** Adherence to treatment is a challenge for facilities with low and high volumes of migrants. Mobility of patients, as medical travellers and internal or cross-border migrants affects HIV treatment adherence and monitoring of patients on antiretroviral treatment. Given high levels of mobility in many HIV endemic settings, such as South Africa, this should be considered in strategies and policies aiming to ensure treatment access for patients.

## WEPEE585

### IDENTIFYING PRIORITIES FOR HIV/AIDS RESEARCH UNDER NATIONAL AIDS CONTROL PROGRAMME IN INDIA

N. Dhingra[1], V. Verma[1], Y. Raj[2], T. Kambli[3], U.M. Jha[1]
*[1]National AIDS Control Organisation, Ministry of Health & Family Welfare, Delhi, India, [2]Independent Consultant, Hyderabad, India, [3]Tata Consultancy Services, Mumbai, India*
*Presenting author email: verma.vinita@gmail.com*

**Background:** Research is a vital component of Strategic Information Management under the National AIDS Control Programme (NACP), India. NACP strongly endorses the need for extensive exchange of knowledge among researchers, programme managers and policy makers to more effectively identify, plan, design and implement appropriate strategies for effective prevention and control of HIV epidemic in India. In order to identify key evidence gaps and research needs of the programme, and to systematically address them through scientific research, NACP has articulated the 'National HIV/AIDS Research Plan' (NHRP).
**Description:** During setting priorities for HIV/AIDS Research under NACP-IV, a detailed exercise to assess existing information gaps in the programme was conducted involving programme managers at NACO, state level and development partners. Research priorities identified by Working Groups during NACP-IV Planning Process for all programme divisions were also included and reviewed. After screening and

Tuesday 19 July
Wednesday 20 July Poster Exhibition

Author Index

reviewing the compiled list to separate the topics which could be studied through analysis of available secondary data and those requiring fresh research, key research questions & concept notes were developed for the identified topics. The priority areas were then segregated into three phases based on the area of priority. Costing & mapping of studies to identify funding support was also undertaken.
**Lessons learned:** There were 90 research priorities identified overall, categorised under epidemiological, socio-behavioural, bio-medical and clinical research, and operational research. Research protocols for 36 priorities under Phase I were invited from over 150 public health institutions, research organisations and medical colleges. A multi-stage screening process was put in place to ensure quality, programmatic relevance and geographic representation. The proposals were selected through various meetings under review and monitoring mechanism i.e., Screening Committee, Technical Group and Ethics Committee. At present, there are 13 research studies underway. The process streamlined research priorities from national to regional level. This initiative produced meaningful evidence through multi-centric and representative research.
**Conclusions/Next steps:** A structured plan for identifying research priorities and commissioning research studies has been helpful in formulating areas for generating fresh evidence customised to Indian settings. The process adopted ensures institutional collaboration and cross-learning as well as ownership of research outcomes and their translation into evidence based policy decisions.

## WEPEE586

### IMPROVING ACCOUNTABILITY IN ORDER TO MEET THE TARGETS IN THE HIV PROGRAM: LESSONS FOR SUSTAINED RESULTS FROM DISTRICT LEVEL SCALE UP OF QUALITY IMPROVEMENT METHODS

P. Wessels[1], N. van der Bergh[2], N. Madlavu[3], B. Ncyanwa[3], B. Snyers[3], L. Treger[4], D. Macharia[4], S. Bhardwaj[4]
*[1]UNICEF, Health & Nutrition, Pretoria, South Africa, [2]Nelson Mandela Bay Health District, HAST, Port Elizabeth, South Africa, [3]Nelson Mandela Bay Health District, Port Elizabeth, South Africa, [4]UNICEF SA, Pretoria, South Africa*
*Presenting author email: jeannettewessels75@gmail.com*

**Background:** South Africa is committed to achieving the SDG goal for health and to improving outcomes for women, children of all ages. This requires that evidence-based recommendations be translated into practice at the facility and community levels. The 3 feet approach applies a bottom-up methodology based on the view that the totality of individuals that are accountable for their actions serves to create accountability at a sub-district, district, and provincial level.
**Description:** Since August 2014, the Three Feet approach has applied the principles of quality improvement (QI) in the Nelson Mandela Bay Health District. The use of tools such as facility level data dashboards, action dashboards, and the 3x4 matrix bottleneck analysis tool have assisted healthcare workers to know their targets, track their performance, and study the effectivity of actions. This has promoted accountability for continuous quality improvement in poorly performing indicators. Examples of district level results between Aug 2014 and Oct 2015: Male Condom distribution has increased from 13.6 to 39.7 condoms per male. ANC client retested for HIV has increased from 54.6% to 99.5
**Lessons learned:** QI processes may have a limited long-term impact unless supportive mechanisms that create the capacity for accountability are also in place. Such mechanisms include:
· Providing an understanding how small activities contribute to the bigger goal of saving lives
· Establishing clear internal feedback mechanisms whereby HCW's can gauge their own performance. This is critical for the intrinsic motivation of an employee. A lack of feedback to those with the greatest influence on results does not foster accountability and results in data reporting for compliance sake.
· Clarifying the linkages and responsibilities between accountable parties i.e. "who is accountable to whom?" and "Who holds who accountable, and by what mechanism?"
· Involving all relevant facility staff in QI decision-making processes
· Acknowledging success as opposed to highlighting poor performance to establish a shared value of continuous learning and improvement.
**Conclusions/Next steps:** Sustained improvements in performance will not be achieved without supportive mechanisms that promote accountability. The HIV program is an effective entry point to influence results across the continuum of care for women and children.

# EVIDENCE OF EFFECT OF HEALTH SYSTEM STRENGTHENING THROUGH HIV PROGRAMMING ON OTHER HEALTH UTILIZATION OR HEALTH OUTCOMES

## WEPEE587

### IMPACT OF ROVING TEAM TECHNICAL ASSISTANCE ON HIV PROGRAMME OUTCOMES AT PRIMARY HEALTHCARE FACILITIES IN RURAL SOUTH AFRICA

J.P. Railton[1], B. Mutasa[1], K.J. Mathekga[1], J.G. Mathebula[1], M. Ntsieni[1], H.E. Struthers[2,3], J.A. McIntyre[2,4], R.P.H. Peters[2,5]
*[1]ANOVA Health Institute, Tzaneen, South Africa, [2]ANOVA Health Institute, Johannesburg, South Africa, [3]University of Cape Town, Department of Medicine, Cape Town, South Africa, [4]University of Cape Town, School of Public Health and Family Medicine, Cape Town, South Africa, [5]University of Pretoria, Department of Microbiology, Pretoria, South Africa*
*Presenting author email: railton@anovahealth.co.za*

**Background:** International donor support of the South African HIV programme moved from an initial emergency response to rapidly scale up access to antiretroviral treatment (ART) through direct service delivery (DSD) to healthcare systems strengthening (HSS) through technical assistance. Different approaches to HSS have been adopted dependent on the geographic characteristics of a specific region. In rural areas, where most HIV care is provided at primary healthcare (PHC) facilities, a roving team technical assistance (TA) model is usually implemented. This study aimed to measure the impact of such roving team TA on specific HIV programme indicators.
**Methods:** We conducted a randomised, stepped-wedged evaluation of USAID-funded TA provided at 17 PHC facilities over a 6-months period in rural Mopani District, South Africa. Implementation of a standardized TA package was randomised to a point in time. This package comprised training material, clinical audit tools and meeting templates to be used by nurse mentors. To improve retention in care defaulter tracing was supported by TA with partial service delivery including provision of tracing tools, generation of defaulter lists and linkage of ward-based outreach teams with PHC facility staff. Routinely available data sources were used to measure impact of the TA package on HIV programme indicators.
**Results:** There was an 8.8% increase in the ART initiation rate over the study period, but this could not specifically be attributed to roving team TA. Roving team TA and partial DSD did improve retention in care at 3 and 6 months, from 78% to 89% and from 72% to 80% respectively. Timeous viral load completion was generally low and only a short-term effect of TA through a quality improvement project was observed.
**Conclusions:** This study is one of the first to comprehensively measure the impact of donor funded support activities on the HIV programme. HSS through TA alone had limited impact on HIV programme indicators, but TA combined with partial direct service delivery did improve retention in care. Our data support the targeted combination approach as specified in PEPFAR's 3.0 strategy of Focus for Impact.

## WEPEE588

### PROGRESS IN IMPLEMENTING AN AMBITIOUS STATE-WIDE HIV STRATEGY TO END THE HIV EPIDEMIC IN NEW SOUTH WALES, AUSTRALIA, BY 2020

J. Holden[1], K. Chant[1], C. Selvey[2], D. Madeddu[1], T. Duck[1], H.-M. Schmidt[1], B. Whittaker[1], N. Parkhill[3], C. Cooper[4], L. Crooks[5], M. Bloch[6], I. Zablotska[7], A. Grulich[7]
*[1]NSW Ministry of Health, Sydney, Australia, [2]Health Protection NSW, NSW, Australia, [3]ACON, Sydney, Australia, [4]Positive Life, New South Wales, Sydney, Australia, [5]Australasian Society for HIV, Viral Hepatitis and Sexual Health Medicine, Sydney, Australia, [6]Holdsworth House Medical Practice, Sydney, Australia, [7]The Kirby Institute, University of NSW, Sydney, Australia*
*Presenting author email: jhold@moh.health.nsw.gov.au*

**Background:** Australia's most populous state, NSW, has an estimated 11,560 people living with HIV and an epidemic largely concentrated among gay men. Rates of new HIV diagnoses are relatively stable at around 350 new infections annually. The NSW Government released a new HIV Strategy in 2012 in response to evidence that early ART confers significant individual and public health benefits. The Strategy set an ambitious goal of virtually ending HIV transmission in NSW by 2020.
**Description:** Core elements of the Strategy include mobilization of affected communities and the health sector and targeted funding to high impact programs. A highly visible "Ending HIV" theme has been utilized to generate awareness of the Strategy's HIV prevention, testing and treatment targets. Rapid HIV testing is available in 15 public clinics, 4 community sites and 7 "pop-up" sites, with clients offered concurrent STI screening. An HIV Support Program assists clinicians with newly diagnosed patients ensuring linkage to care and encouraging early ART uptake. Enhanced data collection systems monitor progress in real time. Strategy evaluation is through a joint project of the NSW Ministry of Health and Kirby Institute.

**Lessons learned:** Newly diagnosed HIV infections were 20% lower in Jan-Sep 2015 compared to the same period in 2012. HIV testing rates increased by 30% over this period. 90% people diagnosed with HIV and attending public sexual health clinics were on ART(estimated at 5500 in 2013 and increasing to over 9200 in 2015). A 300 person PrEP demonstration project is fully enrolled with a PrEP program for 3,700 people now also underway. Community mobilisation has been effective, with community awareness of the health and prevention benefits of early ART increasing from 74% in 2013 to 93% in 2015. The virtual elimination of HIV transmission among people who inject drugs and sex workers and from mother-to-child is being sustained.
**Conclusions/Next steps:** NSW has made significant progress towards ending the HIV epidemic in NSW by 2020. This is being achieved through a partnership approach to maximise HIV testing, promote condoms, encourage immediate ART uptake, scale up PrEP access, enhance safe injecting and harm reduction, and maintain linkage to care.

## WEPEE589

### AN EVALUATION OF THE EARLY IMPLEMENTATION OF OPTION B+ IN HEALTH FACILITIES OF ZIMBABWE IN 2014

N. Sithole
*Ministry of Health, AIDS & TB, Harare, Zimbabwe*
*Presenting author email: ngwasithole@gmail.com*

**Background:** Following the 2013 consolidated ART guidelines by World Health Organization (WHO) which included initiation of triple lifelong ARVs for HIV positive pregnant and lactating women regardless of CD4 count or clinical status, Zimbabwe adopted these guidelines amid concern to adherence to treatment. Implementation of Option B+ had been in progress for 12 months, and it was important to evaluate the early phase of implementation as articulated in the Option B+ transition plan.
**Methods:** A rapid assessment using a cross sectional design was used. Method mix approach (quantitative and qualitative) was used. Participants included key informants healthcare providers, Option B+ users and their partners as well as ordinary members of communities surrounding health facilities. Purposive and random was used to select provinces, districts and health facilities to participate in the assessment. Mutare and Masvingo Provinces were purposively selected as they had operational research/learning sites. The urban provinces of Harare and Bulawayo were also purposively selected in order to include central hospitals, local authority clinics as well as some private facilities. A total of 41 health facilities representing all levels of the healthcare system were selected.
**Results:** Number of sites implementing option B+ increased from 296 sites in 2013 to 1457 by September 2014 while there were 913 ART sites accredited for ART initiation for the general public by the same time. There was a significant increase in the number of infants and children initiated on ART in the first half of 2014 compared to the same period in 2013. Stock outs of ARVS occurred due to high demand. Shorter waiting time before ART initiation as was experienced. There was a decline in women who wanted to first consult their husbands before initiation. Tracking of defaulters was strengthened. Village health workers were an important resource for tracking defaulting patients in the rural facilities.
**Conclusions:** A key recommendation is the operationalization of the joint ART MNCH - Child survival working group and decentralization of viral load testing as well as well as ensuring that facilities participate effectively in quality assurance and improvement in rapid HIV testing as well as laboratory testing.

## WEPEE590

### USING DATA QUALITY ASSESSMENT AS A STRATEGY TO STRENGTHEN M&E SYSTEM AND FACILITATE DATA USE: LESSONS FROM TANZANIA

B. Kilama[1], H. Haule[1], E. Kusunya[1], R. Mkama[1], J. Eshun[1], P. Swai[2], M. Njelekela[1]
*[1]Deloitte Consulting, Project Managment TUNAJALI Program, Dar es Salaam, Tanzania, United Republic of, [2]USAID Tanzania, Dar es Salaam, Tanzania, United Republic of*
*Presenting author email: bkilama@deloitte.co.tz*

**Background:** In 2015, WHO released a consolidated strategic information guidelines for HIV in the health sector. From the guideline, it is advocated to do Data Quality Assessments (DQA) as a routine activity. The guidance guides countries to conduct Data Quality Reviews for evidence decision processes. In TUNAJALI, a comprehensive HIV Care project with support from the US Government through USAID providing services in 5 regions conducted Data Quality Assessment as a means to receive information on strengths and weaknesses of recording and reporting systems in use. We assessed quality of data from Morogoro region for HIV Care services including PMTCT. The assessment was conducted in collaboration with regional and council health management teams.
**Description:** TUNAJALI conducted DQA in Morogoro regions for 11 facilities using national data quality management tools. The exercise assessed reporting performance, data verification and management capacities. Indicators reported at headquarters office were counterchecked at regional office and health facilities. At the facility primary sources were used to conduct manual counting (spot and cross checking across tools) of variables that produce indicators for reporting in cards, registers and archived reports.
**Lessons learned:** The assessment showed spectrum of findings, with document review completeness, timely reporting and missing data fields were fairly good. Completeness
(67% -100%), Timely reporting (100%), missing data fields (18%-72%). Verification exercise for indicators assessed showed verification factors from 0% to 264% demonstrating that under-reporting and over-reporting are all occurring in facilities. The regional and council teams learnt of gaps and strength of facilities they supervise and realized the need to have DQAs budgeted for in the comprehensive health plans.
**Conclusions/Next steps:** Improvement in M&E systems through DQA is a promising approach as gaps and strengths are immediately realized. Corrective measures are key for patient and program monitoring of the health system. The regional and council teams inclusion to facilitate ownership and accountability is emphasized.

*[1]INSERM, UMR_S 912, «Sciences Economiques & Sociales de la Santé et Traitement de l'Information Médicale» (SESSTIM), Marseille, France, [2]Aix Marseille Université, UMR_S 912, IRD, Marseille, France, [3]Observatoire Régional de la Santé Provence-Alpes-Côte d'Azur, Marseille, France, [4]National Center for HIV/AIDS, Dermatology and STD (NCHADS), Phnom Penh, Cambodia, [5]FHI 360, Phnom Penh, Cambodia, [6]University of Health Sciences (UHS), Phom Penh, Cambodia, [7]Institut Pasteur, Paris, France*
*Presenting author email: bruno.spire@inserm.fr*

**Background:** As a result of the international financial crisis of the last years, HIV care services of developing countries tend to reorganize their activities to costs. This may have an impact not only in the capacity of facilities to provide care, but also on the adherence and the living conditions of PLWH. We aimed to investigate whether adherence to antiretroviral treatment (ART) is explained not only by individual factors, but also by the hospitals' characteristics among a sample of PLWH under IP-based regimen in Cambodian care services.
**Methods:** NCHADS/ANRS 2PICAM study has been conducted between February 2013 and April 2014. Data was collected for 1316 PLWH attending 7 services in Phnom-Penh and Cambodian provinces. Adherence was assessed in the questionnaire and a variable indicating whether adherence to ART is low/interrupted (=1) or high (=0). Care services and individual characteristics were included in a Two-level logistic model to investigate their influence on adherence to ART.
**Results:** Among participants 17.1% were low adherent or had interrupted their ART, while 82.9% were highly adherent. Care services out of Phnom-Penh (OR/5.83 95%CI[1.98-17.17]), hospitals with large caseloads (>2393 patients) (OR: 3.68 95%CI[1.5-13.54]) are structural factors that increase the probability of patients to decrease or interrupt their ART uptake. However, patients in care services with important number of medical doctors (OR: 0.79 95%CI [0.70-0.90]), assistant pharmacies (OR:0.62 95%CI[0.39-0.99]), and psychologist counselors (OR:0.18 95%CI [0.05-0.65]) are more likely to be adherent to ART. Discrimination (OR: 1.13 95%CI[1.06-1.20]) and perceived symptoms (OR: 1.10 95%CI[1.12-1.25]) are the only individual factors impairing ART adherence.
**Conclusions:** Adherence is not only determined by individual behavior, but also depends on the organizational characteristics of care services. Health policy in Cambodia should include training for care workers listening patients about the undesirable effects of the treatment in order to reduce the risk of non-adherence. Policy makers should focus on the increase of the number of medical doctors and pharmacists especially in services with big caseloads in Cambodian provinces.

# COMMUNITY-LED RESPONSES TO HIV, SCALE UP AND SUSTAINABILITY: EVIDENCE AND CHALLENGES

## WEPEE592

### REACHING THE MOST VULNERABLE: A DETAILED EVALUATION OF CBO REACH AMONG YOUNG CHILDREN IN AREAS OF HIGH HIV PREVALENCE

A. Yakubovich[1], L. Sherr[2], L. Cluver[1,3], S. Skeen[3,4], I. Hensels[2], A. Macedo[2], M. Tomlinson[4]

*[1]University of Oxford, Social Policy and Intervention, Oxford, United Kingdom, [2]University College London, Department of Infection and Population Health, London, United Kingdom, [3]University of Cape Town, Psychiatry and Mental Health, Cape Town, South Africa, [4]Stellenbosch University, Psychology, Stellenbosch, South Africa*

*Presenting author email: alexa.yakubovich@spi.ox.ac.uk*

**Background:** The response to HIV/AIDS in resource-limited settings has included a call for the support of community-based organizations (CBOs), which have the potential to provide high quality services for orphaned and vulnerable children. However, evidence is lacking as to whether CBOs are reaching those who are most vulnerable, whether attending these organizations is associated with greater psychosocial wellbeing, and how they might work.

**Methods:** Cross-sectional data were obtained from the Young Carers and Child Community Care studies, which both investigated child wellbeing in highly HIV prevalent areas in South Africa using standardized self-report measures. Children from the Child Community Care study were all CBO attenders, whereas children from Young Carers were not receiving any CBO services, thereby serving as a comparison group. The final sample included 1848 South African children aged 9-13. Multivariable regressions were used to test whether children attending CBOs were more deprived on socio-demographic variables (including housing, employment, school attendance, and community violence), and whether CBO attendance was in turn associated with better psychosocial outcomes (including depression, suicidal ideation, and trauma). Mediation analysis was conducted to test whether more positive home environments mediated the association between CBO attendance and significantly higher psychological wellbeing.

**Results:** Overall, children attending CBOs did show greater vulnerability on most socio-demographic variables. For example, compared to children not attending any CBO, CBO-attending children tended to live in more crowded households (OR=1.22) and have been exposed to more community violence (OR=2.06). Despite their heightened vulnerability, however, children attending CBOs tended to perform better on psychosocial measures: for instance, showing fewer depressive symptoms (B=-0.33) and lower odds of experiencing physical (OR=0.07) or emotional abuse (OR=0.22). Indirect effects of CBO attendance on significantly better child psychological wellbeing (lower depressive symptoms) was observed via lower rates of child abuse (B=-0.07) and domestic conflict/violence (B=-0.03) and higher rates of parental praise (B=-0.03). Null associations were observed between CBO attendance and severe psychopathology (e.g., suicidality).

**Conclusions:** These cross-sectional results provide promising evidence regarding the potential success of CBO reach and impact among children in HIV-affected areas but also highlight areas for improvement.

## WEPEE593

### WELL-DESIGNED GRADUATION OF VULNERABLE CHILDREN CRITICAL TO SUSTAINING OUTCOMES: AN EFFECTIVENESS ANALYSIS OF CHILD GRADUATION PROCEDURES AND OUTCOMES IN ETHIOPIA'S YEKOKEB BERHAN PROGRAM

A.E. Mohammed[1], T. Yewhalawork[2], G. Seboka[3]

*[1]Pact Inc, Monitoring, Evaluation, Reporting and Learning (MERL) Unit, Addis Ababa, Ethiopia, [2]Pact Inc, ICT, Addis Ababa, Ethiopia, [3]Pact Inc, Yekokeb Berhan Program Delivery/DCOP, Addis Ababa, Ethiopia*

*Presenting author email: aebrahim@pactworld.org*

**Background:** USAID/Ethiopia's Yekokeb Berhan Program's goal is to reduce vulnerability and increase resiliency among highly vulnerable children. It is implemented through 32 local partners (IPs), over 700 community committees, 15,000 community volunteers and local government. The program currently supports over 325,000 vulnerable children and their caregivers in high HIV-prevalence urban areas. Local community actors have been trained and mentored in beneficiary selection, need assessments and care planning, service provision and program transition and/or beneficiary graduation.

The program employs the coordinated approach to deliver quality care and support, and uses a well-designed graduation strategy to graduated children and caregivers when desired improvements in their conditions have been achieved. A recent study of graduated children and their caregivers was conducted to understand their conditions 6 - 12 months after graduation.

The research question was, "Has the situation of graduated children changed (improved, same, or deteriorated) 6-12 months after their graduation?"

**Description:** The study conducted on 3,201 graduated children and their families, using the customized Child Status Index tool, revealed important improvements in well-being on all 20 indicators. The study showed that 78% of the children had a dramatic reduction in unmet needs and had continued to experience improvements in their conditions after their graduation from the program. A vulnerability analysis of their households revealed that nearly all (99.5%) were economically stable and able to meet basic needs of their children. The results indicate that the program's outcomes at child and household level are sustainable.

**Lessons learned:** A well designed graduation strategy is critical to improving the well-being of children and their families. In addition, helping households understand that graduation is the goal and connecting them to a network of support systems enhances their ability to actively participate in achieving desired changes in their lives and family conditions.

**Conclusions/Next steps:** The dramatic improvements in the conditions of graduated children and their families suggest a carefully planning and graduation strategy is needed to address the unique needs of vulnerable children and their families. Further, the utilization of highly localized tools and active participation of communities starting from program design significantly accelerate graduation of beneficiaries and sustainability of the program's outcomes.

## WEPEE594

### A MODEL REGIONAL STRATEGIC FRAMEWORK ON HIV FOR KEY POPULATIONS IN AFRICA: AN ACTION AGENDA FOR KEY POPULATIONS, DEVELOPED BY KEY POPULATIONS

M.G. Haileyesus[1], N. Bondyopadhyay[2], T. Sellers[3], W. Twaibu[4], H. Pijeneus Malugu[5], K.C.D. Esom[6]

*[1]UNDP RSCA, Addis Ababa, Ethiopia, [2]Private Consultant, Addis Ababa, Ethiopia, [3]UNDP RSC Africa, Addis Ababa, Ethiopia, [4]Uganda Harm Reduction Network (UHRN), Kampala, Uganda, [5]TANPUD, Dar es Salam, Tanzania, United Republic of, [6]African Men for Sexual Health and Rights (AMSHeR), Johannesburg, South Africa*

*Presenting author email: wamalatwaibu@yahoo.com*

**Background:** The 2014 UNAIDS Gap Report indicated that, despite progress made in lowering HIV infection among the general population in Africa, people who use drugs, sex workers, transgender people and men who have sex with men continue to have considerably higher infection rates. While these key populations (KPs) are often engaged in the design and implementation of strategies to address this issue, their role is often limited to contributing to the process instead of owning and leading it. The Model Regional Strategic Framework on HIV for Key Populations, developed over several meetings in 2014 by 35 members of the Africa Key Population Experts Group from 16 countries, is the first Africa regional strategy jointly developed by experts from the four KP groups.

**Description:** The Framework is intended to be used by Regional Economic Communities (RECs) in Africa to promote the adoption of a standard package of services and programmes within their Member States. It is also intended for use by civil society and KP groups as an advocacy and capacity development tool. The Framework is a living document having three goals, six outputs and ten strategies with specific outcome and output indicators for each KP group.

**Lessons learned:** The Framework has been put to use by civil society organizations and KP networks in various ways, including to inform Global Fund concept note development, to review National Strategic Plans on AIDS, produce civil society shadow reports, to set the agenda for regional conferences such as ICASA and to provide inputs for research design. In addition, the Southern Africa Development Community (SADC) used the Framework to develop a regional KP strategy while the East African Community (EAC) used it to inform the development of a transport corridor strategy for KPs.

**Conclusions/Next steps:** Because of the high level of ownership by KPs, the Framework has been extensively used in 2014/15 and continues to be relevant. Having been developed by KPs themselves, it is a unique instrument for use by all four key population groups for advocacy on behalf of one another.

## WEPEE595

### "EENEY MEENEY MINEY MOE": THE EFFECT OF SELECTIVE ENGAGEMENTS OF NATIONAL NETWORKS WITH KEY AFFECTED POPULATION SUBGROUPS

L.R. Rendon[1], M. Poonkasetwattana[1], C. Connelly[2]
*[1]Asia Pacific Coalition on Male Sexual Health (APCOM), Bangkok, Thailand,*
*[2]Australian Federation of AIDS Organisations, Bangkok, Thailand*
*Presenting author email: inadr@apcom.org*

**Background:** JumpStart - MSM and transgender networks capacity strengthening initiative (JumpStart) is an activity implemented by Asia Pacific Coalition on Male Sexual Health (APCOM) and Australian Federation of AIDS Organisations (AFAO). The activity provided national MSM and transgender networks with tailored technical support by catalyzing on their transformational capacity. Ultimately, the networks will improve their advocacy engagements at a country level for a more impactful and effective HIV response.

**Description:** In 2014 and 2015, the national networks in Cambodia, Malaysia, Myanmar, Vietnam and Thailand accomplished the Rapid Assessment Apparatus (Rap App) which measures and identifies their programmatic and organisational capacities. The Rap App also assessed their engagements with the key affected population (KAP) subgroups, advocacy strategy and impact to society.

**Lessons learned:** The Rap App analysis across the networks found that KAP engagements determine their overall organisational advocacy strategy.

Selective engagements limiting to MSM and transgender subgroups has narrowed network strategy into a health-based advocacy. The strategy only focuses on increasing access to, and improvements of, HIV services. The impact expected is limited to the decrease of new HIV infection rates.

On the other hand, wide engagement cutting across KAP subgroups has shaped a holistic rights-based advocacy strategy. Such engagement resulted in defining network targets to include the improved quality of life and experiences of the KAP at a country level. Subsequently, the individual staff members are also inspired at changing peoples' lives contributing to overall social development.

**Conclusions/Next steps:** National networks employing health-based advocacy are donor driven and are operating to achieve particular targets among identified key affected population subgroups. The regional HIV advocacy and competitive funding streams has mainly influenced the country level advocacy. In order for a more impactful and effective HIV response, the country level advocacy needs to go beyond health perspective and encompass rights-based approach cutting across all key population sub groups.

## WEPEE596

### BUILDING CAPACITY TOWARDS COMMUNITY-LED HIV SERVICES: THE FIRST COMPREHENSIVE HIV TREATMENT AND PREVENTION SERVICE MODEL LED BY MSM AND TG COMMUNITIES IN THAILAND

S. Janyam[1], D. Lingjongrat[2], T. Nakpor[3], R. Reankhomfu[4], S. Jittjang[5], T. Pankam[5], J. Jantarapakde[5], S. Pengnonyang[5], R. Janamnuaysook[5], S. Charoenying[6], T. Sattayapanich[6], A. Arunmanakul[6], P. Phanuphak[5], M. Cassell[7], A. Schubert[7], N. Phanuphak[5], R. Vannakit[7]
*[1]Service Workers in Group Foundation, Bangkok, Thailand, [2]Rainbow Sky Association of Thailand, Bangkok, Thailand, [3]Sisters Foundation, Chonburi, Thailand, [4]Caremat Organisation, Chiang Mai, Thailand, [5]The Thai Red Cross AIDS Research Centre, Bangkok, Thailand, [6]FHI 360, Bangkok, Thailand, [7]Office of Public Health, U.S. Agency for International Development Regional Development Mission Asia, Bangkok, Thailand*

**Background:** To achieve the UNAIDS 90-90-90 target, countries are increasingly relying on community resources to expand HIV testing, antiretroviral therapy (ART) and retention support. The Thai Red Cross AIDS Research Centre and the USAID LINKAGES Project, through PEPFAR funds, worked to demonstrate the first community-led HIV treatment and prevention service model for MSM and TG in Thailand.

**Description:** A comprehensive community-led HIV service model for MSM and TG was established at four community-based organizations (CBOs); SWING worked with male sex workers in Bangkok/Pattaya, Rainbow Sky Association of Thailand worked with MSM/TG in Bangkok/Hat Yai, Sisters worked with TG/TG sex workers in Pattaya, and Caremat worked with MSM/TG in Chiang Mai. CBO staff were trained/coached to provide HIV/STI testing, point-of-care CD4 measurement, ART maintenance, tuberculosis screening/prophylaxis, pre-exposure prophylaxis (PrEP) and post-exposure prophylaxis (PEP), and retention support to clients. Quality assessment and PEPFAR Site Improvement Measurement (SIM) tools were used to routinely monitor service quality. Local networks with health professionals were successfully established to provide local oversight to the CBOs and allow case referral when needed.

**Lessons learned:** Community-led HIV services were successfully implemented: From May 2015-January 2016, these CBOs provided HIV testing to 1429 clients (995 MSM, 434 TG), diagnosed 238 HIV-positive individuals (200 MSM, 38 TG), and 77% successfully initiated ART within a median time of 15 days. From October 2015, CBO staff already started PrEP on 130 HIV-negative individuals.

CBOs could be empowered to conduct HIV services: CBO staff were successfully trained as HIV counselors, HIV testers, HIV care providers, and PrEP/PEP providers. They were eager and proud to have their capacities built beyond their routine activities. Quality assessments demonstrated increased capacities in clinical and laboratory services over time. SIM scores increased from 80.5 to 93.4%.

**Conclusions/Next steps:** Model has been shared to obtain national support for endorsing, sustaining and expanding these community-led HIV services. Concerted efforts are needed to inform and reform policy and regulatory frameworks to i) permit CBO staff to perform health-related tasks, ii) formalizes their status and professionalization to enable the funding and training required, and iii) overcome resistance of other health professionals and institutions.

## WEPEE597

### MSM COMMUNITY MOBILIZATION FOR HIV PREVENTION IN UKRAINE: THE EFFECTIVENESS OF MPOWERMENT BEHAVIORAL INTERVENTION

O. Postnov[1,2,3], M. Kasianczuk[1], O. Neduzhko[2], T. Gerasimenko[1,3], O. Sazonova[1,3], T. Kiriazova[2], I. Shvab[4], R. Yorick[4]
*[1]NGO 'Interregional Center for LGBT-Studies 'Donbas-SocProekt', Mariupol, Ukraine, [2]Ukrainian Institute on Public Health Policy, Kyiv, Ukraine, [3]Ukrainian I.I. Mechnikov Anti-Plague Research Institute, Odesa, Ukraine, [4]USAID RESPOND, Pact Inc, Kyiv, Ukraine*
*Presenting author email: apostnovmd@gmail.com*

**Background:** Men who have sex with men (MSM) is one of the key groups most affected by HIV in Ukraine. HIV prevalence among Ukrainian MSM in 2013 reached 5.9%. There is a lack of behavioral interventions (BI) with proven effectiveness for HIV prevention among young MSM in Ukraine. Mpowerment is a community-level BI focused on HIV prevention among young gay/bisexual men. It was implemented in the USA, but never has been evaluated in Ukraine before.

**Methods:** In 2013-2015 Mpowerment was implemented in three Ukrainian cities among young (18-29 y.o.) MSM by local NGOs. A cohort of young MSM was recruited independently of the intervention in five cities (three cities - intervention communities, two - comparison communities). Social-demographic and behavioral characteristics were collected at baseline and at 12-month follow up. The significance of behavioral changes was assessed in both groups using paired t-test (numeric) and McNemara's test (categorical variables).

**Results:** 991 MSM (688 intervention communities, 303 comparison communities) were included in the study. 708 respondents (574 intervention, 134 comparison) completed 12-month follow up. 363 (51.3%) identified as gays, 267 (37.7%) - as bisexual; mean age=23.6 years. Diffusion of Mpowerment was observed in three intervention communities: 46.9% of the respondents heard about Mpowerment, 20.7% participated in BI events (dance parties, movie nights etc.), 16.5% invited their friends to participate in the BI events. The sexual behavior in intervention communities demonstrated positive changes (see table): the mean number of sexual partners decreased from 3.83 to 2.82 (p < 0.001), the proportion of men who had unprotected anal sex with non-steady partner within last three months decreased from 49.3% to 32.9% (p< 0.001) and proportion of MSM who had anal sex with men within last month and always used condoms increased from 30.4 to 37.3% (p=0.002). The corresponding indicators in the comparison group did not improve.

| | Intervention communities | | | | Comparison communities | | | |
|---|---|---|---|---|---|---|---|---|
| Variables | Baseline: abs / mean (%/SD) | 12 month follow up: abs / mean (%/SD) | Pre- to Post-intervention difference (pp - percentage points) | p | Baseline: abs / mean (%/SD) | 12 month follow up: abs / mean (%/SD) | Pre- to Post-intervention difference (pp - percentage points) | p |
| Number of male sexual partners last six months | 3.83 (5.6) | 2.82 (2.4) | - 1.01 | **<0.001** | 3.70 (6.5) | 3.46 (3.0) | - 0.24 | 0.688 |
| The proportion of men who had unprotected anal sex with non-steady male partner within last three months (%) | 283/574 (49.3%) | 189/574 (32.9%) | -16.4 pp | **<0.001** | 37/134 (27.6%) | 56/134 (41.8) | + 14.2 pp | **0.013** |
| The proportion of men who had anal sex male partner in the last 30 days and always used condoms | 156/514 (30.4%) | 195/523 (37.3%) | + 6.9 pp | **0.002** | 54/101 (53.5%) | 55/103 (53.4) | - 0.1 pp | 0.880 |

*[Sexual behavior changes among young MSM]*

**Conclusions:** This study demonstrated that the Mpowerment project, a community-level HIV prevention intervention, resulted in reduction of unprotected anal sex among young MSM in Ukrainian settings.

### IMPACT IN HIV CARE CONTINUUM OF A TAILORED COMMUNITY-BASED HIV VOLUNTARY COUNSELING TESTING CENTRE FOR MEN WHO HAVE SEX WITH MEN: CHECKPOINTLX, LISBON, PORTUGAL

M.J. Campos, M. Rocha, J. Rojas, F. Ferreira, J. Esteves, R. Guerreiro, R. Fuertes, N. Pinto, B. Maia, J. Brito
*GAT Portugal, CheckpointLX, Lisboa, Portugal*

**Background:** Portugal estimates that 20 to 25000 people living with HIV are undiagnosed and in high prevalence settings, such as Lisbon, men lag behind with late or delayed linkage to prevention, care and support. WHO stressed that countries with HIV concentrated epidemics have to prioritize and focus on tailored community-based HIV testing sites (HTS) approaches for those who remain undiagnosed and at greatest ongoing risk for HIV infection. In 2011, Treatment Activist Group (GAT) opened the first community-based HTS in Portugal, tailored to men who have sex with men (MSM).
**Description:** CheckpointLX is a peer-led, community-based, voluntary counselling, testing and linkage to care centre tailored for MSM. Provides condoms and lube, tailored counselling, HIV, syphilis, HCV, gonorrhea, chlamydia and HPV screenings programs, escort those with HIV reactive test to hospital for care and gives access to web-based anonymous partner notification. This centre generates surveillance data through an open cohort, a joint GAT and ISPUP-EPIUnit collaboration.
**Lessons learned:** Between April 2011 and December 2015, 10002 HIV tests were performed in MSM, 4,1% reactive overall. According to official surveillance data, per civil year, on national level, CheckpointLX found 8.71%(2011), 15.27%(2012), 19.95%(2013) and 26.29%(2014) of MSM new HIV infections. Linkage to care was 79.49%(2011), 73.97%(2012), 78.05%(2013), 83.33%(2014) and 74.78%(2015). Overall referred, 2.3% had confirmed primary HIV infection. In 2014, almost 40% of the MSM new cases where late presenters at national level, whilst our data showed only 15%. Between April 2011 and February 2014, 804 MSM were followed for a total of 893 person-years. The overall seroincidence was 2.80/100 person-years (95%IC:1.89-4.14).
**Conclusions/Next steps:** CheckpointLX shows to have an increasing impact on MSM early diagnosis and linkage to care on both local and national levels. The replication of this centre in other Portuguese high prevalence settings, such as Oporto, is urgent. Due to persistent high incidence estimates, new HIV prevention tools roll-out are pressing, namely pre-exposure prophylaxis. This centre has been recognized by ECDC as a new and innovative service developed in Portugal reflecting the Communication's emphasis on key vulnerable populations and selected by WHO as an example of good practice reflecting the new HTS recommendations.

## WEPEE599

### USE OF COMMUNITY OVC PLATFORM FOR HIV CASE IDENTIFICATION (HOW TO DO BETTER TARGETING)

D.H.J. Matos[1], E. Aberra[2], M. Srivastava[2]
*[1]USAID Mozambique, Integrated Health Office, Maputo, Mozambique, [2]USAID, OHA, Washington, United States*

**Background:** In Mozambique, there are approximately two million orphans and vulnerable children, 800,000 of which orphaned due to AIDS. In 2009, Mozambican youth aged 12-19 accounted for 6.8 percent of the overall cases of HIV/AIDS in Mozambique (INSIDA 2009). Despite the high percentage of youth cases, there are very low numbers of children on antiretroviral therapy (ART). In 2012, existing vast OVC platforms throughout the country let to the recommendation to utilize them for active case identification of children with HIV.
**Description:** The use of existing community OVC platforms for HIV case identification illustrate how OVC programs fit in the HIV continuum of response and how to target testing more effectively. Implementation of such strategies includes: case management, coordination, and facilitation. First, volunteers identify the needs of OVC at a household level. Then work with families to develop comprehensive care plans, including HIV testing and counseling for all OVC beneficiaries. Next, the program works to increase coordination and collaboration between both OVC and HTC providers. Lastly, the program helps to facilitate access to HTC for OVC families. The OVC volunteers mobilize families and work with HTC providers to test all members in the family who desire to know their status.
**Lessons learned:** In FY15, Gaza and Zambezia, two of Mozambique's high HIV prevalence Provinces (together these two provinces account for about 40% of PLHIV in Mozambique) and high OVC burden were studied. The results showed that out of 2,491 beneficiaries tested, 91 tested positive
(3.7 percente positivity rate). This result led to the numerous lessons including targeting all beneficiaries may not be the best approach, and that there are particular characteristics of those tested positive, which can be used to make targeting more effective. OVC Implementing Partners will target children with cases of school absenteeism, those who are malnourished, or have skin problems. Furthermore implementing partners discovered issues related to stigma and caregivers opting out of testing when targeting the entire household.
**Conclusions/Next steps:** Partners will continue to sensitize families to actively seek HTC at voluntary counseling and testing sites for those willing to go and those who do not know their status.

## WEPEE600

### INNOVATIVE AND STRUCTURED APPROACH OF CRISIS INTERVENTION AMONG FEMALE SEX WORKERS (FSWS), AN IMPORTANT FACET OF HIV INTERVENTION

G. Sharma[1], J. Kirubakaran[1], U. Das[1], M. Verma[2], N. Chauhan[3], A. Purohit[1], S. Kumar Vishnoi[4], N. Mustafa[5], N. Dhingra[1]
*[1]NACO, New Delhi, India, [2]Swami Sivananda Memorial Institute, New Delhi, India, [3]Saksham Mahila Samiti, Jaipur, India, [4]Rajasthan State AIDS Control Society, Jaipur, India, [5]Technical Support Unit, New Delhi, India*
*Presenting author email: garimasharma1905@gmail.com*

**Background:** Female Sex workers in India face harassment and violence from clients, pimps, regular sexual partners, family, and community people. In India, 70% of sex workers in a survey reported being beaten and harassed power structures. This has been a challenge for the HIV Targeted Intervention (TI) Program of National AIDS Control Organization (NACO); as it prevented many FSWs from accessing HIV services because of the unconducive environment.
**Description:** Knowledge Sharing (KS) Project a pilot initiative (from October' 2015 to December' 2015) supported by World Bank and NACO. Experiential knowledge of Delhi-based TI documented and shared structured crisis response system for effective management of crisis of FSWs with TI of Rajasthan. These innovative and tested approaches of crisis management were replicated in the state of Rajasthan after being tailored to the local context. The approach was made adaptable to the intervention set up based on regional/local, social and cultural milieu. Handholding and onsite support was provided by Delhi TI to Rajasthan TI for replication. The experiential knowledge includes ,but not limited to, restructuring the existing crisis response mechanism, 24/7 open system for reporting of crisis, involving the local influential leaders including religious leaders, sensitizing the law enforcement agencies/police and engaging legal experts. The new approach was implemented in Rajasthan for the period November- December 2015.
**Lessons learned:** Through the experiential knowledge gained from KS initiative, there has been an increase in reporting of crisis by 15% and success rate of resolving crisis has increased by 33%. Further, this has gained FSW community trust over the TI and led to uptake of services by increase in footfall at Drop-in-center.
**Conclusions/Next steps:** Having an active 24/7 structure for reporting and responding crisis and involving police and legal expert in the HIV intervention among FSWs, has benefited the program. This experiential learning will be shared with other FSW TIs in the country, based upon their needs.

## WEPEE601

### A COMMUNITY-BASED APPROACH TO ASSESS THE SITUATION OF HIV IN THE KOKOYO INFORMAL GOLD MINING SITE: WHAT IS BEHIND THE SHINE OF GOLD CONCERNING HIV EPIDEMICS IN MALI? (ANRS-12339/SANU GUNDO)

L. Sagaon-Teyssier[1,2,3], M. Suzan-Monti[1,2,3], M. Mora[1,2,3], M. Bourrelly[3], G. Maradan[1,2,3], F. Diallo[4], H. Balique[5], B. Dembélé Keita[4], B. Spire[1,2,3], SANU GUNDO Study Group
*[1]INSERM, UMR_S 912, Sciences Economiques & Sociales de la Santé et Traitement de l'Information Médicale (SESSTIM), Marseille, France, [2]Aix Marseille Université, UMR_S 912, IRD, Marseille, France, [3]Observatoire Régional de la Santé Provence-Alpes-Côte d'Azur, Marseille, France, [4]ARCAD SIDA, Bamako, Mali, [5]Faculté de Médecine, Aix-Marseille Université, Marseille, France*
*Presenting author email: luis.sagaon-teyssier@inserm.fr*

**Background:** The particular poverty context of informal gold-bearing zones increases vulnerability vis-à-vis health problems, especially sexually transmitted infections (STIs) including HIV. In these sites, the presence of sex workers, and sex-related beliefs may impact HIV prevalence that could be higher than the national prevalence around 1.4%. However, little is known about the HIV epidemics among people attending Malian informal gold mining sites. This analysis aims to estimate HIV prevalence and its determinants among people living in the informal gold mining site of Kokoyo, one of the most important in Mali.
**Methods:** ANRS-Sanu Gundo is a cross-sectional survey conducted in 2015 at Kokoyo. Authorities, village representatives, and gold diggers contributed to the elaboration of the strategy and tools to conduct the survey. ARCAD-SIDA, a Malian NGO, organized prevention activities, medical check-up including STIs HIV testing

and treatment. Those attending the activities were invited to participate to the quantitative and/or qualitative survey (focus groups). The sample was described and logistic regression was implemented to estimate the characteristics associated to be tested HIV+.
**Results:** 236 persons attended the prevention activities: 28.8% gold diggers, 11.9% female sex workers, 33.5% female non-sex workers, 5.9% guards, and 19.9% men with another gold mine-related activity (principally street vendors). STIs treatment was prescribed to 150 (64% were female) and 228 participants accepted the HIV test. The overall prevalence was 8.5%; 3.6% for female sex workers, 7.9% for gold diggers, and 13.9% for female non-sex workers. Among those diagnosed HIV+, 40% had never been tested before the survey. Multivariate analyses show that female non-sex workers (OR=3.46/p=0.032), participants aged 22-30 years (22-26year/OR=11.10/p=0.034 and 27-30year/OR=12.59/p=0.028, vs. youngest and oldest), those earning less than 12000FCFA(19.8US$)/week (OR=1.58/p=0.01), and those perceiving poor health status before being tested (OR=4.98, P=0.006) were more likely to be HIV+.
**Conclusions:** Our results pointed out a high HIV prevalence among people living in informal gold mines and a small number of persons tested before the survey, especially non-sex worker females. Bringing information/prevention activities closer to people working in informal gold mines is an urgent public health action.

## WEPEE602

### TRANSGENDER VOICES, TRANSGENDER POWER. IMPROVING HEALTH AND PREVENTING HIV THROUGH COMMUNITY-LED INTERVENTIONS AND STRENGTHENED SYSTEMS: EXPERIENCE FROM THE PEHCHAN PROGRAM IN INDIA

A. Sarkar[1,2], A. Aher[3], S. Shaikh[3], J. Robertson[3], S. Mehta[3], R. Sarkar[3], R. Chauhan[3], H. Khosa[3]
*[1]India HIV/AIDS Alliance, Programme, New Delhi, India, [2]IRGT: A Global Network of Transgender Women and HIV (IRGT), Oakland, United States, [3]India HIV/AIDS Alliance, New Delhi, India*
*Presenting author email: amitava_kolkata@yahoo.co.in*

**Background:** With 8.82% HIV prevalence, transgender women and hijras have the highest HIV prevalence among key populations in India. Under National AIDS Control Programme - Phase III, transgender/hijra people were counted under MSM umbrella and did not receive specific services responsive to their needs. The government-funded Targeted Intervention programme had limited opportunity for community-led efforts, capacity building and advocacy around transgender issues.
**Description:** Implemented by India HIV/AIDS Alliance with support from the Global Fund, the Pehchan programme has served 32,871 transgender women and 16,263 hijras. Over the last five year, through a community-led approach, Pehchan provided a range of services, including intensive outreach, referral and provision of community-specific sexual health services, counseling, violence mitigation, support to access social entitlements, and fostering an enabling environment by organizing advocacy events at state and national level. Through December 2015, the programme registered 580 transgender/hijra individuals for ART. 1,137 cases of violence against the community were reported, and 1,032 individuals have received support for violence mitigation. A total of 2,315 transgender women and 2,015 hijras linked with social entitlement schemes.
**Lessons learned:** Pehchan helped transgender/hijra beneficiaries not only improved access to sexual health services, but it also strengthened their voice at state and national level as a collective effort to ensuring their health and rights. With Pehchan support and guidance, the National AIDS Control Organization supported efforts to develop a transgender-specific Targeted Intervention strategy.
**Conclusions/Next steps:** Transgender and hijra people in India are marginalized and have been largely unable to access health and other services. Even after the April 2014 Supreme Court of India judgement recognizing the rights of the Third Gender, life on the ground has been largely unchanged. The community-led and need-based approach of Pehchan has complemented the National AIDS Control Programme by facilitating access to sexual health services and by developing capacity of transgender/hijra individuals and organizations to partner with government to improve health access and rights protections.

## WEPEE603

### MICRO PLANNING AS AN INNOVATIVE TOOL TO REACH PEOPLE WHO USE DRUGS (PWUD)

S. Luanda, F. Mohamed, D. Bilon, L. Kishiwa, R. Okola, A. Voets
*Medecins du Monde, Dar es Salaam, Tanzania, United Republic of*
*Presenting author email: fieldmanager.hr.mdmtz@gmail.com*

**Background:** Recent studies in Tanzania have shown high HIV prevalence rates among people who inject drugs (PWID) and other people who use drugs (PWUD). A rapid assessment and response survey undertaken in 2011 in Temeke, Dar es salaam by Médecins du Monde (MdM) revealed HIV prevalence rates of 26% among PWUD while 34.8% among PWID and 67%% among women who inject drugs (WWID). This calls for novel approaches and effective services delivery interventions.
**Methods:** MdM piloted a micro planning (MP) program in which trained peer educators (PEs) deliver tailored harm reduction (HR) services to their peers, in the hotspots where they are using. Each PE has his/her own clients with whom s/he reviews needs on a weekly basis and delivers services accordingly. Services consist of NSP & referral to opioid substitution treatment (OST) for PWID; referral to MdM for regular HIV, hepatitis, STI & TB screening for all PWUD as well as follow-up on general health; and treatment adherence for PWUD on ART, OST, TB or other treatment.
**Results:** With MP, access to HR services has significantly improved; the number of PWUD accessing services increased by four-fold, while the number of syringes distributed tripled. Most PWUD are now aware of their HIV status, thanks to increase in testing; the number of PWUD on ART increased by 37%. Reaching women who use drugs (WWUD) appears to be a challenge that has yet to be overcome.
**Conclusions:** MP proves a replicable means of enhancing HR services by PWUD in a resource limited setting where access to essential health services otherwise remains low.

## WEPEE604

### COMMUNITY-BASED HIV INTERVENTIONS COSTS AND COST-EFFECTIVENESS STUDIES: WHY SO FEW?

C. Chaumont, R. Baruch, S. Bautista-Arredondo
*National Institute of Public Health of Mexico, Division of Health Economics, Distrito Federal, Mexico*
*Presenting author email: claire.chaumont@insp.mx*

**Background:** This study seeks to assess current gaps in published cost and cost-effectiveness studies on community-based HIV interventions and to critically review existing costing methods in the light of community-based interventions' specificities.
**Methods:** We reviewed 46 published primary studies and 4 costing tools from the period 2000-2015 about the costs and cost-effectiveness of community-based HIV interventions. Studies were assessed using a data extraction framework. We complemented this search with five formal interviews with costing experts.
**Results:** The results suggest the published literature on costs and cost-effectiveness of community-based HIV interventions remains sparse, with important gaps in terms of interventions, target populations and geographical locations. The scarcity of dedicated tools and guidelines easily available at global level may further slow down the uptake of community-based HIV costing. Finally, methodological challenges linked to defining the intervention's scope and outputs and measuring its inputs and costs, might hinder the productions of costs of community-based HIV interventions.
**Conclusions:** Getting a general understanding of the challenges and barriers hindering the development of costing studies of community-based HIV interventions can help design methodological and practical solutions to overcome them. Getting more accurate information on the costs of community-based HIV responses will ultimately help leverage them as an additional way to achieve global targets.

## WEPEE605

### BUILDING RESEARCH CAPACITY AND LEADERSHIP AMONG PEOPLE LIVING WITH HIV (PLHIV) THROUGH MEANINGFUL ENGAGEMENT AND STRUCTURED MENTORSHIP: INSIGHT FROM THE COMMITTEE FOR ACCESSIBLE AIDS TREATMENT, TORONTO, CANADA

H. Luyombya[1], C.S.S. Hui[1], A.T.W. Li[1,2], K. Poon[1], J.P.-H. Wong[1,3]
*[1]Committee for Accessible AIDS Treatment, Research, Toronto, Canada, [2]Regent Park Community Health Centre, Clinical, Toronto, Canada, [3]Ryerson University, Nursing, Toronto, Canadaa*

**Background:** People living with HIV (PLHIV) experience systemic barriers to meaningful engagement in research. Despite claims of valuing the lived experiences of PLHIV, there is a lack of political will and investment in research capacity building of PLHIV. Underpinned by the principles of greater involvement and meaningful engagement (GIPA/MEPA) of PLHIV, the Committee for Accessible AIDS Treatment (CAAT) established policies to hire and mentor PLHIV as peer researchers in all their community-based research (CBR) studies. In this paper, we draw on the process outcomes of the multi-year Community Champions HIV/AIDS Advocates Mobilization Project (CHAMP) to illustrate the impact of GIPA/MEPA integration and structured mentorship on PLHIV empowerment.
**Description:** Between 2011 and 2015, CHAMP hired seven PLHIV as peer research associations (PRA). GIPA/MEPA principles were integrated into CHAMP's terms of reference. CHAMP provided comprehensive and ongoing training to all PRA on CBR) design, research ethics, outreach and recruitment, focus group facilitation, survey

collection, data analysis and knowledge translation/exchange (KTE). Capacity building strategies included: establishing collaborative team culture, individual and group mentorship, and critical team dialogue. Project resources were reserved to support PRA presentations and attendances at conferences and KTE forums. Mentors also encouraged and supported PRA to take on leadership roles beyond CHAMP.
**Lessons learned:** CHAMP showed that proactive and meaningful engagement of PLHIV in CBR contributes to the success of community-based HIV research. It also contributes to PLHIV empowerment. After engaging in CHAMP, PRA had become influential HIV champions. They had also taken on leadership roles as board members in AIDS service organizations, HIV advocates in media, and founders of PLHIV driven initiatives. Some had gained employment with other organizations in research, project coordination, PLHIV support, and community education. Others had enrolled in academic studies to pursue career in social services and research.
**Conclusions/Next steps:** CHAMP demonstrated that integration of GIPA/MEPA in CBR promotes research success and PLHIV empowerment. Researcher institutes and funders should recognize the need to dedicate sufficient resources to support the meaningful engagement and capacity building of PLHIVs to maximize the real-life impact of HIV research. Further exploration on ways to support peer researchers to further their opportunities in research is needed.

## WEPEE606

### SUSTAINING HIV PREVENTION, CARE AND TREATMENT PROGRAMMES FOR THE YOUTHS IN CHIPATA DISTRICTS THROUGH YOUTH LEADERSHIP

A. Njovu Chiseni[1], M. Silukena[2]
*[1]Chisomo, Chipata, Zambia, [2]Southern African AIDS Trust (SAT), Lusaka, Zambia*
*Presenting author email: chisomoprogramme@gmail.com*

**Background:** Comprehensive HIV prevention information, access and utilization of sexual and reproductive health services, is low among the youths in Chipata district. While sexual activity is estimated to start at the age of 13, HIV prevalence among 15-24 year olds is reported to be increasing among females than in males. To increase access to such services SAT Zambia funded Chisomo to design and implement an intervention to increase youth access to SRH services with a primary focus on HIV testing and prevention.
**Description:** Implemented between January 2014 and March 2015, 5 school-based youth clubs and 5 communities based clubs were established in the district. Information and weekly activities developed with youth involvement. Previously non-functional, all 5 schools clubs are functional reaching 300 youths with information and referrals for SRHR. The Gender Transformative mapping exercise showed that youths involved in club activities demonstrated increased understanding of transmission modes of HIV as well as the risk of having many sexual partners to HIV infection. Access to HTC increased through linkages and there is reduction in the number of sexual partners among older youths on this program. Communication with parents improved due to community meetings on SRHR for the youths in the community,while teenage pregnancies and school drop outs among girls decreased within the period of implementation in the targeted schools eg one school before the interventions had 54 pregnancies in a year but after implementation reduced to 26 in 2015.Youths acquired other skills such as presentation and leadership.
**Lessons learned:** Active participation of youths in SRH and HIV prevention activities has the potential to build their ability to demand and access services. Interventions for youths must focus on building skills and making them "do it for themselves." Building a supportive environment is important. The approach can be used beyond SRH issues as it has proved to be empowering.
**Conclusions/Next steps:** There is need to scale up the intervention and have further evaluations to validate its impact for replication. The project has been extended within the districts and has raised demand from other areas in districts.

# INCREASING CAPACITY OF PUBLIC HEALTH SYSTEMS TO DELIVER HIV CARE AT SCALE

## WEPEE607

### TRANSITIONING AN HIV RESPONSE TO LOCAL OWNERSHIP, A WAY FOR ACHIEVING 90-90-90

M.J.C. Kazadi
*Catholic Relief Services, Program Impact and Quality Improvement, Baltimore, United States*
*Presenting author email: mwayabo.kazadi@crs.org*

**Background:** Between 2004 and 2013, our program supported rapid scale-up of HIV care and treatment services for poor and underserved people in ten countries across Africa, the Caribbean, and Latin America. The program established a basic package of HIV care and treatment services in resource-constrained environments with the goal of transitioning it to local partners (LPs). LPs capacities were strengthened to ensure smooth transition and sustainability of the HIV response program. This abstract compares their current antiretroviral treatment (ART) qualitative and quantitative outcomes with the program's achievements at the time of transition two years ago.
**Methods:** A qualitative evaluation; conducted in Kenya, South Africa, Tanzania and Uganda; consisted of a review of pre-transition program documents, including transition plans, and 61 phone/Skype interviews with CRS staff, LPs, current and former program staff, local partner treatment facility staff, and government health ministry staff. A common interview guide, developed in consultation with former program staff, was used in all interviews. Interviews were triangulated to account for any potential biases. A comparison of the pre-transition program's and three LPs' patient enrollment on ART for years 2012/13 and 2014 (excluding South Africa) was conducted.
**Results:** Country profiles were compiled for Uganda, Tanzania, Kenya and South Africa. The range of increase in patient enrollment on ART was between 24% and 40%. Uganda had the highest increase in patient enrollment (40%). After the transition, LPs initiated care and treatment services at 57 additional facilities and the number of patients enrolled on ART increased by 53%. Loss to follow up, retention and mortality rates were analyzed and general LPs performance was found to be at similar levels as the pre-transition program.
**Conclusions:** LPs should be provided with capacity strengthening to ensure that sustainable and quality programs are provided by local communities. LPs have shown their capability to maintain and continue providing a high-quality ART program. Under their leadership, the number of patients enrolled on ART has increased and qualitative outcomes have been maintained at preferred levels. This shows that local ownership is a critical factor in achieving the PEPFAR 3.0 and UNAIDS 90/90/90 goal by 2020.

## WEPEE608

### SCALE UP AND SUSTAINABILITY OF HIV TESTING AND COUNSELING THROUGH TASK-SHIFTING APPROACH

I. Pietersen[1], N. Taffa[2], E. Dzinotyiweyi[1], T. Bowra[2], N. Hamunime[1], F. Kaindjee-Tjituka[1], S. Sawadogo[2], A. Wolkon[2], S. Agolory[2], D. Prybylski[2], L. Iipinge[3], J. Balie[4]
*[1]Namibian Ministry of Health and Social Services, Directorate of Special Programmes, Windhoek, Namibia, [2]U.S. Centers for Disease Control and Prevention, Windhoek, Namibia, [3]Ministry of Health and Social Services of Namibia, Directorate of Special Programme, Eenhana, Namibia, [4]Ministry of Health and Social Services of Namibia, Directorate Special Disease, Keetmanshoop, Namibia*
*Presenting author email: pieterseni@nacop.net*

**Background:** In an effort to scale up HIV testing services and respond to the critical shortage of health care providers in Namibia, the President Emergency Plan for AIDS Relief (PEPFAR) and the Ministry of Health and Social Services (MOHSS) entered into a partnership to implement a task-shifting approach by introducing lay community counsellors (CCs) in public health facilities to provide HIV testing and counseling (HTC). We present findings of program evaluation after ten years of implementation and describe the process of transitioning this new cadre into formal government workforce.
**Description:** An end-term mixed methods program evaluation was conducted that triangulated results of multiple qualitative and quantitative data sources to determine the extent to which task-shifting affected the workload on other healthcare providers, the role of CCs in the scale-up of HTC in Namibia, the quality of services provided by CCs and the level of client satisfaction with their services. There were 535 CCs in service at the time of this evaluation; 70% were females; 88.4% had secondary school education; 60% worked in clinics and 42% had worked for 6 or

more years. Between 2007 and 2013, CCs conducted 98-100% of rapid HIV testing in public health facilities and quality control data indicated an average of 99.9% concordance rate for proficiency tests and 0.2% error during re-testing. Although CCs reported receiving low remunerations for their services, interview and focus group discussions (FGDs) with healthcare workers (n=84) revealed their invaluable contributions towards the scale-up of HTC, ART, TB/HIV care and PMCT programs. More than 90% of the interviewed clients (n=800) reported that CCs provided sufficient information about HTC, adhered to confidentiality and adequately explained test results.

**Lessons learned:** MOHSS, fully transitioned all 535 lay counsellors from PEPFAR support to the Government Staff Establishment as Health Assistants by end of September 2015. This program provides a best practice example of how effective multilateral partnerships, careful planning and government ownership can increase access to sustainable HIV response through task-shifting.

**Conclusions/Next steps:** Continued monitoring of the transitioned cadre to ensure that their core function of HTC services is maintained given their additional responsibilities as health assistants.

## ROLE OF COMMUNITY ORGANIZATIONS IN LINKING PEOPLE TO HIV SERVICES AND STRENGTHENING THE HEALTH SYSTEM

## WEPEE609

### THE GETTING TO ZERO SAN FRANCISCO CONSORTIUM: EARLY RESULTS

S. Weber[1], S. Buchbinder[2,3], San Francisco Getting to Zero Consortium
*[1]University of California, Family & Community Medicine, San Francisco, United States, [2]San Francisco Department of Public Health, Bridge HIV, San Francisco, United States, [3]University of California, Department of Medicine, San Francisco, United States*
*Presenting author email: susan.buchbinder@sfdph.org*

**Background:** Cities are mobilizing to address UNAIDS "90,90,90" targets. In 2013, San Francisco formed a new, independent, multisector "Getting to Zero (GTZ) consortium aiming to harness public and private efforts to reduce new HIV infections and related deaths by 90% in San Francisco by 2020.

**Description:** The consortium activated community, providers, researchers, government and private sector to develop a strategic plan and committees to address gaps in the City's response. Because 94% of infected persons are already aware of HIV status in San Francisco, the plan emphasized high yield prevention and treatment care cascade strengthening programs to address 4 problems
1) Underdeveloped systems for pre-exposure prophylaxis (PrEP);
2) Inadequate HIV care initiation for new diagnosis;
3) Gaps in retention and re-engagement in care;
4) HIV-related stigma.

**Lessons learned:** The PrEP committee coordinated
1) "Getting the word out" through media, social network, and PrEP ambassadors
2) "Kick Starting PrEP" through provider training and health navigators.
Over the last year, PrEP delivery sites increased to >30 clinics, >120 providers were trained to deliver PrEP, and community surveys of MSM report PrEP use increased from 15% to 22%. The GTZ "RAPID" committee expanded a pilot public hospital program already achieving time from HIV diagnosis to viral suppression of 65 days through same day linkage and comprehensive medical and social support to 3 sites city-wide, with over 100 enrollees. The Retention and Re-engagement committee identified
1) gaps in support services,
2) need for navigators to re-engagement clients and prevent loss to follow-up and
3) frontline worker capacity-building goals.
After one year, 73% of patients enrolled in navigation have re-linked to care; three public health clinics are implementing an evidence based reengagement and retention package. The stigma committee is developing a city-wide needs assessment through engaging communities affected by HIV. GTZ is supported by the Mayor, Director of Public Health, and private sector.

**Conclusions/Next steps:** The SF GTZ Consortium has achieved multiple process outcomes of its strategic plan including
1) increased PrEP demand and access,
2) reduced time from HIV diagnosis to viral suppression
3) increased navigator support for retention.

## WEPEE610

### SOCIAL AND FINANCIAL INCLUSION SCHEMES AND HIV VULNERABILITY REDUCTION: A STUDY OF MEN WHO HAVE SEX WITH MEN IN SOUTHERN INDIA

D. Ganju[1], S.K. Patel[1], P. Prabhakar[2], R. Adhikary[1]
*[1]Population Council, HIV and AIDS Program, New Delhi, India, [2]India HIV/AIDS Alliance, New Delhi, India*
*Presenting author email: deeganju@gmail.com*

**Background:** HIV prevention interventions are increasingly focusing on social and financial inclusion of high-risk groups as a vulnerability reduction strategy. Our study examines the association between participation in savings and ownership of social entitlements, and HIV risk, among men who have sex with men (MSM) in southern India.

**Methods:** Data are drawn from a cross-sectional survey (2014) among 1200 MSM. Social and financial inclusion was measured using a composite index of ownership of four basic entitlements: three government-promoted social entitlements (ration card, voter identity card, and Adhaar card, which allow access to social security programs and voting rights); and a bank account; those with all four entitlements were defined to have high social and financial inclusion, and others were considered to have low inclusion. Multivariate analysis explored the association between high/low social and financial inclusion and four binary HIV risk outcome indicators: HIV testing, sexually transmitted infection (STI) (past 6 months), experience of violence (past year), and consistent condom use with regular non-paying male partners (past year).

**Results:** Just half (50%) of all MSM owned all four entitlements. Around two-fifths (58%) owned a bank account and 78% had accessed all three social schemes. High social and financial inclusion was positively associated with lower HIV risk; MSM with access to all four entitlements were significantly more likely than those without access to all four entitlements to report HIV testing (Adjusted Odds Ratio [AOR] 1.6; 95%CI 0.96-2.63) and significantly less likely to report recent STI symptoms (AOR 0.3; 95%CI 0.18-0.60). High social and financial inclusion was also positively associated with higher consistent condom use with non-paying regular partners and less experience of violence.

**Conclusions:** Linking high-risk populations to social and financial inclusion schemes presents an important vulnerability reduction opportunity. Findings highlight that MSM who participate in savings and social inclusion schemes are at substantially lower STI risk, have a higher likelihood of seeking prevention services such as HIV testing, and are more likely to adopt safer sex practices. For a sustained HIV response, and to promote service utilization, prevention programs must prioritize efforts to link all MSM to social and financial inclusion schemes.

## WEPEE611

### FEMALE SEX WORKERS' AWARENESS OF AND ACCESS TO HEALTH RIGHTS: FINDINGS FROM A COMMUNITY MOBILIZATION INTERVENTION IN SOUTHERN INDIA

D. Ganju[1], S.K. Patel[1], P. Prabhakar[2], R. Adhikary[1]
*[1]Population Council, HIV and AIDS Program, New Delhi, India, [2]India HIV/AIDS Alliance, New Delhi, India*
*Presenting author email: deeganju@gmail.com*

**Background:** To promote access to HIV prevention and treatment, the health rights of key populations must be protected. Female sex workers (FSWs) bear a large burden of HIV infection, and community mobilization (CM) programs are adopting strategies to protect and promote FSWs' health rights to reduce vulnerability and demand services. This study examines awareness of health rights and associated factors, and barriers and facilitators in accessing rights, among FSWs who are part of a CM intervention for HIV prevention in Andhra Pradesh, India.

**Methods:** Data are drawn from a cross-sectional survey (2014) among 2400 FSWs who are community organization (CO) members. CM was measured based on three binary indices: collective efficacy, collective action and collective agency. Descriptive data were analyzed and odds ratios calculated using STATA 11.

**Results:** Just 45% of FSWs were aware of health rights. FSWs who reported HIV-positive status (adjusted odds ratio [AOR] 1.9; 95% CI 1.31-2.69), had availed a social protection scheme in the past year (AOR 1.4; 95% CI 1.14-1.65) and had a bank account (AOR 1.3; 95% CI 1.06-1.56) were significantly more likely to be aware of health rights than others. Similarly, high collective agency (AOR: 1.8; 95% CI 1.44-2.13) and high collective action (AOR 2.2; 95% CI 1.82-2.56) were positively associated with health rights awareness. Facilitators in claiming rights were mainly COs (57%), followed by government officials (10%) and health clinics (15%); barriers to accessing rights were neighbors (35%), spouse (19%), lack of knowledge (15%) and stigma (13%).

**Conclusions:** FSWs' awareness of health rights is limited, compromising access to preventive services and elevating vulnerability. Current prevention programs that focus on CM must be continued, given the facilitating role of COs in claiming rights, and the positive association between rights awareness and CM (collective agency and collective action) as well as participation in social/financial inclusion schemes

(which are promoted by COs). To reduce HIV risk and protect health rights, COs must prioritize building rights awareness among vulnerable FSWs, support them to claim rights and access services, and build linkages with key stakeholders--government, legal authorities and police—to facilitate service access. Additionally, barriers to claiming rights must be addressed.

## WEPEE612

### "TOGETHER, WE CAN IMPROVE": FACILITY-COMMUNITY PMTCT DATA REVIEWS IN MALAWI

J. Sherman[1], N. Buono[2], A. Ahimbisibwe[2], J. Chinkonde[1], B. Rogers[3], C. Richey[3], C. Luo[3]
*[1]UNICEF, Lilongwe, Malawi, [2]Elizabeth Glaser Paediatric AIDS Foundation, Lilongwe, Malawi, [3]UNICEF, New York, United States*
*Presenting author email: jsherman@unicef.org*

**Background:** Malawi has made good progress towards eliminating mother-to-child transmission of HIV and keeping mothers healthy and alive. New pediatric infections declined from 21,000 in 2010 to 10,000 in 2014. However, in 2014, only 64% of HIV-positive pregnant women received antiretroviral treatment (ART), and one-third discontinued their treatment ('loss to follow-up') at some point along the continuum of care.
**Description:** Under Malawi's Optimizing HIV Treatment Access Initiative, healthcare workers and community representatives in three districts addressed loss-to-follow up by jointly identifying challenges and developing strategies to better support pregnant and breastfeeding women to access services and stay in care. The process included: revitalizing 85 community-based Health Advisory Committees (HACs); convening quarterly health facility data review meetings with district officials, HAC members, community representatives, and health facility staff; and providing follow up and support to facilities and HACs.
At data review meetings, participants reviewed dashboards which illustrate quarterly performance for 13 indicators, including antenatal (ANC) attendance during the first trimester, male participation in ANC, delivery in health facilities, and retention in HIV care of women and children. Participants discussed reasons why indicators are colored red (poor performance), yellow (making some progress), or green (achieving targets). Strategies to address bottlenecks at the community and facility levels were debated and agreed upon by facility staff and community members.
**Lessons learned:** Key indicators showed improvements in facilities participating in the community-facility data reviews. For example:
· Uptake of testing of HIV-exposed infants at 12 months at Jenda Heath Centre increased from 13% in May 2015 to 100% in July 2015
· Uptake of HIV-exposed infant testing within two months of delivery increased from 0% in March 2015 to 100% in April - August 2015 at Katete Community Hospital
· Attendance at 4 ANC visits, 12-month retention of pregnant women on ART and 2 month infant HIV testing uptake increased across 31 facilities in two of the three districts.
**Conclusions/Next steps:** Joint data reviews increased community accountability and resulted in better prioritization of health interventions to improve the impact of PMTCT programs. Involving communities in joint problem solving and action provided a strong pathway to influencing behavior and practices.

# INNOVATIONS IN TESTING AND LABORATORY SUPPORT (INCLUDING POINT-OF-CARE DIAGNOSTICS)

## WEPEE613

### EVALUATION OF SECOND-LINE ART FAILURE AND ELEVATED BILIRUBIN AS A SURROGATE FOR ADHERENCE TO PROTEASE INHIBITOR BASED ART IN TWO URBAN CLINICS IN LILONGWE, MALAWI

D. Ongubo[1,2,3], R. Lim[1,2,4], H. Tweya[5], C. Stanley[1], P. Tembo[5], R. Broadhurst[1,6], S. Gugsa[5], M. Ngongondo[1], C. Speight[5], S. Phiri[5], M. Hosseinipour[1,6]
*[1]University of North Carolina Project, Lilongwe, Malawi, [2]University of North Carolina, Chapel Hill, United States, [3]Tulane University School of Public Health and Tropical Medicine, Tropical Medicine, New Orleans, United States, [4]Tufts University School of Medicine, Boston, United States, [5]Lighthouse Trust, Lilongwe, Malawi, [6]University of North Carolina School of Medicine, Chapel Hill, United States*
*Presenting author email: odenno@yahoo.co.uk*

**Background:** Atazanavir/Ritonavir (ATV/r), the current boosted protease inhibitor (PI/r) used for second line antiretroviral therapy (ART) in Malawi, causes a rise in indirect bilirubin. We sought to determine if elevated serum bilirubin, as a surrogate of ATV/r adherence, can aid in the evaluation of second line ART failure in Malawi.
**Methods:** We conducted a cross-sectional study of HIV-infected patients >13 years who were on PI/r-based second line ART in two urban clinics in Lilongwe, Malawi for at least 6 months. ART and adherence data were extracted from the Electronic Medical Records (EMR) and blood was drawn for HIV-1 RNA, serum total bilirubin, and CD4 count at a clinic visit. Second line ART failure was defined as HIV-1 RNA >1000 copies/ml. Factors associated with ART failure were assessed using multivariate logistic regression model.
**Results:** 379 HIV-infected patients on second line ART were evaluated; 373 (98.4%) were on ATV/r-based therapy. Mean age was 40.7 years (SD±10.3), and 144 (38%) were male. Mean duration on second line ART was 41.9 months (SD±27.5), bilirubin level was 2.2 mg/dL (SD±1.6), and 256 patients (67.6%) had elevated bilirubin (>1.3 mg/dL). Overall, 35 (9.2%) patients were failing on second line ART. Among the ART failing vs. non-failing patients, bilirubin was elevated in 34.3% vs. 70.9% respectively (p< 0.001), although adherence by pill count was similar (62.9% vs. 60.5%, p= 0.783). The odds of ART failure were higher for young adults aged 25-40 years (adjusted Odds Ratio (aOR) 2.5, p=0.048), those with CD4 count< 100 (aOR 17.7, p< 0.001), and those with normal bilirubin levels (aOR 5.4, p< 0.001); but were lower for the overweight/obese patients (aOR 0.3, p=0.026). Poor adherence by pill count (aOR 0.7, p=0.4) and male gender (aOR 1.2, p=0.698) were not associated with increased risk of ART failure.
**Conclusions:** Among patients receiving ATV/r therapy, bilirubin levels better predicted ART failure than pill count adherence. Strategic use of bilirubin and viral load testing to target adherence counseling and support may be a cost effective ART response monitoring strategy for young adults and those with CD4 count < 100 who are at increased risk of second line ART failure.

# TRAINING, MENTORING, AND SUPERVISION TO IMPROVE HIV PROGRAMMES

## WEPEE614

### THE NEED TO DEVELOP EFFECTIVE HIV EDUCATION FOR MEDICAL STUDENTS IN CENTRAL ASIA: INSIGHTS FROM A CROSS-SECTIONAL STUDY AMONG MEDICAL STUDENTS IN ALMATY, KAZAKHSTAN

Z. Nugmanova[1], G. Akhmetova[2], G. Kurmangalieva[3], N. Kovtunenko[1], G. Kalzhanbaeva[1], M. Abdumananova[2], L.-A. McNutt[4]
*[1]Asfendiyarov Kazakh National Medical University, HIV Infection and Infection Control, Almaty, Kazakhstan, [2]Almaty City AIDS Centre, Almaty, Kazakhstan, [3]Asfendiyarov Kazakh National Medical University, Almaty City AIDS Centre, HIV Infection and Infection Control, Almaty, Kazakhstan, [4]Institute for Health and the Environment, University at Albany, State University of New York, Albany, United States*
*Presenting author email: zhamilya.nugmanova@gmail.com*

**Background:** The HIV epidemic continues to expand in Central Asian countries including Kazakhstan. Having gained a foothold in the region through transmission in the injecting drug using communities, the epidemic has now bridged to the general population, largely through heterosexual sexual transmission. In Kazakhstan, HIV education was introduced into the medical curriculum in 2011. The purpose of the study was to learn of medical students' attitudes and behaviors around HIV and safe sexual practices.
**Methods:** Medical students in Almaty, the largest city of Kazakhstan were invited to participate in a cross-sectional study between April and November, 2013. The self-administered survey included questions about the participant's risk behaviours (e.g., injecting drug use, condom use), concerns related to HIV infection risk (e.g., medical care exposures, personal behaviours), and ability to identify HIV-positive individuals without asking their status. Bivariate analyses (Chi-square test or Fisher's Exact Test) and multivariate analysis (log-binomial regression) were conducted.
**Results:** A total of 647 medical students provided sufficient information to be included in these analyses. The majority of students were female (82.2%) and single (92.8%) with a median age of 21-22 years. Sexual activity was reported by 176 (27.2%) students with males much more likely to report sexual activity compared to females (74.8% vs. 16.9%, p< .0001). The majority of sexually active medical students believed they can determine if their partner is HIV-positive without asking or seeking a laboratory test. For males and females who were neither married, nor cohabitating, 65.6% and 68.3%, respectively, believed they usually could spot HIV-positive individuals. For married or cohabitating women, 92.6% believed they knew their partner's HIV status without asking. No association between perceived ability to ascertain HIV status and condom use was identified. In general, among non-cohabitating couples, about half of males and a quarter of females reported using condoms consistently with no significant difference based on perceived ability to ascertain HIV status of partners.

**Conclusions:** The medical students had a relatively naive perception of HIV risk, and their knowledge of risk did not translate to appropriate precautionary behaviours. Much work remains if the epidemic in Central Asia is to be contained.

## WEPEE615

### TASK SHARING: EVALUATION OF INTENSIVE CLINICAL MENTORSHIP ON MID-LEVEL PRACTITIONERS' MANAGEMENT OF TB AND HIV

S. Naikoba[1], D. Kaggwa Senjovu[1], P. Mugabe[1], P.L. Riley[2], C. Mccathy[3], D.T. Kadengye[4], S. Dalal[5]
*[1]Makerere University College of Health Sciences, Infectious Diseases Institute, Kampala, Uganda, [2]Centers for Disease Control and Prevention, Atlanta, United States, [3]National Council of State Boards of Nursing, Chicago, United States, [4]Centers for Disease Control and Prevention, Entebbe, Uganda, [5]World Health Organization, Geneva, Switzerland*
*Presenting author email: ksenjovu@idi.co.ug*

**Background:** In Uganda, majority of the health workforce are mid-level practitioners (MLPs), including clinical officers, registered nurses and midwives, most of whom are often ill-equipped to manage clinical cases of HIV/TB. The Government has embraced task-shifting and clinical mentorship of MLPs to help increase access to quality HIV/TB treatment. However, mentorship quality remains highly variable and inadequate. The study tested the effect of intensive onsite clinical mentorship on MLPs competence in clinical management of HIV/TB.
**Methods:** We conducted a cluster-randomized trial, in which four MLPs from each of five randomly selected health centers in rural Uganda were assigned and received one to one, onsite clinical mentorship for eight hours a week, every six weeks, over a nine-month period; while four MLPs from each of other similar five health centers acted as controls. All MLPs were assessed on HIV/TB knowledge, competence and practice at baseline, and immediately post-intervention. Knowledge and competence assessments respectively used case scenarios and clinical observation tools of patient care, administered at the participants' work-stations by blinded independent assessors. Statistical analysis was done using mixed effects linear regression model and accounted for the study design.
**Results:** Mean scores for knowledge increased by 14.5% (p<0.001) and competence by 27% (p<0.001) in the intervention arm relative to the control arm. There was a greater increase in knowledge scores among registered nurses/midwives (17.8%, p<0.001) compared to clinical officers (7.6%, p=0.278) in the intervention arm relative to the control arm. Similar improvements among both cadres were seen in competence scores (nurses/midwives improving by 28.3% [p<0.001] and clinical officers by 23.6% [p=0.007]). MLP in larger ART clinics showed greater improvements in both assessments. Relative to the control arm, the adjusted increase in mean knowledge scores for MLPs in the intervention arm was 16.7 (95% CI: 9.8, 23.6; p<0.001) and 25.9 (95% CI: 14.4, 37.5; p<0.001) for competence.
**Conclusions:** One-on-one clinical mentorship was an effective in improving MLP knowledge and competence in HIV/TB clinical management. As HIV treatment services scale-up, incorporating clinical mentorship as an approach for in-service training can improve the competence of the available workforce to deliver quality care.

## WEPEE616

### SUCCESSES AND CHALLENGES OF HIV MENTORING IN A PEPFAR-USAID PROGRAM IN MALAWI: THE MENTEE PERSPECTIVE

E. Chien[1], K. Phiri[2], A. Schooley[1,2], M. Chivwala[2], J. Hamilton[1,2], R. Hoffman[1]
*[1]David Geffen School of Medicine, University of California, Medicine, Infectious Disease, Los Angeles, United States, [2]Partners in Hope Medical Center, EQUIP-Malawi, Lilongwe, Malawi*
*Presenting author email: khumbophiri@gmail.com*

**Background:** HIV clinical mentoring has been utilized for capacity building in Africa, but few formal program evaluations have explored mentee perspectives on these programs. EQUIP is a PEPFAR-USAID funded program in Malawi that has been providing HIV mentoring on clinical and health systems since 2010. We sought to understand the successes and challenges of EQUIP's mentorship program through interviews with mentees.
**Methods:** From June-August 2014 we performed semi-structured, in-depth interviews with EQUIP mentees who had received mentoring for ≥1 year. Interview questions were focused on program successes and challenges and were performed in English, audio recorded, coded, and analyzed with ATLAS.ti version 7. Inductive content analysis was used to identify themes from interviews and proportions of themes were calculated.
**Results:** Fifty-two mentees from 32 health centers were interviewed. The majority of mentees were 18-40 years old (79%, N=41), 69% (N=36) were male, 50% were nurses (N=26), 29% (N=15) medical assistants, and 21% (N=11) clinical officers. When asked whether EQUIP mentoring was successful, all mentees answered affirmatively (100%, N=52). The most common benefit reported by mentees (33%, N=17) was the increase in clinical knowledge that allowed them to initiate antiretroviral therapy (ART). One-third of mentees (N=17) reported that patient encounters benefitted from EQUIP's systems mentoring, including support for supply chain (basic supplies and equipment) and the provision of minor construction at clinics allowing for improved efficiency and creating a better environment for mentoring and patient care. The most common challenge (52%, N=27) was understaffing at facilities, with mentees having multiple responsibilities during mentorship visits resulting in impaired ability to focus on learning. Mentees also reported that lack of furniture/limited space in the clinic (46%, N=24) and problems with medication stock-outs (42%, N=22) created challenges for the mentoring process.
**Conclusions:** EQUIP's systems-based mentorship and infrastructure improvements allowed for an optimized environment for clinical training. Shortages of health workers at sites pose a challenge for mentoring programs because they pull mentees away from learning experiences to perform duties outside of the HIV clinic. Evaluations of existing mentoring models are needed to continue to improve upon mentoring strategies that result in sustainable benefits for mentees, facilities, and patients.

## WEPEE617

### IMPROVING ACCESS TO HIGH-QUALITY CARE AND TREATMENT FOR PEOPLE LIVING WITH HIV (PLHIV) IN NAMIBIA USING THE ECHO (EXTENSION FOR COMMUNITY HEALTHCARE OUTCOMES) MODEL OF VIRTUAL TRAINING AND MENTORING

T. Mekonen[1], N. Hamunime[1], J. Kahwadi[1], N. Shoopala[2], G. Mutandi[2], S. Agolory[2], R. Pati[3], T. Ellerbrock[3], L. Tison[3], C. Johnson[3], S. Lee[4], S. Spedoske[4], L. Brandt[5], J. Scott[6], K. Unruh[6], W. Brian[6], J. Lehmer[7], M. Landiorio[7], K. Thornton[7], S. Kalishman[7], B. Reilley[7], B. Struminger[7]
*[1]Ministry of Health and Social Services of Namibia, Sub-Division HIV and STI Control, Windhoek, Namibia, [2]US Centers for Disease Control and Prevention, HIV Care and Treatment, Windhoek, Namibia, [3]US Centers for Disease Control and Prevention, HIV Care and Treatment, Atlanta, United States, [4]Elizabeth Glaser Pediatric AIDS Foundation (EGPAF), Medical and Scientific Affairs, Washington DC, United States, [5]International Training and Education Center for Health (I-TECH), Clinical Programs, Windhoek, Namibia, [6]University of Washington, Seattle, United States, [7]University of New Mexico (UNM), School of Medicine, Albuquerque, United States*
*Presenting author email: tadeteferi@gmail.com*

**Background:** Project ECHO ® is an educational initiative started in 2003 at the UNM whose mission is to expand access to high quality medical care in rural and underserved communities across NM and globally. The ECHO model uses a combination of videoconferencing technology for case-based learning, promotion of best practices, and monitoring of outcomes to support professional communities of learning and practice. The Namibia HIV and STI Control program adapted and implemented this model to support its goal to improve HIV care quality and capacity, empowering front line care teams with the knowledge and skills needed to ensure effective clinical management of HIV.
**Description:** The Namibia Project ECHO HIV TeleECHO Clinic, a collaboration between the Namibia MOHSS, CDC Namibia, CDC Atlanta, EGPAF, Project ECHO, and I-TECH, was launched in November 2015, and offers an opportunity for doctors, nurses, pharmacists, and laboratorians at ten pilot ART sites to meet virtually on a weekly basis for didactic training using a standard HIV care and treatment curriculum and review of complex educational cases. The didactics allow participants to earn up to one hour of continuing professional development credit each week. A one-day initiation training for providers and clinical mentors was held prior to the launch. Participants completed baseline assessments of HIV care and treatment knowledge and self-efficacy evaluations. These assessments will be repeated after completion of the nine-month pilot to evaluate if ECHO has increased clinicians' self-efficacy to provide HIV care and treatment services.
**Lessons learned:** Namibia MOHSS successfully launched the first HIV TeleECHO clinic in Africa. Six weekly clinics have been held with 102 unique participants. Fifty-one percent of participants were nurses and 12% doctors. The improving infrastructure of 3G and Wi-Fi technologies in Africa offer an opportunity to expand medical education to remote areas.
**Conclusions/Next steps:** Weekly HIV ECHO promotes interdisciplinary, case-based learning and enhances extension of technical support to remote settings. Such levels of provider participation indicate acceptance and need for this model of mentorship and training. TeleECHO clinics will be expanded to additional sites, if participation rates remain high and provider knowledge and self-efficacy improve.

## WEPEE618

### THE EFFECT OF A DIFFERENTIATED MSM SEXUAL HEALTH TRAINING PROGRAMME FOR CLINICIANS AND CLINICAL SUPPORT STAFF ON KNOWLEDGE IMPROVEMENT AND HOMOPHOBIC ATTITUDE ABATEMENT IN THE WESTERN CAPE, SOUTH AFRICA

A. Tucker[1,2], J. Liht[3], G. de Swardt[1], C. Arendse[1], J. McIntyre[1,4], H. Struthers[1,5]
*[1]ANOVA Health Institute, Johannesburg, South Africa, [2]University of Cape Town, Department of Environmental and Geographical Sciences, Cape Town, South Africa, [3]Independent Researcher, Cambridge, United Kingdom, [4]University of Cape Town, School of Public Health & Family Medicine, Cape Town, South Africa, [5]University of Cape Town, Department of Infectious Diseases, Cape Town, South Africa*
*Presenting author email: tucker@anovahealth.co.za*

**Background:** While most attention has been paid to offering clinicians MSM training in Africa, there is also a need to offer training to clinical support staff as both groups come into contact with MSM at public facilities. Here it is also important to interrogate a key assumption underpinning clinic training programmes; that an improvement in MSM knowledge is accompanied by a reduction in homophobic attitudes.
**Methods:** In 2015, 83 clinicians and 113 support staff from 5 clinics in the Western Cape undertook *Health4Men MSM Competency training*. Both clinicians and support staff undertook 'foundational' training covering the need to acknowledge and appropriately address MSM health needs. Clinicians also undertook 'advanced' training covering technical details for appropriate sexual health and HIV care. Surveys were administered prior and immediately after training.
**Results:** Post-training improvements in foundational knowledge and reductions in homophobia were significant for both clinicians and support staff (p< 0.001).
Foundational knowledge scores were lower for support staff compared to clinicians prior to training (p< 0.01) and remained so post-training (p< 0.05). Among support staff, the relationship between foundational knowledge and homophobic attitudes was significant pre-training (r (113) = -0.427, p< 0.001) and post-training (r (113) = -0.388, p< 0.001).
For clinicians, advanced knowledge improved overall (p< 0.001) but its association with homophobic attitudes was only significant pre-training (r (83) = -0.266 p< 0.05) and not post-training (r (83) = -0.097, p=0.384).
Participants that scored above 82% in foundational knowledge had a significantly greater probability of showing improvement in homophobia score compared to those who scored below this threshold (p< 0.01).
**Conclusions:** A need clearly exists not just for clinicians but also support staff to undergo MSM training, with support staff scoring significantly lower in foundational knowledge than clinicians before and after training. Data also shows that a reduction in homophobic attitudes is most apparent only after a threshold in foundational knowledge score is obtained for both groups. Clinicians' advanced knowledge necessary to offer appropriate care need not be associated with a reduction in homophobic attitudes. Policy workers must appreciate the relationship between knowledge improvement and homophobia abatement is not straightforward when considering future training initiatives.

## WEPEE619

### BETTER HIV CARE AND ENGAGED HEALTH WORKERS: A MIXED METHODS STUDY FROM TANZANIA

J. Kundy[1], T. Wuliji[2], P. Magesa[3], A. Nswila[3], S. Lunsford[4], I. Kitzantides[5]
*[1]University Research Co., LLC, USAID ASSIST Project, Dar es Salaam, Tanzania, United Republic of, [2]WHO, Monrovia, Liberia, [3]Ministry of Health and Social Welfare, Dar es Salaam, Tanzania, United Republic of, [4]EnCompass LLC, USAID ASSIST Project, Bethesda, United States, [5]Independent Consultant, Boston, United States*
*Presenting author email: jkundy@urc-chs.com*

**Background:** Low- and middle-income countries are experiencing notable heath worker shortages, challenging the provision of quality HIV services at scale. In 2008, the Tanzanian Ministry of Health and Social Welfare declared a health workforce crisis and a plan to increase the workforce by five-fold. By 2013, there were 64,449 health workers, an increase from 47,000 in 2007. An engaged worker is one who is involved, satisfied, and has enthusiasm for their work. Engaged workers also perform better and are more productive. This study sought to identify characteristics of an engaged health workforce and influencing factors; explore the relationship between engagement, performance and retention; and validate a tool to measure engagement.
**Methods:** Self-administered surveys were completed by 1330 health workers; qualitative interviews were conducted with 50 health workers. Facility-level data were gathered via a survey and record review at 183 randomly selected facilities from 27 districts and 6 regions. Principle Components and Cluster Analyses were performed. Content analysis was conducted.
**Results:** Four characteristics of an engaged worker were identified: being a change agent (α 0.75); being accountable (α 0.69); job satisfaction (α 0.72); and equitable and client-centered care (α 0.58). Perceived support from supervisors (α 0.70) and perceived adequacy of competencies to perform (α 0.60) were found to influence engagement. Qualitative data indicate that feedback and praise from colleagues and patients impacted engagement. Engagement was not associated with perceived adequacy of resources, but interviews revealed that insufficient human and material resources can contribute to job dissatisfaction. Less than 10% of health workers intended to change jobs in the next two years; engagement characteristics did not determine health worker intentions. Some interview respondents felt changing jobs would negatively impact services while others shared that leaving a job for further education was necessary for professional advancement.
**Conclusions:** By engaging health workers, the existing health workforce can be optimized to improve and scale-up quality HIV services. Strengthening relationships with immediate supervisors, supporting quality improvement efforts, and strengthening peer learning to improve competencies can improve health workforce engagement.

## WEPEE620

### AN ASSESSMENT OF PERCEIVED AND OBJECTIVE HIV KNOWLEDGE AMONG COUNSELORS PROVIDING HIV DIAGNOSTIC SERVICES IN SOUTH-EASTERN MALAWI

K. Simon[1,2], M.H. Kim[1,2], A. Mazenga[1], X. Yu[3], P.N. Kazembe[1,2], S. Ahmed[1,2]
*[1]Baylor College of Medicine Children's Foundation Malawi, Lilongwe, Malawi, [2]Baylor International Pediatric AIDS Initiative at Texas Children's Hospital, Baylor College of Medicine, Houston, United States, [3]Baylor-UT Houston Center for AIDS Research, Design and Analysis Core, Houston, United States*
*Presenting author email: simon.katier@gmail.com*

**Background:** Reaching the UNAIDS 90-90-90 goals requires significant scale-up in the number of staff trained to provide HIV diagnostic services (HDS) including HIV Testing and Counseling (HTC), Early Infant Diagnosis (EID), and viral load (VL). Training and mentorship are necessary to ensure high quality service delivery, however there is a paucity of evidence describing current knowledge gaps to guide these efforts. Our objective in this study is to assess perceived and objective knowledge of HDS among active counselors in Malawi.
**Methods:** We provided a self-administered anonymous survey to counselors employed by the Malawi Ministry of Health (MOH) in six districts within Malawi's Southeast Zone. Perceived knowledge was assessed using a standard four-point Likert scale and objective knowledge measured using multiple-choice problem-based scenarios based on MOH guidelines. The survey was administered over a 6-month period in 2015. Data was summarized by descriptive statistics (mean, sd, frequency and percentage). Spearman correlation coefficient was calculated to assess the correlation between objective and perceived knowledge using summarized scores by topic.
**Results:** 216 counselors from 66 facilities (catchment area population=1.9 million) participated in the study. Mean(SD) age was 36(5.8) and 73(33.8%) were female. 170(77.3%) had provided testing services in the previous month. The majority (68%) rated themselves as "knowledgeable" or "expert" on self-assessment. Mean (SD) overall score on objective assessment was 84%(9%) Scores were highest on questions about early infant diagnosis (EID) (91%) and HTC (84%). Scores were lower on questions about viral load (69%). Overall, perceived and objective knowledge were positively correlated (0.23, p=0.0008). There was a positive correlation between perceived and objective knowledge in the areas of viral load (0.32, p< 0.0001) and HTC (0.26, p< 0.0001). Perceived and objective EID knowledge was not significantly correlated.
**Conclusions:** Counselors providing HIV diagnostic services in Malawi meet expected knowledge standards and perform particularly well on questions addressing EID and HTC. Knowledge gaps in viral load testing should be addressed. The correlation between perceived and objective knowledge suggests that counselor self-assessment may be an appropriate surrogate for objective assessment in setting training priorities.

## WEPEE621

### ASSESSMENT OF KNOWLEDGE OF PEDIATRIC HIV CARE AND TREATMENT AMONG HEALTH WORKERS IN SOUTH-EASTERN MALAWI

K. Simon[1,2], M.H. Kim[1,2], A. Mazenga[3], X. Yu[4], P.N. Kazembe[1,2], S. Ahmed[1,2]
*[1]Baylor College of Medicine Children's Foundation Malawi, Lilongwe, Malawi, [2]Baylor International Pediatric AIDS Initiative at Texas Children's Hospital, Baylor College of Medicine, Houston, United States, [3]College of Medicine Children's Foundation Malawi, Lilongwe, Malawi, [4]Design and Analysis Core, Baylor-UT Houston Center for AIDS Research, Houston, United States*
*Presenting author email: simon.katier@gmail.com*

**Background:** 2.6 million children under 15 are living with HIV globally, but 1.8 million lack access to lifesaving treatment. To close the treatment gap and provide quality care, well-trained health workers (HCW) are needed. Focused mentorship can equip HCWs to diagnose HIV in children and administer quality care, but there is a paucity of research on specific mentorship needs. Our objective was to assess self-perceived and objective knowledge of pediatric HIV topics (PMTCT/EID, diagnosis, HIV-related diseases, staging, treatment/monitoring) among HCW caring for HIV-infected patients in Southeastern Malawi.
**Methods:** We provided a self-administered anonymous survey to HCWs in six districts (catchment area 1.9 million) within Malawi's Southeast Zone. Perceived knowledge was assessed using a standard four-point Likert scale (1-beginner,2-somewhat knowledgeable, 3-knowledgeable, 4-expert) and objective knowledge measured using multiple-choice problem-based scenarios based on 2014 Malawi Ministry Of Health ART-PMTCT guidelines defining expected standard knowledge. The survey was piloted, refined, and administered over a 6-month period. Data was entered into an MSAccess database and summarized by descriptive statistics (mean, sd, frequency, percentage). Spearman correlation coefficient was calculated to assess correlation between objective and perceived knowledge using summarized scores by topic.
**Results:** 292 HCW from 66 facilities participated. Mean(SD) age was 32.9(10.1) years, 56.9% were female, 32.9% were clinicians (Medical/Clinical Officers and Medical Assistants) and 66.4% nurses. Most providers (79.1%) had treated patients with HIV in the previous month. Mean(SD) self-assessed knowledge score was 2.79 (0.66). Mean(SD) objective score was 71.9%(6.4%). Scores were highest in EID/PMTCT (81%) and poor in pediatric TB(47%). Treatment/monitoring and staging were also suboptimal. Overall perceived and objective knowledge were positively correlated(p< 0.0001).

| Topic | Self-Assessment Score (mean, sd) | Objective Assessment Score (mean, sd) | Coefficient | p-value |
|---|---|---|---|---|
| EID/PMTCT | 2.9 (0.86) | 81% | 0.24 | 0.69 |
| Diagnosis | 2.87 (0.79) | 76% | 0.22 | 0.0002 |
| HIV-Related Diseases | 2.64 (0.73) | 71% | 0.14 | 0.0191 |
| TB (subtopic) | 2.25 (0.88) | 47% | | |
| Staging | 2.72 (0.87) | 68% | 0.23 | <0.0001 |
| Treatment and Monitoring | 2.81 (0.71) | 64% | 0.26 | <0.0001 |
| Overall Score | 2.79 (0.66) | 71.9% (6.4) | 0.31 | <0.0001 |

*[Perceived and Objective Assessment Results]*

**Conclusions:** HCW in Malawi have knowledge deficits in pediatric HIV, with notable gaps in tuberculosis, treatment/monitoring, and staging. Focused attention to these may improve quality care for HIV-infected children. The correlation between perceived and objective knowledge suggests that self-assessment may be an appropriate surrogate for objective assessment in setting training priorities.

## WEPEE622

### PARTNERING TO STRENGTHEN OBSTETRICS AND GYNECOLOGY (OB/GYN) TRAINING AS A WAY TO PREVENT NEW HIV INFECTIONS IN ETHIOPIA

N. Wendwessen Hailemariyam, B. Nigatu
*St. Paul's Hospital Millennium Medical College, Department of Obstetrics and Gynecology, Addis Ababa, Ethiopia*
*Presenting author email: nebiyou2014@yahoo.com*

**Background:** Ethiopia is home to approximately 800,000 people living with HIV (PLHIV). Young women are between two and six times as likely to be HIV-infected compared to young men. HIV prevalence among pregnant women has steadily decreased in the last decade and sites that provide prevention of mother-to-child transmission (PMTCT) services have expanded. However, PMTCT coverage and uptake by women in Ethiopia is still low. In 2011, only 33.4% of pregnant HIV-positive women received PMTCT services and only 9.3% of HIV-exposed infants received ARV prophylaxis.
**Description:** In 2013, the American International Health Alliance (AIHA) began managing an institutional, voluntary, peer-to-peer institutional partnership between the University of Michigan in the United States and St. Paul Hospital Millennium Medical College (SPHMMC), a tertiary level referral hospital, in Addis Ababa. The partnership provided pre-service and in-service training to Ob/Gyn residents to improve the overall quality of women's healthcare, with a specific focus on PMTCT and cervical cancer screening and treatment.
**Lessons learned:** In two years, the institutional partnership enabled SPHMMC Ob/Gyn residents to significantly increase the number of pregnant women who received PMTCT services. For example, the number of pregnant women who tested for HIV and knew their status during pregnancy, labor and delivery, and the postpartum period increased by more than 45.6% from 2,587 to 3,767. Services for HIV-exposed infants also improved: the number who received an HIV test within two months of birth increased from zero to 44; the number of HIV-exposed infants who received co-trimoxazole prophylaxis within two months of birth more than doubled, and the number who received antiretroviral (ARV) prophylaxis more than tripled. The Ob/Gyn residents provided cervical cancer screening, which had never been provided before, to 1,192 women ages 30-49. Almost 20% had precancerous or cancerous lesions and were able to receive treatment.
**Conclusions/Next steps:** AIHA's twinning model, which depends on voluntary contributions of time and technical assistance from both partner institutions, has the potential to build specialized healthcare worker capacity and significantly improve and expand access to HIV prevention, care, and treatment services.

## WEPEE623

### LAY COUNSELORS EMBRACE NEW TECHNOLOGY IN HIV CARE IN BOTSWANA

B.W. Sento[1], N. Modise[1], T. Molelekwa[2], M. Boima[3], M. Balosang[4], W. Bapati[1], G. Pampiri[1]
*[1]Tebelopele VCT, Programs, Gaborone, Botswana, [2]Tebelopele VCT, Business Development, Gaborone, Botswana, [3]Tebelopele VCT, Monitoring and Evaluation, Gaborone, Botswana, [4]Tebelopele VCT, Projects, Gaborone, Botswana*
*Presenting author email: sentob@tebelopele.org.bw*

**Background:** HIV Care is improving over time. This is in line with the global goal of 90-90-90. HIV care is also increasingly becoming costly, especially in less developed countries like Botswana. New technology is continuously being introduced with the aim of facilitating affordable, efficient, and improvement of management of HIV patients. Task-shifting continues to be an option in Botswana. Lay Counsellors are now involved in electronic data collection using tablets and performing Point of Care CD4 testing using a portable PIMA Analyser.
**Description:** Tebelopele Voluntary Counselling and Testing Centre (TVCT) is participating in the Botswana Combination Prevention Project (BCPP), which seeks to investigate the impact of combination of HIV prevention services in reducing HIV incidence over 36 months in 16-64 year old residents of Botswana. TVCT provides HIV testing and counselling to all residence aged 16 - 64 years in the fifteen communities across Botswana. TVCT recruited and trained seventy (70) Lay Counsellors and deployed them to provide home and mobile testing to eligible residents in each of the communities. Lay Counsellors use tablets for electronic data collection, and perform Point of Care CD4 testing for clients with HIV positive results. Later during the implementation of the study, Lay Counsellors were also trained in the preparation of Dry Blood Spot for Viral Load Testing. Quality Assurance procedures both for data collection and laboratory processes have been established. Electronic data collection provides timely data to guide client management decisions. Point of Care CD4 eliminates the challenge of transporting samples to far off laboratories and the delay in the provision of the CD4 test result back to the patient.
**Lessons learned:** The Lay Counsellor cadre continues to be effective and cost-effective cadre in the provision of HIV prevention and care interventions. Lay Counsellors are trainable and easily adapt to change and innovation.
**Conclusions/Next steps:** With the diminishing resources, governments should continue to adopt and harness the Lay Counsellor cadre as per the 2015 WHO HIV Testing Services Guidelines. The current funding landscape dictates that governments and NGOs do more with less. Optimising efficiency in a cost effective manner is key to sustainability.

### SCARLET ALLIANCE NATIONAL TRAINING AND ASSESSMENT PROGRAM, DIPLOMA IN COMMUNITY DEVELOPMENT: PROVIDING A NATIONALLY CONSISTENT, BEST PRACTICE APPROACH TO PEER EDUCATION FOR SEX WORKERS

J. Kim[1,2]
*[1]Scarlet Alliance, Australian Sex Workers Association, Migration Project, Newtown, Australia, [2]Scarlet Alliance National Training and Assessment Program, SANTAP, Sydney, Australia*
*Presenting author email: mpm@scarletalliance.org.au*

**Background:** Sex worker peer-education has been central to Australia's successful HIV/STI response and its value and effectiveness is widely recognised as best practice, including by the UN and Government. The role is complex and highly skilled, yet the skills and knowledge of peer-educators is not acknowledged or valued.
**Description:** Scarlet Alliance National Training and Assessment Program (SANTAP) aims to increase the workforce development of, and number of, trained, qualified sex worker peer-educators. SANTAP sets a national benchmark for sex worker peer-education, providing a set of nationally-recognised qualifications as well as nationally-consistent, best-practice approach to sex worker peer-education. Sex worker peer-educators with at least one year experience are guided by qualified sex worker peer-assessor to identify their skills, prior experience and learning process as evidence to attain a national qualification-the Diploma of Community Development.
**Lessons learned:** It is often the case peer-educators have acquired skills and knowledge informally in the workplace with little access to nationally structured systematic training and assessment. SANTAP provides an opportunity to hone existing skills and examine complexities involved in providing peer-education to their own community and assists in maximising the effectiveness of peer-education programs at sex worker organisations through provision of workforce development and formal accreditation of staff.
**Conclusions/Next steps:** Importantly, the SANTAP is an opportunity for peer-educators to have their work validated and confirmed. The skills and knowledge that inform the complex work of sex work peer-education have never been formally recognised. Recognition assessment makes it possible for sex worker peer-educators to experience respect for and validation of, their skills and competence.

# HIV WORKFORCE: ENUMERATION, REMUNERATION, MOBILITY, TASK SHIFTING AND MULTISKILLING

## WEPEE625

### THE SOCIAL ACCEPTABILITY OF COMMUNITY HEALTH WORKER-LED HIV-TESTING: FINDINGS FROM A MIXED-METHODS STUDY IN SWAZILAND

M. Vaikath[1], T. Baernighhausen[1,2], S. Sibandze[3], M. Mkhwanazi[4], J.-W. de Neve[1], T. Bossert[1], P. Geldsetzer[1]
*[1]Harvard T H Chan School of Public Health, Department of Global Health and Population, Boston, United States, [2]University of KwaZulu Natal, Africa Centre for Health and Population Studies, Mtubatuba, South Africa, [3]Afya Health Management Associates, Manzini, Swaziland, [4]University of Swaziland, Matsapa, Swaziland*

**Background:** Community health worker (CHW)-led HIV testing has been proposed as a key strategy for increasing HIV testing coverage. The CHW Performance Logic Model posits that CHWs' relationship with the community impacts CHW performance. Community trust in CHWs is likely to be of particular importance for CHW-led HIV testing. To inform the model, this mixed-methods study aims to ascertain trust in CHWs and attitudes towards CHW-led HIV testing in Swaziland.
**Methods:** The data collection tools were designed to assess factors impacting CHW performance as posited by the CHW Performance Logic Model. From June to September 2015, we conducted a household survey covering 2,000 households across 100 enumeration areas using two-stage stratified cluster random sampling in two of Swaziland's four regions. We also carried out 19 semi-structured focus group discussions (FGDs) with an average of nine participants, stratified by gender, in four rural and four urban communities in Swaziland. Qualitative data was coded and analyzed using an inductive approach.
**Results:** 48.7% (905/1,859) of household survey respondents stated that they do *not* trust national CHWs (called RHMs) with confidential medical information. Having ever been visited by a RHM was highly predictive of distrusting RHMs with confidential medical information (OR: 0.32; 95% CI: 0.25-0.42; p< 0.001). Similarly, FGD participants expressed hesitance toward receiving HIV tests from RHMs due to concerns around confidentiality and inadequate training of RHMs in providing HIV tests. Two main reasons for confidentiality concerns were that RHMs are
1) members of the same community as their clients, and
2) mostly female. Social acceptability of HIV testing from CHWs in general, as opposed to RHMs, was higher with 67.7% (1,468/2,168) of household survey respondents trusting CHWs with medical information.
**Conclusions:** Low social acceptability is a significant obstacle to CHW-led HIV testing in Swaziland, particularly if implemented through RHMs. Our findings suggest that increasing community trust in RHMs' technical skills and their ability to maintain confidentiality will substantially improve social acceptability, and thus their performance for HIV services. Furthermore, assigning RHMs to work in communities other than the ones in which they reside will likely increase uptake of services for high stigma conditions.

## WEPEE626

### AN ASSESSMENT OF DECENTRALIZATION OF ANTIRETROVIRAL THERAPY IN MYANMAR

H.-N. Oo[1], M. Fujita[2], D. Yu[3], Y. Nyunt[4], M. Thant[5], M.M. Sein[5], Y. Minn[5], E.K. Soe[5], K.Y. Oo[6], T.T. Htay[6], P. Bollen[2], H. Aung[2], M.T.A. Hsan[2], S. Ammassari[7], V. Andreeva[8], E. Murphy[7]
*[1]Ministry of Health Myanmar, Department of Public Health, Nay Pyi Taw, Myanmar, [2]WHO Country Office for Myanmar, Yangon, Myanmar, [3]WHO, SEARO, Delhi, India, [4]National AIDS Programme, MOH Myanmar, Nay Pye Taw, Myanmar, [5]NAP, MOH Myanmar, Nay Pye Taw, Myanmar, [6]National Health Lab, Yangon, Myanmar, [7]UNAIDS Country Office for Myanmar, Yangon, Myanmar, [8]UNAIDS Regional Support Team Asia Pacific, Bangkok, Thailand*
*Presenting author email: tunnyuntoo13@gmail.com*

**Background:** In the context of expansion plans for improved antiretroviral therapy (ART) coverage, the National AIDS Programme (NAP) under the Ministry of Health Myanmar, with support from WHO, UNAIDS, CDC/PEPFAR, and with involvement of the implementing partners, conducted an ART decentralization assessment of 13 decentralized ART sites across the country in March 2015 by a joint team of national and international experts.
**Methods:** The decentralized (DC) ART sites' staff were interviewed using an assessment questionnaire to understand the operations, capacity and management of the sites. Focus group discussions were organized with the site director, partners, and the representatives of PLHIV networks and NGOs, to understand issues related to successes, challenges, and proposed actions to improve access to ART. Short patient interviews were conducted with 3-5 PLHIV who were receiving services from the respective sites to understand their perception of quality of and satisfaction with services.
**Results:** Planning, and coordination partnerships have been established at central and district levels, but not yet at the ART centre/site level. Patient transfer procedures are generally well understood and followed. Task shifting was observed in some DC sites. Most of the essential services: HIV testing and counselling, TB screening and treatment, PMTCT and STI services were available on site, or through referral. In general, patients reported satisfaction with services in the DC sites. However, viral load (VL) and dry blood spots (DBS) for early infant diagnosis (EID) are not currently available in most of the sites. CD4 testing was not available for most of the sites, to which quality assurance (QA) has not been observed. There is generally a lack of system to assess the performance of the DC site, especially with respect to the cascade of HIV services.
**Conclusions:** Initial success has been achieved in a number of the ART decentralized sites with scale up of HIV service provision and enhanced staff'scapacity in Myanmar. Continuous efforts are required to further strengthen planning, coordination, partnerships, monitoring and supervision, and expand key services for HIV identification, ART initiation, retention and virologic suppression for all people in need.

## WEPEE627

### HUMAN RESOURCE FOR MANAGEMENT OF HIV/AIDS: A REVIEW OF NURSE-INITIATED AND MANAGED ANTI-ETROVIRAL THERAPY (NIMART) IN PRIMARY HEALTH CENTERS (PHC) IN AKWA IBOM STATE, NIGERIA

K. Olatunbosun[1], Y. Ogundare[2], K. Odey[1], J. Umana[1], D. Onaiwu[1], F. Eyam[2]
*[1]FHI 360, Prevention Care and Treatment, Uyo, Nigeria, [2]FHI 360, Program Management, Uyo, Nigeria*
*Presenting author email: yemisiogundare@gmail.com*

**Background:** The provision of antiretroviral treatment in Akwa Ibom is mainly offered in secondary facilities with physicians providing ART management. However, the paucity of physicians as well as skewed distribution of healthcare workers toward urban areas resulted in rural areas being underserved. This has restricted access to ART treatment in some parts of the state. In line with the task shifting

strategy to increase access to high quality HIV/AIDS services, NIMART was introduced in Akwa Ibom to increase access to ART services in primary health centers (PHC) in the state.
**Description:** Nurses in existing PHC already offering PMTCT services were trained in ART management. The PHCs were upgraded structurally with the provision of service points, laboratory equipment, consumables, data management tools and commodities. Continuous Quality improvement activities were provided by Strengthening Integrated Delivery of HIV/AIDS Services (SIDHAS) and Ministry of Health Clinicians to ensure conformity with the national guidelines on ART. Prompt referrals for specialized care where necessary were ensured in the NIMART PHCs.
**Lessons learned:** The 9 SIDHAS supported NIMART sites commenced ART management in June 2014 with 14 clients placed on treatment. This progressively increased to 3236 clients by November 2015. Quarterly Data Quality Assessment conducted in June 2014 - November 2015 showed comparably the data quality in NIMART site as 85%, and Secondary health facilities at 89%.
Also retention rates across NIMART health facilities ranged from 50 - 78% compared to Secondary health facilities ranging from 55 - 80%.
Findings also showed that management of HIV/AIDS can be implemented at PHCs by Nurses and lower cadre of staff when properly mentored and supported, however documentation of HIV services was reported as voluminous.
**Conclusions/Next steps:** Implementing agencies to ensure existing ART training manuals are modified to fit the need of nurses and other cadre of staff in the PHCs. Documentation of ART services in the PHCs to be further simplified to ensure staff workload is manageable. Continuous mentorship and quality improvement in the PHCs should be maintained to ensure outcomes of ART management in the PHCs remain comparable to higher levels of healthcare.

## WEPEE628

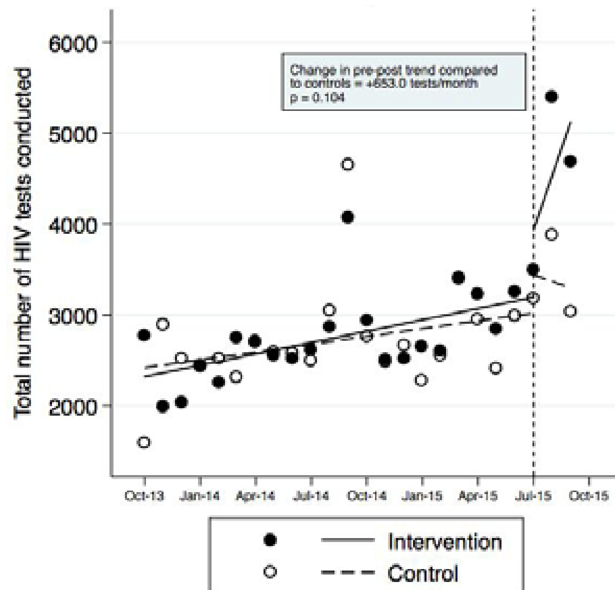
### THE HIV DIAGNOSTIC ASSISTANT: PRELIMINARY FINDINGS FROM A NOVEL HIV TESTING CADRE

K. Simon[1,2], R. Flick[1,3,4], S. Ahmed[1,2], K. Namachapa[5], M. Harawa[1], J. Mhango[1], T. Beyene[1], A. Kabwinja[1], P. Kazembe[1,2], M. Kim[1,2]
*[1]Baylor College of Medicine Children's Foundation Malawi, Lilongwe, Malawi, [2]Baylor International Pediatric AIDS Initiative at Texas Children's Hospital, Baylor College of Medicine, Houston, United States, [3]University of North Carolina Project Malawi, Lilongwe, Malawi, [4]University of Colorado School of Medicine, Denver, United States, [5]Malawi Ministry of Health, Department of HIV/AIDS, Lilongwe, Malawi*
*Presenting author email: harawafm@gmail.com*

**Background:** New strategies for HIV testing and counselling (HTC) are needed to meet UNAID's 90-90-90 targets. One strategy being piloted in Malawi is the HIV diagnostic assistant (HDA) cadre. Previously, health workers were trained to provide HTC, but maintained additional responsibilities. In contrast, HDAs are tasked almost exclusively with HIV testing. In this observational study, we describe the early impact of HDA deployment.
**Methods:** Thirteen health facilities in one district of Malawi's Southeast Zone deployed HDAs in July 2015. We used routine data to assess number of HIV tests done per month pre-post HDA deployment. Thirteen controls in the Southeast Zone were matched to treatment sites according to mean level and rate of change in pre-intervention (Oct 2013-Jun 2015) monthly HIV tests, with control sites paired at p>0.10 to minimize bias. Multiple-group interrupted time series analysis was conducted on the aggregated number of HIV tests done at treatment and control sites to compare pre-post trends.
**Results:** Treatment and control groups were similar at baseline (Table 1). We detected a monthly increase in the pre-post monthly HIV tests trend compared to the change observed in controls (+653 tests/month, p=0.104, Figure 1). Post-intervention, treatment sites recorded more HIV tests (4,528 vs 3,367, p=0.0657) and a higher rate of increase in monthly HIV testing (593.4 vs -71.5, p=0.2031) compared to controls.

| Pre-intervention | Treatment | Control | p-value |
|---|---|---|---|
| Number of HIV tests done per month—mean | 2,735 | 2,703 | 0.4221 |
| Monthly rate of change of HIV tests done—mean | 41.6 | 28.7 | 0.5380 |
| **Post-intervention** | | | |
| Number of HIV tests done per month—mean | 4,528 | 3,367 | 0.0657 |
| Monthly rate of change of HIV tests done—mean | 593.4 | -71.5 | 0.2031 |

*[Table 1. Pre-post number and rate of change in monthly HIV tests]*



*[Figure 1. Impact of HDA deployment, treatment vs. control sites]*

**Conclusions:** Following HDA deployment there was a trend towards an increase in pre-post HIV monthly testing relative to control sites. However, the small number of post-intervention observations limits the significance of our findings. Further analysis is needed as data becomes available to better ascertain the magnitude and durability of the effect.

## HUMAN RESOURCES DEVELOPMENT FOR A MULTI-SECTORAL RESPONSE

## WEPEE629

### THE GAIA SCHOLARSHIP PROGRAM: ENFORCING HEALTH WORKER PUBLIC SERVICE COMMITMENTS TO INCREASE HUMAN RESOURCES FOR HEALTH AND IMPROVE ACCESS TO QUALITY HEALTH CARE IN MALAWI

C. Mwangonde[1], E. Geoffroy[2], E. Schell[2,3], J. Jere[1], T. Schafer[2]
*[1]Global AIDS Interfaith Alliance, Limbe, Malawi, [2]Global AIDS Interfaith Alliance (GAIA), San Rafael, United States, [3]University of California, San Francicso, United States*
*Presenting author email: chimwangonde@gaiamalawi.org*

**Background:** To achieve Sustainable Development Goal (SDG) 3, good health and well-being, and the UNAIDS 90-90-90 targets, it is necessary to build stable, fully-staffed health care systems that provide universal access to and equity in essential health services. In Malawi, a country where the public sector nursing vacancy rate is 65%, every nurse graduated and retained in the public sector is a vital human resource.
**Description:** For the past decade, in collaboration with the Malawi Ministry of Health, and since 2010 with funding from USAID, The Global AIDS Interfaith Alliance (GAIA) Nursing Scholarship Program has worked towards:
1. increasing the number of nurses graduating from Malawian nursing institutions and
2. increasing the number of nurses employed and retained in Malawi's public health sector. By providing scholarships comprising tuition, stipends, material and psychosocial support, GAIA has supported 485 Malawian nursing students, primarily orphaned young women, who have agreed to a public sector service commitment of four to five years post-graduation.
**Lessons learned:** By the end of 2015, 239 scholars had graduated (96% graduation rate) of which 194 have attained licensure (98% licensing rate) and 45 are preparing for licensure exams. One third of all GAIA scholar graduates have been sponsored by the public sector to upgrade their degree post-graduation.
One hundred and twenty-two scholars, monitored at public health facility deployments biannually post-graduation, have completed their public sector service commitment (95% completion rate). Moreover, 81% (29/36) of those who have completed at least three years of work post-commitment have been retained in the public sector. Of the 16 scholars no longer working in the public sector post-commitment,
14 continue to work as nurses within Malawi at private health centers or NGOs. Two have been lost to follow-up.

Author Index

| | Scholars successfully completing public sector service commitment | Scholars completing public sector service commitment + 1 year | Scholars completing public sector service commitment + 2 years | Scholars completing public sector service commitment + 3 years |
|---|---|---|---|---|
| % Retained in the public sector | 95% | 94% | 91% | 81% |

*[Scholars retained in the public sector 0-3 years post service commitment]*

**Conclusions/Next steps:** Programs that emphasize and enforce public sector service post-graduation can be successful in ensuring nurses remain working where needed most. The service commitment affords nurses the opportunity to become established within the public health system, which provides secure employment and opportunities to advance academic qualifications.

## WEPEE630

### SCALING ACCESS TO FAMILY FOCUSED ANC/PMTCT B+ SERVICES VIA TASK-SHARING TO PRIVATE SECTOR NURSES AND MIDWIVES: ADVANCING POLICY AND ACTUALIZING COMMUNITY-BASED PRACTICE TO DELIVER AN AIDS-FREE GENERATION

J. White[1], K. Kapesa[2], K. Malima[3], E. Oywer[4]
*[1]International Health Division, Abt Associates Inc, Bethesda, United States, [2]PRINMAT, CEO's Office, Dar es Salaam, Tanzania, United Republic of, [3]TNMC, Board of Directors (until 2014), Dar es Salaam, Tanzania, United Republic of, [4]Ministry of Health, Nursing Council Registrar's Office (until 2014), Nairobi, Kenya*
*Presenting author email: james_white@abtassoc.com*

**Background:** Nurses and midwives are often available in rural and underserved areas where prescribing physicians are lacking. However, they often have limited formal authority to prescribe and deliver antiretroviral therapy (ART). The USAID-funded SHOPS project implemented a two year policy and practice intervention enabling Tanzania's nurses and midwives to prescribe and deliver the full spectrum of PMTCT and ART services.
**Description:** At the national level, SHOPS supported the Tanzanian Nursing and Midwifery Council (TNMC) to develop the country's first scope of practice (SOP) for nurses and midwives. The project then implemented the SOP's expanded prescribing and task-sharing authorities for PMTCT/ART by integrating family-focused PMTCT and maternal ART services at 53 community-based facilities affiliated with the Private Nurses and Midwives Association of Tanzania (PRINMAT). During just the first nine months of service implementation (June 2014 through Feb 2015) PRINMAT facilities provided HIV testing to a total of 18,942 men and women as part of integrated ANC/PMTCT B+ services. The facilities also progressively increased the number of HIV positive pregnant women and HIV exposed infants accessing integrated care via PRINMAT's private sector network.
**Lessons learned:** Despite early challenges in routinely accessing PMTCT commodities, the project empowered nurses and midwives to play a much stronger and formal role in Tanzania's AIDS response. Community-level implementation further demonstrated that nurses and midwives working in the private sector can be successfully leveraged for rapid scale-up and extension of HTS, PMTCT and ART services to both women and men as part of family-focused integrated services.

| Service Indicator | June 2014 through March 2015 |
|---|---|
| # of HTS provided to pregnant women | 7,017 |
| # of individual HIV Testing Services (HTS) provided | 18,942 |
| Increase in provision of HTS from baseline | Nine fold increase (from 227 HTS /mnth to 2,105/mnth) |
| Pregnant HIV+ women enrolled on ART | 317 |
| Number of HIV+ deliveries | 157 |
| Increase in number of HIV+ deliveries receiving PMTCT intervention via PRINMAT | 5.6 fold increase (from 3/mnth to 17/mnth) |
| Number of HIV exposed infants initiated on short course NVP | 130 |
| # of HIV exposed infants provided with early infant diagnosis (EID) | 47 |
| # of HIV exposed infants testing negative 6 weeks mark post-natal | 42 (89.3%) |

*[Outcomes of PRINMAT Integrated ANC/PMTCT B+ Service Delivery]*

**Conclusions/Next steps:** Nurses and midwives in the private sector have a latent capacity to be unleashed by expanded scopes of practice that advance task-sharing and multi-sectoral collaboration towards scaling PMTCT B+ and ART services. Mobilizing these health cadres can be a much-needed game-changer in rural and underserved communities of high-HIV prevalence countries pursuing the 90-90-90 goals.

## WEPEE631

### HIGH LEVELS OF SELF-REPORTED PERSONAL ACCOMPLISHMENT AMONGST THREE CADRES OF HEALTHCARE WORKERS: BASELINE FINDINGS FROM THE FIRST ROUND OF THE HPTN 071 (POPART) STIGMA ANCILLARY STUDY

A. Harper[1], S. Krishnaratne[2], H. Mathema[3], D. Milimo[4], P. Lilliston[5], G. Hoddinott[3], T. Mainga[4], M. Moyo[4], A. Schaap[4], V. Bond[2,4], J. Hargreaves[6], A. Stangle[5], On behalf of the HPTN071 (PopART) Study Team
*[1]Desmond Tutu TB Centre, Department of Paediatrics and Child Health, Stellenbosch University, Social Sciences, Cape Town, South Africa, [2]London School of Hygiene and Tropical Medicine, Department of Global Health and Development, London, United Kingdom, [3]Desmond Tutu TB Centre, Social Sciences, Cape Town, South Africa, [4]Zambart, Lusaka, Zambia, [5]International Center for Research on Women, Washington, United States, [6]London School of Hygiene and Tropical Medicine, Centre for Evaluation, London, United Kingdom*
*Presenting author email: harpera@sun.ac.za*

**Background:** There is increased recognition of the impact of work stress and burnout on healthcare workers (HCWs) in low and middle income countries with a high burden of disease and limited resources. HPTN 071 (PopART) is a cluster-randomised trial evaluating the impact of a multi-component intervention, including universal access to ART, on HIV incidence. This ancillary study examined levels of HIV-related stigma and job stress among HCWs, and included an open cohort of HCWs involved in implementing the PopART intervention. We describe self-reported job stress amongst three cadres of HCWs in Zambia and South Africa at baseline (entrance into the cohort).
**Methods:** Three types of HCWs participated: (a) facility-based worker, (b) community-based care worker, and (c) Community HIV-Care Providers (CHiPs - employed to deliver the community-based PopART intervention). The former two categories of workers were government employees while CHiPS were employed by the study. All workers were invited to participate. The questionnaire was self-administered using electronic data capture devices. Job stress is assessed using the Maslach Burnout Inventory (adapted for language competency) which groups items into three domains:
1) emotional exhaustion
2) depersonalisation (in attitudes toward clients) and
3) personal accomplishment. Items are displayed in English with translations available on the device or from the research assistant.
**Results:** Of 2818 eligible HCW's, 66.5% participated at baseline, a total of 1,875 HCWs (Zambia = 1,244; South Africa = 631) 300 also reported living with HIV. Self-reported levels of personal accomplishment are uniformly high, (82% in Zambia; 77% in South Africa). Low levels of job stress are reported across job cadres in both countries. Moderate to high levels of emotional exhaustion were reported by 37% of HCWs in Zambia and 33% of HCWs in South Africa. Moderate to high levels of depersonalization were reported by 10% of Zambian HCWs and 15% of South African HCWs.
**Conclusions:** The high levels of personal accomplishment reported by HCW's may build resilience and offer a protective effect from burnout. The surprisingly low levels of job stress in these high burden contexts is encouraging. Additional research is needed to understand how HCWs perceived accomplishments impact quality of care and service delivery.

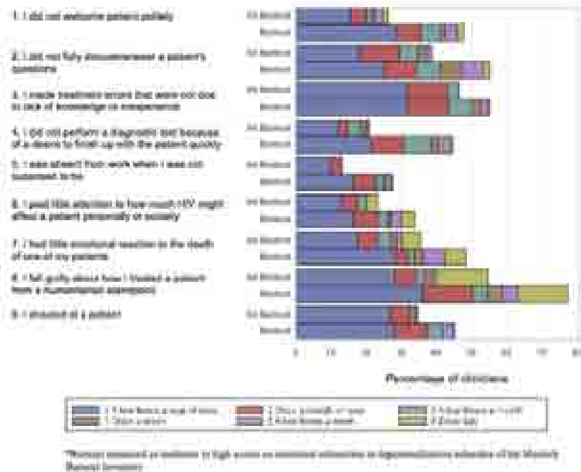
## WEPEE632

### BURNOUT AND SELF-REPORTED PATIENT CARE AMONGST HEALTH CARE WORKERS PROVIDING HIV CARE IN MALAWI

M. Kim[1,2], A. Mazenga[1], K. Simon[1,2], X. Yu[3], S. Ahmed[1,2], P. Nyasulu[1], G. Zomba[4], P. Kazembe[1], E. Abrams[5]
*[1]Baylor College of Medicine Children's Foundation Malawi, Lilongwe, Malawi, [2]Baylor International Pediatric AIDS Initiative at Texas Children's Hospital, Baylor College of Medicine, Houston, United States, [3]Design and Analysis Core, Baylor-UT Houston Center for AIDS Research, Houston, United States, [4]HIV Unit, Malawi Ministry of Health, Lilongwe, Malawi, [5]ICAP-Columbia University, Mailman School of Public Health, New York, United States*
*Presenting author email: mariakim01@gmail.com*

**Background:** Since 2002 there has been a > 100-fold increase in the number of persons accessing antiretroviral treatment, without a concomitant increase in healthcare workers (HCWs) providing HIV care. Burnout is a syndrome of emotional exhaustion (EE), depersonalization (DP), and a sense of low personal accomplishment (PA). Burnout amongst HCWs may have a negative impact on services. The aim of this study was to determine the prevalence of burnout amongst HCWs in Malawi and explore its relationship to self-reported patient care practices.
**Methods:** Cross-sectional study amongst HCWs providing HIV care in 66 facilities, across 6 high HIV prevalence districts in southeastern Malawi. Burnout was mea-

sured using the Maslach Burnout Inventory and defined as scores in the mid-high range on the EE or DP subscales. Nine questions developed for this study assessed self-reported patient care. Surveys were administered anonymously. Data was summarized by descriptive statistics (mean, SD, frequency). Chi-square test was used to test the association between burnout and any self-reported suboptimal patient care practices.
**Results:** Among 292 HCWs (mean (SD) age 33 (10) years, 57% female, 56% married) 56% met criterion for burnout. In the three dimensions of burnout, 47% reported moderate-high EE, 28% moderate-high DP. Participants reported several suboptimal patient care practices including making mistakes in treatment not due to lack of knowledge/experience (51%), shouting at patients (41%), and not performing diagnostic tests due to a desire to finish up quickly (34%). Compared with non-burned-out HCWs burned-out HCWs were significantly more likely to self-report any suboptimal patient care practice (93% vs. 81%; P=0.001).



[Figure 1. Relationship of burnout to self-reported suboptimal patient care practices]

**Conclusions:** Burnout was common among HCWs providing HIV care and was associated with self-reported suboptimal patient care. Additional research is needed to identify factors that contribute to or protect against burnout to inform the development of strategies to reduce burnout.

# NOVEL EMPIRICAL APPROACHES TO EVALUATE THE IMPACT OF HIV PROGRAMMES AND POLICIES, INCLUDING REGRESSION DISCONTINUITY AND OTHER NON-EXPERIMENTAL APPROACHES

## WEPEE633

### SAMPLING DESIGN ALTERNATIVES IN POPULATION-BASED SURVEY FOR HIV PROGRAMMING

L. Busang[1], N. Forcheh[2], F. Mwangemi[3], L. Mokgatle[2], J. Mafeni[4]
[1]African Comprehensive HIV/AIDS Partnership, Research, Monitoring and Evaluation, Gaborone, Botswana, [2]University of Botswana, Statistics, Gaborone, Botswana, [3]African Comprehensive HIV/AIDS Partnership, Programmes, Gaborone, Botswana, [4]African Comprehensive HIV/AIDS Partnership, Gaborone, Botswana
Presenting author email: lesego@achap.org

**Background:** Household surveys based on census sampling frame are a standard practice in conducting surveys. However cost of their fieldwork is too high for many organisations and programmes relying on surveys for programmes management. This makes achieving more results with less resources difficult hence the need for alternative approaches. This study establish if alternative approach (mapped public places sampling frame) can provide comparable results to that of household survey for circumcision study.
**Methods:** Two quantitative cross-sectional studies were conducted simultaneously on the same locations using the same questionnaire. However the study participants were sampled using two different approaches. The first approach was the use of Census sampling frame. The second sampling approach used mapped public places as a sampling frame for respondents. Inclusion criterion were males aged 15 to 49 years randomly selected and agreeing to participate in the study through an informed consent process. Binary logistics regression was used to establish factors influencing uptake of circumcision (alpha set at 0.05).
**Results:** The age distribution of the two samples were significantly different from each other, p< 0.001. The proportion of men circumcised was not significantly different (p=0.563) between the samples at 22% and 23% from household and public places samples respectively. Logistic regression table below show consistent odds ratios though with discordances.

| Variable | Household OR | Public Places OR |
|---|---|---|
| Service access knowledge | 3.106 | 3.488 |
| Penis appearance | 3.105 | 3.093 |
| Educational (Tertiary / No Tertiary) | 2.17 | * |
| Eligibility knowledge | 1.967 | * |
| Excessive bleeding fear | 1.775 | 1.901 |
| Penis hygiene | 1.661 | * |
| Believe pain during procedure | 0.325 | 0.39 |
| Believe pain AFTER procedure | * | 0.332 |
| Risk death | 0.224 | * |
| Constant | 0.04 | 0.13 |
| *not significant | | |

*[Odds Ratio of being circumcised by sample group]*

**Conclusions:** Mapped public places sampling frames can be used for estimation, however, care should be taken to ensure that age groups and other demographics of interest are controlled for during sampling.

### A HOME-BASED REHABILITATION INTERVENTION FOR ADULTS LIVING WITH HIV AND DISABILITY: A RANDOMIZED CONTROLLED TRIAL

S. Cobbing[1], J. Hanass-Hancock[2], H. Myezwa[3]
[1]University of KwaZulu Natal, Physiotherapy, Durban, South Africa, [2]University of KwaZulu Natal, HEARD, Durban, South Africa, [3]University of the Witwatersrand, Physiotherapy, Johannesburg, South Africa
Presenting author email: cobbing@ukzn.ac.za

**Background:** South Africa has the highest number of people living with HIV (PLHIV) globally. With an increased uptake of ART, PLHIV are living longer lives but this is accompanied by an increased risk of disabilities. Effective management of disability requires rehabilitation interventions. Rehabilitation professionals are in short supply in South Africa's public sector, which makes it challenging to deliver rehabilitative care close to patients' homes. There is a dearth of literature related to home-based rehabilitation (HBR) interventions for PLHIV in South Africa.
**Methods:** A single blind randomised controlled trial was conducted in a public health care setting in KwaZulu-Natal. Adult participants on ART for more than six months, who were identified with mobility-related challenges, were recruited. A total of 76 participants were allocated to either the intervention or control group. The intervention group received weekly rehabilitation in their homes for 16 weeks, provided by home-based care workers, trained and supervised by a qualified physiotherapist. Participants in the control group received the standard of care as well as written advice on healthy living. Pre and post intervention testing assessed disability (WHODAS 2.0), quality of life (WHOQOL-HIV BREF), functional mobility (Rivermead Mobility Index) and functional capacity (6 Minute Walk Test).
**Results:** Participants in the HBR intervention group improved in overall quality of life as well as the physical quality of life domain (p< 0.05). WHODAS 2.0 scores showed improvements in perceived disability for both study groups. No significant improvements were recorded with the Rivermead Mobility Index, while both groups improved significantly in the total distance walked in the 6 Minute Walk Test (p< 0.05). Although the participants in the intervention group improved more than the participants in the control group across all four outcome measures, between-group differences were non-significant.
**Conclusions:** HBR for PLHIV is a safe means of addressing the functional deficits experienced by this population and appears to improve their quality of life. It was of further interest to note the improvements in the control group who received health information only. This task-shifting approach is a feasible method of addressing disability, however the impact of such interventions needs to be tested on a larger scale.

### ASSESSING INDIVIDUAL AND DISSEMINATED EFFECTS OF A NETWORK INTERVENTION FOR HIV PREVENTION

D. Spiegelman[1], S. Vermund[2], S. Friedman[3], A. Buchanan[4]
*[1]Harvard T.H. Chan School of Public Health, Epidemiology, Biostatistics, Nutrition and Global Health, Boston, United States, [2]Vanderbilt University School of Medicine, Vanderbilt Institute for Global Health and Department of Pediatrics, Nashville, United States, [3]National Development and Research Institutes, Institute for Infectious Disease Research, New York, United States, [4]Harvard T.H. Chan School of Public Health, Biostatistics and Epidemiology, Boston, United States*
*Presenting author email: stdls@hsph.harvard.edu*

**Background:** In network-randomized trials, some group members randomized to an intervention receive the intervention directly while others receive it indirectly if at all. The individual effect is that among directly treated participants; the disseminated effect is that among participants in the same network as those directly treated. Estimation of crude effects (i.e., average treatment effect compared among all study participants) and composite effects (i.e., sum of the separate individual and spillover effects) is of interest.
**Methods:** We developed new statistical methods for point and interval estimation of individual, disseminated and composite effects in studies with a network feature. We proved that the average effect is less than or equal to the composite effect. Even when the networks are randomized to the intervention, the validity of some of these quantities of interest do not benefit from randomization, and we developed causal inference methods for estimating these quantities. We estimated individual and disseminated effects in HPTN037, a Phase III network-randomized HIV prevention trial among injection drug users and their network members. The index participant in a treated network received a repeated educational intervention. Log-binomial models were used to estimate relative risks and 95% confidence intervals (CIs), accounting for correlations using a robust variance. The specific risk behavior was *shared cotton* (an indicator of sharing needle/syringe "works").
**Results:** HPTN037 included 515 participants, of whom 48% were in treated networks and 52% were in control networks. There was a 44% reduction in risk (95% CI= 0.37, 0.84) for "sharing works" (crude effect), while the adjusted composite effect was more strongly protective (adjusted rate ratio (aRR)= 0.37, 95% CI = 0.19, 0.75). The individual effect trended towards protection (aRR=0.70, 95% CI = 0.33, 1.47), while the disseminated effect among non-treated network members in the intervention arm compared to control was significantly protective (aRR= 0.62, 95% CI = 0.40, 0.95).
**Conclusions:** This analysis highlights the utility of these novel methods to quantify the complex information available in network-based interventions. These new methods will improve best preventative practices among people who inject drugs and their risk networks by leveraging network-based effects.

## WEPEE636

### THE ROLE AND IMPACT OF DATA QUALITY IN IMPLEMENTATION SCIENCE RESEARCH: EXAMPLE FROM AN ASSESSMENT OF PMTCT SERVICES IN CÔTE D'IVOIRE

S. Granato[1,2], S. Dali[2,3], J. Robinson[1,2,4], I. Ahoba[5], D. Aka[5], S. Kouyaté[1,2], D. Billy[1,2], S. Kalibala[6], A. Koné[1,2], S. Gloyd[1,2]
*[1]Health Alliance International, Seattle, United States, [2]University of Washington, Department of Global Health, Seattle, United States, [3]Insitut National de la Santé Publique, Abidjan, Cote D'Ivoire, [4]University of Washington, School of Social Work, Seattle, United States, [5]Ministère de la Santé et de l'Hygiène Publique, Programme National de Lutte contre le SIDA, Abidjan, Cote D'Ivoire, [6]Population Council, Washington, United States*
*Presenting author email: sgranato@uw.edu*

**Background:** Implementation science aims to understand and improve health care delivery systems in context. However, intervention identification and impact assessment can be confounded by poor data quality of health information systems. This paper discusses the role and impact of poor data quality on conducting implementation science research in the context of a national assessment and intervention project on PMTCT in Côte d'Ivoire.
**Methods:** We randomly selected a cross-sectional sample of 30 Ivorian health facilities providing PMTCT services. At each site we retrospectively assessed all available primary data sources for eight PMTCT-related indicators for the period June 2011-May 2012 to determine data completeness. We also compared on-site data with data reported in the national PMTCT database to identify the degree of concordance between site-based data and nationally reported data. Finally, we compared data from different data sources including patient charts to identify incongruence between sources and to identify potential areas for data quality improvement.
**Results:** Across the 30 site sample, 2,628 of 2,880 data elements (91.25%) were available on site in at least one of 18 different official and unofficial data sources. Of 240 values compared between on-site data and nationally reported data, 97 (40%) were concordant, 69 (29%) were discordant with lower values reported at the facility level, and 74 (31%) were discordant with lower values reported at the national level. We also found incongruent data when comparing registry data with data on the availability of and representativeness of patient charts.
**Conclusions:** Data quality issues suggest that facility staff, health directors, and national policy makers may be misinformed regarding performance at all levels of the PMTCT cascade. Implementation science research aiming to improve service delivery should:
1) review data for completeness, concordance, consistency and representativeness to create a more informed overall picture of service bottlenecks;
2) data quality concerns that illuminate systemic weaknesses in the intervention phase and address these as part of the intervention.
These two recommendations will help improve reliability of the measurement of impact of the intervention while improving data quality as part of the overall health system.

## WEPEE637

### CAUSAL EFFECTS OF TIME TO ART INITIATION ON THE SURVIVAL OF HIV-INFECTED PATIENTS IN A REGIONAL REFERRAL HOSPITAL IN WESTERN KENYA, 2011-2014

K.K. Mutai, B. Burmen
*Kenya Medical Research Institute, Centre for Global Health Research, HIV Implementation Science and Services, Kisumu, Kenya*
*Presenting author email: kkmuttai@gmail.com*

**Background:** Estimating causal inferences in observational studies with time varying covariates require methods that can address complexities such as non-random allocation of patients' to treatment groups, possible censoring of, exposure variables e.g., time to antiretroviral therapy (ART) initiation, and outcome variables e.g., mortality. We set out to evaluate the causal effects of time to ART initiation on the survival of human immunodeficiency (HIV) infected patients in a longitudinal observational study.
**Methods:** We conducted a retrospective review of patient records of HIV-infected adults' aged≥15 years enrolled between January 2011 and December 2013 at Jaramogi Oginga Odinga Teaching and Referral Hospital, Kenya. ART was initiated as per the WHO 2010 ART guidelines. Time to ART initiation was defined as time from the earliest date of ART eligibility to date of ART initiation and patients were categorized as 'early-initiators' (ART initiation within 12 weeks of eligibility) or 'late- initiators' (ART initiated after). Occurrence rate of death was computed as the number of deaths per 100 person-years of follow-up in each group (early/late initiators).
The hazard of death among early-initiators versus late-initiators was computed using unadjusted Cox proportional hazards (Cox-PH) model, adjusted Cox-PH model (adjusting for age, gender, CD4 category, WHO stage, education level, marital status, and weight) and marginal structural Cox-PH model.
**Results:** Of 786 patients enrolled; 606 (77%) were ART-eligible. Of 444 (73%) patients with documented time to ART initiation, 41 (9%) were late-initiators. With 3 deaths and 9.2 person-years of follow-up; 31 deaths and 115.8 person-years of follow-up; the occurrence rate of death was 33 and 27 per 100 person-years among late-initiators compared to early-initiators respectively.
Compared to early-initiators, the hazard of dying among late-initiators computed using unadjusted Cox-PH model, adjusted Cox-PH model and marginal structural Cox-PH model was 1.6 (95% CI 0.5-5.4) and 1.9 (95% CI 0.5-6.7) and 3.2 (95% CI 1.7-6.4) respectively.
**Conclusions:** Marginal structural Cox-PH model, adjusting for and assuming no unmeasured confounders, revealed that delay in time to ART initiation increases the hazard for death. Clinical longitudinal observational studies should employ appropriate models in estimating treatment effects for accurate conclusions.

## WEPEE638

### FACTORS ASSOCIATED WITH RETENTION OF HIV EXPOSED CHILDREN AT 18 MONTHS: A LONGITUDINAL COHORT STUDY, MAHARASHTRA, INDIA

A.S. Hegde[1], T. Mulik[2], R.S. Gupta[2], D.C.S. Reddy[3], N. Seguy[4]
*[1]WHO, National AIDS Control Organisation, Thane, India, [2]National AIDS Control Organisation, Basic Service Division, Delhi, India, [3]WHO, Delhi, India, [4]WHO, CDS, Delhi, India*
*Presenting author email: drashahegde@gmail.com*

**Background:** As per the National guidelines in India, all HIV positive pregnant women are initiated on lifelong ART irrespective of CD4 count or WHO clinical staging. During postnatal period, HIV exposed babies are followed up for early infant diagnosis (EID) starting at 6 weeks of age, aiming to the final antibody testing at 18 months of age. Minimizing loss to follow up among HIV positive pregnant women

and their infants in the postnatal period is crucial to ensure elimination. To ensure retention at every step of the PMTCT service, a line list of HIV positive pregnant women was developed in Maharashtra province in India. To understand the gaps in the cascade, the cohort data form the line list of HIV positive mothers and their babies from 2008-2013 were analysed. The objective of this study is to identify the possible socio-demographic characteristics and other factors associated with retention in care of HIV exposed children at the age of 18 months.
**Description:** Data on 10,697 HIV positive mothers from 2008-2014 were analysed. Retention in care at 18 months of age was determined by assessing whether the child was followed up until the age of 18 months for antibody testing. If a child was tested or was confirmed to have died before the age of 18 months, it was considered to be in care, otherwise it was considered as lost to follow up (LTFU). Logistic regression analyses were performed to assess factors associated with retention in care at 18 months.
**Lessons learned:** Out of 10697 live births to HIV positive women, 77% children were either tested at 18 months or confirmed to have died, and 23% were LTFU. Children with HIV negative fathers were 25% more likely to be LTFU (AOR=1.24, 95% CI=1.1-1.4), whereas children whose father's HIV status was not known were 74% more likely to be LTFU (AOR=1.74, 95% CI=1.49-2.03), compared to children who had HVI positive fathers.
**Conclusions/Next steps:** Findings highlight the need to to closely monitor the children of sero-discordant couple to ensure regular follow up and higher retention at 18 months of age. Couple counselling and disclosure need to be encouraged by the program.

## WEPEE639

### USING COMPUTER SIMULATION TO OPTIMIZE DESIGN OF A MULTILEVEL HIV INTERVENTION: A CROSS-DISCIPLINARY EXPERIMENT

A.R. Patel[1,2], K. Ruggles[1], S. Schensul[3], J. Schensul[4], A. Sarna[5], Q. Zhou[1], K.A. Nucifora[1], R.S. Braithwaite[1]
*[1]New York University, New York, United States, [2]University of British Columbia, Vancouver, Canada, [3]University of Connecticut, Storrs, United States, [4]Institute of Community Research, Hartford, United States, [5]Population Council, Delhi, India*
*Presenting author email: anikpatel10@gmail.com*

**Background:** Multilevel interventions (for example, including both treatment and prevention goals at individual, group and community levels) are instrumental in efforts to end the HIV pandemic. However, multilevel interventions may be composed of a number of constituent interventions or risk targets, and it is unclear which ones should be included. Our objective was to apply a quantitative optimization approach to inform multilevel intervention trials targeting alcohol-using HIV patients on ART in India.
**Methods:** We developed, parameterized and calibrated a simulation of HIV disease progression and transmission to estimate the effect of one or more single focus interventions on HIV infections averted, costs, and quality-adjusted life expectancy (QALY). Input data came from an extensive literature review and analyses of Maharashtra state level HIV patient data collected from 2007- 2014 (n=23,701). We included 15 unique constituent interventions defined by target, level and duration, which could be combined into 32,768 possible configurations of the multilevel intervention. To identify the optimal configurations, we estimated 20-year clinical and economic outcomes and compared their value ($/QALY) using three criteria: greatest health benefit given budget constraints, greatest health benefit for the money (not considering budget constraints), and consideration of the extent to which additional research could enhance value for India.
**Results:** We found that 23% of the possible 32,768 configurations of a multilevel intervention were cost saving, and 27% offered favorable value (< $15,000/QALY based on WHO standards). Given budget constraints, the optimal multi-level intervention would have constituents including *individual alcohol counseling*, *individual text-message support* and *group counseling for sex-risk*. Not considering budget constraints, the optimal multi-level intervention would have constituents including *individual alcohol counseling*, *individual text-message support*, group counseling for *sex-risk, individual counseling for sex-risk and community level sex-risk intervention*. Explicitly considering the value of additional research, the top intervention for the trial would be *individual depression counseling alone*.
**Conclusions:** This study was the first to use operations research methods to inform how to constitute a multilevel intervention with a vast array of possible constituents. Using simulations to predict the best investment for clinical trials can be extended to broader HIV epidemics or other clinical settings.

## WEPEE640

### APPLICATION OF A SOCIAL NETWORK INTERVENTION TO IDENTIFY OPINION LEADERS AMONG PEER HEALTH WORKERS TO SUPPORT UPTAKE OF HIV SERVICES IN KENYA

T. Odeny[1,2], M. Petersen[3], C. Muga[1], E. Bukusi[4], E. Geng[5]
*[1]Kenya Medical Research Institute, Center for Microbiology Research, Kisumu, Kenya, [2]University of Washington, Epidemiology, Seattle, United States, [3]University of California, Biostatistics and Epidemiology, Berkeley, United States, [4]Kenya Medical Research Institute, Nairobi, Kenya, [5]University of California, Medicine, San Francisco, United States*
*Presenting author email: taodeny@gmail.com*

**Background:** Using opinion leaders to accelerate the dissemination of evidence-based public health practices is a promising strategy for closing the gap between evidence and practice. Network interventions (using social network data to accelerate behavior change or improve organizational performance) are a promising but under-explored strategy. We used mobile phone technology to quickly and inexpensively map a social network and identify opinion leaders among a cadre of peer health workers in a large HIV program in western Kenya.
**Methods:** In May 2015, we administered a five-item socio-metric survey to community health assistants using a mobile phone SMS-based questionnaire. We used the survey results to construct and characterize a social network of opinion leaders among respondents. We calculated the extent to which a particular respondent was a popular point of reference ("degree centrality"), and the influence of a respondent within the network ("eigenvector centrality").
**Results:** Surveys were returned by 38/39 (97%) of peer health workers contacted; 52% were female. Median survey response time (from initial "trigger" SMS to survey completion) was 13.75 minutes (inter-quartile range: 8.8-38.7). Each incoming and outgoing SMS cost US$0.01 to relay through a secure cloud-based SMS aggregator, for a total cost of US$2.85 for outgoing and US$2.82 for incoming response messages.Resulting social networks were dense - there was a high number of connections as a proportion of the maximum possible connections. The most connected individuals (high degree centrality) were also the most influential (high eigenvector centrality). The distribution of influence (eigenvector centrality) was highly skewed in favor of a single influential individual at each site.
**Conclusions:** Leveraging increasing access to SMS technology, we mapped the network of influence in a cadre of peer health workers associated with a HIV care and treatment program in Kenya. Using mobile phones, we carried out a socio-metric survey over the course of three days and at a cost of 8.46 dollars. Efficient mapping of social networks opens the door to reproducible, feasible and efficient empirically-based network interventions that seek to spread novel practices and behaviors among health care workers.

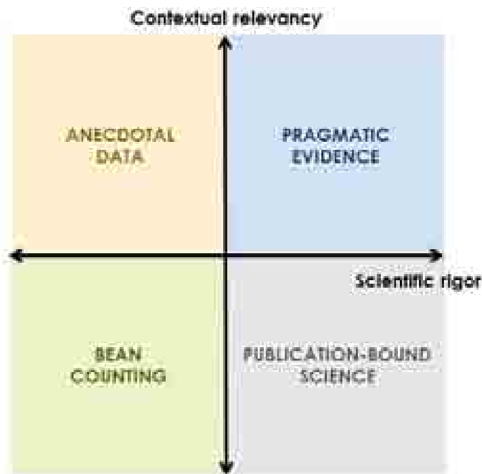
# CAPACITY-BUILDING IN IMPLEMENTATION RESEARCH

## WEPEE641

### INTEGRATOR-BASED IMPLEMENTATION RESEARCH: LOCALLY-LED CAPACITY BUILDING FOR DEVELOPMENT OF PRAGMATIC EVIDENCE ON HIV PROGRAM PERFORMANCE

K. Webb, V. Chitiyo, P. Nesara, T. Maphosa, S. Page-Mtongwiza, D. Patel, B. Engelsmann
*Organisation for Public Health Interventions and Development (OPHID) Trust, Harare, Zimbabwe*
*Presenting author email: kwebb@ophid.co.zw*

**Background:** Quality implementation research requires integration of contextual knowledge of local implementers with evidence-based interventions, using rigorous scientific methods. Reaching 90-90-90 goals requires generation of pragmatic evidence regarding program effectiveness in near-to-real time. Local capacity to conduct implementation research remains limited in many high-burden settings, resulting in missed opportunities. We describe our experience as a local organization actively pursuing implementation research in Zimbabwe's HIV Care and Treatment Program.
**Description:** OPHID Trust uses an integrator-based approach to building capacity for implementation research in Zimbabwe's HIV Care and Treatment Program, actively involving multiple stakeholders including Ministry of Health and Child Care (MOHCC), academic collaborators, a dedicated operational research unit, program and strategic-information staff, to facility and community-level stakeholders. Research and assessment topics are derived from current trends within routinely collected program data. Results are disseminated among MOHCC structures at multiple levels in near-to-real time.



*[Quadrant diagram depicting relationship between contextual relevancy and scientific rigor for generation of pragmatic evidence]*

**Lessons learned:** Since 2011, in collaboration with its partners, OPHID has led the registration and completion of 6 study protocols; conducted over 10 targeted program assessments and presented more than 30 abstracts at national, regional, and international AIDS conferences. Research and evaluation findings have contributed to national program and policy approaches; development and testing of new interventions to increase demand, uptake and retention; identification of bottlenecks and real-time corrections in Zimbabwe's HIV Care and Treatment Program. Challenges of local capacity building in implementation research include effective use of theoretical frameworks, 'resource-rigor' compromises in design and data management, publication of findings and supporting active involvement of academic and MOHCC collaborators within resource-constrained program contexts.
**Conclusions/Next steps:** OPHID's integrator-based approach to implementation research has proved a low-cost, productive model for the generation of pragmatic evidence in Zimbabwe's HIV Care and Treatment Program. Investment in local implementation research capacity, particularly within MOHCC structures, should be prioritized for sustainable and context-relevant evidence generation on HIV programs.

## DATA SYSTEMS TO SUPPORT HIV PREVENTION AND CARE

### WEPEE642

### ENHANCING SYSTEMS FOR MONITORING AND EVALUATION OF OPTION B+ REGIMEN FOR PMTCT: RWANDA EXPERIENCE IN RETROSPECTIVE COHORT MONITORING

J.O. Twahirwa Rwema[1], P. Mugwaneza[1], J.D.D. Ndagijimana Ntwali[1], E. Remera[1], S. Nsanzimana[1], F. Mwanyumba[2], HIV Exposed Children Born between September - November 2013
*[1]Rwanda Biomedical Center, Institute of HIV/AIDS Prevention and Control ( IHDPC), Kigali, Rwanda, [2]UNICEF, Kigali, Rwanda*
*Presenting author email: twaholiver@gmail.com*

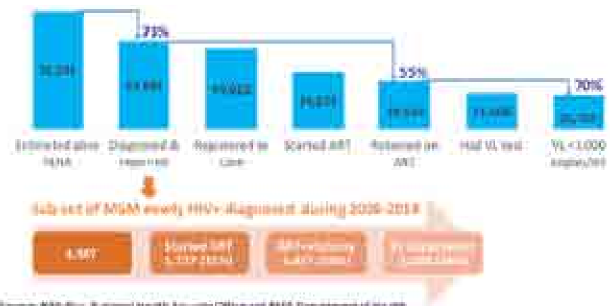
**Background:** In order to cost-effectively monitor implementation of option B+ and measure MTCT rate by 18 months, routine PMTCT data for HIV infected mothers and exposed infants was collected using longitudinal registers. Data from a three month retrospective cohort of HIV exposed children born 18 months prior to the survey was analyzed to determine MTCT rate.
**Description:** The purpose of the Programme is to determine the final status of HIV exposed infants and the impact of option B+ in reducing MTCT rate. Longitudinal registers were designed to monitor HIV infected mother-infant pairs enrolled in PMTCT facilities using unique identification numbers: The ANC and ART number of the mother and the registration number of the exposed child are linked. Key indicators were integrated in the registers and monitored at 6 weeks, 9 months and 18 months, the time when exposed infants are offered HIV testing. Health workers were trained, mentored on data collection and use, for service improvement.
**Lessons learned:** In June 2015, Rwanda conducted a retrospective review of data from a three month cohort of mother-infant pairs enrolled between Sept-November, 2013 to estimate MTCT rate by 18 months. Data on key PMTCT indicators from 402 (81%) facilities was extracted and analyzed using STATA. A total of 2,378 HIV exposed infants were enrolled, of whom 2146 (95%) received ARV prophylaxis at birth. At six weeks, 1.11% (25/2251) were HIV positive; 0.63% (15/2378) died and 3.11% (74/2378) missed appointments. At 9 months, 0.24% (5/2092) were HIV positive, 0.79% (18/2268) died; 4.32% (98/2268) were lost to follow-up. At 18 months, 0.26% (5/1925) were HIV positive; 0.47% (10/2119) died and 3.87% (82/2119) were lost to follow-up. The overall MTCT rate by 18 months was 1.79 (35/1955), 1.95% (43/2198) deaths and 7.57% (180/2378) loss to follow-ups.
**Conclusions/Next steps:** The low MTCT rate is an indication that Rwanda is close to eliminating MTCT. Use of longitudinal registers and retrospective cohort analysis is a cost-effective method of monitoring option B+ implementation and in determining MTCT rate and other outcomes. Results from other ongoing studies on HIV exposed infants will show the determinants of HIV transmission, loss to follow up and deaths.

### WEPEE643

### UTILIZATION OF MULTIPLE STRATEGIC INFORMATION TO INFORM PROGRAM BARRIERS TOWARDS THE "ENDING AIDS BY 2020" IN BANGKOK, THAILAND

P. Chaiphosri[1], S. Jantaramanee[2], S. Tanpradech[3], K. Nilsum[1], P. Chomvonges[4], B. Meemano[4], W. Peerapattanaphokin[5], A. Teeraratkul[3], P. Rungthonkij[1], T. Durant[3,6]
*[1]Division of HIV/AIDS, Department of Health, Klongsan, Thailand, [2]Division of HIV/AIDS Surveillance, Bureau of Epidemiology, Ministry of Public Health, Muang, Thailand, [3]Thailand MOPH - U.S. CDC Collaboration, Thailand Ministry of Public Health, Muang, Thailand, [4]National Health Security Office, Region 13, National Health Security Office, Laksi, Thailand, [5]Analysis and Advocacy Regional Support Team, Policy Research and Development Institute, Muang, Thailand, [6]Center for Global Health, Division of Global HIV/AIDS and TB, U.S. Centers for Disease Control and Prevention, Atlanta, United States*
*Presenting author email: ka_littletor@hotmail.co*

**Background:** Thailand commits to launch the 2014 Paris Declaration on Fast-Track Cities Initiative in Bangkok through achieving the 90-90-90 targets by 2020, 90% of persons living with HIV (PLHIV) knowing their status, 90% of PLHIV who know their status on antiretroviral therapy (ART), and 90% of those on ART virologically suppressed. To address the intervention status, multiple strategic information (SI) were analyzed.
**Description:** SI sources were (1) AIDS Epidemic Model (AEM), updated in 2015, estimating number of PLHIV and new infections; (2) Community-based Integrated Bio-Behavioral Surveillance (IBBS) using time-location-sampling among men having sex with men (MSM), biennially implemented during 2007-2014, reporting the percentage of MSM reached by community outreach and receipt of HIV counseling and testing (HCT), and (3) Patient program monitoring (NAP), reported by 63 ART sites in Bangkok, describing the Test-Treat-Retain cascade among PLHIV and MSM newly HIV+ diagnosed during 2008-2014. The results were synthesized to identify areas for intensified responses.
**Lessons learned:** AEM outputs revealed estimated 72,591 PLHIV in 2014 with 2,000 annual new infections. MSM was the major driver for HIV epidemic. The IBBS indicated constant trend of MSM reached by outreach interventions (35.2%-53.3%) during 2007-2014, and substantially declining in receiving HCT with knowing their test result from 52% in 2007 to 28% in 2014, $p < .05$. Using NAP and AEM outputs, the Test-Treat-Retain cascade among PLHIV was 73%-55%-70% in 2014 (Figure 1). A sub-set of 4,987 MSM, newly diagnosed and reported in NAP during 2008-2014, showed only 35% starting ART and 30% retained in-care.



*[Figure 1: Test-Treat-Retain Cascade among PLHIV, Bangkok, Thailand, 2014]*

**Conclusions/Next steps:** To achieve the 90-90-90targets in Bangkok remains challenging. Intensified community outreach is urgently needed to increase recruitment of MSM for prevention and HCT. Assessing the barriers limiting referral and access to ART services, especially among MSM should be considered. Effective quality ART services to improve ART retention are essential.

## WEPEE644

### DEVELOPMENT OF A NEW RESOURCE FOR HIV AND HEPATITIS C DRUG THERAPY/DRUG INTERACTIONS

A. Tseng[1], M. Foisy[2], P. Giguere[3,4]
*[1]University Health Network, Pharmacy, Toronto, Canada, [2]Northern Alberta Program, Alberta Health Services, Edmonton, Canada, [3]The Ottawa Hospital, Pharmacy, Ottawa, Canada, [4]The Ottawa Hospital Research Institute, Clinical Epidemiology Unit, Ottawa, Canada*

**Background:** Antiretrovirals (ARVs) and directly acting antivirals (DAAs) for hepatitis C (HCV) continue to be developed and marketed at a rapid pace. There is a high potential for drug interactions with these medications, particularly in patients with high rates of comorbidities and polypharmacy. Existing tools for the management of drug interactions are specific to either HIV or HCV, and often lack in offering a holistic approach to patient care.
**Methods:** The application development team consists of 3 specialized pharmacists, two computer programmers/developers and a medical interface designer. Key elements for the application design included an intuitive, multiplatform search engine allowing for rapid access of scientific information on drug-drug interactions, as well as a function proposing alternatives to treatments. A drug database was developed from existing, internationally recognized drug interaction websites (www.hivclinic.ca and www.hcvdruginfo.ca).
**Results:** The web application includes information on 45 HIV and HCV licensed and investigational drugs and allows for interaction searches with over 500 other commonly prescribed drugs. The database is regularly updated to include the latest publications and presentations from major HIV and HCV scientific conferences, and currently includes interaction information on over 15,000 unique drug combinations. The application is available on the HIV & HCV websites, which receive over 2000 separate visits per month. A free mobile application, with the potential to operate in absence of an internet connection, is available for download from the websites and from iTunes/Google Play stores in order to reach a vastly greater audience.
**Conclusions:** This web application consolidates ARV and DAA information from two established, internationally recognized drug therapy websites into a single program, and allows practitioners to quickly identify and manage significant drug interactions in HIV and/or HCV-infected patients.

## WEPEE645

### DISCREPANCIES BETWEEN 'MY ADDRESS', 'WHERE I LIVE', AND 'WHERE YOU MIGHT FIND ME': QUALITATIVE LESSONS FOR HIV DATA CAPTURE IN EXPANDING HIV CLINIC SERVICES TO COMMUNITY-BASED SERVICES

H. Myburgh[1], G. Hoddinott[1], M. Theart[1], N. Grobbelaar[2], L. Viljoen[1], on behalf of the HPTN 071 Study Team
*[1]Desmond Tutu TB Centre, Department of Paediatrics and Child Health, Stellenbosch University, Stellenbosch, South Africa, [2]ANOVA Health Institute, Cape Winelands Project, Paarl, South Africa*
*Presenting author email: hmyburgh@sun.ac.za*

**Background:** In South Africa, clients eligible for ART are entitled to receive care at any facility offering ART services. Across South Africa, such HIV-related health-services are expanding from facilities into communities. Accurate linkage of information across service-delivery platforms is important for
(1) ensuring continuum of care,
(2) monitoring and evaluation to improve public health implementation, and
(3) identification of fraudulent addresses.
Electronic capture and linkage create the possibility of unified client records across the service delivery network. Such a system will be facilitated by accurate records of which health facilities' clients visit and where clients might be reached by community-based services. We present a case study of a community where a door-to-door HIV-service referral intervention (as part of HPTN 071 (PopART)) is implemented, to identify gaps in creating a client record system.
**Methods:** At the clinic, paper-based patient folders are routinely captured into the 'TIER.Net' health information system. We conducted a qualitative review of folders of clients receiving ART at the clinic who were not reported as living with HIV by the door-to-door intervention team in the clinic's catchment area. This was supplemented by 24 months of ethnographic observations and discussions. The clinic catchment area is an Afrikaans-speaking suburb of a farming/minor-industry town with government-built basic-housing developments and informal settlements around it.
**Results:** From the addresses in the patient folders (and our ethnography), we identified five conditions where clients were missed by door-to-door service delivery:
(1) short-term absences from home (often due to hospitalisation, temporary employment, and incarceration).
(2) Cyclical absences, particularly migration to former 'homelands' and seasonal farm labour.
(3) Clients providing an address in the catchment area because they stay there occasionally whilst actually living outside the catchment area.
(4) Non-disclosure of HIV-status in homes leading to active avoidance of home-based HIV-related services.
(5) Membership of multiple households within or outside the catchment area.
**Conclusions:** Client addresses are currently experienced as primarily an administrative detail and their value for ensuring quality care is not emphasized. In highly mobile or migrant places, greater emphasis should be placed on integrating accurate capture and linkage of not just a client 'home' address but also alternatives.

## WEPEE646

### ENHANCING SUPPLY CHAIN MANAGEMENT OF ANTIRETROVIRAL DRUGS IN A RESOURCE-LIMITED SETTING THROUGH WEB-BASED ORDERING SYSTEM TO INCREASE THEIR AVAILABILITY: A CASE OF EAST CENTRAL UGANDA

D. Namuganga[1,2], F.H. Kazibwe[2], A. Mugume[1]
*[1]JSI/STAR-EC, Jinja, Uganda, [2]JSI/STAR-EC, Technical, Jinja, Uganda*
*Presenting author email: dnamuganga@starecuganda.org*

**Background:** Uganda is having problems getting the right type of medicines to the right people at the right time. When essential medications are out of stock especially in remote areas where there is no alternative solution, patients blame the health workers who have no control over the medicine supply chain. The Uganda National Minimum Health Care Package (UNMHCP) obliges the government to make essential drugs available to the population including (Anti Retro Viral drugs-ARVs) drugs for HIV/AIDS, TB, malaria and other infectious diseases. Because of these concerns, MoH replaced the use of hard copies of reports and orders with the web based ordering system an easy and quick way to place drug orders from the lowest level of care in the most remote and hard to reach area to the national ware house so as to enhance the supply chain management of ARVs.
JSI under a USAID funded project "Strengthening TB and HIV& AIDS Response in East Central (STAR-EC) Uganda has since supported this system in the facilities to acquire ARVs.
**Description:** STAR-EC trained ART in charges and stores personnel in facilities offering ART in proper quantification and ordering of ARVs and with the help of Health Management Information System personnel, health facilities submit drug orders which are directly submitted to the national ware house which in turn determines the needed quantities per facility and drugs are supplied on a bimonthly basis.
**Lessons learned:** There has been an improved reporting rate in all facilities under STAR-EC from 60% to 80% in a period of approximately 2 years since introduction of the system which is attributed to the fact that one does not have to incur costs of travelling from the furthest place to submit an order to the national supplier. There is improved efficiency in disseminating information from one place to another as well as reducing on time spent especially from facilities found in hard to reach areas.
**Conclusions/Next steps:** With improved use of technology and good internet connectivity, even the hard to reach areas can have an improved supply chain management system.

## WEPEE647

### PATIENT LEVEL TRACKING THROUGH AN ELECTRONIC DATABASE IN RESOURCE-LIMITED SETTINGS: LESSONS LEARNT IN IMPLEMENTATION OF AN ELECTRONIC DATABASE (EDB) IN ZIMBABWE

C. Muchuchuti, T. Chigariro, E. Tachiwenyika, A. Mahomva, A. Chadambuka, A. Muchedzi
*Elizabeth Glaser Paediatric AIDS Foundation, Harare, Zimbabwe*
*Presenting author email: cmuchuchuti@pedaids.org*

**Background:** The urgent need to monitor the HIV and AIDS epidemic of affected populations has required health information systems to go beyond its traditional capacities. Electronic patient-level databases (EDB) have emerged as promising tools. In September 2011, EGPAF-Zimbabwe supported Ministry of Health and Child Care (MOHCC) to develop an EDB that collects prevention of mother-to-child HIV transmission (PMTCT) longitudinal client data for routine program monitoring, rapid assessments, and PMTCT outcome evaluation.
**Description:** The EDB was implemented in 36 public health facilities across five districts in three phases;
(1) five district hospitals - September 2011,
(2) 13 facilities - March 2012 and
(3) 18 facilities July 2012.
EGPAF and MOHCC sourced IQSolutions, an open-source database supportable in-country with limited resources. The database was customized to include indicators from six MOHCC PMTCT registers. Facilities were selected based on patient volume

and accessibility from the district hospital using public transport. Eighteen data entry clerks (DECs) were recruited and trained to enter patient level longitudinal data into the EDB on an ongoing basis. Site support and supervision was provided by technical staff from MOHCC and EGPAF.

**Lessons learned:** Involvement of key decision-makers from the inception resulted in early buy-in of the database and utilization of an open-source system that did not require any licensing reduced the costs. Phased implementation enabled testing and modifications to refine the database in a small number of sites before scale up to additional sites. The database helped reduce the workload of the health workers on reporting and follow-up of defaulting clients as these were generated from the system easily. Site selection based on accessibility enabled one clerk to support more than one facility to reduce costs.

**Conclusions/Next steps:** The MOHCC started implementing a national level patient level database based on the lessons learned from EGPAF. DECs have been recruited and implementation in a phased approach was adopted. The goal is to eventually have the database in all the sites.

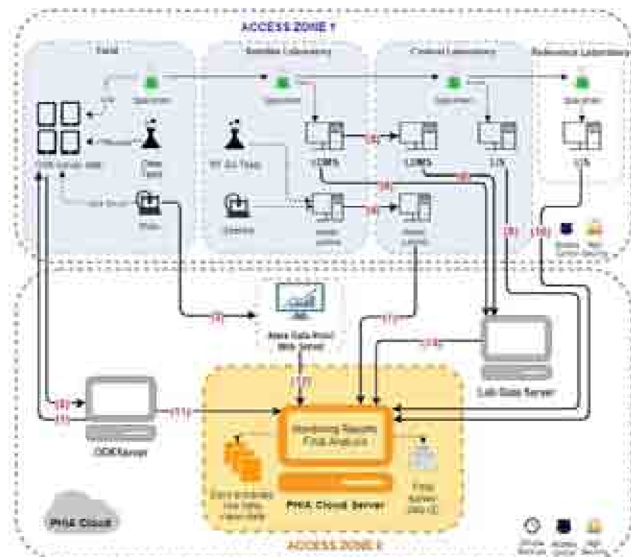
## WEPEE648

### ACHIEVING REAL TIME QUALITY AND EFFICIENCY MONITORING THROUGH ELECTRONIC DATA SHARING ARCHITECTURE FOR NATIONAL POPULATION-BASED BIOMARKER SURVEYS IN DEVELOPING COUNTRIES: THE POPULATION-BASED HIV IMPACT ASSESSMENTS (PHIA) PROJECT 2015-2017

S. Saito[1], R. Mitchell[2], M. Metz[1], E. Hudak[2], R. Smith[1], H. Chung[1], K. Lee[1], T. Kupamupindi[3], D. Hoos[1]
*[1]Columbia University, ICAP, New York, United States, [2]Westat, Rockville, United States, [3]ICAP at Columbia University, Mailman School of Public Health, Pretoria, South Africa*
*Presenting author email: tk2677@cumc.columbia.edu*

**Background:** With improvements in technology and increasing affordability, electronic data capture (EDC) is quickly replacing paper-based data collection (PDC) as a standard for large-scale surveys in developing countries. Electronic data can be efficiently processed and summarized, permitting timely identification of potential implementation challenges.

**Description:** ICAP at Columbia University is implementing the Population-based HIV Impact Assessment (PHIA) Project, a PEPFAR initiative funded through the Centers for Disease Control and Prevention to conduct population-based HIV biomarker surveys measuring national HIV incidence and subnational estimates for viral load suppression. The surveys involve questionnaires, and HIV and other point of care whole blood tests, including CD4, syphilis and hepatitis B. Additional tests, including viral load and HIV incidence testing, are conducted at laboratories. A data collection form was developed in ODK (Open Data Kit) and deployed on Android tablets to capture consents with electronic signatures, household and individual interviews, and specimen collections. Specimen transport and processing as well as QA/QC data are captured in laboratory databases. A data sharing architecture was developed to securely transmit the data in near real-time from the field teams and laboratories to a central data warehouse (Figure 1).



*[Figure 1: PHIA Data Architecture - Survey Collection Data Flow]*

**Lessons learned:** The PHIA Project started data collection in Zimbabwe and Malawi in late 2015. Overall, 10,199 interviews, 11,396 blood draws, and 17,169 specimen tubes have been collected to date. A survey monitoring dashboard that pulls data from questionnaire and laboratory data sources provides PHIA partners with daily updates that summarize response and recruitment rates by participant age group, survey team, and survey week as well as specimen quality indicators.

**Conclusions/Next steps:** The PHIA Project has demonstrated the need for EDC and a robust data sharing architecture that efficiently integrates data from multiple devices and users, for effective monitoring on quality and efficiency of the survey effort.

## WEPEE649

### IMPROVING HIV OUTCOMES: USING RYAN WHITE HIV/AIDS PROGRAM CLIENT-LEVEL DATA TO TARGET INTERVENTIONS AND ADDRESS HEALTH INEQUITIES IN THE UNITED STATES

S. Cohen, P. Klein, A. Dempsey, T. Matthews, L. Robinson, H. Hauck, L. Cheever
*Health Resources and Services Administration, US Department of Health and Human Services, Rockville, United States*
*Presenting author email: sgagne@hrsa.gov*

**Background:** To address the HIV epidemic in the United States (U.S.), Congress passed legislation in 1990 for the Health Resources and Services Administration to implement the Ryan White HIV/AIDS Program (RWHAP), a comprehensive system of care that addresses the needs of low-income and vulnerable people living with HIV (PLWH). To monitor the program, its impact, and clients' HIV-related outcomes, it was necessary for the RWHAP to establish a client-level data collection system.

**Description:** In 2010, the RWHAP fully implemented the "Ryan White Services Report" (RSR), a client-level data collection system that collects de-identified data from the nearly 2,000 RWHAP-funded sites across the U.S. In December 2015, the RWHAP published its inaugural client-level data report, featuring RSR data about the half-million clients served by the RWHAP during 2010-2014. The publication provided an in-depth look at the socio-demographic composition of clients (e.g., age, race/ethnicity, transmission risk, poverty level, health care coverage, housing status) and key HIV care indicators measuring the RWHAP's progress toward the goals of the National HIV/AIDS Strategy for the U.S.

**Lessons learned:** Through the implementation of its RSR client-level data system, the RWHAP can better identify and understand health inequities and guide RWHAP investments and programmatic efforts to improve care, treatment, and health outcomes for PLWH. The data report showed that the RWHAP provided HIV medical care, treatment, and supportive services to approximately 52% of all people living with diagnosed HIV in the U.S. Among clients receiving medical care, viral suppression increased from 69.5% in 2010 to 81.4% in 2014. Although inequities remain, the program demonstrated increases in viral suppression among several key populations, including youth aged 15-24 (45.8% in 2010 to 64.3% in 2014); women (66.3% to 80.2%); men who have sex with men (71.9% to 82.8%); and transgender individuals (61.5% to 74.0%).

**Conclusions/Next steps:** Client-level health information management systems are important tools to inform policy, programmatic, and clinical decisions about HIV care by governmental agencies and non-governmental organizations. Making national RWHAP client-level data publically available allows stakeholders and partners to better target interventions and measure the effectiveness of these strategies for improving HIV-related outcomes.

## USE OF BIG DATA TO ASSESS IMPACT OF HIV PREVENTION AND TREATMENT PROGRAMMES

### WEPEE650

### PROGRESS TO 90-90-90: A LONGITUDINAL ANALYSIS OF THE TANZANIAN NATIONAL TREATMENT CASCADE FROM 2006 TO 2014

P. Mee[1,2], B. Rice[3], G. Somi[4], J. Nondi[4], A. Ramadhani[4], J. Renju[1,5], J. Todd[1,5]
*[1]Faculty of Epidemiology and Population Health, London School of Hygiene and Tropical Medicine, Department of Population Health, London, United Kingdom, [2]Medical Research Council/Wits University Rural Public Health and Health Transitions Research Unit (Agincourt), School of Public Health, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa, [3]Faculty of Public Health and Policy, London School of Hygiene and Tropical Medicine, Department of Social and Environmental Health Research, London, United Kingdom, [4]Tanzanian National AIDS Control Programme, Ministry of Health, Dar es Salaam, Tanzania, United Republic of, [5]Kilimanjaro Christian Medical University College, Moshi, Tanzania, United Republic of*
*Presenting author email: paul.mee@lshtm.ac.uk*

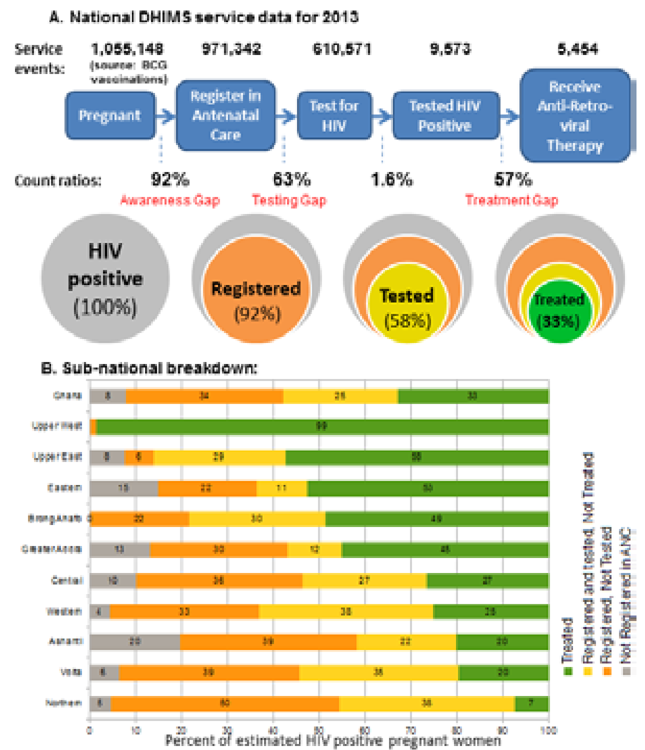
**Background:** In order to end HIV as a global health threat it is essential that countries analyse the development of their HIV treatment cascade over time and adapt their treatment programs to improve coverage and reduce attrition. In addition they need to identify whether any progress achieved is generalised or whether certain population sub-groups have sub-optimal, engagement with or retention in, care. This study provides such an analysis using routine data collected at clinics throughout Tanzania.
**Methods:** Repeated cross-sectional analyses were carried out annually of data collated in the Tanzanian national care and treatment centre (CTC) database. The study population was defined as all those with a visit to a CTC within 90 days of the mid-year cut-off date.
**Results:** Over the period 2006 to 2014 the percentage of those who were engaged with CTC's who were on treatment increased from 22.2% to 82.1%. The percentage of these successfully treated (WHO stage 1-3) increased from 65.2% to 82.1% over the same period. By 2014 44.4 % of those on treatment had been so for more than 4 years. The sex ratio (female:male) for those on treatment increased from 1.7 in 2006 to 2.4 in 2014. From 2008 to 2012, the percentage of males aged 15-19 in care who were on treatment was significantly higher than for their female contemporaries. Otherwise similar trends were seen for all age and sex strata in the population. The median time between individuals first knowing their HIV status and starting treatment increased for all groups between 2007 and 2012 from 46 to 64 days and then decreased to 25 days by 2014. The decrease was greater for females than males.
**Conclusions:** These results demonstrate that considerable progress has been made since the introduction of ART in Tanzania. All sub-groups in the population have experienced these benefits. Of particular concern however is the evidence for an increasing female:male gender ratio amongst those on treatment which is only partially explained by the higher HIV prevalence for adult females (5.7%) compared to males (3.9%). Strategies to overcome barriers to care experienced by males are urgently indicated by these results.

### WEPEE651

### DATA FROM RECENTLY DEPLOYED ONLINE HEALTH SERVICES INFORMATION COLLECTION SYSTEM SHOWS MOTHER TO CHILD TRANSMISSION (MTCT) RATES OF HIV IN GHANA ARE HIGHER THAN PREVIOUSLY ESTIMATED

S. Ayisi Addo[1], L. Shpigelman[2], O. Shaham[2], A. Ofosu[3], R. Gray[4], J. Bucher-Brown[5], M. Cappello[6], Y. Goldschmidt[2], E. Appiah-Denkyira[7], E. Paintsil[8]
*[1]Ghana Health Service, National AIDS/STI Control Programme, Accra, Ghana, [2]IBM Research Lab, Healthcare Informatics, Haifa, Israel, [3]Ghana Health Service, Policy Planning Mentoring and Evaluation, Accra, Ghana, [4]IBM, WW Sales & Distribution, St. Leonards, Australia, [5]IBM Research, Business Development, Bethesda, United States, [6]Yale, School of Public Health, New Haven, United States, [7]Ghana Health Service, Office of the Director General, Accra, Ghana, [8]Yale, School of Medicine, New Haven, United States*
*Presenting author email: lavi@il.ibm.com*

**Background:** The rate of Mother-to-child transmission (MTCT) of HIV in Ghana is estimated using the Spectrum software, based on a mix of estimated variables. The national MTCT rates were 8.99% and 8.37% for 2012 and 2013, respectively. We hypothesized that replacing estimated variables in the Spectrum model with actual service data obtained through the digital health information systems (DHIS) platform, would yield more accurate and actionable national (and sub national) rates.
**Methods:** Data were analyzed using the DHIS reporting system. Best indicators of number of births, ANC registration, PMTCT testing, HIV prevalence among the pregnant population and ARV treatments during pregnancy were collected at the national and regional levels. MTCT was estimated using DHIS data as opposed to that generated with the Spectrum model.
**Results:** The resulting DHIS-estimated rates of HIV MTCT for 2012 and 2013 in Ghana were 24.8 % and 24.2% respectively, significantly higher than estimates published in the 2014 national report. We observed large gaps across the PMTCT care cascade at both the regional and national levels (Figures 1A and 1B). Based on the projected total number of HIV infected women, only 33% were likely to have received ARV treatment during pregnancy, compared with the previously reported national estimate of 76%.
**Conclusions:** MTCT will continue to fuel the HIV epidemic in Ghana at the current performance level of its PMTCT program. Our findings demonstrate that DHIS platforms, which are already deployed in many resource-limited countries, are effective at providing valuable, low-cost, real-time information that can be used to shape policy at local, regional, and national levels. Based on this assessment, the Ghana National AIDS/STI Control Program (NACP) has embarked on remedial actions, including commodity and stock management, resource allocation based on district-specific disease burden, and national targeting of gaps in PMTCT services.



**National and regional gaps in Ghana for 2013: A. the Antenatal care cascade. Shows service event counts and their rations in percentages. Onion layers provide national percentages of subgroups from the total estimated number of women in need of treatment. B. Subnational breakdown. Percent values reflect the size of each group minus the size of the next group. In Upper West and Brong Ahlo where the ANC registered HIV positive population was greater than the estimated population size (based on the number of BCG doses and HIV prevalence), the HIV population size was set to the number of HIV positive registrants.**

### WEPEE652

### CHARACTERISTICS OF CHILDREN ENTERING CARE AND AT ANTIRETROVIRAL THERAPY INITIATION IN THE CENTRAL AFRICA IEDEA COHORT, 2004-2013

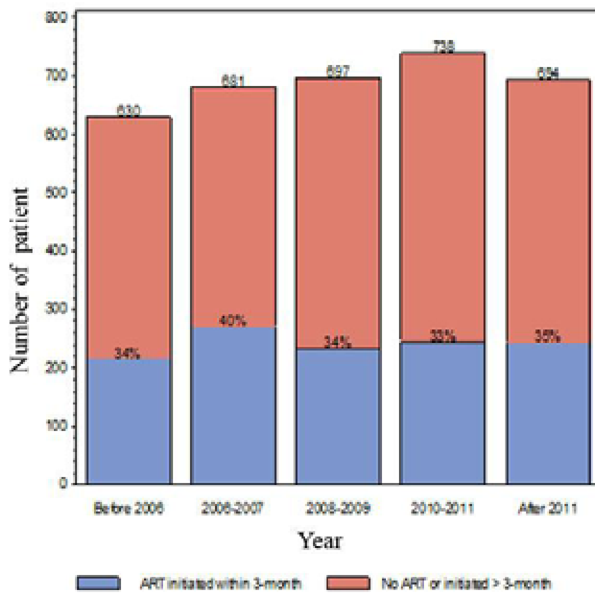
A. Adedimeji[1], A. Edmonds[2], D. Hoover[3], Q. Shi[4], J.D. Sinayobye[5], T. Niyongabo[6], K. Anastos[1], D. Nash[7], M. Yotebeing[8], Central Africa IeDEA Collaboration
*[1]Albert Einstein College of Medicine, Epidemiology and Population Health, New York, United States, [2]University of North Caroline, Chapel Hill, United States, [3]Rutgers University, New Jersey, United States, [4]Data Solutions, Bronx, United States, [5]Rwanda Military Hospital, Kigali, Rwanda, [6]Centre Hospitalo-Universitaire de Kamenge, Bujumbura, Burundi, [7]City University of New York, New York, United States, [8]Ohio State University, Columbus, United States*
*Presenting author email: adebola.adedimeji@einstein.yu.edu*

**Background:** Despite the World Health Organization (WHO) regularly updating guidelines to allow earlier initiation of antiretroviral therapy (ART) in children, the proportion of HIV-infected children initiating ART in sub-Saharan Africa lags behind adults. The impacts of implementing increasingly less conservative ART guidelines

on access to care and treatment initiation has not been described in Central Africa. We describe trend characteristics of children 0 - 12 years entering HIV care and initiating ART from 2004-2013 in Burundi, Democratic Republic of Congo, and Rwanda.

**Methods:** Data are from the Central Africa International Epidemiologic Databases to Evaluate AIDS (IeDEA) pediatric cohort of all children (n=5508) entering care. Measures included CD4 count, WHO clinical stage, age, and weight-for-age Z score (WAZ) using 2006 WHO standards, taken both at enrollment into HIV care and at ART initiation. Changes in the median or proportions of each measure by year of enrollment and at ART initiation were assessed to capture potential impacts of changing ART guidelines.

**Results:** Median age at care enrollment was 77.2 months (interquartile range (IQR); 44.8, 110) in 2004-2005, decreasing progressively to 30.3 months (IQR 5.8, 86.6) in 2012+. The proportion of children ≤24 months increased from 12.7% in 2004-2005 to 46.7% in 2012+. Similar, though less pronounced trend was observed at ART initiation with median age decreasing from 83.0 months (IQR 49.8, 117) in 2004-2005 to to 66.9 (IQR 24.3, 115) in 2012+. The proportion of children 0-24 months at ART initiation also increased from 9.6% in 2004-2005 to 24.2% in 2012+.



*[Proportion of children initiating ART within 3 months of enrolling in HIV care]*

**Conclusions:** Changes in guidelines may have succeeded in increasing the number of children entering care and/or initiating ART earlier. Gaps remain and more needs to be done to reduce time between diagnosis, enrolment in care and ART initiation.

## WEPEE653

### THE RELATION BETWEEN EFFECTIVENESS AND EFFICIENCY: ECONOMIC IMPACT OF SUBOPTIMAL PERFORMANCE IN HIV TREATMENT INITIATION AND VIRAL SUPPRESSION

D. Contreras-Loya[1], S. Bautista-Arredondo[1], S.M. Bertozzi[2]
*[1]Instituto Nacional de Salud Publica, Health Economics, Cuernavaca, Mexico,*
*[2]University of California, School of Public Health, Berkeley, United States*
*Presenting author email: sbautista@insp.mx*

**Background:** Over 70,000 individuals currently benefit from universal antiretroviral treatment (ART) in Mexico provided at MoH facilities. As in most low- and middle-income countries today, the financial constraints of the Mexican publicly funded system and the implementation of the new WHO guidelines of HIV treatment initiation threat the sustainability of the national treatment program. Facility-level performance data is one of the most promising tools to increase value-for- money in HIV spending and access to more patients within the current budget constraint.

**Methods:** We analyzed the SALVAR database of the Mexican MoH to calculate three indicators of facility-level performance: percentage of patients who initiated ART with CD4>200 cel/mm$^3$, percentage of patients in viral suppression (viral load< 50 copies/mm$^3$) and percentage of patients in viral suppression and CD4 recovery. The sample included 116 facilities and 4,831 patients who started treatment in 2012. We calculated total annual costs of antiretroviral drugs per patient and compared the cost per person-year along three stages in the continuum of care: cost per patient on treatment, cost per virally suppressed patient, and cost per virally suppressed and immunologically recovered. We estimated best-practice frontiers to assess heterogeneity in facility performance.

**Results:** In 2012, 49% of all new patients initiated ART with CD4>200 cel/mm$^3$(IC 95%: 47.4;52.3), and 77% were below the undetectable viral load threshold (IC 95%: 73.8;79.4). Average annual cost per patient treated was 4,137 USD, and this figure increased steadily along the treatment cascade: 9,210 per early initiated patient, 6,028 per virally suppressed patient and 9,329 per patient in viral suppression and CD4 recovery. The difference in costs between the least and the most expensive facility was 4.3 times the cost per treated patient, 11.6 times the cost per early initiated patient, 13.9 per virally suppressed patient and 11.4 per patient with viral suppression and CD4 recovery.

**Conclusions:** In Mexico, there is enormous potential for gains in health outcomes and costs efficiency due to early initiation and treatment effectiveness of HIV patients receiving ART. Our results advocate for the proper measurement of patient attrition to the treatment cascade and the prompt dissemination of public performance data.

## WEPEE654

### UTILIZING LABORATORY DATA TO IMPUTE ART START DATES AND MONITOR COHORT TREATMENT OUTCOMES

M. Maskew[1], C. Hendrickson[1], W. MacLeod[1,2], I. Sanne[1,3], S. Carmona[4], W. Stevens[4,5], M.P. Fox[1,2,6], J. Bor[1,2]
*[1]Health Economics and Epidemiology Research Office, Department of Internal Medicine, School of Clinical Medicine, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa, [2]Boston University School of Public Health, Department of Global Health, Boston, United States, [3]Clinical HIV Research Unit, Department of Internal Medicine, School of Clinical Medicine, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa, [4]National Health Laboratory Service, Johannesburg, South Africa, [5]University of the Witwatersrand, Department of Molecular Medicine and Hematology, Johannesburg, South Africa, [6]Boston University School of Public Health, Department of Epidemiology, Boston, United States*
*Presenting author email: mmaskew@heroza.org*

**Background:** Routine laboratory data can be used to impute missing clinical records in resource-limited settings. We previously demonstrated ART start dates can be imputed with high sensitivity and PPV based on laboratory results. We assess the validity of using imputed start dates relative to known start dates in the validation cohort to asses treatment outcomes.

**Methods:** Utilizing data from an urban public-sector facility in Johannesburg, South Africa, we created two cohorts: 1) known ART start date from clinical records and 2) start date imputed using only laboratory data (first documented hemoglobin or alanine transaminase test among patients with CD4 count in 12-months prior to these tests). We then estimated CD4 count and viral load responses by 12 months on ART (defined as the period 3 months prior to, and up to 3 months after, 12 months on ART). We report simple proportions achieving these outcomes stratified by cohort.

**Results:** Among the individuals retained on ART at 12 months post-initiation (n=9620 for the known cohort; n=9515 for the imputed cohort), almost identical CD4 and viral load outcomes at 12 months were observed for both cohorts (Table 1). Median CD4 count at 12 months post initiation was 262 (IQR 180-364) and 258 (IQR 178-361) in the known and imputed cohorts, respectively while proportion with a suppressed viral load was 87.3% and 87.1 % respectively.

**Conclusions:** Evaluation of clinical treatment outcomes in HIV care programs is possible national-level laboratory data. ART start dates imputed through a simple algorithm are sufficiently accurate to be used as a reference date for assessing ART treatment outcomes, and can be used in monitoring and evaluation of treatment programs.

| | | Known ART start date (n=9620) | Imputed ART start date (n=9515) |
|---|---|---|---|
| CD4 count at ART start date | *Number with CD4 result (n; %)* | 9120 (94.8%) | 9294 (97.7%) |
| | *Absolute CD4 result (median; IQR)* | 99 (38-172) | 102 (39-175) |
| CD4 count at 12 months post initiation | *Number with CD4 result (n; %)* | 7835 (81.4%) | 7724 (83.1%) |
| | *Absolute CD4 result (median; IQR)* | 262 (180-364) | 258 (178-361) |
| | *Absolute change in CD4 count (median; IQR)* | 158 (90-241) | 155 (86-237) |
| Viral load at 12 months post initiation | *Number with viral load result (n; %)* | 8434 (87.7%) | 8349 (89.8%) |
| | *Number achieving viral suppression (n; %)* | 8394 (87.3%) | 8285 (89.1%) |

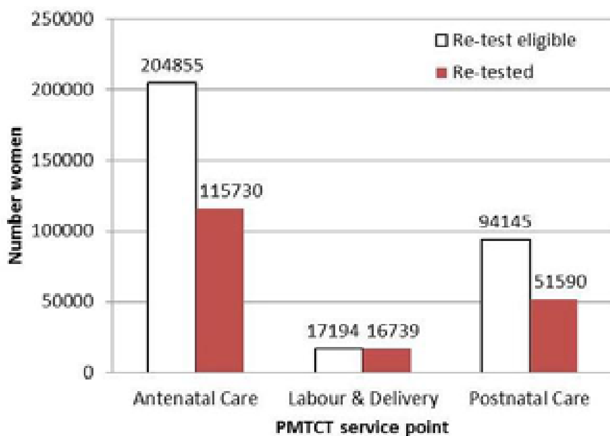
*[Clinical outcomes among individuals retained in care at 12 months post initiation for the known and imputed ART start date cohorts (n=19,135)]*

## WEPEE655

### WILL LOW HIV RE-TEST RATES THREATEN THE MTCT ELIMINATION AGENDA? PROGRAMMATIC EVIDENCE FROM ZIMBABWE

K. Webb, V. Chitiyo, P. Nesara, S. Page-Mtongwiza, T. Maphosa, B. Engelsmann
*Organisation for Public Health Interventions and Development (OPHID) Trust, Harare, Zimbabwe*
*Presenting author email: kwebb@ophid.co.zw*

**Background:** Zimbabwe has an HIV prevalence of 16.1% among women in antenatal care and HIV is the leading cause of maternal death. Elimination of mother-to-child-transmission (MTCT) of HIV in Zimbabwe (< 5%) will require effective identification and enhanced interventions among groups of HIV positive women at high risk of MTCT. National guidance recommends re-testing all women without confirmed HIV status every 3 months during pregnancy and breastfeeding. Our objective was to determine recorded rates of HIV re-testing in Zimbabwe's PMTCT program.
**Description:** We utilised routinely collected aggregate data from 824 health care facilities offering PMTCT services in 6 Provinces of Zimbabwe. We descriptively analysed program data from September 2014 to December 2015 to determine HIV re-test rates among women accessing services along the PMTCT cascade. Chi square tests were used to determine significance of differences in proportion of women re-tested for HIV in PMTCT care setting.
**Lessons learned:** From Sept 2014-Dec 2015, among 245,816 women recorded in ANC, 6.7% (n=16,583) had a known positive HIV status and 6.4% (n=15,880) tested positive. Overall, 115,730 re-tests were recorded in ANC. Compared to number identified as eligible for re-testing, documented re-tests in Labour and Delivery were high (97.4%) while re-test rate in postnatal care was low (54.8%), a highly significant difference in proportion $\chi^2(1, N = 179,668) = 2265.55$, $p < 0.001$.



*[Number pregnant and lactating women HIV re-test eligible vs. re-tested, Jan 2014 - Dec 2015]*

**Conclusions/Next steps:** While limited by our inability to document cohort-based re-testing and individual outcomes, our analysis documented low HIV re-test rates among eligible pregnant and breastfeeding women in ANC and PNC in Zimbabwe. Low re-test rates in ANC are likely attributable to late gestational age at first ANC booking. Future research on supply- and demand-side barriers and implementation research on enhanced interventions to increase HIV re-testing in Zimbabwe's PMTCT program should be supported as a national priority in the drive to eliminate pediatric HIV and keep mothers alive.

# SCALE UP OF POINT-OF-CARE TECHNOLOGIES

## WEPEE656

### IMPROVING MARKET TRANSPARENCY AND STRATEGIC PROCUREMENT TO IMPROVE ACCESS TO POC EID

J.E. Cohn[1,2], N. Doi[3], R. Allen[3], M. Wareham[3], K. Bonner[4], R. Bailey[1], F. Celletti[1]
*[1]Elizabeth Glaser Paediatric AIDS Foundation, Geneva, Switzerland, [2]University of Pennsylvania School of Medicine, Infectious Diseases, Philadelphia, United States, [3]Clinton Health Access Initiative, New York, United States, [4]Médecins Sans Frontières, Geneva, Switzerland*
*Presenting author email: jcohn@pedaids.org*

**Background:** Globally, only half of infants born to HIV-infected mothers undergo early infant diagnosis (EID) and of these, only half ever receive test results. EID is the first step to getting onto treatment and without ART, 80% of children die by 5 years of age. Point-of-care (POC) EID can improve both coverage of EID and receipt of results, increasing the number of children linked to care and enrolled on ART. As access to and uptake of new POC EID is still limited, innovative strategies are required to improve overall access to this essential technology. EGPAF, MSF and CHAI support are working in 13 countries to document POC EID's impact on pediatric diagnosis and treatment, model cost effectiveness, and use strategies to improve price and terms and conditions to improve access to POC EID.
**Description:** In order to strengthen negotiations and improve access to POC EID, several organizations with large proportions of the nascent POC EID market are collaborating to pool volumes, jointly negotiate contracts, analyze cost of goods, and provide transparency for price and terms and conditions for procured products.
**Lessons learned:** Pooling volumes and joint negotiations can result in manufacturer contract terms that will improve access for POC EID, including service and maintenance agreements that are responsive to key priorities identified by in-country staff, such as more rapid module replacement and provision of loaner platforms when off-site repairs are required. Cost of goods for cartridges ranged from $6.20-10.91 USD, while market prices average about $20 USD, suggesting there is some room for price reductions in this market, particularly if volumes were to increase or be bundled with similar diagnostics, such as POC HIV viral load.
**Conclusions/Next steps:** Although the POC EID market is relatively small, use of procurement strategies, especially: pooled procurement; contract transparency; and knowledge of cost of goods can help to support healthier markets that support affordable and sustainable access to this critical diagnostic. In the future, bundling procurement of this test with POC diagnostics for other diseases (e.g. tuberculosis) can help further reduce prices of cartridges and transactional costs.

## WEPEE657

### AMPLIFICATION REFRACTORY MUTATION (ARMS) WITH REAL TIME DETECTION OF MUTATIONS M184V AND K103N AMONG NAIVE PATIENTS IN PANAMA

C. Gonzalez, A. Martinez, A. Ortiz, J. Gondola, Y. Zaldivar, J.M. Pascale
*The Gorgas Memorial Institute for Health Studies, Genomics and Proteomics, Panama, Panama*
*Presenting author email: claudiamgv@gmail.com*

**Background:** The HIV epidemic is still ongoing in Central American countries. Here we analyze the use of the ARMS technique for detecting known point mutations (M184V and K103N) in the HIV polymerase gene. This method is suitable for rapid, cost-effective and safe, and also an adaptation to a real time system.
**Methods:** Fifty plasma samples were analyzed for viral load and genotyping of HIV-1. The ARMS qPCR results were compared with the genotype test Viroseq v2.5. RNA was extracted using QIamp viral RNA mini kit. For the ARMS-PCR we used the primers described by Nanfack et al. and probes that allow the detection of each mutation using Rotorgene Q.
**Results:** For the M184V mutation 48 naive patients were analyzed; from them we obtained a concordance of 100 % with the sequencing method. Instead, for the mutation K103N, 5 samples for the analysis of K103N were mutated and the test got a concordance of 80 percent. On the other hand, The ARMS qPCR had a 95.56 % of concordance capable of detecting wild type samples for K013N.
**Conclusions:** ARMS qPCR proved to be capable of detecting specific mutations M184V and K103N, which is important because both are common in transmitted drug resistance. This could be an option as novel method for the detection of the status of the patient before the beginning of their treatments in countries with low resources where sequencing methods are not available. This method could minimize the time to obtain the results.

## SCALE UP OF VIRAL LOAD MONITORING

### WEPEE658

### VIRAL LOAD AWARENESS AMONG PEOPLE ON ANTIRETROVIRAL TREATMENT IN NSANJE DISTRICT, MALAWI

K. Mwenda[1], S. Mphande[1], E. Wanjiru[1], F. Gent[1], D. Kanzimbi[1], F. Chimombo[1], S. Kapinda[1], Y. Navaya[2], B. Madalo[2], J.P. Mangion[1], A.F. Da Silva[1], S. Baert[3]
*[1]Médecins Sans Frontières, Nsanje, Malawi, [2]Ministry of Health, District Health Office, Nsanje, Malawi, [3]Médecins Sans Frontières, Southern Africa Medical Unit, Cape Town, South Africa*

**Background:** In 2014 routine viral load (VL) monitoring was implemented in Nsanje district, Malawi. To increase patient's awareness of VL, health talks on VL were held in ART waiting areas and VL was explained individually to patients with a high VL. Patients' awareness of VL is vital to motivate their adherence and create demand for VL. We assessed patients' understanding of VL in order to further adapt patient education strategies.
**Methods:** A questionnaire was developed and pretested in Chichewa, examining patients' understanding of the goal of a VL test, its result interpretation and the offer of a VL test at the clinics. The questionnaires were administered in August 2015 at three health facilities to adults on ART greater than 18 years presenting in the ART waiting area of the health facility.
**Results:** A total of 384 patients were interviewed and the majority (76%) were female. Two hundred sixty seven (70%) patients had heard about VL testing of whom 77% reported that a VL test measures the amount of HIV in the blood, 88% understood that an undetectable VL means there is still HIV to be found in the blood and 21% knew the threshold at which their VL may require action. Sixty five percent identified poor adherence as the primary reason for having a high VL, while 24% thought this was due to having unprotected sex with an HIV+ person. Of the 267 who had heard about VL, 156 (58%) had never had a VL test performed, with 65% stating that the test had not been offered to them by the health care worker. Of the 111 who did get a VL test, only 50% received the result.
**Conclusions:** Empowerment of patients to request their VL and act upon on its result are important steps in the scale-up of viral load monitoring. Patient education on VL has led to a majority of patients on ART being aware of new HIV treatment monitoring standards. Interpretation of VL results by patients remains unsatisfactory and further patient education on result interpretation is needed, in conjunction with strategies targeting health care workers.

### WEPEE659

### ROLE OF COMMUNITY ART GROUP (CAGS) IN INTRODUCING ROUTINE HIV VIRAL LOAD MONITORING IN A RURAL DISTRICT OF MOZAMBIQUE

E. Simons[1], T. Ellman[2], R. Giuliani[3], C. Bimansha[1], C. das Dores T.P. Mosse Lázaro[4], M. Jose Simango[4]
*[1]Médecins Sans Frontières, Tete, Mozambique, [2]Médecins Sans Frontières, Southern Africa Medical Unit, Capetown, South Africa, [3]Médecins Sans Frontières, Maputo, Mozambique, [4]Provincial Health Department, Tete, Mozambique*
*Presenting author email: esimons4@gmail.com*

**Background:** In December 2013, in line with WHO guidelines, Médecins Sans Frontières together with the Ministry of Health introduced routine monitoring of viral load (VL) for ART-enrolled patients in Changara District, Mozambique. Dried blood spots (DBS) were tested using the BioMerieux NucliSENS assay. More than 50% of ART patients in Changara are CAG members. The aim of the evaluation is to assess the VL cascade in Changara District, Mozambique and to compare outcomes between community ART group (CAG) and non-CAG patients.
**Methods:** Routinely collected data from the VL monitoring program was analysed retrospectively. The study population consisted of all patients more than 6 months on ART and attending Changara district ART facilities between December 2013 and September 2015. Coverage of VL and VL cascade outcomes were analysed by age, sex, time on treatment, and CAG membership. The high VL cascade included patients with first VL before October 2014.
**Results:** Among 3378 eligible patients, 62% (2108) completed a first VL. Coverage was higher among CAG than non-CAG patients (72% vs. 47%). 40% had a VL ≥1000; 60% and 38% among patients < 15 years and ≥15 years, respectively. There was no significant difference in proportion with elevated VL by sex, CAG status, or time on treatment.
Among 352 patients with VL ≥3000 copies/ml, 70% had ≥1 adherence counselling session. Of 82 (23%) who had a repeat VL 3-9 months later, 22% had a VL < 3000 copies/ml. Of an additional 27% (97) with a repeat VL 9-15 months later, 30% had a VL < 3000 copies/ml. 10% (13/131) of patients switched to second-line drugs.
**Conclusions:** Routine VL testing is feasible in this remote setting, with DBS sent to a centralised laboratory. Coverage remained low after 2 years but was higher among CAG members; CAGs were integral in disseminating information within CAG and mobilizing other members for VL sample collection. Rates of virological failure were worryingly high in all groups, suggesting that resistance and poor adherence are significant problems in this population. Further work is needed to clarify the reasons for failure and to ensure rapid access to second-line.

### WEPEE660

### HIV VIRAL LOAD TESTING SCALE UP IN MOZAMBIQUE: LABORATORY PERSPECTIVES AFTER 2 YEARS OF IMPLEMENTATION

M. Freitas[1], R. Giuliani[1], A. Torrens[1], W. Macueia[1], T. Ellman[2]
*[1]Médecins Sans Frontières, Maputo, Mozambique, [2]Médecins Sans Frontières, SAMU - South Africa Medical Unit, Cape Town, South Africa*
*Presenting author email: marcelamfreitas@hotmail.com*

**Background:** The project purpose was to support Mozambican Ministry of Health to implement and scale up viral load (VL) testing and to investigate the feasibility in the country. The current paper describes the implementation strategy, outcomes and challenges after 2 years of VL testing from a laboratory perspective.
**Description:** In September 2013 MSF in partnership with Ministry of Health implemented Viral Load testing in Maputo and Tete. The Biomerieux NUCLISENS platform was installed in Maputo. The initial capacity estimated was 2500 tests per month. DBS samples were collected for routine viral load from 16 Health Centers with a cohort of 50405 patients on ART. Additional 26 facilities had access to target viral load. The laboratory received 46400 samples between Jan-2014 and Dec-2015 and carried out 44565 tests. Monthly collection increased from 933 to 3585. On average 1348 and 2366 tests/month were done in 2014 and 2015 respectively.
**Lessons learned:** The scale up was successful due a close collaboration between clinicians, laboratory staff and the counsellor team. Initially clinicians were failing to identify eligible patients through their files, while laboratory staff were playing a key role scheduling and collecting additional VL for all eligible patients with a request combined with CD4. Counsellors were also involved e in identifying eligible patients attending the health centre, i.e pharmacy for drug refill or waiting areas, and highlighting them to clinicians. The difference between number of samples collected and tests done was due to frequent breakdowns of the platform and reagent stock outs. The invalid rate was 2% and 3% for 2014 and 2015 respectively. Lack of skilled human resources at facility and central laboratory level and access to safe disposal of laboratory reagents were major challenges encountered.
**Conclusions/Next steps:** This experience demonstrates the feasibility of rapid scale-up of viral load in Mozambique. Lessons learned highlight the importance of adequate laboratory staffing, machine maintenance, robust reagents supply and effective waste disposal, and the importance of close cooperation between laboratory, clinical, and counselling teams in promoting uptake of viral load.

### FREQUENT AND 'BURST-LIKE' REACTIVATION FROM LATENCY IN SIVMAC239M INFECTED MACAQUES

M. Pinkevych[1], A. Reynaldi[1], C. Fennessey[2], C. Reid[2], P. Nadella[2], L. Lipkey[2], L. Newman[2], V. Ayala[2], S. Jain[2], G. Del Prete[2], J. Estes[2], D. Ott[2], J. Lifson[2], C. Ohlen[2], B. Keele[2], M. Davenport[1]

*Presenting author email: m.davenport@unsw.edu.au*

**Background:** Anti-retroviral treatment interruption is usually followed by the recrudescence of infection within a few weeks. This is thought to arise from the reactivation and viral production of a number of latently infected cells. However, very little is known about the basic dynamics of reactivation from latency, such as the frequency of latent cell reactivation, whether reactivated cells live for a prolonged period, how much virus they produce, and whether they die following reactivation. We have developed a novel system of 'tagged' viruses to study the reactivation of individual latent cell 'reactivation founders' and combine this with viral dynamics modeling to better understand HIV reactivation.
**Methods:** Rhesus macaques were infected with 2.2 x 10^5 IU of a modified SIVmac239 containing an SIV population with ≈10,000 different clonotypes differing only at a 34bp 'tag' inserted between the Vpx and Vpr genes (SIVmac239M). Animals were treated with TFV/FTC/RAL at day 6 for 82 days (n = 3, group 1), or with TFV/FTC/IND/RTV on day 4 for >300 days (n = 2, group 2) prior to treatment interruption. Illumina sequencing was used to identify the frequency of individual clonotypes following treatment interruption.
**Results:** All animals showed a diversity of SIVmac239M clonotypes in serum prior to treatment, and rapid recrudescence of infection after treatment interruption. Analysis of the number and relative size of individual reactivation founder clonotypes revealed that between 3 and 63 unique clonotypes were detectable in different animals. Modeling of the ratios of the clonotypes in different animals showed that the frequency of reactivation from latency ranged from 27.3 reactivations per day to 0.46 per day.
Moreover, the ratio of clonotypes also showed that the duration of viral production from individual latent after reactivation must be "burst-like" in order to produce the observed frequencies.
**Conclusions:** The use of 'tagged' SIVmac239M is an extremely powerful tool for analyzing the dynamics of HIV reactivation from latency. Analysis of the reactivating clonotypes shows that the frequency of reactivation is higher in animals treated for shorter periods of time. The rapid 'burst-like' production of virus from reactivated cells suggests that these cells may be short lived following reactivation.

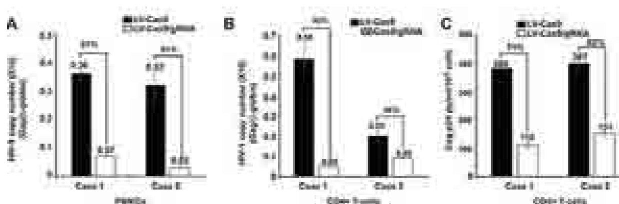
### EXCISION OF HIV-1 DNA BY GENE EDITING: IN VITRO, EX VIVO AND IN VIVO STUDIES

R. Kaminski[1], W. Hu[1], J. Karn[2], K. Khalili[1]
[1]*Temple University, Lewis Katz School of Medicine, Philadelphia, United States,* [2]*Case Western Reserve University, Microbiology, Cleveland, United States*
*Presenting author email: kkhalili@temple.edu*

**Background:** Cure strategy for HIV-1 infection and AIDS should include methods that directly eliminate the proviral genome from HIV-1 positive cells and/or eliminate infected cells harboring latent virus.
**Methods:** We modified the CRISPR/Cas9 system to enable recognition of specific DNA sequences positioned within the HIV-1 promoter spanning the 5' long-terminal repeats (LTR) and various viral genes including Gag. We applied CRISPR/Cas9 by several methods including plasmid, lentiviral and Adeno-associated virus to cell models for latency, in vitro HIV-1 infection of CD4+ T-cells, CD4+ T-cells from HIV-1 positive patients and transgenic animals encompassing integrated copies of HIV-1 to assess efficacy of our gene editing molecule in excising a segment of HIV-1 for cells in in vitro, ex vivo and in vivo systems.
**Results:** We demonstrated complete elimination of HIV-1 DNA from latently infected cells, a drastic decrease in HIV-1 replication in in vitro replication of PBMCs and CD4+ T-cells, suppression of HIV-1 expression in PMCs and CD4+ T-cells for HIV-1+/AIDS patients due to InDel mutations in the viral genome and excision of viral DNA positioned between the LTR and Gag gene in tissues of HIV-1 transgenic mice upon injection of AAV-CRISPR/Cas9.
**Conclusions:** CRISPR/Cas9 can offer an effective, precise, efficient and safe strategy for eradication of HIV-1 in several laboratory model systems and can be considered for its advancements toward clinical trials.



*[Figure 1. Suppression of HIV-1 replication in PBMCs and CD4+ T-cells of HIV-1 infected patients]*

PBMCs or CD4+ T-cells from HIV-1 infected volunteers were treated with LV-Cas9 or LV-Cas9 plus LV-gRNAs A/B. **A.** Viral DNA determined by qPCR and normalized to β-globin DNA show decrease in viral copy number with LV-gRNAs. **B.** LV-Cas9 or LV-Cas9 plus LV-gRNA A/B infected CD4+ T-cells show reduction in HIV-1 DNA copy number with LV-gRNAs. **C.** Quantitation of p24 Gag ELISA from infected cells as measure of viral replication.

### CCR5 GENE EDITED CELLS TRAFFIC TO VIRAL RESERVOIR TISSUES AND UNDERGO SHIV-DEPENDENT POSITIVE SELECTION IN NONHUMAN PRIMATES

C.W. Peterson[1], J. Wang[2], P. Polacino[3], S.-L. Hu[3], M.C. Holmes[2], H.-P. Kiem[1]
[1]*Fred Hutchinson Cancer Research Center, Seattle, United States,* [2]*Sangamo BioSciences, Richmond, United States,* [3]*University of Washington, Seattle, United States*
*Presenting author email: cwpeters@fhcrc.org*

**Background:** Gene editing of the CCR5 coreceptor locus in hematopoietic stem/progenitor cells (HSPCs) is a promising therapy for HIV infection. We have previously demonstrated the feasibility of this approach in nonhuman primates. Here, we leverage our expertise with gene editing in the pigtailed macaque, *M. nemestrina* to interrogate the clonal persistence, trafficking, and antiviral efficacy of CCR5-edited cells. Our objectives were to understand how individual gene-edited HSPCs persist following autologous transplantation and virus infection, determine whether HSPC-derived, gene-edited progeny traffic to viral reservoir tissues, and develop strategies to increase the number of these cells *in vivo*.
**Methods:** Zinc Finger Nucleases (ZFNs) are used to target the CCR5 locus in macaque HSPCs. Gene edited HSPCs are transplanted into animals either prior to infection with simian/human immunodeficiency virus (SHIV), or in SHIV-infected animals that are treated with a combination antiretroviral therapy (cART) regimen designed to approximate a well-suppressed $HIV^+$ patient. Edited cells are measured in peripheral blood, bone marrow, gastrointestinal (GI) tract, lymph nodes, and at necropsy in a panel of 25 tissues, using methods including deep sequencing.
**Results:** We observe up to 14-fold enrichment of CCR5-gene edited memory $CD4^+$ T-cells in SHIV-infected animals, consistent with virus-dependent selection against CCR5 wt memory $CD4^+$ T-cells. Gene edited cells are found in a broad array of anatomical sites. These include tissues that we have identified as viral reservoirs in our model, namely GI tract and lymph nodes. Spatial and temporal tracking of CCR5 mutations suggests that gene edited cells persist long-term, and are polyclonal. Homology directed repair (HDR) pathways can be exploited in macaque $CD34^+$ HSPCs, facilitating knock-in of selectable markers at the disrupted CCR5 locus.
**Conclusions:** Our gene editing strategy results in stable engraftment of CCR5-mutated and SHIV-resistant HSPCs and their progeny in blood, and in tissues known to serve as viral reservoirs. Importantly, gene-edited $CD4^+$ T-cells undergo positive selection during active infection, further supporting the validity of this approach in the clinic. Our preliminary *ex vivo* HDR data suggest that these gene-edited cells could be engineered to undergo positive selection without the need for ongoing viral replication.

*Presenting author email: giorgio.bozzi@nih.gov*

**Background:** Sources of HIV persistence during combination antiretroviral therapy (cART) remains uncertain, and the contribution of active cycles of HIV replication in tissue compartments is unknown. Genetic analyses are sensitive measures to detect ongoing cycles of virus replication, particularly in individuals who undergo cART early after infection, when HIV populations are relatively monomorphic and increases in genetic diversity are easily detectable. To investigate whether ongoing replication occurs in tissues, we studied HIV populations in blood and anatomic compartments from 3 individuals who initiated antiretroviral therapy shortly after HIV infection and maintained viral suppression for > 8y.
**Methods:** Samples from three individuals in IRB-approved studies were studied. Individuals started cART soon after infection, maintained HIV RNA < 50 c/ml for 8-16y, and underwent autopsy for primary effusion lymphoma (N=1), or colonoscopy (N=2). HIV from autopsy was quantified (RT-PCR), and HIV sequences (*pro-pol*, 1200 nt) were obtained from tissues and peripheral blood lymphocytes (PBL) using single genome sequencing (SGS). Sequences were aligned, subjected to phylogenetic (MEGA), and compartmentalization (Slatkin-Maddison, FST, geographic subdivision) analyses; 263 sequences from autopsy and 293 from individuals undergoing colonoscopy were analyzed.
**Results:** HIV DNA was detected in most tissues at autopsy (median 1.8 copies/1e6 cells, range 1-75/1e6 cells). HIV had limited genetic diversity in tissues and PBL (average pairwise difference, APD 0.3 - 0.6%). From the autopsy, PBL (N=124), spleen (38), lymph node (30), ileum (30), jejunum (12), colon (5), effusion cells (10), kidney (5), lung (3), testes (1) were obtained; no HIV was recovered from frontal lobe, spinal cord, or the cell-free effusion fluid. HIV populations were well-mixed in tissues and non-divergent from PBL-derived HIV, with no evidence of compartmentalization in any tissue. Identical hypermutated sequences in PBL and several tissues demonstrated distribution of clonally expanded cells had occurred. In 2 individuals undergoing colonoscopy, analysis of HIV from ileum, colon, and PBL revealed no evidence of ongoing replication and no divergence from pretherapy plasma RNA obtained 12-16 years prior to colonoscopy.
**Conclusions:** No evidence of ongoing replication was detected in tissues compared to peripheral blood in individuals undergoing cART, suggesting combination antiretroviral therapy blocks active HIV replication, including in tissues.

## THAA0105

### ALLOGENEIC STEM CELL TRANSPLANTATION IN HIV-1-INFECTED INDIVIDUALS; THE EPISTEM CONSORTIUM

A.M. Wensing[1], J.L. Diez-Martin[2], G. Huetter[3], J. Kuball[1], M. Kwon[2], M. Nijhuis[1], A. Saez-Cirion[4], V. Rocha[5], M. Salgado[6], J. Schulze zur Wiesch[7], A. Stam[1], J. Martinez-Picado[6,8]
*[1]Utrecht University, Medical Center, Utrecht, Netherlands, [2]Hospital General Universitario Gregorio Maranon, Madrid, Spain, [3]Cellex, Dresden, Germany, [4]Institute Pasteur, Paris, France, [5]Oxford University Hospital, Oxford, United Kingdom, [6]AIDS Research Institute IrsiCaixa, Badalona, Spain, [7]University Medical Center Hamburg-Eppendorf, Hamburg, Germany, [8]ICREA, Barcelona, Spain*
*Presenting author email: a.m.j.wensing@umcutrecht.nl*

**Background:** To date, the only and most compiling evidence of a medical intervention that has been able to cure HIV-1 infection (the “Berlin patient”), involved an allogeneic stem cell transplant (SCT) from a donor who was homozygous for CCR5Δ32. Although this high-risk procedure is only indicated for certain hematological malignancies, the strategy raised tremendous scientific potential to gain insight in the mechanisms of HIV eradication.
**Methods:** The EpiStem consortium aims to guide clinicians of HIV infected patients who require an SCT in donor search and CCR5 screening, ethical regulations, the SCT procedure, sampling procedures and in depth investigations to study HIV persistence. The patients are included in the EPISTEM observational cohort. Detailed analysis of the cohort should provide insight as to whether additional factors such as conditioning regimen, total body irradiation and graft versus host disease may contribute to the eradication of the potentially infectious viral reservoir in addition to the lack of a functional CCR5 receptor.
**Results:** Nearly 30,000 cord blood units in multiple European blood banks and more than 1.000.000 adult donors have been genotyped for CCR5 to generate a registry of CCR5Δ32 available donors. Twenty HIV positive patients with diverse hematological malignancies have been registered to the EPISTEM cohort. Since 2012, 13 patients have been transplanted; 4 with a CCR5Δ32, 1 with a heterozygous, and 8 with a CCR5 WT donor. In 3 cases the donor cells came from cord blood and in 10 cases from an adult donor. So far, 5 patients have successfully passed the 12 months follow-up after transplantation, and 8 patients have died after transplantation, despite achieving full donor chimerism in most cases. Preliminary analysis of virological and immunological data from blood and tissue samples shows a systematic reduction of HIV-1 reservoirs to very low levels.
**Conclusions:** EPISTEM is actively recruiting new cases and continues to systematically investigate HIV persistence over time to gain insight in potential HIV-1 eradication.

## THAA0106LB

### ELIMINATION OF HIV-1 LATENTLY INFECTED CELLS BY PKC AGONIST GNIDIMACRIN ALONE AND IN COMBINATION WITH A HISTONE DEACETYLASE INHIBITOR

L. Huang, W. Lai, L. Zhu, C.-H. Chen
*Duke University Medical Center, Surgery, Durham, United States*
*Presenting author email: li.huang@duke.edu*

**Background:** Several classes of HIV-1 latency reversing agents (LRAs) including PKC agonists and HDACis have been investigated for their effects against latent HIV-1 infection. Although many LRAs were capable of reactivating latent HIV-1, it is less certain if they can actually reduce the latent viral reservoirs. To identify potent LRAs that can effectively eliminate/reduce latent HIV-1 reservoirs, we investigated the PKC agonist gnidimacrin (GM) alone and in combination with a selective HDAC inhibitor thiophenyl benzamide (TPB) for their effectiveness on elimination of HIV-1 latently infected cells.
**Methods:** 1) cell line model: U1 cells were treated with various concentrations of GM with/without the presence of TPB. The culture supernatant was then collected for P24 ELISA to quantify latent HIV-1 activation; 2) *ex vivo* model: PBMCs from HIV+ patients (with >5 years of ART and undetectable viral load) were treated with GM, GM+TPB, or vorinostat in the presence of anti-retroviral agents. The viral DNA in the lately infected cells were quantified with RT-PCR and the frequency of latently infected cells was determined by using a limiting dilution viral outgrowth assay.
**Results:** In U1 model, the $EC_{50}$ of GM was 18 pM for latent viral activation and its potency was enhanced about three-fold in the presence of TPB. In *ex vivo* model, GM alone (20 pM) was able to reduce pro-viral DNA and the frequency of latently infected cells by 5-10 folds. Addition of TPB further increased the effect of GM by over three-fold.
**Conclusions:** The results of this study demonstrate that GM is an extremely potent LRA that can effectively reduce HIV-1 latently infected cells *ex vivo* at pM concentrations. In the presence of TPB, the effect of GM was further enhanced. TPB exhibited good selectivity with no overlapping cytotoxic and effective doses in contrast to other tested HDACIs. Moreover, TPB may antagonize the potential side effects of GM by inhibiting high dose GM-induced inflammatory cytokine production. Thus, combination of GM and TPB provides a unique and effective option in reducing the latent HIV-1 reservoir.

# THAA02 IMMUNE CONTROL OF HIV

## THAA0201

### NOVEL CONSERVED ELEMENT HIV/SIV DNA VACCINES MAXIMIZE BREADTH AND MAGNITUDE OF IMMUNE RESPONSE

B.K. Felber[1], X. Hu[1], A. Valentin[1], F. Dayton[1], Y. Cai[1], M. Rosati[1], C. Alicea[1], N.Y. Sardesai[2], R. Gautam[3], M.A. Martin[3], J.I. Mullins[4], G.N. Pavlakis[1]
*[1]National Cancer Institute at Frederick, Center for Cancer Research, Vaccine Branch, Frederick, United States, [2]Inovio Pharmaceuticals, Inc., Plymouth Meeting, United States, [3]National Institute of Allergy and Infectious Diseases, NIH, Bethesda, United States, [4]University of Washington, Seattle, United States*
*Presenting author email: barbara.felber@nih.gov*

**Background:** HIV sequence diversity and potential "decoy" epitopes are hurdles in the development of an effective AIDS vaccine. To target immune responses towards invariable viral regions, we engineered DNA-based immunogens encoding conserved elements (CE) of HIV-1 selected on the basis of stringent conservation, functional importance, broad HLA-coverage, and association with viral control.
**Methods:** DNA vectors were generated expressing 7 collinearly arranged CE from $p24^{gag}$ to cover >98% of group M sequences. By analogy, a similar vaccine was developed against SIV Gag. Heterologous DNA regimens consisting of CE prime were followed by a boost with DNA expressing either full-length Gag or a combination of CE+full-length Gag. Immune responses were evaluated in macaques vaccinated by IM/electroporation.
**Results:** All HIV and SIV CE DNA-vaccinated macaques developed robust CE-specific memory responses with a significant fraction of cytotoxic T cells. In contrast, vaccination with HIV or SIV full-length *gag* DNA was very inefficient in inducing CE responses (50% responders; fewer CE recognized). Subsequent *gag* DNA vaccination significantly boosted the preexisting CE responses. Interestingly, vaccination with a combination of CE+*gag* DNA efficiently increased the breadth of preexisting CE responses, indicating a significant change in epitope hierarchy both for the HIV and SIV vaccine regimens. The induced T cell responses rapidly disseminated into secondary lymphoid organs and effector mucosal sites. CE responses were maintained for >2 years. A single booster vaccination with CE DNA resulted in rapid increase of pre-existing responses reaching up to ~7% of total T cells.
**Conclusions:** Priming with CE DNA is critical to induce broad responses to vulnerable sites of the virus while avoiding variable or decoy targets that may divert effective T cell responses towards less protective viral determinants. Combination of CE and full-length immunogens provides a novel strategy to increase the breadth and magnitude of cellular and humoral immunity. This strategy allows for the development of robust T cell responses targeting a broad number of epitopes, including subdominant conserved viral epitopes. The expanded breadth of the responses could provide an advantage in restricting viral propagation. This vaccine regimen is currently under development for testing in an HVTN clinical trial.

## THAA0202

### CD8+ T CELL BREADTH AND EX VIVO VIRUS INHIBITION CAPACITY DISTINGUISH BETWEEN VIREMIC CONTROLLERS WITH AND WITHOUT PROTECTIVE HLA CLASS I ALLELES

C.K. Koofhethile[1], Z. Ndhlovu[1,2], C. Thobakgale[1], J. Prado[3], N. Ismail[1], Z. Mncube[1], L. Mkhize[1], M. van der Stok[1], N. Yende[4], B.D. Walker[1,2], P.J.R. Goulder[1,5], T. Ndung'u[1,6,7], Sinikithemba Cohort
*[1]University of KwaZulu-Natal, HIV Pathogenesis Programme (HPP), Durban, South Africa, [2]Massachusetts Institute of Technology and Harvard University, Ragon Institute of Massachusetts General Hospital, Boston, United States, [3]Hospital Universitari Germans TriasiPujol, AIDS Research Institute IrsiCaixa, Barcelona, Spain, [4]University of KwaZulu-Natal, Centre for the AIDS Programme of Research in South Africa (CAPRISA), Durban, South Africa, [5]University of Oxford, Paediatrics, Oxford, United Kingdom, [6]Massachusetts Institute of Technology and Havard University, Ragon Institute of Massachusetts General Hospital, Boston, United States, [7]University of KwaZulu-Natal, KwaZulu-Natal Research Institute for Tuberculosis and HIV (K-RITH), Durban, South Africa*
*Presenting author email: khei79@yahoo.com*

**Background:** The mechanisms of viral control and loss of viral control in chronically infected individuals with or without protective HLA class I alleles are not fully understood. We characterized longitudinally the immunological and virological features that may explain divergence in disease outcome in 70 HIV-1 C-clade infected antiretroviral therapy (ART)-naïve South African adults, 35 of whom possessed protective HLA class I alleles.
**Methods:** Viral loads, CD4 counts, HLA typing and sequencing were performed by standard molecular methods. HLAs A*74:01, B*57, B*58:01, B*81:01 were considered protective. HIV-specific $CD8^+$ T-cell immune responses were quantified using the interferon gamma (IFN-g) enzyme-linked immunosorbent spot (ELISPOT) assay after stimulation with overlapping peptides (OLP) and HLA-specific optimal peptides derived from the C clade HIV consensus sequence covering the whole proteome. T cell polyfunctionality and proliferation upon stimulation with Gag peptide pool was assessed by flow cytometry and CFSE assay respectively. Virus inhibition was assessed by an *ex vivo* co-culture assay.
**Results:** Over five years of longitudinal follow-up, 35% of individuals with protective HLA class I alleles lost viral control compared to none of the individuals without protective HLA class I alleles (p=0.06). Sustained HIV-1 control in patients with protective HLA class I alleles was associated with breadth of HIV-1 $CD8^+$ T-cell responses against Gag and enhanced ability of $CD8^+$ T cells to suppress viral replication *ex vivo*. In some cases loss of virological control was associated with reduction in both total breadth of $CD8^+$ T cell responses and the ability of $CD8^+$ T cells to suppress viral replication *ex vivo,* in the absence of differences in HIV-1-specific $CD8^+$ T cell polyfunctionality or proliferation. In contrast, viremic controllers without protective HLA class I alleles possessed low breadth of HIV-1-specific $CD8^+$ T cell responses characterized by reduced ability to suppress viral replication *ex vivo*.
**Conclusions:** These data suggest that the control of HIV-1 in individuals with protective HLA class I alleles may be driven by broad $CD8^+$ T cell responses with potent viral inhibitory capacity while control among individuals without protective HLA class I alleles may be mediated by $CD8^+$ T cell independent mechanisms.

## THAA0203

### NEUTROPHILS MEDIATE POTENT AND RAPID ANTI-HIV ANTIBODY-DEPENDENT FUNCTIONS

M.J. Worley[1], A.D. Kelleher[2,3], S.J. Kent[1,4], A.W. Chung[1]
*[1]University of Melbourne, Department of Microbiology and Immunology, Melbourne, Australia, [2]The University of New South Wales, The Kirby Institute, Sydney, Australia, [3]St. Vincent's Centre for Applied Medical Research, Immunovirology Laboratory, Sydney, Australia, [4]Monash University, Melbourne Sexual Health Centre and Department of Infectious Diseases, Melbourne, Australia*
*Presenting author email: worleym@student.unimelb.edu.au*

**Background:** Functional antibodies have been shown to mediate innate immune effector responses such as antibody dependent cellular cytotoxicity (ADCC) and their importance in HIV protection was highlighted by the RV144 HIV vaccine trial. However, the majority of studies have focused on antibody activation of NK cells and monocytes, while neutrophils remain understudied. Neutrophils are of particular importance as they are abundantly present in the mucosal sites of HIV transmission, constitute 40-70% of white blood cells and can respond rapidly to stimuli. We investigated the repertoire of antibody dependent functions in HIV infected patients and examined any differences between long-term slow progressors (LTSP) and progressors.
**Methods:** Neutrophils, PBMC, monocytes and NK cells were isolated from healthy donors and were evaluated for ADCC killing kinetics utilising HIV-specific antibodies. In addition, antibody-dependent phagocytosis (ADP) and ADCC activity of purified plasma IgG from 33 HIV positive subjects not on antiretroviral therapy was evaluated using healthy donor neutrophils. Nineteen subjects were LTSP, who maintained CD4 T-cell >450 cells/µl (median 656/µl) for over 7-years after infection, while 14 were HIV progressors who progressed to treatment within 6-years of infection (median CD4 T-cell 478/µl) at the time of sample collection.
**Results:** Neutrophils readily mediated HIV-specific ADCC and ADP and significant correlations between the functions were observed for LTSP $R_s$=0.626 (p=0.004) and progressors $R_s$=0.653 (p=0.014). Neutrophils mediated potent ADCC activity, having 2 fold greater responses than NK cells, enhanced killing capacity compared to PBMC's, and induced similar responses to monocytes. Neutrophils required a higher concentration of HIV IgG to reach their maximal ADCC activity compared to NK cells, PBMC and monocytes. Similar levels of ADP and ADCC were observed in neutrophils between the LTSP and progressors patient groups.
**Conclusions:** HIV-specific IgG can activate neutrophils to mediate ADP and ADCC against HIV-1 envelope protein. As both of these functions are highly correlated, the same Fc receptors/antibodies may be utilised to mediate these responses. Neutrophils may require more Fc receptor/antibody interactions for activation. The rapid action and high magnitude of ADCC by neutrophils highlights their potential importance early in HIV infections.

## THAA0204

### IMPACT OF ANTIBODY ISOTYPE AND ASSOCIATION CONSTANT RATE ON ANTIVIRAL FUNCTIONS AGAINST HIV-1

S.G. Okala[1], D. King[1,2], R. Shattock[1]
*[1]Imperial College London, Medicine, London, United Kingdom, [2]International AIDS Vaccine Initiative, London, United Kingdom*
*Presenting author email: s.okala12@imperial.ac.uk*

**Background:** Both IgG and IgA are found at mucosal surfaces where HIV-1 enters the body in over 90% of the cases. However, few studies have investigated whether IgG and IgA recognising the same epitopes presented different antiviral abilities that could prevent HIV-1 infection. Here, we compared the antiviral properties of IgG and IgA in various assays and examined the relationships between kinetics parameters of antibody-virions interactions and antiviral functions.
**Methods:** A panel of 12 neutralising monoclonal antibodies (mAbs) including IgG, monomeric (m)IgA and dimeric (d)IgA were compared for their ability to bind, capture, mediate viral aggregation, neutralise and inhibit HIV-1 virions transcytosis across epithelial cells. Kinetics parameters of mAbs and HIV-$1_{Bal}$ gp140 interactions were measured using Bio-Layer Interferometry (BLI), HIV-$1_{Bal}$ capture by the panel of mAbs was determined by ELISA, antibody mediated viral aggregation (AMVA) was detected using Nanoparticle Tracking Analysis (NTA), neutralisation was assessed by TZM-bl assay and inhibition of viral transcytosis through a monolayer of HEC-1A cells was quantified by real-time Reverse Transcription Polymerase Chain Reaction (RT-PCR).
**Results:** We showed previously that the association constant rate ($K_{on}$) correlates with antibody ability to capture viral particles, with IgG binding more quickly to its target and capturing more HIV-1 virions than its mIgA and dIgA counterparts with the same epitope specificity. In this study, we demonstrated that not only the $K_{on}$ of neutralising mAbs significantly correlates with viral capture but also with neutralisation ($p< 0.01$). Additionally, we found a significant relationship between the proportions of virions captured and the antibody neutralisation activity ($p< 0.01$). However, no relationship was observed between $K_{on}$ and AMVA or between $K_{on}$ and inhibition of viral transcytosis. Interestingly, dIgAs were able to induce viral aggregates and to inhibit HIV-1 transcytosis while IgGs and mIgAs recognising the same epitopes failed to show these functions.
**Conclusions:** Thus, this work implies that the association constant rates of mAbs might be use as an indicator of antibody ability to capture viral particles and to neutralise infectious virions. Moreover, it shows that antibody isotype influences antiviral functions and provided insights for the selection of potent antibody against HIV-1.

## THAA0205

### T REGULATORY CELL DEPLETION IN CONTROLLER MACAQUES REACTIVATES SIV AND BOOSTS CTLS

T. He[1], B. Policicchio[1], E. Brocca-Cofano[1], J. Stock[1], C. Xu[1], K. Raehtz[1], T. Gaufin[2], R. Gautam[2], I. Pandrea[1,2], C. Apetrei[1,2]
*[1]University of Pittsburgh, Center for Vaccine Research, Pittsburgh, United States, [2]Tulane University, Tulane National Primate Research Center, Covington, United States*
*Presenting author email: tih19@pitt.edu*

**Background:** T regulatory cells (Tregs) may be involved in formation of latent reservoir, being susceptible to HIV/SIV infection. Resting Tregs harbor high levels of HIV/SIV. During acute infection, Tregs decisively contribute to the establishment of HIV reservoir by reversing CD4+ T cell immune activation status. During chronic infection, they contribute to the impairment of CTL responses, as Treg expansion correlates with loss of CTL function and their ex vivo depletion enhances T cell responses to HIV/SIV antigens. HLAB27+and B57+ HIV-specific CD8+ T cells from elite controllers evade Treg suppression. We hypothesized that Treg depletion is a valid approach for HIV cure, in which a single intervention reduces the size of the reservoir, reactivates the virus and boosts cell-mediated immune responses.
**Methods:** Five SIVsab-infected RMs, in which spontaneous supercontrol of virus replication (< 3 copies/ml plasma) associates complete control of immune activation, were depleted of Tregs with Ontak (Denileukin diftitox), an engineered protein combining IL-2 and diphtheria toxin. Treg depletion was monitored by flow cytometry and immunohistochemistry; plasma viral load was measured by single copy assay; specific cellular immune responses to SIV antigens were monitored flow-cytometrically by intracellular cytokine staining after stimulation with SIVsab peptides.
**Results:** Ontak administration to SIVsab-infected RMs resulted in significant depletion (>75%) of the circulating Fox-P3+CD25+CD4+ T cells. Up to 60% and >50% of Tregs were depleted from gut and the lymph nodes, respectively. Ontak impact on overall CD8+ T cell counts was minimal. Treg depletion resulted in a major increase of the levels of CD4+ T cell activation (Ki-67). In the absence of antiretroviral therapy, virus rebound to 103 vRNA copies/ml of plasma occurred after Ontak administration. Importantly, Treg depletion resulted in a significant boost of the SIV-specific CD8+ T cells and rapid clearance of the reactivated virus.
**Conclusions:** Treg depletion in chronically SIV-infected superelite controller RMs resulted in both reactivation of latent virus and a boost of CTL responses. The overall Treg ability to control immune responses was significantly impaired despite the fact that Treg depletion was incomplete. As no latency reversing agent in development has such a dual activity, our strategy holds great promises for cure research.

## THAA0206

### PD-1 BLOCKADE SYNERGIZES WITH ART FOR RESTORING ANTI-VIRAL CD8 T CELL FUNCTION AND POSSIBLY DESTABILIZING THE VIRAL RESERVOIR IN SIV INFECTED MACAQUES

G. Mylvaganam[1], S. Hicks[1], B. Lawson[1], M. Nega[1], V. Velu[1], R. Ahmed[1], G. Freeman[2], R.R. Amara[1]
*[1]Emory University, Yerkes National Primate Research Center, Atlanta, United States, [2]Harvard Medical School, Boston, United States*
*Presenting author email: ramara@emory.edu*

**Background:** The expression of the inhibitory receptor programmed death-1 (PD-1) on anti-viral CD8 T cells and virally infected CD4 T cells provides an immunological signature for both T cell dysfunction and viral latency during chronic SIV/HIV infection. We hypothesized that PD-1 blockade administered during the initiation of anti-retroviral therapy (ART) and under fully suppressive ART would have direct effects on both dysfunctional CD8 T cells and latently infected CD4 T cells. To test our hypothesis we developed a primatized anti-human PD-1 Ab to allow for repeated infusions in rhesus macaques (RMs) and administered PD-1 blockade to chronically SIV infected RMs in combination with ART.
**Methods:** SIVmac251 infected RMs were administered 5 infusions (over 14 days) of a 3mg/kg dose of primatized anti-PD-1 Ab 10 days prior to the initiation of ART. About 8 months post ART, RMs received 3 monthly infusions of 10mg/kg anti-PD-1 or saline. ART was interrupted at 2 weeks after the final PD-1 Ab infusion.
**Results:** PD-1 blockade administered during the initiation of ART enhanced proliferation of anti-viral CD8 T cells ($p=0.02$), increased their cytotoxic potential ($p=0.04$) and polyfunctionality ($p=0.01$). Importantly, the PD-1 Ab treated animals showed more rapid viral suppression (42 days in the PD-1 group versus 140 days in saline group; $p = 0.01$) and greater reconstitution of Th17 cells in the rectal mucosa ($p = 0.01$) following initiation of ART. Moreover, PD-1 blockade administered under suppressive ART resulted in transient but significant increases in viremia, suggesting possible effects on destabilizing the latent viral reservoir. Following ART interruption, PD-1 Ab treated animals showed up to 80-fold reduction in set point viremia compared to set point levels prior to initiation of ART.
**Conclusions:** These results reveal for the first time the potential of PD-1 blockade both on restoring anti-viral CD8 T cell function and possibly destabilizing the viral reservoir under ART. They highlight the potential of PD-1 blockade to work synergistically with other therapeutic agents such as vaccines and latency reversing agents to effectively diminish HIV reservoir under ART as a means to establish a functional cure.

### EXTENDED ART INITIATION CRITERIA CAN BE IMPLEMENTED SUCCESSFULLY IN RURAL SOUTH AFRICA

S.J. Steele[1], G. Arellano[2], T. Ellman[3], A. Shroufi[1], G. Van Cutsem[1]
*[1]Médecins Sans Frontières, Cape Town, South Africa, [2]Médecins Sans Frontières, Eshowe, South Africa, [3]SAMU, Medecins Sans Frontieres, Cape Town, South Africa*
*Presenting author email: sarahtaleski@gmail.com*

**Background:** There is concern that earlier initiation of antiretroviral treatment (ART) in lower resource settings may compromise access to care for patients with lower CD4 counts, and that patients with higher CD4 counts may have lower retention in care (RIC). In July 2014, we extended ART initiation criteria from CD4 cell counts of ≤350 to ≤500 copies/ µl in 9 primary health clinics in KwaZulu-Natal, South Africa. Here we assess whether any compensatory reduction in initiation of sicker patients was seen and whether retention among those newly eligible was satisfactory in this public sector setting.
**Methods:** In this retrospective cohort analysis we compare proportions initiated on ART and RIC at 6 months among patients with baseline CD4 taken between July 1

and December 31, 2014 (CD4≤500 eligibility cohort) and between July1 and December 31, 2013 (CD4≤350 eligibility cohort). Pregnancy, TB, age < 15 years and WHO stage 3 or 4 were exclusion criteria. Outcomes were determined from baseline CD4 and analysed using survival analysis.
**Results:** There were 768 patients in the CD4≤350 eligibility cohort, with 31% having baseline CD4 ≤200; 51% 201-350, and; 12% 351-500. Of the 856 in the CD4 ≤500 eligibility cohort 23% had a baseline CD4 ≤200, 37% 201-350 and 33% 350-500. In both cohorts, median age was 31 years and 67% were female. Among participants with CD4 351-500, percentage initiated on ART within 3 months increased 10 fold between the periods from 7% (95%CI:3.4-13.0) to 70% (95%CI: 61-78); among those with CD4≤200 this increased from 70% (95%CI:55-80) to 86% (95%CI:79-93). The proportion initiated within 3 months among those with baseline CD4 201-350 remained unchanged at approximately 75%. RIC at 6 months was 82% (95%CI:79%-85%) in the CD4≤500 cohort and 80% (95%CI:76%-84%) in the CD4≤350 cohort.
**Conclusions:** Expanding eligibility for ART to CD4≤500 resulted in rapid change in time to ART initiation among those with baseline CD4 351-500 without compromising initiation or RIC among those with a CD4 ≤ 350. Extended initiation criteria can be successfully implemented in high HIV prevalence, low resources-settings without compromising access to care for more vulnerable patients.

Chan School of Public Health, Department of Global Health and Population, Boston, United States*
*Presenting author email: jbor@bu.edu*

**Background:** Immediate initiation of antiretroviral therapy (ART) reduces HIV transmission in serodiscordant couples in randomized controlled trials. However, the effect of immediate ART under real-life conditions is not well characterized. We investigate the effect of immediate ART eligibility on HIV incidence among HIV-uninfected household members using a large population-based longitudinal cohort in KwaZulu-Natal, South Africa. We use a quasi-experimental regression discontinuity design to estimate causal effects using the CD4 count-based threshold rule for ART initiation.
**Methods:** Households members of patients seeking care at the Hlabisa HIV Treatment and Care Programme between January 2007 and August 2011 with CD4 counts up to 350 cells/µl were eligible for inclusion if they had at least two HIV tests and were HIV-uninfected at the time the index patient linked to care (N=4,115). A regression discontinuity design was used to assess the intention-to-treat effect of immediate versus delayed ART eligibility on HIV incidence among household members. Exploiting the CD4-count based threshold rule for ART initiation (CD4< 200 cells/µl until August 2011), we used Cox proportional hazards models to compare outcomes for household members of patients who presented for care immediately above versus immediately below the threshold.
**Results:** Characteristics of household members of index patients initiating HIV care were balanced between those with an index patient immediately eligible for ART (N=2,489) versus delayed for ART (N=1,626). In the immediate group, median age was 20 years (IQR 16 to 48) and 61.4% were female, compared to median age 20 years (IQR16 to 47) and 62.4% female in the delayed group. Seventy-eight percent of index household members immediately eligible for ART initiated ART within 6 months of initiating care, compared to 22.3% of those delayed for ART. Overall HIV incidence among household members was 2.8 infections per 100 person-years (95% CI 2.5 to 3.1). Immediate eligibility for treatment resulted in a 45% decrease in HIV incidence in households (HR=0.55, 95% CI 0.35-0.87).
**Conclusions:** Outside of a tightly-controlled clinical trial setting, we demonstrate substantial reductions in household-level HIV incidence with immediate eligibility for ART. The benefit of ART uptake may extend outside of couples into spillover effects in households.

*Presenting author email: jscurrier@mednet.ucla.edu*

**Background:** Health benefits of postpartum antiretroviral therapy (ART) for women with high CD4 counts have not been assessed in randomized trials.
**Methods:** Asymptomatic, HIV+, non-breastfeeding women with pre-ART CD4 cell counts ≥ 400 cells/mm³ started on ART during pregnancy were randomized up to 42 days after delivery to continue or discontinue ART. LPV/RTV+TDF/FTC was the preferred ART regimen. The primary composite endpoint included death, AIDS-defining illness, and serious non-AIDS events. The sample size was selected to provide 88% power to detect a 50% reduction from an annualized primary event rate of 2.07%. A post-hoc analysis evaluated WHO Stage 2 and 3 events. All analyses were intent to treat.
**Results:** 1652 women from 52 sites in Argentina, Botswana, Brazil, China, Haiti, Peru, Thailand and the US were enrolled (1/2010-11/2014). Median age was 28 years and major racial categories were Black African (28%), Thai (16%) and White (15%). Median entry CD4 count was 696 cells/mm³, median ART exposure prior to delivery was 19 weeks (IQR 13-24) and 94% had entry HIV-1 RNA < 1000 copies/ml. After a median follow-up of 2.3 years, the primary composite endpoint rate was 0.34%, significantly lower than expected and not significantly different between arms. WHO Stage 2 and 3 events were reduced with continued ART (Table). Toxicity rates were higher in the continue arm but the difference was not statistically significant. Among women randomized to continue ART, 189/827 (23%) had virologic failure. Of the 155 with resistance testing, 134 (86%) failed without resistance to their current regimen, suggesting non-adherence.

| Endpoint (time to first event) | Continue ART | | Discontinue ART | | Hazard Ratio | p-value |
|---|---|---|---|---|---|---|
| | no. | no./ 100 pyr | no. | no./ 100 pyr | | |
| Primary Endpoint | 6 | 0.31 | 7 | 0.36 | 0.87 (0.29, 2.59 | 0.80 |
| AIDS Defining (WHO 4) | 2 | 0.10 | 3 | 0.15 | 0.67 (0.11, 4.02) | 0.66 |
| Serious Non-AIDS (Renal) | 2 | 0.10 | 1 | 0.05 | 2.00 (0.18, 22.01) | 0.56 |
| Death | 2 | 0.10 | 4 | 0.20 | 0.52 (0.09, 2.81) | 0.44 |
| Secondary Endpoints | | | | | | |
| Composite Endpoint of HIV/AIDS related events and WHO stage 2-3 events | 57 | 3.09 | 100 | 5.55 | 0.56 (0.40, 0.77) | <=0.001 |
| WHO 2-3 events | 38 | 2.02 | 80 | 4.36 | 0.47 (0.32, 0.68) | <=0.001 |
| Grade 2 Toxicity and above | 260 | 18.4 | 232 | 15.4 | 1.17 (0.98, 1.40) | 0.08 |
| Grade 3 and 4 Toxicity | 188 | 12.0 | 160 | 9.8 | 1.21 (0.98, 1.50) | 0.07 |

*[Study Endpoint Table]*

**Conclusions:** In the largest randomized trial to date evaluating postpartum ART, serious clinical events were rare among young women with high CD4 cell counts. Continued ART was safe and was associated with reductions in WHO 2/3 conditions. Virologic failure rates were high, underscoring the need to improve adherence in this population.

### SALIF TRIAL: SWITCHING SUPPRESSED FIRST-LINE PATIENTS TO TENOFOVIR/EMTRICITABINE/RILPIVIRINE (TDF/FTC/RPV) IS NON-INFERIOR TO TDF/FTC/EFAVIRENZ (TDF/FTC/EFV) AND COULD BE AN ALTERNATIVE TREATMENT OPTION IN LMICS

P. Munderi[1], E. Were[2], A. Avihingsanon[3], P. Abena Messomo Mbida[4], L. Mohapi[5], B.M. Samba[6], M. Jansen[7], P. Mohammed[8], G. Sawyerr[9], P. Barnes[8], Y. van Delft[10]
*[1]MRC/UVRI Uganda Research Unit on AIDS, Entebbe, Uganda, [2]Partners in Prevention, Eldoret, Kenya, [3]HIV-NAT The Netherlands Australia Thailand Research Collaboration, Bangkok, Thailand, [4]Cabinet Medical IDOC, Douala, Cameroon, [5]Perinatal HIV Research Unit, University of the Witwatersrand, Johannesburg, South Africa, [6]District Centre de Gaspard Kamara, Dakar, Senegal, [7]Janssen, Global Clinical Development Operations, Tilburg, Netherlands, [8]Janssen, Global Public Health, High Wycombe, United Kingdom, [9]Janssen, Research & Development LLC, Titusville, United States, [10]Janssen, Global Public Health, Tilburg, Netherlands*
*Presenting author email: paula.munderi@mrcuganda.org*

**Background:** Current global antiretroviral therapy (ART) guidelines recommend immediate initiation of ART and thus an increasing number of HIV patients are becoming eligible for treatment. There is a pressing need for simple, efficacious, well tolerated, affordable ART regimens. Rilpivirine (RPV) has a good safety profile and is a well-tolerated NNRTI whose low recommended once-daily dosing makes it a good candidate component for an affordable fixed-dose-combination (FDC) in low- and middle income countries (LMIC).

**Methods: SALIF** *(**S**witching **A**t **L**ow HIV-1 RNA **I**nto **F**ixed Dose Combinations)* was a 48 week, multicenter, phase 3b, randomized, open-label clinical study, designed to demonstrate non-inferiority of TDF/FTC/RPV to TDF/FTC/EFV (both as FDC) in maintaining HIV-1 RNA suppression (VL< 400copies/mL) among adults currently on first-line NNRTI-based (EFV or nevirapine) ART with HIV-1 RNA < 50copies/mL. The study was conducted in Cameroon, Kenya, Senegal, South Africa, Thailand and Uganda from 08/2013 to 10/2015.

**Results:** 424 individuals were included in the ITT analysis (64.3% women, median age: 41 years, mean CD4: 547cells/mm$^3$, median time on ART: 5.2 years). Virological suppression (< 400copies/mL) after 48 weeks was maintained in 200/213 (93.9%) individuals switched to TDF/FTC/RPV and in 203/211 (96.2%) on TDF/FTC/EFV (FDA Snapshot difference -2.3%; 95% CI (-6.4%, 1.8%)); results were identical using a cut-off of < 50copies/mL. Virological Failure (≥ 400copies/mL) was observed in one individual in each arm, without the development of drug-resistance associated mutations. High adherence rates (>95% adherence based on tablet count) were documented in 95.8% (TDF/FTC/RPV) and 97.6% (TDF/FTC/EFV). In the TDF/FTC/RPV arm 17 individuals (8.0%) discontinued assigned treatment vs. 10 (4.7%) in the TDF/FTC/EFV arm. Most frequent reasons were: adverse events (3.8% vs. 0.5%), loss to follow-up (0.9% vs. 1.4%) and subject withdrawal (0.9% vs. 1.4%).

| Number of individuals, n (%) | TDF/FTC/RPV (n=213) | TDF/FTC/EFV (n=211) | All Subjects (n=424) |
|---|---|---|---|
| SAEs | 16 (7.5%) | 11 (5.2%) | 27 (6.4%) |
| At least one DAIDS grade 3 or 4 AE | 40 (18.8%) | 56 (26.5%) | 96 (22.6%) |
| Fatal AEs | 1 (myocardial infarction; unrelated to study medication) | 0 | 1 |
| Treatment limiting AEs | 8 (3.8%) | 1 (0.5%) | 9 (2.1%) |
| At least one diabetes / hyperglycemia event of interest | 10 (4.7%) | 4 (1.9%) | 14 (3.3%) |
| At least one neuropsychiatric event of interest | 60 (28.2%) | 63 (29.9%) | 123 (29.0%) |

*[Table 1 Safety Overview]*

**Conclusions:** In adults with suppressed viral load on first-line NNRTI-based ART in a LMIC setting, switching to a FDC of TDF/FTC/RPV was non-inferior to TDF/FTC/EFV in maintaining high rates of viral suppression with a comparable tolerability profile.

## THAB0105

### VIROLOGICAL OUTCOMES OF PATIENTS ON SECOND-LINE ART (BOOSTED ATAZANAVIR VERSUS BOOSTED LOPINAVIR)

E. Laker Agnes Odongpiny[1], D. Nalwanga[1], A. Kaimal[1], A. Kiragga[1], S.M. Nabaggala[1], B. Castelnuovo[1], R. Parkes-Ratanshi[2]
*[1]Infectious Diseases Institute, Makerere College of Health Sciences, Kampala, Uganda, [2]University of Cambridge, Institute of Public Health, Infectious Diseases, London, United Kingdom*
*Presenting author email: elaker@idi.co.ug*

**Background:** Since 2010 the WHO guidelines recommend the use of boosted Atazanavir (ATV/r) as a preferred protease inhibitor (PI) alongside boosted Lopinavir (LPV/r) in patients who have failed first line antiretroviral therapy (ART) in sub-Saharan Africa. However, there are no RCTs or observational studies comparing virological outcomes of ATV/r to LPV/r in sub Saharan Africa.

**Methods:** This is a retrospective analysis of patients who were initiated on a standard second line therapy of 2NRTIs plus LPV/r or ATV/r between 01/Jan/2010 and 01/Dec/2014 in a large urban clinic in Uganda. Viral load (VL) monitoring has been made available in 2014; therefore most patients had a VL test done after this. We compared baseline characteristics of patients started on ATV/r and LPV/r and performed logistic regression analysis to determine factors associated with viral failure (VL>400 copies/ml).

**Results:** A total of 285 patients begun ATV/r regimen versus 215 on LPV/r .Baseline characteristics for the 2 groups as in the table were not significantly different except median duration on first line.

| Characteristic | ATV/r n=285 | LTV/r n=215 | P value |
|---|---|---|---|
| Age in years, Mean(SD) | 37(9.0) | 37(9.2) | 0.4979 |
| Sex, n (%) | | | |
| Female | 187(65.6) | 135(62.8) | 0.514 |
| Male | 98(34.4) | 80(37.2) | |
| BMI, Median(IQR) | 22.3(19.7-54.4) | 21.7(19.3-24.5) | 0.1554 |
| Time(months) on first line therapy, Median(IQR) | 39(22-65) | 40(14-64) | 0.0150 |
| CD4 count cell/µl, Median(IQR) | 109(53-202) | 114(60-206) | 0.5022 |
| Viral load copies/mm3, Median(IQR) | 4.8(4.3-5.2) | 4.9(4.3-5.4) | 0.2501 |

*[Baseline Characteristics of patients at time of switch to second line regimen]*

Viral loads (VL) were available for 230(80.7%) patients on ATV/r and 173(80.5%) patients on LPV/r. A total of 205(87.6%) patients on ATV/r and 136(80.5 %) patients on LPV/r had a VL< 400 copies/ml (p=0.050).Using logistic regression the following baseline characteristics at start of second line were not associated with the virological outcome: gender (OR=0.658, 95%CI:0.343,1.265), current second line regimen group (OR=0.475, 95%CI:0.204,1.104), BMI (OR=0.997, 95%CI:0.992,1.003), age (OR=0.999, 95%CI:0.97,1.04),CD4 cell count (OR=0.999, 95%CI:0.996,1.001), duration on second line ART (OR=1.001, 95%CI:0.985,1.029). However, there was trend towards likelihood of VL>400 copies/ml if duration on first line was shorter (OR=1.015, 95% CI: 1.003, 1.027).

**Conclusions:** This study showed a generally high level of viral suppression between patient on second line regimens containing ATV/r or LPV/r .We did not find statistical differences in virological outcome of patients started on LPV/r as compared to ATV/r.

## THAB0106LB

### LOW ACCEPTANCE OF EARLY ANTIRETROVIRAL THERAPY (ART) AMONG POST-PARTUM WOMEN ENROLLED IN IMPAACT PROMISE STUDIES ACROSS THE GLOBE

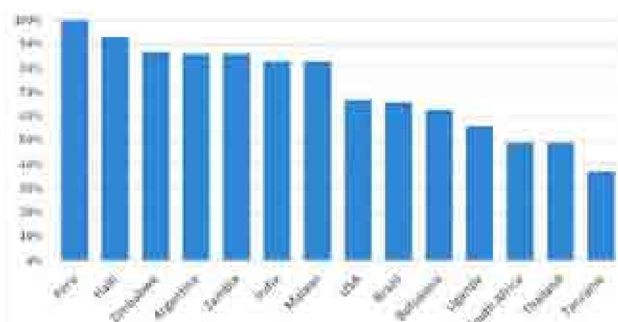
**Background:** The PROMISE trials enrolled 5398 asymptomatic HIV-infected pregnant women not eligible for antiretroviral treatment (ART) and randomly assigned different antiretroviral strategies to assess vertical transmission during pregnancy and post-delivery, infant safety, and maternal health. The START study subsequently demonstrated clear benefit in initiating ART regardless of CD4 count. The PROMISE study team informed active participants of these results and strongly recommended that women not receiving ART immediately initiate treatment to optimise their own health. We summarize PROMISE participants' responses to these recommendations and their reasons given to either accept or decline early ART.

**Methods:** A mixed methods approach was used to gather responses from participants receiving the START information. Staff actively contacted participants to return to the clinic and delivered START results, utilising a structured script and assessing comprehension. Women not on ART were advised to accept the offer to initiate ART, during a client-centred counselling session.

Women selected their primary reason for accepting or rejecting the offer of early ART from a set of closed options. We report the uptake of early ART and the primary reasons in support of their decisions.

**Results:** The 1483 women not on ART were advised to initiate ART. The offer was accepted by 984 women (66%) but 499 (34%) declined. Acceptance rates by country varied.



*[HIV-infected mothers accepting Early ART after single counseling session]*

Women declined ART as they wanted more time to consider (200/494-40%) and felt well and knew CD4 count was high (89/494-18%). The women accepting early ART did so for health concerns (444/792-56%) and because of the recommendation given by the protocol team (348/792-44%).

**Conclusions:** A substantial number of women were not willing to initiate early ART after a single counselling session. Over one third needed more time to consider the offer to start early ART for their own health. This finding is important to ART programme implementers scaling up test-and-treat strategies.

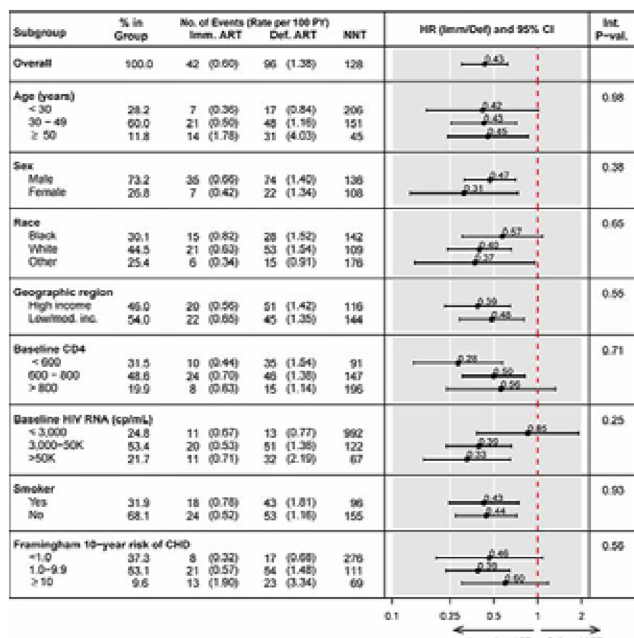
**Background:** The START trial showed that immediate antiretroviral therapy (ART) in asymptomatic adults with >500 CD4 cells/mm$^3$ reduces the risk of primary events (a composite of serious AIDS, serious non-AIDS conditions or death) by 57% vs. deferring ART until CD4 < 350. We investigated which subgroups benefitted most from immediate treatment.

**Methods:** Within subgroups defined by 8 predefined baseline characteristics (Figure), we estimated event rates for the START primary endpoint, and the number need to treat (NNT) immediately for one year to prevent one event compared with the deferral strategy. Using proportional hazards models, we estimated hazard ratios (HR) of immediate versus deferred ART within subgroups, and tested for interactions between treatment groups and subgroups to assess heterogeneity of the treatment effect across subgroups.

**Results:** Among the 4685 participants followed for a mean of 3.0 years, the event rates (absolute risk) for the primary endpoint in the immediate and deferred ART arms were 0.6 and 1.38 per 100 PY, respectively, NTT=128. Across all 8 subgroups, HRs consistently favored the immediate arm (Figure). While HRs were similar across subgroups (p≥0.25 for all interactions), the event rates and reductions in absolute risk were higher among older participants (NNT=50 for age >50 years), those with higher baseline HIV RNA level (NNT=67 for HIV RNA >50,000 copies/mL), higher Framingham risk score (NNT=69). There is a trend towards lower NNT among participants with lower baseline CD4 levels.



| Subgroup | % in Group | No. of Events (Rate per 100 PY) Imm. ART | Def. ART | NNT | HR (Imm/Def) and 95% CI | Int. P-val. |
|---|---|---|---|---|---|---|
| Overall | 100.0 | 42 (0.60) | 96 (1.38) | 128 | 0.43 | |

*[Figure. Incidence of Serious AIDS or Serious non-AIDS Events and NNT by Subgroups]*

**Conclusions:** In asymptomatic ART-naïve adults with >500 CD4 cells/mm³, immediate ART was superior to deferral across all subgroups, with similar relative risk reduction. Due to higher absolute risk, older participants, those with higher plasma HIV RNA level, lower baseline CD4 count, and higher Framingham risk score will benefit more from immediate treatment. Immediate ART also reduces transmission risk, which is essential for cost-effectiveness considerations, but not reflected in NNT.

*Presenting author email: a.arenas-pinto@ucl.ac.uk*

**Background:** Randomized trials have shown increased risk of suicidality associated with efavirenz (EFV). The START trial randomized ART-naïve HIV-positive adults with high CD4 cell counts to immediate versus deferred ART (initiation at CD4 < 350 cells/mm³). EFV-based regimens were common.
**Methods:** We compared the rate of suicide or investigator reported suicidal and self-injurious behaviour ("suicidal behaviour") between the immediate versus deferred ART groups using Cox proportional hazards models. Before randomization, the initial ART regimen was pre-specified for each participant. We compared the treatment groups, overall, and separately for those with EFV-containing and EFV-free pre-specified regimens using intention to treat (ITT) analyses (all of follow-up and first year), and after censoring participants in the deferred arm at ART initiation.
**Results:** Of the 4685 participants, median age 36 years, 270 (5.8%) had prior psychiatric diagnoses. EFV was pre-specified for 3516 participants (75%); less often in those with psychiatric diagnosis (40%) than without (77%). While the overall ITT comparison shows no difference in suicidal behaviour between immediate and deferred ART (51 events, HR=1.07, p=0.80) (Table), subgroup analyses suggest that those who pre-specified EFV-containing regimens were at an increased risk of suicidal behaviour compared to those who did not. In the deferred group, 13 of 24 events occurred after ART start, median time 5.6 months. When censoring follow-up at ART start in the deferred group, the HR for EFV versus their ART-naïve controls was 4.16 (p=0.02) and the HR for non-EFV regimens versus their ART-naïve controls was 1.04 (p=0.93) (p=0.05 for difference in HRs). Excess risk associated with EFV was greater for those with a psychiatric diagnosis at baseline (table footnotes c-d).

| | | | No. pts with events (rate per 100 PY) | | | | | |
|---|---|---|---|---|---|---|---|---|
| Comparison | Pre-specified ART regimen | No. pts | Imm. ART | Def. ART | HR [a] (95% CI) | p-val. | HR Ratio | Int. p-val.[b] |
| By intent-to-treat (ITT) (mean follow-up 3.0 yrs) | Any regimen (all pts) | 4685 | 27 (0.39) | 24 (0.34) | 1.07 (0.6, 1.9) | 0.80 | NA | NA |
| ITT, subgroup analysis (mean follow-up 3.0 yrs) | EFV-based | 3516 | 18 (0.34) | 11 (0.21) | 1.42 (0.7, 3.0) | 0.37 | 1.92 | 0.23 |
| | No EFV | 1169 | 9 (0.51) | 13 (0.72) | 0.74 (0.3, 1.8) | 0.50 | | |
| ITT, 1st year only, subgroup analysis (mean follow-up 1.0 yrs) | EFV-based | 3516 | 9 (0.52) | 2 (0.11) | 3.75 (0.8, 17.5) | 0.09 | 3.68 | 0.15 |
| | No EFV | 1169 | 7 (1.25) | 7 (1.29) | 1.02 (0.4, 2.9) | 0.96 | | |
| Immediate: Follow-up from EFV/non-EFV ART start (mean 3.0 yrs); Deferred: Follow-up censored at ART start (mean follow-up 2.1 yrs) | EFV-based [c] | 3516 | 17 (0.35) | 3 (0.08) | 4.16 (1.2, 14.4) | 0.02 | 4.00 | 0.05 |
| | No EFV [d] | 1137 | 9 (0.59) | 8 (0.69) | 1.04 (0.4, 2.7) | 0.93 | | |

[a] Estimated in Cox proportional hazards models, stratified by psychiatric diagnosis.
[b] Interaction between indicators for treatment group and pre-specified regimen.
[c] Of these events, 6 and 0, in the immediate vs deferred arms, respectively, occurred among 108 participants with prior psychiatric diagnoses.
[d] Of these events, 5 and 2, in the immediate vs deferred arms respectively, occurred among 162 participants with prior psychiatric diagnoses. Of the 1169 participants without EFV in the pre-specified regimen, 32 were excluded (in the immediate group, 7 never started ART, and for 25, the first ART regimen contained EFV). Follow-up in the immediate group was censored at EFV start.

*[Table. Suicidal and self-injurious behaviour]*

**Conclusions:** These findings suggest that participants using EFV in the immediate ART group, particularly those with a prior psychiatric diagnosis, had an increased risk of suicidal behaviour compared to ART-naïve controls.

## THAB0203

### STRIIVING: SWITCHING TO ABACAVIR/DOLUTEGRAVIR/LAMIVUDINE FIXED DOSE COMBINATION (ABC/DTG/3TC FDC) FROM A PI, INI OR NNRTI BASED REGIMEN MAINTAINS HIV SUPPRESSION AT WEEK 48

J.E. Lake[1], B. Trottier[2], J. Garcia-Diaz[3], H. Edelstein[4], P. Kumar[5], U.F. Bredeek[6], M. Loutfy[7], C. Brennan[8], J. Koteff[8], B. Wynne[8], J. Hopking[9], M. Aboud[10]
*[1]UCLA, Infectious Diseases, Los Angeles, United States, [2]Clinique Med.e L'actuel, Montreal, Canada, [3]Ochsner Clinic Foundation, New Orleans, United States, [4]Highland Hospital, Alameda Health System, Oakland, United States, [5]Georgetown University, Washington, DC, United States, [6]Metropolis Medical, San Francisco, United States, [7]Maple Leaf Research, Toronto, Canada, [8]ViiV Healthcare, Research Triangle Park, United States, [9]GlaxoSmithKline, London, United Kingdom, [10]ViiV Healthcare, London, United Kingdom*
*Presenting author email: michael.x.aboud@viivhealthcare.com*

**Background:** STRIIVING is a phase 3b, randomized, open-label, North American, 48-week (W) study and is the first to evaluate the efficacy, safety, pharmacokinetics and health outcomes of switching from a protease inhibitor (PI), non-nucleoside reverse transcriptase inhibitor (NNRTI) or integrase inhibitor (INI) based regimen to ABC/DTG/3TC FDC in virologically-suppressed [HIV-1 RNA < 50 copies/mL (c/mL)] participants. Here we report the W48 efficacy and safety results.
**Methods:** Participants were randomized 1:1 to switch to ABC/DTG/3TC FDC at baseline [early switch, (ES)] or maintain current ART (cART) with a switch to ABC/DTG/3TC at W24 [late switch (LS)]. The primary endpoint was non-inferiority (-10% margin) of ABC/DTG/3TC relative to cART in maintaining plasma HIV-1 RNA < 50 c/mL at W24 by FDA snapshot. Plasma HIV-RNA < 50 c/mL was summarized as a secondary endpoint at W48 after all subjects switched to the DTG-based FDC.
**Results:** A total of 553 participants were randomized and treated (ABC/DTG/3TC 275, cART 278). Baseline characteristics were similar across treatment arms. The primary endpoint of non-inferiority at W24 was met (HIV-1 RNA < 50 c/mL; ABC/DTG/3TC 85% vs. cART 88%). At W48, 219/275 (80%) of ES subjects were virologically suppressed with HIV-1 RNA < 50 c/mL. The proportion of LS subjects (n=222/244) with HIV-1 RNA < 50 c/mL at W48 was comparable to the proportion at W24 for the ES arm (LS to ABC/DTG/3TC 91%; ES to ABC/DTG/3TC 85%). There were no protocol defined virologic failures or treatment emergent resistance in either arm. In the ES arm, 10 (4%) subjects withdrew due to AEs in the first 24 weeks of ABC/DTG/3TC; in the LS arm, 4 (2%) withdrew due to AEs following switch to ABC/DTG/3TC.
**Conclusions:** In virologically suppressed patients, switching to once daily ABC/DTG/3TC FDC was non-inferior to continuing cART with no evidence of virologic failure or treatment emergent resistance through 24 weeks. Early switch subjects also maintained virologic suppression from W24 through W48. There were fewer withdrawals due to AEs in the LS vs. ES arm. The safety profile of ABC/DTG/3TC in STRIIVING is consistent with current labeling for ABC/DTG/3TC.

## THAB0204

### EXPERIENCES WITH LONG-ACTING INJECTABLE ART: A QUALITATIVE STUDY AMONG PEOPLE LIVING WITH HIV PARTICIPATING IN A PHASE II STUDY OF CABOTEGRAVIR + RILPIVIRINE (LATTE-2) IN THE UNITED STATES AND SPAIN

D. Kerrigan[1], A. Mantsios[1], D. Margolis[2], M. Murray[3]
*[1]Johns Hopkins University, Health, Behavior & Society, Baltimore, United States, [2]ViiV Healthcare, Raleigh-Durham, United States, [3]ViiV Healthcare, London, United Kingdom*
*Presenting author email: dkerriga@jhsph.edu*

**Background:** Adherence to antiretroviral therapy (ART) among people living with HIV (PLHIV) is essential to improve individual outcomes and curb ongoing transmission. Challenges with daily oral medication have stimulated the development of long-acting injectable (LAI) ART as a means to address barriers.
**Methods:** We conducted 39 in-depth interviews including with 27 PLHIV (25 men, 2 women) and 12 clinical providers participating in a Phase IIb study (LATTE-2) evaluating a long-acting intramuscular ART regimen in the United States and Spain. Participants were treatment-naïve upon study entry and randomized to daily oral ART or LAI ART every 4 or 8 weeks. Interviews explored participant and provider attitudes and experiences with daily oral and LAI ART. Interviews were audiotaped, transcribed, coded and analyzed using thematic content analysis. All trial participants had completed a minimum of 32 weeks of LAI ART following 20 weeks of oral ART.

**Results:** Almost all participants experienced some level of side effects associated with LAI ART, mostly temporary soreness at the injection site. Yet, all reported being satisfied and interested in continuing LAI ART. Participants relayed practical and emotional benefits of LAI ART compared to oral ART. Practical benefits included convenience and logistical ease of receiving an injection every 4 or 8 weeks versus a daily pill. In many cases, participants reported LAI ART helped them manage stigma. LAI ART was seen as more discreet with less possibility of others discovering one's HIV status and it did not involve the "daily reminder of living with HIV". Most participants felt LAI ART could be beneficial to all PLHIV but particularly those with oral ART adherence challenges. While providers recognized the benefits of LAI ART, they expressed concerns LAI ART candidates would still need to be able to adhere to clinic visits for injections and concerns regarding the clinical management of LAI ART if it were necessary to stop the regimen given its long-acting nature.
**Conclusions:** LAI ART was preferable to a daily oral regimen among PLHIV participating in a Phase IIb trial given its practical and emotional benefits. Further research is needed regarding appropriate candidates for LAI ART including among women and "non-adherent" populations.

## THAB0205LB

### SUPERIOR EFFICACY OF DOLUTEGRAVIR/ABACAVIR/LAMIVUDINE (DTG/ABC/3TC) FIXED DOSE COMBINATION (FDC) COMPARED WITH RITONAVIR (RTV) BOOSTED ATAZANAVIR (ATV) PLUS TENOFOVIR DISOPROXIL FUMARATE/EMTRICITABINE (TDF/FTC) IN TREATMENT-NAÏVE WOMEN WITH HIV-1 INFECTION (ARIA STUDY)

C. Orrell[1], D. Hagins[2], E. Belonosova[3], N. Porteiro[4], S. Walmsley[5], V. Falcó[6], C. Man[7], A. Aylott[8], A. Buchanan[7], B. Wynne[9], C. Vavro[7], M. Aboud[10], K. Smith[7]
*[1]University of Cape Town, Desmond Tutu HIV Foundation, Cape Town, South Africa, [2]Chatham County Health Department, Savannah, United States, [3]Orel Regional Center for AIDS, Orel, Russian Federation, [4]Fundación IDEAA, Buenos Aires, Argentina, [5]University Health Network, Toronto, Toronto, Canada, [6]Hospital Vall d'Hebron, Barcelona, Spain, [7]ViiV Healthcare, Research Triangle Park, United States, [8]GlaxoSmithKline, Stockley Park, United Kingdom, [9]ViiV Healthcare, Philadelphia, United States, [10]ViiV Healthcare, Brentford, United Kingdom*

**Background:** The FDC of DTG/ABC/3TC is built upon an unboosted integrase-strand transfer inhibitor (INSTI), and may offer a simplified regimen for the treatment of HIV-1 infection. To gain additional data for women on this regimen, we conducted ARIA, an international, randomized, open-label study to evaluate the safety and efficacy of DTG/ABC/3TC versus ATV+RTV+FTC/TDF (ClinicalTrials.gov: NCT01910402).
**Methods:** Treatment-naïve adult women, with HIV-1 RNA ≥500 copies(c)/mL were randomized (1:1, stratified by plasma HIV-1 RNA and CD4+ count) to 48 weeks of treatment with DTG/ABC/3TC or ATV+RTV+FTC/TDF once daily. The primary endpoint was the proportion of women achieving an HIV1 RNA < 50 c/mL at Week 48 (Snapshot algorithm). Women who became pregnant were withdrawn, and where possible offered an option to enter a DTG/ABC/3TC pregnancy study.
**Results:** 495 women were randomized and treated. Median age was 37 years. Subjects were well matched for demographic and baseline (BL) characteristics. DTG/ABC/3TC was superior to ATV+RTV+FTC/TDF, with 82% and 71%, respectively, achieving HIV-1 RNA < 50 c/mL at Week 48 (adjusted difference 10.5%, 95% CI: 3.1% to 17.8%, p=0.005). Differences were driven by lower rates of both discontinuations due to adverse events (AEs) and Snapshot virologic failures in the DTG/ABC/3TC group. Increases in CD4+ count were similar between treatment groups. The safety profile of DTG/ABC/3TC was favorable compared to ATV+RTV+FTC/TDF, with fewer drug-related AEs reported in the DTG/ABC/3TC group. Of six DTG/ABC/3TC subjects who met protocol-defined virologic withdrawal criteria, none had treatment-emergent primary INSTI or ABC/3TC resistance mutations, compared with four ATV+RTV+TDF/FTC subjects who met virologic withdrawal criteria of which one had an emergent NRTI mutation, M184M/I/V.

| | DTG/ABC/3TC, N=248 | ATV+RTV+TDF/FTC, N=247 |
|---|---|---|
| Race: White (%), African heritage (%) | 46, 41 | 43, 44 |
| Median BL CD4+ (cells/mm³) | 340 | 350 |
| Median BL HIV-1 RNA ($log_{10}$ c/mL) | 4.41 | 4.43 |
| Week 48 HIV-1 RNA <50 c/mL (Snapshot, %) | 82 | 71 |
| Median change in CD4+ at Week 48 (cells/mm³) | 234 | 200 |
| Virologic failure (Snapshot, %) | 6 | 14 |
| Discontinuations due to AEs (%) | 4 | 7 |
| Pregnancies (%) | 2 | 3 |
| Drug-related AEs (%) | 33 | 49 |

*[Table 1]*

**Conclusions:** DTG/ABC/3TC demonstrated superior efficacy and a favorable safety profile compared with ATV+RTV+FTC/TDF in treatment-naïve women after 48 weeks of treatment. The study provides important information to help guide treatment decisions for women.

## THAB0206LB

### CABOTEGRAVIR + RILPIVIRINE AS LONG-ACTING MAINTENANCE THERAPY: LATTE2 WEEK 48 RESULTS

D. Margolis[1], D. Podzamczer[2], H.-J. Stellbrink[3], T. Lutz[4], J. Angel[5], G. Richmond[6], B. Clotet[7], F. Gutierrez[8], L. Sloan[9], S. Griffith[1], M. St Clair[1], D. Dorey[10], S. Ford[11], J. Mrus[12], H. Crauwels[12], K. Smith[1], P. Williams[12], W. Spreen[1]

**Background:** Cabotegravir (CAB) and rilpivirine (RPV) are under development as long-acting (LA) injectable nanosuspensions. LATTE-2 was designed to select an intramuscular (IM) regimen of CAB LA + RPV LA and to evaluate safety and efficacy of 2-drug IM ART, relative to 3-drug oral ART (CAB + ABC/3TC) to maintain viral suppression of HIV-1.
**Methods:** Phase 2b, multicentre, parallel group, open-label study in ART-naïve HIV infected adults. Enrolled patients with plasma HIV-1 RNA < 50 c/mL during the 20-week Induction Period on daily oral CAB 30 mg + ABC/3TC were randomized 2:2:1 to IM CAB LA + RPV LA every 4 weeks (Q4W), every 8 weeks (Q8W), or oral CAB + ABC/3TC (PO) in the Maintenance Period (MP). Dosing regimens were evaluated according to antiviral activity, protocol defined virologic failure (PDVF), and safety at the pre-specified Week 48 endpoint in MP (ITT Maintenance Exposed (ME)).

| Week 48 Snapshot Study Outcomes (ITT-ME) | CAB LA + RPV LA Q8W (n=115) | CAB LA + RPV LA Q4W (n=115) | Oral CAB 30 mg + ABC/3TC (n=56) |

Author Index

**Results:** 309 patients were enrolled (ITT-Exposed): 91% male, 20% non-white, and 19%>100,000 c/mL HIV-1 RNA. 286 pts were randomized into the MP. At Week 48, 92% (Q8W), 91% (Q4W), and 89% (PO) remained suppressed (ITT-ME). More patients on Q8W (5%), relative to Q4W (< 1%) and PO (0%) had HIV-1 RNA >50 c/mL at Week 48; 5/6 Q8W patients subsequently achieved HIV-1 RNA < 50 c/mL. Three ME patients had PDVF during MP (PO [W8]; Q8W [W4, W48]); one with NNRTI/INI mutations (Q8W[W48]). Grade 1/2 injection site pain occurred commonly, median duration 3 days, < 1% ISR withdrawals. MP SAEs occurred in IM (7%) and PO (5%), none drug-related.
**Conclusions:** Both Q8W and Q4W IM dosing demonstrated good virologic response rates and were generally well tolerated through 48 weeks. Q4W dosing resulted in modestly lower rates of virologic non-response than Q8W. Q4W dosing was chosen for progression into phase 3 studies while Q8W and Q4W remain under evaluation within LATTE-2.

## THAC01 MSM: Diverse realities require nuanced programmes

## THAC0101

### A small proportion of acts of anal intercourse within homosexual male serodiscordant couples in three countries are high-risk for HIV transmission

B.R. Bavinton[1], N. Phanuphak[2], F. Jin[1], I. Zablotska[1], B. Grinsztejn[3], G. Prestage[1,4], A.E. Grulich[1], Opposites Attract Study Group
*[1]The University of New South Wales, The Kirby Institute, Sydney, Australia, [2]Thai Red Cross AIDS Research Centre, Bangkok, Thailand, [3]Instituto de Pesquisa Clínica Evandro Chagas, Rio de Janeiro, Brazil, [4]La Trobe University, Australian Research Centre in Sex, Health and Society, Melbourne, Australia*
*Presenting author email: bbavinton@kirby.unsw.edu.au*

**Background:** There are few data about the range of strategies used to prevent sexual HIV transmission within homosexual male serodiscordant couples (HM-SDC).
**Methods:** Opposites Attract is an ongoing cohort study of HM-SDC. At baseline, HIV-positive partners (HPP) had viral load (VL) tested; HIV-negative partners (HNP) reported the previous three months' sexual behaviour and perception of the HPP's last VL test. Each act of condomless anal intercourse (CLAI) within couples was categorised by HIV prevention strategy.
**Results:** By February 2016, 331 couples were enrolled (Australia=151, Brazil=91, Thailand=89). At baseline, 78.8% of HPPs had undetectable VL (UVL); however, only 55.9% of HNPs perceived their partners to have UVL (96.4% of HPPs who were perceived to have UVL actually did). In the previous three months, 53.2% of couples had CLAI: 46.5%, 28.1%, and 15.7% of HNPs reported insertive CLAI, receptive CLAI with withdrawal, and receptive CLAI with ejaculation respectively. Eighteen HNPs (5.4%) took daily pre-exposure prophylaxis (PrEP). Over the previous three months, HNPs reported a total of 8,439 acts of anal intercourse with their HPP (mean per couple=25.5). Of these, 4,627 (54.8%) were protected by condoms, while there were 3,812 (45.2%) acts of CLAI. Of the CLAI acts, 2,488 (65.3%) were when the HNP perceived his HPP to have UVL; 94 (2.5%) were protected by PrEP in the HNP; and 244 (6.4%) were protected by perceived UVL in the HPP and PrEP in the HNP. Of the remaining 986 CLAI acts where the perceived VL was detectable or unknown and were not protected by PrEP, 484 were when the HNP was insertive (strategic positioning) and 428 were when the HNP was receptive (277 with withdrawal and 151 with ejaculation). Overall, 53.9% of all anal intercourse acts reported by HNPs were protected by condom use, 33.6% by perceived UVL, 4.2% by PrEP, and 6.0% by strategic positioning; while 3.4% were receptive with withdrawal, and 1.9% were receptive with ejaculation.
**Conclusions:** Couples used condoms, PrEP or perceived UVL for prevention in the vast majority of anal intercourse acts. Only a very small proportion of events were not protected, and the majority of receptive CLAI acts involved withdrawal.

## THAC0102

### Is pre-exposure prophylaxis needed for men who have sex with men in West Africa? HIV incidence data from a prospective multi-country cohort study (CohMSM ANRS 12280)

C. Couderc[1], B. Dembélé Keita[2], C. Anoma[3], A.S. Wade[4], A. Ouédraogo[5], A. Coulibaly[2], S. Ehouman[3], A.K. Diop[4], M. Somda[6], Y. Yomb[7], E. Henry[8], B. Spire[9], C. Laurent[1]
*[1]Université de Montpellier, TransVIHMI, IRD UMI 233 / INSERM U 1175, Montpellier, France, [2]ARCAD-SIDA, Bamako, Mali, [3]Espace Confiance, Abidjan, Cote D'Ivoire, [4]Division SIDA/IST, Ministère de la santé, de l'Hygiène Publique et de la Prévention, Dakar, Senegal, [5]Centre Muraz, Bobo-Dioulasso, Burkina Faso, [6]REVS+, Bobo-Dioulasso, Burkina Faso, [7]Alternatives Cameroon, Douala, Cameroon, [8]Coalition PLUS, Paris, France, [9]SESSTIM UMR 912, Inserm / IRD / Université Aix-Marseille, Marseille, France*
*Presenting author email: clotilde.couderc@ird.fr*

**Background:** The World Health Organization (WHO) recommends from September 2015 to use pre-exposure prophylaxis (PrEP) as part of a comprehensive HIV prevention package for people at substantial risk of HIV infection (incidence greater than 3 per 100 person-years in the absence of PrEP). Men who have sex with men (MSM) are one of the most vulnerable populations and may be eligible to PrEP. However, few data are available among this population in Africa. We therefore estimated the incidence of HIV infection among MSM in four West African countries.
**Methods:** A prospective cohort study was conducted in 2013-2014 in Bamako (Mali), Abidjan (Côte d'Ivoire), Dakar (Senegal) and Bobo-Dioulasso (Burkina Faso). Men over 18 years, reporting at least one sexual relationship with another man within the last three months, and HIV-negative (status confirmed at inclusion in the study) were eligible. A 6-month follow-up was offered to them including a quarterly HIV screening (M3 and M6) along with pre- and post-screening counseling and free condoms. If necessary, treatment for sexually transmitted infections was provided.
**Results:** A total of 440 HIV-negative MSM were recruited. Of them, 316 (71.8%) had at least one screening test during follow-up: 168 (53.2%) in Mali, 73 (23.1%) in Côte d'Ivoire, 54 (17.1%) in Senegal and 21 (6.6%) in Burkina Faso. The median age was 23.7 years (interquartile range [IQR]: 20.8-28.0). These men were followed up for a total period of 167.9 person-years. During follow-up, HIV screening tests were performed after a median time from inclusion of 3.2 months (IQR: 3.0-3.6) and 6.3 months (IQR: 6.0-6.6). Eight seroconversions were observed (six at the first screening test and two at the second test), giving an incidence rate of 4.8 per 100 person-years (95% confidence interval: 2.4-9.5).
**Conclusions:** Based on HIV incidence observed in this study, MSM leaving in West African countries are eligible for PrEP according to the WHO-recommended criteria. Operational research is now needed to guide the implementation of specific programs for prevention and comprehensive care including PrEP in this context.

## THAC0103

### Reaching the unreachable: MSM recruitment strategy using social networks to HIV prevention services in Guatemala City

R. Mendizabal-Burastero, C. Galindo-Arandi, M.P. Yancor, I. Vela, J.M. Aguilar-Martinez
*Colectivo Amigos contra el Sida, Guatemala, Guatemala*
*Presenting author email: rmendizabalb@gmail.com*

**Background:** MSM report a 9% HIV prevalence in Guatemala, and only 45% of them had an HIV test done in the last 12 months. Evaluation of preventions programs report that these interventions target the same MSM with the same messages repeatedly; and the coverage of HIV prevention interventions represent less than 10% of MSM estimation. The need to improve access to HIV testing is an urgency in Guatemala.
**Description:** Colectivo Amigos contra el Sida (CAS) is a mostly gay association that work in HIV prevention. Several strategies were developed to increase HIV tested and diagnosed MSM in Guatemala city in 2014 and 2015. First, a strong group of volunteers were conformed and trained, a result of the implementation of HIV prevention model Mpowerment. An intense work of "snowball" outreach by social networks was performed. Facebook, Twitter, Grindr and Whatsapp were used to promote HIV testing services, by direct message for promotion. Each promoter started with their own social network, and the inclusion of new volunteers, that shared their networks, helped to continue the recruitment. Also, the inclusion in sex encounters groups in Whatsapp or Facebook also provided an interesting platform to find MSM. The MSM "social stars" also represented a good way to reach more MSM networks.
**Lessons learned:** 7,244 gay men and other MSM were recruited between July 2014 and December 2015, with nearly 50% getting tested for HIV. Nearly 200 HIV cases were diagnosed, making a twist in male/female ratio in national HIV statistics, from

1.4 in 2013 to 2.1 in 2015. Compared to MSM estimations, 23% of MSM in Guatemala city were tested for HIV, and 22% of the HIV estimated cases in MSM for these city were diagnosed and linked to an HIV service. These new strategies to outreach MSM seems to be promising in a low income country.

**Conclusions/Next steps:** Expansion to other cities in Guatemala is needed to increase access to MSM for HIV services. More intense work with other community based organization (CBO), to use these model is also a major challenge. Training of other CBOs in Central America will also help to improve current strategies for these population.

## THAC0104

### Trends in internet use to meet sex partners among men who have sex with men

G. Paz-Bailey[1], B. Hoots[1], M. Xia[2], T. Finlayson[1], J. Prejean[1], D. Purcell[3], for the NHBS Study Group

*[1]Centers for Disease Control and Prevention, Atlanta, United States, [2]ICF Macro, Atlanta, United States, [3]Centers for Disease Control and Prevention (CDC), Atlanta, United States*

*Presenting author email: nzp1@cdc.gov*

**Background:** Internet-based platforms are increasingly prominent interfaces for sexual networking among men who have sex with men (MSM). We used data among MSM participating in the National HIV Behavioral Surveillance to evaluate changes from 2008 to 2014 in using the internet to meet sex partners and in having met the last sex partner online. We also investigated the association of internet use and partner seeking and testing behavior in 2014.

**Methods:** MSM were recruited through venue-based sampling in 2008, 2011, and 2014 in 20 U.S. cities. Among men reporting ≥ 1 male partner in the past 12 months, we used log-linked Poisson regression with GEE to calculate adjusted prevalence ratios (APR) and 95% confidence intervals (CI) to compare internet use (IU) to meet sex partners and meeting the last sex partner online by year. Models were adjusted for age, race, and education. We used the Wilcoxon rank sum and chi-square tests to compare factors associated with increased IU. IU was categorized as ≤once a month, >once a month but < once a week, and ≥once a week.

**Results:** IU at least once a week increased from 20% in 2008 to 44% in 2014 (APR=2.2, 95% CI: 2.1-1.3). Similarly, having met the last partner online increased from 19% in 2008 to 32% in 2014 (APR=1.7, 95% CI: 1.6-1.8). Median number of partners in the past 12 months increased with increasing IU (≤ once a month: median of 2 partners, interquartile range [IQR]: 1-5; >once a month: 4, IQR: 2-9; ≥ once a week: 5, IQR: 3-12, P< .0001). HIV testing in the past 12 months also increased with increasing IU (59%, 68%, and 71%, respectively, P< .0001). While the percent HIV-positive and aware of their status was similar by frequency of IU (16%), the percent HIV-positive but unaware decreased as IU increased (6%, 5%, and 4%, P< .0001).

**Conclusions:** Both internet use to meet sex partners and meeting the last partner online have increased since 2008. Although men who used the internet more frequently reported more partners, they were also more likely to report testing and were less likely to be HIV-positive but unaware.

## THAC0105LB

### Incidence and correlates of STIs among Black men who have sex with men participating in a US PrEP study

L. Hightow-Weidman[1], M. Magnus[2], G. Beauchamp[3], C. Hurt[4], S. Shoptaw[5], L. Emel[3], E. Piwowar-Manning[3], K. Mayer[6], L. Nelson[7], L. Wilton[8], P. Watkins[9], S. Fields[10], D. Wheeler[11]

*[1]Behavior and Technology Lab, Institute for Global Health and Infectious Diseases, University of North Carolina at Chapel Hill, Chapel Hill, United States, [2]George Washington University, Washington, United States, [3]Fred Hutchinson Cancer Research Center, Seattle, United States, [4]University of North Carolina-Chapel Hill, Medicine/Infectious Diseases, Chapel Hill, United States, [5]UCLA, Los Angeles, United States, [6]The Fenway Institute, Boston, United States, [7]University of Rochester, Rochester, United States, [8]Binghamton University, Binghamton, United States, [9]FHI 360, Durham, United States, [10]Charles R. Drew University, Los Angeles, United States, [11]University of Albany-SUNY, Albany, United States*

*Presenting author email: lisa_hightow@med.unc.edu*

**Background:** HPTN 073 assessed the feasibility, acceptability, and safety of pre-exposure prophylaxis (PrEP) for Black men who have sex with men (BMSM). Understanding the relationship between PrEP uptake, and sexually transmitted infection (STI) acquisition is critical to informing best practices in PrEP delivery for BMSM, a population most highly affected by HIV in the US.

**Methods:** From August 2013 - September 2014, we enrolled 226 HIV-uninfected BMSM in three cities (Los Angeles, CA; Washington, DC; and Chapel Hill, NC). All participants received client-centered care coordination and were offered daily oral PrEP with emtricitabine/tenofovir. Men were followed for 12 months with scheduled clinical visits and STI testing (rectal and urine NAAT for gonorrhea and chlamydia, RPR for syphilis) at weeks 26 and 52. Logistic regression was used to examine the association between STI prevalence and baseline factors. Person-years (PY) follow-up time was calculated to the first STI event or last STI date from either the PrEP acceptance date or enrollment date depending if BMSM accepted PrEP.

**Results:** Baseline STI prevalence was 14%; no differences were noted among study sites. Men < 25 were more likely to have a baseline STI (25.3% vs. 6.7%; OR 4.39, 95% CI: 1.91, 10.11**)**. Sixty participants (26.5%) acquired ≥1 STI during follow-up, 9 participants had an STI at both follow-up visits. Higher rates of STIs were seen during follow-up among those with STIs at baseline (Table 1). STI rate was 32.8/100 PY (24.3, 43.2) among those who accepted PrEP compared to those who declined 26.8/100 PY (12.9, 49.3).

*[Table 1. Characteristics of Incident STIs by PrEP Acceptance and Visit]*

**Conclusions:** While we found higher rates of STIs in younger BMSM, the overall rates of STI in this trial were lower than in prior PrEP trials with no increase over time. BMSM with STIs at PrEP initiation may require additional counseling on STI acquisition risk and more frequent STI testing during follow-up.

## THAD0101

### HEALTHCARE SUPPLY-RELATED BARRIERS TO ADHERENCE AMONG HIV-POSITIVE PATIENTS FOLLOWED WITHIN THE CAMEROONIAN ANTIRETROVIRAL TREATMENT PROGRAM: THE DELETERIOUS EFFECT OF STOCK OUTS (EVOLCAM - ANRS 12288)

C. Tong[1], M. Suzan-Monti[1,2,3], L. Sagaon-Teyssier[1,2,3], O. Ossanga[4], C. Laurent[5], G. Maradan[1,2,3], A. Ambani[1,2,3], L. Vidal[1,2], B. Spire[1,2,3], S. Boyer[1,2,3], EVOLCAM Study Group
*[1]Aix Marseille Université, UMR_S 912, IRD, Marseille, France, [2]Institut National de la Santé et de la Recherche Médicale (INSERM), UMR_S 912 (SESSTIM), Marseille, France, [3]ORS PACA, Observatoire Régional de la Santé Provence Alpes Côte d'Azur, Marseille, France, [4]Université Catholique d'Afrique Centrale, Yaoundé, Cameroon, [5]UMI 233 Institut de Recherche pour le Développement (IRD), INSERM U 1175, Université de Montpellier, Montpellier, France*
*Presenting author email: marie.suzan@insrm.fr*

**Background:** Adherence to antiretroviral treatment (ART) is the main driver of virological success, an essential issue in the fight against HIV. As international financial resources are decreasing while number of ART-treated patients is increasing, healthcare supply barriers may play an important role in ART adherence. This study aimed to investigate individual and healthcare supply-related factors of non-adherence and >2 days treatment interruption (TI) among HIV-positive patients followed within the Cameroonian antiretroviral treatment program.
**Methods:** Present analyses included 1875 ART-treated patients in 19 HIV services in the Centre and Littoral regions of Cameroon. Data on adherence were collected using a face-to-face questionnaire. Adherence was evaluated using a validated algorithm measuring respect of the dosing schedule during the last four weeks. Two-level hierarchical logistic models were used to investigate correlates of non-adherence and >2 days TI.
**Results:** Among study patients, 29.3% were highly adherent, 49.7% were non-adherent and 21.0% reported TI. Common factors associated with a lower risk of non-adherence and TI were current or recent tuberculosis treatment at the individual level and medium-sized hospitals at the healthcare supply level, whereas binge drinking at the individual level and occurrence of ART stock outs at the healthcare supply level were risk factors of those two outcomes. Lower educational level and having benefited from an interview with a counselor during the past year were additional individual factors associated with a lower risk of non-adherence while people feeling stigma and taking multi-tablets ART regimen were more likely to be non-adherent. Regarding individual factors of TI, we found that older patients and those living as a couple or being single were less likely to report TI. Conversely, patients dissatisfied with their doctor's listening or having consulted a traditional healer were more likely to report TI. Furthermore, patients followed-up in decentralized hospitals in the Littoral region were at lower risk of non-adherence.
**Conclusions:** Our study highlights suboptimal adherence outcome of the Cameroonian ART program, and a deleterious effect of ART stock outs on both adherence and TI. Unless effective ART supply management measures are urgently implemented to secure ART access, progress in the fight against HIV may be jeopardized.

## THAD0102

### OUTCOMES OF A PSYCHOSOCIAL SUPPORT PROGRAMME FOR HIV-INFECTED YOUNG MOTHERS AT AN ANTIRETROVIRAL ACCESS CLINIC

R. Phillip, T. Mudzviti, T. Shamu, C. Chimbetete
*Newlands Clinic, Harare, Zimbabwe*
*Presenting author email: ritap@newlandsclinic.org.zw*

**Background:** Through the maturation of antiretroviral rollout programmes several challenges have been observed in young women accessing care. These young women are reaching sexual maturity and are now having children of their own. There is a risk of these infants becoming vertically infected unless optimal adherence is maintained. Newlands Clinic runs a support group for such young women who have either become married or have children. The young mother's support group has been established to provide psychosocial support and improve the quality of life of HIV infected young women.
**Description:** The young mothers' support group is a support group for women less than 25 years who are in relationships, those that have been married, staying with partners with or without children. The group is structured as a monthly focused group discussion in which participants receive training and counselling concurrently in vocational skills, health issues including adherence, legal matters and continued life skill training. This training is provided for by a qualified nurse counsellor equipped to deal with both medical and psychosocial issues.
**Lessons learned:** Through the support group, 26 young mothers with a mean age of 21.5 (SD = 2.10) have been retained in care from 2012 to 2015. All of the young mothers are on antiretroviral therapy with a median duration of 196 weeks (IQR= 97-332) and 15 of them have maintained undetectable viral load (< 20 copies per ml). The programme has seen 18 of the young mothers maintained on first line and 8 receiving second line antiretroviral therapy. We could ascertain post weaning HIV status for 17 of their children, 16 were negative and 1 was positive. Eleven of the young mothers have been treated for sexually transmitted infections from 2012 through to 2015.
**Conclusions/Next steps:** Perinatally infected young girls are attaining sexual maturity and having children of their own. The prevalence of STIs among this group is very high and is a cause of concern. Creation of support groups to partner with the medical programmes helps in retaining patients in care and improving treatment outcomes which has an overall benefit to quality of life.

## THAD0103

### APPROACHES TO CARE FOR THE HIV-INFECTED ADOLESCENTS ACROSS NATIONAL HIV/AIDS PROGRAMS PARTICIPATING IN THE NEW HORIZONS ADVANCING PAEDIATRIC HIV CARE COLLABORATIVE

N. Rakhmanina[1,2], B. Corrigan[1], J. Kose[1], K. Manson[3], New Horizons Advancing Pediatric HIV Care Collaborative
*[1]Elizabeth Glaser Paediatric AIDS Foundation, Washington, United States, [2]George Washington University, Children's National Health System, Pediatrics, Washington, United States, [3]Janssen-Cilag Ltd, London, United Kingdom*
*Presenting author email: nrakhmanina@pedaids.org*

**Background:** *New Horizons* (NH) *Advancing Pediatric HIV Care* is a multi-sector collaborative to advance a holistic integrated approach, promote best practice sharing and research, and leverage resources for improved management of treatment-experienced pediatric patients on second- and third-line antiretroviral treatment. The NH collaborative also aims to create a framework of support for HIV-infected adolescents and their care providers. The objective of this analysis is to describe the national approaches for adolescent disclosure of HIV status and transition to adult HIV care in country programs currently participating in the NH collaborative.
**Methods:** Data were collected from four national HIV/AIDS programs (Kenya, Zambia, Swaziland, and Lesotho) during a NH technical support workshop in South Africa (November 2015). Data were extracted from country presentations on national approaches and guidelines for disclosure of HIV status and transition to adult care.
**Results:** All four countries reported initiating partial disclosure (discussing infection without specific naming of HIV) starting at age 4-8 years. Three countries reported full disclosure of HIV status by age 10 years, and three countries require full disclosure before initiating ART and transition to adult care. Among the four countries, only Kenya's National Adolescent Package of Care included standardized national tools for the transition to adult care. There are no national guidelines for the age of transition, but the reported standard practice ranges are all ≥15 years. All countries have national health strategies for adolescents; however, the focus on adolescents in the national pediatric, adult and consolidated (pediatric and adult) HIV guidelines varies greatly (Table).

| Country | National Adolescent Health Strategy | Adolescent Focus in National HIV Strategy/Guidelines | Disclosure: Partial (PD) Full (FD) | Transition to adult care |
|---|---|---|---|---|
| Kenya | National Adolescent Package of Care, 2014 | Integrated in adult guidelines as a separate chapter Referred to as "special population" | PD from 6 years FD by 13-16 years | By 19 years National transition algorithm and evaluation tools |
| Zambia | Adolescent Health Strategic Plan, 2011-2015; Adolescent Health Communication Strategy, 2013-2015 | Included in consolidated pediatric and adult guidelines as Separate Population | PD from 5 years FD by 10 years | From 15 years |
| Swaziland | National Adolescent Strategic Plan, 2014-2018 | Integrated in both pediatric and adult guidelines Separate section in pediatric guidelines "Special Considerations for Adolescents" to address consent, disclosure and psychosocial support | PD at 4-8 years FD at 8-10 years | By 21 years (19-21 years range) |
| Lesotho | National Adolescent Health Policy, 2012; Draft Adolescent Health Strategy, 2015 | Included in consolidated pediatric and adult guidelines as Special Population | PD from 5 years FD from 10 years | By 20 years (15-18 years range) |

*[National HIV Strategy and Guidelines by Country]*

**Conclusions:** A standardized approach based on the best available evidence is needed to guide adolescent HIV care on a national level in resource-limited settings. Informed by this analysis, the NH collaborative is developing capacity building tools on disclosure and transition to adult care to be shared among national programs participating in NH activities, and globally.

## THAD0104

### A COMPARATIVE STUDY OF POLICY AND PRACTICE FACTORS INFLUENCING PROGRESSION THROUGH THE HIV CARE CONTINUUM IN KISUMU AND NAIROBI IN KENYA

C. Cawley[1], S. Oti[2], B. Njamwea[2], A. Nyaguara[3], F. Odhiambo[3], F.O. Otieno[4], M. Njage[5], T. Shoham[1], K. Church[1], J. Todd[1], B. Zaba[1], A. Wringe[1], ALPHA (Analysing Longitudinal Population-Based HIV/AIDS Data on Africa) Network
*[1]London School of Hygiene and Tropical Medicine, London, United Kingdom, [2]African Population and Health Research Center, Nairobi, Kenya, [3]KEMRI Center for Global Health Research, Kisumu, Kenya, [4]Nyanza Reproductive Health Society, Kisumu, Kenya, [5]Consultant, Nairobi, Kenya*
*Presenting author email: fotieno@nrhskenya.org*

**Background:** The extent to which national HIV policies are implemented in health facilities in Africa has rarely been described. We describe HIV policy formulation with regards to HIV testing, and access to and retention in HIV care, and investigate the extent to which national HIV policies are implemented in health facilities serving the populations of two health and demographic surveillance sites (HDSSs) in Kenya (Nairobi and Kisumu).
**Methods:** Twenty national HIV policy documents published between 2003-2013 were reviewed, with policy indicators extracted relating to HIV testing and counselling (HTC), prevention of mother-to-child transmission (PMTCT) and HIV care and treatment. Additionally, facility surveys were conducted in 44 HIV clinics (10 in Nairobi, 34 in Kisumu) serving the HDSS populations. Policy implementation across the HIV care continuum was assessed by comparing reported practices from health facility surveys with findings from the HIV policy review across pre-defined indicators that covered service coverage, quality of care, coordination of care, medical management and patient support.
**Results:** Explicit policies existed for most aspects of HIV service delivery, and were widely implemented across all facilities, particularly indicators relating to access to treatment and retention in care. There were policy implementation gaps in relation to testing: national guidelines stated that key populations should have tailored access to HTC, but only 16/44 (36%) facilities offered HTC targeted at high-risk groups. In addition, frequent stock-outs of HIV test-kits were reported at 50% (5/10) of facilities in Nairobi and 70% (24/34) of facilities in Kisumu. Formulation and implementation of policy relating to Option B+ was weak, with only 20% of facilities in Nairobi (2/10) and 6% (2/34) of facilities in Kisumu offering this as the standard of care for HIV-positive pregnant women.
**Conclusions:** Levels of policy implementation were similar in the two HDSS, and service performance in relation to ART access and retention in care was strong. However, weaknesses in relation to quality of care exist along the HIV care continuum, and service access problems were noted in relation to HIV testing. Health facilities are likely to require additional support to ensure delivery of future policies such as "test and treat".

## THAD0105

### BARRIERS IN ACCESS TO HEALTH SERVICES FOR PEOPLE LIVING WITH HIV IN MOLDOVA

S. Bivol[1], V. Catranji[2], L. Caraulan[3]
*[1]Center for Health Policies and Studies, Chisinau, Moldova, Republic of, [2]CBS AXA Agency, researcher, Chisinau, Moldova, Republic of, [3]Center for Health Policies and Studies, HIV, Chisinau, Moldova, Republic of*
*Presenting author email: stela.bivol@pas.md*

**Background:** The purpose: to establish levels of access to health services of people living with HIV (PLHIV) through Tanahashi dimensions of access: availability, accessibility, acceptability, contact and effective coverage with services and compare them to general population (where available). Findings will be used to inform specific interventions to reduce barriers in access to services.
**Methods:** Study design: quantitative cross-sectional study based on face-to-face interviews. Study population: 450 PLWH over 18 years, recruited through community groups and service provision points, sampling based on quotas regarding geographic distribution, age, gender.
**Results:** The study included 45% women 55% men; mean age 36 years, 63% urban, 37% rural, 41% employed, 36% unemployed, and 23% economically inactive respondents. Geographic accessibility was high: 96% had access to a primary care doctor in their locality, lower in rural residents (44%). Financial accessibility was lower than in general population: 55% had health insurance versus 83% in the general population, main reason being unemployment (84%) and 56% had to renounce seeking health services due to anticipated costs, almost twice higher than in the general population (30%), with higher shares among women (61%), age over 40 years (62%) and urban residents (62%). General acceptability of general health services was high: positive attitudes at 86%, but only 30% of PLWH disclosed their HIV status to their last general health provider. Compared to general population, respondents seek health services more often, as 50% saw a health provider compared to 21% in the general population. Of them, 65% were prescribed medicines and 44% women and 52% did not buy prescribed medicines due to costs. Coverage with HIV-related treatment was high, as 97% saw an HIV provider and 74% were on ART.
**Conclusions:** While access to HIV care and treatment was high, the study identified specific systemic barriers in access to general health services of PLWH compared to general population, such as higher economic barriers. These call for structural solutions, such as increasing access to health insurance and decreasing private expenditures for medicines, in order to increase effective coverage with health services overall.

## THAD0106LB

### ENGAGING COMMUNITY STAKEHOLDERS IN PREPARATION FOR HIV VACCINE TRIALS NETWORK (HVTN) 703/HIV PREVENTION TRIALS NETWORK (HPTN) 081, AN ANTIBODY MEDIATED BIOMEDICAL HIV PREVENTION TRIAL IN SUB-SAHARAN AFRICA (SSA)

J. Lucas[1], S. Karuna[2], K. Hinson[1], N. Sista[1], N. Yola[3], F. Ntombela[4], N. Mgodi[5], N. Luthuli[6], S. Wakefield[2], P. Andrew[1], E. Greene[1], S. Delany-Moretlwe[7], G. Gray[8], R. White[1]
*[1]FHI 360, Durham, United States, [2]HIV Vaccine Trials Network, Seattle, United States, [3]Desmond Tutu HIV Foundation, Cape Town, South Africa, [4]CAPRISA, Durban, South Africa, [5]University of Zimbabwe (UZ-UCSF Collaboration), Harare, Zimbabwe, [6]HIV Vaccine Trials Network, Johannesburg, South Africa, [7]WRHI, Johannesburg, South Africa, [8]South African Medical Research Council, Cape Town, South Africa*
*Presenting author email: jlucas@fhi360.org*

**Background:** HIV prevalence among heterosexual women in SSA continues to be highest in the world, with acquisition rates in some locations as high as 6-8% per year. Effective long-acting biomedical HIV prevention options, such as broadly neutralizing antibodies (bnAbs), could significantly reduce HIV incidence. HVTN 703/HPTN 081 is a phase 2b study evaluating safety, tolerability, and HIV prevention efficacy of VRC01 (a monoclonal bnAb developed by the National Institutes of Health Vaccine Research Center) among heterosexual women in SSA. Engaging community stakeholders prior to study initiation fosters researcher-stakeholder partnerships and is essential to facilitate community awareness, understanding, and support particularly for complex experimental biomedical studies.
**Description:** : In March 2016, the South African Medical Research Council (SAMRC), HPTN, and HVTN convened a stakeholder meeting with 85 attendees from seven SSA countries and the United States, including representatives from IRBs, community/research health clinics, traditional healing communities, governmental and non-governmental organizations, advocacy organizations, and community advisory boards. The consultation facilitated diverse audience dialogue, detailed explanation of intricate biomedical concepts such as bnAbs and monoclonal antibody infusions, and stakeholder questions and recommendations about HVTN 703/HPTN 081 implementation prior to initiation.
**Lessons learned:** Based on experience and knowledge of community norms, attendees discussed facilitators and barriers to study participation, including understanding the complex concept of monoclonal antibodies. Interactive, participatory processes enabled stakeholders to express considerations regarding the women-only trial design and the evolving role of PrEP in HIV prevention efficacy trials in SSA. Researchers were encouraged to consider the feasibility of intravenous (IV) administration of VRC01. While HVTN 703/HPTN 081 is a proof of concept study, participants felt strongly that if VRC01 was found efficacious it should move to licensure while more efficient bnAb delivery systems (e.g. subcutaneous injections) and vaccines are explored.
**Conclusions/Next steps:** The SAMRC, HPTN, and HVTN recognize that trial success requires local implementers, potential participants, and advocates as partners with trial designers. These partnerships facilitate early ownership of the research by key decision-makers and policy makers. This inclusion enables generous local insight into successful implementation of complex biomedical HIV prevention interventions and adds value of transparent, authentic dialogue about a wide range of trial considerations.

# THAD02 Cash and care: Economic empowerment for HIV prevention

## THAD0201

### A randomized study of short-term conditional cash and food assistance to improve adherence to antiretroviral therapy among food insecure adults with HIV infection in Tanzania

S.I. McCoy[1], P. Njau[2,3], C. Fahey[1], N. Czaicki[1], N. Kapologwe[4], S. Kadiyala[5], W. Dow[1], N. Jewell[1], N. Padian[1]
*[1]University of California, Berkeley, Berkeley, United States, [2]Ministry of Health and Social Welfare, Dar es Salaam, Tanzania, United Republic of, [3]Health for a Prosperous Nation, Dar es Salaam, Tanzania, United Republic of, [4]Regional Medical Office, Shinyanga, Tanzania, United Republic of, [5]London School of Hygiene & Tropical Medicine, London, United Kingdom*
*Presenting author email: smccoy@berkeley.edu*

**Background:** Food insecurity is a barrier to antiretroviral therapy adherence and retention in care among people living with HIV infection (PLHIV). We evaluated the effectiveness of short-term cash and food assistance to mitigate food insecurity and improve adherence and retention among PLHIV in Shinyanga, Tanzania.
**Methods:** At three HIV care and treatment facilities, 805 participants were randomized into one of three arms in a 3:3:1 ratio, stratified by site: nutrition assessment and counseling (NAC) plus cash transfers (~$11/month), NAC plus food basket, and NAC only. Eligible participants were: 1) ≥18 years; 2) PLHIV; 3) initiated antiretroviral therapy ≤90 days before enrollment; and 4) food insecure, ascertained by the validated Household Hunger Scale. Cash or food transfers were provided for ≤6 months, conditional on visit attendance. Participants were followed for 6 months to determine treatment adherence measured by the medication possession ratio (MPR) and scheduled appointment adherence.
**Results:** At enrollment, 64% of participants were female, average age was 37 years, mean CD4 count was 213 cells/mL, and mean body mass index was 21.4 kg/m$^2$. Food security increased significantly among all participants at 6 months and was non-significantly higher among NAC+food (40%) and NAC+cash groups (41%) compared to NAC only (31%, p=0.41). Six-month adherence data were available for 789 participants (98% of study cohort). In an intent-to-treat analysis adjusted for site and multiple comparisons, MPR was significantly higher among those randomized to NAC+cash (n=347, MPR=83%) compared to NAC+food (n=338, MPR=78%, p=0.01) and NAC only (n=104, MPR=71%, p< 0.01). Achievement of MPR≥95% was non-significantly higher in the NAC+cash group (57%) compared to the NAC+food group (50%, p=0.13) and NAC only group (46%, p=0.13). Appointment adherence was 81% overall and significantly higher among those randomized to NAC+cash (83%) compared to those in the NAC+food (75%, p< 0.01) and NAC only (71%, p< 0.01) groups.
**Conclusions:** Preliminary data indicate that short-term conditional cash assistance may improve medication possession and appointment adherence better than food assistance and NAC alone among food-insecure PLHIV initiating treatment in Tanzania. Future studies are needed to investigate the optimal size and conditions of financial incentives, cost effectiveness, and whether benefits are sustained.

## THAD0202

### Economic empowerment of sex workers to improve their health, safety and wellbeing: Innovative interventions and lessons learned from the Stepping Up, Stepping Out program

N. Jagessar[1], L. Papua[2], E. Ndunda[3], M.-L. Wijne[4], S. Hendriks[1]
*[1]AIDS Fonds, Sex Work Program, Amsterdam, Netherlands, [2]Organisasi Perubahan Sosial Indonesia (OPSI), Jakarta, Indonesia, [3]Health Options for Young Men on HIV, AIDS and STIs (HOYMAS), Nairobi, Kenya, [4]Netherlands Ministry of Foreign Affairs, The Hague, Netherlands*
*Presenting author email: njagessar@aidsfonds.nl*

**Background:** Worldwide countless women and men earn money through sex work. They are twelve times more likely to be living with HIV compared to the general population. However, sex workers who are more empowered to access additional sources of income and have more control over their financial resources, are better able to negotiate safe sex, extricate themselves from violent clients and access health and support services. It also improves their financial security and livelihood during times they cannot work.
**Description:** As part of Aids Fonds' Stepping Up, Stepping Out (SUSO) program, a variety of innovative economic empowerment interventions were developed by sex worker-led organizations in eleven countries in Africa, Asia and Latin-America, reaching over 2,500 sex workers. One of the interventions is a savings and credit cooperation, giving sex workers the opportunity to save up and take loans for investments. The concept was implemented in Kenya by HOYMAS (Health Options for Young Men on HIV, Aids and STIs) and in Indonesia by OPSI (Organisasi Perubahan Sosial Indonesia).
**Lessons learned:** In both countries the cooperative is run by sex workers. Funds can be accessed by sex workers who have 1) completed a financial skills training and 2) made regular savings in their account. The experience in Kenya showed that for sustainable results, developing the habit of saving proved more important than the amount saved. In Indonesia we learned that repayment schemes of loans will vary as not all types of investment become profitable equally fast. Not taking this reality into account could lead people into further debt. While in both countries the cooperation required focus and determination of the people involved, it provided them with an opportunity to turn their dreams into reality.
**Conclusions/Next steps:** Economic empowerment is a powerful strategy to reduce sex workers' vulnerability to HIV. The following elements are essential (confirmed by the Dutch Radboud University that evaluated SUSO):
- Alternative sources of income outside the sex industry are not necessarily required. Earning more from sex work in better working conditions is also economic empowerment.
- Economic empowerment increases sex workers' self-esteem.
- Basic financial skills are a pre-condition for the success of other economic empowerment interventions.

## THAD0203

### Exploring the consequences of cash transfers for adolescent boys and girls in inner city Johannesburg

N. Khoza[1], J. Stadler[1], C. MacPhail[1,2], A. Chikandiwa[1], H. Brahmbhatt[3], S. Delany-Moretlwe[1]
*[1]University of the Witwatersrand, Faculty of Health Sciences, Johannesburg, South Africa, [2]University of New England, Collaborative Research Network for Mental Health and Wellbeing, New South Wales, Australia, [3]John Hopkins Bloomberg School of Public Health, Department of Population, Reproductive and Family Health, Baltimore, United States*
*Presenting author email: nkhoza@wrhi.ac.za*

**Background:** Cash transfers (CTs) are increasingly being explored as a structural approach for HIV prevention. While there is much interest in expanding CT programmes to leverage health-related (including HIV) outcomes, there are few available data on the potential social consequences of offering CTs to adolescent boys and girls. This paper explores the consequences of CTs on adolescent recipients.
**Methods:** Using qualitative data collected during a pilot randomized controlled trial of three different cash transfer strategies (monthly payments unconditioned vs. conditioned on school attendance vs. a single direct payment conditioned on a clinic visit) conducted in 120 consenting adolescents aged ≥16 years in the inner-city of Johannesburg. In-depth interviews were conducted with a sub-sample of 41 participants (18 girls and 23 boys), 6 months after receiving CT and up to 12 months after the cash was withdrawn. Interviews were conducted in English/ isiZulu, transcribed and translated by two trained fieldworkers. Codes were generated using an inductive approach; initial transcripts were coded based on emerging issues, and subsequently transcripts coded deductively. Atlas-ti 7.5 was used to organize and code data.
**Results:** Overall, CTs were highly acceptable to recipients, they were used for personal items and reduced household stress. This was interpreted by recipients as a sign of maturity and independence. There were, however, distinctive gender differences in the meaning adolescents placed on the CTs. Boys' spending and saving patterns reflected a concern with maintaining their public social status, through which they asserted an image of the responsible adult. In contrast, girls' spending and saving reflected domestic concerns. Some girls mentioning CTs as protective against transactional sexual relationships. Although generally regarded positively, adolescents reported some negative consequences of CTs, such as easier access to alcohol, cigarettes, recreational narcotics, and vulnerability to predatory money-lenders. While this was a concern raised by participants, it did not come out in the trials' quantitative data.
**Conclusions:** These data suggest that CTs benefit individuals as well as households in dense, urban environments, and may instill responsibility in young adults. However, negative consequences of CTs need to be monitored and interventions that address alcohol and drug use could be included in CT programmes.

## THAD0204

### SUPERVISION, SCHOOL AND ADOLESCENT-SENSITIVE CLINIC CARE: REDUCING UNPROTECTED SEX AMONG HIV-POSITIVE ADOLESCENTS THROUGH COMBINATION SOCIAL PROTECTION INTERVENTIONS

E. Toska[1,2], L.D. Cluver[1,3], M.E. Boyes[4], M. Isaacsohn[5], R. Hodes[2], L. Sherr[6], Mzantsi Wakho Cohort Study

*[1]University of Oxford, Centre for Evidence-Based Intervention, Department of Social Policy & Intervention, Oxford, United Kingdom, [2]University of Cape Town, AIDS and Society Research Unit, Centre for Social Science Research, Cape Town, South Africa, [3]University of Cape Town, Department of Psychiatry and Mental Health, Cape Town, South Africa, [4]Curtin University, Health Psychology and Behavioural Medicine Research Group, School of Psychology and Speech Pathology, Perth, Australia, [5]Emory University School of Medicine, Atlanta, United States, [6]University College London, London, United Kingdom*

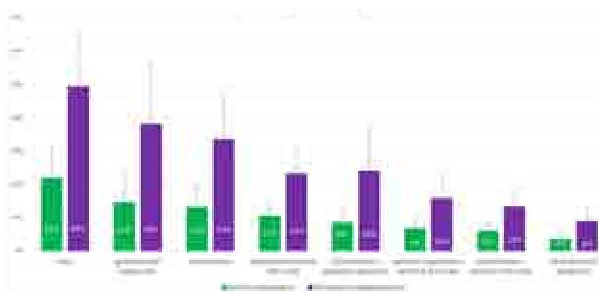
*Presenting author email: elona.toska@gmail.com*

**Background:** Each day, 440 new adolescent HIV-infections happen in sub-Saharan Africa: preventing onward transmission presents a powerful challenge to HIV-positive adolescents. There is very limited evidence on interventions that reduce sexual risk-taking among HIV-positive adolescents.

**Methods:** ART-initiated adolescents (10-19 years old) from 53 government facilities in South Africa: 1,059 were interviewed (90.1% of eligible sample, 4.1% refused, the rest excluded due to: severe cognitive delays (0.9%), other reasons (1.2%) and could not be traced (3.7%)). Voluntary informed consent from adolescents and caregivers was obtained. Potential social protection included nine “cash/ cash-in-kind” and “care” provisions. Analyses used multivariate logistic regression, controlling for adolescent age, gender, location, informal housing, vertical/horizontal infection, and caregiving arrangement. Potential interactive and additive effects of combinations were tested in logistic regressions and marginal effects models.

**Results:** Adolescents reported high rates of unprotected sex: 18% in the full sample, and 28% among girls. In the final model, adolescents reported lower rates of unprotected sex if they received strong parental supervision (OR.61 CI.38-.98 p=0.041), had access to school (OR.53 CI.35-.81 p=0.003), and received adolescent-sensitive care when accessing sexual health services (OR.42 CI.25-.71 p=0.001). There were no interactive effects. In marginal effect models, receiving more than one social protection provision had an additive effect on predicted probabilities of unprotected sex rates, controlling for covariates (chart). This effect was even stronger among adolescent girls: without any interventions 49% were likely to report unprotected sex; with 1-2 of the interventions 14-38%; and with all interventions only 9%.

**Conclusions:** These findings provide exciting new evidence that combinations of social protection intervention can increase safe sex among HIV-positive adolescents, particularly among HIV-positive adolescent girls. Single interventions may not suffice to address the sexual health needs of this highly vulnerable population as they transition from adolescence to adulthood.



*[Figure. % predicted probabilities of unprotected sex among HIV-positive adolescents by access to social protection interventions (controlling for socio-demographic co-factors)]*

## THAD0205

### EQUITY IN ADHERENCE TO ANTIRETROVIRAL THERAPY AMONG ECONOMICALLY-VULNERABLE ADOLESCENTS LIVING WITH HIV IN UGANDA

L. Gauer Bermudez[1], L. Jennings[2], F. Ssewamala[1], P. Nabunya[3], C. Mellins[4], M. McKay[5]

*[1]Columbia University, School of Social Work, International Center for Child Health and Asset Development, New York, United States, [2]Johns Hopkins Bloomberg School of Public Health, Department of International Health, Social and Behavioral Interventions, Baltimore, United States, [3]University of Chicago School of Social Service Administration, Chicago, United States, [4]New York State Psychiatric Institute & Columbia University Medical Center, HIV Center for Clinical and Behavioral Studies, New York, United States, [5]New York University Silver School of Social Work, McSilver Institute for Poverty Policy and Research, New York, United States*

*Presenting author email: lgb2123@columbia.edu*

**Background:** Studies from sub-Saharan Africa indicate that children made vulnerable by poverty have been disproportionately affected by HIV with many exposed via mother-to-child transmission. Yet, for youth living with HIV, adherence to life saving treatment regimens are likely to be affected by a complex set of economic and social circumstances that challenge their families and exacerbate health problems.

**Methods:** Using baseline data from the National Institute of Child and Human Development (NICHD) funded Suubi+Adherence study, bivariate and multivariate regression analyses were employed to examine the extent to which measures of economic and social equity were associated with self-reported adherence among Ugandan adolescents aged 10-16 (n = 702) living with HIV.

**Results:** Greater asset ownership, specifically familial possession of seven or more tangible assets, was associated with greater odds of self-reported adherence (OR 1.69, 95% CI: 1.00-2.85). Our analyses also indicated that distance to the nearest health clinic impacts youth’s adherence to an ARV regimen. Youth who reported living nearest to a clinic were significantly more likely to report optimal adherence (OR 1.49, 95% CI: 0.92-2.40). Moreover, applying the composite equity scores, we found that adolescents with greater economic advantage in ownership of household assets, financial savings, and caregiver employment had higher odds of adherence by a factor of 1.70 (95% CI: 1.07-2.70).

**Conclusions:** These findings suggest that economic and social determinants of adherence be given due priority in the design and development of programs affecting youth with HIV in sub-Saharan Africa. Specifically, interventions that aim to improve financial assets, enable participation in formal financial institutions; and provide geographically closer HIV treatment services such as through mobile clinics may offer promising returns for greater equity in ARV uptake and adherence among adolescent populations living in low resource environments.

## THAE01 FINANCING THE RESPONSE TO HIV: SHOW US THE MONEY

## THAE0102

### THE IMPLICATIONS OF MACROECONOMIC STABILITY ON ACHIEVING SUSTAINABLE, DOMESTIC FINANCING FOR HIV IN ZAMBIA

T. Fagan[1], C. Zulu[2], W. Zeng[1], V. Menon[1]

*[1]Palladium, Health, Washington, United States, [2]USAID, Lusaka, Zambia*

*Presenting author email: thomas.fagan@thepalladiumgroup.com*

**Background:** Zambia’s reclassification as a lower-middle-income country in 2011 underscored its need to begin transitioning to more sustainable, domestic sources of HIV financing. Nonetheless, at US$366 in 2015, donor contribution per PLHIV remains among the highest in Sub-Saharan Africa. Donor funding for HIV in Zambia declined for the first time in 2015, a trend likely to continue as the Zambian government (GRZ) is asked to take greater ownership of the country’s HIV response.

**Methods:** The USAID- and PEPFAR-funded Health Policy Project performed detailed secondary analysis of GRZ’s budgets for 2012-2015. Two types of line items were allocated to the total budget for HIV: HIV-specific items, including anti-retroviral (ARV) procurement, HIV mainstreaming and awareness, and the National AIDS Council, all allocated at 100%; and health systems line items, including salaries for health workers, administrative costs, and development activities, all allocated at approximately 22% based on Clinton Health Access Initiative’s estimates of the human resource requirement of current treatment targets.

**Results:** Between 2012 and 2015, GRZ’s contribution to Zambia’s HIV response increased nominally from ZMW488 million to ZMW965 million. The budget for ARV procurement increased from ZMW50 million to ZMW226 million, while salaries for the proportion of health worker time (22%) allocated to HIV care and treatment grew from ZMW223 million to ZMW501 million. However, during this period, the kwacha (ZMW) depreciated by 60 percent against the US dollar from 5.14 ZMW/US$ to 8.62 ZMW/US$. In real terms, GRZ’s HIV budget grew by just 5.6% annually

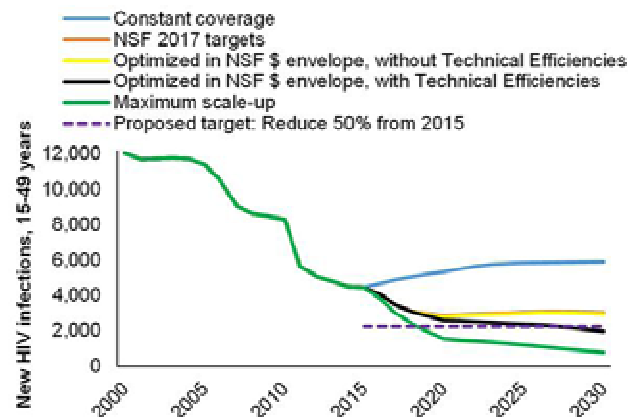
from 2012 to 2015 and in fact declined by 26% between 2014 and 2015.
**Conclusions:** Zambia's macroeconomic instability, driven largely by falling global prices for copper, which accounts for 10% of the country's GDP and 70% of export earnings, threatens the sustainability of domestic sources for HIV financing. Although total donor funding has plateaued since 2012, the resource requirement to reach the 90-90-90 targets is expected to grow from US$8 million in 2016 to US$144 million in 2020. Therefore, preserving the value of existing streams of financing and identifying new sources of domestic funding has never been more important to maintain and build upon the gains already made.

## THAE0103

### AN HIV/AIDS INVESTMENT CASE FOR NAMIBIA: HEALTH IMPACTS AND RESOURCE NEEDS FOR ALTERNATIVE PROGRAM SCALE UP PACKAGES OVER 2016-2030

E. Korenromp[1], M. Haacker[2], M. Turay[3], K. Rotich[3], M. Strauss[4], T. Barihuta[3], I. Semini[5], J. Stover[6], A.-M. Nitschke[7], N. Forster[7], N. Poku[4]
*[1]Avenir Health, Modelling and Policy Analysis, Geneva, Swaziland, [2]Harvard T.H. Chan School of Public Health, Boston, United States, [3]UNAIDS Namibia, Windhoek, Namibia, [4]University of KwaZulu-Natal, Health Economics and HIV and AIDS Research Division, Durban, South Africa, [5]UNAIDS Southern Africa Regional Office, Johannesburg, South Africa, [6]Avenir Health, Modelling and Policy Analysis, Glastonbury, United States, [7]Namibia Ministry of Health and Social Services, Windhoek, Namibia*
*Presenting author email: nkpoku1@gmail.com*

**Background:** As ART coverage and cost grow while donor funding falls, Namibia must strategize its intervention package, to ensure sustainability and maximize impact. We projected impacts and costs over 2016-2030 for scenarios: Constant coverage at 2015 levels; National Strategic Framework (NSF) 2017 targets; Maximum scale-up aligned with UNAIDS *Fast Track* targets; and Resource-constrained optimization with and without technical efficiencies.
**Methods:** The dynamic Spectrum-Goals model was fitted to surveillance, survey and programmatic data. Scenarios varied in coverage of FSW and MSM outreach, workplace intervention, ART (82% of CD4< 500/uL from 2017 in NSF and Optimized scenarios, to 90% of all PLWH by 2030 in Maximum). Voluntary male medical circumcision, community mobilization, mass media, condom promotion, youth outreach, PMTCT and post-exposure prophylaxis were scaled-up without variations across scenarios. Unit costs for HIV prevention and treatment services varied over time with economic context; program support costs increased less-than-linearly with service costs. Maximum and Technical efficiency scenarios assumed that viral suppression and infectivity reduction during ART improved from 75% at 2015 to 95% by 2030. Optimization followed intervention-specific cost per infection averted over 2015-2030.
**Results:** Maximum and Optimized scenarios with technical efficiency could reduce annual new infections by 50% over 2015–2030. Only Maximum scale-up reduced annual HIV/AIDS deaths by almost 50% by 2030. Optimization with technical efficiencies, by prioritizing FSW and ART for lower-CD4 patients while rationalizing HIV testing and workforce prevention, reduced new infections by 35% at 2030, compared to NSF. Annual resource need increased from US$ 190 million in 2015, to US$ 231-252 million for NSF and Optimized, and US$ 257 million for Maximum by 2020.



*[Namibia HIV infections impact from program scale-up scenarios_03Feb2016]*

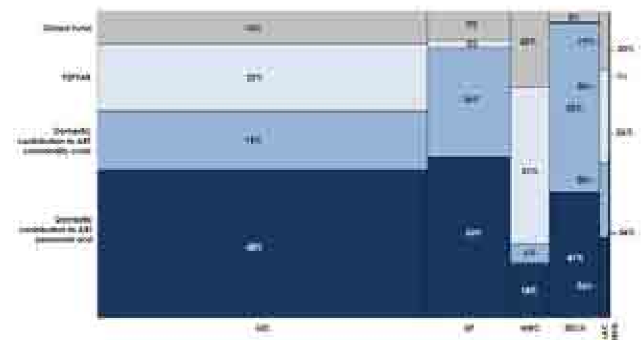
**Conclusions:** By optimizing the NSF, Namibia could considerably enhance health impacts while containing cost within expected budgets. Reaching *Fast Track* targets will require increasing (domestic) financing.

## THAE0104

### POTENTIAL DOMESTIC SOURCE FINANCING FOR SCALED UP ANTIRETROVIRAL THERAPY IN 97 COUNTRIES FROM 2015 TO 2020

A. Dutta, C. Barker
*Palladium, Washington DC, United States*
*Presenting author email: catherine.barker@thepalladiumgroup.com*

**Background:** Recent global initiatives such as 90-90-90 focus on rapidly scaling up antiretroviral therapy (ART). Substantial additional resources will be needed, and there is increased emphasis on shared responsibility and mobilizing domestic resources. Few studies have projected domestic resources available for ART specifically and the potential funding gap.
**Methods:** In a study by the USAID-and-PEPFAR-funded Health Policy Project, we estimated financial resources available to meet facility-level ART service delivery costs in 97 non-OECD countries with significant HIV epidemics based on country-specific funding trends from the Global Fund, PEPFAR and domestic contributions (DCs). DCs were based on publicly known country-reported procurement estimates, Global Fund's counterpart financing thresholds, and proportional contributions to HIV responses as reported to UNAIDS. Separately, we modeled uncertainty in the annual resource requirements for antiretroviral drugs, laboratory tests, and facility-level personnel and overhead, and compared the financial requirements to all sources of estimated funding.
**Results:** We estimated that these countries can contribute US$6.2 billion in domestic resources to ART commodity procurement and US$13.5 billion for site-level overhead and personnel from 2015 to 2020 if ART eligibility is expanded to all people living with HIV, ART coverage increases in line with recent trends, and current funding obligations remain constant. Under optimistic assumptions, DCs could account for the majority of site-level resources available for ART in Eastern and Southern Africa (68%), Asia and the Pacific (88%), Eastern Europe and Central Asia (96%), Latin America and the Caribbean (51%), and the Middle East and North Africa (80%).West and Central Africa would see only 24% from these sources. The six-year funding gap for reaching 90-90-90 is estimated to be US$24.2 to US$25 billion, depending on PEPFAR contributions, and the estimated commodity gap alone is US$16.8 billion.



*[Six-year ART financing by funding source and region]*

**Conclusions:** Additional resource mobilization from domestic or innovative financing sources or efficiency gain is needed to meet global ART targets.

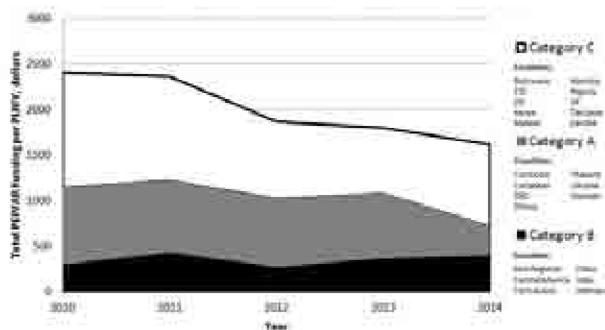
## THAE0105

### COUNTRIES WITH CONCENTRATED EPIDEMICS AMONG KEY POPULATIONS STILL RECEIVE DISPROPORTIONALLY LOWER PEPFAR COP FUNDING THAN GENERALIZED EPIDEMICS

L. Lazar[1], A. Grosso[2], G. Millett[1], B. Honermann[1], J. Sherwood[1], J. MacAllister[1], K. Lindsey[1], C. Chandra[1], S. Blumenthal[1], C. Lyons[3], S. Baral[3]
*[1]amfAR, The Foundation for AIDS Research, Public Policy Office, Washington, United States, [2]Public Health Solutions, New York, United States, [3]Johns Hopkins School of Public Health, Epidemiology, Baltimore, United States*
*Presenting author email: lauralaz@gmail.com*

**Background:** Men who have sex with men (MSM) and people who inject drugs (PWID) continue to be disproportionately affected by HIV. Previous work (Grosso et al., 2012) demonstrated that in 2009-2010, PEPFAR countries with concentrated epidemics in MSM and PWID received significantly less funding than countries with generalized epidemics. This analysis assesses changes in PEPFAR allocations from 2010-2014.
**Methods:** Utilizing a previously published algorithm, countries (n=19) and regions (n=4) with available MSM and PWID HIV data that received PEPFAR funding within 2010-2014 were categorized epidemiologically; Category A: transmission primarily in MSM or PWID; Category B: transmission primarily in MSM, PWID, and hetero-

sexuals; Category C: generalized epidemic. PEPFAR funding data came from amfAR's Country Operational Plans (COPs) database. The sample comprises 67% of all COP funding. Multivariate regression analysis of overall funding by epidemic type was conducted, controlling for population, number of people living with HIV (PLHIV), and gross domestic product per capita.
**Results:** From 2010-2014, relative funding to countries with mixed/concentrated epidemics increased from 2009-10 baseline by 38% in Category A countries and 29% in Category B countries. However, Category A countries received $146 million less and Category B countries received $160 million less COP funding than Category C countries after adjusting for other factors. Category A and B countries received 9.9% of total COP funding to the sample despite comprising 26.4% of PLHIV among the sample. In 2014, Category C countries received 2.2 times more funding per PLHIV than Category A countries, and 4.4 times more than Category B countries.



*[Figure. Total PEPFAR Funding per Person Living with HIV (PLHIV) by Epidemic Category]*

**Conclusions:** While PEPFAR COP processes have made measurable improvements since 2010 to earmark key population (KP)-specific funds, allocations to countries with concentrated/mixed epidemics continue to be disproportionately lower. Greater transparency in funding decisions and increased proportionality of resource allocation, based on epidemiological evidence, will improve KP service delivery, accelerating progress towards HIV eradication.

## THAE0106

### HIV PREVENTION RESEARCH & DEVELOPMENT FUNDING TRENDS 2000-2015: TRACKING INVESTMENT FLOWS FROM RESEARCH TO ROLLOUT OF NEW PREVENTION TECHNOLOGIES

E. Donaldson[1], D. Mattur[2], K. Fisher[1], T. Harmon[3], P. Harrison[1], J.A. Izazola-Licea[2], A. Naeveke[3], M. Warren[1]
*[1]AVAC, New York, United States, [2]Joint United Nations Programme on HIV/AIDS (UNAIDS), Geneva, Switzerland, [3]International AIDS Vaccine Initiative (IAVI), New York, United States*
*Presenting author email: edonaldson@avac.org*

**Background:** The HIV Vaccine & Microbicides Resource Tracking Working Group tracked year-to-year and long-term trends in research and development (R&D) investments and expenditures for biomedical HIV prevention, including HIV vaccines, microbicides, pre-exposure prophylaxis (PrEP), treatment as prevention and medical male circumcision from 2000 to 2015.
**Methods:** R&D data were collected via annual surveys and direct outreach on disbursements by public, private and philanthropic funders for product development, clinical trials, trial preparation, community education and policy advocacy efforts to estimate annual investment in HIV prevention R&D. Investment trends were assessed and compared by year, prevention type, research phase, funder category and geographic location.
**Results:** The Working Group collated and analyzed 2015 data for all areas of HIV prevention R&D. The Group found that in 2015 overall investment in HIV prevention research reflected slight increases in US and private sector funding. With two phase II vaccine trials starting in 2015 funding for vaccines increased marginally, while funding towards microbicides decreased as ongoing efficacy trials began to wind down. In 2014, the Working Group began collecting data on PrEP implementation research and funding increased from 2014 to 2015 with several demonstration projects beginning in 2015.
**Conclusions:** Overall, fewer individual funders supported HIV prevention research than in previous years, with the US public sector and the Bill & Melinda Gates Foundation accounting for over 80 percent of all funding. Expanding and diversifying the investment base could provide a critical range of perspectives, human capacity and innovative concepts to the HIV prevention research agenda. With a shift in the funding formula for AIDS at the US NIH and adoption of Sustainable Development Goals focused on ending AIDS as part of a public health approach, it is critical to ensure continued prioritization of HIV prevention R&D on the US and global development agenda by evaluating research in the context of public, private and philanthropic funding. Mapping of funding trends is critical as HIV prevention R&D progresses through the pipeline from research to rollout to identify investment needs, prioritize research areas, assess impact of public policies that affect spending levels and provide the fact base for advocacy to sustain investments.

## THAE0202

### SYSTEM-LEVEL BARRIERS TO FP-HIV INTEGRATION IN MALAWI

L. Irani[1], E. McGinn[2], M. Mellish[2], O. Mtema[2,3], P. Dindi[3]
*[1]UNICEF, Gender Section, New York, United States, [2]Palladium, Health Policy Plus Project, Washington, United States, [3]Palladium, Health Policy Plus Project, Lilongwe, Malawi*
*Presenting author email: olive.mtema@thepalladiumgroup.com*

**Background:** Malawi has several policies for integrating family planning (FP) and HIV services. The 2011 national HIV clinical management guidelines recommended provider-initiated FP counseling (PIFP) and provision of condoms and injectables at ART settings. The USAID- and PEPFAR-funded Health Policy Project's 2015 study assessed the extent of integration occurring at the facility level, with special attention to identifying systems-level barriers.
**Methods:** Data were collected from a purposive sample of 41 public and private facilities across nine districts of Malawi. Facilities ranged from large high-volume hospitals to small health posts. Data collectors conducted 41 facility audits, 41 interviews with facility in-charges, 122 interviews with providers, and 425 client exit interviews.
**Results:** While 85% of ART clinics had condoms available, only 31% had injectables on hand; only 20% had a range of four or more types of contraceptives available. Fewer than half of the ART registers were tracking FP provision; the rest either kept separate registers or had no mechanism for documenting FP provision. About one-fifth of providers working at these facilities had no FP training, and only one-quarter had received any training on FP-HIV integration specifically. Although 93% of providers said they had time to counsel ART clients on FP, only 14% of clients reported being asked about their fertility intentions or FP on that day's visit. Even though providers reported referring out for FP, few knew detailed information about where and when those other services could be accessed. Clinic hours and provider availability were also identified as hindering FP service provision for ART clients. Almost half (44%) of the facilities reported stockouts or expirations of FP commodities in the past three months; one-third reported stockouts of HCT kits and one-quarter reported ARV stockouts.
**Conclusions:** Although national policies support FP-HIV integration, systems at facility level are not yet adequate to fully implement integration. The study and analysis offer recommendations for how facilities can improve their organization of services, strengthen both internal and external referral processes, increase training of providers on PIFP, improve patient registers and other M&E systems to better capture data, and address both FP and HIV commodity and supply stockouts.

## THAE0203

### EVALUATING THE COSTS AND EFFICIENCY OF INTEGRATING FAMILY PLANNING SERVICES INTO HIV AND AIDS TREATMENT SERVICES IN ZAMBIA

S. Faye, B. Johns, E. Baruwa, K. Ambrose
*Abt Associates Inc, International Health, Bethesda, United States*
*Presenting author email: sophie_faye@abtassoc.com*

**Background:** Integrating HIV and AIDS services with other health services is a key strategy to achieving an AIDS-free generation. In particular, integrating family planning (FP) and HIV services can improve health outcomes and continuity of care, and make service delivery more sustainable by supporting the efficient utilization of resources. At the request of USAID's Office of HIV/AIDS and the USAID Zambia mission, the Health Finance and Governance project used quantitative indicators to assess the costs and efficiencies of two models of FP and ART service integration in Zambia.
**Methods:** We conducted a cross-sectional, non-randomized comparison of two integration models - "internal referral" (IR), where patients can be counselled on FP within the ART clinic but are referred to the FP clinic onsite for further services, and "one-stop-shop" (OSS), where patients can be counseled and receive an FP method within the ART clinic. The models were compared using three indicators of efficiency: percentage of missed FP opportunities at ART clinics, time spent coun-

seling ART patients on FP, and unit cost per ART patient counseled on FP and given an FP method. Data were collected from health management information systems, patient files, and exit interviews at ten sites in Zambia for the period from October 2013 to September 2014.

**Results:** The study found no statistically significant difference in efficiency between OSS and IR models for any of the proposed indicators, including cost. Additional costs of FP provision were US$3 on average per patient using OSS, and USD$8 on average per patient using IR. FP counseling added an average of 3 minutes to ART consultation time (p=0.03), but there was no statistically significant difference in that added time between the two models (p=0.65). There was widespread variation in the practice of integration among sites and models. Weak referral systems and poor client tracking limited potential integration gains.

**Conclusions:** Providing a comprehensive package of ART and FP services to HIV-positive women costs relatively little regardless of the integration model used. However, improved referral and client tracking systems could increase efficiency. Additional time and effort is required for facilities to consistently collect data on efficiency, referrals, and client tracking.

### SCREENING FOR HYPERTENSION AND DIABETES AT THE TIME OF HIV TESTING IN UMLAZI TOWNSHIP, DURBAN, SOUTH AFRICA

I. Bassett[1,2,3], T. Hong[4], P. Drain[4], S. Govere[5], H. Thulare[5], M. Krows[4], M.-Y. Moosa[6], B. Mhlongo[5], D. Wexler[7,8], M. Huang[2,9], S. Frank[2,9], E. Hyle[1,2], R. Parker[2,3,10]
*[1]Massachusetts General Hospital, Department of Medicine/Division of Infectious Disease, Boston, United States, [2]Medical Practice Evaluation Center, Department of Medicine, Massachusetts General Hospital, Boston, United States, [3]Harvard University Center for AIDS Research (CFAR), Boston, United States, [4]University of Washington, Seattle, United States, [5]AIDS Healthcare Foundation / Ithembalabantu Clinic, Durban, South Africa, [6]University of KwaZulu Natal, School of Clinical Medicine, Durban, South Africa, [7]Massachusetts General Hospital, Department of Medicine, Diabetes Unit, Boston, United States, [8]Harvard Medical School, Boston, United States, [9]Massachusetts General Hospital, Division of General Medicine, Boston, United States, [10]Biostatistics Center, Massachusetts General Hospital, Boston, United States*
*Presenting author email: ibassett@partners.org*

**Background:** The South African HIV treatment guidelines recommend screening for hypertension and diabetes before initiation of antiretroviral therapy. Our objective was to assess the prevalence and risk factors for hypertension and diabetes at HIV testing in Durban.

**Methods:** We enrolled adults (≥18 years) presenting for voluntary HIV testing at a high-volume clinic in Umlazi Township. We asked about mode of transport to clinic (walk, public bus/taxi, car), and measured a seated blood pressure before rapid HIV testing. Among those HIV-infected, we measured height, weight and random glucose by point-of-care glucometer. We defined hypertension as systolic blood pressure ≥140 mmHg or diastolic blood pressure ≥90 mmHg. We defined likely diabetes as random blood glucose ≥11.1 mmol/L and likely impaired glucose tolerance (IGT) or prediabetes as ≥7.8 to < 11.1 mmol/L (based on International Diabetes Federation definition 2 hours post a 75g oral glucose load). We defined obesity as body mass index ≥30kg/m$^2$. We used separate multivariate logistic regression models to determine risk factors for hypertension and IGT/diabetes among HIV-infected participants.

**Results:** Among 3,082 enrollees, 1,572 (51%) were female and 1,170 (38%) were HIV-infected, with median CD4 count 299/µl (IQR 154-459). The majority (78%) walked to clinic; 22% took a public bus/taxi and < 1% arrived by car. HIV-uninfected participants were less likely to have hypertension (6%, 118/1799) compared to HIV-infected participants (13%, 157/1,153, p< 0.001). Among HIV-infected participants, 4% (21/492) met criteria for likely IGT or diabetes and 20% (100/492) were obese. Adjusting for gender, age ≥35 (OR 2.5, 95% CI 1.4-4.4, compared age < 25) and BMI ≥30 (OR 2.1, 95% CI 1.4-3.1) were associated with hypertension. Adjusting for obesity, not walking to clinic (OR 2.9, 95% CI 1.2-7.1, as compared to walking) and hypertension (OR 2.8, 95% CI 1.0-7.5) were associated with IGT/diabetes.

**Conclusions:** Screening for hypertension and diabetes was high-yield in a Durban HIV clinic. Traveling to clinic by public bus/taxi or car instead of walking, which may be a marker for low physical activity, was associated with nearly triple the odds of IGT/diabetes. Screening for chronic non-communicable diseases can be successfully performed at the time of HIV testing in resource-limited settings.

## THAE0205

### ONE-STOP SHOPPING FOR TB AND HIV SERVICES IMPROVED INITIATION OF ANTIRETROVIRAL THERAPY FOR PATIENTS WHO ARE CO-INFECTED IN EASTERN UGANDA

A. Mukuye, N. Lukoda, B. Crandall
*Management Sciences for Health, Kampala, Uganda*
*Presenting author email: mukdre@yahoo.com*

**Background:** Initiation of antiretroviral therapy (ART) for patients co-infected with HIV and TB is low in certain districts of Eastern Uganda. One way to improve this is a one-stop shop where TB and HIV co-infected patients access a full package of services at one location.

**Description:** Strengthening TB and HIV & AIDS Responses in Eastern Uganda (STAR-E), a USAID project funded by PEPFAR and implemented by Management Sciences for Health, supported a health facility-based intervention in TB treatment sites in Kapchorwa District between January-September 2015.

The project provided on-site mentorship to 15 health workers at 5 health facilities on implementing a "one-stop shop" model for treating TB/HIV co-infected patients. Health workers from the TB clinic, ART clinic, and mother-baby care point were mentored on the Uganda national guidelines for treating TB/HIV co-infection, and given job aids, guidelines, and diagnostic charts. The health workers then mentored others. Data was collected at baseline and during implementation.

**Lessons learned:** Following establishment of the one-stop shop approach, the percent of TB/HIV co-infected patients started on ART increased from 42% to 100% (see Table).

| Quarter | Total cases detected | Tested for HIV | % who tested | HIV+ | % HIV+ | CPT | % on CPT | ARV | % on ART |
|---|---|---|---|---|---|---|---|---|---|
| Oct-Dec 2014 | 30 | 28 | 93% | 19 | 67.9% | 19 | 100% | 8 | 42% |
| Jan-Mar 2015 | 32 | 32 | 100% | 16 | 50.0% | 16 | 100% | 14 | 88% |
| Apr-Jun 2015 | 23 | 23 | 100% | 15 | 65.2% | 15 | 100% | 13 | 87% |
| Jul-Sep 2015 | 29 | 29 | 100% | 13 | 44.8% | 13 | 100% | 13 | 100% |

*[TB/HIV Treatment - Oct 2014 to Sep 2015]*

Provision of TB/HIV co-infected treatment services with the one-stop shop approach increased co-infected patients' initiation of ART.

**Conclusions/Next steps:** Continued implementation of vertical HIV/AIDS and TB programs that treat each disease separately is inadequate and should be replaced by new models of care that integrate services and maximize efficient use of already-limited resources. This intervention indicates integration may be effective for timely initiation of ART amongst TB patients in a low resource rural African setting. Scale up of this approach to health facilities providing TB/HIV services should be considered.

## THAE0206

### PROMISING PRACTICE: INTEGRATING GENDER AND GENDER-BASED VIOLENCE INTO COMMUNITY-BASED ORGANIZATIONS CAPACITY BUILDING, HIV PREVENTION, COUNSELLING AND TESTING PROGRAMS

H. Bryant[1], E. Oliveras[2], E. Colua[3], E. Marinda[4]
*[1]FHI 360, Social and Economic Development, Washington, United States, [2]FHI 360, Mozambique Country Office, Maputo, Mozambique, [3]FHI 360, M&E, Maputo, Mozambique, [4]Health Information Matrix, Johannesburg, South Africa*
*Presenting author email: ecolua@fhi360.org*

**Background:** In Mozambique, HIV prevalence is 13.1% for women, 9.2% for men, 1 in 3 women experience physical violence; 12% of women over 15 experience sexual violence. Risk factors include early marriage, transactional sex, and male dominance in decision making. Under the PEPFAR Gender-based Violence Initiative, USAID/Mozambique supported the Capable Partners Program (CAP) to scale up GBV prevention within their capacity building program. CAP and the Health Policy Project provided training and technical assistance to help six CBOs design and implement social and behavioural change communication activities that address gender norms/GBV and HIV together.

CBOs organized series of 8-12 small group debates addressing gender-based risk factors and barriers to HIV prevention and testing. CAP developed videos to spur meaningful debates and ensured quality activities. Interventions aimed at preventing sexual transmission of HIV and promoting HIV testing reached 70,892 women and men ages 15-49 in four provinces during 2012-2015.

**Methods:** A 2014 quantitative cross-sectional endline population survey interviewed 1531 men and women aged 15-49 about gender norms and testing. Propensity score matching compared people exposed to CAP to those not exposed.
**Results:** Among the exposed group, 21% agreed it is acceptable for men to make all decisions for the family without including the wife, versus 33% among the unexposed. The exposed were less likely to think it acceptable for teachers to request sex from their students (12% vs 24%) and to think that men can have sex with girls younger than 14 (16% vs 26%). Furthermore, 32% of the exposed indicated that they tested with their sexual partner compared to 5% of the unexposed (p< 0.01). Qualitative results indicate a strong, but not yet pervasive, effect on awareness about the legal framework and GBV reporting.
**Conclusions:** Community-based interventions that integrate GBV with HIV prevention are positively associated with more balanced community gender norms and lead to increased preventive behaviors.

## THAE03 BANG FOR THE BUCK: COST-EFFECTIVENESS AND MODELLING

### THAE0301

### ESTIMATING COUNTRY COST IMPLICATIONS ASSOCIATED WITH NEW WHO HIV TREATMENT GUIDELINE REVISIONS: FORECASTING CAMBODIA'S 5-YEAR PROGRAMME COSTS FOR ADULTS

J.R. Campbell[1], K. Gustafson[2], P. Jalan[2], B. Ngauv[3], S. Sovannarith[3], A. Wilhelm[4], S. Sopheap[3], C. Vichea[3], C. Middlecote[4], L.P. Sun[3]
*[1]Clinton Health Access Initiative, Applied Analytics, Boston, United States, [2]Clinton Health Access Initiative, Phnom Penh, Cambodia, [3]Ministry of Health, National Centre for HIV/AIDS, Dermatology, and STDs, Phnom Penh, Cambodia, [4]Clinton Health Access Initiative, Health Access Program, London, United Kingdom*
*Presenting author email: jcampbell@clintonhealthaccess.org*

**Background:** HIV treatment coverage rates in Cambodia are high. Cambodia's National Centre for HIV/AIDS, Dermatology, and STD (NCHADS) wanted to understand the cost and feasibility of expanding the national HIV treatment program to include eligibility for all HIV-positive patients regardless of CD4 count and expanding access to viral load (VL) monitoring. In order to optimize both available resources and treatment quality, the financial impact of adopting the 2015 World Health Organization HIV treatment guidelines must be considered. They also wanted to explore the impact of new technologies and antiretroviral drugs (ARVs) on HIV treatment program costs and drug transitions.
**Methods:** We used a five-year forecast Excel-based morbidity model, to run five comparison scenarios side-by-side evaluating different treatment policy decisions:
1) baseline of the current treatment eligibility at CD4< =350copies/mL and accounting for key populations;
2) increased treatment eligibility to CD4< =500copies/mL;
3) increased treatment eligibility to treat-all;
4) treat-all and reduced CD4 monitoring;
5) treat-all, reduced CD4 monitoring, and initiating and gradually transition eligible efavirenz (EFV) patients to low-dose EFV.
All scenarios had an increase in VL coverage. Cambodian HIV epidemic and program data were used to estimate patient numbers and costs for first-line and second-line ARVs and buffer stocks, labs, and human resources. Patient years were disaggregated by patient types and assigning different treatment statuses such as pre-ART, PMTCT, newly initiating patients, stable patients, and non-stable patients.
**Results:** Estimated patient-years on treatment increased by 8% when adopting treat-all, with a large jump in the first year with additional pre-ART patients initiating treatment. This surge resulted in approximately $5million cost increase over five years. Savings were found in reducing CD4 monitoring ($2.6million) and further savings with transitions to low-dose EFV ($2.4million), netting lower five-year costs with these shifts compared to the baseline scenario. By year five, 45% of first-line patients are on low-dose EFV regimens, the cost per patient year decreases from $260 to $233 in scenario-five compared to scenario-three.
**Conclusions:** NCHADS used these results in consideration for their new guideline revisions. They decided that treat-all was feasible and would be adopted, and low-dose EFV would be incorporated into the program in lieu of EFV for eligible patients.

### THAE0302

### ANTICIPATED REDUCTIONS IN LONG-TERM TUBERCULOSIS INCIDENCE AND ASSOCIATED COST SAVINGS WITH ADOPTION OF THE TREAT ALL PEOPLE LIVING WITH HIV POLICY IN BOTSWANA, 2016-2035

B. Kgwaadira[1], T. Katlholo[1], L. Fiebig[2], R. Boyd[3], M. Wame[4], L. Kuate[1], D. Agegnehu[1,5], W. Dikobe[1], N. Sangrujee[6], C. Petlo[7], B. Nkomo[7], A. Avalos[4], M. Skiles[8], H. Phillips[9], T. Wuhib[3], A. Finlay-Vickers[3]
*[1]Ministry of Health, Botswana National Tuberculosis and Leprosy Programme, Gaborone, Botswana, [2]Robert Koch Institute, Berlin, Germany, [3]US Centers for Disease Control and Prevention, Gaborone, Botswana, [4]Careena Centre for Health, Gaborone, Botswana, [5]KNCV, Gaborone, Botswana, [6]US Centers for Disease Control and Prevention, Atlanta, United States, [7]Ministry of Health, Department of AIDS Prevention and Care, Gaborone, Botswana, [8]US Agency for International Development, Gaborone, Botswana, [9]UNAIDS, Gaborone, Botswana*
*Presenting author email: btkgwaadira@gmail.com*

**Background:** Botswana is a high tuberculosis (TB)/HIV burden country with the second highest HIV prevalence in the world of 18.5% in the general population, an estimated TB incidence of 385 cases per 100,000 population and TB/HIV co-infection rate of 60% in 2014. In 2012, Botswana expanded ART eligibility to include all people living with HIV (PLHIV) with a CD4 count of < 350 cells/µl$^3$ or WHO clinical Stage 3/4 disease. To inform the national decision to increase coverage by providing ART to all PLHIV (Treat All policy), we modeled the expected reductions in TB incidence and resulting TB-related cost savings from 2016-2035 comparing 1) a baseline scenario with current ART eligibility and HIV prevention coverage levels to 2) a Treat All scenario for PLHIV.
**Methods:** The HIV Spectrum Model was used to generate annual estimates of the number of PLHIV on ART and not on ART for each scenario from 2016-2035. TB and multidrug-resistant TB (MDR-TB) incidence and differential TB risk was modeled for each scenario; annual numbers of expected TB and MDR-TB cases among PLHIV were calculated. Base costs per TB and MDR-TB case were estimated from the cost of anti-TB treatment drugs and laboratory tests for diagnosis and clinical monitoring per national TB guidelines.
**Results:** Under the baseline scenario the annual number of TB cases among PLHIV would increase through 2035. Adopting a Treat All policy in Botswana would potentially prevent 71,862 TB/HIV cases, including 2,605 MDR-TB/HIV cases, resulting in cumulative TB cost savings of over $40 million from 2016-2035. By 2035, we predict Treat All could reduce TB incidence from an estimated 1,321/100,000 among PLHIV (baseline) in Botswana to 568/100,000 (Treat All) and contribute a 36% reduction in overall TB incidence between 2015 and 2035.
**Conclusions:** While our projection is subject to several limitations, sensitivity analysis suggests that a marked reduction in TB incidence is robust. Immediate adoption of a Treat All policy in Botswana would be an important, effective TB prevention and control intervention. Additional TB control strategies will be needed to meet the End TB milestone of reducing TB incidence by 95% by 2035.

### THAE0303

### ASSESSING PROGRESS, IMPACT, AND NEXT STEPS IN ROLLING OUT VOLUNTARY MEDICAL MALE CIRCUMCISION FOR HIV PREVENTION IN FOURTEEN PRIORITY COUNTRIES IN EASTERN AND SOUTHERN AFRICA AS OF 2015

P. Stegman[1], K. Kripke[1], E. Njeuhmeli[2], J. Samuelson[3], M. Schnure[4], S. Dalal[3], T. Farley[5], C. Hankins[6], A. Thomas[7], J. Reed[8], N. Bock[9]
*[1]Project SOAR, Avenir Health, Washington, DC, United States, [2]United States Agency for International Development (USAID), Washington, DC, United States, [3]World Health Organization, Geneva, Switzerland, [4]Palladium Group, Washington, DC, United States, [5]Sigma3 Services, Nyon, Switzerland, [6]Amsterdam Insititue for Global Health and Development, Amsterdam, Netherlands, [7]Naval Health Research Center, US Department of Defence, San Diego, United States, [8]Jhpiego, Washington, DC, United States, [9]U.S. Centers for Disease Control and Prevention, Atlanta, United States*
*Presenting author email: enjeuhmeli@usaid.gov*

**Background:** In 2007, the World Health Organization and the Joint United Nations Programme on HIV/AIDS (UNAIDS) identified 14 priority countries across eastern and southern Africa for scaling up voluntary medical male circumcision (VMMC) services. Several years into this scale-up effort, we reflect on progress made thus far.
**Methods:** Using the Decision-Makers' Program Planning Tool (DMPPT) 2.1, we assessed the age-specific impact, cost-effectiveness, and coverage attributable to circumcisions performed through end 2014. The analysis also compared impact of actual progress to that of achieving 80% coverage among men ages 15-49 in 12 VMMC priority countries and Nyanza Province, Kenya. The models were populated with age-disaggregated VMMC service statistics, and with population, mortality, and HIV incidence and prevalence projections exported from country-specific

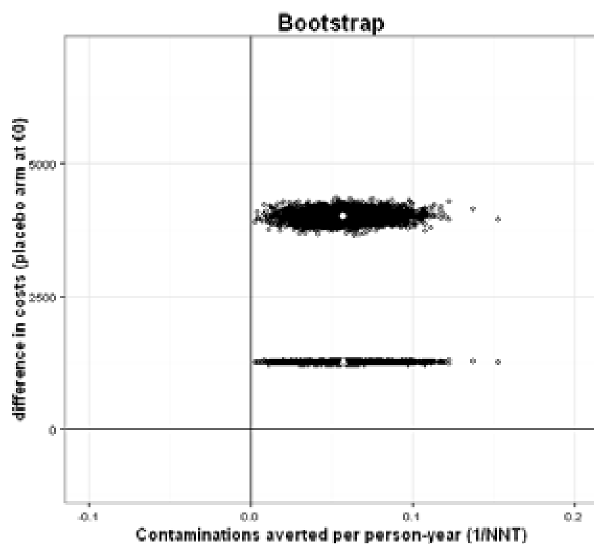
Spectrum/Goals files, assuming achievement in each country of the new 90-90-90 treatment targets.
**Results:** Over 9 million VMMCs had been conducted through 2014: 43% of the estimated 20.9 million VMMCs required to reach 80% coverage by end 2015. Assuming each country reaches the 90-90-90 HIV treatment targets, the modelling analysis projected that VMMCs conducted through 2014 will avert a total of 240,000 infections by 2025, compared to 1.1 million if each country had reached 80% coverage by 2015. The median estimated cost per HIV infection averted was $4,400. Nyanza province in Kenya, the 11 priority regions in Tanzania, and Uganda have reached or are approaching MC coverage targets among males ages 15-24, while coverage in other age groups is lower. Across all countries modelled, over 50% of the projected HIV infections averted were attributable to circumcising the 10- to 19-year-olds.
**Conclusions:** The priority countries have made considerable progress in VMMC scale-up, and VMMC remains a cost-effective strategy for epidemic impact, even assuming near-universal HIV diagnosis, treatment coverage, and viral suppression. Examining circumcision coverage by 5-year age groups will provide countries with better insights into the progress of their VMMC programs and help them to make more informed decisions about next steps.

## THAE0304

### COST EFFECTIVENESS OF ON DEMAND PREP IN MEN WHO HAVE SEX WITH MEN (MSM) IN THE ANRS IPERGAY STUDY

I. Durand-Zaleski[1], P. Mutuon[1], I. Charreau[2], C. Temblay[3], D. Rojas[4], J. Chas[5], C. Chidiac[6], C. Capitant[2], B. Spire[2], L. Meyer[2], J.M. Molina[5], ANRS IPERGAY
*[1]Assistance Publique Hopitaux de Paris, Public Health, Paris, France, [2]INSERM, Paris, France, [3]Université de Montréal, Montreal, Canada, [4]AIDES, Paris, France, [5]Assistance Publique Hopitaux de Paris, Infectious Diseases, Paris, France, [6]Hospitalier et Universitaire de Lyon, Lyon, France*
*Presenting author email: isabelle.durand-zaleski@aphp.fr*

**Background:** ANRS IPERGAY showed the efficacy of on demand PrEP with TDF/FTC in preventing HIV acquisition among MSM.
**Methods:** A prospective economic evaluation was performed during the trial from the healthcare system perspective to determine the cost of PrEP per HIV-infection averted in the TDF/FTC arm. Both hospital and non-hospital resources were considered. Costs for counseling were added. Drugs (TDF/FTC and drugs for STIs), tests (for HIV and STIs), visits and hospital admissions were valued with the national tariff and based on their mean use during the trial (15 tablets of TDF/FTC per month). Robustness of results was tested by sensitivity analyses. The incremental cost-effectiveness ratio (ICER) of PrEP per HIV-infection averted was calculated for one year and compared to the yearly and lifetime cost of one HIV-infection in France (€20,170 and € 535,000 respectively).
**Results:** The trial enrolled 400 participants and found that the number needed to treat for one year to prevent one HIV-infection was 17.6. The cost of counseling was 690 € per person-year. The total one-year costs of PrEP were €4,004 per participant, of which 78% were drug costs (€500 for 30 tablets of TDF/FTC). PrEP ICER was €70,470 per infection averted. Using TDF/FTC costs of €60 for 30 tablets, the one-year cost was €1,253 per patient and the ICER was €22,052 per infection averted, similar to the yearly cost of treating HIV-infection. Sensitivity analyses in figure 1 show the contribution of drug costs and NNT results on the ICER.



*[Figure 1. Sensitivity analysis of the ICER at current and low drug prices]*

**Conclusions:** In France, the ICER of on demand PrEP in MSM with TDF/FTC at the current price is higher than the cost of treating a patient with HIV-infection for one year but much lower than the lifetime cost of HIV-infection. Using the lower cost of TDF/FTC however, PrEP becomes cost-neutral on a yearly basis.

## THAE0305

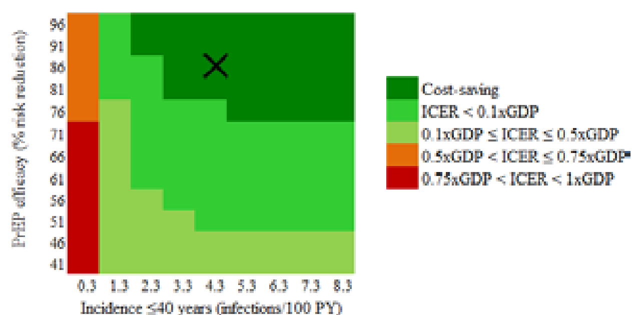
### THE COST-EFFECTIVENESS OF HIV PRE-EXPOSURE PROPHYLAXIS (PREP) IN HIGH-RISK MEN WHO HAVE SEX WITH MEN (MSM) AND TRANSGENDERED WOMEN (TGW) IN BRAZIL

P.M. Luz[1], B. Osher[2], B. Grinsztejn[1], R.L. MacLean[2], E. Losina[2,3,4], C.J. Struchiner[1], R.A. Parker[3,5,6], K.A. Freedberg[7,8,9], F. Mesquita[10], R.P. Walensky[3,7,11], V.G. Veloso[1], A.D. Paltiel[12]
*[1]National Institute of Infectious Diseases, Oswaldo Cruz Foundation, Rio de Janeiro, Brazil, [2]Massachusetts General Hospital, Medical Practice Evaluation Center, Department of Medicine, Boston, United States, [3]Harvard University, Center for AIDS Research, Boston, United States, [4]Brigham and Women's Hospital, Divison of Rheumatology, Department of Medicine, Department of Orthopedic Surgery, Boston, United States, [5]Massachusetts General Hospital, Division of General Medicine, Medical Practice Evaluation Center, Department of Medicine, Biostatistics Center, Boston, United States, [6]Harvard Medical School, Boston, United States, [7]Massachusetts General Hospital, Division of General Medicine, Medical Practice Evaluation Center, Department of Medicine, Division of Infectious Disease, Boston, United States, [8]Harvard University, Center for AIDS Research, Department of Epidemiology, Department of Health Policy and Management, Boston, United States, [9]Boston University School of Public Health, Department of Biostatistics, Department of Epidemiology, Boston, United States, [10]World Health Organization (WHO), Brasilia, Brazil, [11]Brigham and Women's Hospital, Division of Infectious Disease, Boston, United States, [12]Yale School of Public Health, New Haven, United States*
*Presenting author email: fabio.mesquita@aids.gov.br*

**Background:** The effectiveness of tenofovir-based oral PrEP for preventing HIV infection has ranged from 44-96% in clinical trials. We examined the cost-effectiveness of PrEP in MSM and TGW in Brazil.
**Methods:** We used the CEPAC-International model of HIV prevention and treatment to simulate clinical outcomes, costs, and cost-effectiveness of daily TDF-FTC PrEP among high-risk MSM and TGW in Brazil. Our comparator, *no PrEP*, featured guideline-concordant care, including universal ART access. In the *PrEP* strategy, high-risk HIV-negative adults age < 40y received daily PrEP, HIV testing every 4m, and annual creatinine. Base case parameters, derived from Brazil-specific sources, included mean age (31y), annual HIV incidence (age≤40y: 4.3/100PY; age≥40y: 1.0/100PY), PrEP efficacy (86%), PrEP drug costs ($12.50/m), and PrEP program costs ($0.99/m). We varied key parameters in sensitivity analyses.
**Results:** Compared to *no PrEP*, *PrEP* decreased lifetime HIV infection risk by 37%. *PrEP* increased per person discounted (undiscounted) survival from 20.7 (36.9) to 22.4 (41.1) years and decreased lifetime medical costs from $4,090 ($10,910) to $3,470 ($7,660); *PrEP* was therefore cost-saving (Figure 1). *PrEP* remained cost-saving under key parameter variation, including PrEP cost, initial cohort age, and HIV testing frequency on/off PrEP. When PrEP was only used until age 30, PrEP ceased to be cost-saving, but its incremental cost-effectiveness ratio (ICER) remained < 1x Brazil's per capita GDP. The ICER of *PrEP* also remained cost-saving or < 1xGDP when PrEP efficacy and HIV incidence varied widely (Figure 1), but exceeded 1xGDP when HIV incidence was ≤ 0.24 infections/100PY at base case PrEP efficacy (86%).
**Conclusions:** PrEP is cost-saving for MSM and TGW in Brazil. Our results strengthen local PrEP demonstration project results and offer justification for a future national PrEP program for MSM/TGW in Brazil.

| Strategy | Total cohort cost/patient | Total cohort LE/patient | HIV+ cases (% of cohort) | % reduction in lifetime HIV infection risk | Average years to infection (SD) |
|---|---|---|---|---|---|
| No PrEP | $4,090 | 20.7 | 50.07% | - | 13.7 (13.7) |
| PrEP | $3,470 | 22.4 | 31.57% | 37% | 24.2 (15.8) |
| All costs discounted at 3%/year; PrEP: pre-exposure prophylaxis; LE: life expectancy; HIV+: HIV-positive; SD: standard deviation | | | | | |

*[Table 1. Base case results of an analysis of PrEP cost-effectiveness in Brazil]*



**PrEP:** pre-exposure prophylaxis; **PY:** person-year; **ICER:** incremental cost-effectiveness ratio; **GDP:** gross domestic product per capita

**Notes:** Incidence >40 years in each scenario was 0.233x incidence ≤40 years, thereby retaining the base case incidence ratio for >40 year olds versus ≤40 year olds (1.0 per 100PY/4.3 per 100 PY=0.233). 'X' denotes base case value.

*[Figure 1. Two-way sensitivity analysis of PrEP efficacy and incidence]*

## THAX01 PHYLODYNAMICS: TRACKING TRANSMISSION IN VULNERABLE POPULATIONS

### THAX0101

### IDENTIFYING PATTERNS OF HIV-1 TRANSMISSION AMONG MSM COMMUNITIES IN JAPAN FOR TARGET SELECTION OF AN ACTIVE PREVENTION PROGRAM

T. Shiino[1], J. Hattori[2], K. Sadamasu[3], M. Nagashima[3], A. Hachiya[4], W. Sugiura[5], K. Yoshimura[6], the Japanese Drug Resistance HIV-1 Surveillance Network
*[1]National Institute of Infectious Diseases, Infectious Disease Surveillance Center, Shinjuku-ku, Japan, [2]National Institutes of Health, National Cancer Institute, Frederick, United States, [3]Tokyo Metropolitan Institute of Public Health, Department of Microbiology, Shinjuku-ku, Japan, [4]Nagoya Medical Center, Clinical Research Center, Nagoya, Japan, [5]Glaxo Smith Kline K.K, Tokyo, Japan, [6]National Institute of Infectious Diseases, AIDS Research Center, Shinjuku-ku, Japan*
*Presenting author email: tshiino@nih.go.jp*

**Background:** Understanding the transmission dynamics of HIV-1 among a risk population can provide clues for developing an efficient prevention strategy. In order to characterize the transmission dynamics of HIV-1 spread among men who have sex with men (MSM) in Japan, we conducted sequence-based transmission clustering using advanced phylogenetic inferences followed by a network analysis.
**Methods:** Protease-reverse transcriptase sequences from 4,386 subtype B-infected individuals registered in the Japanese Drug Resistance HIV-1 Surveillance Network between 2003 and 2012 were included in the analysis. The number of patients infected within 6 months was estimated using a BED assay for plasma samples. Phylogenetic relationships of these sequences were inferred using three different methods, and depth-first searches of monophyletic groups with >95% in interior branch test, >95% in Bayesian posterior probability, and < 10% diversity were identified as a transmission cluster (TC). Time of the most recent common ancestor (tMRCA) and basic reproduction number (R0) of the TC were estimated with Bayesian inference. Transmission networks were estimated by linking two individuals in a TC whenever their sequences showed less than 1.5% genetic distance. Correlation between some network coefficients and demographic parameters in each TC were analyzed.
**Results:** We identified 312 TCs that included 3,708 individuals. The majority of TCs involved men (3,625 cases) and MSMs (2,656 cases). Orientation towards clustering was significantly associated with sex, risk behavior, and recent seroconversion of the individual. Number of individuals, tMRCA, median age, and R0 of TCs did not vary within the major geographic region of a TC. Network analysis of the 44 largest TCs showed that density as well as degree centralization indices was correlated with tMRCA, suggesting a consistent developing pattern of transmission clusters in the Japanese MSM population from a dense and local transmission network to a sparse and widely distributed one.
**Conclusions:** Our results suggest that HIV-1 spreads through MSM communities with a consistent pattern in Japan. Since patients in the cluster may have good awareness of HIV testing, the network information of the MSM community estimated from viral sequence may help to select a target for the active prevention program, i.e. PrEP, in Japan.

### THAX0102

### A STUDY OF POTENTIAL HIV TRANSMISSION HOTSPOTS AMONG MEN WHO HAVE SEX WITH MEN AND TRANSGENDER WOMEN IN LIMA, PERU

M. Villaran[1], A. Brezak[2,3], S. Ahmed[4], A.Ulrich[5], A. Duerr[6], J. Herbeck[7], J. Mullins[4], E. Seto[8]
*[1]IMPACTA, Lima, Peru, [2]Fred Hutchinson Cancer Research Center, Vaccine and Infectious Disease Division, Seattle, United States, [3]University of Washington, Biology, Seattle, United States, [4]University of Washington, Laboratory Medicine, Seattle, United States, [5]University of Washington, Epidemiology, Seattle, United States, [6]Fred Hutchinson Cancer Research Center, Vaccine and Infectious Diseases, Seattle, United States, [7]University of Washington, Global Health, Seattle, United States, [8]University of Washington, School of Public Health, Seattle, United States*

**Background:** Innovative prevention strategies for MSM and transgender women (TGW) that effectively reduce incidence are critically needed; building these strategies will require identifying transmission networks and associated drivers of ongoing HIV transmission. The objective of this study was to identify key drivers and geographic sources of transmission among MSM/TGW in Lima, Peru through two aims: 1) To recognize geographic transmission hotspots through mapping locations of venues at which participants reported having sexual encounters and their residences; 2) To identify clusters of related incident infections through phylogenetic analysis and link these clusters to real-time data on sexual encounters, high-risk behaviors, and attendance at social venues (bars, clubs, saunas, etc.).
**Methods:** Between September 2013 and October 2015, MSM and TGW (n=3,191) were screened for participation in a 24-month follow-up study (HIV prevalence=20.5%). HIV-uninfected individuals (n=2,078) agreed to monthly HIV testing and completing surveys covering drug and alcohol use, sexual activity, and attendance at social venues. Cohort HIV incidence was 8.6 per 1000 person-years (n=303). Locations of HIV-infected participants' residence and social venues where participants reported a sexual encounter were mapped and analyzed using the Getis-Ord-Gi* method to identify HIV hotspots. Putative transmission networks were identified by phylogenetic analysis of partial *pol* sequences obtained from incident HIV infections. Phylogenetic clusters were linked with individuals' data on venue attendance and sexual partners.
**Results:** In the geographic analysis, 7 of the 20 social venues were identified as transmission hotspots (99% confidence); no neighborhoods were identified as hotspots. Phylogenetic analysis indicated 13 clusters of highly-related infections (bootstrap values >90%). Within clusters with sufficient behavioral data covering the time of infection (n=7), all or most members reported sexual encounters in the 60 days prior to HIV diagnosis with partners they met at specific venues that had been identified as transmission hotspots in the geographic analysis.
**Conclusions:** Both the phylogenetic and geographic cluster analyses identified related HIV incident cases associated with specific venues. These results support offering HIV prevention services, testing, and linkage-to-care efforts at high-risk social venues rather than in neighborhoods.

### THAX0103

### USING PHYLOGENETICS OF HIV TO INFORM PREVENTION AMONG YOUNG BLACK MEN WHO HAVE SEX WITH MEN IN CHICAGO

E. Morgan[1], A. Nyaku[2], R. D'Aquila[2], J. Schneider[1]
*[1]University of Chicago, Public Health Sciences, Chicago, United States, [2]Northwestern University, Chicago, United States*
*Presenting author email: morgane@uchicago.edu*

**Background:** Phylogenetic analysis of HIV sequence data has potential to guide public health efforts and to clarify transmission network dynamics. Young black MSM (YBMSM) are now at greatest risk for HIV infection and a driver of continuing spread of HIV in Chicago. We identified characteristics associated with membership in phylogenetic clusters of HIV sequences and degree of connectivity among a cohort of YBMSM in Chicago.
**Methods:** uConnect is the largest cohort study of YBMSM (aged 16-29) in Chicago (n=618). Survey data were collected using respondent-driven sampling. We analyzed HIV-1 genetic sequences from dried blood spots. We determined pairwise genetic distance, inferred transmission events between persons whose *pol* sequences were ≤1.5% genetically distant, and constructed clusters of HIV that connected persons (≥1 tie to another sequence). We determined demographic and risk attributes associated with both membership in a phylogenetic cluster and degree of connectivity within each cluster.
**Results:** Our sample contained 214 (34.6%) HIV-diagnosed persons, from whom we analyzed 77 (36.0%) HIV *pol* sequences. Of 77 HIV sequences, 42 (54.5%) had a tie to genomes from ≥1 other person.
In adjusted zero-inflated Poisson regression analyses, we determined that self-identity as either straight (Relative Risk [RR] = 9.12; 95% CI: 3.47—23.96) or bisexual (RR = 5.94; 95% CI: 3.75—9.41), depressive symptoms (RR = 1.91; 95% CI: 1.36—2.68),

Author Index

and recreational use of both marijuana (RR = 12.14; 95% CI: 6.91—21.32) and cocaine/crack (RR = 5.22; 95% CI: 2.81—9.72) were associated with greater connectivity within a phylogenetic cluster. We also found being currently insured (RR = 0.61; 95% CI: 0.42—0.88), being in a relationship (RR = 0.40; 95% CI: 0.27—0.59, and a greater number of confidants (RR = 0.78; 95% CI = 0.67—0.92) to be associated with a lower degree of connectivity. We found no significant predictors of membership in a cluster.
**Conclusions:** We determined that self-reported sexual identity, depressive symptoms, and recreational drug use are associated with a high degree of connectivity within potential HIV transmission networks. Increasing access to mental health services and youth-focused drug use prevention programs may reduce HIV transmission among YBMSM.

## THAX0104

### HIV PHYLOGENETIC ANALYSIS SHEDS LIGHT ON TRANSMISSION LINKAGES IN YOUNG WOMEN IN HIGH HIV BURDEN DISTRICTS IN KWAZULU-NATAL, SOUTH AFRICA

T. de Oliveira[1], P. Khumalo[2], C. Cawood[3], R. Dellar[4], F. Tanser[5], G. Hunt[6], A. Grobler[2], A. Kharsany[2], L. Madurai[7], Q. Abdool Karim[2], S. Abdool Karim[2]
*[1]University of KwaZulu-Nata, Nelson R Mandela School of Medicine, College of Health Sciences, Durban, South Africa, [2]Centre for the AIDS Programme of Research in South Africa (CAPRISA), University of KwaZulu-Natal, Durban, South Africa, [3]Epicentre AIDs Risk Management (Pty) Limited, Cape Town, South Africa, [4]University of Oxford, oxford, United Kingdom, [5]Africa Centre for Health and Population Studies, University of KwaZulu-Natal, Mtubatuba, South Africa, [6]Centre for HIV and STIs, National Institute for Communicable Diseases, National Health Laboratory Service (NICD/NHLS, Johannesburg, South Africa, [7]Global Clinical and Virology Laboratory, Durban, South Africa*
*Presenting author email: tuliodna@gmail.com*

**Background:** Strategies to reduce HIV transmission would benefit greatly from a better understanding of the sexual networks that drive HIV transmission in young women. Phylogenetic analysis has recently emerged as a powerful tool to examine the underlying dynamics of HIV-1 transmission.
**Methods:** Samples were obtained from the HIV Incidence Provincial Surveillance System (HIPPS), a household-based study designed to monitor HIV prevalence and incidence trends in Vulindlela and Greater Edendale in rural KwaZulu-Natal. HIV genotyping of the pol region (1250bp) was performed for 999 samples with viral load of >1,000 c/ml. The best fitting evolutionary model (GTR+G+I) was calculated and a maximum likelihood tree constructed with 100 bootstrap replicates. Clusters of linked infections were identified (i.e. >=2 sequences with bootstrap support ≥90 and diversity ≤4%). Statistical analysis was performed using Stata 10.0/SE
**Results:** We identified 27 phylogenetic clusters (average bootstrap= 99.2% and diversity= 1.7%). Of these, 10 were mixed gender clusters; 9 dyads and a cluster with 4 individuals (1 male and 3 females). In total, 12 females were linked to 10 males. All of the males were not on ART and had high viral load (Mean: 187,423 c/ml; Median: 106,165 c/ml). The mean age of males was 32.1 years and 27.7 years for the females. Six of the women were aged ≤ 24 years (Mean age: 20.3 years) and were linked to 5 men with a mean age of 28.4 years (p=0.014). The mean age difference in the remaining mixed clusters was 1.7 years. The age difference between linked women and men decreases as the woman age
**Conclusions:** Our results show that all the men linked to woman were not on ARVs and had a high viral load. Furthermore, the age disparity between young women (≤ 24 years) and linked men was on average less than 10 years. While we need to increase our sample coverage to test this results further, this study indicates that phylogenetics can provide key insight into the underlying dynamics of HIV-1 transmission in South Africa. In conclusion, breaking the HIV transmission cycle from older men to young women is crucial to control the epidemic

## THAX0105

### STREAMLINED QUASISPECIES AND SUBTYPE ANALYSIS OF HIV-1 SEQUENCES GENERATED BY HIGH-THROUGHPUT SEQUENCING USING THE HIGH-PERFORMANCE INTEGRATED VIRTUAL ENVIRONMENT (HIVE)

B. Hora[1], N. Gulzar[2], Y. Chen[1], F. Cai[1], C. Su[1], K. Karagiannis[2], K. Smith[2], V. Simonyan[2], S.A. Shah[3], M. Ahmed[3], A.M. Sanchez[1], M. Stone[4], M.S. Cohen[5], B.F. Haynes[1], M.P. Busch[4], R. Mazumder[2], T.N. Denny[1], F. Gao[1]
*[1]Duke University Medical Center, Duke Human Vaccine Institute and Departments of Medicine, Durham, United States, [2]George Washington University, Washington DC, United States, [3]Bridge Consultants Foundation, Karachi, Pakistan, [4]Blood Systems Research Institute, San Franscisco, United States, [5]University of North Carolina at Chapel Hill, Medicine, Epidemiology and Microbiology and Immunology, Chapel Hill, United States*
*Presenting author email: bhavna.hora@duke.edu*

**Background:** High-throughput sequencing (HTS) has recently been used to characterize HIV-1 genome sequences. While sequences of HIV-1 from each sample can be easily analyzed with small gene fragments, it has been challenging to analyze half or whole genome sequences due to short HTS reads. To reliably identify diverse quasispecies populations and determine subtype of HTS sequences generated from long HIV-1 genome sequences, we have developed a new pipeline that defines distinct virus populations in each sample and determines subtypes or recombination breakpoints of the sequences using the High-performance Integrated Virtual Environment (HIVE).
**Methods:** Viral RNA was extracted from 70 plasma samples from two chronic infection cohorts; External Quality Assurance Program Oversight Laboratory (EQAPOL) and the Center for HIV/AIDS Vaccine Immunology (CHAVI). The 3' half genome was amplified by RT-PCR and PCR amplicons were then sequenced by HTS on MiSeq. Raw reads were assembled and analyzed with the Geneious software and the HTS analysis tools in HIVE.
**Results:** Final consensus sequences of 3'-half genomes were first generated for all viruses using Geneious. Genetic analysis of these sequences identified 17 A1s, 4 Bs, 30 Cs, 1 D, 6 CRF02_AG and 12 unique recombinant forms (URFs). Sequences from 41 viruses (58.6%) contained 1-178 ambiguous bases each, suggesting the presence of quasispecies viral populations in each sample and the single consensus generated by Geneious could not fully represent the viral population in these samples. We then analyzed the same raw reads using HIVE and found one species in 5 samples (7.1%), 2-10 species in 45 samples (64.3%), 11-20 species in 13 samples (18.6%), 21-30 species in 5 (7.1%), and 31-37 species in 2 samples (2.9%). Three samples contained two predominant populations which were not identified by Geneious. The subtyping and recombinant analysis results of the main species consensus sequences were the same as those determined by Geneious.
**Conclusions:** HIVE provides a useful platform with specialized tools to analyze HTS data generated for the half HIV-1 genome by identifying multiple distinct quasispecies populations and determining subtypes or recombination patterns of each species consensus sequences in the same samples.

*Presenting author email: jarthos@nih.gov*

**Background:** Integrin α4β7 mediates the trafficking of leukocytes including $CD4^+$ T cells to lymphoid tissues in the gut, which are principal sites of HIV and SIV replication during acute infection.
**Methods:** We evaluated the impact of an anti-integrin α4β7 mAb, which acts as an α4β7 antagonist, on the distribution of both SIV infected cells and $CD4^+$ cells in rhesus macaques infected with highly pathogenic SIV on live animals using a PET/CT imaging technique. Probes for both the gp120 envelope protein and the CD4 receptor were employed.
**Results:** We determined that the anti α4β7 mAb reduces viral replication in gut associated lymphoid tissues, but also in other tissues including lung, spleen and axillary and inguinal lymph nodes that are not linked to α4β7 mediated homing. The reduction in viral replication in gut tissues occurred despite the fact that α4β7 mAb treatment did not deplete gut tissues of $CD4^+$ cells. Treatment with anti α4β7 during the acute phase of infection appeared to facilitate $CD4^+$ cell reconstitution at a later stage of infection.
**Conclusions:** These results demonstrate that an α4β7 antagonist can reduce viral replication in gut tissues without depleting those tissues of $CD4^+$ cells. Because damage to the gut is believed to play a central role HIV pathogenesis, these results support further evaluation of α4β7 antagonists in the study and treatment of HIV disease.

### THPDA0102

**HIV PERSISTS IN COLON AND BLOOD CCR6+CD4+ T CELLS DURING ART**

A. Gosselin[1], T.R. Wiche Salinas[2], D. Planas[2], V.S. Wacleche[2], Y. Zhang[2], R. Fromentin[1], V. Mehraj[3], N. Chomont[2], J.-P. Routy[3], P. Ancuta[1]
*[1]CHUM Research Centre, Montreal, Canada, [2]Université de Montréal, Montreal, Canada, [3]McGill University Health Centre, Montreal, Canada*
*Presenting author email: jean-pierre.routy@mcgill.ca*

**Background:** Peripheral blood CD4+ T-cells expressing the Th17 marker CCR6 are highly permissive to HIV. Retinoic acid (RA), a gut-homing inducer, increases HIV integration/replication only in CCR6+ T-cells; this further supports the role of the gut in HIV disease progression. Herein, we investigated the contribution of CCR6+ T-cells from the colon and blood to viral persistence during antiretroviral therapy (ART) and tested the ability of RA to reactivate latent HIV in these cells.
**Methods:** Experiments were performed on matched blood/colon biopsy samples (n=7)
and PBMC collected by leukapheresis (n=14) from chronically HIV-infected subjects aviremics under ART. Cells were extracted from colon biopsies by enzymatic digestion; then, memory CCR6+/CCR6- CD4+ T-cell subsets were sorted by flow cytometry (BD AriaIII). Blood total ($T_M$, CD45RA-), effector ($T_{EM}$, CD45RA-CCR7-) and central memory ($T_{CM}$, CD45RA-CCR7+) CD4+ T-cells expressing or not CCR6 and producing cytokines (IL-17A or IFN-g) were also sorted by flow cytometry. Integrated HIV genomes were quantified by real-time PCR. HIV reactivation was induced by stimulation with CD3/CD28 Abs in the presence or absence of RA (10 nM) and/or ART for 9 days. Levels of HIV-RNA in cell-culture supernatants were quantified by real-time RT-PCR.
**Results:** Memory CCR6+ compared to CCR6- T-cells isolated from the blood and colon biopsies were highly enriched in integrated HIV-DNA (median blood: 2,298 *vs.* 830, p=0.0041; median colon: 2,484 *vs.* 1,463 HIV-DNA copies/$10^6$ cells; p=0.01). Among the $T_M$ pool in the blood, CCR6+ $T_{CM}$ showed the highest levels of integrated HIV-DNA. Upon TCR triggering, HIV reactivation was preferentially observed in blood CCR6+ compared to CCR6- $T_M$, $T_{CM}$, and $T_{EM}$; exposure to RA further induced HIV reactivation in CCR6+ T-cells, including cells producing IL-17A.
**Conclusions:** We identified CCR6 as a marker for CD4+ T-cells enriched in HIV reservoirs in the blood and the colon of ART-treated subjects and demonstrated that HIV-DNA persists in IL-17-producing cells. The finding that RA promotes HIV latency reversal in a TCR-dependent manner indicates an important contribution of the intestinal environment to viral persistence and reactivation. Understanding molecular mechanisms of HIV persistence in Th17 cells will be critical for the design of therapeutic strategies aimed at viral eradication.

**$CD8^+$ CYTOTOXIC T LYMPHOCYTES EXERT A STRONG CYTOLYTIC EFFECT ON VIRALLY-INFECTED CELLS PRIOR TO VIRAL INTEGRATION IN SIVMAC251-INFECTED RHESUS MACAQUES**

B. Policicchio[1,2], C. Xu[1], D. Ma[1], T. He[1,3], K. Raehtz[1,4], R. Sivanandham[1], A. Kleinman[1,4], N. Krampe[1], G. Haret-Richter[1], T. Dunsmore[1], C. Apetrei[1,2,4], I. Pandrea[1,2,3], R. Ribeiro[5]
*[1]University of Pittsburgh, Center for Vaccine Research, Pittsburgh, United States, [2]University of Pittsburgh, Infectious Diseases and Microbiology, Pittsburgh, United States, [3]University of Pittsburgh, Pathology, Pittsburgh, United States, [4]University of Pittsburgh, Microbiology and Molecular Genetics, Pittsburgh, United States, [5]Los Alamos National Laboratory, Theoretical Biology and Biophysics, Los Alamos, United States*

**Background:** The mechanism of action of $CD8^+$ T cells in controlling virus during HIV infection is not completely elucidated. Previous experiments using NRTIs in CD8-depleted SIV-infected macaques indicate that this mechanism is non-cytolytic. However, it is uncertain if $CD8^+$ T cells have the ability to eliminate infected cells prior to virus integration. To answer this question, we analyzed the effects of integrase inhibitor raltegravir (RAL) monotherapy on infection outcome in SIV-infected rhesus macaques (RMs) either with or without $CD8^+$ T cells.
**Methods:** Eleven SIVmac251-infected RMs were given either RAL, the CD8-depleting antibody M-T807R1, or a combination of both and were followed for 23 days, at which point RAL was interrupted. Plasma viral loads (VLs) were monitored with conventional qRT-PCR. Changes in T cell counts and immune activation were monitored by flow cytometry.
**Results:** The CD8 depletion only group exhibited a plasma VL increase of ~1 log. RMs receiving RAL exhibited a decline in VL, with the CD8 depletion plus RAL group showing both a smaller decay in plasma virus compared to the RAL only group and a slower secondary VL decline. We fitted a heuristic model with double exponential decay to the first 10 days of VL decline, during complete CD8 depletion. The results showed that the very early phase of decay (< 3 days) occurred at the same rate in the CD8-depleted and non-depleted groups (rate ~1/day). However, the next phase of decay was much slower in the CD8 depleted group (~0.015/day) than in the non-depleted group (~0.12/day). Moreover, this model fitted the data significantly better (p=0.045) than a model with the same second phase rate for both groups of RMs. These results are consistent with a dynamical model in which the first rate of decay corresponds to the death of productively infected cells and the second rate of decay corresponds to the loss rate of infected cells prior to provirus integration.
**Conclusions:** Use of RAL monotherapy revealed a potential cytolytic effect of $CD8^+$ T cells in SIV infection. Our results indicate that almost 90% of the death/loss rate of infected cells prior to proviral integration is due to $CD8^+$ T cells.

### THPDA0104

**UNDERSTANDING THE EFFECTS OF LATENCY REVERSING AGENTS ON HIV RNA SPLICING: IMPLICATIONS FOR LATENCY REVERSAL**

T.M. Mota[1], G. Khoury[1], J.C. Jacobson[1], H.K. Lu[1], F. Wightman[1], R.M. Van der Sluis[1], J.L. Anderson[1], P.U. Cameron[1,2], S.R. Lewin[1,2], D.F.J. Purcell[1]
*[1]University of Melbourne, Doherty Institute for Infection and Immunity, Melbourne, Australia, [2]Alfred Health and Monash University, Department of Infectious Diseases, Melbourne, Australia*
*Presenting author email: taliamm13@gmail.com*

**Background:** Latency reversing agents (LRAs) are currently under investigation as part of a strategy for an HIV cure. Histone deacetylase inhibitors (HDACi) increase transcription of unspliced (US) HIV RNA but have limited potency in vivo. We investigated whether this may arise from impaired splicing of HIV RNA. We determined the effect of LRAs on HIV RNA splicing in the presence and absence of HIV Tat protein, which impacts splicing alongside transcription.
**Methods:** We employed an LTR-driven splicing reporter construct where HIV Envelope gp140 is fused to eGFP and is expressed if the RNA transcribed from the reporter remains unspliced. If the RNA is spliced across the naturally occurring splice

donor-4 and acceptor-7 within *env*, then a Rev mutant fused to dsRed is expressed instead. This system therefore allows the detection of unspliced and spliced RNA products through the measurement of eGFP or dsRed via flow cytometry. HEK293T-cells were transfected with the reporter construct with or without a Tat expression plasmid and treated with a panel of LRAs. Fluorescence was assessed and Paired T-tests were performed.

**Results:** In cells transfected with the splicing reporter, treatment with romidepsin, panobinostat, JQ1 and PMA/ionomycin significantly increased the expression of unspliced product compared to DMSO in the absence of Tat (4.3, 1.6, 2.9, 6.8 fold change (FC) respectively, all p< 0.05) and in the presence of Tat (1.5, 1.7, 1.5, 1.2, 1.7 FC respectively, all p< 0.05). Interestingly, without Tat only JQ1 and PMA/ionomycin significantly increased the expression and proportion of spliced product (dsRed/(dsRed+eGFP)) (4.9, 4.6 FC respectively, both p< 0.05). Conversely, although HDACi had no effect on the level of spliced product without Tat, when Tat was added, a significant reduction in the proportion of spliced product was observed following treatment with vorinostat, romidepsin and panobinostat compared to DMSO (0.54, 0.62, 0.76 FC respectively, all p< 0.05).

**Conclusions:** HDACi reduce the efficiency of HIV RNA splicing in the absence or presence of Tat. This was not seen with other LRAs including JQ1 and mitogen. In addition to the effect of LRAs on HIV transcription, we propose that an assessment of RNA splicing should also be evaluated.

## THPDA0105

### REAL TIME IMAGING OF HIV UNCOATING IN LIVING CELLS

T.J. Hope[1], J. Mamede[2]
[1]*Northwestern University, Feinberg School of Medicine, Chicago, United States,*
[2]*Northwestern University, Cell and Molecular Biology, Chicago, United States*
*Presenting author email: thope@northwestern.edu*

**Background:** Following the viral fusion of HIV with the cell membrane, the HIV genome is delivered into the cytoplasm within a fullerene cone-like structure known as the capsid. The capsid is composed of the viral proteins p24CA, and at some point, is separated from the reverse transcribing HIV genome in a process known as uncoating. The timing of the uncoating event remains controversial with some models proposing that the conical capsid structure is lost early while other models suggest that the intact capsid structure docks at the nuclear pore. The lack data for kinetics and localization of uncoating has led to intense discussions over recent years.

**Methods:** To develop a cell biology approach to visualize dynamic changes in capsid integrity and composition, we utilized GFP as a fluid phase marker intravirion marker. With this technique, the loss of the fluid phase GFP occurs in two steps, with fusion and upon the loss of the capsid core integrity. Live-cell microscopy of dual labeled virions allows for the moment of fusion and capsid integrity loss to be timed, thereby revealing the kinetics, localization and composition of HIV-1 early steps of infection.

**Results:** Direct observation of individual virions reveals that the time between fusion and uncoating for both HIV envelope and VSVg mediated fusion in tissue culture and primary cells (macrophages and T cells), is approximately 30 minutes. Uncoating occurs entirely in the cytoplasm. Inhibition of reverse transcription or RNAseH activity delays uncoating. Quantification of p24CA reveals that the majority of p24CA is lost when the capsid integrity is disrupted revealing uncoating happens on a minute time scale. Long term imaging experiments at less that one particle per cell reveals that the early uncoating particles are associated with productive infection.

**Conclusions:** Our observations demonstrate that uncoating occurs approximately 30 minutes after fusion in primary cells and transformed tissue culture cells. The newly developed ability to follow HIV at the single particle level and demonstrate that specific virion behavior is associated with productive infection opens up many opportunities to define and characterize the earliest steps of the HIV lifecycle and how the virus interacts with innate host defenses.

# THPDB01 HIV EXPOSURE: HOW DOES IT AFFECT CHILDREN?

*Presenting author email: jeanleid@gmail.com*

**Background:** The effect of perinatal HIV- and antiretroviral exposure on neurodevelopment in HIV-exposed uninfected (HEU) children remains unclear. We prospectively compared neurodevelopmental outcomes in HEU vs. HIV-unexposed (HU) children at 24 months of age.

**Methods:** We enrolled HIV-infected and HIV-uninfected mothers (during pregnancy or 1 week post-partum) and their babies in the prospective observational Tshipidi study in 2 sites in Botswana (1 urban and 1 rural) from May 2010-July 2012. LIveborn infants and their mothers were followed for 24 months postpartum, with socio-demographics and health data collected at entry and at 6 month intervals. Neurodevelopmental outcomes were assessed at 24 months of age with an adapted version of Bayley Scales of Infant and Toddler Development-Third Edition (Bayley-III), a comprehensive child assessment, and the Developmental Milestones Checklist (DMC), a parent-report of general development designed for the African context.

**Results:** Among the 910 (453 HEU, 457 HU) infants, 670 (313 HEU, 357 HU) had at least 1 valid domain on the Bayley-III prior to 30 months of age (>90% completed all five domains), and 731 (342 HEU, 349 HU) children had a parent-completed DMC. Among HEU infants, 116 (37%) were exposed *in utero* to 3-drug antiretroviral combinations, and 196 (62.6%) to zidovudine; 355 (99%) of HU infants vs. 27 (9%) of HEU infants ever breastfed. In adjusted analyses of Bayley-III scores, only mean cognitive scores differed significantly (slightly higher in HEU than HU, see Table 1). All Bayley-III outcomes were associated with at least one SES factor, such as home electricity, food security, or toilet facilities. In adjusted models, there were no significant differences between HEU and HU in DMC scores across the four domains evaluated (Table 1).

| | Mean (SD) Scores | | Unadjusted Differences | | Adjusted Differences | |
|---|---|---|---|---|---|---|
| Bayley-III Domain | HEU (N=313) | HU (N=357) | Mean Difference | P-value | Mean Difference | P-value |
| Cognitive | 53.75 (3.37) | 53.07 (3.25) | 0.68 | 0.01 | 0.60 | 0.02 |
| Gross Motor | 52.66 (2.77) | 52.91 (2.67) | -0.25 | 0.25 | -0.14 | 0.51 |
| Fine Motor | 37.25 (1.80) | 37.35 (1.80) | -0.10 | 0.46 | -0.07 | 0.63 |
| Expressive Language | 25.02 (4.36) | 25.85 (3.98) | -0.83 | 0.01 | -0.49 | 0.14 |
| Receptive Language | 21.07 (3.54) | 20.76 (3.21) | 0.31 | 0.24 | 0.14 | 0.61 |

*[Table 1: Crude and Adjusted Differences in Mean Bayley-III Scores]*

**Conclusions:** HIV exposed uninfected children performed equally well to HIV unexposed children on 2 assessments of neurodevelopment at 24 months of age, easing the concern that HIV exposure and/or related neonatal ARV exposure negatively impact neurodevelopment.

## THPDB0102

### NEURODEVELOPMENT OF UGANDAN AND MALAWIAN PROMISE HIV UNEXPOSED UNINFECTED CHILDREN

M. Boivin[1], A. Sikorskii[2], J. Aizire[3], L. Maliwichi-Senganimalunje[4], L. Wambuzi Ogwang[5], R. Kawalazira[6], M. Nyakato[7], I. Familiar[1], H. Ruisenor-Escudero[1], M. Mallewa[6], T. Taha[3], M.G. Fowler[3]
[1]*Michigan State University, Psychiatry, East Lansing, United States,* [2]*Michigan State University, Statistics and Probability, East Lansing, United States,* [3]*Johns Hopkins School of Public Health, Infectious Disease, Baltimore, United States,* [4]*Johns Hopkins School of Public Health, Global Mental Health, Baltimore, United States,* [5]*Makere University - Johns Hopkins University (MUJHU), IMPAACT Studies, Kampala, Uganda,* [6]*Malawi College Medicine - Johns Hopkins University, IMPAACT Studies, Blantyre, Malawi,* [7]*University of Chester, Family and Child Psychology, Chester, United Kingdom*
*Presenting author email: boivin@msu.edu*

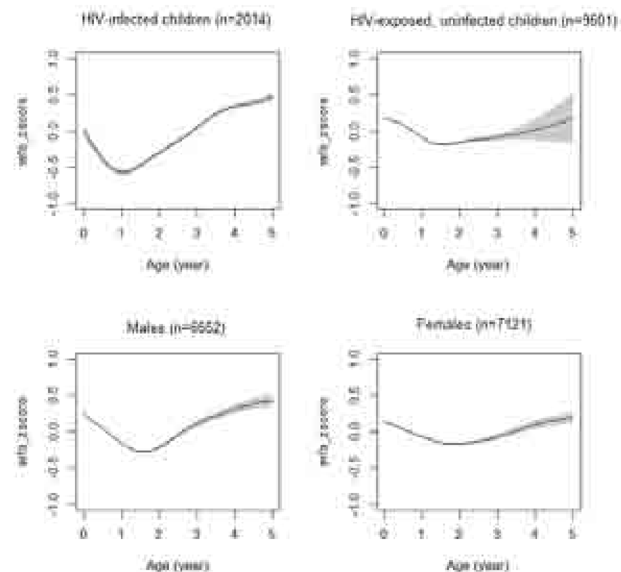
**Background:** HIV exposed uninfected (HEU) in Africa are developmentally at-risk both from the effects of HIV disease on the mother and fetus during gestation, and from pre- and postnatal (breast feeding) exposure to anti-retroviral treatments (ARTs). This NIH/NICHD-sponsored study compares neurodevelopmental outcomes of co-enrolled PROMISE Malawian and Ugandan children, to age and gender-matched HIV uninfected unexposed (HUU) community controls.
**Methods:** 125 Malawian (Blantyre) and 125 Ugandan (Kampala) HEU infants completed neurodevelopmental assessment at both age 12 and 24 months of age, along with 139 Malawian and 125 Ugandan age- and gender-matched HUU children. Children were tested with the Mullen Scales of Early Learning (MSEL). Data from 60% of total enrolled sample are presented here since 24-month MSEL testing is still going on. Overall loss to follow-up so far is 8%, mostly in the Malawian control cohort perhaps due to displacement from severe flooding in Blantyre January 2015. Least-squared means for standardized scores were compared by exposure group (HUU, HEU) and by country site (Uganda, Malawi) for 12 and 24 months using the linear mixed models with interaction effects of time, site and HIV exposure status.
**Results:** In a repeated-measure (12 & 24 months) mixed models, HUU children had higher composite MSEL composite cognitive ability scores than the HEU cohort for the Malawi children at 12 months and for the Ugandan children at 24 months. This composite difference of ~1/2 *SD* (normative) was clinically meaningful in terms of developmental delay. Significant MSEL differences favoring HUU were obtained for Visual Reception, Fine Motor, and Expressive Language scales. Gross Motor and Receptive Language between-cohort differences were not significant. MSEL scores were significantly higher for the Malawian children differences for all scales ($p< 0.002$) except for Fine Motor.
**Conclusions:** HEU breastfed children on NVP prophylaxis or with maternal ART exposure are at greater overall neurodevelopmental risk than a matched cohort of HUU children, even though they receive monthly medical and nutritional monitoring and support through their enrollment in the IMPAACT PROMISE study. However, these preliminary findings suggest that most developmental domains are more at risk for the HEU children.

## THPDB0103

### EVALUATION OF THE GROWTH OF YOUNG CHILDREN BORN TO HIV-INFECTED MOTHERS IN WESTERN KENYA

M. McHenry[1,2], E. Apondi[2,3], S. Ayaya[2,3], W. Tu[4], G. Bi[4], E. Sang[2], R. Vreeman[1,2,3]
[1]*Indiana University, School of Medicine, Children's Health Services Research, Indianapolis, United States,* [2]*Academic Model Providing Access to Healthcare (AMPATH), Eldoret, Kenya,* [3]*Moi University, College of Health Sciences, School of Medicine, Department of Child Health and Paediatrics, Eldoret, Kenya,* [4]*Indiana University, School of Medicine, Biostatistics, Indianapolis, United States*
*Presenting author email: rvreeman@iu.edu*

**Background:** Understanding growth patterns and associated factors for children born to HIV-infected mothers is critical for reducing morbidity and mortality. This study evaluated anthropometrics and factors associated with underweight status for children born to HIV-infected mother in western Kenya.
**Methods:** Retrospective chart review was performed using data collected prospectively and stored in the electronic medical record system of Academic Model Providing Access to Healthcare (AMPATH). Data were obtained from children under the age of 5 years between January 2011-September 2014. Descriptive statistics and logistic regression analysis were performed.
**Results:** Data from 13,925 children born to HIV-infected mothers were included. 51.7% (n=7197) female, 2.67% (n=3731) double orphans, 69.2% (n=9639) HIV-exposed, uninfected (HEU), 14.75% (n=2054) HIV-infected, and 16.0% (n=2232) without confirmatory HIV testing during study period. Mean age at HIV diagnosis was 2.04±1.53years. Mean weight-for-age Z score (WFAZ) was -0.68 ±1.45. 32.8% (n=4561) WFAZ -2 to -3 (moderately underweight) and 14.4% (n=2014) WFAZ < -3 (severely underweight) during the study period. Mean height-for-age Z score (HFAZ) was -1.38±1.92. 46.7% (n=6506) HFAZ -2 to -3 (moderately stunted) and 25.0% (n=3488) HFAZ < -3 (severely stunted). WFAZ changes over time differed between males/females and HIV/HEU (Figure 1). For those with a HIV-infected sibling, HIV-infected were more likely to have WFAZ< -2 (OR: 1.167; 95%CI:1.042-1.307), while HEU were less likely(OR:0.932;95%CI:0.970-0998). HEU were more likely to have WFAZ< -2 if they were orphaned (OR 1.189; 95%CI1.001-1.413) and enrolled in clinic at a later age (OR 3.212; 95%CI:3.012-3.425), with each year of delayed enrollment increasing risk of WFAZ< -2 by 17% (OR:1.167;p-value< 0.001).



*[Figure 1: Weight-for-age Z scores over time: comparisons]*

**Conclusions:** Children born to HIV-infected mothers in western Kenya have greater degrees of underweight and stunting than the general Kenyan population. There appears to be a difference in the overall WFAZ trend over time between males and females, as well as between HIV-infected and HEU children.

## THPDB0104

### DRIVERS, BARRIERS AND CONSEQUENCES OF HIV DISCLOSURE TO HIV-INFECTED CHILDREN AGE 9-14 YEARS: A QUALITATIVE STUDY AMONG CHILDREN AND THEIR CAREGIVERS IN THIKA, KENYA

N. Njuguna[1,2], K. Ngure[1,3,4], D. Bukusi[2], D. Wamalwa[3,5], N. Mugo[1,3,6]
[1]*Partners in Health, Research and Development, Nairobi, Kenya,* [2]*Kenyatta National Hospital, Nairobi, Kenya,* [3]*University of Washington, Seattle, United States,* [4]*Jomo Kenyatta University of Agriculture and Technology, Juja, Kenya,* [5]*University of Nairobi, Nairobi, Kenya,* [6]*Kenya Medical Research Institute, Nairobi, Kenya*

**Background:** HIV disclosure to adolescents is associated with increased adherence to antiretroviral drugs and reduced anxiety. However, disclosure rates remain low with recent studies estimating that only 3-37% of HIV infected children under 15 years old in Sub-Saharan Africa are aware of their HIV status. We sought to understand the motivation, process and impact of HIV disclosure to HIV-infected children in Thika, Kenya.
**Methods:** We conducted semi-structured interviews between May-December 2014 through focus group discussions (FGDs) and in-depth interviews (IDIs) among HIV-infected children 9-14 years old enrolled in a human papilloma virus vaccine study and their caregivers (parents/guardians). IDIs were conducted among child-caregiver dyads while children's FGDs were stratified by age and sex with caregivers interviewed separately. Transcripts were analysed thematically to identify concepts related to HIV disclosure patterns and practices.
**Results:** We conducted 20 IDIs with child-caregiver dyads (median age of children=12 years, adults = 42 years) and 9 FGDs (3 with HIV infected boys, 4 with HIV infected girls and 2 with adult caregivers). Both children and caregivers reported disclosure as a one-time event with some HIV-infected caregivers choosing to disclose their own status at the same time. Disclosure was mainly as a consequence of persistent questioning by children concerning use of chronic medication or frequent hospital visits. Caregivers reported disclosing when they felt a child was 'mature enough' to maintain confidentiality of HIV status. Caregivers typically described an older age group as ideal for disclosure when compared to children's preference. Most children expressed emotional distress following the disclosure event. Many caregivers described support and encouragement by healthcare workers as a key

Tuesday 19 July
Wednesday 20 July
Thursday 21 July Poster Discussions
Friday 22 July
Late Breaker Posters
Author Index

enabler for disclosure. Stigma and feeling of inadequacy were identified as the main reasons for not disclosing their child's status earlier. Negative community perceptions concerning HIV were identified as hindering disclosure by both children and their caregivers.
**Conclusions:** Disclosure of HIV status continues to be a challenge for most caregivers resulting in abrupt disclosure with subsequent negative emotional outcomes for HIV-infected children. Structured disclosure interventional tools and techniques for parents and healthcare providers should be incorporated as part of healthcare management of HIV-infected children.

## THPDB0105

### RIGHT HEART ABNORMALITIES IN HIV-INFECTED CHILDREN IN HARARE, ZIMBABWE

E.D. Majonga[1,2], J. Rylance[3,4], J.O. Odland[5], K. Kranzer[1], G. Mchugh[2], J. Metcalfe[6], T. Bandason[2], H. Mujuru[7], J.P. Kaski[8,9], R.A. Ferrand[1,2]
*[1]London School of Hygiene & Tropical Medicine, Clinical Research Department, London, United Kingdom, [2]Biomedical Research and Training Institute, Harare, Zimbabwe, [3]University of Liverpool, Liverpool, United Kingdom, [4]Liverpool School of Tropical Medicine, Liverpool, United Kingdom, [5]UiT, The Arctic University of Norway, Tromso, Norway, [6]UCSF, San Francisco, United States, [7]University of Zimbabwe, Paediatrics, Harare, Zimbabwe, [8]Inherited Cardiovascular Diseases Unit, Great Ormond Street Hospital, London, United Kingdom, [9]Institute of Cardiovascular Science, University College London, London, United Kingdom*
*Presenting author email: edithmajonga@gmail.com*

**Background:** Cardiac abnormalities are a cause of chronic morbidity in HIV infected children. Left ventricular (LV) hypertrophy and systolic and diastolic dysfunction are well described in HIV-infected children. In contrast, the right side of the heart is rarely studied. HIV infected individuals are at an increased risk of pulmonary hypertension (PHT) and this may affect right ventricular (RV) function. This study aimed to determine the prevalence and risk factors of echocardiographically determined right heart abnormalities in HIV-infected children on ART.
**Methods:** HIV-infected children aged 6-16 years on ART were enrolled from the Paediatric HIV clinic at Harare Central Hospital. Assessment included clinical history, New York Heart Association (NYHA) class, incremental shuttle walk testing, spirometry, viral load, CD4 count and transthoracic 2D, M-mode, pulsed wave and continuous wave Doppler echocardiography.
**Results:** 201 children, median age 11 (IQR 9-12) and 48% females were enrolled. The median CD4 count was 726.5 (IQR 473-935) and 68% had a viral load of < 50 copies/ml. Chest pain on exertion was reported in 11% and chronic cough in 15%. Two children (1%), were hypoxic at rest and 11% post-exercise; 18% were symptomatic in NYHA score 2 and 3. Abnormal spirometry was found in 24%. The prevalence of right heart abnormalities was 30% (N=59). Right ventricular dilatation (RVD) was most common in 28% (N=56) and of these, 63% (N=37) had concomitant left heart abnormalities. There was biventricular dilatation in 3 patients and 45% (N=25) had RVD with LV systolic and/or diastolic dysfunction. PHT was found in 2% (N=3) and they had normal right ventricle size. Right heart abnormalities were not associated with any of the reported symptoms including chest pains, chronic cough or abnormal lung function.
**Conclusions:** Our findings show a high prevalence of abnormalities of the right heart in HIV-infected older children and adolescents. Strikingly was the substantial proportion of patients with RV dilatation not associated with PHT. This could be secondary to left heart abnormalities or primary RV abnormality due to lack of association with lung function abnormality. Furthermore, inappropriate normative data may have over diagnosed RV dilatation.

**Background:** UNAIDS has set 90-90-90 targets for diagnosis, treatment and viral suppression in HIV-infected children by 2020. The Thailand Global AIDS Response Program estimated 4,869 HIV-infected pregnant women and 102 new perinatal HIV-infected children in 2014. We describe the coverage of early infant diagnosis and treatment cascades of perinatally HIV-infected infants in the National Program.
**Methods:** The national AIDS program provides HIV DNA PCR testing for all HIV-exposed infants and antiretroviral therapy (ART) is provided, free of charge, regardless of CD4 count. Viral load testing is performed at 6 and 12 months after ART initiation. We analyzed national data collected on HIV-infected infants by the Active Case Management Network and the HIV DNA PCR database of 15 laboratories. The coverage of infant diagnosis will be calculated against estimated data from 2014.
**Results:** From August 2014-December 2015, 21,415 HIV DNA PCR tests were performed. Of these, 101 HIV-infected infants were identified, accounting for 70% of the estimated number of newly infected infants per year. ART was initiated in 83 infants (82%);74 (89%) received the lopinavir/r-based regimen. The median age at ART initiation was 2.5 months (IQR 1.2-4.2). In 55% of infants, ART was initiated the same day that blood was drawn for confirmatory HIV DNA PCR. The median (IQR) CD4 cell count was 2251(1554-3057) cell/mm$^3$and the HIV-RNA prior to ART was 5.5(3.6-6.4) $\log_{10}$ copies/ml. The overall mortality rate was 14% (9 infants died prior to and 5 infants died after ART initiation) and median age at death was 4.4 months (IQR 2.4-6.2), with pneumonia being the commonest cause of death. Of these 15 deaths, 11 (73%) did not receive neonatal antiretroviral prophylaxis. The proportion of infants on ART with HIV RNA < 400 copies/ml were (23/47) 49% (95% CI: 34-64) at 6 months and (11/18) 61% (95% CI: 36-83) at 12 months.
**Conclusions:** 70% of HIV-infected infants diagnosed, 82% began treatment, and 61% achieved virological suppression. A high mortality rate was noted, particularly among HIV-infected infants not included in the cascade care. Additional work is needed to prevent HIV-associated infant mortality and improve virological suppression among infants on ART.

### POINT-OF-CARE CRYPTOCOCCAL ANTIGEN SCREENING A CASE-CONTROL DIAGNOSTIC ACCURACY STUDY OF THE IMMUNO-MYCOLOGICS CRYPTOCOCCAL ANTIGEN LATERAL FLOW ASSAY FOR SCREENING FINGER-PRICK BLOOD AND URINE AMONG ASYMPTOMATIC HIV-INFECTED ADULTS

R. Wake[1,2], J. Jarvis[3,4,5], T. Harrison[1], S. Mashamaite[6], N. Govender[2,7,8]
*[1]St George's University of London, London, United Kingdom, [2]National Institute for Communicable Diseases, Johannesburg, South Africa, [3]London School of Hygiene and Tropical Medicine, London, United Kingdom, [4]Botswana-UPenn Partnership, Gabarone, Botswana, [5]University of Pennsylvania, Philadelphia, United States, [6]Right to Care, Johannesburg, South Africa, [7]University of the Witwatersrand, Johannesburg, South Africa, [8]University of Cape Town, Cape Town, South Africa*
*Presenting author email: rmwake@gmail.com*

**Background:** Reflex laboratory screening of blood samples with CD4 counts of less than 100 cells/µl for cryptococcal antigen (CrAg) is being introduced nationally in South Africa. This enables identification of patients with sub-clinical cryptococcal infection and administration of pre-emptive fluconazole therapy to prevent life-threatening meningitis. However, access to laboratories may be limited in rural

areas. The CrAg lateral flow assay (LFA) is ideally formatted for point-of-care (POC) use. Therefore, the accuracy of the CrAg LFA on finger-prick blood and urine samples performed in clinic settings by front-line health workers was determined.
**Methods:** Patients with asymptomatic cryptococcal antigenaemia detected by reflex laboratory-based CrAg screening, were identified from HIV clinics in Johannesburg, along with CrAg-negative controls. A CrAg LFA was performed on finger-prick blood and urine samples by a nurse and repeated in a laboratory. Results of POC and laboratory-performed LFA tests were compared to the reference laboratory-based CrAg LFA test performed on plasma during the previous month. Testing was repeated on positive urine samples following centrifugation at 2000rpm for ten minutes.
**Results:** Fifty-three patients with known CrAg status (19 CrAg-positive: 34 CrAG-negative) were tested using POC and laboratory-based CrAg LFA. POC CrAg LFA on blood had a sensitivity of 89.5% (95%CI 66.7-98.7%) and specificity of 100% (89.7-100%). Both CrAg positive patients who were tested as POC-LFA negative had very low CrAg titres. Sensitivity improved to 100% using laboratory-based testing. POC CrAg LFA on urine had a sensitivity of 84.2% (60.42-96.62%) and a specificity of 44.1% (27.2-62.1%), with no improvement using laboratory-based testing, or after centrifugation.

| | n, (Sensitivity, 95% CI) | n, (Specificity, 95% CI) |
|---|---|---|
| POC finger-prick blood | 17/19 (89.47%, 66.86% - 98.7%) | 34/34 (100%, 89.72% - 100%) |
| Lab pipetted blood | 19/19 (100%, 82.35% - 100%) | 34/34 (100%, 89.72% - 100%) |
| POC dipped urine | 16/19 (84.2%, 60.4% - 96.6%) | 19/34 (44.1%, 27.2% - 62.1%) |
| Lab pipetted urine | 15/19 (79.0%, 54.4% - 94.0%) | 17/34 (50.0%, 32.4% - 67.6%) |
| Lab centrifuged urine | N/A | 10/18 (55.6%, 30.7%-78.5%) |

*[Table 1. Sensitivity and specificity of the CrAg LFA used on blood/urine at the POC and in a laboratory, compared to laboratory LFA on plasma]*

**Conclusions:** CrAg LFA on finger-prick blood is an appropriate POC method for screening HIV-infected adults commencing ART. This could reduce turn-around time and loss to follow up, particularly where laboratory access is limited. Urine samples should not be used due to a high rate of false positive results.

## THPDB0202

### UTILITY OF GENEXPERT MTB/RIF ASSAY IN THE DIAGNOSIS OF EXTRAPULMONARY TUBERCULOSIS

P. Ramjathan[1,2], N. Reddy[2], K.P. Mlisana[1,2]
*[1]National Health Laboratory Services, Microbiology, Durban, South Africa, [2]University of KwaZulu-Natal, Department of Medical Microbiology, Durban, South Africa*
*Presenting author email: praksha.ramjathan@gmail.com*

**Background:** South Africa has high rates of both HIV and tuberculosis. HIV infection is linked with an increased risk of extrapulmonary tuberculosis (EPTB), and the risk increases as the CD4+ lymphocyte count declines. EPTB is difficult to diagnose due to its paucibacillary nature and culture takes up to 6 weeks. The GeneXpert MTB/RIF Assay (GXP) is a fully automated system developed by Cepheid that is easy to use with results available in 2 hours. There have been many studies on its use in pulmonary tuberculosis but few studies have focused on its utility with EPTB.
**Methods:** The study was performed from June to October 2014 at King Edward VIII Hospital in Durban, Kwa-Zulu Natal. 50 Extrapulmonary specimens were processed at the National Health Laboratory Services facility. Specimens were incubated with sample reagent buffer and then GXP was performed according to manufacturer's instructions.
**Results:** Specimens analyzed included 11 biopsy specimens, 15 pus specimens, 7 Body fluids (1 pericardial fluid, 3 peritoneal fluids, and 3 ascitic fluids), 9 pleural fluids and 8 cerebrospinal fluids. Of the 50 extrapulmonary specimens processed, 12(24%) were GeneXpert positive and 8(16%) were culture positive. Of a total of 8 culture positive specimens, 6 were GXP positive, and 2 were GXP negative giving a pooled sensitivity of 75 % (using culture as the gold standard). Of a total of 42 culture negative specimens, 36 were GXP negative resulting in a specificity of 85.7%. There were 6 specimens that were GXP positive but culture negative. 90% (45/50) of the extrapulmonary specimens were smear microscopy negative.
**Conclusions:** The GXP assay provides rapid results that would aid in diagnosing extrapulmonary tuberculosis earlier than culture. This study showed similar results to Hilleman et al 2011, who found that the sensitivity of the GXP was 77.3 %. The 6 specimens that were GXP positive and culture negative could represent patients with tuberculosis that culture missed or they could be false positive results.

## THPDB0203

### STABILITY OF HIV SEROLOGICAL MARKERS COLLECTED BY HEMASPOT OR DRIED BLOOD SPOTS

M. Manak[1], A. Shutt[1], H. Hack[1], L. Jagodzinski[2], S. Peel[2], B. Danboise[2]

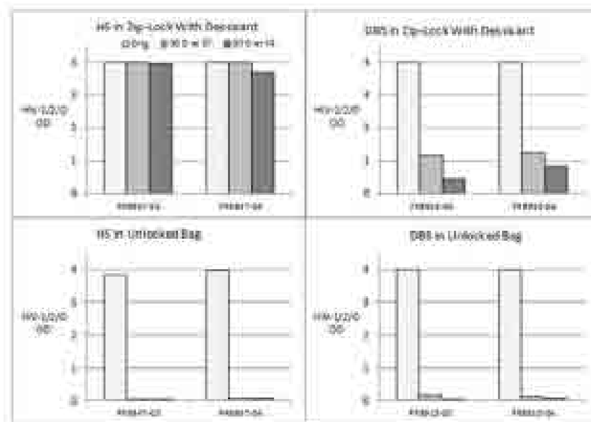
*Presenting author email: mmanak@hivresearch.org*

**Background:** Dried blood spot (DBS) technology is increasingly being used to acquire clinical specimens for biosurveillance, clinical trials, epidemiology, diagnosis and monitoring of vulnerable populations in remote areas. Problems with analyte recovery after prolonged storage at high temperature and humidity in addition to cumbersome processing procedures have hindered widespread acceptance of these methods. In this study, we compared the performance of the HemaSpot™(Spot On Sciences) Blood Collection Device to DBS for collection and testing of HIV positive specimens.
**Methods:** The HemaSpot™ Blood Collection Device and standard Whatman 903 DBS were evaluated on clinical specimens including HIV seroconversion panels known to be positive for HIV markers. Serum or plasma samples were reconstituted with an equal volume of whole blood from HIV negative donors; 100ul was applied to the DBS or HemaSpot and placed into unsealed or sealed zip-lock bags containing desiccant. Specimens were stored at room temperature or in high humidity (95%) at 37°C or 45°C for 30 days. Blood was eluted in 200ul PBS-0.2% Tween, and tested by HIV-1/2/O, HIV Combo Ag/Ab EIA (EIA), HIV-1 Western Blot (WB), and MultiSpot HIV-1/HIV-2 Rapid Tests (MS), (Bio-Rad, Hercules, CA).
**Results:** All HIV infected samples tested positive in the HIV-1/2/O, MultiSpot, and WB assays following up to 1 month storage at room temperature. A marked loss in reactivity was observed in samples stored at 37° or 45°C under high humidity conditions (Fig 1). Samples placed in a sealed bag with desiccant were protected from degradation. The HIV-1/2 Combo assay could not be used for screening with either device due to excessive background signal.



*[Fig. 1. Performance of HIV-1/2/O EIA on reconstituted seroconversion panel members (PRB947 and PRB910, SeraCare) eluted from HemaSpot (HS) or DBS]*

**Conclusions:** Dried blood spot samples are suitable for collection, transport, and HIV testing by HIV 1/2/O Combo, MultiSpot, and WB, provided they are protected from humidity. The HemaSpot device was easier to use than standard DBS methods.

### EVALUATION OF ABBOTT REALTIME HIV-1 DBS ASSAY

N. Tang[1], V. Pahalawatta[1], A. Frank[1], J. Lampinen[1], G. Leckie[1], R. Bilkovski[1], Z. Bagley[2], R. Viana[2], C.L. Wallis[2], K. Abravaya[1]
*[1]Abbott Molecular Inc, Des Plaines, United States, [2]BARC-SA and Lancet Laboratories, Johannesburg, South Africa*

**Background:** HIV RNA suppression is a key indicator for monitoring of antiretroviral therapy. Viral load (VL) testing using Dried Blood Spots (DBS) is a promising alternative to plasma based VL testing in resource-limited settings. The analytical and clinical performance of the Abbott RealTime HIV-1 assay using DBS from venous blood and finger prick blood was evaluated.
**Methods:** Limit of detection (LOD) was determined using dilution of HIV-1 Virology Quality Assurance stock in venous blood. 316 HIV-1 positive adult clinical samples collected from Ivory Coast, Uganda and South Africa were tested. For each participant sample, plasma, DBS-venous and DBS-finger were collected. Samples collected

from Ivory Coast and Uganda were tested at Abbott Molecular and samples collected in South Africa were tested at Lancet Laboratories. For each HIV-1 participant, DBS-venous, DBS-finger and plasma sample results were compared. Correlation and mean bias values were obtained. The sensitivity and specificity were analyzed based on DBS misclassification at a threshold of 1000 HIV RNA copies/mL in plasma.
**Results:** The LOD of the Abbott HIV VL assay on DBS was found to be 839 copies / mL. Participant samples included 195 (62.3%) ≥ LOD, 95 (30.35%) "Not detected", 23 (7.35%) "<LOD detected" based on plasma results. Within the linear range of 839 copies/ml to 1x10$^7$ copies/mL, the correlation coefficient for DBS-finger versus plasma (n=150) was 0.887, for DBS-venous versus plasma (n=150) was 0.902, for DBS-finger versus DBS-venous (n=146) was 0.947. The mean bias was -0.13 log copies for DBS-finger versus plasma, -0.10 log copies for DBS-venous versus plasma and -0.05 for DBS-finger versus DBS-venous. Using a misclassification threshold of 1,000 copies/ml: For DBS-finger,13/152 samples had an HIV VL ≥1000 with plasma and <1000 with DBS-finger giving a sensitivity of 91.4%; For DBS-Venous, 9/152 samples had an HIV VL≥1000 with plasma and <1000 with DBS-venous giving a sensitivity of 94.1%. The specificity was 96% (155/161) for both DBS-finger and DBS-venous (6/161 samples misclassified with a VL<1000 for plasma and ≥1000 for DBS).
**Conclusions:** The HIV-1 VL quantitated between DBS-finger, DBS-venous and plasma correlates well. The mean bias between the sample types were all < 0.2 log copies/ mL.

### GENEXPERT HIV-1 QUANT: A TOOL FOR MONITORING THE SUCCESS OF ART PROGRAMME IN DEVELOPING COUNTRIES

S. Kulkarni[1], S. Jadhav[1], P. Khopkar[1], S. Sane[1], V. Chimanpure[1], V. Dhilpe[1], R. Londhe[1], M. Ghate[1], R. Yelgate[1], N. Panchal[1], G. Rahane[1], B. Rewari[2], R. Gangakhedkar[3]
*[1]National AIDS Research Institute, Virology, Pune, India, [2]WHO Country Officer for India, New Delhi, India, [3]National AIDS Research Institute, Pune, India*
*Presenting author email: skulkarni@icmr.org.in*

**Background:** Recent guidelines re-identify virologic monitoring as the gold standard practice for diagnosing and confirming ART failure. In support to the national ART programme to scale up HIV-1 viral load testing with the point-of-care (POC) technologies, GeneXpert HIV-1 Quant assay was validated at NARI, Pune, India.
**Methods:** 314 HIV positive individuals (pre ART n=151, on ART n=129, suspected ART failures n=34) were screened by the Abbott m2000rt Real Time HIV-1 viral load assay. 219 plasma specimens falling in different viral load ranges (< 40 to > 5L cp/ml) were selected and tested by the GeneXpert HIV-1 Quant assay. Additionally, 20 seronegative, 16 stored specimens (1, 2, 3 months storage) and 10 spiked copy controls (40 to 40L cp/ml) were tested. Statistical analysis was carried out for determining the coefficient of variation (Inter and intra assay), linear regression, Bland-Altman plots, sensitivity, specificity, NPV, PPV. The percent misclassifications were calculated for international and national cut-offs used for classifying the treatment failures (DHSs/AISs-200 cp/ml; WHO-400 cp/ml and NACO-1000 cp/ml).
**Results:** Correlation between two assays (r = 0.938) was statistically significant (p < 0.01) and linear regression showed a good fit ($R^2$= 0.878). The GeneXpert HIV-1 Quant assay compared well with the gold standard with a higher sensitivity (91-95%), specificity (99-100%) and reproducibility on the spiked copy controls. The LLD and ULD of the GeneXpert HIV-1 Quant were 1.94 $\log_{10}$ and 6.98 $\log_{10}$ cp/ml. The misclassification rates for the three viral load cut offs were not statistically different when compared by proportion test (p = 0.830). Bland-Altman analysis showed almost all differences were within limits of agreement. All seronegative samples were negative and viral loads of the stored samples showed a good fit in the linear regression ($R^2$= 0.896 to 0.982).
**Conclusions:** With the ease of performance and rapidity, the POC GeneXpert platform that is ued for detection of *M. tuberculosis* DNA can be used for HIV-1 quantification for better management of ART therapy. This will facilitate an integrated management of patients with HIV and TB and can be an important tool for scaling up the UNAIDS 90:90:90 initiative in resource limited settings.

## THPDB0206

### LYNX P24 ANTIGEN POINT-OF-CARE TEST CAN IMPROVE INFANT HIV DIAGNOSIS IN RURAL ZAMBIA

C. Sutcliffe[1], P. Thuma[2], K. Sinywimaanzi[2], M. Hamahuwa[2], W. Moss[3]
*[1]Johns Hopkins School of Public Health, Epidemiology, Laurel, United States, [2]Macha Research Trust, Choma, Zambia, [3]Johns Hopkins Bloomberg School of Public Health, Epidemiology, Baltimore, United States*
*Presenting author email: phil.thuma@macharesearch.org*

**Background:** An affordable and effective point-of-care test would increase access to testing for HIV-1 exposed infants and linkage to care for HIV-infected infants. The LYNX p24 antigen point-of-care test, developed by CIGHT at Northwestern University and Northwestern Global Health Foundation, was shown to be valid in laboratory and clinical studies and has the potential to reduce the time to diagnosis and treatment in rural sub-Saharan Africa.
**Methods:** From July 2014-June 2015, LYNX testing machines were evaluated at the Macha Hospital HIV clinic in rural Southern Province, Zambia. HIV-exposed infants requiring early infant diagnosis were enrolled. At the study visit, a dried blood spot card was collected for HIV DNA testing in Lusaka and a blood sample was collected for the LYNX test. The LYNX test was performed immediately by clinic counselors under observation by study staff. All steps in performing the LYNX test were assessed; HIV DNA test results were recorded.
**Results:** 156 infants (median age: 5.0 months; 48% male; 88% received PMTCT) were tested. 97% of tests were performed according to protocol. Among these, test results were available in a median of 55 minutes (IQR: 54, 58). Electricity was not available at the health care facility for 11% of tests (testing machines were operated using battery power). Eight infants tested positive and 137 tested negative by HIV DNA PCR (6 results yet to be returned). Of the 8 positive infants, 6 were also positive by the LYNX test (sensitivity: 75%; 95% CI: 35, 97). Of the 137 HIV DNA negative infants, 1 LYNX test was invalid and 136 were negative (specificity: 100%; 95% CI: 97, 100). The median time from sample collection to returning the HIV DNA PCR results to the mother was 90 days (IQR: 84, 141). Three mothers defaulted and 1 infant died while waiting for test results.
**Conclusions:** The LYNX test was successfully performed by counselors in rural health facilities and identified the majority of HIV-infected infants, without misdiagnosing any children. The LYNX test would significantly decrease the turnaround time for diagnosis in this setting, enabling HIV-infected infants to initiate antiretroviral therapy at an earlier age.

# THPDC01 SAFER CONTRACEPTION CHOICES FOR HIV-AFFECTED COUPLES

### DIFFICULT DECISIONS: INDIVIDUAL AND COUPLE FERTILITY DESIRES AND HIV ACQUISITION AMONG HIV SERODISCORDANT COUPLES IN ZAMBIA

D. Joseph Davey[1], K. Wall[2], M. Inambao[3], W. Kilembe[3], I. Brill[4], E. Chomba[3], N. Htee Khu[3], J. Mulenga[3], A. Tichacek[2], B. Vwalika[3], S. Allen[2], Rwanda-Zambia HIV Research Group
*[1]University of California, Los Angeles (UCLA), Epidemiology, Los Angeles, United States, [2]Emory University, Atlanta, United States, [3]Rwanda-Zambia HIV Research Group, Lusaka, Zambia, [4]University of Alabama, Birmingham, United States*
*Presenting author email: dvoradavey@gmail.com*

**Background:** Previous research on the determinants of fertility desires in HIV-infected women, and serodiscordant couples has yielded mixed results. Despite the risk of HIV acquisition, transmission and mortality associated with conception, safer conception interventions for serodiscordant couples are not readily available in sub-Saharan Africa. This study evaluated determinants of fertility desires and effect of fertility desire on HIV acquisition among HIV serodiscordant couples in an open cohort in Lusaka, Zambia.
**Methods:** We collected demographic, behavioral, clinical exposures, and data on fertility desires in a prospective cohort of HIV serodiscordant couples from 1995 to 2012. Factors associated with fertility desires by gender were evaluated using multivariable logistic regression. To estimate the overall effect of fertility desire on risk of HIV infection, we developed inverse-probability-of-treatment-weighted estimation of a marginal structural model to adjust for time-varying confounders affected by prior exposure.
**Results:** Among 1,029 serodiscordant couples, 311 agreed that they wanted a child in the future (30.4%), 368 agreed they did not want a child (36.0%), and 344 couples disagreed about having more children (33.6%). Women's fertility desire was associated with younger age (aOR=0.95; 95% CI=0.91, 0.99), not being pregnant at baseline (aOR=0.21; 95% CI=0.12, 0.37), fewer living children (aOR=0.75; 95%

CI=0.62, 0.90), fewer previous pregnancies (aOR=0.87; 95% CI=0.61, 0.98), and partner wanting a child (aOR=2.79; 95%CI=1.97-3.95). Men's fertility desire was associated with younger age (aOR=0.88; 95%CI=0.80-0.97), fewer years cohabiting (aOR=0.95;95%CI=0.90-1.00), fewer living children (aOR=0.84; 95% CI=0.70-1.01), and partner wanting a child (aOR=2.83; 95% CI=2.00, 4.01). The adjusted risk ratio for woman's HIV acquisition was 2.06 (95% CI=1.40, 3.03) among women wanting a child, 1.75 (95% CI=1.07, 2.87) for men wanting a child, and highest at 2.55 (95% CI=1.32, 4.93) when the couple agreed on wanting a child compared to couples who agreed they didn't want a child. Male seroconversion was not associated with fertility desire.
**Conclusions:** Women had increased risk of seroconverting if they or their partner wanted a child. Safer conception interventions are needed to protect serodiscordant couples who want children.

## THPDC0102

### PREP AND ART REDUCE HIV TRANSMISSION BETWEEN MEMBERS OF HIV SERODISCORDANT COUPLES DURING PREGNANCY AND PREGNANCY ATTEMPTS

R. Heffron[1], N. Mugo[2], K. Ngure[2], E. Bukusi[2], J. Odoyo[2], E. Katabira[3], N. Bulya[3], S. Asiimwe[4], E. Tindimwebwa[4], J. Haberer[5], M. Marzinke[6], C. Celum[1], J.M. Baeten[1]
*[1]University of Washington, Seattle, United States, [2]Kenya Medical Research Institute, Nairobi, Kenya, [3]Makerere University, Kampala, Uganda, [4]Kabwohe Clinical Research Center, Kabwohe, Uganda, [5]Massachusetts General Hospital, Boston, United States, [6]Johns Hopkins University, Baltimore, United States*
*Presenting author email: rheffron@uw.edu*

**Background:** HIV-negative members of HIV serodiscordant couples are extremely vulnerable to HIV acquisition during pregnancy attempts because it is necessary to forgo condom use. Antiretroviral treatment (ART) and pre-exposure prophylaxis (PrEP) are powerful HIV prevention strategies and can be leveraged to reduce HIV transmission risk during pregnancy attempts.
**Methods:** Among 1013 Kenyan and Ugandan high risk HIV serodiscordant couples, we implemented an integrated ART and PrEP strategy for HIV prevention and followed couples for 2 years. Following quarterly HIV testing, PrEP was provided to HIV-negative partners until HIV-positive partners used ART for ≥6 months. Contraception was available at all study sites. Pregnancy testing was conducted when clinically indicated and self-reported data on fertility desires and sexual behavior were collected through standardized interviewer administered questionnaires on a quarterly basis.
**Results:** In 67% of couples, the woman was the HIV-positive partner. At enrollment, 37% of HIV-positive and 39% of HIV-negative women reported intentions to have a child within 3 years and 77% of HIV-positive and 66% of HIV-negative women were not using effective contraception, proportions that remained fairly constant throughout follow up. Among HIV-positive and negative women, there were 154 incident pregnancies (incidence rate = 18.6/ 100 person years) and 87 incident pregnancies (incidence=20.3/ 100 person years), respectively. There were no HIV transmissions to male partners during incident pregnancies or in the 6 months preceding those pregnancies. One woman seroconverted and became pregnant during the same 3-month interval; behavioral reports and biological testing confirm that she was not using PrEP prior to seroconversion. During the three months prior to pregnancy diagnosis, 62% of couples were using PrEP or ART; 30% were using both. Of 34 women who were using PrEP when they became pregnant, 88% elected to continue using PrEP during pregnancy.
**Conclusions:** Fertility intentions were common and most couples chose to use PrEP and/or ART, which nearly eliminated HIV transmission during pregnancy and preconception periods in this large cohort with high pregnancy rates. ART and PrEP are important elements to promote within safer conception programs for HIV serodiscordant couples.

## THPDC0103

### UNDIAGNOSED HIV-INFECTED PARTNERS ARE THE MAJOR GAP IN THE CASCADE FOR SERODISCORDANT COUPLES IN TWO HIGH PREVALENCE SETTINGS

D. Maman[1], H. Huerga[2], G. Van Cutsem[3], I. Mukui[4], B. Chilima[5], W. Hennequin[6], C. Masiku[7], L. Salumu[8], T. Ellman[9], J.-F. Etard[2]
*[1]Epicentre - Médecins Sans Frontières (MSF), Cape Town, South Africa, [2]Epicentre - Médecins Sans Frontières (MSF), Paris, France, [3]Médecins Sans Frontières, Cape Town, South Africa, [4]National AIDS and STDs Control Program, Nairobi, Kenya, [5]Community Health Sciences Unit, Malawi Ministry of Health, Lilongwe, Malawi, [6]Médecins Sans Frontières, Nairobi, Kenya, [7]Médecins Sans Frontières, Lilongwe, Malawi, [8]Médecins Sans Frontières, Paris, France, [9]Southern Africa Medical Unit, Medecins Sans Frontières, Cape Town, South Africa*
*Presenting author email: david.maman@epicentre.msf.org*

**Background:** Discordant couples are a major source of HIV transmission. We quantified the prevalence of HIV discordant couples and, among HIV infected individuals, evaluated each step of the cascade of care in two high prevalence settings in sub-Saharan Africa.
**Methods:** Two population-based surveys of persons age 15 to 59 were conducted in Ndhiwa (Nyanza, Kenya) and Chiradzulu (Malawi) between September 2012 and May 2013, to assess HIV incidence and cascade of care. Each individual who agreed to participate was interviewed and tested for HIV at home. All HIV-positive were tested for VL and CD4, regardless of their ART status. A couple consisted of two persons who were legally married or who were living together in a consensual union.
**Results:** In total 7,425 houses were visited and among 15,104 individuals eligible, 13,345 (88.4%) were included and tested for HIV. Among 2,970 identified as couples, HIV discordancy was found in 15.8% (95%CI 13.9-17.9) in Kenya and 10.0% (95%CI 7.9-12.7) in Malawi. Among couples with at least one HIV-infected partner, the proportion of HIV-discordancy was 45.8% in Kenya, 40.9% in Malawi. Men were the HIV-positive partner in 63.6% (95%CI 56.7-70.0) of the discordant couples in Kenya, higher than in Malawi (47.9%; 95%CI 40.4-55.5).
HIV status awareness among HIV-positive partner of discordant couples was 42.2% in Kenya and 64.4% in Malawi. VL suppression was 34.6% in Kenya and 54.5% in Malawi, lower than in the general population (40.0% in Kenya, 61.9% in Malawi). VL suppression was higher in women compared to men, in Kenya (39.5% vs 26.8%, p=0.1) and in Malawi (61.2% vs 46.5, p< 0.01).
**Conclusions:** Discordant couples were frequent and VL suppression ranged between 35 and 55% among HIV-positive partners. The high rate of unawareness of status among HIV-positive partners must be addressed in order to promote timely initiation of ART and/or PREP to reduce transmission within this high-risk group.

## THPDC0104

### CLINICAL OUTCOMES AND LESSONS LEARNED FROM A SAFER CONCEPTION CLINIC FOR HIV-AFFECTED COUPLES TRYING TO CONCEIVE

S. Schwartz[1], R. Phofa[2], N. Yende[2], J. Bassett[2], I. Sanne[3], A. Van Rie[4,5]
*[1]Johns Hopkins University, Epidemiology, Baltimore, United States, [2]Witkoppen Health and Welfare Centre, Johannesburg, South Africa, [3]University of the Witwatersrand, Clinical HIV Research Unit, Johannesburg, South Africa, [4]University of North Carolina, Epidemiology, Chapel Hill, United States, [5]University of Antwerp, Antwerp, Belgium*
*Presenting author email: nompumeleloy@witkoppen.co.za*

**Background:** Many couples affected by HIV express the desire to conceive despite the risk of horizontal and vertical HIV transmission. *Sakh'umndeni* is one of the first safer conception services integrated within a primary care clinic in Sub-Saharan Africa.
**Methods:** Since July 2013, Witkoppen Health and Welfare Centre in Johannesburg, South Africa, offers safer conception services to individuals in relationships who wish to conceive in the next three months if one or both partners are living with HIV. The safer conception clinic, *Sakh'umndeni,* offers patients a range of services and choices for HIV prevention including antiretroviral therapy (ART) initiation for HIV-positive partners independent of CD4 count, pre-exposure prophylaxis (PrEP) for HIV-negative partners, STI screening and treatment, viral load monitoring, counseling around peak fertility identification, self-insemination, and referral to on-site male medical circumcision. Participants are followed prospectively from enrollment until HIV testing at age 6 weeks of the infant.
**Results:** Overall, 406 individuals participated in *Sakh'umndeni*, including 144 couples and 118 unaccompanied women. About half (46%) of all couples were serodiscordant (n=66/144). The majority (341/406, 84%) of participants were HIV-positive. Most men (90%) and women (60%) already had one or more children. Median age was 34 years [IQR30-38] among women and 37 years [IQR34-43] among men. At enrolment, almost half (45%) of participants had engaged in condomless sex with their partner in the past 30 days. At first visit, 81% of HIV-positive women and 70% of HIV-positive men were already on ART. During follow-up, 51/52 HIV-positive ART-naïve individuals initiated ART. Only 14 of 66 (21%) HIV-negative participants chose PrEP:

13/30 HIV-negative women and 1/36 HIV-negative men. To-date, 57 pregnancies among 52 women (52/262=20%) have been documented, of which 9 (16%) resulted in a miscarriage. All 29 women failing to conceive with 6 months of attempted conception were referred to a fertility clinic with their partners. No horizontal transmissions have been observed; all 24 live-born babies ≥6 weeks tested HIV-negative.
**Conclusions:** Results from over two years of *Sakh'umndeni* suggest that safer conception services can be effective at primary care in high burden settings, with low risks of horizontal and vertical HIV transmission.

## THPDC0105

### UPTAKE AND CLINICAL OUTCOMES FROM A PRIMARY HEALTHCARE BASED SAFER CONCEPTION SERVICE IN JOHANNESBURG, SOUTH AFRICA: FINDINGS AT 7 MONTHS

N.E.C.G. Davies[1], S. Mullick[1], S. Schwartz[1,2]
*[1]University of the Witwatersrand, Wits Reproductive Health and HIV Institute, Johannesburg, South Africa, [2]Johns Hopkins School of Public Health, Center for Public Health and Human Rights, Baltimore, United States*
*Presenting author email: ndavies@wrhi.ac.za*

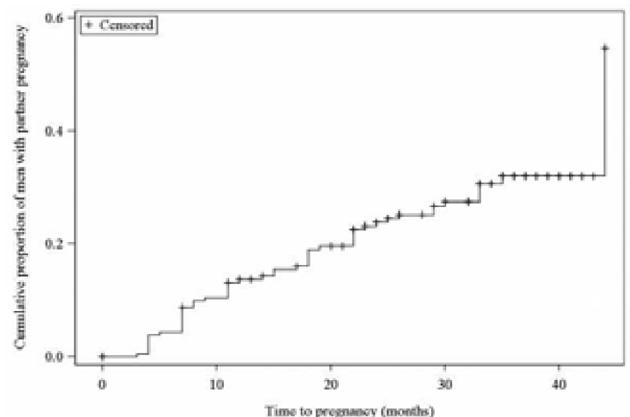
**Background:** Safer-conception services (SCS) for HIV-seroconcordant, serodiscordant or sero-unknown couples support HIV counselling and testing (HCT), ART initiation, viral load (VL) suppression and HIV prevention. The South African Contraception and Fertility Planning Policy includes SCS provision yet primary healthcare (PHC)-based SCS remain rare. This study aimed to develop, implement and evaluate a PHC-based SCS, in Johannesburg, South Africa. Here, we report early uptake and clinical outcomes.
**Methods:** Individuals and couples in HIV-seroconcordant, serodiscordant and sero-unknown relationships desiring pregnancy enrolled at the new SCS from existing PHC services. Safer-conception strategies offered included: HCT, ART initiation, VL monitoring, STI screening/management, and periovulatory condomless sex or self-insemination. Data were collected using standardised clinical record forms.
**Results:** Of 218 participants enrolled, 141 (65%) were female (average 33.5years; range 19-45) and 77 male (average 37.4years, range 24-57). Overall, 134/141 (95%) women and 62/77 (81%) men were HIV-positive, including five newly diagnosed. No seroconversions have occurred amongst 22 HIV-negative clients.
Among SCS-users, 74 enrolled as couples (51 seroconcordant; 23 serodiscordant) and 70 as unaccompanied individuals (27 reporting seroconcordant relationships, 16 serodiscordant and 27 with unknown partner status). Among unaccompanied females, 7/18 disclosed to their partners post-enrolment, resulting in two more male HIV diagnoses and one ART initiation. Tailored safer-conception strategies were offered based on initial assessment. Twenty-one ARV-naïve clients initiated treatment. Out of eleven on ART for ≥3 months, 9 had VL< 200 copies. Nine of 172 (5%) ART-experienced clients had VL>200 copies. All received adherence support. Four with confirmed virological failure switched to second-line therapy.
Fourteen pregnancies have been confirmed, two via self-insemination. Eight couples/individuals (57%) utilised optimal SC strategies, four attended only one consultation, two partners were not on ART. Thirteen (93%) of the women were virally suppressed with CD4 counts >350 cells at pregnancy confirmation. All attended antenatal care (ANC) ≤7 weeks' gestation.
**Conclusions:** Implementing a PHC-based safer-conception service is acceptable and feasible, impacting HCT, ART initiations, viral suppression and PMTCT targets including earlier ANC access. High demand for the service creates opportunities for HIV prevention and improved HIV treatment outcomes. However, challenges include partner non-disclosure, difficulties engaging men and pregnancies occurring before SC strategies are optimised.

## THPDC0106

### HIGH PLANNED PARTNER PREGNANCY INCIDENCE AMONG HIV-POSITIVE MEN IN RURAL UGANDA: IMPLICATIONS FOR COMPREHENSIVE SAFER CONCEPTION SERVICES FOR MEN

A. Kaida[1], J. Kabakyenga[2], M. Bwana[2], F. Bajunirwe[2], K. Bennett[3], J.E. Haberer[4], Y. Boum[2,5], J.N. Martin[6], P. Hunt[6], D.R. Bangsberg[2,7], L.T. Matthews[7]
*[1]Simon Fraser University, Faculty of Health Sciences, Vancouver, Canada, [2]Mbarara University of Science and Technology (MUST), Mbarara, Uganda, [3]Bennett Statistical Consulting, Ballston Lake, United States, [4]Massachusetts General Hospital (MGH) Global Health and Department of General Medicine, Boston, United States, [5]Epicentre Mbarara, Mbarara, Uganda, [6]Department of Medicine, University of California at San Francisco (UCSF), San Francisco, United States, [7]Massachusetts General Hospital (MGH) Global Health and Division of Infectious Disease, Boston, United States*
*Presenting author email: angelakaida@gmail.com*

**Background:** In 2015, UNAIDS called for greater inclusion of men within sexual and reproductive health programming. An estimated 30-50% of HIV-positive men intend to have children, and approximately half have HIV-uninfected partners. Men often play a dominant role in reproductive decision-making, including uptake of strategies that support achievement of pregnancy while minimizing sexual HIV transmission. To inform implementation of male-inclusive safer conception services, we measured partner pregnancy incidence among HIV-positive men engaged in HIV care.
**Methods:** Participants were enrolled in the Uganda AIDS Rural Treatment Outcomes cohort of HIV-positive individuals initiating antiretroviral therapy (ART) in Mbarara, Uganda. Bloodwork (CD4 cells/mm$^3$, HIV-RNA) and questionnaires (including health status, behaviors, partner dynamics, and self-reported partner pregnancy) were completed at baseline and quarterly. Our analysis includes 189 HIV-positive men enrolled between 2011-2015. We measured partner pregnancy incidence overall and by reported partner HIV-serostatus and pregnancy intention.
**Results:** At baseline, median age was 40 years [Q1,Q3: 35,47] and median number of living children was 4 [Q1,Q3: 2,5]. 74% were married with 66% reporting HIV-positive partners. 19% reported ≥2 sexual partners. Median years on ART was 3.9 [Q1,Q3: 0,5.1], median CD4 was 318 cells/mm$^3$ [Q1,Q3: 235,424], and 51% were virally suppressed (< 400 copies/mL). Over 480.7 person-years of follow-up, 63 men reported 85 partner pregnancies (incidence rate 17.7/100 person-years). By three years of follow-up, 33% reported at least one partner pregnancy (Figure 1). Of 85 pregnancies, 45% of partners were HIV-negative/unknown-serostatus and only 7% were unintended.
**Conclusions:** One-third of HIV-positive men on ART reported at least one partner pregnancy within 3 years of follow-up. Nearly half of all pregnancy partners were at risk for HIV acquisition and over 90% were intended pregnancies. Findings highlight the need for reproductive health services that include men and support uptake of strategies to minimize sexual HIV transmission risk in the context of intended pregnancy.



*[Figure 1: Probability of reported partner pregnancy over time among HIV-positive men on ART in Mbarara, Uganda]*

## THPDD01 COMMUNITY ENGAGEMENT AND ETHICS IN CURE RESEARCH

### THPDD0101

### ETHICAL AND SOCIAL IMPLICATIONS OF PROPOSED HIV CURE RESEARCH: STAKEHOLDER PERSPECTIVES FROM SOUTH AFRICA

K. Moodley[1], Z. Duby[1], C. Staunton[1], M. Hendricks[1], G. Nair[2], M. de Roubaix[1], D. Skinner[3]
*[1]Stellenbosch University, Centre for Medical Ethics and Law, Cape Town, South Africa, [2]University of KwaZulu Natal, CAPRISA, Durban, South Africa, [3]Stellenbsoch University, Community Health Division, Cape Town, South Africa*
*Presenting author email: km@sun.ac.za*

**Background:** The ethical concerns associated with HIV prevention and treatment research have been widely explored in South Africa. However, HIV cure research is relatively new to the region and significant ethical and social challenges are anticipated as various scientific strategies including early treatment of acute infection, neutralizing antibodies, gene therapy and therapeutic vaccines are explored. Consequently, early stakeholder engagement is critical. While two studies in China and Australia have researched stakeholder perspectives, there has been no similar published empirical enquiry in Africa regarding HIV cure research. This study was conducted to gain preliminary data from South African HIV clinicians, patients, caregivers, medical students, researchers and activists.
**Methods:** In-depth interviews were conducted on a purposive sample of thirty-five stakeholders in South Africa from October 2015 to February 2016. In addition five focus group discussions (FGDs) were conducted with adolescent patients, caregivers, adult patients, Community Advisory Board members and medical students. Audiotaped interviews and FGDs were transcribed verbatim with concurrent thematic analysis. Analyst triangulation occurred as the data were analysed by three researchers independently and then integrated via discussion.
**Results:** Common themes emerged from the interviews. The rapid evolution of HIV cure research agendas was prominent with participants expressing some concern that the global North was driving the cure agenda. Assessing and managing knowledge and expectations around HIV cure research emerged as a central theme related to challenges to constructing 'cure'. Distinguishing between biomedical and emotional cure, remission and healing was highlighted as important. Avoiding curative misconception would be critical. Treatment interruption was regarded as a major risk if "cure" failed.
**Conclusions:** A holistic approach integrating biomedical treatment, prevention and cure research is critical to achieve HIV eradication. The synergistic effect of such scientific research will be enhanced if the social and ethical dimensions of cure are taken into account. The findings of this study have important implications for community engagement, consent processes and possibly compensation for failed interventions in future cure trials. Undoubtedly, knowledge and resource sharing in the context of collaboration between research scientists working in cure and those working in treatment and prevention will accelerate progress towards cure.

### THPDD0102

### COMMUNITY ENGAGEMENT IN HIV CURE-RELATED RESEARCH: APPLYING GOOD PARTICIPATORY PRACTICE (GPP) PRINCIPLES TO COMMUNITY EDUCATION EFFORTS

J. Salzwedel[1], S. Hannah[1], J. Taylor[2], K. Dube[3]
*[1]AVAC, New York, United States, [2]Collaboratory of AIDS Researchers for Eradication (CARE) Community Advisory Board (CAB), Palm Springs, United States, [3]University of North Carolina-Chapel Hill Gillings School of Public Health, Chapel Hill, United States*
*Presenting author email: jessica@avac.org*

**Background:** Meaningful community engagement demands basic scientific knowledge and principles of engagement. We investigated the attitudes and beliefs of people living with HIV toward HIV cure research. The Good Participatory Practice guidelines for HIV Biomedical Prevention (GPP) is a set of recommendations that outlines practices to engage a broad set of stakeholders in the research process.
**Methods:** We completed a cross-sectional survey with 400 American adults living with HIV (22% females; 77% males; < 1% transgender) connected to HIV cure research networks in 2015 to assess basic knowledge and attitudes around HIV cure research. The sample was ethnically diverse with broad geographical representation. We also conducted extensive key informant interviews with 36 people living with HIV, researchers, bioethicists and regulators to discuss the role of community in HIV cure research.
**Results:** Of the survey respondents, 96% [95% CI: 91, 100%]; n = 399 were generally interested in HIV cure research and 95% [90, 100%]; n = 399 were concerned with medical issues. Nonetheless, a proportion of respondents - 8% [3, 13%]; n = 350 thought a cure for HIV was already in existence. Study participants agreed that more information around HIV cure research was needed at a basic level of understanding given the complexity of the science, particularly about the various risks of HIV cure research modalities under investigation. Furthermore, the results revealed a disconnect between this stakeholder group and the research process, highlighting the need for a comprehensive and robust stakeholder engagement plan around HIV cure research in the United States.
**Conclusions:** Given that a subset of HIV-positive survey respondents thought a cure for HIV existed but wasn't currently available to everyone, a comprehensive education and stakeholder engagement plan is needed. Engaging people living with HIV early in the research process using Good Participatory Principles can help lessen potential participants' misconceptions and fears and lead to greater acceptance and support for HIV cure research. Additional formative research is needed with different stakeholder groups, including physicians, religious leaders and community educators.

### THPDD0103

### HIV CURE RESEARCH: A SURVEY OF AUSTRALIAN PEOPLE LIVING WITH HIV ON PERSPECTIVES, PERCEIVED BENEFITS AND WILLINGNESS TO PARTICIPATE IN TRIALS

J. Power, J. Lucke, G. Dowsett, G. Brown, A. Lyons
*La Trobe University, The Australian Research Centre in Sex, Health and Society, Melbourne, Australia*
*Presenting author email: jennifer.power@latrobe.edu.au*

**Background:** In 2015, there were over 100 HIV Cure-related trials operating worldwide. Participation in current, and future, trials may pose health risks for people living with HIV (PLHIV), while being unlikely to deliver therapeutic benefit. As such, there is an ethical imperative for researchers to understand the motivations, expectations and understandings of potential trial participants. This paper reports on a survey of Australian PLHIV which aimed to identify:
· familiarity with HIV Cure research and optimism regarding achieving a cure
· anticipated benefits of cure
· socio-demographic and health-related characteristics of PLHIV who indicate willingness to participate in HIV Cure trials
· factors that moderate willingness to participate in a trial.
**Methods:** Data for this study were derived from a cross-sectional survey of PLHIV in Australia conducted in 2015/2016. There were ~800 responses collected via a self-complete instrument that could be filled-in online or using a 'pen and paper' survey. The study was advertised through HIV organisations, relevant email lists, social media and websites. Analysis involved:
(1) multivariate hierarchical regression to identify factors associated with greater willingness to participate in trials and;
(2) non-parametric tests to identify participants' expectations regarding HIV cure.
**Results:** Preliminary data analysis shows that not passing HIV to others and not being at risk of ill-health were the most desirable 'HIV Cure' outcomes reported. Approximately 80% indicated willingness to participate in a trial. However, this was reduced if respondents thought participation could result in greater unpredictability of viral load, increased risk of resistance to current antiretroviral treatment, or increased susceptibility to illness. Belief that an HIV Cure would be achieved within the respondent's lifetime was associated with greater willingness to participate in a trial.
**Conclusions:** These findings suggest that many Australian PLHIV are open to participating in HIV Cure trials. However, concern about possible effects on treatment efficacy and viral suppression clearly influences willingness, pointing to the importance of high quality informed consent processes. Optimism for achieving an HIV Cure may also influence willingness to participate. This is a further ethical concern as unrealistic optimism may be associated with misunderstanding of the therapeutic benefits of trial participation.

## THPDD0104

### TREATMENT INTERRUPTIONS IN HIV CURE STUDIES IN THE UNITED STATES: PERCEPTIONS, MOTIVATIONS AND ETHICAL CONSIDERATIONS FROM POTENTIAL HIV-POSITIVE VOLUNTEERS

D. Evans[1], J. Taylor[2], L. Sylla[3], S. Garner[4], B. Weiner[5], A. Skinner[5], S. Greene[5], S. Rennie[6], K. Dubé[6]
*[1]Project Inform, Research Advocacy, South Pasadena, United States, [2]Collaboratory of AIDS Researchers for Eradication (CARE), Palm Springs, United States, [3]defeatHIV Community Advisory Board, Seattle, United States, [4]Division of AIDS (DAIDS), National Institute of Allergy and Infectious Diseases (NIAID), Bethesda, United States, [5]UNC Gillings School of Global Public Health, Chapel Hill, United States, [6]Center for Bioethics, Department of Social Medicine, UNC-Chapel Hill, Chapel Hill, United States*
*Presenting author email: devans@projectinform.org*

**Background:** We investigated perceptions of and willingness to undergo analytical treatment interruptions (ATIs) as part of HIV cure studies in the United States.
**Methods:** We completed a cross-sectional survey with 400 American adults living with HIV (22% females; 77% males; < 1% transgenders) in 2015. The sample was ethnically diverse and 38 U.S. states were represented. We also conducted extensive key informant interviews with 36 people living with HIV, researchers, bioethicists and regulators to assess motivations, perceptions of and concerns around ATIs.
**Results:** In the sample of potential HIV-positive volunteers, 98% [95% CI: 93, 100]; n = 400) were currently taking antiretrovirals. Almost half 44% [39, 49%]; n = 399) reported they had ever participated in an HIV treatment study and 7% [2, 12%]; n = 400 said they had ever been part of a HIV cure-related study. Of the survey respondents, 26% [21, 31%] were very willing to interrupt treatment, 42% [37, 47%] were somewhat willing, 12% [7, 17%] were not very willing, 9% [4, 14%] were not at all willing and 11% [6, 16%]; n = 359 were unsure. Close to two thirds (65% [60, 70%]; n = 350) reported that no more HIV treatment ever would be the definition of cure to them. Motivations for undergoing ATIs included: desire to help find a cure, past experiences with treatment interruptions and compensation. A subset of potential volunteers considered ATIs to be "too much risk" and expressed concerns about the possibility of viral rebound and development of resistance to ARVs. Clinicians-researchers and regulators were divided on the topic of ATIs. Some believed ATIs should not be attempted unless proof of concept is established for experimental modalities. Others agreed that there are criteria for proceeding with ATIs, including strong scientific justification, close monitoring and demonstrated substantial reduction in reservoir size and/or significant augmentation of the immune clearance function.
**Conclusions:** As a functional cure may be defined as ART-free remission, ATIs could become a clinically meaningful measure for cure. To ensure ethical utilization, it will be important to continue understanding stakeholders' perspectives while minimizing risks.

## THPDD0105

### INTERRUPTING HIV TREATMENT IN CURE RESEARCH: SCIENTIFIC AND ETHICAL CONSIDERATIONS

S. Garner[1], S. Rennie[2], J. Ananworanich[3], K. Dube[2], D. Margolis[2], J. Sugarman[4], R. Tressler[5], A. Gilbertson[2], L. Dawson[6]
*[1]Henry M. Jackson Foundation, Division of AIDS, NIAID, NIH, Bethesda, United States, [2]University of North Carolina at Chapel Hill (UNC), Chapel Hill, United States, [3]U.S. Military HIV Research Program, Bethesda, United States, [4]Johns Hopkins University, Baltimore, United States, [5]Henry M. Jackson Foundation, Bethesda, United States, [6]Division of AIDS, NIAID, NIH, Bethesda, United States*
*Presenting author email: karine_dube@med.unc.edu*

**Background:** Intense activity is being directed at strategies for remission or eradication of HIV infection. However, current laboratory assays for HIV reservoir measurement are insufficient to demonstrate clearance of HIV and the best available test is to interrupt antiretroviral therapy (ART)—known as analytic treatment interruption (ATI)—for a defined period of time or until viral rebound occurs. Although ATIs are currently used in some HIV cure research, they raise important scientific and ethical questions.
**Methods:** A multidisciplinary group conducted an ethical analysis of the use of ATI in HIV cure research. The analysis examined the rationale for ATI and its potential scientific utility as well as the risks and burdens to study participants. Criteria for use of ATI in HIV cure studies were developed.
**Results:** Despite the ethical obligation to minimize research risks, there are limited data to directly inform risk assessment for ATIs in HIV cure trials. Experts have extrapolated from information from trials using longer repeated treatment interruptions, and from biological assays measuring effects of viral replication and inflammation. Despite these best efforts, it is difficult to ascertain the probability and magnitude of harm from a single ATI. There is also disagreement about the scientific utility of ATI in different types of studies. In spite of these uncertainties, studies involving ATIs must meet three basic ethical criteria:
1) a strong scientific justification for the ATI;
2) minimization of risks to study participants; and
3) a robust informed consent process.
**Conclusions:** Based on the ethical criteria identified in this analysis, investigators should carefully consider the acceptability of ATIs by providing a strong justification of an ATI and carefully select participants. Further work should be undertaken by clinical researchers in partnership with social scientists, behavioral researchers and ethicists to enhance the ethical conduct of studies employing ATIs.

## THPDD0106LB

### AN INNOVATION CONTEST AS COMMUNITY ENGAGEMENT FOR HIV CURE RESEARCH IN NORTH CAROLINA: A MIXED METHODS EVALUATION

A. Mathews[1], A. Anderson[2], S. Farley[3], L. Hightow-Weidman[1], K. Muessig[1], S. Rennie[4], J. Tucker[1]
*[1]University of North Carolina at Chapel Hill, Institute for Global Health and Infectious Disease, Chapel Hill, United States, [2]University of North Carolina at Greensboro, Greensboro, United States, [3]University of North Carolina at Chapel Hill, Chapel Hill, United States, [4]University of North Carolina at Chapel Hill, Social Medicine, Chapel Hill, United States*
*Presenting author email: amathews@email.unc.edu*

**Background:** Optimal ways to engage communities about HIV cure research remain unclear. The early stages of HIV cure research require an examination of alternative community engagement strategies that adopt a bottom-up approach. Innovation contests solicit contributions from the community, then evaluate and celebrate them. This pilot study evaluates community engagement in an innovation contest on HIV cure using social media analytics and qualitative methods.
**Methods:** The innovation contest solicited images and videos of what HIV cure meant to people. Participants submitted entries to an Ideascale site, an encrypted online platform specifically designed for innovation contests. We primarily engaged Black young adults between 18 to 35 years old in North Carolina because they are at the highest risk for acquiring HIV in the state. Recruitment included radio interviews and in-person and online engagement. Google, Twitter, and Facebook analytics assessed social media contest engagement. Online engagement included: page follows (unique users who subscribe to page update alerts), page visits, video views, reach (unique users who saw any contest-related material), and contest submissions. Qualitative research included focus groups and community forums that were transcribed, coded, and analyzed using MaxQDA.
**Results:** The innovation contest resulted in substantial in-person and online engagement, including in-person events (n=258 participants), focus groups and community forums (n=172 participants), and a reach of 168,364 unique users online. We had 31 contest submissions. Facebook analytics showed 277 page followers, 1297 page visits, 1409 video views, and a combined 112,041 unique users who viewed any contest-related media. Similar trends were observed on Twitter, Youtube, and Google analytics. Qualitative findings reveal the innovation contest was perceived as feasible and inclusive. In-person and online engagement about HIV cure research facilitated contest participation. Low HIV cure literacy and HIV-related stigma were barriers to contest participation.
**Conclusions:** Innovation contests may be useful for HIV cure community engagement. Findings suggest that combining recruitment through in-person events and multimedia platforms reach a broad range of individuals for potential participation in innovation contests. Community contributions to innovation contests may provide useful content for culturally relevant and locally responsive social marketing campaigns.

## THPDE01 HIV SERVICES IN PRISONS: LET'S RAISE THE BAR

### THPDE0101

#### PROJECT START INTERVENTION INCREASES HIV TESTING UPTAKE AND DECREASES HIV RISK BEHAVIOUR AMONG MEN RELEASED FROM PRISON: A RANDOMIZED STUDY IN UKRAINE

T. Kiriazova[1], Y. Sereda[1], O. Neduzhko[1], O. Postnov[1], R. Yorick[2], I. Shvab[2], S. Dvoriak[1]
*[1]Ukrainian Institute on Public Health Policy, Kyiv, Ukraine, [2]USAID RESPOND, Pact Inc, Kyiv, Ukraine*
*Presenting author email: kiriazova@uiphp.org.ua*

**Background:** In Ukraine, the prevalence of infectious diseases and substance use disorders is high among incarcerated population. This study assessed whether the effective case-management intervention Project START decreases risk of HIV in men who transfer from prison to community in four regions of Ukraine.
**Methods:** Male prisoners were randomized either to standard services or to an intervention group that included two sessions before release and up to four sessions within three months after release focused on decreasing risk of HIV, STIs and hepatitis transmission. Participants were assessed at baseline before the intervention, and at 3- and 6-month follow-ups. Primary outcome variables were: being at risk of contracting HIV due to their behavior in the past 3 months, and having had an HIV test in the past 12 months. The effects for group, time and group by time interactions were analyzed using mixed effects logistic regression with random intercepts.
**Results:** In total, 394 male prisoners (mean age 35.2 ± 9.4 years, mean duration of imprisonment 41.0 ± 24.7 months, 56.9%% reported history of injection drug use) were included in the study. Follow-up rates at 3- and 6-month assessments were 86% and 85% for the intervention group and 82% and 82% for the control group, correspondingly. Compared to controls, participants in the intervention group were significantly less likely to report HIV-related risk behavior, including irregular condom use or/and sharing injection needles in the past three months (AOR 0.51, 95% CI: 0.39 to 0.67, identical for the 3- and 6-month post-release assessments). Intervention was associated with higher odds of testing for HIV at 3-month (AOR 4.56, 95% CI: 1.61 to 12.94) and 6-month (AOR 1.70, 95% CI: 1.08 to 8.88) follow-ups.
**Conclusions:** In this first implementation study of the Project START in Ukraine, the intervention was shown effective in increasing HIV testing uptake and decreasing HIV risk behavior in men released from prison, and can be implemented in other countries of the Eastern Europe and Central Asia.

### THPDE0102

#### EXPANDING HIV AND STI CARE TO PRISONERS: THE EXPERIENCE FROM ZOMBA CENTRAL PRISON, MALAWI

D.B. Garone[1], G. Mateyu[1], J. van Oosterhout[1], V. Singano[1], V. van Schoor[1], M. Chigayo[2], H. Ndindi[2], A. Kwekwesa[1], S. Gaven[1], K. Harawa[1]
*[1]Dignitas International, Medical, Zomba, Malawi, [2]Malawi Prison Health Services, Medical, Zomba, Malawi*
*Presenting author email: a.kwekwesa@dignitasinternational.org*

**Background:** Globally, prevalence rates of HIV, sexually transmitted infections (STI's) and hepatitis B (HBV) in prison populations are 2 to 50 times higher than in general populations. Risks affect prisoners, prison staff, their families and the entire community. In 2013, the Malawi Prison Services established a steering committee to scale-up HIV care and treatment in Malawian Prisons. We used routinely collected program data to evaluate the HIV cascade and prevalence of syphilis and HBV in Zomba Central Prison, a high-security facility in the south of Malawi.
**Description:** Since 2014 Dignitas International and the Malawi Prison Health Services have been implementing a comprehensive package of care and treatment for HIV-TB and STI's. Prisoners are routinely screened for HIV, TB and STI at entry and when they are released. In addition, HIV, TB, syphilis and HBV screening campaigns are conducted every six months.
**Lessons learned:** During a June 2015 screening campaign 1052/1745 (60%) prisoners with unknown HIV status accepted to be tested for HIV, HBV and syphilis. 68/1052 (6.5%) tested HIV positive, resulting in an overall prison HIV prevalence of 35%. 52/1052 (4.9%) tested positive for syphilis and 59/1052 (5.7%) tested positive for HBV. 1.1% were co-infected with HIV/HBV. By October 2015, 482/539 (89%) HIV positive patients were on ART, 52% were initiated due WHO 3/4, 48% due to low CD4 (< 350 or < 500 cells/µL, depending on calendar episode). 98% were on the standardized 1st line ART regimen. All ART patients who were eligible for routine viral load (VL) monitoring according to National Guidelines received VL testing. 277/319 (86%) were virologically suppressed (< 1000 copies/ml). All patients with VL≥1,000 accessed enhanced adherence counseling.
**Conclusions/Next steps:** Malawian Prisoners attained acceptable HIV testing coverage, high ART uptake, and good adherence demonstrated by high virological suppression. Incarceration provides an opportunity to address HIV care in hard-to-reach individuals. Prison health care programs needs to carefully plan for the special needs of prisoners such as confidentiality and continuity of care within and outside prisons.

### THPDE0103

#### INSTITUTIONALIZING HEALTH EDUCATION IN PRISONS: THE ADOPTION OF PEER EDUCATION AS THE NATIONAL APPROACH FOR HIV PREVENTION AMONG INMATES IN MOZAMBIQUE

A. Zandamela[1], M.R. Mobaracaly[1], M. Benedetti[2], D. Solomon[3], V. Bernardo[1]
*[1]Pathfinder International, Maputo City, Mozambique, [2]Pathfinder International, Watertown, United States, [3]Pathfinder International, Consultant, Watertown, United States*
*Presenting author email: azandamela@pathfinder.org*

**Background:** Incarcerated populations in Mozambique are particularly vulnerable to HIV infection. A recent study found the HIV prevalence among male prisoners to be 24%, nearly three times higher than the general adult male population (9.2%). Transmission and acquisition of HIV is affected by many factors, with a large proportion of incarcerated men reporting consensual sex, commercial sex and coerced sex involving both inmates and staff. Overcrowding, poor sanitation, lack of medical assistance, malnutrition, and violence also increase prisoners' vulnerability to HIV exposure, making them a priority group for HIV prevention and care interventions. Despite this, health facilities are often scarce within the prison system.
**Description:** To respond to the health needs of the prison population, Pathfinder International, in partnership with Ministry of Justice (MOJ) and supported by CDC/PEPFAR, developed a multi-faceted HIV prevention program implemented in 10 prisons across Mozambique that incorporated behavioral, biomedical, and structural interventions. In order to generate demand and stimulate behavior change, a 48-hour training curriculum on sexual and reproductive health and rights was used to train 100 peer educators. These peer educators conducted one-on-one sessions with other inmates, and also led groups of 5 - 8 people in a series of five sessions that provided information regarding HIV, STIs, and TB. Additionally 26 senior prison staff were trained to facilitate linkages between prison and health facilities to improve access to health services.
**Lessons learned:** Between April and December 2015, 3,988 inmates took part in the peer education program, resulting in 2,265 referrals to health services and 991 people receiving HTC (HIV testing and counselling). 87 people (8.8%) were found to be HIV positive and 58 (66.7%) were enrolled into care and treatment. The use of a peer-led model allowed for the integration of health services into the existing prison model. This promotes both scalability and sustainability. In addition, although the project focused on HIV prevention and treatment, the training curriculum also provided information on STIs, TB, nutrition, hygiene and sanitation, allowing for adaption of this model to address a range health needs.
**Conclusions/Next steps:** Peer support mechanisms are an effective method of generating demand and reinforcing healthy behavior among incarcerated populations.

#### FEMALE PRISONERS IN ZAMBIA: RESOURCING AND RELATIONAL RISK FACTORS FOR HEALTH AND HEALTHCARE ACCESS

S.M. Topp[1,2], C.N. Moonga[2], C. Mudenda[2], C. Chileshe[3], G. Magwende[3], S.J. Heymann[4], G. Henostroza[5,6]
*[1]James Cook University, College of Public Health, Medical and Veterinary Sciences, Belgian Gardens, Australia, [2]Centre for Infectious Disease Research, Lusaka, Zambia, [3]Zambian Prison Service, Kabwe, Zambia, [4]University of California Los Ageles, School of Public Health, Los Angeles, United States, [5]University of Alabama at Birmingham, School of Medicine, Birmingham, United States, [6]Centre for Infectious Disease Research in Zambia, Lusaka, Zambia*
*Presenting author email: clement.moonga@cidrz.org*

**Background:** In sub-Saharan Africa, empirical research focussing on the experiences and issues of women prisoners is almost non-existent. Forming part of a larger programme to strengthen Zambian prison health systems this study examined factors driving health and access to healthcare among Zambia's female inmates.
**Methods:** A total of 44 interviews were conducted with a cluster random sample of 23 women
(50% HIV-positive) prisoners and 21 officers and healthcare workers. Four Zambian prisons were purposively selected based on geographic spread (one facility in each of four provinces), and a range of security levels (two medium-, one maximum- and one low-security District facility). Interviews were translated and transcribed and analysed using an inductive approach that drew on the principles of health systems analysis.

Thursday 21 July Poster Discussions
Friday 22 July
Late Breaker Posters
Author Index

**Results:** Poor environmental conditions - including massive overcrowding and lack of adequate sanitation - and poor quality or insufficient quantity of food affected all female prisoners' health. Access to health services was shaped by a combination of prison resourcing, administrative bias and inmate-officer relationships. For example, basic service availability was weak due to the absence of internal health services in any of the female prisons. However, in some sites, access was further limited when male prisoners (in adjacent holding facilities) were given priority access to already limited transport for travel to external health centres. A further compounding factor was the varied and *ad hoc* female officers' responsiveness to requests for healthcare access, with sympathetic responses often dependent on inmates' wealth or long-term relationship with the officer. Women prisoners with no visible physical symptoms of ill-health, as well as those looking after children, reported particular difficulties in persuading officers to commit resources to helping them access services.
**Conclusions:** This study highlights the compounding effect that resource deficits (e.g. weak infrastructure, lack of health services and poor nutrition) and organisational culture (e.g. female officers' lack of responsiveness to women's health needs and implicit prioritisation of male inmates' service access) are having on the health status and healthcare access of Zambian female prisoners. Findings suggest that vulnerabilities and inequities experienced by Zambian women in society are being exacerbated and deepened in prison.

### PROMOTING HUMAN RIGHTS AND ACCESS TO HEALTH SERVICES IN PRISONS IN SOUTHERN AFRICA: VSO, UNODC AND SDC WORKING TOGETHER TO REDUCE HIV AND IMPROVE THE HEALTH OF INCARCERATED POPULATIONS

C. Ingleby[1], M. Ayalew[2], T. Ponde[2]
*[1]Voluntary Service Overseas, Programme Development and Policy Team, London, United Kingdom, [2]Voluntary Service Overseas Rhaisa, Pretoria, South Africa*
*Presenting author email: clive.ingleby@vsoint.org*

**Background:** Across Southern Africa HIV infection rates in the regions overcrowded prisons are double that of the general population. Health service provision is poor and rates of disease such as TB, STIs and hepatitis are unacceptably high. Female prisoners, adolescent and juvenile males are at particular risk of sexual coercion and violence.
Governments are reluctant to invest money in prisoner health or rehabilitation despite the fact that up to 33% of prisoners are on remand and most prisoners are eventually released back into society.
**Description:** The project works across 7 countries (Malawi, Zimbabwe, Swaziland, Zambia, Mozambique, Lesotho and Tanzania) following a holistic programming approach including:
- Base line research to establish conditions in relation to prisoner health across the region
- Building capacity of civil society organisations by placing VSO volunteers with organisational development and social work skills to improve health services delivered in prison settings
- Regional advocacy by the VSO supported Southern African Network on Prisons and working with and training Southern African parliamentarians to lobby for implementation of regional minimum prison health standards
- Engaging with ex-offenders and raising their voice at national level Prisons Technical Working Groups.

**Lessons learned:** Evaluation conducted to date has highlighted the following:
- Working with prisoner populations requires time and commitment. A long process of sensitization was undertaken with ministries of justice, parliamentarians, donors and ex-offenders to build support.
- The importance of an evidence base. VSO conducted research and small scale prison projects over a number of years prior to this project.
- The joint approach of capacity building of civil society organizations and prison settings whilst undertaking high level advocacy is most effective
- Working regionally, across 7 countries, maximizes opportunities to share learning
- Long term funding support from SDC provides essential project stability.

**Conclusions/Next steps:**
- Use learning from the first 3 focus countries (Malawi, Swaziland and Zimbabwe) to expand project activity across the remaining four.
- Increase focus on youth and juvenile prisoners as the most vulnerable sub-group scaling up the provision of psycho-social support
- Promote prison health at global level in line with SDG commitments to leave no-one behind.

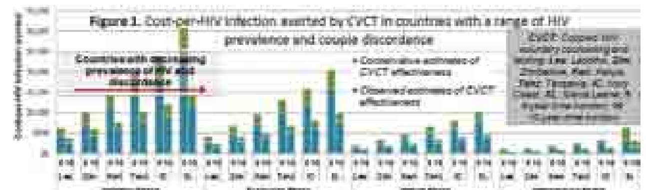
### MODELLING THE COST-PER-HIV INFECTION AVERTED BY COUPLES' VOLUNTARY HIV COUNSELLING AND TESTING IN SIX AFRICAN COUNTRIES

K. Wall[1], M. Inamba[2], W. Kilembe[3], E. Karita[4], B. Vwalika[3], J. Mulenga[3], R. Parker[5], T. Sharkey[3], A. Tichacek[5], E. Hunter[5], R. Yohnka[5], J. Abdallah[5], S. Allen[5]
*[1]Emory University, Epidemiology, Atlanta, United States, [2]Emory University Rwanda Zambia HIV Research Group, Ndola, Zambia, [3]Emory University Rwanda Zambia HIV Research Group, Lusaka, Zambia, [4]Emory University Rwanda Zambia HIV Research Group, Kigali, Rwanda, [5]Emory University Rwanda Zambia HIV Research Group, Atlanta, United States*
*Presenting author email: kristin.wall@gmail.com*

**Background:** Though couples' voluntary HIV counseling and testing (CVCT) has been shown to be effective in multiple countries and financially cost-effective in Zambia, it is not yet widely implemented, funded, or systematically measured in sub-Saharan Africa.
**Methods:** We recently demonstrated the cost effectiveness of CVCT in Zambia using the actual financial expenditures and observed HIV prevention impact of implementing CVCT in Lusaka, Copperbelt, and Southern Provinces among 172,981 couples. Here, we estimate the cost-per-HIV infection averted (CHIA) by CVCT in six sub-Saharan African countries with very different HIV epidemics. We used the prevention impact of CVCT observed in Zambia (63-84% reduction in HIV incidence) as well as conservative estimates of effect (50% reduction). Based on experience implementing CVCT in two countries, models assume a 4-phase CVCT implementation: in the initiation phase, we assume 10% of couples are tested at $75/couple; in the expansion phase an additional 10% of couples tested at $50/couple; in the mature phase an additional 60% of couples tested at $25/couple; and in the maintenance phase 20% of residual and new couples tested at $10/couple.
**Results:** CVCT CHIA ranged from extremes of $35 (in Lesotho, assuming 10-years of impact and observed estimates of CVCT effectiveness) to $3,076 (in Sierra Leone, assuming 5-years of impact and conservative estimates of CVCT effectiveness) (Figure 1). Our model is most sensitive to HIV prevalence and couple serodiscordance. CHIAs were lowest in areas with high prevalence of HIV and HIV discordance (as in Southern Africa) and highest in areas with lower prevalence of HIV and HIV discordance (as in Western Africa).



*[Figure 1]*

**Conclusions:** Estimates of CVCT CHIA were cost-effective under a range of real-world implementation scenarios. These findings provide further support for inclusion of CVCT as a required indicator and for funding priority setting.

## THPDE0202

### HIV PREVENTION COSTS AND ITS DETERMINANTS: EVIDENCE FROM THE ORPHEA PROJECT IN KENYA

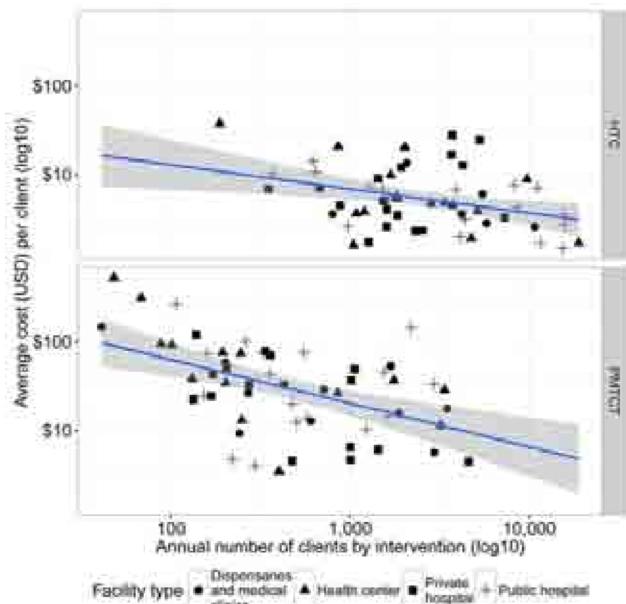
O. Galarraga[1], R.G. Wamai[2], S.G. Sosa-Rubi[3], M. Mugo[4], D. Contreras[3], S. Bautista-Arredondo[3], H. Nyakundi[5], J. Wang'ombe[5]
*[1]Brown University, Health Services, Policy & Practice, Providence, United States, [2]Northeastern University, Global Health Initiative, Boston, United States, [3]National Institute of Public Health (INSP), Cuernavaca, Morelos, Mexico, [4]University of Nairobi, School of Economics, Nairobi, Kenya, [5]University of Nairobi, School of Public Health, Nairobi, Kenya*
*Presenting author email: omar_galarraga@brown.edu*

**Background:** As part of the "Optimizing the Response of Prevention: HIV Efficiency in Africa" (ORPHEA) project, we analyzed determinants of economic efficiency for two HIV prevention interventions in Kenya: HIV testing & counselling (HTC), and prevention of mother-to-child transmission (PMTCT).
**Methods:** We collected retrospective data from key informants, administrative registers and time-motion observations for 2011-12 from 78 multi-stage sampled health facilities in 33 districts across Kenya. We stratified analyses by health facility type, ownership, size, and intervention type. We computed total costs of production using both quantities and unit prices for each input. We estimated average costs by

dividing total cost per intervention by number of clients accessing the intervention. We used forward-selection stepwise regression methods to identify and analyze significant determinants of log-transformed average costs (p< .05).
**Results:** For HTC, the cost per client tested was $7.4 and cost per client tested and positive was $146. For PMTCT, cost per client tested was $57.4, and cost per client tested and positive was $677 (**Table**). We found evidence of economies of scale for the two interventions: doubling the number of clients per year was associated with average cost reductions of 25% for HTC, and 48% for PMTCT (**Figure**). Task shifting was associated with reduced costs for PMTCT (59-63%), but not for HTC. On the other hand, costs in facilities that target testing (for persons most at risk or for those with symptoms) tend to have higher costs for HTC (63-75%) but not for PMTCT.
**Conclusions:** Aside from increasing production scale, HIV prevention costs may be further contained by using task shifting for PMTCT; targeted testing for HTC may require more resources.

| | | N (facilities) | Mean | Patient-volume weighted mean | Median | Standard deviation | IQR |
|---|---|---|---|---|---|---|---|
| HTC: | Cost per client tested | 56 | 7.4 | 6.5 | 4.8 | 7.1 | 5.9 |
| | Cost per client tested and positive | 56 | 145.9 | 80.2 | 54.9 | 318.0 | 74.7 |
| PMTCT: | Cost per client tested | 57 | 57.4 | 47.3 | 32.7 | 84.8 | 60.5 |
| | Cost per client tested and positive | 49 | 677.2 | 753.9 | 254.2 | 1,056.8 | 571.6 |
| | Cost per client on ART | 14 | 2,472.6 | 1,752.6 | 364.6 | 5,464.7 | 1,689.9 |

*[Average cost (US$) per client across HIV prevention service cascade in Kenyan health facilities, 2011-12]*



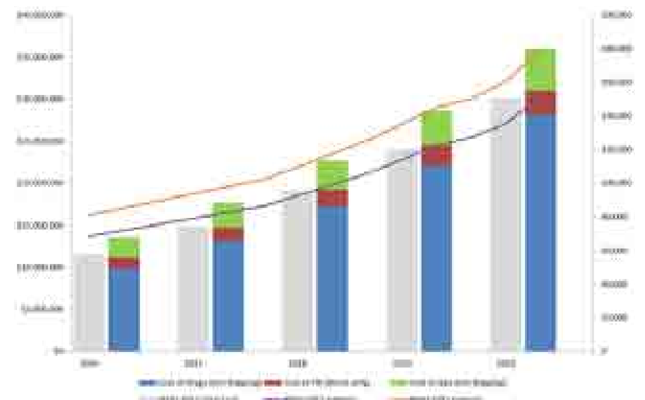
*[Economies of scale in HIV prevention services: Kenyan health facilities, 2011-12]*

## THPDE0203

### ANSWERING THE FINANCIAL QUESTION WITH COUNTRY PROGRAMS: WHAT IS THE COST AND IMPACT OF ADOPTING THE 2015 WHO PAEDIATRIC HIV TREATMENT GUIDELINES?

A. Wilhelm[1], C. Amole[2], C. Middlecote[1], J. Harwell[3], E. Mccarthy[4]
*[1]Clinton Health Access Initiative, HIV Access Team, London, United Kingdom, [2]Clinton Health Access Initiative, HIV Access Team, Boston, United States, [3]Clinton Health Access Initiative, Clinical Support Team, Boston, United States, [4]Clinton Health Access Initiative, Applied Analytics Team, Lusaka, Zambia*
*Presenting author email: awilhelm@clintonhealthaccess.org*

**Background:** The 2015 revisions to the WHO pediatric HIV treatment guidelines align with the UNAIDS 90-90-90 strategy by recommending countries treat all HIV+ patients < 15 years. In moving from the 2013 guidelines, which recommended treating all < 5 years and treating those >5 years if CD4< 500, Governments want to understand the costs in adopting both this treat-all strategy and latest optimized IATT products, such as heat-stable LPV/r oral pellets to replace cold-chain LPV/r syrup to improve treatment outcomes for new initiates < 3 years.
**Methods:** We conducted a macro-level, government-perspective, 5-year (2016-2020) cost analysis of a hypothetical country (defined as 150,000 HIV+ children < 15 years). We included the following variable costs: antiretroviral (ARV) drugs, CD4 tests, viral load tests, early infant diagnosis tests, and health worker salaries, with fixed and programmatic costs excluded. Three scenarios - comparing WHO 2013 vs. 2015 eligibility guidelines, and also a LPV/r pellet and ABC/3TC 120/60mg regimen choice for ART initiates - were then analyzed and compared in an Excel-based mathematical model.
**Results:** A per-patient-per-year costing using WHO 2013 vs. 2015 guidelines yielded estimated ARV costs of US$119 vs. $US122 in 2016, increasing to US$152 vs. $US156 in 2020 to reach the "90% coverage by 2020" UNAIDS target. Total ARV+Lab+HR program costs for 2013 vs. 2015 guidelines were estimated at US$11.5M vs. US$13.6M in 2016, with an annual average of US$22M vs. US$26M through 2020. Notably, adopting LPV/r oral pellets only added $US4M to total 5-year costs for 2015 guideline adoption.



*[Comparing Annual Pediatric Costs and Patient Volumes: WHO 2013 vs 2015 Guidelines]*

**Conclusions:** This evidence indicates a 23% increase in overall costs to adopt a treat-all pediatric strategy featuring LPV/r pellets. This should encourage countries to develop a budgetary roadmap to expand HIV treatment to all infected children. The model and process can be applied in new contexts for informed HIV treatment scale-up policy and implementation decisions.

## THPDE0204

### AVERAGE COSTS OF VOLUNTARY MEDICAL MALE CIRCUMCISION AND THEIR DETERMINANTS IN KENYA, RWANDA, SOUTH AFRICA AND ZAMBIA

S.G. Sosa-Rubí[1], S. Bautista-Arredondo[1], M. Opuni[2], D. Contreras-Loya[1], G. La Hera-Fuentes[1], A. Salas-Ortiz[1], A. Kwan[3], J. Condo[4], K. Dzekedzeke[5], O. Galárraga[6], N. Martinson[7], F. Masiye[8], S. Nsanzimana[9], R. Wamai[10], J. Wang'ombe[11]
*[1]Instituto Nacional de Salud Pública, Health Economics, Cuernavaca, Mexico, [2]UNAIDS, Geneva, Switzerland, [3]World Bank, San Francisco, United States, [4]National University of Rwanda, School of Public Health, Kigali, Rwanda, [5]Dzekedzeke Research & Consultancy, Lusaka, Zambia, [6]Brown University, Providence, United States, [7]University of the Witwatersrand, Perinatal HIV Research Unit, Johannesburg, South Africa, [8]University of Zambia, Division of Economics, Lusaka, Zambia, [9]Rwanda Biomedical Center, Kigali, Rwanda, [10]Northeastern University, Boston, United States, [11]University of Nairobi, School of Public Health, Nairobi, Kenya*
*Presenting author email: sbautista@insp.mx*

**Background:** Voluntary medical male circumcision (VMMC) is recommended by WHO as a key component of HIV prevention. VMMC programs have substantially contributed to avert new infections, but while coverage scales up, critical challenges arise such as technology adoption and availability of resources hindering the achievement of their goals. The objective of this study was to estimate average costs and to analyze the determinants of efficiency of VMMC in Kenya, Rwanda, South Africa and Zambia for 2013, as part of the ORPHEA project.
**Methods:** ORPHEA is a cross-sectional observational study with data collected in Kenya, Rwanda, South Africa, and Zambia between 2011 and 2013. The analytical sample comprise of 82 facilities: 25 facilities in Kenya, 20 facilities in Rwanda, 23 facilities in South Africa, and 14 facilities in Zambia. Micro-costing methods were applied to determine relevant costs (personnel, supplies, utilities, equipment and property) and output data. Information on self-reported time allocation was used to estimate staff costs and national prices of surgical kits and HIV tests were used in the calculations.
**Results:** Average cost per VMMC was US$ 29 in Rwanda, US$ 51 in Zambia, US$ 32 in Kenya, and US$ 106 in South Africa. Considerable variation in the average cost within countries was found; staff costs dominated in South Africa and Zambia

Author Index

(55 and 59% respectively), and circumcision kits costs in Kenya and Rwanda (46%). In all countries, except for Rwanda, we found that unit cost per VMMC decreased with the number of MC clients: from 31 to 48% of average reduction by doubling the number of clients. In general, there were also variations by type of facility, with lower average cost per MC clients found in health centers (both public and private) as compared to hospitals.
**Conclusions:** There were important differences in the average cost per VMMC across facilities in the four countries studied that provide opportunities for increase the levels of efficiency in the provision of VMMC. Additionally, it is important to expand the volume of VMMC services by means of sustained demand generation, while acceptable levels of quality are maintained.

## THPDE0205

### SPENDING MORE TO SPEND LESS: THE UNIT COSTS OF A TAILORED DEMAND CREATION INTERVENTION TO INCREASE UPTAKE OF VOLUNTARY MEDICAL MALE CIRCUMCISION

S. Torres-Rueda[1], H.A. Weiss[1], M. Wambura[2], H. Mahler[3], J. Chilongani[2], E. Kuringe[2], R. Hayes[1], M. Plotkin[3], M. Makokha[3], A. Hellar[3], C. Schutte[4], G. Mshana[2], N. Larke[1], G. Lija[5], J. Changalucha[2], J.M. Grund[6], F. Terris-Presthol[1]
*[1]London School of Hygiene & Tropical Medicine, London, United Kingdom, [2]National Institute for Medical Research (NIMR), Mwanza, Tanzania, United Republic of, [3]Jhpiego Tanzania, Dar es Salaam, Tanzania, United Republic of, [4]Strategic Development Consultants, Durban, South Africa, [5]Ministry of Health and Social Welfare, National AIDS Control Program, Dar es Salaam, Tanzania, United Republic of, [6]Centers for Disease Control and Prevention, Division of Global HIV/AIDS, Atlanta, United States*
*Presenting author email: sergio.torresrueda@lshtm.ac.uk*

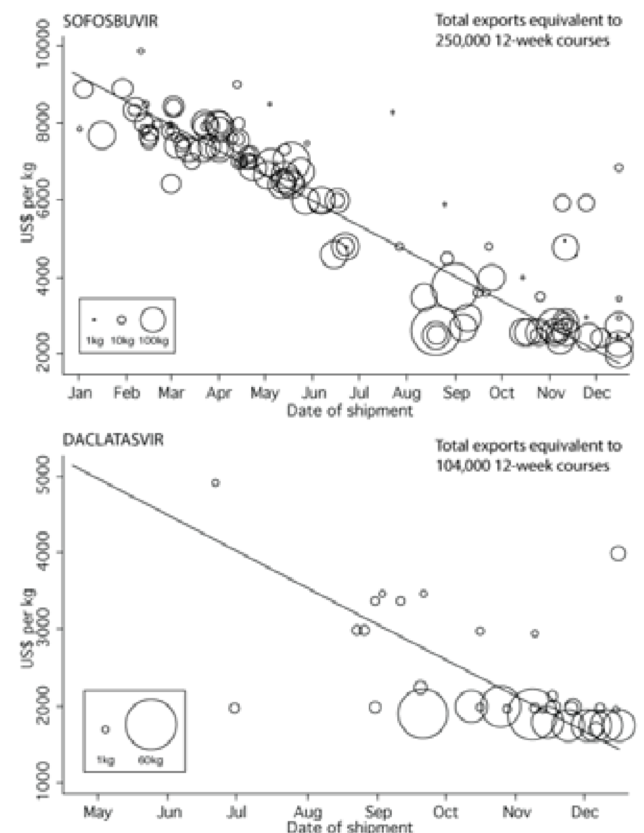
**Background:** HIV prevalence is higher for men aged 20-34 years than for younger males (aged 15-19 years) in Tanzania. Voluntary medical male circumcision (VMMC) is a proven HIV prevention intervention, but uptake in Tanzania is highest among younger males. A cluster randomised controlled trial was conducted to assess the effectiveness of a locally-adapted demand creation intervention in increasing uptake of VMMC among men aged 20-34 years in Tabora and Njombe regions of Tanzania. The intervention evaluated included: demand-creation messages; use of peer promoters; separate waiting areas for older clients; and information sessions for female partners. This study presents the total, incremental and unit costs of this VMMC intervention.
**Methods:** Cost data were collected from a provider's perspective on surgical, demand-creation and supervisory activities in all clusters across both trial arms. Costs per circumcision were calculated taking into account staff, supplies, start-up and capital costs. Univariate sensitivity analyses were conducted to understand drivers of unit costs.
**Results:** The total mean costs per cluster were higher in the intervention arms ($48,820 and $46,222, in Tabora and Njombe, respectively) than the control arms ($36,088 and $37,344). Cluster-level client load varied widely across clusters and was higher in the intervention arms (480 to 1187 in Tabora, and 218 to 500 in Njombe) than in the control arms (272 to 951, and 102 to 268, respectively). Demand increased more than proportionately, resulting in lower unit costs: the costs per male circumcised in the intervention arms were $62 ($42-$99) in Tabora and $139 ($93-$195) in Njombe, while in the control arms they were $72 ($39-$123) and $202 ($132-$313), respectively. The sensitivity analysis showed that client volume was a greater determinant of unit costs than input prices or other variables.
**Conclusions:** The higher unit cost of VMMC in Njombe compared to Tabora may be due to greater VMMC saturation: the number of clients in Tabora was 2.5 times higher than in Njombe. Despite added costs of delivering the intervention, mean unit costs per circumcision were lower. Developing a tailored demand creation package for older VMMC clients is likely an effective approach to increase uptake and ultimately reduce unit costs.

## THPDE0206

### RAPIDLY FALLING COSTS FOR NEW HEPATITIS C DIRECT-ACTING ANTIVIRALS (DAAS): POTENTIAL FOR UNIVERSAL ACCESS

D. Gotham[1], M. Barber[2], J. Fortunak[3], A. Pozniak[4], A. Hill[4]
*[1]Imperial College London, Faculty of Medicine, London, United Kingdom, [2]Cambridge University, Centre of Development Studies, Cambridge, United Kingdom, [3]Howard University, Chemistry and Pharmaceutical Sciences, Washington, United States, [4]Chelsea and Westminster Hospital, St Stephens AIDS Trust, London, United Kingdom*
*Presenting author email: dg1911@ic.ac.uk*

**Background:** Novel direct-acting antivirals (DAAs) achieve high sustained viral response rates of >90% in chronic hepatitis C (HCV). But access to DAAs is low: 'access' prices are available in countries covering only 50% of the worldwide epidemic. Production costs depend largely on prices of active pharmaceutical ingredient (API).
**Methods:** Data on the per-kilogram prices of exported API, and export volumes, were extracted from an online database (www.infodriveindia.com) for Jan-Dec 2015. Mean end-2015 API costs were calculated using linear regression models weighted by shipment size (figures). For velpatasvir, API cost was calculated by analysing chemical synthesis, costs of raw materials, processes, and yields. Per-pill API costs were calculated based on daily dosage. Estimated costs for formulation and excipients ($0.04/ pill), packaging ($0.35/month), and a profit margin (50%) were added.
**Results:** Total exports from India in 2015 were, sofosbuvir: 8.4 tons, (equivalent to 250,000 12-week treatment courses), daclatasvir: 523 kg (104,000 courses), ledipasvir: 56 kg (7300 courses). API prices decreased throughout 2015 (Figure). End-2015 API prices were sofosbuvir $1758/kg, daclatasvir $1432/kg, ledipasvir $11,432/kg. API cost for velpatasvir was estimated at $8900-11,700/kg. US price was 884 times higher than the target price for sofosbuvir, 3706 times for daclatasvir and 409 times higher for sofosbuvir+ledipasvir.
**Conclusions:** HCV DAAs production costs are falling rapidly. We estimate that 12-week treatments of sofosbuvir can be manufactured for $95, sofosbuvir+ledipasvir $231, daclatasvir $17, velpatasvir $119-154, all including a 50% profit margin. These low production prices show the potential for Universal Access programmes for HCV, similar to those already established for HIV/AIDS.



*[Decreasing prices of exported sofosbuvir/daclatasvir through 2015. 1 bubble = 1 shipment, bubble area scaled to size of shipment in kg]*

| Drug | End-2015 API cost/kg | Target price per 12-week treatment | Current global lowest price per 12-week treatment | Current US price per 12-week treatment |
|---|---|---|---|---|
| Sofosbuvir (SOF) | $1,758 | $95 | $483 | $84,000 |
| Daclatasvir | $1,432 | $17 | $183 | $63,000 |
| Ledipasvir (LDV) | $11,432 | $136 | unknown | unknown |
| SOF+LDV | N/A | $231 | $615 | $94,500 |
| Velpatasvir | $8,900-11,700 | $119-154 | unknown | unknown |

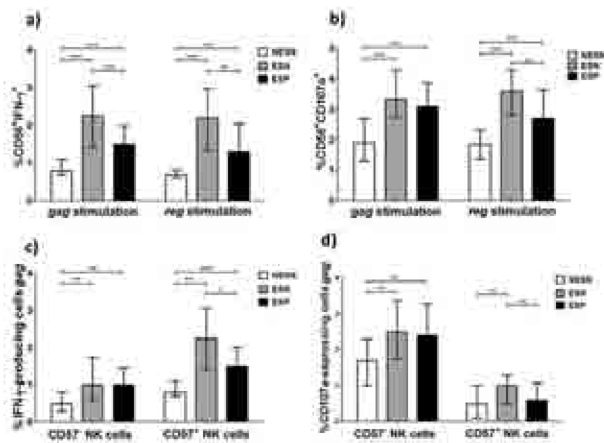
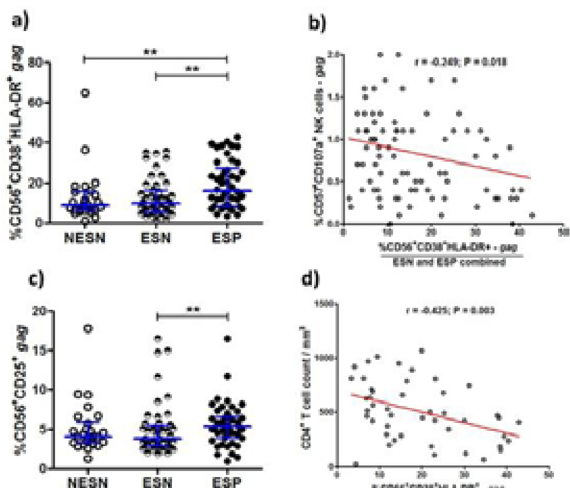
### EX-VIVO STIMULATION WITH HIV-1-SPECIFIC ANTIGENS SUPPORTS THE EXISTENCE OF NK-CELL MEMORY-LIKE RESPONSE

M. Mbow[1,2,3], S. Jallow[3], M. Thiam[1], M. Seydi[4], C.T. Ndour[4], S. Mboup[1], E.M. Riley[5], M.R. Goodier[6], A. Jaye[1,3]
[1]*Laboratory of Bacteriology and Virology of Aristide le Dantec University Hospital, Dakar, Senegal, [2]Cheikh Anta Diop University, Immunology, Dakar, Senegal, [3]Medical Research Council, Immunology, Fajara, Gambia, [4]Fann University Hospital, Infectious Diseases, Dakar, Senegal, [5]London School of Hygiene and Tropical Medicine, Immunology, London, United States, [6]London School of Hygiene and Tropical Medicine, Immunology, London, United Kingdom*
*Presenting author email: moustaphazero@yahoo.fr*

**Background:** The protective immune correlates of HIV infection are yet to be fully elucidated to inform anti-HIV vaccine design. The existence and importance of anti-HIV Natural Killer cell (NK) memory response have been identified in mice and recently in SIV infected macaques.
**Methods:** We selected 49 HIV-1 infected seropositive (ESP) individuals, 48 of their exposed seronegative (ESN) partners, and 28 non-exposed seronegative (NESN) individuals as negative responder control. PBMCs were stimulated for 18h with whole HIV-1 clade A peptide pools of Reg (Tat, Rev, Vif, Vpu, and Vpr) and Gag. Flow cytometry analyses were carried out to assess the characteristics of NK cell effector functions including CD107a and IFN-γ as well as activation status. Differences between groups were assessed using the nonparametric Krushal-Wallis H and Mann-Whitney U tests and correlations performed using the Spearman Rho test.



*[Differential HIV-1-antigen-specific NK recall responses in HIV-1 infected (ESP) and HIV exposed uninfected (ESN) sero-discordant couples]*



*[HIV-1-specific CD56+ and CD56+D57+ NK functional response is associated with low immune activation]*

**Results:** We observed significantly higher proportion of individuals in the ESN had higher NK cell frequencies for functional expression of CD107a and IFN-g which resided predominantly within the more differentiated CD56$^{+}$CD57$^{+}$ NK cell subset. This response was inversely correlated with levels of immune activation markers in both ESN and ESP and positively correlated with the CD4 T cell count in ESP.
**Conclusions:** These data suggest that anti-HIV-1 specific NK recall functional response can be induced in an HIV infected host status in which immune activation is controlled.

**Background:** Innate Lymphoid Cells (ILCs) play a central role in the response to infection by secreting cytokines critical for immune-regulation, tissue homeostasis and repair, whereas cytotoxic ILCs (NK cells) have important antiviral functions. Although dysregulation of these systems is central to pathology and antiviral function, the dual impact of HIV-1 on ILCs and NK cells remains unknown.
**Methods:** We used flow cytometry to track levels of innate lymphocytes in 4 chronic infected cohorts from Durban, South Africa. RNA-sequencing of cell sorted innate immune populations during early acute HIV-1 infection was used to study the underlying transcriptional changes in helper and cytotoxic ILCs.
**Results:** We show that human blood ILCs are severely depleted in a large cohort of viremic HIV-1 infected subjects with correlations to disease stage. Moreover, in a unique cohort of early acutely HIV infected subjects enrolled from Durban, South Africa we show that ILC depletion occurs prior to peak viremia and does not reconstitute following resolution of peak-viremia or antiretroviral therapy (ART) begun in chronic disease. However, ILC levels are preserved by very early ART treatment, started 1 day after HIV nucleic acid detection in acute infection. In contrast, we find that NK cells (cytotoxic ILCs) expand during the very early phase of acute HIV infection and subsequently return to baseline levels following resolution of peak viraemia. This expansion is blunted by very early ART treatment. Transcriptional profiling of ILCs from untreated patients during acute infection reveals significant upregulation of genes associated with apoptosis and cell-death that is curbed by early ART. Cytotoxic ILCs (CD56$^{+}$CD16$^{+}$) sorted longitudinal from acute infection however show a distinct transcriptional profiles that provides mechanistic insight into the expansion induced by acute viremia.
**Conclusions:** Taken together, these data show for the first time a striking distinct response pattern of circulating helper and cytotoxic innate lymphocytes that underline their respective distinct roles during acute HIV-1 infection.

### THE IMPACT OF KIR:HLA LIGAND GENOTYPES IN ACQUISITION OR RESISTANCE TO HIV-1 CLADE C INFECTION IN SUB-SAHARAN AFRICA

S. Zulu[1,2], S. Loubser[3], S. Reddy[4], T. Reddy[5], G. Ramjee[4], A. Coutsoudis[1], C. Tiemessen[6], P. Kiepiela[7]
[1]*University of KwaZulu Natal, Department of Paediatrics and Child Health, Durban, South Africa, [2]University of KwaZulu Natal, Durban, South Africa, [3]National Institute of Communicable Diseases and Faculty of Health Sciences, University of the Witswatersrand, Johannesburg, South Africa, [4]Medical Research Council, HIV Prevention Research Unit, Durban, South Africa, [5]Medical Research Council, Biostatistics Unit, Durban, South Africa, [6]National Institute of Communicable Diseases and Faculty of Health Sciences University of the Witswatersrand, HIV Vaccine Research, Johannesburg, South Africa, [7]Medical Research Council, Wits Health Consortium, Durban, South Africa*

**Background:** Immunogenetic studies have suggested a role for KIR:HLA ligand interactions in protection and control of HIV-1 infection. The aim of this study was to determine the possession of select KIR and HLA ligands alone or in combination, associated with host susceptibility/resistance to HIV-1 infection in South African women.
**Methods:** KIR:HLA class I ligand genotypes were determined in 222 HIV-1 infected and 498 HIV-1 exposed seronegative (HESN) women participating in two microbicide clinical trials (MIRA 2002-2005 and Carraguard, 2004-2007). Genomic DNA ex-

tracted from stored dried blood spots was genotyped for select KIRs (2DL2; 2DL3; 2DL5; 2DS1; 2DS2; 2DS3; 2DS5 and 3DS1) and HLA ligands (HLA-A/B Bw4-80I/TA/TL and HLA-C C1/C2) using "in house" real time PCR assays. Fisher exact tests and odds ratios were calculated to assess the association between genotype and HIV status. We applied Bonferroni correction to adjust for multiple comparisons. Cox proportions hazards regression was used to determine the effect of genotypes on time to seroconversion.
**Results:** C1C1 alone or in combination with 2DS2, 2DL3 as well as possessing at least one C1 ligand in combination with 2DL2, 2DL3 or 2DL2/2DL3 was significantly associated with slower time to seroconversion (Table 1). C2 C2 alone or in combination with 2DL32DL3, was significantly associated with more rapid HIV acquisition.

| | Percent representation | | Time to HIV seroconversion | | |
|---|---|---|---|---|---|
| Protective | HIV Exposed seronegative | Sero-converters | p-value | HR (95% CI) | p-value |
| C1C1 | 51% | 26% | <0.001* | 0.38 (0.28 - 0.52) | <0.001* |
| 2DL3/C1 | 57% | 42% | <0.001* | 0.60 (0.45 - 0.78) | <0.001* |
| 2DL2/C1C1 | 32% | 18% | <0.001* | 0.48 (0.34 - 0.69) | <0.001* |
| 2DL3/C1C1 | 39% | 20% | <0.001* | 0.41 (0.29 - 0.58) | <0.001* |
| 2DS2/C1C1 | 26% | 15% | <0.001* | 0.50 (0.34-0.74) | 0.001* |
| 2DL22DL3/C1C1 | 24% | 12% | <0.001* | 0.45 (0.30-0.69) | <0.001* |
| Acquisition C2C2 | 15% | 24% | 0.003* | 1.60 (1.17 - 2.19) | 0.003* |
| 2DL32DL3/C2C2 | 5% | 11% | 0.001* | 1.98 (1.31 - 3.01) | 0.001* |

*[Table 1:The frequency and effect of KIR: HLA ligand genotypes on HIV status and time to seroconversion]*

**Conclusions:** A potential protective role of C1 ligands alone or in combination with 2DL2, 2DL3 and 2DS2 was identified in HIV-1 acquisition and longer time to seroconversion. There was a higher risk of acquisition and shorter time to seroconversion in individuals who possessed C2 ligands only or in combination with 2DL3.

### TLR3 AGONISTS SUPPORT THE GENERATION OF A HIGHLY-FUNCTIONAL CDC SUBSET THAT IS PREFERENTIALLY OBSERVED IN CDC FROM HIV ELITE CONTROLLERS AFTER HIV-1 EXPOSURE

E. Martin-Gayo[1], M. Cole[2], K.E. Kolb[1,3,4], Z. Ouyang[1], J. Cronin[1], S.W. Kazer[1,3,4], B.D. Walker[1,5], M. Lichterfeld[1], N. Yosef[1,2], A.K. Shalek[1,3,4], X.G. Yu[1]
*[1]Ragon Institute of MGH, MIT and Harvard, Cambridge, United States, [2]Electrical Engineering & Computer School, UC Berkeley, Berkeley, United States, [3]MIT Institute for Medical Engineering & Science (IMES) and Department of Chemistry, Cambridge, United States, [4]Broad Institute of MIT and Harvard, Cambridge, United States, [5]Howard Hughes Medical Institute, Chevy Chase, United States*
*Presenting author email: xyu@mgh.harvard.edu*

**Background:** Conventional dendritic cells (cDCs) from HIV-1 Elite Controllers (ECs) may contribute to the generation of highly efficient T cell-mediated antiviral immune responses through induction of potent type I IFN responses with improved antigen-presenting properties upon exposure to HIV-1. Mechanisms to support the expansion of EC-like DC phenotype in a broader patient population may provide novel opportunities for improving immune-based approaches for HIV treatment and prevention.
**Methods:** Expression changes of a panel of costimulatory molecules and maturation markers on DCs from different study cohorts were evaluated at 24 hours post-exposure to HIV-1. Allogeneic mixed leukocyte reaction (MLR) assays were used to assess the functional properties of identified DC subsets. TLR ligands were tested for their ability to induced desired DC subsets in DCs from HIV-1 negative donors in the presence of HIV-1 viruses or Gag ssDNA
**Results:** In response to HIV-1 exposure, cDC from EC developed a distinct CD64hi/PDL1hi phenotype (p=0.007), in contrast to cDCs from chronic progressors or healthy individuals. Importantly, this cDC subset demonstrated superior antigen-presenting properties in MLR assays compared to autologous CD64int/lo PDL1 int/lo cDC subsets. In ex-vivo culture assays, synthetic TLR3 agonists were able to induce this highly functional cDC subset in cDCs from HIV-1 negative individuals in response to both HIV viral exposure and Gag ssDNA. The inhibitor of TBK1, a downstream molecule of both TLR3 activation and cGAS-mediated DNA sensing pathways, abrogated the generation of this cDC subset in cDCs from EC after exposure to HIV-1
**Conclusions:** This study identified a previously unrecognized subpopulation of cDCs with improved antigen-presenting properties in HIV-1 ECs. Generation of this cDC subset in HIV-1 negative donors can be significantly facilitated by using TLR3 agonists as adjuvant, suggesting that an EC-like functional profile of cDC can be induced through manipulation of TLR3 signaling pathways.

### PREVALENCE AND IMMUNO-METABOLIC ASSOCIATIONS OF FRAILTY IN OLDER AUSTRALIAN MEN LIVING WITH HIV: A CROSS-SECTIONAL ANALYSIS

H.L. Yeoh[1], A. Cheng[1,2], J. Hoy[1,2], C. Palmer[2,3], S. Crowe[1,2,3]
*[1]Monash University, Melbourne, Australia, [2]The Alfred Hospital, Melbourne, Australia, [3]Burnet Institute, Melbourne, Australia*
*Presenting author email: hyeo6@student.monash.edu*

**Background:** Frailty, a manifestation of physical and psycho-social vulnerability, is a condition of increasing concern as the HIV population ages. The definition of frailty is contentious and the pathophysiology is unknown. This study compared two commonly used frailty instruments, and identified biomarkers associated with frailty, in older Australian HIV+ men.
**Methods:** HIV+ men aged over 50-years, on ART for >6 months were enrolled between March and August 2015 in a Melbourne HIV referral centre. Frailty was assessed using the Frailty Phenotype (FP), and the Frailty Index (FI). Markers of immune activation (%CD38$^+$DR$^+$ T-cell subsets), metabolic dysregulation (Glut1$^+$ mean fluorescence intensity (MFI) of T-cells) and mitochondrial dysfunction (DiOC$_6$(3)$^+$ MFI of monocytes) were measured by flow cytometry, and the inflammatory marker, sCD163, was measured by ELISA. Differences in co-variates between frail and non-frail groups using FP were tested using Kruskal-Wallis tests, and correlations with the FI using Spearman's rho. Linear and logistic regression models were constructed.
**Results:** 84 HIV+ men completed both clinical and laboratory aspects of the study: median age 59 years; 95% Caucasian, 93% had undetectable viral load. Using the FP, 10% (n=8) were categorized as frail, 52% (n=44) pre-frail and 38% (n=32) robust. The median FI score was 0.13, (0.25 was the cut-off between frail and non-frail), with 23% (n=19) categorised as frail on the FI. HIV+ pre-frail and frail men (using the FP) had higher levels of inflammation than robust men (mean plasma sCD163 3.07 vs. 2.35 ng/ml, respectively, *p*=0.015), remaining significant on multivariable analysis. The FI correlated with markers of inflammation, metabolic dysregulation and mitochondrial dysfunction (plasma sCD163 (ρ=0.263, *p*=0.036), Glut-1 MFI and DiOC$_6$(3) MFI on non-classical monocytes (ρ=0.246, *p*=0.049; ρ=-0.248, *p*=0.048 respectively) with Glut-1 and DiOC$_6$(3) remaining significant in multivariable analysis. Neither the FP nor the FI were associated with T-cell immune activation.
**Conclusions:** Frailty in older HIV+ men on ART using both tools was correlated with inflammatory marker, sCD163. The Frailty Index was also associated with markers of metabolic dysregulation and mitochondrial dysfunction in the inflammatory non-classical monocytes. Our findings do not support an association between frailty and T-cell immune activation.

*Presenting author email: shepison@yahoo.com*

**Background:** Neutrophils are an important component of the innate immune response and are one of the first cells recruited to the site of infection or inflammation. They elicit an immune response through phagocytosis, secretion of antimicrobial molecules, cytokines and neutrophil extracellular traps. Alterations in neutrophil function that occur during HIV infection might be associated with increased susceptibility to opportunistic infections such as tuberculosis. Neutrophils are the first cells recruited to the lungs after *M. tuberculosis* infection and are the most abundant and heavily infected cells at the site of disease.
The primary aim of this study is to investigate modulation of the neutrophil gene expression and proteomic profile during the course of acute HIV infection, in order to establish whether this contributes to the increased susceptibility of HIV infected individuals to opportunistic infections.

**Methods:** Neutrophils were isolated from blood of individuals a few days after HIV infection and followed up to chronic stage of infection. In order to identify the mechanisms of neutrophil dysfunction during HIV infection we employed RNA sequencing (RNAseq) and Liquid chromatography-mass spectrometry/mass spectrometry (LC-MS/MS) for the molecular analysis of neutrophils gene expression and proteomic profiles respectively. Understanding the earliest immunologic events during acute HIV infection is critical to inform understanding of the pathogenesis of HIV and treatment efforts.
**Results:** A number of genes and proteins where differentially expressed between the neutrophils of acute HIV patients and controls at different time points. Using ingenuity pathway analysis, the modulated genes and proteins represented the canonical pathways of cellular detoxification, oxidative stress, inflammation and immune responses.
**Conclusions:** Elucidating the neutrophil gene and protein expression changes that are driven by acute HIV infection provide a better understanding of the impact of acute viremia on the function of this vital immune subset. This may uncover novel mechanistic links between acute HIV infection and increased susceptibility to pulmonary infections such as tuberculosis.

*Presenting author email: sasha.moola@gmail.com*

**Background:** Understanding the evolution of broadly neutralizing antibodies against HIV during natural infection is fundamental to the design of a vaccine that elicits broadly neutralizing antibodies. Here, we focus on the evolution of a lineage of broadly neutralizing antibodies targeting the apex of HIV Env, using monoclonal antibodies and deep sequencing derived variants from over the course of 3 years of natural infection.
**Methods:** 36 phylogenetically related monoclonal antibodies targeting the V2/apex of HIV Env were isolated from IAVI Protocol C Donor PC64 at 4 time points, showing an increase in neutralization breadth over time. Further, deep sequencing of donor peripheral blood mononuclear cells and filtering of the resulting sequences based on similarity to the isolated monoclonal antibodies led to the identification of further heavy chain variants from this lineage. In particular, a variant with 99.6% identity to a human germline V-gene was identified. It was paired with a germline-reverted light chain for further characterization as an unmutated common ancestor (UCA) of the antibodies. Select antibodies were expressed as fragment antigen-binding (Fab) fragments and subjected to extensive crystallization screening (384 conditions) to obtain crystal structures.
**Results:** Structures of the UCA and of PC64_26, one of the broadest and most somatically mutated antibodies in the lineage, were determined. Thus, in addition to comparing these structures to those of previously determined broadly neutralizing antibodies targeting the same region, we were also able to compare the UCA and its mature counterpart and map the evolutionary changes to gain a greater understanding of the evolution of the lineage over time - in particular, to map the changes that correspond to the development of heterologous breadth.
**Conclusions:** Our findings constitute important first steps towards a comprehensive structural understanding of the evolution of antibody breadth in Donor PC64. Further studies will be focused on the intermediate members of the lineage and on obtaining sequence and structural information regarding the antibody-Env interactions that drove the development of these broadly neutralizing antibodies.

### THPEA008

### Identification of HIV-1 MPR-directed broadly neutralizing antibodies from the acute-infection cohort RV217 subject 40512

*[1]National Institutes of Health, VRC/NIAID, Bethesda, United States, [2]U.S. Military HIV Research Program, Silver Spring, United States, [3]Henry M. Jackson Foundation, Bethesda, United States, [4]Duke University, Durham, United States, [5]Vanderbilt University, Nashville, United States*
*Presenting author email: nicole.doriarose@nih.gov*

**Background:** Insight into the natural development of broad and potent HIV-1 neutralizing antibodies (bNAbs) provides critical clues for vaccine design. Several known bNAbs that target the Env membrane-proximal region (MPR) are broadly cross-reactive, neutralizing over 90% of global strains, making the MPR an attractive target for vaccine design. However, the developmental pathways of these bNAbs are unknown.
**Methods:** Individuals within the RV217 acute-infection cohort were longitudinally assessed for neutralizing antibodies starting at 30 days post-infection. The serum neutralizing activity was mapped by peptide competition, activity against chimeric viruses, and neutralization fingerprinting. MPR peptide tetramers were used to sort antigen-specific B cells, and IgG genes were recovered and expressed from single cells. Neutralization was assessed using single-round-of infection Env-pseudoviruses on TZMbl cells. Binding and neutralization patterns of the isolated antibodies were compared to the known MPR-directed antibodies 4E10, 10E8, and 2F5.
**Results:** We identified a donor, RV217-40512, who developed bNAbs after 21 months. This donor had been superinfected between months 5 and 13. Serum neutralizing activity was mapped to the MPR. We isolated and expressed IgG genes from month 21, and identified three lineages of MPR-directed bNAbs. (1) RV217-VRC42.01 is genetically similar to 4E10. It neutralized 93% of a 200-virus cross-clade panel, with a signature that correlates strongly with 4E10 and 10E8. Lineage members bound to autologous virus gp140 proteins as well as MPR peptides, and mapped to an epitope similar to 4E10 and 10E8 at the MPR C-terminus. (2) RV217-VRC43.01 is genetically unrelated to other known MPR bNAbs. It neutralized 63% of a 200-virus cross-clade panel. Neutralization mapping suggests an epitope in the central portion of MPR. The RV217-VRC42 and -43 lineages bound to cardiolipin, indicating autoreactivity similar to 4E10. (3) RV217-VRC46.01 uses the same VH gene as RV217-VRC42 but is not somatically related. It neutralized 13/29 viruses and binds to the gp140 derived from primary but not superinfecting autologous virus.
**Conclusions:** Mapping the co-evolution of virus with multiple neutralizing antibody lineages from the earliest timepoints in acute infection will yield new insights to how HIV MPR-directed broad neutralizing antibodies develop. Such insights will be invaluable for rational vaccine design.

## B cells and alterations in subsets

### Impact of HAART on activation and exhaustion of B cell subpopulations in pediatric HIV infection

R. Singh[1], A. Mukherjee[1], N. Negi[2], S.K. Kabra[1], R. Lodha[1], B.K. Das[2]
*[1]All India Institute of Medical Sciences, Department of Pediatrics, New Delhi, India, [2]All India Institute of Medical Sciences, Department of Microbiology, New Delhi, India*
*Presenting author email: ravinder.rathore.singh@gmail.com*

**Background:** Limited information is available on the effect of highly active antiretroviral therapy (HAART) on activation and exhaustion of B cell subpopulations in HIV infected children less than 5 years of age. Hence, we undertook this study to unveil the effect of HAART in a cohort of treatment naive HIV infected children.
**Methods:** Four-color flow cytometry was performed to evaluate the expression of CD86 and PD-1 on naïve (CD19+IgD+CD27-), non-switched memory (NSM: CD19+IgD+CD27+), switched memory (SM: CD19+IgD-CD27+) and double negative memory (DNM: CD19+IgD-CD27-) B cells in HIV-1 infected children at baseline and 12 months of HAART. The percentage of B cell subpopulations expressing CD86 and PD-1 in HIV infected children at baseline was compared with those obtained in healthy children (n=30).
**Results:** Twenty-seven HIV-1 infected children with a median (IQR) age of 22 (12-44) months were enrolled. Compared to healthy controls, HIV infected children displayed higher expression of CD86 on naïve ($p=0.002$), NSM ($p=0.0005$), SM ($p<0.0001$) and DNM B cells ($p=0.0001$). Similarly, the expression of PD-1 on na-

ïve, NSM, SM and DNM was higher in HIV infected children (naïve: p<0.0001; NSM: 0.0001; SM & DNM: p=0.0002). At 12 months of HAART, expression of CD86 on B cell subpopulations decreased (although not significant) from baseline values in HIV infected children. Additionally, frequency of naïve B cells expressing PD-1 declined significantly (p=0.001) from baseline values. Similar decline was observed in the frequency of PD-1 expressing NSM, SM and DNM B cells (NSM, p=0.02; SM, p=0.003, DNM, p=0.0007). However, the expression of CD86 was significantly higher on naïve (p<0.0001), NSM (p<0.0001), SM (p=0.0002) and DNM B cells (p=0.001) in HIV infected HAART treated children compared to their healthy counterparts at 12 months visit. Moreover, frequency of naive B cells expressing PD-1 was higher in HAART treated children compared to healthy controls (p=0.02).
**Conclusions:** Although HAART was able to reduce the expression of activation and exhaustion markers on B cell subpopulations in HIV infected children, yet complete normalization was not observed at 1 year of HAART.

## T-CELL IMMUNE RESPONSES (CD4 AND CD8)

#### IMPACT OF HIV-ART ON TH17 AND TREG SUBPOPULATIONS IN BLOOD AND GENITAL MUCOSA

M.P. Holgado[1], J. Falivene[1], P. Caruso[1], D.H. Zurita[2], N. Laufer[1,2], C. Castro[3], Á. Nico[2], Y. Ghiglione[1], M.J. Ruiz[1], P. Cahn[2,4], O. Sued[4], G. Turk[1], V. Fink[2], M. Gherardi[1]
*[1]Instituto de Investigaciones Biomedicas en Retrovirus y SIDA, Ciudad Autonoma de Buenos Aires, Argentina, [2]Hospital JA Fernandez, Ciudad Autonoma de Buenos Aires, Argentina, [3]Centro Médico Accord, Buenos Aires, Argentina, [4]Fundacion Huésped, Ciudad Autónoma de Buenos Aires, Argentina*
*Presenting author email: piaholgado@gmail.com*

**Background:** Th17 and Treg cells play a key role in HIV infection. The aim of this study was to analyze the effect of antiretroviral therapy (ART) on these T-cell subsets in peripheral blood and female genital mucosa (FGM) employing different patient groups.
**Methods:** PBMCs and cervical mononuclear cells (CMCs) from FGM were obtained from the following groups: HIV$^-$ (n=24), HIV$^+$ART$^+$ (>3 years on ART, n=11) and HIV$^+$ (ART*naïve*) (n=15). Th17 and Treg cells were stained with specific markers and analyzed by flow-cytometry. Cytokines secreted by CMCs were measured by Cytometric Bead Array.
**Results:** In PBMCs %Th17 in HIV$^+$ART$^+$ was higher than in HIV$^+$ (p< 0.001), and reached values similar to HIV$^-$, whereas significant lower Th17 values were found in HIV$^+$ in relation to the other groups. Th17/Treg ratios were also incremented after ART (HIV$^+$ART$^+$: medians: 0.22 vs HIV$^+$: 0.03; p< 0.01) and these levels resulted similar compared to those found in HIV$^-$ (p=0.13). However, percentages of Treg cells in HIV$^+$ART$^+$ and HIV$^+$ were comparable (1.52 and 0.97, respectively) and both resulted higher in relation to HIV$^-$ (0.76; p< 0.05). HIV$^+$ART$^+$ showed lower T-cell activation than HIV$^+$ (4.96 vs 11.66, p< 0.002) but still remained at higher levels compared to HIV$^-$ (3.11, p< 0.01). Importantly, ART did not increment CD4$^+$/CD161$^+$ counts (gut-homing Th17 precursor population), as no differences were found in HIV$^+$ART$^+$ vs HIV$^+$ and both groups had significantly lower values compared to HIV$^-$. At genital mucosa level we observed that CMCs from HIV$^+$ART$^+$ secreted lower levels of IL-17A and IL-10 than HIV- upon stimulation (IL-17A: 6.61 pg/ml vs 32.88 pg/ml, p< 0.025; IL-10: 1.27 pg/ml vs 8.10 pg/ml, p< 0.015). Interestingly, we observed in HIV$^+$ART$^+$ patients with detectable levels of IL-17F from CMCs, a positive correlation with higher counts of CD4$^+$/CD161$^+$ counts in peripheral blood (p=0.0333, r=0.8857).
**Conclusions:** Results indicated that after ART, proportions of Th17 and Th17/Treg in peripheral blood were incremented, but Treg were still augmented. Importantly, quantities of gut-homing Th17 precursors and secretion of IL-17A and IL-10 from CMCs were impaired compared to HIV$^-$, suggesting that ART did not restore completely immune functions at mucosal level.

### THPEA011

#### MODIFICATION OF THE HIV-SPECIFIC CD8$^+$ T CELL RESPONSES IN AN ELITE CONTROLLER AFTER CHIKUNGUNYA VIRUS INFECTION

Y.A. Ghiglione[1], M.J. Ruiz[1], J. Salido[1], C. Trifone[1], Y. Martin[2], P. Patterson[2], H. Perez[2], H. Salomón[1], G. Turk[1], N. Laufer[1,2]
*[1]Institute of Biomedical Research in Retroviruses and AIDS, Buenos Aires, Argentina, [2]Juan A. Fernández Hospital, Infection Disease Unit, Buenos Aires, Argentina*
*Presenting author email: yghiglione@fmed.uba.ar*

**Background:** Chikungunya virus (CHIKV), the arbovirus that causes Chikungunya fever, can produce a transient depletion of CD4$^+$ T-cells. Here, we present data of an HIV Elite Controller (EC) who acquired CHIKV infection.
**Aim:** To evaluate the impact of transient CD4$^+$ T-cell depletion on the CD8$^+$ T-cell (CTL) quality response.
**Methods:** Three blood samples, post-CHIKV infection, were obtained at: 3 weeks (Sample 1,S1); 6 weeks (S2) and 52 weeks (S3). Other 15 EC samples were evaluated for comparison. CD4-counts, viral load (VL) and immune activation were recorded. Phenotypic (CD45RO/CCR7) and functional markers (cytokines/CD107) were evaluated to characterize the HIV-specific CTL quality. Gp120-specific IgG/IgA levels were assessed. Data was analyzed using non-parametric statistics.
**Results:** A male HIV$^+$ EC (median CD4-counts= 702cell/µl (574-1161), VL< 50copies/ml and HAART-naïve over 10 years), was confirmed for CHIKV infection. At S1, his CD4-count dropped to 211cells/µl, presented a blip of HIV VL (145copies/ml) and high immune activation. All parameters were recovered by S3. Polyfunctionality was dramatically distorted in S1 and S2 presenting higher %monofunctional CD107$^+$ HIV-specific CTLs (p< 0.005 and p< 0.01) and lower percentage of bi- and tri-functional CTLs (p< 0.002 and p< 0.009), compared to the EC control group. Also, higher percentage of fully-differentiated HIV-specific CTLs was observed (p< 0.01). In contrast, the %Naïve-CTLs decreased (p< 0.008). Polyfunctionality showed an ongoing recovery by S3, presenting decreased of %CD107$^+$ CTLs and increased bi-functional (CD107$^+$/IFN-γ$^+$) CTLs, mirroring the results observed in typical EC. However, the distribution of CTL memory subsets still displayed an altered profile. Antibody responses didn't change over time and were similar to that of EC.
**Conclusions:** This is the first report where the HIV-specific CTL response was studied in an EC co-infected with CHIKV. The results showed that HIV-specific CTLs presented the capacity to control the transient HIV viral rebound concomitant to the co-infection. This capacity was related to an increased proportion of degranulating CTLs, occurring even in the context of presumably non-optimal CD4$^+$ T-cell help. These results provide useful information to undestand how EC maintain their status, control HIV infection and alert of the negative impact to the immune function of HIV-infected patients living in CHIKV endemic areas.

*Presenting author email: julia.roider@k-rith.org*

**Background:** Without antiretroviral therapy (ART), disease progression following HIV infection is typically much faster in children compared to adults. However, a subgroup (~5-10%) of HIV-positive, ART-naive children, maintain normal-for-age CD4 counts despite persistent high viremia. Here, we investigate the cellular and humoral responses in a cohort of slow progressors.
**Methods:** We studied ART-naïve HIV-infected children aged >5yrs, age-matched controls and adult controls matched for viral load and CD4 count. Phenotypic characterisation of T-cells was undertaken using mAbs specific for CD3, CD4, CD8, CD127, CD56, CRTH2. Functional characterisation of CD4+ T-cells was performed after 5 hour stimulation with PMA/ Ionomycin and intracellular staining for 8 cytokines using a BD FACS Aria cell sorter. IL-4, IL-5, IL-13 levels in cell culture supernatant of 7 days *ex vivo* stimulation with ConcanavalinA were quantified via Luminex. mRNA of stimulated cells was extracted using a iScript cDNA Synthesis kit (Biorad) and cytokine expression levels quantified using a Lightcycler 480 qPCR system (Roche). Antibody neutralization was measured in plasma using the TZM-bl cell assay with Env-pseudotyped viruses. Breadth was defined as neutralization of >40% of a large multi-subtype panel.

**Results:** bNAbs were detected in 65% of slow-progressing paediatric subjects (n=66) compared to 19% of infected adults (n=21) (p< 0.0001). The NAb titres were exceptionally high in the children compared to the adults (p< 0.0001). When compared to healthy controls or adults matched for viral load and CD4 count, slow progressing children showed significantly elevated levels of Th2 cytokines IL-5 (p=0.003 PSP vs. HC) and IL-13 (p=0.004 PSP vs. HC). QPCR revealed increased expression of IL-5 in stimulated cells (p=0.001 PSP vs HC). For IL-5, an increased secretion was also observed in ICS assays when comparing slow progressors to healthy controls.
**Conclusions:** An increased production of Th2 cytokines (IL-5 and IL-13) was observed in HIV-infected slow-progressing paediatric subjects when compared to healthy controls. Both IL-5 and IL-13 have been implicated in B-cell maturation/ antibody production and thus might represent a cellular immune correlate of broadly neutralizing antibodies in this unique group of children.

**Background:** Antigen-specific CD4 T helper cell responses have long been shown to be a critical component of effective antiviral immunity. However, precise details of CD4 T cell contribution to immune protection against HIV have not been adequately defined, particularly in clade C infection, because of the lack of sensitive assays for studying HIV-specific CD4 T cell immune responses. Here, we set out to identify immunodominant CD4 T cell epitopes and the restricting HLA class II DRB1 alleles. We used this information to synthesize MHC class II tetramers, which were used for detailed phenotype and functional characterization of HIV-specific CD4 T cell responses in chronic clade C HIV-1 infection.
**Methods:** A total of 72 chronically HIV-infected individuals from a clade C HIV infection cohort based in Durban, South Africa were analyzed using the IFNγ Elispot assay to investigate the peptide sequences and epitopes that induce HIV-specific CD4 T cell responses. CD8-depleted cryopreserved peripheral blood samples were tested to clade-specific overlapping (15-18-mer) peptides spanning the entire HIV-1 proteome. Breadth and magnitude were characterized to elucidate immunodominance hierarchies of these responses. Class II HLA restricted HIV-specific CD4 T cell responses were defined using the HLA-DRB1 restriction assay. Six MHC class II tetramers were synthesized using allele variants associated with the highest frequency of responders and most frequently targeted peptides.
**Results:** In chronic HIV-1 clade C infection, HIV-specific CD4 T cell responses were detectable against a limited number of epitopes. Epitopes in the Gag region were the most targeted by CD4 T cells, with OLP 41 in the Gag p24 region being the most dominant epitope targeted (40%), followed by OLP 40 and OLP 6 targeted by 23% and 20% of responders respectively. HLA-DRB 03:01, 13:01 and 11:01 alleles showed the greatest restriction when tested against immunodominant epitopes. The peptide specificity of HIV-specific CD4 T cell responses were verified by dual class II tetramer staining.
**Conclusions:** Low frequency antigen-specific CD4 T cells can be efficiently identified using MHC class II tetramers. Class II tetramers will be used to more precisely define phenotype and function of HIV-specific CD4 T cells over time.

*Presenting author email: jeff.schneider@northwestern.edu*

**Background:** MUC16 is a major component of the glycocalyx that protects the epithelial barrier of the upper female reproductive tract (FRT). We have recently published an IgG binding function in a fragment of MUC16 (MUC16RnD). Increased IgG binding was observed in the sera of HIV infected individuals. Surface Plasmon Resonance (SPR) analysis revealed the IgG interaction with the MUC16RnD is Fc-mediated. Removal of the Fc glycan leads to increased binding while enzymatically modifying the antibodies to the G0 glycoform gave tightest binding (6.2 ± 3.2 nM $K_D$ for VRC01). In contrast treating MUC16RnD with PNGaseF to remove N-linked glycans caused an ablation of IgG binding, revealing that mucin glycosylation is necessary for binding.
**Methods:** We isolated IgG from the serum of SIV infected rhesus macaques (RM) and obtained IgG from serum of chronically HIV infected individuals. Human and RM IgG populations that associate with MUC16 were then interrogated for their antigen specificity through a Luminex assay and effector function through FcγR ELISA and a fluorescent ADCC assay. Finally we subcloned out smaller fragments of MUC16 to precisely identify the IgG binding region and mutated N-linked glycosylation residues that could contribute to binding.
**Results:** Analysis of the MUC16 associated IgG from SIV infected macaques revealed that MUC16 associating antibodies were enriched approximately 8-fold for gp41 specificity. Reduced ADCC and FcγR engagement were observed in these MUC16 associated IgG populations relative to the input IgG, highlighting Fc specialization and a unique effector function profile. Subcloning revealed a ~300 amino acid region of MUC16 containing the major IgG binding activity. Mutagenesis of the single N-glycosylation site therein greatly decreased IgG binding.
**Conclusions:** These results reveal that MUC16 has at least one Fc receptor with nanomolar binding to the G0 IgG glycoform. The population of IgG binding to MUC16 is distinct from the FcγR binding and ADCC acting population. The increased amounts of gp41 specific IgG binding to MUC16 indicates that a specific antigen response is naturally targeted to MUC16. Through dissection of the precise mucin domain where IgG binds we can exploit the glycocalyx to create an antibody shield to prevent HIV from breaching mucosal barriers.

### ROLE OF MYELOID DERIVED SUPPRESSIVE CELLS ON ECOHIV EVASION FROM VACCINE INDUCED T CELL IMMUNE RESPONSE

L. Liu, J. Peng, S. Tang, J. Liang, K. Nishiura, Y. Du, H. Kwok, Z. Chen
*University of Hong Kong, AIDS Institute, Department of Microbiology, Hong Kong, Hong Kong*
*Presenting author email: zchenai@hku.hk*

**Background:** Innate immune responses are critical for initiating the CD8 T cells responses for the resolution of infection, and aberrant innate immune response, such as expansion of myeloid derived suppressive cells (MDSC) induced by some viral infection contribute to persistent infection by suppression of T-cell function. Role of innate immune response on prophylactic effects of vaccination has not been carefully studied.
**Methods:** Balb/c mice were immunized with sPD1-p24$_{fc}$/EP vaccine through intramuscular. After 4 weeks, immunized and non-immunized mice were challenged with EcoHIV via i.p. route. Five mice in each group were euthanized at 1, 2, 3 and 12 weeks post inoculation (wpi). Blood and lymphoid tissues were collected for analysis of virus infection, immune response and T cells function.
**Results:** immunization in mice elicited high frequencies of p24-specific IFN-γ+CD8+ T cells, with on around, 45% of total splenic CD8+ T cells. However, provirus DNA was readily detected in PBMC and spleen in all of the infected mice at every time

point tested with no detectable resistant mutations. Compared to non-immunized mice, provirus copies in immunized mice was reduced 2.52 fold at 1, and 2.63 fold at 2 wpi with slight decrease over the following weeks. Infection of mice led to an increase in MDSCs in spleen as early as 7 dpi, which was enhanced at 2 wpi and sustained throughout chronic infection. Expansion of MDSC was associated with decreased p24-specific CD8 T cells number (15% at 2 wpi and decreased overtime by more than 50%), and increased surface expression of PD-1 and Tim 3 and provirus copies. Importantly, MDSCs were primarily infected, and potently suppressed p24-specific memory CD8 T cells proliferation in a dose dependent manner. Depletion of MDSC recovered T cells proliferation in vitro.
**Conclusions:** MDSCs infection and expansion at early stage of infection likely have a critical role in rendering virus resistant to vaccine protection by serving as viral reservoir and suppression of CD8 T cells memory recall and function. This study has important implication for future vaccine strategy design.

**Background:** Altered interplay between gut mucosa and dysbiotic bacteria during HIV infection seems to contribute to chronic immune dysfunction. Nutritional interventions exert immunologic effects, but a deep understanding of how these interventions could ameliorate gut dysbiosis and influence health among HIV-infected individuals remain unexplored. cts
**Methods:** Forty-four subjects, including 12 HIV+ viremic untreated (VU), 23 antiretroviral therapy-treated (ART+) virally suppressed (15 immunological responders and 8 non-responders) and 9 HIV- controls (HIV-), were blindly randomized to receive either prebiotics (scGOS/lcFOS/glutamine) or placebo (34/11), during 6 weeks. We performed a comprehensive assessment of changes in fecal microbiota composition using 16S rRNA deep sequencing and measured in blood a number of immunological and genetic markers involved in HIV immunopathogenesis.
**Results:** The short dietary supplementation with prebiotics attenuated HIV-associated dysbiosis, which was most apparent in VU individuals and less in ART+ subjects, especially among those with CD4+ T cell recovery above 350 cells/mm$^3$, whose gut microbiota was found more resilient. This compositional shift was not appreciated in the placebo arm. After the intervention, significant declines in markers of bacterial translocation and T-cell activation, improvement of thymic output, and changes in butyrate production, were observed. Increases in the abundance of *Faecalibacterium* and *Lachnospira* were observed with the prebiotic intervention and strongly correlated with an increase of butyrate production and amelioration of the inflammatory biomarkers soluble CD14 and high-sensitivity C reactive protein.
**Conclusions:** We found evidence of interplay between intestinal microbial ecology, characterizing key components of the microbiota, and levels of inflammatory predictors of disease progression. This interaction occurred, at least, partially through the production of butyrate by intestinal bacteria. We showed that the response to the prebiotics depends on the stability and resilience of the whole bacterial community.
Hence, bacterial butyrate synthesis pathway holds promise as a viable target for interventions.onse to the prebiotics depends on the stability and resilience of the whole bacterial community.

#### SIRTUIN1 INHIBITOR NICOTINAMIDE DISRUPTS HIV-1 LATENCY

S. Samer[1], T. Oshiro[2], J. Galinskas[1], M.C.S. Umaki[1], M.C. Sucupira[1], S. Tenori[1], A. Duarte[2], R.S. Diaz[1]
*[1]Federal University of Sao Paulo, Medicine, Sao Paulo, Brazil, [2]University of São Paulo, Dermatology, Sao Paulo, Brazil*
*Presenting author email: sadia.samer1@gmail.com*

**Background:** Quiescent, integrated, replication competent latent provirus is the biggest hurdle in sterilizing cure. This latent pool doesn't diminish unless the cells carrying it die by apoptosis or be succumbed to cytopathic effect once viral replication is induced by antigenic stimuli. In the walk of breaking this dormancy of HIV, various histone dependent and independent activators and inhibitors are being used to flush this latent reservoir. Nicotinamide (NAD) is a Sirtuin1 (Class III deacetylase) inhibitor. Sirtuin1 naturally deacetylases p65 subunit of NFKB which being deacetylated cannot recruit P-TEFb on LTR. NAD blocks this pathway facilitating recruitment of TFs and Polymerase II to LTR of HIV, thus breaking latency in an antilatent fashion and creating a hyper activation cell state.
**Methods:** CD8T-cell depleted PBMCs isolated from 15 HIV+antiretroviral-treated patients with undetectable viral loads over a period of two years were used.We measured HIV-1 recovery in ex-vivo cell cultures first activated by PHA and treated with NAD for 48 hours and then cultivated in RPMI medium supplemented with IL-2 and fetal bovine serum. While CD8+T-cell depleted PBMCs activated with PHA alone and then cultivated in RPMI medium supplemented with IL-2 and fetal bovine serum were used as control samples.
**Results:** NAD induced purging in 12 out of 15 subjects. Three days after treatment with NAD, culture supernatants were tested for viral load using qPCR and the results revealed HIV-1 emergence from day 4th- day 18th (median 7 days) with viral load from 2.5 log10 to 7.0 log10 (median of 6.2), whereas viruses were not detected in control experiments. Relating viral emergence with clinical parameters showed that culture positivity is independent of CD4+T cell nadir, time of viral load below detection limits, antiretroviral scheme and viral tropism.
**Conclusions:** Certain Sirtuin substrates can be tied to pathogenesis of diseases (like cancer) infections (HIV-1) and metabolic disorders. Hence NAD, being inhibitor of Sirtuin1, can be promising in flushing out the reservoirs. Since NAD is also depleted in HIV-1 patients, it may further help in regulating the redox environment, without any significant toxicity.

### THPEA018

#### THALIDOMIDE REVERSES LATENCY OF HIV-1 PROVIRUS

S. Samer[1], T. Oshiro[2], T. Vergara[1], J. Gakinskas[1], S. Tenori[1], M.C. Sucupira[1], A. Duarte[2], R.S. Diaz[1]
*[1]Federal University of Sao Paulo, Sao Paulo, Brazil, [2]University of São Paulo, Dermatology, Sao Paulo, Brazil*
*Presenting author email: sadia.samer1@gmail.com*

**Background:** Chronic immune activation is a hallmark of HIV infection, one of the triggers of which is the breach in the integrity of mucosal immune system and microbial translocation which in turn determines the rate of progression to AIDS. Thalidomide is a derivative of glutamic acid that besides being an inhibitor of TNF-α and having an anti-inflammatory property has immunomodulatory and anti-oncogenic properties as well. Thalidomide and its analogues have been shown to have phosphorylation activity of certain transcription factors (TFs) and cell surface receptors, involved in cell signaling.
Since HIV transcription utterly needs active cell state with upregulated TFs and their access to viral genome, we tested Thalidomide for its potential in reactivating HIV-1 from latency.
**Methods:** CD8T-cell depleted PBMCs isolated from 15 HIV+antiretroviral-treated patients with undetectable viral loads over a period of two years were used.We measured HIV-1 recovery in ex-vivo cell cultures first activated by PHA and treated with thalidomide for 48 hours and then cultivated in RPMI medium supplemented with IL-2 and fetal bovine serum. While CD8+T-cell depleted PBMCs activated with PHA alone and then cultivated in RPMI medium supplemented with IL-2 and fetal bovine serum were used as control samples.
**Results:** Thalidomide induced purging in 6 out of 7 subjects. Second day after treatment with Thalidomide, culture supernatants were tested for viral load using qPCR and the results revealed HIV-1 emergence at day 4th with viral load from 2.2 log10 to 6.0 log10 (median of 5.7),whereas viruses were not detected in control experiments. Relating viral emergence with clinical parameters showed that culture positivity is independent of CD4+T cell nadir, time of viral load below detection limits, antiretroviral scheme, viral tropism and subtype of virus.

**Conclusions:** Our results show that Thalidomide is causing purging of HIV by an unknown mechanism so therapeutic manipulation with this drug can generate particular interest. A better understanding of its pharmacology and its sensitive targets is needed to harness the full potential of this agent in HIV-infection.

## THPEA019

### TARGETING HSF1-MEDIATED STRESS RESPONSE CAN ENHANCE HSP90 INHIBITOR-INDUCED SUPPRESSION OF HIV-1 REACTIVATION FROM LATENCY

A. Kabakov, E. Petrova, S. Sobenin
*Biomedical Research Center, Moskow, Russian Federation*
*Presenting author email: kabakov_alex@mail.ru*

**Background:** The state of latency, when HIV-1 persists in cellular reservoirs, allows the virus to avoid eradication and be reactivated afterwards. It was previously shown that heat shock protein 90 (Hsp90) is required for HIV-1 reactivation from latency, so that inhibitors of the Hsp90 chaperone activity can suppress this reactivation and be considered as anti-AIDS agents. Taking into account that the Hsp90 dysfunction provokes the heat shock transcriptional factor-1(HSF1)-mediated up-regulation of inducible Hsp90, Hsp70, Hsp27, MDR1/Pgp, we hypothesized that such accumulation of stress-proteins in cellular reservoirs somewhat assists the virus and impairs the beneficial effects of Hsp90-inhibiting treatments. Here we examined whether the suppressive action of Hsp90 inhibitors on the HIV-1 reactivation can be enhanced by targeting HSF1.
**Methods:** The HIV-1 reactivation was studied in cultured J-Lat cells. 17AAG and AUY922 were used as cell-permeable inhibitors of Hsp90. The HSF1-mediated stress-response in the Hsp90 inhibitor-treated cells was blocked by co-treatments with quercetin or KNK437. Expression of the (co)chaperones and inducible stress-proteins was analyzed by immunoblotting and imunoprecipitation.
**Results:** It was found that inhibition of the Hsp90 chaperone activity with 17AAG or AUY922 does suppress the HIV-1 reactivation in the drug-treated cells; however, this is also accompanied by the HSF1 activation and up-regulation of the cellular levels of inducible chaperones (Hsp90, Hsp70 and Hsp27) and Pgp (a drug-excluding membrane pump).
In the case of inhibitory co-treatments (17AAG or AUY922 + quercetin or KNK437), no increase in the cellular levels of inducible stress-proteins or Pgp took place despite of the dysfunction of Hsp90-dependent chaperone machine. Importantly, such a combination of the two inhibitors simultaneously targeting the Hsp90 activity and the HSF1-mediated stress response stronger suppressed the chaperone-dependent HIV-1 reactivation from latency, as compared with the action of Hsp90 inhibitors alone.
**Conclusions:** The suppressive effects of Hsp90-inhibiting drugs on the HIV-1 reactivation from latency are partly impaired by the newly induced chaperones and Pgp. Herein, the beneficial action of Hsp90 inhibitors can be enhanced by parallel inhibiting the HSF1-mediated stress response.

## THPEA020

### A NOVEL ASSAY TO EVALUATE THE RESPONSE OF PATIENT-DERIVED VIRUS TO LATENCY-REVERSING AGENTS *EX VIVO*

H. Lu[1], M. Moso[1,2], L. Gray[2,3], T. Mota[1,4], J. Jacobson[1,4], A. Ellett[3], W.-J. Cheng[3], D. Purcell[1,4], P. Cameron[1,2], M. Churchill[2,3,5], S. Lewin[1,2]
*[1]Peter Doherty Institute, University of Melbourne, Melbourne, Australia, [2]Monash University, Department of Infectious Diseases, Melbourne, Australia, [3]Burnet Institute, Centre for Biomedical Research, Melbourne, Australia, [4]University of Melbourne, Microbiology and Immunology, Melbourne, Australia, [5]Monash University, Department of Microbiology, Melbourne, Australia*
*Presenting author email: hao.lu@unimelb.edu.au*

**Background:** Despite antiretroviral therapy (ART), HIV latency remains a major barrier to cure. One strategy to eliminate latently infected cells is to stimulate virus production from latency. Latency-reversing agents (LRAs) have been shown to be highly potent *in vitro*, however their efficacy in activating latent HIV is highly variable *ex vivo* and *in vivo*. We developed a novel model of HIV latency to test the efficacy of LRAs on patient-derived viruses.
**Methods:** Integrated HIV long terminal repeats (LTRs) isolated from $CD4^+$ T-cells of four ART-treated patients were cloned into a modified HIV lentiviral vector, pGBFM-nefFluc. Vesicular stomatitis virus G glycoprotein pseudotyped viruses were generated for infection of activated primary $CD4^+$ T-cells. Cells were cultured for 10-12 days post-infection and then negatively sorted by flow cytometry based on size and expression of the activation markers CD69, CD25 and HLA-DR. The activity of LRAs (vorinostat, panobinostat, romidepsin, JQ-1 and chaetocin) on HIV transcription was measured by quantification of luciferase activity.
**Results:** After prolonged culture of infected cells, we identified 3 populations of cells based on size and activation marker expression. In the large (blast) $CD69^+$/$CD25^+$/$HLA\text{-}DR^+$ T-cells, luciferase expression persisted but in the $CD69^-CD25^-HLA\text{-}DR^-$ blasts, luciferase activity was downregulated. There was minimal luciferase expression from the small (non-blast) cells. Following mitogen re-stimulation, luciferase expression increased maximally in the $CD69^-CD25^-HLA\text{-}DR^-$ blasts, consistent with the establishment of latency within these cells.
Following infection with pseudotyped viruses containing either NL4-3 or patient-derived LTRs, we showed that the LRAs romidepsin and chaetocin had the most potent effect on LTR reactivation. Finally, there was no difference in the response to the LRAs following infection with pseudotyped viruses containing patient-derived LTRs.
**Conclusions:** We have generated a new model of post-activation HIV latency to screen LRAs using patient-derived LTR viruses. In these patients, the LTR sequence alone did not determine the potency of response to an LRA.

## THPEA021

### THERAPEUTIC IMMUNE RECOVERY PREVENTS EMERGENCE OF CXCR4-TROPIC HIV-1

J. Bader[1], M. Daeumer[2], A. Thielen[2], F. Schoni-Affolter[3], J. Boeni[4], M. Gorgievski-Hrisoho[5], G. Martinetti[6], T. Klimkait[1], Swiss HIV Cohort Study
*[1]University of Basel, Department Biomedicine, Basel, Switzerland, [2]Institute for Immunogenetics, Kaiserslautern, Germany, [3]University Hospital Lausanne, Swiss HIV Cohort Study Data Center, Lausanne, Switzerland, [4]University of Zurich, Institute of Medical Virology, National Center for Retroviruses, Zurich, Switzerland, [5]University of Bern, Institute for Infectious Diseases, Berne, Switzerland, [6]Ente Ospedaliero Cantonale, Department of Microbiology, Bellinzona, Switzerland*
*Presenting author email: thomas.klimkait@unibas.ch*

**Background:** In the absence of therapy CXCR4-tropic HIV increases over time, associated with an accelerated disease progression. In most successfully treated patients the situation is quite different: The majority harbors CCR5-tropic variants in the circulation. As antiretroviral therapy itself may be responsible for reducing CXCR4-tropic HIV-1 this study aimed at monitoring the abundance of CXCR4-tropic viral sequences in infected cells during suppressive antiretroviral therapy.
**Methods:** For a group of patients in the Swiss HIV Cohort Study with documented suppressive ART, all carrying subtype B virus, the relative frequencies of CXCR4-tropic proviral HIV-1 variants in circulating PBMC were assessed by next-generation sequencing and interpretation by Geno2Pheno (FPR 3.5%, R5=X4< 2%) before and after treatment initiation. Aside from a continuous viral suppression a steady CD4 T cell recovery under cART were was documented for all patients. Viral phylogenetics and evolution were analysed.
**Results:** In 28 of the 35 patients (80%) we observed that frequencies of CXCR4-tropic provirus decreased or in fewer remained stable under therapy. This is in contrast to the situation in untreated patients. In the 7 other individuals (20%) the frequency of CXCR4-tropic provirus increased. In all these latter cases a single viral variant emerged, which was already detectable at time points before therapy initiation. Although a certain proviral sequence evolution was demonstrable in >50% of all patients under therapy this growing diversity was not associated with a similar frequency increase of CXCR4-tropic proviruses.
**Conclusions:** Our study demonstrates that under successful therapy particularly those cells that are infected with CXCR4-tropic HIV decline in most patients, leading to an overrepresentation of CCR5-tropic provirus. This indicates a preferential pressure on cells harboring CXCR4-tropic envelops. Such a progressive proviral reduction in the immune-competent host could eventually lead to the selective depletion of the pool of CXCR4-tropic HIV in successfully treated individuals, paralleling the improving immune response. A better understanding of the underlying mechanism and of the involved cell types may provide crucial information for the new strategies towards HIV eradication.

## THPEA022

### DENDRITIC CELLS PROGRAMMED BY INFLAMMATORY MEDIATORS CAN EFFECTIVELY INDUCE BOTH THE IMMUNOLOGIC 'KICK' AND 'KILL' OF LATENT HIV-1

J. Kristoff[1], R.B. Mailliard[1], J.M. Zerbato[2], N. Sluis-Cremer[2], M. Carlson[1], M. Ding[1], P. Gupta[1], C.R. Rinaldo[1]

residual viremia in cART-suppressed individuals following analytic treatment interruption. Here we investigate the degree to which DC maturation/polarization status affects the ability of DC to promote both HIV-1 latency reversal and CTL targeting of autologous HIV-1 reservoir antigen.
**Methods:** Using HIV-1-infected Multicenter AIDS Cohort Study participants on cART, and our previously published culture methods, we generated differentially polarized monocyte-derived DC, as characterized by their combined surface expression of CD83, CD86, CCR7, OX40L, Siglec-1, and their IL-12p70 producing capacity. These DC were loaded with autologous HIV-1 antigen and used to test their ability to induce HIV-1 specific cytolytic CD8+ T cells (CTL). The DC were also tested for their ability to induce HIV latency reversal by co-culture with autologous CD4+ T cells in the absence or presence of Efavirenz and/or antigen (SEB), respectively. Cellular and culture supernatant viral RNA content was quantified by qRT-PCR.
**Results:** Type 1-polarized DC (DC1), which were generated using a combination of inflammatory mediators and characterized by their increased expression of CD83/CD86/Siglec-1/CCR7 and IL-12p70, effectively induced both CTL responses and increases in transcription of proviral DNA from CD4+ T cells. Importantly, the increase in HIV-1 replication observed using DC1 was antigen-dependent. In contrast, IL-12p70-deficient, OX40L-expressing, type-2-polarized DC (DC2) generated in the presence $PGE_2$ exhibited a decreased capacity to either induce HIV-1-specific CTL responses or to promote HIV-1 latency reversal.
**Conclusions:** The ability of DC to promote either the 'kick' or 'kill' of the latent HIV-1 reservoir is greatly influenced by their maturation/polarization status. We show that DC1 are superior to DC2 in both functions. This critical information is currently being used in development of a potentially effective personalized DC1-based immunotherapeutic approach towards curing HIV-1 infection.

## Systems biology approaches to HIV infection

### THPEA023

#### Association of the chemokine stromal-derived factor-1 (SDF-1) genetic polymorphism with transaminitis in HIV-infected Thais who are on combined antiretroviral therapy

T. Chiraunyanann[1,2], K. Changsri[3], W. Sretapanya[4], K. Yuenyongchaiwai[5], C. Akekawatchai[3]
*[1]Bureau of AIDS, TB & STIs, Department of Disease Control, Ministry of Public Health, Nonthaburi, Thailand, [2]Graduate Program in Medical Technology, Faculty of Allied Health Sciences, Thammasat University, Pathumthani, Thailand, [3]Faculty of Allied Health Sciences, Thammasat University, Department of Medical Technology, Pathumthani, Thailand, [4]Nakhon Nayok Hospital, Nakhon Nayok, Thailand, [5]Faculty of Allied Health Sciences, Thammasat University, Department of Physical, Pathumthani, Thailand*

**Background:** Liver disease has emerged as one of the major causes of death in HIV-infected patients who are on combined antiretroviral therapy (ART). The chemokine stromal-derived factor-1 (SDF-1) has an important role in homing of immune cells to the liver and an increase of SDF-1 levels has been demonstrated to be associated with acute and chronic liver injury.This study was aimed to determine frequency of SDF-1 gene polymorphism and its association with transaminitis in HIV-infected patients on combined ART.
**Methods:** A single-center cross-sectional study was conducted from October 11, 2011 to 2013 in Thai HIV-infected patients. Combination ART was received by 71.4% % of the patients, median duration; 39 (16-55) months. They were examined for transaminitis defined as increased levels from the upper normal limits of aspartate aminotransferase (AST) and/or alanine aminotransferase (ALT), hepatitis B or C coinfection and distribution of SDF-1 gene polymorphisms, a G to A transition at position 801 in 3'UTR region, in the patients by tetra-primer polymerase chain reaction. Logistic regression analyses were performed to determined risks for transaminitis in the studied group.
**Results:** Of 164 HIV patients, rate of transaminitis was 28% and prevalence of hepatitis B virus (HBV) coinfection, hepatitis C virus (HCV) coinfection and HBV/HCV triple infection were 9.1%, 8.3% and 0.8% respectively. Genotype frequencies of AA, GA and GG in the studied group were 6.5%, 36.1%, 57.1% respectively. Chi-square test demonstrates a significant association between AA/GA genotypes and transaminitis ($p$=0.014). In univariate logistic regression analysis, presented that AA/GA genotypes are significant risk factors of transaminitis (crude odd ratio; 95%CI; p-value: 2.5; 1.2-5.3; $p$=0.015), together with male gender (crude odd ratio; 95%CI; p-value: 3.7; 1.6-8.4; $p$=0.002) and hepatitis C virus (HCV) coinfection (crude odd ratio; 95%CI; p-value: 12.2; 2.4-61.5; $p$=0.002).
However, multivariate analysis indicated only coinfection with hepatitis C virus (HCV) as a significant risk of transaminitis in this studied group (adjusted odd ratio; 95%CI; p-value: 22.2; 2.5-199.1; $p$<0.006).
**Conclusions:** The SDF-1 3'A polymorphism is an independent risk for transaminitis, potentially leading to severity of liver disease in Thai HIV-infected patients who are on long-term treatment of combination ART.

### THPEA024

#### Optimal resource allocation of a female sex workers HIV prevention interventions across districts of different size and prevalence

J. Panovska-Griffiths[1], P. Vickerman[2]
*[1]LSHTM/UCL, London, United Kingdom, [2]University of Bristol, School of Social and Community Medicine, Bristol, United Kingdom*

**Background:** HIV transmission in India is driven by high-risk groups such as female-sex workers (FSWs) and their clients. Interventions targeting FSWs have in the past been effective in reducing the number of HIV interventions by 42% over 4 years, but at substantial cost ($258 million over 4 years). One of the reasons for this was the absence of guidance on how money should be allocated to districts of different size and prevalence. We combine modelling and cost data from a large FSW intervention to consider best strategies for allocation of resource across different districts as well as exploring the optimal intervention combination necessary.
**Methods:** A model for HIV transmission amongst FSWs and their clients was parametrised using behavioural and cost data from a large-scale FSW intervention in India and calibrated against reported HIV prevalence. We simulated different combinations of scale and intensity HIV condom-use prevention intervention, and projected the optimal allocation of resources across districts of different size and / or prevalence.
**Results:** Across each district the optimal intervention combines initial intensity increase with intervention scaling-up and a final increase in intensity when all FSWs are reached. Small budget levels (< $31 per FSW reached) can be allocated regardless of district size or prevalence with an optimal intervention of low scale and increasing intensity that averts a small number (< 3%) of HIV infections averted. Budget between $31-$94 per FSW reached requires scaling up of the intervention and should be allocated to either more prevalent (of same size) districts or the larger (of same prevalence) districts. When choosing between larger but less prevalent district and smaller but more prevalent one, resource would be allocated to the smaller more prevalent district up to certain district size. Budget above $94 per FSW reached need to be split between different districts.
**Conclusions:** Both size and prevalence of districts are important in deciding how to optimally allocate available resources with a combination of scaled-up and intensity focus interventions in line with the recent UNAIDS/UN recommendation in HIV intervention.

## Novel approaches in immunotherapeutics (including bnAbs and anti-inflammatory mediators

### THPEA025

#### A novel bispecific immunoadhesin displays enhanced breadth and potency against diverse HIV-1 subtypes *in vitro* and in humanized mice

X. Wu, J. Guo, M. An, Z. Chen
*AIDS Institute University of Hong Kong, Hong Kong, Hong Kong*
*Presenting author email: xilinwu88@126.com*

**Background:** Without an effective vaccine for eliciting broadly neutralizing antibodies (bnAbs), passive immunization using existing bnAbs, Ab-like immunoadhesins (IAs) or bi-specific bnAbs/IAs becomes an attractive strategy for human immunodeficiency virus (HIV) prevention and immunotherapy. We aimed to generate a bi-specific IA (BiIA) with improved breadth and potency against diverse HIV-1 subtypes.
**Methods:** Based on the newly identified HIV-1 bNAbs, we have designed and constructed five secretory IAs (PG9, PG16, PGT128, hu5A8, VRC01) by linking the gene-optimized scFv of antibodies with the hinge and Fc regions of human IgG1. Bi-specific IAs were generated by either single gene encoded or "knobs into holes" methods. The breadth and potency of BiIAs were evaluated by a panel of 40 HIV-1 Env-pseudotyped viruses or three live viruses in vitro and their efficacy were assessed in humanized NSG mice.
**Results:** We found that one single gene-encoded bi-specific IA (combining PGT128 and hu5A8), namely BiIA-SG, neutralized 100% of the 40 viruses tested, including five transmitted/founder viruses and two viruses resistant to both parental IAs. The mean IC50 (1.122 nM) of BiIA-SG is significant better than that of parental PGT128 (69.1 nM) and hu5A8 (13.0 nM). Moreover, BiIA-SG achieved complete protection

against live HIV-1JFRL and Transmitted/Founder HIVBJZS7 challenges in humanize NSG mice. No infected cells were found in all tissue compartments tested including brain, spleen, lung, intestine, kidney and liver. Critically, AAV-delivered BiIA-SG also exhibited complete suppression of viral replication in HIV-1JFRL-infected animals. Interestingly, splenocytes derived from 2/5 treated mice did not cause new infections in new naïve humanized NSG mice via adoptive transfer experiments.
**Conclusions:** Our results demonstrated that the novel BiIA-SG is an attractive candidate of passive immunization for antibody-based prophylactics and immunotherapy.

## B CELL-BASED VACCINES

### THPEA026

### EVOLUTION OF CROSS-NEUTRALIZING ANTIBODIES AND MAPPING EPITOPE SPECIFICITIES IN PLASMA OF CHRONIC HIV-1 INFECTED ART NAÏVE CHILDREN FROM INDIA

M. Makhdoomi[1], A. Nair[1], S. Kumar[1], H. Aggarwal[1], S. Sharma[1], R. Lodha[2], R. Singh[2], M. Singla[2], N. Shah[2], S. Kabra[2], K. Luthra[1]
*[1]All India Institute of Medical Sciences, Biochemistry, New Delhi, India, [2]All India Institute of Medical Sciences, Pediatrics, New Delhi, India*
*Presenting author email: muzamilbiochem@gmail.com*

**Background:** Very little information is available on the neutralizing antibody response in HIV-1 infected children. In this study, we assessed the neutralizing antibody specificities, over time, in HIV-1 infected children from India.
**Methods:** We enrolled and followed up twenty ART naïve HIV-1 chronically infected children. Plasma neutralization activity at five time points was assessed against a panel of 14 pseudoviruses including subtype A, A/D, B and C using TZM-bl cell line. Neutralization epitope specificities were determined using N332A, N156K, K169A and K171A mutant pseudoviruses. Max50 binding titres were determined by ELISA using consensus V3B, V3C, IDR, MPER-B and MPER-C peptides. CD4bs specificity of plasma antibodies was evaluated using CD4bs-selective probe RSC3 and its mutant RSC3Δ371I/P363N for ELISA and for magnetic bead based depletion assays.
**Results:** This is the first longitudinal study to assess neutralizing antibody response and epitope specificities in HIV-1 infected children from India. All HIV-1 infected children (11 male and 10 female; median age: 9.5yrs; median CD4 count at baseline: 645cells/µl) were ART naïve, asymptomatic and had mother-child transmission. Twelve (60.0%) baseline and fifteen (75%) follow up samples neutralized ≥50% of the viruses tested. A modest improvement in neutralization breadth and potency was observed with time. At baseline Subtype C specific neutralization predominated (P=0.018); interestingly, follow up samples exhibited cross neutralizing activity (P=0.098). None of the plasma showed N332A dependence while AIIMS_329 and AIIMS_330 showed N160K dependence, suggesting the presence of V1/V2 directed neutralizing antibodies. Epitope mapping revealed V3C reactive antibodies with a significantly increased Max50 binding titres (0.043) in follow up samples. CD4bs specific antibodies were found in AIIMS_523 which improved with time(p=0.041). RSC3 depleted flow through of AIIMS_523 plasma demonstrated more than 50% ID50 decrease in the neutralization capacity against four pseudoviruses. Further, the presence of CD4 binding site specific plasma neutralizing antibodies of AIIMS_523 was confirmed by competition with sCD4 against JRFL gp120.
**Conclusions:** Improvement in plasma cross neutralizing activity with time, suggests the evolution of broadly neutralizing antibodies. V1/V2 and CD4bs directed plasma neutralizing activity seen in children identifies these individuals as potential candidate for the isolation of V1/2 specific and CD4bs directed neutralizing antibodies.

### MOLECULAR CHARACTERISTICS AND USE OF BOVINE IGG WITH BROAD HIV-1 NEUTRALIZING ACTIVITY FROM COLOSTRUM OF COWS VACCINATED WITH ENV-GP140 TRIMERS

B. Heydarchi[1], R. Center[1], J. Cuthbertson[1], J. Bebbington[1], C. MacKenzie[1], B. Muller[1,2], M. Kramski[1], Z.Q. Chai[1], G. Rawlin[2], D. MacInnes[2], G. Khoury[1], C. Gonelli[1], D. Purcell[3]
*[1]Doherty Institute, University of Melbourne, Melbourne, Australia, [2]Reef Pharmaceuticals, Pty Ltd, Melbourne, Australia, [3]Doherty Institute, University of Melbourne, Microbiology and Immunology, Melbourne, Australia*
*Presenting author email: dfjp@unimelb.edu.au*

**Background:** HIV-patient serum with elite virus-neutralizing breadth has led to preparation of monoclonal antibodies (mAb) with long and highly mutated CDRH3 domains that can neutralize a broad array of viral strains and prevent transmission in animal models. Primate vaccination has not matched these broad neutralizing antibody responses, but vaccination of a Holstein Friesian dairy cow (7004) before then during pregnancy with four 100µg doses of purified HIV-1$_{AD8}$Env-gp140 trimers in adjuvant yielded vast quantities of polyclonal IgG in colostrum that binds HIV Env-gp140 with titres of 1x10$^5$ and neutralized all 27 Env (24-strongly, 3-moderately) from clade A, B and C reference panels. We explored the suitability and feasibility using bovine HIV-neutralising antibody in a topical vaginal microbicide.
**Methods:** We repeat vaccinated cow-7004 during 2 subsequent pregnancies at either early then late interval, or just a late timepoint in the last trimester with 100µg of HIV-1$_{AD8}$ Env-gp140, and harvested serum and colostrum. IgG was tirated for Env binding by ELISA and neutralisation of pseudotyped reporter viruses. Circulating lymphocytes were collected 5 days after vaccination and draining lymph node at autopsy for isolation of IgG+CD21+memory B-cells. Single cell mRNA was used to prepare mAbs with matched chimeric bovine-VH and -VL with human C-regions from HIV gp140-binding IgG+ CD21+ circulating memory B-cells present at 0.66%.
**Results:** Potent bovine IgG responses were sustained at equivalent levels through two ensuing pregnancies. 33 mAbs were selected that had long CDRH3 sizes ranging from 12 - 64 aa's with a high Cys and aromatic-aa frequency. Two mAbs, 6A and 8C, displayed strong binding to HIV-1$_{AD8}$ Env-gp140 uncleaved trimers, but not monomer, and bound cleaved covalently-stablized HIV-1$_{AD8}$ SOSIP gp140 trimers. The VH somatic mutation rate for 6A and 8C was 27% and 25% respectively and their 21 and 14aa CDRH3 domains were 57% and 93% mutated from germline. Mutation of CDRH3 Cys or Trp eliminated the HIV-specific binding characteristics.
**Conclusions:** Reproducible production of large quantities of HIV-neutralizing polyclonal IgG from hyperimmune bovine colostrum shows its suitability and feasibility for testing as an HIV microbicide. The current bovine-V-region mAbs, despite strong trimer-specific binding, haven't yet matched the broad neutralizing activity of the polyclonal IgG.

## NOVEL VECTORS AND STRATEGIES

### THPEA028

### INTRANASAL VACCINATION WITH A LIVE RECOMBINANT RHINOVIRUS AND A DNA BOOST ELICITS HIV-SPECIFIC IMMUNITY THAT CONTROLS ECOHIV INFECTION IN MICE

K. Tomusange[1], D. Wijesundara[1], J. Gummow[1], Y. Li[1], S. Wesselingh[2], A. Suhrbier[3], B. Grubor-Bauk[1], E. James Gowans[1]
*[1]University of Adelaide, Adelaide, Australia, [2]South Australian Health and Medical Research Institute, Adelaide, Australia, [3]QIMR Berghofer Medical Research Institute, Brisbane, Australia*
*Presenting author email: khamis.tomusange@adelaide.edu.au*

**Background:** Most HIV-1 transmissions occur via genitorectal mucosa, highlighting the need for vaccines that elicit mucosal immunity. HIV Gag-specific cell mediated immunity (CMI) and anti-Tat neutralizing antibodies are considered essential for long-term control of HIV. Thus, Gag and Tat are desirable components of a HIV vaccine. We developed a candidate mucosal vaccine by engineering a replication-competent human rhinovirus serotype A1 (HRV-A1) to encode Gag and Tat (rHRV-Gag/Tat). Intranasal administration of this novel vaccine may generate robust pan-mucosal and systemic HIV-specific immunity.
**Methods:** Balb/c mice (n=7 per group) were vaccinated intranasally with 2 doses (5x10$^6$ TCID$_{50}$/dose) of rHRV-Gag/Tat or WT-HRV then boosted intradermally with a 50 µg of a DNA vaccine encoding Gag and a novel oligomerised Tat (pVAXGag/Tat). Another group of mice received 3 intradermal doses (50 µg/dose) of pVAXGag/Tat. Splenocytes and lymphocytes from mesenteric lymph nodes were analysed for Gag-specific systemic and mucosal CMI by ELIspot and ICS. We also analysed blood and cervical vaginal lavage (CVL) samples for Tat-specific systemic (IgG) and mucosal (IgA), respectively.
**Results:** Peptide-stimulated lymphocytes from rHRV-Gag/Tat vaccinated mice showed significantly higher numbers of effector memory CD8$^+$T-cells producing IFN-γ, IL-2 and TNF-α (130 vs 62, P= 0.0192) than mice vaccinated with 3 doses of pVAXGag/Tat. The Tat-specific IgG titers were significantly higher in rHRV-Gag/Tat vaccinated mice (titer~1:17704 vs 1:338, p=0.0221). Only rHRV-Gag/Tat vaccinated mice developed detectable Tat-specific IgA (titer~1:100) in CVL samples after a DNA boost. rHRV-Gag/Tat vaccinated mice showed superior control of EcoHIV infection (a surrogate murine HIV challenge model) in the peritoneal cavity and the spleen (2 log reduction in viral load) compared with wt-HRV vaccination. Experiments comparing the protective efficacy of heterologous prime-boost rHRV-DNA vaccination to homologous prime-boost pVAXGag/Tat vaccination are currently ongoing.
**Conclusions:** Our data shows that rHRV-Gag/Tat has the potential to prevent or at least control HIV infection at the mucosa. We believe that this is the first time rHRVs have been used to vaccinate against HIV and highlights the need to further test rHRV-Gag/Tat in large animals and humans.

## THERAPEUTIC VACCINES

### THPEA029

### HIV-TAT FUSED TO THE OLIGOMERISATION DOMAIN OF THE C4-BINDING PROTEIN IS HIGHLY IMMUNOGENIC AND CONTROLS ECOHIV CHALLENGE IN MICE

K. Tomusange[1], D. Wijesundara[1], J. Gummow[1], T. Garrod[2], Y. Li[1], L. Gray[3,4], M. Churchill[4], B. Grubor-Bauk[1], E. James Gowans[1]
*[1]University of Adelaide, Adelaide, Australia, [2]Royal Australasian College of Surgeons, Adelaide, Australia, [3]Centre for Biomedical Research, Burnet Institute, Melbourne, Australia, [4]Department of Infectious Diseases, Monash University, Melbourne, Australia*
*Presenting author email: khamis.tomusange@adelaide.edu.au*

**Background:** The HIV Tat protein is a promising component of a HIV vaccine. A DNA-based Tat vaccine would be a cheap, cost-effective and therefore readily accessible HIV-1 vaccine to low-income communities which are greatly affected by HIV. However, native Tat is highly unstable, easily oxidised and degraded by proteolysis, which affects its immunogenicity. Thus, protecting Tat from these detrimental processes would be expected to improve Tat immunogenicity.
**Methods:** We have developed a candidate Tat-DNA vaccine (pVAX-sTat-IMX313) encoding Tat fused with the oligomerisation domain of a chimeric C4-binding protein (C4b-p), termed IMX313, resulting in Tat heptamerisation. To ensure that the bulk of heptamerised Tat is secreted, we linked Tat to the leader sequence of tissue plasminogen activator (TPA). Another DNA vaccine (pVAX-sTat) encoding Tat linked to TPA, but without IMX313 was also developed as a control. Balb/c mice (n=7 per group) were vaccinated intradermally with 5 doses (50 µg/dose) of pVAX-sTat-IMX313 or pVAX-sTat. Splenocytes were harvested 14 days after the last dose and analysed for Tat-specific cell-mediated immunity by ELIspot. Blood and cervical vaginal lavage samples were harvested prior to each dose and 14 days after the last dose and analysed for Tat-specific serum (IgG) and mucosal (IgA), respectively.
**Results:** Peptide-stimulated splenocytes from pVAX-sTat-IMX313 vaccinated mice showed higher Tat-specific IFN-γ responses than pVAX-sTat vaccinated mice (mean SFUs 601 vs 498). pVAX-sTat-IMX313 vaccinated mice developed higher titres of IgG (~1: 65957 vs 35871) that showed higher inhibition of Tat transactivation activity in an *in vitro* assay (~80% vs 76% inhibition). IgA was detected in 7/7 (100%) of pVAX-sTat-IMX313- and in only 4/7 (57%) pVAX-sTat-vaccinated mice. The EcoHIV viral load (a surrogate murine HIV challenge model) was reduced by ~11 fold in the peritoneal cavity ($p$= 0.0022) and by ~7 fold in the spleen ($p$= 0.0022) in pVAX-sTat-IMX313- compared with pVAX-sTat-vaccinated mice.
**Conclusions:** We believe that this is the first time secreted Tat has been fused to IMX313 to improve the immunogenicity of Tat-DNA vaccine and highlights the need to further test pVAX-sTat-IMX313 in large animals and humans.

## NOVEL ASSAYS OF IMMUNE RESPONSES

### THPEA030

### INTRODUCING THE NEW FULLY-AUTOMATED VOLUMETRIC AQUIOS FLOW CYTOMETER PANLEUCOGATE (PLG) PLATFORM FOR CD4-T LYMPHOCYTE ENUMERATION IN SOUTH AFRICA. PART I: ESTABLISHING INSTRUMENT PRECISION AND ACCURACY

D. Glencross[1,2], L. Coetzee[1,2], K. Moodley[2]
*[1]National Health Laboratory Service (NHLS), National Priority Programme (NPP), CD4 Unit, Johannesburg, South Africa, [2]University of the Witwatersrand, Department of Molecular Medicine and Haematology, Johannesburg, South Africa*
*Presenting author email: lindi.coetzee@nhls.ac.za*

**Background:** The new Aquios "load and go" cytometer incorporates fully automated sample preparation/analysis with a small bench-top footprint and CD4 PanLeucogating protocol. The aim of the study was to establish the accuracy/precision of this system prior to validation against the current predicate system (MPL/CellMek with PLG).
**Methods:** For 12 consecutive days, two Aquios instruments were evaluated with daily quality control (QC) material, Immunotrol 'Normal' and 'Low' (Beckman Coulter, Miami, USA) and reproducibility studies (10x analysis/sample) using Immunotrol and three patient samples/group with low, medium or high CD4 counts. Inter-instrument comparison was done on 50 random CD4 samples. Ten fresh samples were aged on the bench and tested daily for 5 days to assess the impact on accuracy. GraphPad software was used for statistical analysis and %coefficient of variance (%CV) to indicate accuracy. Results for both absolute CD4 count (CD4#) and CD4 percentage of lymphocytes (CD4%) are reported. A retrospective external quality assessment (EQA) panel (n=20) was analysed and standard deviation index (SDI) calculated.
**Results:** Daily QC over 12 days showed %CV values of < 8% for CD4# and CD4% using 'Normal' or 'Low' Immunotrol. Reproducibility data with both levels of Immunotrol showed excellent precision with %CVs< 7%. Reproducibility using patient CD4 samples>700cells/µl (high) and 300-500 cells/µl (medium), showed excellent reproducibility with CV's< 5%. CD4 counts < 40cells/µl showed increased CV's ~11%. Differences were not clinically significant. Inter-instrument variability was negligible, with corresponding %similarity of 100±2.85% (CV's < 3%), and a bias of 12.9±27 cells (95% limit of agreement -40.2 to 66.1) in a cohort with CD4 counts from 2-1582 cells/µl (median 424cells/µl). Samples aged for 5 days (23-1001 cells/µl) showed no statistically significant changes over 4 days. EQA panel data revealed overall accuracy (SDI values >0 - +2) for low and normal panel samples for CD4# and CD4% respectively.
**Conclusions:** Internal and external quality control assessment material and a range of CD4 counts (patient samples) confirmed accuracy and excellent reproducibility of the Aquios PLG system over time. Accuracy was not impaired by sample age and inter-instrument comparisons showed minimal bias, making the Aquios platform suitable for replacement of older technology.

## ACUTE AND EARLY INFECTION

### THPEB031

### ACUTE HIV DISCOVERED DURING ROUTINE HIV SCREENING IN 6 URBAN EMERGENCY DEPARTMENTS (EDS)

K. Jacobson[1], N. Glick[2], T. Giordano[3], D. White[4], P. Mammen[5], S. Arora[6], M. Menchine[7], L. Kelly[8], S. Pasalar[3], B. Branson[9]
*[1]University of Southern California, Kick School of Medicine, Alhambra, United States, [2]Mt. Sinai Hospital, Department of Medicine, Chicago, United States, [3]Harris Health System, Houston, United States, [4]Alameda Health System, Oakland, United States, [5]Jefferson University Hospital, Philadelphia, United States, [6]University of Southern California, Los Angeles, United States, [7]University of Southern California, Emergency Medicine, Los Angeles, United States, [8]Jefferson University Hospital, Chicago, United States, [9]Scientific Affairs LLC, Atlanta, United States*
*Presenting author email: kjacobso@med.usc.edu*

**Background:** Lab-based 4th generation HIV 1/2 Ag/Ab testing platforms in emergency departments (EDs) provide HIV test results in approximately 1 hour and can also detect acute HIV infection (AHI) 10-21 days after exposure, when patients are often symptomatic and seeking medical care.
We describe the prevalence of AHI among patients screened in 6 EDs across the United States and the percentage of all new HIV infections identified that were acutely infected.
**Methods:** We obtained HIV test results from patients undergoing routine HIV screening in 6 EDs since implementation of the fourth generation testing algorithm to determine the total number of HIV tests performed, the number of new HIV diagnoses and the number with AHI. AHI was defined based on a repeatedly reactive HIV Ag/Ab assay, negative HIV ½ antibody differentiation test, and detectable HIV-1 RNA.
**Results:** The EDs initiated routine HIV screening at different time points between November 2012 and July 2015. Over 120 cumulative months of screening through November 30, 2015 in the 6 EDs, 154,389 HIV Ag/Ab tests were performed . There were 569 (0.37%) new HIV diagnoses, of which 80 (14.1%) were AHI. Prevalence of AHI amongst those screened was 0.05%. The percentage of new HIV diagnoses ranged from 0.31% to 0.47%, and the percentage of newly diagnosed HIV that were AHI ranged from 10.6% to 37.5% in the 6 EDs

| Location | Screening period, months | HIV Tests | New HIV diagnoses, n (%) | New diagnoses that were acute HIV, n (%) |
|---|---|---|---|---|
| Chicago | 36 | 17,125 | 62 (0.36%) | 12 (19.4%) |
| Houston | 13 | 61,886 | 189 (0.31%) | 20 (10.6%) |
| Los Angeles | 29 | 48,324 | 229 (047%) | 31 (13.5%) |
| Oakland | 19 | 17,936 | 55 (0.31%) | 8 (14.5%) |
| Philadelphia (1) | 18 | 6,652 | 26 (0.39%) | 6 (23%) |
| Philadelphia (2) | 5 | 2,466 | 8 (0.32%) | 3 (37.5%) |

*[New HIV Diagnoses and Acute HIV Infections Identified during Routine HIV Screening, 6 urban EDs]*

**Conclusions:** HIV Ag/Ab screening in EDs offers a unique opportunity to identify undiagnosed HIV, of which a substantial percentage are acute infections. The disproportionate percentage of acute infections among ED patients is likely secondary to these patients seeking medical care for symptoms attributable to AHI, and provides a valuable opportunity for early intervention.

## THPEB032

### PLASMA AND GENITAL HIV DECLINE ON ART AMONG PREGNANT/POSTPARTUM WOMEN WITH RECENT HIV INFECTION

A. Drake[1], J. Kinuthia[2], D. Matemo[2], B. Richardson[3], S. Emery[4], J. Overbaugh[4], G. John-Stewart[1]
*[1]University of Washington, Global Health, Seattle, United States, [2]Kenyatta National Hospital, Nairobi, Kenya, [3]University of Washington, Biostatistics, Seattle, United States, [4]Fred Hutch, Seattle, United States*
*Presenting author email: barbrar@uw.edu*

**Background:** Early and acute maternal HIV infection increases risk of mother-to-child and heterosexual transmission due to high maternal HIV viral load (VL). While plasma VL is rapidly decreased with antiretroviral therapy (ART), ART response in the genital tract has not been well characterized among pregnant/postpartum women with recent HIV infection and could contribute to transmission.
**Methods:** Women with early or acute infection (detected by nucleic acid amplification tests on plasma samples conducted serially during pregnancy and postpartum) were identified in a prospective study in Western Kenya. Women initiating ART within 40 days of confirmatory HIV diagnosis and with ≥2 vaginal or ≥2 cervical samples collected were included in the analysis. Cox proportional hazards regression was used to determine time to HIV suppression, defined as < 75 copies/mL for cervical/vaginal samples or < 150 copies/mL for plasma samples, using the GenProbe HIV RNA assay.
**Results:** Among 23 women with early or acute infection who initiated ART, median age was 22 years (interquartile range [IQR]:19-26) and time to ART initiation was 14 days (IQR 8-20). All women had detectable cervical and vaginal HIV at diagnosis. Mean plasma VL (5.44 $log_{10}$ copies/mL) prior to ART initiation was >1 log higher than cervical and vaginal VL (4.13 and 3.90 $log_{10}$ copies/mL, respectively; p< 0.001 for both). Viral suppression was more frequent in the vagina (87%) than cervix (83%, p=0.07) or plasma (65%, p=0.06). Among women with viral suppression, median time to suppression was shorter in the cervix (2.5 months) than in the vagina (3.3 months) or plasma (7.8 months); there were no differences in time to viral suppression in any compartment between women who acquired HIV in pregnancy versus postpartum. Following viral suppression in the cervix or vagina, detection of virus at a subsequent visit was common: 48% cervical and 70% vaginal.
**Conclusions:** HIV was detected in genital secretions soon after HIV diagnosis, at lower levels than in plasma. Viral suppression following ART occurred more rapidly in the cervix and vagina than plasma, however, was not consistently sustained in any compartment. Improving viral suppression among pregnant and postpartum women with recent HIV will be important to prevent transmission.

## THPEB033

### FASTER RESTORATION OF CD4:CD8 RATIO DURING THE FIRST 12 WEEKS OF ART INITIATED AT EARLY HIV INFECTION COMPARED WITH ART INITIATED AT CHRONIC INFECTION IN THE SAME PATIENTS

A. Pasternak[1], J. Prins[2], B. Berkhout[1]
*[1]Academic Medical Center of the University of Amsterdam, Medical Microbiology, Amsterdam, Netherlands, [2]Academic Medical Center of the University of Amsterdam, Internal Medicine, Amsterdam, Netherlands*
*Presenting author email: a.o.pasternak@amc.uva.nl*

**Background:** Early initiation of antiretroviral therapy (ART) is believed to result in better immunological reconstitution than initiation of ART during chronic HIV infection (CHI). However, the degree and rate of immune restoration haven't been directly compared in the same patients between ART initiated during primary HIV infection (PHI) and CHI ART.
**Methods:** We studied 48 patients that received 24 or 60 weeks of temporary ART initiated at PHI and subsequently reinitiated ART during CHI after a median of 2.4 years without treatment. Clinical parameters were measured at ART initiation and every 12 weeks thereafter up to week 60 of both PHI and CHI ART.
**Results:** Median $CD4^+$ counts were 505 (IQR: 303-713) and 310 (245-418) cells/$mm^3$ at the PHI and CHI ART baselines, respectively (p< 0.0001, paired Wilcoxon test). No difference in the dynamics of $CD4^+$ count reconstitution between the PHI and CHI ART was observed throughout the follow-up period. Median $CD4^+$ count gains by 60 weeks ART were 210 cells/$mm^3$ for both PHI and CHI ART. In contrast, although there was no significant difference in the CD4:CD8 ratio at the PHI and CHI ART baselines (0.48 (0.25-0.80) vs. 0.36 (0.25-0.41), respectively; p>0.05), by 12 weeks ART this ratio increased to 0.95 (0.74-1.29) on PHI ART and 0.52 (0.41-0.74) on CHI ART (p< 0.0001). Significant difference in CD4:CD8 ratio between PHI and CHI ART persisted throughout the follow-up period, but no further difference in the dynamics of CD4:CD8 ratio increase was observed after the first 12 weeks. By 48 weeks ART, 59% of patients treated during PHI and 24% of patients treated during CHI achieved the CD4:CD8 ratio of 1 (p=0.0049, Fisher's test).
**Conclusions:** This is the first study to directly compare immune reconstitution between PHI and CHI ART in the same patients. Although no difference was observed in the dynamics of $CD4^+$ count reconstitution, the CD4:CD8 ratio demonstrated faster restoration in the first 12 weeks of PHI ART compared to the CHI ART, which translated into a larger percentage of patients achieving the CD4:CD8 ratio of 1 by 48 weeks ART. Early initiation of ART conveys a significant immunological benefit to the patient.

## THPEB034

### EARLY START OF ANTIRETROVIRAL THERAPY DURING PRIMARY HIV INFECTION IS ASSOCIATED WITH FASTER OPTIMAL IMMUNOLOGICAL RECOVERY - RESULTS OF ITALIAN NETWORK OF ACUTE HIV INFECTION (INACTION) RETROSPECTIVE STUDY

*[1]San Gerardo Hospital, Milano-Bicocca University, Infectious Diseases Unit, Monza, Italy, [2]INMI L. Spallanzani, Rome, Italy, [3]Amedeo di Savoia Hospital - University of Turin, Turin, Italy, [4]ARNAS Garibaldi Hospital, Catania, Italy, [5]Pugliese-Ciaccio Hospital, Catanzaro, Italy, [6]Umberto I Hospital - La Sapienza University, Rome, Italy, [7]San Martino Hospital, Genova, Italy, [8]University of Brescia, Dept of Infectious and Tropical Diseases, Brescia, Italy, [9]Hospital of Siracusa, Siracusa, Italy, [10]San Matteo Hospital, Pavia, Italy, [11]San Paolo Hospital - University of Milan, Milan, Italy, [12]San Raffaele Hospital, Milan, Italy, [13]Amedeo di Savoia Hospital, Turin, Italy, [14]Papa Giovanni XXIII Hospital, Bergamo, Italy, [15]Sacco Hospital - University of Milan, Milan, Italy, [16]Mater Domini Hospital, Catanzaro, Italy*
*Presenting author email: a.muscatello@asst-monza.it*

**Background:** INACTION is a network currently including 24 centers, created with the aim of studying primary HIV infection (PHI). Aim of this study: to assess whether an early start of combined antiretroviral therapy (cART) during PHI could be beneficial in terms of time to immunological recovery and virological suppression.
**Methods:** Patients with PHI diagnosed between 2008 and 2014 at 16 Italian centers were enrolled in this retrospective cohort study. PHI was classified according to Fiebig criteria. Patients starting cART within 3 months since PHI diagnosis (baseline, BL) were classified as early-cART group (E-cART-g), while other patients as late-cART group (L-cART-g).
**Results:** Overall, 247 patients were enrolled (median age 38y, 87.4% males, 61.5% homo/bisexual, 67.6% Fiebig ≥4, BL-median CD4 452 cells/µL, BL-median HIVRNA 5.64 $log_{10}$copies/mL). During follow-up, cART was started in 247 (100%) patients, of which 177 (71.7%) in E-cART-g.

| | Early-cART (n=177) | Late-cART (n=70) | P-value |
|---|---|---|---|
| Symptomatic PHI | 146 (82.5%) | 48 (68.6%) | 0.026 |
| BL-CD4 cells/mm3 | 450 (312-579) | 488 (376-637) | 0.062 |
| BL-CD4/CD8 >1 | 19 (10.7%) | 3 (4.3%) | 0.028 |
| BL-HIV-RNA, log10copies/mL | 5.91 (5.19-6.57) | 5.07 (4.45-5.74) | <0.001 |
| cART NNRTI-based | 19 (10.7%) | 31 (44.3%) | <0.001 |
| cART PI-based | 138 (78.0%) | 33 (47.1%) | <0.001 |
| cART InSTI-based | 176 (99.4%) | 8 (11.4%) | <0.001 |
| First-cART-regimen>3 drugs | 76 (42.9%) | 3 (4.3%) | <0.001 |
| HIV-Diagnosis 2008-2011/2012-2014 | 40(22.6%)/ 137(77.4%) | 39(55.7%)/ 31(44.3%) | <0.001 |

*[Table 1 - Main baseline characteristics PHI patients]*

At multivariate analysis, higher plasma HIV-RNA and PHI diagnosis between 2012-2014 vs 2008-2011 were associated with E-cART-g. At Cox analysis, predictors to time to virological suppression were CD4/CD8>1 (p=0.005), HIV-RNA $log_{10}$copies/mL (p< 0.001) and years of HIV diagnosis (2012-2014 vs 2008-2011) (p< 0.001). E-cART-g had shorter time to optimal immunological recovery (see Figure1):

*[Figure 1: Proportion of pts with optimal immunological recovery (defined as: CD4>500/mmc, CD4%>30, CD4/CD8>1); w48: E-cART-g 39.2% vs L-cART-g 19.3%]*

Association of early-cART to optimal immunological recovery was confirmed in multivariate analysis {aHR=1.99(1.09-3.63;95%CI), p=0.026}, after adjusting for immunological BL characteristics, first cART regimen and years of diagnosis.
**Conclusions:** PHI patients who started cART within 3 months after PHI achieved optimal immunological recovery faster after therapy initiation than patients who began later during the course of infection, despite worst E-cART-g BL viro-immunological conditions.

## THPEB035

### USING DDPCR TO ASSESS PERSISTENCE OF HIV DNA RESERVOIRS IN PERINATALLY INFECTED INFANTS TREATED WITH CART BEFORE OR AFTER 12 MONTHS OF AGE

P. Soni[1], L. Alderette[2], K. Nielsen[1], J. Deville[1], M.A. Hausner[2], B.J. Ank[2], D.N. Vatakis[2], I.J. Kim[2], Y. Bryson[2]
*[1]UCLA - David Geffen School of Medicine, Pediatric Infectious Disease, Los Angeles, United States, [2]UCLA - David Geffen School of Medicine, Los Angeles, United States*

**Background:** The major barrier to achieving HIV remission is the establishment of HIV in latent CD4+ T cells during acute infection. Recent studies suggest that early treatment of neonatal infection may reduce the establishment and quantity of latent reservoirs and enhance proviral decay, allowing potential drug-free HIV remission as seen in the "Mississippi baby." Data is limited, so we measured persistent HIV viral reservoirs and HIV antibody profiles in a cohort of 10 perinatally infected infants with known timing of treatment and serially banked blood samples.
**Methods:** In a retrospective study, 10 HIV perinatally infected infants followed from birth and initiating cART before or ≥ 12 months of age were divided into "early" or "late" treatment cohorts. All children remained on cART. Serial analysis of banked peripheral blood samples were assessed for HIV RNA viremia, HIV antibodies, and proviral reservoirs over time. We measured HIV RNA PCR ~ Q4 months. Of those treated early, HIV antibody levels were assessed by 4th generation Western blot (WB) at 16 months and 1-5 years post-cART. We defined incomplete WB by band analysis (< 4 of 9 +). HIV DNA reservoirs were quantified by droplet digital PCR (ddPCR) at the same time points.
**Results:** Of infants treated early, 5/8 (62.5%) had incomplete WBs at 16 months of age; 6/8 (75%) remained incomplete at second time point. Half of early treated with incomplete WBs, also had marked decrease in HIV provirus. ddPCR was performed in 10 infants, 8 with early Rx and 2 with late Rx. At 16 months of age the early Rx cohort had a mean proviral DNA of 12,773 copies/million cells compared to 14,864 copies/million cells at 1-5 years later.
**Conclusions:** Preliminary data suggests that the majority of early treated infants showed incomplete antibody profiles by WB at 16 months which persisted in follow up. The quantity of proviral reservoir was not significantly different among the early cohort. However, a subset showed a decrease in proviral reservoir size. This data confirms that early treatment may inhibit viral replication and development of HIV antibody. Further studies are needed to correlate HIV antibody profiles with proviral reservoir levels.

# HIV DIAGNOSTIC TESTING (INCLUDING NEW ALGORITHMS, RAPID/POINT OF CARE TESTING, AND STRATEGIES FOR EXPANDING/IMPROVING TESTING)

## THPEB036

### HIGH YIELD OF 4TH GENERATION EIA TESTING FOR HIV IN DENGUE-LIKE FEBRILE ILLNESS IN SINGAPORE

A.J. Verrall[1,2], D.L.C. Boon[3], S. Pada[1,4], N. Smitasin[1], C.K. Lee[5], M.J. Khoo[5], E.S. Koay[6], Y.S. Leo[3], D.A. Fisher[1,7], S. Archuleta[1,7]
*[1]National University Hospital, Division of Infectious Diseases, University Medicine Cluster, Singapore, Singapore, [2]University of Otago, Department of Pathology and Molecular Medicine, Wellington, New Zealand, [3]Tan Tock Seng Hospital, Department of Infectious Diseases, Singapore, Singapore, [4]Jurong Health Services, Ng Teng Fong General Hospital, Singapore, Singapore, [5]National University Hospital, Department of Laboratory Medicine, Singapore, Singapore, [6]National University Hospital, Department of Pathology, Singapore, Singapore, [7]National University of Singapore, Department of Medicine, Yong Loo Lin School of Medicine, Singapore, Singapore*
*Presenting author email: nares_smitasin@nuhs.edu.sg*

**Background:** Strategies to diagnose Acute HIV infection (AHI) are needed to improve individual and public health outcomes. As AHI causes a febrile illness in up to 89% of cases, routinely offering sensitive new-generation AHI tests to well defined clinical populations could identify a high number of AHI cases. In Asia, 800,000 new HIV infections each year must be distinguished from other causes of fever, including over 2 million episodes of dengue fever (DF). We sought to estimate the prevalence of AHI in suspected DF patients using 4th generation Antigen-Antibody Enzyme-linked Immunoassay (EIA) and Nucleic Acid Amplification Test (NAAT).
**Methods:** This cross-sectional study prospectively recruited febrile patients with clinical features of DF at three Singapore hospital clinics and acute medical wards. Eligible participants were Singaporean citizens, aged over 21 years, with a fever >37.5°C and two symptoms of DF (WHO, 2009). Patients were excluded if they were pregnant or had a clinically obvious diagnosis based on signs (e.g. varicella) or diagnostic tests performed prior to their presentation. We assessed risk of recent HIV exposure and collated clinical and laboratory data with a questionnaire. HIV-1 testing was by concurrent EIA and NAAT, and confirmed by quantitative viral load and western blot. Participants gave informed consent to participate in the study, which was approved by the National Healthcare Group Domain Specific Review Board.
**Results:** Of the 263 eligible participants, 140 consented to AHI testing (53.2% acceptance). Three of 140 participants had AHI, 2.14% (95% confidence interval (CI): 0.6% - 6.5%). The AHI cases had rash and blood count abnormalities typical of DF. Restricting HIV testing to those reporting sex in the last three months would limit testing to 56.4 % of our cohort of suspect DF patients, and result in a slightly higher yield 2.7% (2.2 - 11.4%). The negative predictive value of a sexual history was 100% in our sample, but could be lower (95% CI: 94.1% - 100.0%).
**Conclusions:** We have shown routine AHI testing has a high yield in this population and is acceptable to many. Testing could be further targeted according to recent risk exposures.

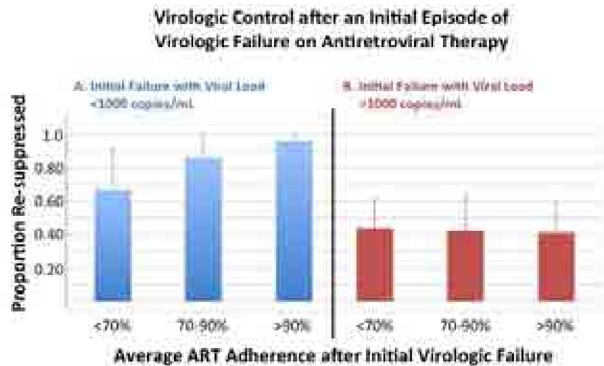
## THPEB037

### APPROPRIATENESS OF WORLD HEALTH ORGANIZATION TO DETECT AND MANAGE VIROLOGIC FAILURE FOR PEOPLE LIVING WITH HIV ON ANTIRETROVIRAL THERAPY: RESULTS FROM AN OBSERVATIONAL COHORT STUDY

M. Siedner[1], N. Musinguzi[2], J. Haberer[1], V. Marconi[3], J. Martin[4], P. Hunt[4], Y. Boum II[5], D. Bangsberg[1]
*[1]Massachusetts General Hospital, Medicine, Boston, United States, [2]Mbarara University of Science and Technology, Mbarara, Uganda, [3]Emory University, Atlanta, United States, [4]Univeristy of California, San Francisco, United States, [5]Epicentre Research Base, Mbarara, Uganda*
*Presenting author email: msiedner@partners.org*

**Background:** World Health Organization HIV guidelines recommend viral load (VL) measurements annually after 6 months of antiretroviral therapy (ART). Regimen change is recommended for patients with two VL measurements >1,000, at least three months apart, with adherence reinforcement in the interim. These recommendations presume that 1) a VL < 1,000 is unlikely to predict persistent virologic failure, and 2) high adherence after an initial detectable VL is likely to result in virologic control. We assessed the appropriateness of these recommendations using data from a longitudinal cohort in southwestern Uganda.
**Methods:** Participants in the Ugandan AIDS Rural Treatment Outcome Study were followed quarterly after ART initiation with VL monitoring. ART adherence was monitored using electronic pill monitors. We analyzed episodes in which participants

had 1) a detectable VL (>400) 6-12 months after ART initiation or after a prior suppressed VL; and 2) continued on the same ART regimen until the next VL measurement. We assessed relationships between initial VL result and re-suppression, and evaluated whether ART adherence in the interim predicted re-suppression.
**Results:** We identified 231 detectable VL events in 168 participants. 82% (102/124) of those with an initial VL < 1,000 re-suppressed, but only 42% (43/103) re-suppressed if the initial VL was >1,000 (p< 0.001). Average adherence in the interim predicted re-suppression for those with an initial VL < 1,000 (*P*=0.002), but not for those with an initial VL >1,000 (*P*=0.628), interaction term *P* =0.013 (**Figure 1**).



*[Figure 1. Antiretroviral adherence and re-suppression after virologic failure]*

**Conclusions:** Patients with a detectable VL < 1000 have a high probability of re-suppression, and interim levels of adherence correlate with odds of re-suppression. However, those with a VL >1000 have a low probably of re-suppression, and odds of re-suppression is not associated with adherence, suggesting a high likelihood of drug resistance. WHO recommendations to delay regimen changes in those with a high VL should be reconsidered.

## THPEB038

### A CLUSTER-RANDOMIZED TWO-PERIOD CROSSOVER TRIAL ASSESSING NURSE-DRIVEN HIV SCREENING TARGETING KEY POPULATIONS IN FRENCH EMERGENCY DEPARTMENTS

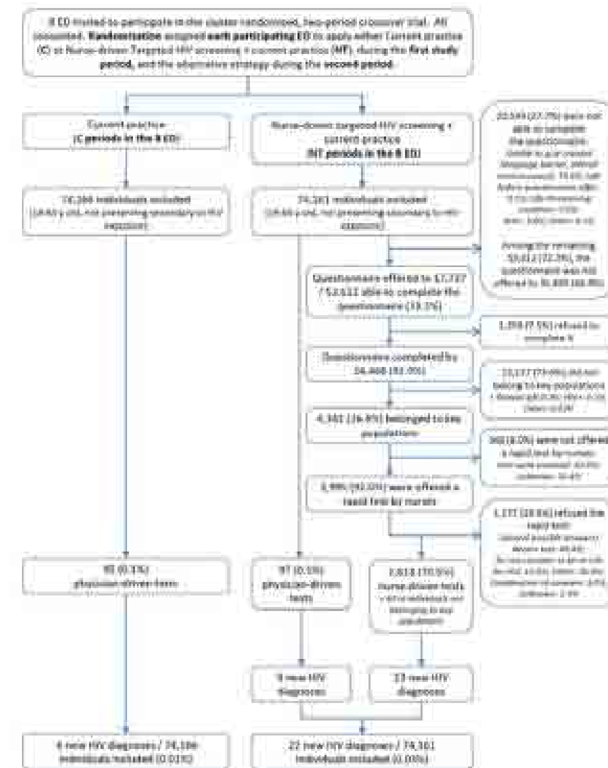
*[1]Assistance Publique - Hôpitaux de Paris (AP-HP), Groupe Hospitalier des Hôpitaux Universitaires Est Parisien, Clinical Research Center of East of Paris (CRC-Est), Paris, France, [2]Université Paris Saclay - Université Versailles Saint-Quentin, Doctoral School of Public Health (EDSP), UMR 1173, Garches, France, [3]AP-HP, Groupe Hospitalier des Hôpitaux Universitaires Est Parisien, Clinical Research Unit of East of Paris (URC-Est), Paris, France, [4]Sorbonne Universités, UPMC Univ Paris 06, INSERM, Institut Pierre Louis d'Épidémiologie et de Santé Publique (IPLESP UMRS 1136), Paris, France, [5]AP-HP, Hôpital St Antoine, Emergency Department, Paris, France, [6]AP-HP, Hôpital Raymond-Poincaré, Infectious Disease Department, Garches, France, [7]AP-HP, Hôpital St Louis, Microbiology Department, Paris, France, [8]Université Paris Sud, Univ Paris 11, INSERM, Centre for Research in Epidemiology and Population Health, U 1018, Villejuif, France, [9]AP-HP, Groupe Hospitalier des Hôpitaux Universitaires Est Parisien, Department of Clinical Pharmacology and Clinical Research Center of East of Paris (CRC-Est), Paris, France, [10]Sorbonne Universités, UPMC Univ Paris 06, INSERM, UMR 1148, Paris, France, [11]Université Versailles Saint-Quentin, UMR 1173, Garches, France*
*Presenting author email: judith.leblanc@aphp.fr*

**Background:** In France, a country with HIV concentrated epidemic, the number of New HIV Diagnoses (NHIVD) continues to increase among key populations. Thus optimizing screening to reach individuals with undiagnosed infection is challenging. Physician-directed diagnostic testing is routinely performed in French Emergency Departments (ED). The feasibility and impact of combining nurse-driven targeted screening with physician current practice on the identification of NHIVD were evaluated.
**Methods:** A cluster-randomized, two-period crossover trial compared Nurse-driven Targeted screening+current practice (NT) to Current practice alone (C) in ED. All individuals aged 18-64, not presenting secondary to HIV exposure were included. In periods with NT, a self-administered questionnaire was proposed, resulting in a nurse's offer of a rapid test to patients belonging to key populations: Sub-Saharan African origin or partner, men having sex with men, >5 sexual partners/last year, lifetime injection drug use. A sample size of 140,000 subjects was estimated assuming 3.38 and 1.04 NHIVD/10,000 persons in NT and C periods, respectively, with b=80%, a=5%. The proportions of NHIVD in each group were compared using a Poisson generalized linear mixed-model.
**Results:** Between June 2014-June 2015, 74,161 (NT periods) and 74,166 individuals (C periods) were included in 8 ED in metropolitan Paris (see Figure). In NT periods, the questionnaire was offered to 17,727 individuals, out of which 2,818 were tested by nurses (64% men, 36% women), resulting in 13 NHIVD. Combined with 9 NHIVD among 97 physician-directed diagnostic tests, the total number of NHIVD in NT periods was 22 (22/74,161: 0.03%; 95% CI 0.02-0.05). In C periods, 92 individuals were tested, resulting in 6 NHIVD (6/74,166: 0.01%; 95% CI 0.00-0.02). Nurse-driven targeted screening combined with current practice increased the identification of NHIVD (relative risk 3.7; 95% IC 1.2-10.9).



*[Figure]*

**Conclusions:** Targeted screening by ED nurses added to current practice was feasible. This innovative strategy significantly enhanced the identification of new HIV diagnoses.

## THPEB039

### USE OF A LIMITING ANTIGEN AVIDITY ASSAY TO MONITOR VIRAL BREAKTHROUGH DURING ANTIRETROVIRAL TREATMENT

S. Wendel[1], S.H. Eshleman[2], R.D. Moore[2], J.C. Keruly[2], T.C. Quinn[2,3], O. Laeyendecker[2,3]
*[1]Georgetown University School of Medicine, Washington DC, United States, [2]Johns Hopkins University School of Medicine, Baltimore, United States, [3]NIAID, Baltimore, United States*
*Presenting author email: olaeyen1@jhmi.edu*

**Background:** HIV viral load testing is used to monitor antiretroviral treatment (ART). However, this testing requires special equipment, laboratory expertise, and is not affordable in many resource-limited settings. Simple and less expensive laboratory tests are needed to monitor ART in these settings. Previous studies have shown that viral suppression can down-regulate the anti-HIV antibody response, and that viral breakthrough during ART may be associated with serologic changes. We evaluated whether a limiting antigen avidity enzyme immunoassay (LAg-Avidity assay) could be used to detect viral breakthrough in individuals on ART.
**Methods:** Samples were obtained from adults in the United States who were infected with HIV for >2 years and on ART. This included: (1) 72 samples from 18 adults with 1 sample before and 3-7 samples after ART initiation; and (2) 179 samples from 20 adults who were virally suppressed on ART and had viral breakthrough with subsequent viral suppression (22 viral breakthrough events). A cutoff of 400 copies/mL was used to define viral suppression. Samples were tested with the LAg-Avidity assay; results were reported as normalized optical density units (OD-n). We compared the difference in OD-n values between individuals who were or were not virally suppressed, and evaluated the change in OD-n values in longitudinally-paired samples, where individuals were suppressed at both time points (n=120), or at only one time point (n=22).
**Results:** LAg-avidity values were strongly correlated for a given individual; therefore, these data were only useful for analysis of longitudinal samples. Significant differences in OD-n values were observed more frequently for paired samples when viral

breakthrough occurred, then when individuals were suppressed at both time points (86% [16/22] vs. 68% [39/120], p<0.001, Fisher's exact test). Using an increase of 0.2 OD-n between paired time points as a cutoff, the sensitivity of detecting viral breakthrough was 65% (14/22) and specificity of detecting viral breakthrough was to 86% (17/120, p <0.001, Fisher's exact test).
**Conclusions:** The LAg-avidity assay cannot identify individuals with viral breakthrough using a single sample due to intra-individual variation in OD-n values. When paired longitudinal samples were evaluated, viral breakthrough was identified in a majority of cases.

### COMPARISON OF THE NEW SIEMENS VERSANT® HIV-1 RNA 1.5 ASSAY (KPCR), VERSANT® HIV-1 RNA 1.0 ASSAY AND THE ABBOTT REALTIME HIV-1 ASSAYS ON CLINICAL SAMPLES FROM WEST AND CENTRAL AFRICA

C. Wagner, D. Monga, G. Kritikos, T. Battersby
*Siemens Healthcare Diagnostics, R&D, Berkeley, United States*
*Presenting author email: cynthia.r.wagner@siemens.com*

**Background:** The high frequency of HIV-1 mutations is a known risk for viral load assays. Continuous surveillance of HIV sequence databases led to an update of the VERSANT® HIV-1 RNA 1.0 Assay (kPCR). Performance of the new assay design was evaluated using HIV infected patient plasma samples from West and Central Africa.
**Methods:** HIV infected patients from Cameroon, Guinea-Bissau, Senegal, and Congo representing Group M subtypes and Group O were evaluated. Samples were tested with the VERSANT® HIV-1 RNA 1.5 Assay (kPCR)* and VERSANT® HIV-1 RNA 1.0 Assay(kPCR) using the VERSANT® kPCR Molecular System at Siemens Healthcare Diagnostics Inc., Berkeley, CA. Abbott REALTIME HIV-1 Assay testing was performed at the Siemens Clinical Laboratory, Berkeley, CA. The linear relationship was determined using Deming regression of a scatter plot of the paired log copies/mL quantitations.
**Results:** All samples (85) were quantified by the VERSANT® HIV-1 RNA 1.5 Assay (kPCR) and 1.0 Assay. The regression line slope for the log-log plot was 0.96 and the R-squared value was 0.96. The majority of the discrepant results showed higher quantitations of CRF02_AG with the VERSANT® HIV-1 RNA 1.5 Assay (kPCR). The average difference between the VERSANT® HIV-1 RNA 1.5 Assay (kPCR) and Abbott REALTIME HIV-1 Assay was -0.08 $log_{10}$ copies/mL. The regression line slope was 0.95 and the R-squared value was 0.94. Among the 82 patient samples in which viral load levels were determined by both assays, 76 samples (93%) differed by less than 0.5 $log_{10}$ copies/mL.
**Conclusions:** The new VERSANT® HIV-1 RNA 1.5 Assay (kPCR) accurately detects samples of HIV infected patients from West and Central Africa, has good correlation with the VERSANT® HIV-1 RNA 1.0 Assay (kPCR), and shows overall higher quantitation of subtype CRF02_AG. The VERSANT® HIV-1 RNA 1.5 Assay (kPCR) has a high degree of correlation with the Abbott REALTIME HIV-1 Assay.

## THPEB041

### EVALUATION OF TRIN-SCREEN HIV FROM TRINITY BIOTECH, A SCREENING RAPID TEST FOR THE DETECTION OF HUMAN HIV-1/2

K. Parker[1], P. Tran[1], K. Burns[2]
*[1]Trinity Biotech, Research and Development, Carlsbad, United States, [2]Trinity Biotech, Bray, Ireland*
*Presenting author email: kenneth.burns@trinitybiotech.com*

**Background:** The objective of this study was to evaluate the performance (sensitivity and specificity) of the new Trin-Screen HIV rapid lateral-flow assay against a 2-test algorithm, 1st line and 2nd line, used as the reference standard (1st line: Alere Determine™ HIV-1/2, 2nd line confirmatory: Uni-Gold™ HIV). Performance was also compared to First Response HIV-1/2.O and KHB HIV (1+2).
**Methods:** A total of 437 prospective EDTA whole blood samples were collected at two hospitals in the Republic of South Africa between October 2015 and January 2016. A total of 202 male, 225 female and 10 unidentified gender samples were collected from patients aged between 3 months to 89 years of age. The clinical status of the patients was defined using the 2 rapid test algorithm, Alere Determine™ HIV-1/2 as the 1st line screening assay and Uni-Gold™ HIV as the 2nd line confirmatory assay. If the screen and confirmatory assays conflicted, the HIV status for the sample was uncertain and excluded from the study. All products were used in accordance with their IFU procedure.
**Results:** A total of 144 samples were confirmed HIV seropositive, while 289 samples were confirmed HIV seronegative with the 2-test algorithm. The Trin-Screen HIV demonstrated 100% (144/144) sensitivity and 99.65% (288/289) specificity versus the 2 rapid test algorithm. Versus both other rapids (First Response HIV-1/2.O and KHB HIV (1+2)), the Trin-Screen HIV gave 100% (144/144) agreement for HIV seropositive samples and 99.65% (288/289) agreement for HIV seronegative samples.
**Conclusions:** The new Trin-Screen HIV rapid test demonstrates excellent sensitivity and specificity when compared to the 2-test algorithm for detection of HIV-1/2. Trin-Screen HIV is a viable alternative to the current 1st line HIV test assays in Africa.

## THPEB042

### THE CHALLENGE OF DISCRIMINATION BETWEEN HIV-1, HIV-2 AND HIV-1/2 DUAL INFECTIONS

B. Langhoff Hønge[1,2,3], S. Jespersen[1,3], C. Medina[4], D. da Silva Té[4], Z. José da Silva[1,5], A. Lund Laursen[3], C. Wejse[1,3,6], H. Krarup[7], C. Erikstrup[2], The Bissau HIV Cohort Study Group
*[1]Indepth Network, Bandim Health Project, Bissau, Guinea-Bissau, [2]Aarhus University Hospital, Department of Clinical Immunology, Aarhus, Denmark, [3]Aarhus University Hospital, Department of Infectious Diseases, Aarhus, Denmark, [4]Ministry of Health, National HIV Programme, Bissau, Guinea-Bissau, [5]Ministry of Health, National Public Health Laboratory, Bissau, Guinea-Bissau, [6]Aarhus University, GloHAU, Center of Global Health, School of Public Health, Aarhus, Denmark, [7]Aalborg University Hospital, Department of Clinical Biochemistry, Section of Molecular Diagnostics, Aalborg, Denmark*
*Presenting author email: bohonge@gmail.com*

**Background:** It is important to discriminate between HIV types, as HIV-2 is intrinsically resistant to non-nucleoside reverse transcriptase inhibitors (NNRTIs), which is often used in first-line antiretroviral treatment (ART) regimens. However, correct discrimination may be difficult because of cross-reacting antibodies and because many HIV-2 infected patients do not have detectable HIV-2 RNA plasma levels. The performance of established discriminatory assays in populations harboring HIV-1, HIV-2 and HIV-1/2 dually infected patients is not well known. This study validates two of the most widely used discriminatory assays.
**Methods:** Samples from ART naïve HIV infected patients from the Bissau HIV Cohort in Guinea-Bissau were selected for the study. The two tests INNO-LIA HIV-1/2 Score and ImmunoComb HIV 12 Bispot were performed on all samples. HIV-1 and HIV-2 RNA was measured on plasma samples using Abbott m2000 system and an *in-house* method, respectively. To ease comparison, HIV positive (untypable) results by INNO-LIA were classified as HIV-1/2 dual infections.
**Results:** The median age of the 239 included patients was 36 years (IQR 29-45), and 73% were females. The median CD4 cell count was 245 cells/μL (IQR 140 - 464).
INNO-LIA categorized samples as 122 HIV-1 positive, 69 HIV-2 positive and 48 HIV-1/2 dually positive. According to ImmunoComb, 122 were HIV-1, 49 HIV-2 and 68 HIV-1/2 dually infected. There was disagreement in 22 samples, of which 20 were typed HIV-2 infected by INNO-LIA but HIV-1/2 dually infected by ImmunoComb. None of these 20 samples had detectable HIV-1 RNA and 10 (50.0%) had detectable HIV-2 RNA levels. These results are in accordance with the HIV-2 typing called by INNO-LIA but not with dual infection as called by ImmunoComb, as undetectable HIV-1 RNA in untreated dual infected patients is unlikely.
In two other samples disconcordantly typed HIV-1 and HIV-1/2 dually infected, HIV-1 RNA was detected whereas HIV-2 RNA was not. Thus, final type determination could not be concluded.
**Conclusions:** Both assays have been used as gold standards for HIV type discrimination in several studies. However, ImmunoComb overestimated the number of HIV-1/2 dually infected samples and HIV RNA measurements did not disprove any INNO-LIA results.

## CD4 measurement (including point of care diagnostics)

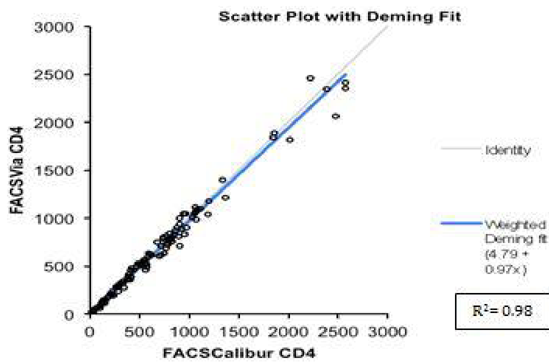
#### Accurate and precise performance of the BD FACSVia™ system for determination of CD4 cell count and %CD4 cell concentration

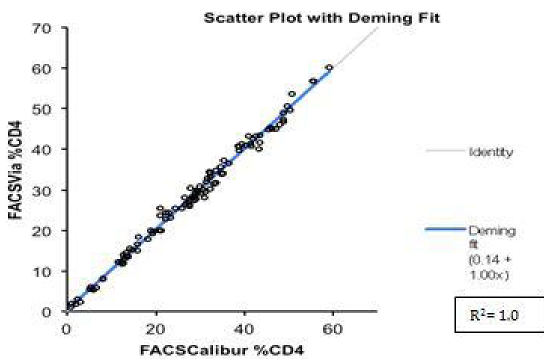
C. Bush-Donovan, J. Nguyen, M. Kalyan, A. Lin, T. Frey, I. Omana-Zapata
*BD Biosciences, San Jose, United States*
*Presenting author email: imelda_omana-zapata@bd.com*

**Background:** An accurate, precise determination of CD4 cell count and %CD4 cell concentration is essential for quality care of HIV-infected individuals. The BD FACSVia™ system,* a new, easy-to-use flow cytometer, designed for clinical settings such as reference and district hospitals, to maintain continuity of quality testing. It features a lightweight, compact design with fixed alignment and pre-optimized detector settings to simplify testing and reduce cost-of-operation. This abstract describes the analytical performance of this system tested against the BD FACSCalibur™ predicate cytometer.
**Methods:** A study compared the BD FACSVia system to BD FACSCalibur system results. Accuracy was evaluated by testing venipuncture samples from 104 HIV-infected individuals (Biocollections, Florida, USA) using BD Tritest™ CD3/4/45 with BD Trucount™ tubes for CD4 cell count and %CD4 cell concentration on both systems. Precision was evaluated in a 21-day study using commercially available CD4 controls and following CLSI EP5 A3 guidelines. Deming regression was used to compare the two methods.
**Results:** Deming regression for absolute CD4 cell count showed an $R^2$ of 0.98 and a slope of 0.97 (Figure 1).



*[Figure 1. Specimens Tested for Absolute CD4 by BD FACSVia and FACSCalibur]*

Deming regression for %CD4 cell concentration showed an $R^2$ of 0.99 and a slope of 1.0 (Figure 2).



*[Figure 2. Specimens Tested for %CD4 by BD FACSVia and BD FACSCalibur]*

BD FACSVia precision studies showed %CVs for CD4 cell counts and % CD4 concentration of 8% and 6%, respectively.
**Conclusions:** The accuracy of CD4 cell count and %CD4 cell concentration using the new BD FACSVia system is consistent with BD FACSCalibur/Tritest performance.
*Product not yet available for sale. For Investigational Use Only.

#### CD4 variability in Malawi: Implications for continued use of a CD4 threshold of 500 cells/mm³ versus universal eligibility for antiretroviral therapy

A. Schooley[1,2], P. Kamudumuli[3], S. Vangala[4], C.-H. Tseng[4], C. Soko[1], K. Phiri[1], J. Parent[1], D. Namarika[1], A. Jahn[5,6], R. Hoffman[2]
*[1]Partners in Hope Medical Center, EQUIP-Malawi, Lilongwe, Malawi, [2]David Geffen School of Medicine, University of California, Department of Medicine/Division of Infectious Diseases, Los Angeles, United States, [3]URC Malawi Lab Project, Lilongwe, Malawi, [4]David Geffen School of Medicine, University of California, Department of Medicine, Los Angeles, United States, [5]University of Washington, Global Health, International Training and Education Center for Health (I-TECH), Lilongwe, Malawi, [6]Ministry of Health, Lilongwe, Malawi*
*Presenting author email: rhoffman@mednet.ucla.edu*

**Background:** Despite WHO recommendations for universal antiretroviral therapy (ART), many resource-constrained countries may continue to use CD4 threshold to determine eligibility. Given the uncertainty about the ability of a single CD4 count to accurately classify a patient as ART eligible, we sought to understand the extent to which CD4 variability results in misclassification at a CD4 threshold of 500 cells/mm³.
**Methods:** We performed a prospective study of CD4 variability in Malawian HIV-infected, ART-naive, WHO Stage 1or 2, non-pregnant adults. CD4 counts were performed daily for 8 consecutive days. We fit a Bayesian linear mixed effects model of log-transformed CD4 cell counts to the data. Using samples from the posterior distribution, we employed Monte Carlo approximations to estimate misclassification rates for different observed values of CD4 based on different numbers of repeated measurements. The misclassification rate was defined as the conditional probability of the true CD4 being below 500 cells/mm³ given a geometric mean of N measurements being above 500 cells/mm³.
**Results:** Fifty patients were enrolled from two sites yielding 387 samples. The median age was 33.5 years (IQR 27.5, 40.0) and 34 (68%) were female. Misclassification rates were < 1% when the observed CD4 counts were ≤250 cells/mm³ or ≥750 cells/mm³. Rates of misclassification were high at observed CD4 counts between 350-650 cells/mm³, particularly when a single measurement was used (up to 46.7%). Repeated CD4 measures resulted in decreases in misclassification rates with the largest benefit observed at CD4 counts of 350-650 cells/mm³.

| Observed CD4 (cells/mm³) | Misclassification Rates % (95% Credible Interval) [illegible] | | | | |
|---|---|---|---|---|---|
| | N=1 | N=2 | N=3 | N=4 | N=5 |
| [illegible] | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) |
| [illegible] | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) |
| [illegible] | <0.1 (<0.1, 0.1) | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) |
| [illegible] | 5.8 (2.3, 10.7) | 0.8 (0.1, 1.7) | 0.1 (<0.1, 0.3) | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) |
| [illegible] | [illegible] | 34.8 (16.2, 57.2) | [illegible] | 21.8 (6.7, 46.9) | 17.3 (3.8, 41.9) |
| [illegible] | 15.8 (7.3, 28.9) | 13.5 (3.6, 25.1) | 11.5 (1.8, 21.2) | [illegible] | 8.5 (0.8, 20.4) |
| [illegible] | 4.1 (1.3, 7.7) | 1.2 (0.1, 2.8) | 0.4 (<0.1, 1.1) | 0.1 (<0.1, 0.4) | <0.1 (<0.1, 0.3) |
| [illegible] | 0.6 (0.1, 1.8) | 0.1 (<0.1, 0.4) | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) |
| [illegible] | 0.3 (<0.1, 0.8) | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) |
| [illegible] | <0.1 (<0.1, 0.1) | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) | <0.1 (<0.1, <0.1) |

*[Table. Misclassification Rates (%) by Observed CD4 Based on the Geometric Mean of N Measurements]*

**Conclusions:** Our data show that ART eligibility based on a single CD4 count results in highest risk of misclassification when CD4 counts are in the range of 350-650 cells/mm³. Given the benefits of early ART, countries should weigh the costs and complexity of CD4 testing using a 500 cell/mm³ threshold against the cost savings and public health benefits of universal eligibility.

#### Implementation and validation of PIMA CD4 program in Ukraine

A. Shost[1], O. Burgay[1], S. Filippovych[1], G. Mukhina[2], M. Pettigrove[2], L. Galley[2], I. Andrianova[3], A. Scherbinska[3]
*[1]International Charitable Foundation 'Alliance for Public Health', Kyiv, Ukraine, [2]American Society for Microbiology, Washington, United States, [3]SI 'Ukrainian Center for Socially Dangerous Diseases Control of the Ministry of Health of Ukraine', Kyiv, Ukraine*
*Presenting author email: shost@aph.org.ua*

**Background:** The Fast-Track treatment targets are known as the 90-90-90 targets that refer to the pathway by which a person is tested, linked and retained in HIV care, and initiates and adheres to antiretroviral drugs. Despite the changes in the national HIV treatment protocol on increasing the index of CD4-lymphocytes as one of the most important criterion in making the decision to start ART to 500 cells/µL, CD4 definition remains relevant for MARPs.
**Description:** To scale up PWIDs' linkage to care, the PIMA point-of-care (POC) CD4 testing has been implemented within the framework of the GFATM program in Ukraine and the Cooperative Agreement between the USCDC and the ASM funded

Author Index

by PEPFAR. Alliance procured 30 Alere Pima CD4 analyzers. Analyzers were distributed to regional AIDS centers, mental hospital, general hospitals, medical units of State Penitentiary Service in 17 regions of Ukraine.
**Lessons learned:** PIMA CD4 program was launched with PIMA analyzers validation provided by National Reference Laboratory. With technical support from the ASM 4 trainings on the PIMA Analyzer utilization; 2 trainings on PIMA CD4 program management; 1 training on the role of case managers in PIMA program were conducted. Guidelines for PIMA CD4 testing with SOPs for method and communication algorithm were developed. Proficiency Testing for PIMA CD4 count was established, 93.1% of POC received correct results. PIMA CD4 testing at POC started in November 2014. Target group includes MARPs who: got positive test results for HIV first time; already got confirmed HIV-positive result; are registered at AIDS-center and don't receive ART. 15545 patients were tested for PIMA CD4 T-lymphocytes; mean count was 351 cells/µL. It showed that mostly of HIV infection cases were detected at late stages of disease. The average number of days from receiving positive result of HIV rapid test till ART start is about 60 days. After integration PIMA CD4 test initiation and beginning of ART took about 15 days.
**Conclusions/Next steps:** First results showed that PIMA POC CD4 testing and the interaction between HCIs and NGOs can improve HIV-infected PWID linkage to care. Next steps will be introduction of the mainstream PIMA analyzers use in mobile clinics and VCT sites.

### THPEB046

#### Increasing access to routine viral load with nearly point-of-care SAMBA-1: outcomes from a decentralised HIV program in Malawi

S. Nicholas[1], E.C.J.-M. Poulet[1], B. Schramm[1], J. Wapling[2], A. Rakesh[2], I. Amoros[3], M. Gueguen[4], E. Szumilin[4]
*[1]Epicentre, Research, Paris, France, [2]Médecins Sans Frontières, Chiradzulu, Malawi, [3]Médecins Sans Frontières, Lilongwe, Malawi, [4]Médecins Sans Frontières, Paris, France*

**Background:** Viral load (VL) testing is key for timely provision of intensive adherence counselling or switching treatment regimen of suspect failures. From August 2013, Médecins sans frontières implemented gradually in 4 decentralised sites and 1 hospital of Chiradzulu district (Malawi) the semi-quantitative (1000 copies threshold) VL test with SAMBA-1, a nearly point-of-care (POC) system. The protocol recommends 2 follow-up tests after a high VL before a change in ART regimen for those remaining high. The objective is to review the VL cascade and identify challenges with VL monitoring.
**Methods:** We describe sequence of VL tests performed between August 2013 and December 2015 in five ART-treatment sites on first line ART-patients with at least 1 VL test, up-to 1 year after the first high VL.
**Results:** Over the study period, 13,675 patients had a VL test, among which 1,611 (11.8%) had a high VL. VL coverage ranged from 60 to 81% depending on POC implementation. Among patients with high VL, 1,146 (71.1%) had follow-up tests. Median time between tests was 3.2 months [IQR 2.8-4.6] and clinical review was same day for over 80% of tests in decentralised sites. Among the 1,146, 354 (30.9%) suppressed at 2nd test and 94 suppressed at 3rd test giving an overall suppression of 39.1% and a marginal gain of 11.3%. A total of 381 patients remained with high VL at 3rd test and 259 (68.0%) were switched to 2nd line regimen in a median time of 1.0 month [IQR 0-3]. Second VL test was missing for 465 patients and third one for 317. Among these, over 80% were still followed on 31/12/2015.
**Conclusions:** Good treatment adherence and VL coverage were observed. Use of POC VL demonstrated short turn-around time for clinical review. However VL follow-up of suspect failures remains a major challenge. Further the VL algorithm of 3 tests showed minimal gain in virological suppression whilst a large number of patients remained on a potentially failing regimen.
One follow-up test at 3 months after high VL seems sufficient to confirm treatment failure. This will simplify the process and may lead to improvement in VL test monitoring and HIV treatment outcomes.

## Drug resistance testing

### THPEB047

#### Gag-PR interplay and HIV-1 PI resistance in the Swiss HIV Cohort

K. Kletenkov[1], S. Wagner[1], D. Hoffmann[2], J. Boeni[3], S. Yerly[4], V. Aubert[5], F. Schoni-Affolter[6], D. Struck[7], J. Verheyen[8], T. Klimkait[1], Swiss HIV Cohort Study
*[1]University of Basel, Molecular Virology, Department Biomedicine, Basel, Switzerland, [2]University of Duisburg - Essen, Research Group Bioinformatics, Centre for Medical Biotechnology, Essen, Germany, [3]University of Zurich, Institute of Medical Virology, National Center for Retroviruses, Zurich, Switzerland, [4]University Hospital Geneva, Laboratory of Virology, Geneva, Switzerland, [5]University Hospital Lausanne, Division of Immunology and Allergy, Lausanne, Switzerland, [6]University of Lausanne, Swiss HIV Cohort Study, Data Centre, Institute for Social and Preventive Medicine, Lausanne, Switzerland, [7]Luxembourg Institute of Health, Department of Population Health, Strassen, Luxembourg, [8]University of Essen, Institute of Virology, Essen, Germany*
*Presenting author email: thomas.klimkait@unibas.ch*

**Background:** HIV resistance against protease inhibitors (PIs) is typically characterized by the accumulation of mutations in the viral protease (PR). However, the Gag polyprotein, natural substrate of PR, intricately interacts with PR, also on the way of selecting for therapy resistance.
Since current genotyping algorithms generally analyze only the PR gene itself to predict the degree of PI resistance, we set out to investigate the role of Gag in PI resistance by assessing the mutational patterns observed in Gag-PR under antiretroviral therapy.
**Methods:** Data sets were collected from routine diagnostics of 369 PI treatment-experienced (PI-TE) and 521 PI treatment-naïve patients infected with subtype B HIV-1 at the cohort enters in Basel and Zurich. Each set included Gag C-terminal sequences (up to 140 AA), along with protease sequences and treatment history. Fisher's exact test with significance level alpha=0.05 was used for linking PI treatment to changes in Gag. Pairwise associations between selected mutations were identified in PI-TE samples.
**Results:** We assessed the prevalence of 49 Gag mutations that have previously been reported to associate with PI-exposure or -resistance: Among the PI-TE samples 82.4% carried ≥1 such Gag mutations. 17.9% of all PI-TE samples had mutations in Gag that had been experimentally proven to decrease PI susceptibility either alone or in combination with PR resistances.
We also report novel associations of A360S/P (OR=6.3), Q369L (OR=5.5), T427D/N (OR=2.9), E467V/K (OR=4.8) to PI exposure, and specifically of T427D/N to LPV (OR=3.1), E467K to NFV (OR=3.5), Q474H (OR=3.5) and Y484P to DRV. Some of these mutations could potentially influence Gag processing through altering p6 phosphorylation.
Additionally we deciphered the development of resistance mutational patterns that include the observed mutations and obtained first phenotypic evidence of fitness-compensating role of T427D and previously described mutations S451N and R452S.
**Conclusions:** Principles of collecting and structuring comprehensive data sets on mutations in Gag have been implemented and help to improve current genotypic algorithms. This study contributes to the deeper understanding of PI resistance by providing additional details on clinical relevance, development, and interplay of Gag and PR resistance patters.

### THPEB048

#### How accurate is the WHO viral load-based first-line ART failure determination algorithm? Evidence from southern Swaziland

D. Etoori[1], B. Kerschberger[1], M. Sikhathele[2], G. Maphalala[2], M. Ndlangamandla[1], I. Zabsonre[1], R. Teck[3,4], A. Telnov[3], I. Ciglenecki[3]
*[1]Médecins Sans Frontières (OCG), Mbabane, Swaziland, [2]Swaziland Ministry of Health, Mbabane, Swaziland, [3]Médecins Sans Frontières, Geneva, Switzerland, [4]Médecins Sans Frontières, Southern Africa Medical Unit, Cape Town, South Africa*

**Background:** HIV drug-resistance (HIVDR) testing is used to determine the need for anti-retroviral treatment (ART) switching and make informed decisions on drug selections in resource-rich countries. However, the high costs and very limited testing capacities limit its routine use in resource-limited settings. Therefore, WHO recommends treatment switching when virologic failure (VF) is detected, defined as two consecutive viral loads (VL) ≥1000 copies/ml despite intensive adherence counselling. We aimed to assess the performance of the WHO VL algorithm in rural Swaziland to predict HIVDR and the need for treatment switching.
**Methods:** From 08/2013 to 10/2014, dried blood spot (DBS) samples from patients (aged ≥18 years) on ART and with VF were genotyped using ATCC kits at the resistance testing laboratory at CDC, (Atlanta) and , DR mutations were interpreted with the Stanford HIVdb algorithm. We combined all levels of DR against first-line

ART (lamivudine (3TC) with zidovudine (AZT)/ tenofovir (TDF) and nevirapine (NVP)/ efavirenz (EFV)) and the second-line drug lopinavir/ritonavir (LPV/r), and evaluated the positive predictive value (PPV) of the WHO VL algorithm to accurately identify patients with DR requiring treatment switching.
**Results:** Overall, 135 DBS samples were successfully genotyped and 123 (56.2%) were females. Fifty nine (43.7%) were on AZT/3TC/NVP, 23 (17.0%) on AZT/3TC/EFV, 13 (9.6%) on TDF/3TC/NVP and 40 (29.6%) on TDF/3TC/EFV. AZT resistance in the four regimens ranged from 17.5 - 74.6% (p< 0.001), 3TC from 85.0 - 93.2% (p=0.569), TDF from 47.8 - 77.5% (p=0.027) and for NVP and EFV combined from 87.5 - 94.9% (p=0.623). Of the 53 patients receiving TDF, 12 (22.6%) showed resistance against AZT and none against LPV/r. Of the 82 patients receiving AZT, 40 (48.8%) had resistance against TDF and one (1.2%) against LPV/r. The overall PPV was 91.9% and ranged from 87.5% (p=0.5986) for TDF/3TC/EFV to 94.9% (p=0.6477) for AZT/3TC/NVP.
**Conclusions:** This study demonstrated high accuracy of the WHO VL switching algorithm in predicting HIVDR to the current first-line ART regimens. In our setting following a public health approach, most patients failing their first-line regimens may not require DR testing for diagnosis and confirmation of virologic treatment failure.

## THPEB049

### A POINT MUTATION RESISTANCE ASSAY TO OPTIMIZE HIV-1 SUBTYPE C ANTIRETROVIRAL THERAPY IN INDIA

S. Saravanan[1], T.R. Dinesha[1], S. Gomathi[1], J. Boobalan[1], S. Poongulali[1], N. Kumarasamy[1], S. Solomon[1,2], L. Ledingham[3], A. Derache[4], P. Balakrishnan[1], M. Coetzer[3], D. Katzenstein[5], R. Kantor[3]
*[1]YRG Centre for AIDS Research and Education, Chennai, India, [2]Johns Hopkins University School of Medicine, Baltimore, United States, [3]Brown University, Providence, United States, [4]Africa Centre for Health and Population Studies, University of KwaZulu-Natal, Durban, South Africa, [5]Stanford University, Stanford, United States*
*Presenting author email: saravanan@yrgcare.org*

**Background:** HIV guidelines recommend tenofovir in first/second line therapy. Upon failure, regimens may be optimized by genotyping. Conventional genotyping (Sanger) is expensive and typically unavailable for care in India and other resource-limited settings,where nucleos(t)ides combinations for new regimens are limited. Point mutation assays can be subtype/region-specific due to genomic variability. We evaluated whether a simple, lower-cost point mutation assay for tenofovir-associated K65R mutation can help optimize regimens and identify patients who may benefit from zidovudine addition.
**Methods:** At YRG-CARE, Chennai, India, we developed an allele specific PCR (ASPCR) point mutation assay for K65R, tested it in RNA and DNA from drug naïve and tenofovir-treated, HIV-infected, YRG-CARE patients, and compared results to Sanger sequencing, to evaluate its detection as a minority variant (>5%). Resistance interpretations were with Stanford Database tools.
**Results:** Participants included 83 adults (≥18 years); 37 drug naïve (64% female; median age 26 years; viral load 62,053 copies/mL) and 46 on tenofovir-based 1st-line (n=26) or 2nd-line (n=20) regimens (54% female; median age 38 years; viral load 102,920 copies/mL). All sequences were subtype C. K65R was not detected among naïves by Sanger, while of 46 patients failing tenofovir, 96% and 89% had reverse transcriptase drug resistance, 85% and 67% dual-class, and 26% and 17% had K65R in RNA and DNA, respectively (Table). ASPCR detected >5% K65R in 1/37 (3%) RNA and DNA naïves, and 20% of RNA (those detected by Sanger and additional 2) and 26% DNA (those detected by Sanger and additional 8) treated. Of 14 patients with high-level predicted resistance to tenofovir in RNA and 8 in DNA by Sanger,12 (86%) and 8 (100%) were identified by ASPCR.
**Conclusions:** An ASPCR point mutation assay may provide a simple, lower cost approach in resource limited settings, to identify K65R and tenofovir resistance. In those patients with evidence of K65R, zidovudine may be added in the next regimen for additional activity. The significance of K65R minority variant detection >5% by ASPCR (below the Sanger >20% threshold) remains to be determined.

## THPEB050

### VERY LOW PREVALENCE OF PRIMARY RESISTANCE MUTATIONS TO INTEGRASE INHIBITORS AMONG PATIENTS INFECTED WITH HIV-1 IN A SINGLE CENTRE (NORTHERN ITALY)

G. Lapadula[1], S. Malandrin[2], A. Bandera[1], S. Costarelli[1], M. Fabbiani[1], A. Muscatello[1], A. Soria[1], N. Squillace[1], A. Cavallero[2], A. Gori[1]
*[1]San Gerardo Hospital, University of Milano-Bicocca, Infectious Diseases Unit, Monza, Italy, [2]San Gerardo Hospital, Virology Unit, Monza, Italy*

**Background:** Genotypic resistance testing (GRT) for integrase strand inhibitor (INSTI) is not currently recommended before antiretroviral therapy (ART) initiation, due to low prevalence of primary resistance. Nonetheless, increase in INSTI use suggests that continuous surveillance is advisable.
**Methods:** All consecutive HIV-infected patients naïve to ART, undergoing GRT between January 2012 and May 2015 in Monza (Italy), were evaluated for the presence of INSTI resistance mutations. Mutations in the integrase region were assessed using a commercially available kit (Trugene OpenGene, SIEMENS). Antiretroviral resistance was estimated using the Stanford HIV drug resistance database. HIV subtype was assigned basing on *pol* gene sequences.
**Results:** One-hundred-eighty-two naïve patients were included (82% male, mean age 40y [SD:11.8y], 35% MSM, 71% subtype-B). Among non-B subtypes, the most prevalent were CRF02_AG (10%) and C (6%). Major INSTI resistance mutations were detected in only one patient, whose virus harboured S147G and the accessory mutation H51Y. Other accessory mutations (H51Y, T97A, V151I, E157Q) were found in 10 additional patients. Moreover, the following amino-acid substitutions, not previously associated with exposure or reduced susceptibility to INSTI , were found at relevant codon positions listed by the Stanford HIV database: H51S, L68I, L74I/V, T97P/S, E138D, G163E/Q/T/V/X. Mutation patterns interpretation resulted in high-level resistance to raltegravir in 1/182 patient (0.5%). Low-level or potential-low-level resistance to raltegravir, dolutegravir or elvitegravir was detected in 8 (4.4%), 9 (4.9%) and 2 (1.1%) patients, respectively.

| Patient | Subtype | Major Mutations | Accessory Mutations | Substitutions in relevant positions | RAL | DTG | EVG |
|---|---|---|---|---|---|---|---|

*[Mutational pattern and predicted susceptibility to integrase inhibitors of viruses harbouring major or accessory mutations in the integrase region]*

Despite a steady increase in INSTI prescription (from < 10% in 2012 to >40% in 2015, in our cohort), the proportion of patients harbouring major or accessory INSTI mutations did not significantly change across time (8.2%, 4.4%, 4.3% and 5.9% in 2012, 2013, 2014 and 2015, respectively).
**Conclusions:** In this single centre analysis, primary resistance to INSTI was rare but not absent. Local and global continuous surveillance are advisable as use of INSTI becomes more widespread.

## Clinical Trials: Phase I/II

### THPEB051

### Antiviral activity and safety of ABX-464 in HIV-infected treatment-naive patients

J.-M. Steens[1], S. Khuanchai[2], R. Winai[3], K. Ruxungtham[4], R. Rouzier[5], D. Scherrer[6], P. Gineste[7], P. Pouletty[7], H. Ehrlich[7], R. Murphy[8]
*[1]ABIVAX SA, Chief Medical Officer, Paris, France, [2]Chiang Mai University, Research Institute for Health Sciences, Chiang Mai, Thailand, [3]Faculty of Medicine Siriraj Hospital, Preventive and Social Medicine, Bangkok, Thailand, [4]Chulalongkorn University, Faculty of Medicine, Bangkok, Thailand, [5]Cap Research, Mauritius, Mauritius, [6]ABIVAX, Montpellier, France, [7]ABIVAX, Paris, France, [8]Northwestern Feinberg Medical School, Chicago, United States*
*Presenting author email: jean-marc.steens@abivax.com*

**Background:** ABX464 is a first-in-class antiviral drug candidate for the treatment of patients with HIV-infection. It is an orally available small molecule that blocks HIV replication through an entirely novel mechanism, inhibition of Rev activity. Preclinical data in humanized mice showed that ABX 464 monotherapy had an antiviral effect which was sustained after treatment interruption (Campos et al, Retrovirology 2015 12:30) A prior food-effect study demonstrated a 3-fold increase in parent drug exposure when administered with food without a significant impact on the active glucuronide metabolite.
**Methods:** The objective of this study was to evaluate the safety of ABX-464 at ascending doses versus placebo in HIV-infected treatment-naive patients. Patients were randomized into successive cohorts of 8 patients where 6 received 14-or 21 days of ABX 464 and 2 placebo. Patients from Mauritius and Thailand were included in the study after confirmation of HIV infection and no history of prior antiretroviral therapy. At day 0, patients received the first dose of ABX-464/ placebo in a once daily schedule. Safety assessments and laboratory parameters were recorded throughout the study. After completion of each cohort, a DSMB reviewed safety data and recommended whether the next cohort be initiated at a higher dose. Successive cohorts received 25, 50, 75, 100 and 150 mg QD. The 25, 50 and 100 mg.cohorts took drug fasting for 21 days, the 75 and 150 mg cohorts took drug with food for 14 days.
**Results:** Safety and Tolerability : No grade 3 or 4 events were noted. No patient stopped the study due to adverse events and all patients completed at least 14 days of treatment. Viral load reduction was observed in 3/12 patients in the 75 and 100 mg cohorts and 4/6 in 150 mg cohort; there were no significant viral load changes in the 6 placebo patients from these cohorts.
**Conclusions:** ABX 464 was well tolerated in this first study in HIV-infected patients. ABX 464 monotherapy showed early antiviral activity in HIV-infected treatment naïve patients. These results warrant the further planned development of this novel acting antiretroviral drug.

### THPEB052

### Satisfaction, tolerability, and acceptability of cabotegravir (CAB) + rilpivirine (RPV) long-acting therapy: LATTE-2 results

M. Murray[1], D. Dorey[2], S. Griffith[3], J. Mrus[4], W. Spreen[3], D. Margolis[3]
*[1]ViiV Healthcare, Global Health Outcomes, Brentford, United Kingdom, [2]GlaxoSmithKline, Mississauga, Canada, [3]ViiV Healthcare, Research Triangle Park, United States, [4]Janssen, Research Triangle Park, United States*
*Presenting author email: miranda.i.murray@viivhealthcare.com*

**Background:** CAB and RPV are long-acting injectables (LAI), in Phase 2b development for treatment of HIV-1. LATTE-2 evaluated an intramuscular (IM) regimen of CAB LA + RPV LA and assessed the safety and efficacy of 2-drug IM antiretroviral therapy (ART), compared to 3-drug oral ART (CAB + ABC/3TC). Secondary objectives include tolerability, satisfaction, and acceptability of CAB LA + RPV LA.
**Methods:** LATTE-2 is an open-label study in ART-naïve HIV infected adults. Patients who were virologically suppressed with oral CAB+ABC/3TC during the 20-week Induction Period (IP) were randomized 2:2:1 to IM CAB LA + RPV LA every 4 weeks (Q4W), every 8 weeks (Q8W), or remained on daily oral CAB + ABC/3TC (PO) in the Maintenance Period (MP). Acceptability and tolerability were self-assessed with the HIV-Medication Questionnaire (HIV-MQ) while satisfaction was measured with the adapted HIV-Treatment Satisfaction Questionnaire (HIV-TSQ). The HIV-TSQ and HIV-MQ were administered at Wks -16 and -4 (during IP); and at Day 1, Wk8, and Wk32 during MP.
**Results:** LATTE-2 included 309 patients. In the MP, 95% (Q8W) and 94% (Q4W) of patients maintained HIV-1 RNA < 50 c/mL at W32 compared to 91% on PO (ITT-ME). Drug-related AEs included injection site pain (92% of patients on IM arms) with 99% of injection site reactions (ISRs) being mild (82%) or moderate (17%), lasting a median of 3 days and decreasing in frequency after the first injection. HIV-MQ results show that 151/215 (70%) with CAB LAI found no/very little pain through Wk 32; similar results (71%) were observed with RPV LAI. HIV-TSQ showed that most patients found the Q8W 101/106 (95%) or Q4W 93/100 (93%) LAI regimen much more convenient than the PO regimen. At Wk 32, patients were significantly more satisfied with LAI treatment in both the Q4W and Q8W arms compared to PO treatment in the IP on all items of the HIV-TSQ, including convenience, flexibility, and ease of use.
**Conclusions:** While ISRs occurred in most patients receiving LAI, questionnaire results suggest that they had little impact on the patients and they experienced a high level of overall satisfaction with and preference for LAI on dimensions in the HIV-TSQ.

## Clinical Trials: Phase III

### THPEB053

### Association between NNRTI exposure, virological suppression and emergence of resistance in HIV-infected patients on tuberculosis treatment: a substudy from the CARINEMO-ANRS12146 trial

E. Baudin[1], N. Bhatt[2], C. Rouzioux[3,4], M. Serafini[5], L. Molfino[6], I. Jani[2], A.-M. Taburet[7], M. Bonnet[1], A. Calmy[8], CARINEMO Study Group
*[1]Epicentre, Paris, France, [2]Instituto Nacional de Saude, Maputo, Mozambique, [3]Paris-Descartes University, EA3620, Sorbonne Paris Cite, France, [4]APHP, Necker Hospital, Paris, France, [5]Médecins Sans Frontières, Geneva, Switzerland, [6]Médecins Sans Frontières, Maputo, Mozambique, [7]APHP, Bicêtre Hospital, Paris, France, [8]Geneva University Hospitals, Geneva, Switzerland*
*Presenting author email: acalmy@gmail.com*

**Background:** The CARINEMO randomized clinical trial included 570 HIV-tuberculosis co-infected patients in Mozambique with the objective of comparing two non-nucleoside reverse transcriptase inhibitors (NNRTIs) in treatment naïve patients. The non-inferiority of the nevirapine (NVP) compared to efavirenz (EFV)-based antiretroviral therapy was not shown. We explored the relationship of NNRTI concentrations with virological suppression and the possible emergence of resistance mutations at week 48.
**Methods:** Participants were randomized to NVP or EFV (no lead-in-dose) and were followed for 48 weeks. At inclusion and every three months, blood was collected to measure HIV-RNA. Plasma concentrations of NNRTI were measured 12 hours after administration at weeks 12, 24, 36 and 48.
Resistance mutations to (N)NRTI were determined in all patients with HIV-RNA counts greater than 400 copies/mL at week 48. Viral suppression was defined as an HIV-RNA below 400 copies/mL, and viral escape as an HIV-RNA above 400 copies/mL at a given timepoint. Percentiles of drug concentrations were calculated for each NNRTI.
**Results:** Among the 570 randomized patients, 470 (82%) had an HIV-RNA result at week 48. Patients who modified their allocated NNRTI during the conduct of the trial (n=21), and patients with NNRTI concentrations below the limit of quantification at all timepoints (n=3), were excluded, leaving 446 for these analyses. At week 48, 54 (12.1%) patients had a viral escape and 34 patients had a virus with resistance mutations ((N)NRTI) detected.
Among patients with virological escape at week 48, 18 (40.9%) had a drug concentration below the 25th percentile at week 12. Among patients who had a suppressed HIV-RNA at week 48, only 78 (23.2%) were below the 25th percentile at week 12.
Low drug exposure at week 12 (below the 10th percentile) was associated with virologic escape (OR 2.6, 95%CI [1.2; 6.0]) and also with the emergence of (N)NRTI mutations (OR 5.7 95%CI [2.4; 13.9]) at week 48.
**Conclusions:** The NNRTI level of exposure even during the first 3 months of treatment translates into changes of virological suppression and low measurable concentrations leads to emergence of resistance mutations.

## Clinical Trials: Post-licensing

### THPEB054

### The role of plasma HIV RNA and T cell subset counts/percent and ratio in explaining the benefit of immediate antiretroviral therapy (ART) initiation in HIV+ individuals with high CD4+ counts

A. Babiker[1], B. Grund[2], S. Sharma[2], A. Phillips[3], J. Arribas[4], S. Badal-Faesen[5], S. Collins[6], S. de Wit[7], M. Johnson[8], M. Losso[9], R. Novak[10], M. Proschan[11], G. Touloumi[12], F. Gordin[13], S. Emery[14], J. Lundgren[15], J. Neaton[2], INSIGHT START Study Group

*[1]University College London, MRC Clinical Trials Unit at UCL, London, United Kingdom, [2]University of Minnesota, Minneapolis, United States, [3]University College London, Infections and Population Health, London, United Kingdom, [4]Hospital La Paz CRS, Madrid, Spain, [5]Helen Joseph Hospital, Johannesburg, South Africa, [6]HIV i-Base, London, United Kingdom, [7]St Pierre University Hospital, Brussels, Belgium, [8]Royal Free Hospital, London, United Kingdom, [9]Hospital General de Agudos JM Ramos Mejia, Buenos Aires, Argentina, [10]University of Illinois, Chicago, United States, [11]National Institute of Allergy and Infectious Diseases, Bethesda, United States, [12]Athens University Medical School, Athens, Greece, [13]VA Medical Center, Washington DC, United States, [14]The Kirby Institute, Sydney, Australia, [15]University of Copenhagen, CHIP, Dept of Infectious Diseases, Rigshospitalet, Copenhagen, Denmark*

**Background:** The START study demonstrated a 57% risk reduction in serious AIDS, serious non-AIDS events or death (primary endpoint) with immediate versus deferred ART. Most events occurred at CD4+ counts >500 cells/mm$^3$. We investigated the extent to which treatment differences in CD4+, CD8+ and plasma HIV RNA (VL) explained the clinical benefit of immediate ART.

**Methods:** ART-naïve HIV+ participants with CD4+ >500 cells mm$^3$ were randomised to immediate (n=2326) or deferred ART (n=2359) with assessments every 4 months for CD4+, CD8+ counts/percent, and VL. We estimated average biomarker levels using longitudinal mixed models, and hazard ratios (HR, Immediate/Deferred ART) using Cox models with and without adjustment for most recent (latest) biomarker levels.

**Results:** Over mean follow-up of 3 years, 138 participants experienced primary events. Average levels of CD4+, CD8+ and VL were 194 cells/mm$^3$ higher, 189 cells/mm$^3$ lower, and 1.2 $\log_{10}$ copies/mL lower, respectively, with immediate compared to deferred ART. Latest CD4+ count was modestly associated with the primary endpoint in the deferred arm ((HR=0.87 per 100 cells higher; 95% CI: (0.79, 0.97), p=0.01) but not in the immediate arm (HR 0.98 (0.88, 1.11) p=0.78). In contrast, higher VL, higher CD8+, CD8+% and lower CD4+/CD8+ ratio were strong predictors of the primary endpoint regardless of treatment group. The association with CD8+ count and CD4+/CD8+ ratio remained strong after adjusting for VL (data not shown). As shown in the table, treatment differences in CD4+%, CD8+%, or CD4+/CD8+ ratio during follow-up predicted less than half the observed risk reduction conferred by immediate ART.

| Adjustment[a] | HR(Immediate/Deferred ART) after adjustment for latest marker levels HR | 95% CI | P | Proportion of treatment effect explained (PTE)[b] Estimate | (95% CI) |
|---|---|---|---|---|---|
| No adjustment | 0.43 | (0.30, 0.62) | <0.001 | - | - |
| CD4+ cell count | 0.52 | (0.35, 0.76) | 0.001 | 0.15 | (0.00, 0.42) |
| CD4 percent | 0.66 | (0.44, 0.98) | 0.041 | 0.40 | (0.18, 0.90) |
| CD8+ cell count | 0.50 | (0.34, 0.72) | <0.001 | 0.12 | (0.05, 0.27) |
| CD8 percent | 0.62 | (0.42, 0.92) | 0.016 | 0.33 | (0.14, 0.71) |
| Log CD4/CD8 ratio | 0.69 | (0.46, 1.02) | 0.065 | 0.45 | (0.20,1.02) |
| Log HIV RNA | 0.98 | (0.62, 1.55) | 0.937 | 0.97 | (0.40, 2.44) |

[a] Biomarkers were considered singly in the adjustment.
[b] PTE = 1 - (unexplained risk reduction/net risk reduction). For each biomarker, the unexplained risk reduction is one minus the adjusted HR. Net risk reduction (0.57) is one minus the unadjusted HR.

*[Proportion of treatment benefit (immediate vs deferred ART) that could be explained by treatment differences in laboratory markers]*

**Conclusions:** In this population, latest CD8+ count and percent and CD4+/CD8+ ratio are better predictors of clinical outcome than latest CD4+ count. The reduction in incidence of the primary endpoint conferred by Immediate ART could be explained mostly by the reduction in VL and, to a lesser extent, by increase in log CD4/CD8 ratio.

## Timing of therapy initiation

### THPEB055

### Treatment initiation at higher CD4s: challenges to HIV care in four African countries

C. Polyak[1,2], K. Ganesan[1,2], M. Liu[1,2], T. Crowell[1,2], A. Parikh[1,2], E. Bahemana[3], B. Keshinro[4], F. Kiweewa[5], J. Maswai[6], J. Owuoth[7], J. Ake[1], RV329 AFRICOS Study Group

*[1]U.S. Military HIV Research Program, Walter Reed Army Institute of Research, Silver Spring, United States, [2]Henry M. Jackson Foundation for the Advancement of Military Medicine, Bethesda, United States, [3]Walter Reed Program-Tanzania, Mbeya, Tanzania, United Republic of, [4]Walter Reed Program-Nigeria, Abuja, Nigeria, [5]Makerere University-Walter Reed Project, Kampala, Uganda, [6]KEMRI/Walter Reed Project, Kericho, Kenya, [7]KEMRI/Walter Reed Project, Kisumu, Kenya*

*Presenting author email: cpolyak@hivresearch.org*

**Background:** Immediate initiation of antiretroviral therapy (ART), regardless of CD4 count, and routine monitoring of viral load (VL) improve clinical outcomes among HIV-infected individuals but can be difficult to implement in resource-limited settings. Evaluating the effectiveness of current mechanisms for ART initiation and VL monitoring can inform new strategies to facilitate best practices in resource-limited settings.

**Methods:** The African Cohort Study prospectively enrolls adults at 11 PEPFAR-supported facilities in Uganda, Kenya, Tanzania, and Nigeria. HIV management history and laboratory assessments were obtained at entry and every 6 months. We categorized participants into 3 groups by first available CD4: low (≤350 cells/mm$^3$), middle (351-500) and high (>500). Viral suppression (VS) was defined as VL <50 copies/mL. We evaluated demographics, incident illnesses, time from entry into HIV care to ART eligibility, and rates of VS at most recent visit using t-tests, Chi-squared tests, ANOVA and negative binomial regression to compare CD4 groups.

**Results:** Between January 2013 and September 2015, we enrolled 1732 HIV-infected adults (59% female) with a mean age of 39 years (SD 10). The low CD4 group included 62% of participants, middle 16%, and high 22%. Among those with a low CD4, 87% were WHO stage IV. Febrile illnesses were common (17.0/100 person-years [PY] in the low CD4 group, 15.2/100PY in the middle, 12.6/100PY in the high; p=0.61). All-cause hospitalizations were also common (8.1/100PY, 5.8/100PY, 9.1/100PY; p=0.63). Time from entry into care to ART eligibility varied by CD4 group with the low group having a mean (SD) of 0.21yrs (0.7), the middle 1.3yrs (1.7) and the high 2.2yrs (2.02) (p< 0.001). Rates of VS in those on ART were similar across CD4 groups with 74% in the low group, 80% in the middle and 80% in the high (p=0.057).

**Conclusions:** Despite expanded testing, enrollment into HIV care with advanced disease is common and delays in ART initiation exist. Once on ART, participants in our cohort achieve VS regardless of CD4 strata and differences in clinical events are not observed. Interventions are needed to engage HIV-infected individuals in care and initiate ART before CD4 declines are observed.

### THPEB056

### Immediate HIV treatment reduces mortality and improves long-term immune health: causal evidence on the real-world impact of immediate versus deferred ART in rural South Africa

J. Bor[1], C. Oldenburg[2], E. Moscoe[3], F. Tanser[4,5], T. Mutevedzi[4], D. Pillay[4,6], T. Bärnighausen[3,4]

*[1]Boston University School of Public Health, Global Health, Boston, United States, [2]Harvard T.H. Chan School of Public Health, Department of Epidemiology, Boston, United States, [3]Harvard T.H. Chan School of Public Health, Department of Global Health and Population, Boston, United States, [4]Africa Centre for Population Health, Mtubatuba, South Africa, [5]University of KwaZulu-Natal, Durban, South Africa, [6]University College London, London, United Kingdom*

*Presenting author email: ceo242@mail.harvard.edu*

**Background:** Immediate initiation of antiretroviral therapy (ART) improves clinical outcomes and reduces mortality in randomized controlled trials. However, the effect of immediate ART under real-life conditions, where patients may have reduced adherence and retention in care compared to trials, is not well characterized. We present results from a large population-based longitudinal cohort in KwaZulu-Natal, South Africa, to investigate the effect of immediate ART initiation on all-cause mortality. We use a quasi-experimental regression discontinuity design that enables estimation of causal effects even in the presence of confounding.

**Methods:** All patients seeking care at the Hlabisa HIV Treatment and Care Programme between January 2007 and August 2011 with CD4 counts up to 350 cells/µl were included in the analysis (N=4,435). Patients were followed until December 2014. A

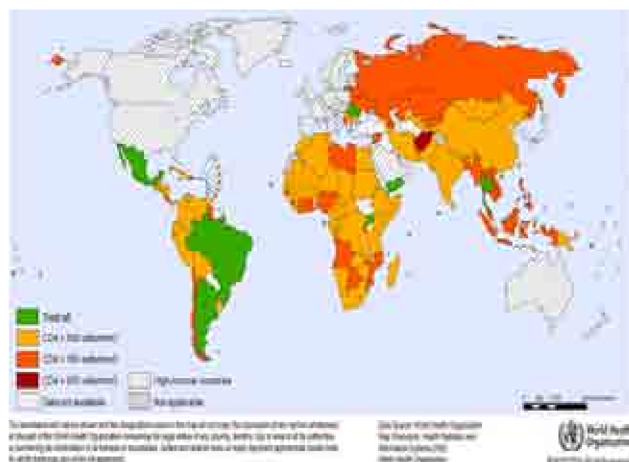
regression discontinuity design was used to assess the intention-to-treat (ITT) effect of immediate versus deferred ART eligibility on all-cause mortality, HIV-related and HIV-unrelated mortality, and immune health (CD4 count). Exploiting the threshold rule for ART initiation (CD4< 200 cells/µL until August 2011), we used Cox proportional hazards models to compare survival for patients just above versus just below the threshold and mixed effects regression models to assess immune health.
**Results:** Among 4,435 index patients, 69.2% were female, 30.8% male, mean age was 33.9 years, and 2,751 (62.0%) were eligible for ART at presentation (CD4 count < 200 cells/µl). There were 935 deaths among the 4,435 individuals over 19,282 person-years of follow-up (incidence rate 4.8 deaths per 100 person-years, 95% CI 4.5 to 5.2). Immediate eligibility for treatment resulted in a 33% decrease in all-cause mortality mortality (HR=0.67, 95% CI 0.48-0.93). Effects were driven entirely by reductions in HIV-related mortality. Immediate eligibility led to a 75-cell advantage in CD4 counts, which persisted at five years.
**Conclusions:** We demonstrate large reductions in mortality and long-run gains in immune health in a population-based cohort study with immediate eligibility for ART. Previous clinical trials in sub-Saharan Africa have not been powered to detect an effect of immediate ART initiation on mortality. These results provide support for scaling up immediate ART in sub-Saharan Africa.

## THPEB057

### UPTAKE AND IMPLEMENTATION OF THE WHO 2015 CONSOLIDATED ARV GUIDELINES: PROGRESS TOWARDS TREAT ALL

M. Doherty[1], M. Beusenberg[2], F. Lule[3], R. Pendse[4], R. Beanland[2], N. Ford[2], M. Vitoria[2], G. Hirnschall[2]
*[1]World Health Organization, HIV/Hepatitis Department, Gex, France, [2]World Health Organization, Geneva, Switzerland, [3]World Health Organization, Brazzaville, Congo, Republic of the, [4]World Health Organization, Delhi, India*
*Presenting author email: dohertym@who.int*

**Background:** Progress towards the ending the AIDS epidemic by 2030 depends on adoption and implementation of global guidelines to optimally treat all people living with HIV. With the *2015 Consolidated ARV Guidelines*, WHO successfully updated and launched new policy recommendations on the clinical and service delivery aspects of HIV treatment and care, and raised the bar to treat all PLHIV.
**Methods:** WHO operates a country intelligence monitor to better follow policy trends at country level. Data from country surveys, MoH HIV focal points, and Global AIDS Response Progress Reporting (GARPr) have been triangulated and validated for the adoption of priority HIV treatment policies within 144 LMIC and 20 WHO focus countries for Fast Track support.
**Results:** Data are presented for 144 LMIC and 20 fast track counties, respectively. 54% of all LMIC and 80% of fast track countries adopted a CD4 count threshold of ≤500 cells/mm3, while 7% and 10% have moved to a treat all policy regardless of CD4 cell count. Adoption and implementation of treatment eligibility varied by WHO region (Figure 1).



*[Figure 1. Uptake of WHO Policy for ART initiation threshold among adults and adolescents living in LIMC, 2015]*

83% and 100% adopted PMTCT Option B/B+; 80% and 95% adopted TDF + 3TC (or FTC) + EFV as the preferred first-line therapy, 60% as a fixed dose combination (FDC); and 63% and 70% implement routine viral load monitoring; all other fast track countries implement targeted viral load monitoring. An update on the country implementation of these policies will be available in April 2016.
**Conclusions:** With the *2015 Consolidated ARV Guidelines*, WHO has rapidly updated global guidance to reflect new science regarding the benefit of early HIV treatment. There is broad support for universal treatment among fast track countries and many are committed to adopting 'Treat All' policies; challenges to full implementation remain. Differentiated service delivery models are key to improving efficiency while maintaining quality as programs expand.

# FIRST-LINE THERAPY

## THPEB058

### SAFETY AND TOLERABILITY OF TENOFOVIR-CONTAINING ANTIRETROVIRAL THERAPY IN WOMEN WHO ACQUIRED HIV IN TWO TENOFOVIR GEL TRIALS

N. Naicker[1], A. Naidoo[1], L. Werner[1], N. Garrett[1], S.S. Abdool Karim[1,2]
*[1]Centre for the AIDS Programme of Research in South Africa, University of KwaZulu-Natal, Durban, South Africa, [2]Department of Epidemiology, Columbia University, New York, United States*
*Presenting author email: nivashnee.naicker@caprisa.org*

**Background:** We assessed whether women who acquired HIV while receiving tenofovir gel pre-exposure prophylaxis can be safely treated with tenofovir-containing antiretroviral therapy (ART).
**Methods:** Between May 2011 and October 2014, women who acquired HIV from two tenofovir gel trials (CAPRISA 004 and CAPRISA 008 studies) were recruited for participation in the CAPRISA 009 study when eligible for ART (CD4 count < 350 cells/µl, pregnancy or AIDS-defining illness). Women were randomised to tenofovir-containing (tenofovir, lamivudine/emtricitabine, efavirenz) or tenofovir-sparing (zidovudine, lamivudine/emtricitabine, efavirenz) antiretroviral treatment regimens. The proportion with adverse events and drug switches were compared.
**Results:** Fifty-nine women, median age 28 [Interquartile range (IQR) 25-31], were enrolled and followed-up for median 18 months (IQR 6-24). Twenty-nine women (7 tenofovir gel exposed) were randomized to a tenofovir-containing and 30 (9 tenofovir gel exposed) to a tenofovir-sparing regimen. Twenty-two (37%) women, 6 with prior tenofovir gel exposure, experienced at least one grade 3 or 4 adverse event. Of the 37 adverse events reported, 24 (65%) occurred in women receiving a tenofovir-sparing regimen with 11 (46%) being possibly or probably related to study-initiated ART in this arm (3 efavirenz-related, 6 zidovudine-related, 2 other drugs). Three of the zidovudine-related adverse events were related to bone marrow suppression, requiring hospitalisation in two cases. A total of 15 drug switches were required in 11 women; all on the tenofovir-sparing regimen (p< 0.001). There were 12 drug switches related to drug toxicities; 7 zidovudine-related toxicities (4 haematological, 2 metabolic, and 1 sleep disturbance), 3 efavirenz-related psychiatric toxicities and 2 general metabolic toxicities. Of the remaining 3 women with drug switches, 2 were due to poor compliance to the twice daily zidovudine regimen, and one was due to pregnancy. One death occurred in each arm, one suicide and one cardiac arrest, cause unknown.
**Conclusions:** These data show that tenofovir-containing ART was more tolerable in women who acquired HIV in tenofovir gel trials. Adverse events and drug switches for toxicity were frequent on the tenofovir-sparing regimen and close clinical monitoring is indicated in young women receiving this regimen.

# SECOND-LINE THERAPY

## THPEB059

### HYPERLIPIDEMIA IN HIV-INFECTED PATIENTS ON LOPINAVIR/RITONAVIR MONOTHERAPY IN RESOURCE-LIMITED SETTINGS

M. Matoga[1], M. Hosseinipour[1,2], E. Aga[3], H. Ribaudo[3], N. Kumarasamy[4], J. Bartlett[5], M. Hughes[3], ACTG A5230 Study Team
*[1]University of North Carolina Project, Kamuzu Central Hospital, Lilongwe, Malawi, [2]University of North Carolina, The Department of Medicine, Division of Infectious Diseases, Chapel Hill, United States, [3]Harvard T.H. Chan School of Public Health, Center for Biostatistics in AIDS Research, Boston, United States, [4]YRG Centre for AIDS Research and Education, Chennai, India, [5]Duke Medical Center, Division of Infectious Diseases, Durham, United States*
*Presenting author email: mmatoga@unclilongwe.org*

**Background:** Cardiovascular disease (CVD) is an emerging concern for HIV-infected patients. Hyperlipidemia is a risk factor for CVD and a complication of protease-inhibitor-based antiretroviral therapy, but little is known about its incidence and risk factors in treated patients in resource-limited settings (RLS).

**Methods:** This is a secondary analysis of ACTG A5230 trial in which HIV-infected adults from India, Malawi, Tanzania, Thailand and South Africa, with virologic relapse on first line therapy were initiated on lopinavir/ritonavir (LPV/r) monotherapy. Hyperlipidemia was, a Grade 2+ elevated fasting total cholesterol (FTC≥240 mg/dl) or fasting triglycerides (FTG≥500 mg/dl) or calculated low density lipoprotein cholesterol (LDL≥160 mg/dl) based on measurements at weeks 12, 24, 48, 68 and 104. We evaluated factors potentially associated with quantitative lipid changes from baseline to week 12. These were age, sex, race, site, and baseline body mass index, CD4 cell count, HIV-1 RNA level, and lipids.
**Results:** 106 participants without hyperlipidemia at baseline started LPV/r; median age 39 years, 68% black African, 55% female. The cumulative incidence of hyperlipidemia at week 104 was 48% (95% CI: 36-58%). At week 12, there were significant mean increases from baseline in FTC (17 mg/dL, P<0.001) and FTG (104 mg/dL, P<0.001). In multivariable analysis, higher baseline FTC (P=0.044), FTG (P=0.025), Thai (P<0.001) or Indian sites (P=0.020) versus African sites were associated with increased risk of hyperlipidemia.
**Conclusions:** In HIV-infected adults in RLS initiating LPV/r, hyperlipidemia was common. Baseline lipid measurements and routine monitoring should be recommended in individuals starting LPV/r-based treatments with borderline high lipids.

## THPEB060

### SECOND LINE ART - ESTIMATED NEED VS ACTUAL INITIATIONS - GAP ANALYSIS

B.B. Rewari[1], R. Rana[2], M. Bamrotiya[2], V. Purohit[3]
*[1]WHO India, New Delhi, India, [2]National AIDS Control Organisation, New Delhi, India, [3]I-TECH, New Delhi, India*
*Presenting author email: drbbrewari@yahoo.com*

**Background:** Free ART programme in India was rolled out in 2004 and currently over 9.20 lakh PLHIV receive ART at 520 ART centers. The Second line ART was introduced in 2008 at 10 Centers of Excellence and is currently initiated from 72 ART plus centers across the country. The PLHIV with suspected treatment failure are evaluated by an expert panel at these centers and are initiated on second line ART if Viral load is >1000 copies/ml. It is estimated from available literature that 3% of patients on first line need second line after 5 years on firstline ART. However programme data show that actual no. of PLHIV on second line (16920 as of October 2015) is much less than the estimated numbers (36,900; 3% of PLHA initiated first line ART, March 2015). A crude data analysis was undertaken to understand this gap.
**Methods:** An excel based format was circulated to 15 ART centers across 5 States to capture the baseline and serial CD4 of PLHIV receiving first line ART for more than 3 years. The ART centers were asked to randomly select 90-100 patients and provide these details. Data of 1,495 patients was collected and serial CD4counts were analyzed on WHO immunological failure criteria.
**Results:** Out of 1495 PLHIV, around 22.4% had one or more of criteria of immunological failure after data cleaning. Among these 8% had CD4 below baseline, 18% had more than 50% fall from peak value while 1% persistently had CD4 below 100/cmm. Nearly 4% of suspected immunological failure cases had multiple failing criteria.
**Conclusions:** This study provides a rough estimate of suspected failure and these PLHIV need to be assed for adherence level, existing OIs and any CD4 -VL discordance for confirming failure to first line. Nevertheless it indicates need for second line ART could be much higher than those currently receiving second line ART. There is need to build the capacity of human resource at ART center for timely identification of immunological failure and referral ; expand number of sites for second line initiation as well as to expand viral load testing early for identification of failure.

### ROLE OF EVG/COBI/FTC/TDF (QUAD) PLUS DARUNAVIR REGIMEN IN CLINICAL PRACTICE

A. Díaz, A. Moreno, C. Gómez-Ayerbe, M.J. Vivancos, S. Bañón, M.A. Rodríguez, F. Dronda, C. Quereda, J.L. Casado, S. Moreno, M.J. Pérez-Elías
*Hospital Universitario Ramon y Cajal, Madrid, Spain*
*Presenting author email: mjperez90@gmail.com*

**Background:** Patients with prior failures, currently in complex suppressive ART, usually claim for an easier regimen. A combination of EVG/COBI/FTC/TDF (Quad) plus darunavir (DRV) 800 mg gives the opportunity of reducing significantly the number of pills while maintaining similar antiretroviral activity. Our objective is to assess the short term safety, efficacy of QUAD plus DRV and DRV levels.
**Methods:** All Quad plus DRV-treated subjects in our clinic were retrospectively collected since July 2014. Baseline and complete follow-up of each patient were entered into a database. Demographics, baseline CD4 cell count and viral load, reasons for new regimen use, change/end of QUAD plus DRV use and darunavir plasma levels while taking new regimen at least one month after initiating it were assessed. Paired analysis were explored.
**Results:** We included 20 participants, 47.9 years old, 75% men, 45% prior IDU, 66.7% AIDS stage, and 45% HCV co-infected. Median baseline and nadir CD4+ cell count were 539 and 122 cells/mm3, respectively. Median length of prior ART was 186 months with exposure to a median of 3.75 drug families. Six HIV strains (30%) presented darunavir-specific mutations (66% L33F and 33% I54L). Main reasons for prescribing new regimen were: simplification 55%, treatment intensification 20%, naive to ART and transmitted mutations 13.3%, and prior toxicity 6.7%. Only one (6%) was a treatment-naïve patient. 80% had HIV RNA level below 100 copies/mL. 30% of patients changed study therapy due to toxicity: 5 patients showed creatinine clearance worsening (4 ml/min mean decrease) and another person suffered from arthralgia. Daily number of pills decreased from 4.6 (SD 1.6) to 2. No significant changes were observed in lipid, hepatic, kidney profiles and CD4+ cell count after a median follow up of 10 months (4 months SD). 88% (15/17) of the patients with follow-up viral load data showed HIV-RNA below 50 copies/mL at week 24. Median darunavir concentrations were 4349 ± 3808 ng/mL in 14 patients. 85% showed adequate DRV concentrations (trough levels >400 ng/mL).
**Conclusions:** In clinical practice darunavir 800 mg once daily plus Quad Combo Tablet were used as a simplification regimen in highly treated patients, with adequate darunavir levels and viral response.

# SIMPLIFICATION (WITH ONE- OR TWO-AGENT REGIMENS) AND SWITCH STUDIES

## THPEB062

### SWITCHING FROM TRIPLE THERAPY WITH PROTEASE INHIBITORS PLUS TWO NUCLEOS(T)IDES TO DUAL THERAPY WITH PROTEASE INHIBITORS PLUS LAMIVUDINE FOR MAINTENANCE OF HIV VIRAL SUPPRESSION: A META-ANALYSIS OF EFFICACY AND SAFETY

J. Moreira[1,2], R. Castro[1,3], N. Bhatt[2], B. Grinsztejn[1], V.G. Veloso[1]
*[1]Fundacão Oswaldo Cruz (FIOCRUZ), Instituto Nacional de Infectologia Evandro Chagas, Rio de Janeiro, Brazil, [2]Instituto Nacional de Saude, Ministerio da Saude, Maputo, Mozambique, [3]Universidade Federal do Estado do Rio de Janeiro, Instituto de Saúde Coletiva, Rio de Janeiro, Brazil*
*Presenting author email: josemoreyyra@gmail.com*

**Background:** Antiretroviral treatment simplification to protease inhibitor (PI/r) plus lamivudine (3TC) has shown to be safe and effective. We conducted a meta-analysis to assess the efficacy and safety of switching from triple therapy (TT) consisting of PI/r plus two N(t)RTIs to dual therapy (DT) with PI/r plus 3TC.
**Methods:** Electronic databases were searched for studies evaluating switching from TT to DT. Eligible patients were adults, with at least 3-months of suppressed viremia, without previous treatment failure, and negative Hepatitis B surface antigen. Randomized clinical trials and cohort's studies were included. Random-effect meta-analysis model was conducted to measure the proportion of achieving virological suppression. Analysis of changes in $CD4^+$ cell count, total cholesterol and estimated glomerular filtration rate (eGFR) were evaluated in both arms. The outcomes were reported in Risk Ratios (RRs) and standardized differences in means.
**Results:** We identified seven studies; three were randomized and four observational. A total of 928 patients were included, 357 continue the TT and 571 switched to DT. Of the 571 patients with DT; 272, 167 and 132 used ATZ/r, DRV/r and LPV/r as the PI/r, respectively. Tenofovir-based NRTI backbone was present in 71% of the patients before switching to DT. Meta-analysis found no statistically significant difference in efficacy (i.e. by intention-to-treat analysis with HIV RNA < 50 copies/mL) between DT and TT (RR 1.03; 95% confidence interval (CI) 0.97-1.10; $p = 0.27$; $I^2 = 0\%$). No significant differences for change in $CD4^+$ cell counts was observed between the two arms (standardized differences in means = 0.109 cells/mm3; p =0.341). DT was associated with an increase in both total cholesterol (standardized difference in means= 0.30 mg/dl; p=0.041) and eGFR (standardized difference in means = 0.2744 mL/min; p < 0.001) *vs* TT. Of the 571 assigned to DT, 61 (10.6%) developed virological failure (*vs* 15.4% in TT), but primary PI/r-associated mutations were not found.
**Conclusions:** Switching from TT to DT is non-inferior and is not associated with increased risk of resistance development in virologically suppressed HIV patients. However, there are mixed patterns of changes attributable to discontinuation of tenofovir component, which is known to reduce both total cholesterol and eGFR.

**Background:** Previous studies (FOTO, BREATHER) have given encouraging results with a 5/7days efavirenz-based maintenance regimen. Based on pilot experience (Leibowitch, FASEBJ-2015), we conducted a 48-week multicenter, open-label, single-arm prospective study evaluating efficacy and safety of a 4/7days maintenance therapy in HIV infected patients with controlled VL.

**Methods:** The main inclusion criteria were age>18 years; current regimen with 2 nucleoside analogs and either a boosted protease inhibitor PI/r or a NNRTI; no treatment modification in the last 6 months; VL< 50 c/ml for at least one year; no resistance mutation to the drugs in current regimen. Maintenance therapy used the same regimen, taken 4 consecutive days of each week. Virological failure (VF) was defined as VL>50 c/ml confirmed within 4 weeks between D0-W48. Patients were evaluated at D0, W4, W8, W12, W16, W24, W32, W40, and W48. The study was designed to show that the efficacy of the strategy >80%, assuming a success rate ≥ 90%, with a power of 87% and a 5% type-one error. Values are presented as median [range]. Adherence to therapy was assessed by questionnaires, pill count, drug concentrations, and MEMS caps for a subgroup of patients.

**Results:** One hundred patients were included in the study, 82 men and 18 women, median age 47[25-75], CD4 nadir 282[7-1044] cells/µl, and receiving ARV therapy since 5.1[1.3-25.2] years with VL< 50 since 4.1[0.5-15.5] years. Current regimen included tenofovir-DF+FTC (89 patients) or abacavir+3TC (11 patients), combined with a PI/r for 29 (lopinavir/r:1, atazanavir/r:13, darunavir/r:15) or a NNRTI for 71 (EFV:41, RPV:25, ETV:5). After 48 weeks, 96% [95%CI 90-98, Kaplan-Meier estimate] were still under maintenance 4/7days regimen without failure; 1 patient returned to 7/7 regimen and left the study at W4, VF was confirmed in 3/100 patients at W4, W8, W40, with VL 785, 124, and 969 c/ml respectively. These 3 patients returned to 7/7 regimen and VL was subsequently suppressed in all 3.

**Conclusions:** Over 48 weeks, maintenance ARV therapy with a 4 days a week regimen was effective in these patients with suppressed VL under 2 nucleosides and either a PI/r or a NNRTI, resulting in a success rate of 96%.

# PHARMACOLOGY / PHARMACOKINETICS / PHARMACOGENOMICS / ROLE OF THERAPEUTIC DRUG MONITORING

## THPEB064

### IMPACT OF FOOD ON THE BIOAVAILABILITY OF DARUNAVIR, COBICISTAT, EMTRICITABINE AND TENOFOVIR ALAFENAMIDE, THE FIRST PROTEASE INHIBITOR-BASED COMPLETE HIV-1 REGIMEN (DCFTAF)

H. Crauwels[1], B. Baugh[2], E. Van Landuyt[1], S. Vanveggel[1], J. Letal[1], A. Hijzen[1], M. Opsomer[1]

*[1]Janssen Infectious Diseases BVBA, Beerse, Belgium, [2]Jansen Research & Developement LLC, Raritan, Belgium*

*Presenting author email: bbaugh@its.jnj.com*

**Background:** DCFTAF is the first one pill, once-a-day protease inhibitor-based complete HIV-1 regimen containing darunavir (DRV, 800mg), cobicistat (COBI, 150mg), emtricitabine (FTC, 200mg) and tenofovir alafenamide (TAF, 10mg). The efficacy and safety of DCFTAF is being investigated in two large Phase 3 studies (NCT02431247, NCT02269917). The present study evaluated the impact of food on the bioavailability of the DCFTAF components (NCT02475135).

**Methods:** Open-label, 2-period crossover study in 24 healthy subjects. Subjects received a single dose of DCFTAF in fasted conditions or after a standardized high-fat breakfast, with a 7-day washout in between. Pharmacokinetic sampling occurred over 72 hours after dosing. Plasma concentrations of DRV, COBI, FTC and TAF were determined using validated LC-MS/MS assays. Pharmacokinetic parameters were calculated using non-compartmental methods. Safety and tolerability were assessed throughout the study.

**Results:** Results are summarized in the Table. The exposure to DRV and COBI administered as DCFTAF was 30-45% and 16-30% lower, respectively, in fasted compared to fed conditions. For FTC, the $C_{max}$ was 26% higher in fasted compared to fed conditions, while AUC was comparable. For TAF, the $C_{max}$ was 82% higher in fasted conditions, while the AUC was 20% lower ($AUC_{inf}$) to comparable ($AUC_{last}$, boundaries 90% CI within 80-125%) in fasted compared to fed conditions. Administration of DCFTAF was generally safe and well tolerated in fed and fasted conditions. There were no grade 3/4 or serious adverse events, and no discontinuations due to adverse events.

**Conclusions:** The exposure to DRV from the DCFTAF tablet is increased in fed conditions, similar to other (co-)formulations of DRV. Differences in the exposures to COBI, FTC and TAF in fed compared to fasted conditions are not considered clinically relevant. The DCFTAF tablet should be taken with food, which is also the recommended intake in the ongoing Phase 3 trials.

# ANTIRETROVIRAL DRUG RESISTANCE

## THPEB065

### HIV-1 DRUG RESISTANCE PATTERN AMONG PATIENTS SUSPECTED OF FAILING SECOND-LINE ANTIRETROVIRAL THERAPY IN NAMIBIA

S. Sawadogo[1], A. Shiningavamwe[2], D. Baughman[3], T. Negussie[3], G. Mutandi[3], C. Yang[4], N. Hamunime[5], S. Agolory[3]

*[1]CDC Namibia, Laboratory Services, Windhoek, Namibia, [2]Namibia Institute of Pathology, Windhoek, Namibia, [3]CDC Namibia, Windhoek, Namibia, [4]CDC, Atlanta, United States, [5]Ministry of Health and Social Services, Windhoek, Namibia*

*Presenting author email: gmutandi@cdc.gov*

**Background:** HIV-infected patients on antiretroviral therapy (ART) are at increased risk of emergence of HIV drug resistance (HIVDR) and virologic failure (VF) due to the lifelong nature of ART, continuous drug pressure on HIV virus, and the associated treatment adherence challenges. The cost of antiretroviral drugs (ARVs) dramatically increases with change of ART regimen from 1st-line to 2nd- or 3rd-line and hence necessitates the need for careful monitoring of HIVDR. Since 2007, Namibia has been conducting limited resistance testing in the public sector for patients suspected of failing 2nd-line ART containing nucleoside reverse-transcriptase inhibitors (NRTI) tenofovir plus lamivudine plus zidovudine, plus protease-pump inhibitor (PI) lopinavir or atazanavir plus ritonavir. Here we report the results of retrospective HIVDR analyses.

**Methods:** We conducted a retrospective review of all laboratory reports for patients undergoing genotyping resistance testing between 2010 - 2015 after VF on 2nd-line ART. HIVDR genotyping results were abstracted from laboratory database and analysed for HIVDR mutations and subtypes. All genotypes were done using the TRUGENE HIV-1 Genotyping Kit (Siemens, Munich, Germany).

**Results:** A mong 898 patients with VF; 420 patients [51% female; median age 38 [IQR 28; 45] were successfully genotyped of whom 341 (82%) harboured any HIVDR mutations. Of those genotyped, 75%, 63% and 23% had non-nucleoside reverse transcriptase inhibitors (NNRTI), NRTI, and PI mutations, respectively. Furthermore, 55% had NRTI and NNRTI, and 19% had NRTI, NNRTI and PI mutations. Dominant NRTI mutations included M184V/I (33%), T215Y/F (17%), D67N (12%), K219Q/E (11%) and K65R (7%). K103N was the dominant NNRTI mutation (21%) followed by G190A/S (13%) and V106M (9%). PI mutations included I54V (8%), V82A (7%), L76V (4%), L33F (3%), L90M (2%) and I84V (2%). HIV-1 subtype C was the most dominant (90%), followed by recombinants B/C (5%) and, 08_BC/C and CRF02_AG 3% each.
**Conclusions:** Our findings revealed high prevalence of HIVDR among patients suspected of failing 2nd-line, although most maintained susceptibility to LPV. Our findings indicate the need for routine viral load monitoring and surveillance of HIVDR and that genotyping is needed to guide selection of appropriate ARVs for 3rd-line regimens.

## THPEB066

### CONSEQUENCES OF AN ADHERENCE SUPPORT PROGRAM AND GENOTYPIC RESISTANCE TESTING FOR SECOND-LINE ART ELIGIBILITY

G. Liotta[1], J.B. Sagno[2], J. van Oosterhout[3,4], S. Mancinelli[1], R. Luhanga[2], B. Chilima[5], H. Jere[2], L. Palombi[1], M.C. Marazzi[6]
[1]*University of Rome 'Tor Vergata', Biomedicine and Prevention Dept, Rome, Italy,* [2]*DREAM Program, Blantyre, Malawi,* [3]*Dignitas International, Zomba, Malawi,* [4]*College of Medicine, Dept of Medicine, Blantyre, Malawi,* [5]*Ministry of Health, CHSU, Lilongwe, Malawi,* [6]*LUMSA University, Rome, Italy*
*Presenting author email: j.vanoosterhout@dignitasinternational.org*

**Background:** Of more than 500,000 Malawian patients on ART in 2015, around 98% are on first-line treatment. Adherence support and diligent management of ART failure are crucial to limit emergence of HIV drug resistance (HIVDR). We aimed to evaluate an adherence support program carried out by the DREAM program in Malawi, and the potential role of HIVDR testing in selecting patients for 2nd line ART.
**Methods:** Among 2,614 patients on first-line ART in 5 DREAM health centres, routine VL monitoring after 12 months of ART was conducted between August 2011 and March 2013. Non-pregnant adults with VL>1,000 copies/ml underwent genotypic HIVDR testing. They received intensive adherence support for 6 months and at 18 months VL was repeated.
**Results:** VL>1,000 at 12 months was found in 85 (3.3%) patients. 65 (76%) were female, mean age was 38 years. In multivariable analysis VL>1,000 at 12 months was associated with lower adherence, but not with age, gender, WHO clinical stage, BMI, VL, CD4 count and haemoglobin level at ART initiation. Genotyping showed 42 (49%) patients harbouring major HIVDR mutations
(8 to NRTI, 3 to NNRTI and 31 to both). Presence of HIVDR mutations was associated with lower BMI and CD4 count at ART initiation and with current ART regimen. After the adherence support program 41/82 (50%) patients had VL< 1000 copies/ml at 18 months, of whom 31 fully suppressed. 14/41 (32.6%) with mutations at 12 months had VL< 1,000 at 18 months, this was 27/41 (65.9%) for those without mutations (p=0.012), 3 VL results were missing. Independent determinants of 18 months VL>1,000 were higher VL at 12 months (OR 2.12; 95%CI: 1.02-4.47) and presence of HIVDR mutations at 12 months (OR 4.35; 95%CI: 1.59-11.1).
**Conclusions:** Similar to other experience, our adherence intervention for patients found with VL>1,000 copies/ml upon routine VL monitoring at 12 months was highly effective in re-suppressing VL to below the 2nd line ART threshold. Presence of HIVDR mutations at 12 months was strongly associated with VL>1,000 after adherence support, although an important percentage with mutations still suppressed.

## THPEB067

### HIV-1 DRUG RESISTANCE MUTATIONS AND SUBTYPES DETECTED IN THE EASTERN CAPE PROVINCE, SOUTH AFRICA

S.T. Kiewitz[1], M. Claassen[2], G.B. Jacobs[1], G.U. Van Zyl[1,2], S. Engelbrecht[1,2]
[1]*Stellenbosch University, Medical Virology, Cape Town, South Africa,* [2]*NHLS, Medical Virology, Tygerberg Coastal, South Africa*
*Presenting author email: 16563328@sun.ac.za*

**Background:** South Africa forms the epicentre of the AIDS pandemic with more than 6.8 million people infected with HIV-1. More than 3.1 million individuals are currently receiving antiretroviral treatment (ART), the highest number world-wide. The HIV-1 prevalence amongst antenatal women in the Eastern Cape Province was 29.1% in 2012, but limited information is available about HIV-1 drug resistance mutations (DRMs).
The aim of this study was to characterize and sequence the HIV-1 *protease* (PR), *reverse transcriptase* (RT) and *integrase* (IN) regions of the *pol* gene.
**Methods:** We received blood samples from 527 patients during 2014. Viral RNA was isolated, the PR, partial RT and IN regions of the pol gene were amplified by RT-PCR and directly sequenced using in-house developed assays. The Stanford drug resistance database was used to identify mutations that are associated with drug resistance. Online subtyping tools, jpHMM, REGA, RIP, Comet, SCUEAL and Stanford, were used for preliminary subtyping. Multiple sequence alignments were done with MAFFT and codon aligned. Maximum likelihood phylogenetic analysis was done with Geneious R8 and MEGA version 6.
**Results:** Samples were obtained from clinics and hospitals in 33 towns in the Eastern Cape. The age of the patients ranged from 12 months to 67 years and included 65.5 % females and 34.5 % males. Eighty five percent of the patients had DRMs. PR sequences with DRMs was 4.4% and RT sequences with NRTI and NNRTI DRMs were 78.7% and 81.2% respectively. A total of 3.1% of the sequences had both NNRTI, NRTI and PI DRMs. Additionally, 15.3% of the sequences had accessory mutations in the Integrase region and 0.75% had major IN mutations. Subtyping and phylogenetic analysis indicated that the majority of the samples were subtype C. Other subtypes detected, included HIV-1 subtypes A, B and unique recombinant forms (URFs).
**Conclusions:** With a complex epidemic that is constantly evolving, it is of utmost importance to monitor continuously for DRMs amongst people receiving ART. It is a growing concern that we have detected this high number of DRMs. Keeping patients on failing regimens could complicate ART options and regimens in the future.

## THPEB068

### PREVALENCE OF RESISTANCE-ASSOCIATED VARIANTS IN LONG-TERM LOW VIREMIC HIV PATIENTS

F. Wiesmann[1], P. Braun[2], G. Naeth[1], H. Knechten[1]
[1]*PZB Aachen, Aachen, Germany,* [2]*PZB Centre Aachen, Aachen, Germany*
*Presenting author email: pab@pzb.de*

**Background:** Goal of each antiretroviral therapy is to suppress HIV viral-load (VL) <50 copies/ml. Despite an appropriate adherence to therapy, successful reduction of VL is not always achievable. The focus of this analysis was to estimate resistance developments under different regimens in patients with long-term low-level-viremia <1000 copies/ml.
**Methods:** Genotypic resistance data of 272 patients were selected according to quantified VLs consecutively between 50-1000 copies/ml between two relevant tests T1 and T2 (mostly < 24 months). VLs at T2 were categorized into group A with VLs of 40-100 copies/ml (n=56), group B 101-200 (n=75), group C 201-500 (n=87) and group D 501-1000 copies/ml (n=54), respectively. Newly developed resistance associated mutations (RAMs) and pre-existing variants were assessed according to HIV-Grade (at least intermediate resistance).
**Results:** In total, primary RAMs could be detected at T2 in 19/56 patients of group A (34.0%), 27/75 in group B (36.0%), 34/87 in group C (39.1%) and 19/54 in group D (35.2%). Newly diagnosed RAMs were detected in 5/56 (8.9%), 11/75 (14.7%), 13/87 (14.9%) and 11/54 (20.4%) at T2, respectively. In these patients, 2/5 (40%), 3/11 (27.3%), 11/13 (84.6%) and 9/11 (81.8%) had wildtype variants at T1. In group A, newly developed RAMs were NRTI-related (M184V/I=3/5 and M41L=2/5), although quantified VLs remained < 200 copies/ml between T1 and T2. In group B, 5 NRTI-mutations newly developed. PI-mutations occurred under 2/23 PI-based therapies (8.7%), INI-mutations in 5/10 (50%), respectively. In group C, 9 RAMs were NRTI-related (all M184V), 4/11 Integrase-RAMs were newly detected (36.4%) and 3/10 (30%) were NNRTI-related, respectively. In group D, 8 cases showed NRTI-related resistance, 6 included M184 substitutions. NNRTI-resistance occurred in 5 of 8 therapies (62.5%) and Integrase-RAMs were detected in all 6 INI-treated patients in this group.
**Conclusions:** Newly developed RAMs increased with the level of VL in this analysis. Substitutions at position M184 occurred at high prevalence and represented early events in resistance development under common 3TC/FTC-based therapies. INI-relevant mutations also occurred frequently in patients with VLs>200 copies/ml in this evaluation. In total, resistant variants derived from wildtype viruses at T1 occurred mostly in patients with VLs>200 copies/ml in this analysis.

### PROTEASE INHIBITOR RESISTANCE AFTER FAILURE OF SECOND-LINE THERAPY IN A RURAL SOUTH AFRICAN SETTING

L.E. Hermans[1,2], H.A. Tempelman[2], R. Schuurman[1], A.M.J. Wensing[1]
*[1]University Medical Center Utrecht, Department of Medical Microbiology, Utrecht, Netherlands, [2]Ndlovu Care Group, Groblersdal, South Africa*
*Presenting author email: lhermans@ndlovu.com*

**Background:** Antiretroviral therapy (ART) programmes in South Africa report high on-treatment suppression rates. However, virological failure and selection of drug resistance occurs regularly leading to increasing uptake of protease inhibitor (PI)-based second line ART. This study investigates drug resistance profiles in cases of virological failure during second line ART in a longstanding cohort of patients attending a rural South African clinic.
**Methods:** Virological failure was defined as ≥2 consecutive HIV-RNA measurements of >1000 copies/ml in patients receiving second line ART ≥6 months. Genotypic drug resistance testing on Dried Blood Spots (DBS) was performed as routine clinical procedure. DBS were shipped to a WHO-reference laboratory. Population genotypic analysis of the PR-RT region was performed. Resistance mutations were determined according to 2015 IAS-USA figures. Clinicians received feedback including treatment advice based on mutational patterns, treatment history and drug availability.
**Results:** Between 2006 and 2015, 281 patients had received second line ART ≥6 months (64% female, median age 36.0 [IQR: 26.7 - 43.5]). Forty-three patients in care met the definition of virological failure on second line ART (58% female, median age 36.2 [IQR: 31.0 - 44.1]). All 43 patients received boosted lopinavir either with AZT/3TC (72.1%), TDF/3TC (18.6%) or other NRTIs (9.3%). Median time after initiation of ART was 3.9 years and median time on second line ART was 1.7 years. At failure of second line ART median CD4 was 249 [IQR: 81 - 378] cells/mm$^3$ and median log-HIV-RNA was 4.43 [IQR: 3.85 - 4.86] copies/ml.
Major resistance mutations were present in 69.7% of cases. (Partial) resistance to the current regimen was present in 55.8%. PI resistance was noted in 7 cases (6.0%). In 5/7 cases of PI resistance, encountered mutations conferred high-level resistance to lopinavir.
**Conclusions:** In this longstanding rural cohort virological failure during second line ART was frequently encountered. Although PI resistance was more frequently observed than is reported in high-income settings, almost half of the patients did not have resistance mutations to the second line regimen and a third did not harbour resistance mutations at all. These results indicate a potential role for drug resistance testing to enable clinicians to make rational treatment switches.

## ADHERENCE

## THPEB070

### ADHERENCE AND VIRAL SUPPRESSION IN PREGNANT WOMEN ALREADY ON ART WHEN ENTERING ANTENATAL CARE IN CAPE TOWN, SOUTH AFRICA

K. Brittain[1], R.H. Remien[2], C.A. Mellins[2], T. Phillips[1], A. Zerbe[3], E.J. Abrams[3,4], L. Myer[1]
*[1]University of Cape Town, Division of Epidemiology & Biostatistics, School of Public Health & Family Medicine, Cape Town, South Africa, [2]Columbia University, HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute, New York, United States, [3]Columbia University, ICAP, Mailman School of Public Health, New York, United States, [4]Columbia University, College of Physicians & Surgeons, New York, United States*
*Presenting author email: kirstybrittain@gmail.com*

**Background:** Prevention of mother-to-child transmission (PMTCT) services have previously focussed on HIV+ women who are newly initiating antiretroviral therapy (ART) in pregnancy. However, increasing numbers of women are already on ART when entering antenatal care. Despite the growing size of this population, there are few data on their ART adherence and HIV viral suppression. We examined self-reported non-adherence, non-suppressed viral load (VL), and factors associated with each among HIV+ pregnant women already on ART when entering PMTCT services in Cape Town, South Africa.
**Methods:** We recruited HIV+ women entering PMTCT services at a large primary care clinic for the MCH-ART study. This analysis focussed on women on ART ≥4 months. At enrolment, self-report measures of concerns about taking ART during the perinatal period (Cronbach's α: 0.77), adherence self-efficacy (α: 0.93) and ART adherence were administered; VL testing (Abbott RealTime HIV-1) was conducted. We used multivariable logistic regression to explore factors associated with non-adherence (defined as missed ART doses on ≥2 days during the preceding 30 days) and with non-suppressed VL (VL >1,000 copies/mL).
**Results:** Among 482 women (mean age: 31.2 years; mean duration of ART use: 3.4 years), 22% reported any missed ART dose in the preceding 30 days; 15% reported non-adherence; and 20% and 12% had VL >50 and >1,000 copies/mL, respectively. Non-adherence was strongly associated with non-suppressed VL (OR: 2.68; 95% CI: 1.41-5.11). Adjusting for age, non-adherence was associated with single marital status (OR: 1.80; 95% CI: 1.03-3.15), unintended pregnancy (OR: 1.75; 95% CI: 0.99-3.08) and greater concern about taking ART (OR: 1.40; 95% CI: 1.09-1.82); higher adherence self-efficacy was associated with a reduced odds of non-adherence (OR: 0.47; 95% CI: 0.26-0.82). In adjusted analyses, non-suppressed VL was associated with report of previous discontinuation of ART (OR: 6.59; 95% CI: 2.93-14.79), greater concern about taking ART (OR: 1.38; 95% CI: 1.03-1.85) and unintended pregnancy (OR: 1.92; 95% CI: 1.02-3.64).
**Conclusions:** Among HIV+ pregnant women entering PMTCT on ART, substantial levels of non-adherence and non-suppressed VL were observed. Tools for identifying women entering antenatal care already on ART with adherence difficulties and elevated VL are needed to target counselling interventions and adherence monitoring.

## THPEB071

### UTILITY AND ACCEPTABILITY OF DRIED BLOOD SPOT (DBS) AND HAIR BIOMARKERS AS OBJECTIVE MEASURES OF ANTIRETROVIRAL THERAPY (ART) ADHERENCE AMONG HIV+ ADULTS IN SOUTH AFRICA

P. Warne[1], R. Robbins[1], P. Anderson[2], H. Gouse[3], J. Joska[3], H. Jiang[4], C.-S. Leu[1,5], Y. Mtingeni[3], M. Henry[3], J. Lopez-Rios[1], J. Castillo-Mancilla[2], S. Cremers[4], B. Levin[5], C. Mellins[1], R. Remien[1]
*[1]NYSPI/Columbia University, HIV Center for Clinical and Behavioral Studies, New York, United States, [2]University of Colorado Denver, Aurora, United States, [3]University of Cape Town, Cape Town, South Africa, [4]Columbia University Medical Center, Irving Institute for Clinical and Translational Research, New York, United States, [5]Columbia University Mailman School of Public Health, Biostatistics, New York, United States*
*Presenting author email: rhr1@cumc.columbia.edu*

**Background:** Current ART adherence measures have disadvantages such as subjectivity and patient/provider burden; none in clinical use measures drug ingestion. In a "real-world" setting, we compared utility and acceptability of assays of tenofovir-diphosphate (TFV-DP) in DBS and tenofovir (TFV) in hair as objective measures of ART adherence reflecting drug ingestion.
**Methods:** In 5 monthly visits, 28 HIV+ South African adults who had started ART containing TFV in the past month and were being monitored by an electronic monitoring device, Wisepill (WP), provided DBS and hair samples. At each visit, they were interviewed on acceptability of sampling, e.g., pain and willingness for repeated collection and self-collection. DBS TFV-DP and hair TFV were quantified by validated LC-MS/MS methods. We examined correlations between DBS TFV-DP and hair TFV and between drug levels from each source and percent of 28 days prior to sampling when WP was opened. Generalized estimating equations were used to account for intra-participant repeated observations.
**Results:** Participants were 90% women; mean age, 30 years. Mean % WP openings in prior 28 days was 74% (SD=34%). In currently available matched samples (37 from 15 participants), mean DBS TFV-DP was 967 fmol/punch (SD=391), and mean hair TFV was .86 ng/mg (SD=.59). DBS TFV-DP and hair TFV were significantly correlated (r=.598, p=.002). Correlations of DBS TFV-DP and hair TFV with % WP openings were .378 (p=.040) and .148 (p=.327), respectively. Over time, participants reported high acceptance of finger-stick DBS sampling, including little/no pain and increasing willingness to do finger sticks at clinic visits and by self-collection. In contrast, over time, participants increasingly reported being unwilling to give repeated monthly hair samples as part of regular clinical care.
**Conclusions:** This is one of the first studies examining biomarkers of ART adherence among HIV+ South African adults in real-world clinical settings. Although this pilot study revealed a significant correlation between TFV-DP in DBS and TVF in hair, only TFV-DP in DBS was correlated with use of WP - another "objective" measure of ART adherence. Findings also suggest that DBS sampling may be more acceptable than monthly hair sampling for long-term use in this population.

## THPEB072

### ADHERENCE IN HIV-POSITIVE PATIENTS TREATED WITH SINGLE TABLET REGIMENS VERSUS RECOMMENDED ONCE DAILY MULTI-PILL REGIMEN IN CLINICAL PRACTICE: FINDINGS FROM THE INTERNATIONAL ISTRAP STUDY

C. Martinez[1], M.A. Rodriguez Sagrado[2], K. Manavi[3], A.P. Brito[4], G. Di Perri[5], S. Luque Pardos[6], P. Hay[7], F. Aragão[8], H. Ramroth[9], G. Reilly[8], F. Rogatto[8], A. Antinori[10]
*[1]Hospital Universitario de la Princesa, Madrid, Spain, [2]Hospital Ramón y Cajal, Pharmacy Department, Madrid, Spain, [3]University Hospital Birmingham, Birmingham, Spain, [4]Centro Hospitalar de Setubal, Sétubal, Portugal, [5]Universta di Torino, Department of Infectious Diseases, Torino, Italy, [6]Hospital del Mar, Barcelona, Spain, [7]St Georges Hospital, London, United Kingdom, [8]Gilead Sciences, EAME Medical Affairs Department, London, United Kingdom, [9]Gilead Sciences, Drug Saftey & Public Health, Epidemiology, London, United Kingdom, [10]National Institute for Infectious Diseases 'L. Spallanzani', Rome, Italy*
*Presenting author email: felipe.rogatto@gilead.com*

**Background:** People living with HIV (PLWHIV) may not adhere to antiretroviral therapy (ART) by not taking the full regimen or, if on a multi-tablet regimen (MTR), by taking only part of the regimen (selective adherence; SA). To our knowledge this is the first international study to compare single tablet regimens (STRs) to once-daily (QD) EACS V7.0 recommended MTR.
**Objectives:** To evaluate, in a European setting, how STRs, SA-free regimens, impact on adherence in HIV-1 infected patients compared to recommended once-daily MTRs.
**Methods:** iSTRAP is a retrospective, non-interventional international (Spain, Portugal, Italy and United Kingdom) study. The primary endpoint was to evaluate the probability of achieving ≥90% adherence. Patient-regimens consisting of recommended QD regimens lasting for at least 90 days between 2009 and 2013 were considered. In order to maximize homogeneity between the STR and MTR cohorts, and reduce the impact of treatment-selection bias, a propensity score matching (PSM) approach was applied (characteristics described in table 1) before applying a multivariate logistic model, adjusting for potential confounders.
**Results:** 915 patients were included, contributing 1393 patient-regimens over 5 years. After PSM, 911 regimens (453 STR, 458 MTR) remained for analysis. Patients on STRs were 2.4 (95% C.I. 1.7, 3.5, p<0.0001) times more likely to reach the ≥90% adherence threshold than patients on MTR (Table 2). Results were consistent using 95% threshold (OR 2.1, 95% C.I. (1.5, 2.9), p<0.0001).

| Variable | | STR | MTR | p-value before PSM | STR | MTR | p-value after PSM |
|---|---|---|---|---|---|---|---|
| Sex, N (%) | Males | 548 (75.4) | 456 (68.5) | 0.0003 | 333 (72.7) | 332 (73.3) | 0.8703 |
| Age (Mean/Standard error) | Years | 45.5 (0.3899) | 46.2 (0.3795) | 0.0275 | 45.2 (0.4643) | 46.1 (0.4641) | 0.1744 |
| Smoking (Yes/No), N (%) | Yes | 210 (28.9) | 264 (39.6) | <0.0001 | 158 (34.5) | 142 (31.3) | 0.3113 |
| Drinking (Yes/No), N (%) | Yes | 74 (10.2) | 108 (16.2) | 0.0009 | 62 (13.5) | 62 (13.7) | 0.9476 |

| Illegal drug use, N (%) | Yes | 46 (6.3) | 75 (11.3) | 0.0012 | 40 ( 8.7) | 38 ( 8.4) | 0.8523 |
| Presence of comorbidities, N (%) | No | 442 (60.8) | 326 (48.9) | <0.0001 | 257 (56.1) | 246 (54.3) | 0.5524 |
| Current opioid substitution, N (%) | None | 697 (95.9) | 607 (91.1) | 0.0005 | 432 (94.3) | 423 (93.4) | 0.5830 |

*[Table 1 Regimen population (N=1393) according to STR/MTR status before and after Propensity Score Matching (PMS)]*

| Variable | | ≥90% adherent N (%) | <90% adherent N (%) | OR | 95 %-CI | p-value |
|---|---|---|---|---|---|---|
| Regimen | MTR | 316 (69.8) | 137 (30.2) | Ref. | - | - |
| | STR | 385 (84.1) | 73 (15.9) | 2.4 | (1.7, 3.5) | <.0001 |
| Previous virologic failure | No | 622 (77.6) | 180 (22.4) | Ref. | - | - |
| | One | 46 (70.8) | 19 (29.2) | 1.0 | (0.38, 2.8) | 0.9334 |
| | More than one | 33 (75.0) | 11 (25.0) | 2.7 | (0.90, 8.1) | 0.0769 |
| Art duration (per year longer) | | | | 1.00 | (0.95, 1.0) | 0.9308 |
| HIV RNA >100,000 copies/ml | | | | 1.3 | (1.0, 1.7) | 0.0366 |
| CD4 / 100 mm3 (per cell/mm3 higher) | | | | 1.0 | (0.90, 1.1) | 0.9946 |
| CD4 nadir <100 mm3 | | | | 1.0 | (0.84, 1.2) | 0.8626 |

*[Table 2 Multivariate results for 90% adherence]*

**Conclusions:** In this real-world setting, STRs were associated with improved adherence when compared to a matched cohort of patient-regimens consisting of recommended QD regimens.

## THPEB073

### RELATIONSHIP BETWEEN HEALTH-RELATED QUALITY OF LIFE AND ADHERENCE TO ANTIRETROVIRAL THERAPY OVER TIME IN A COHORT OF PATIENTS AT TWO CLINICS IN SOUTH AFRICA

R.V. Vagiri, J.C. Meyer, A.G.S. Gous
*Sefako Makgatho Health Sciences University, Pharmacy, Pretoria, South Africa*
*Presenting author email: vrajeshvikram@gmail.com*

**Background:** With the advent of antiretroviral therapy (ART), people living with HIV are not only concerned with survival, but also the health-related quality of life (HRQoL) they are able to lead while on life-long ART. Adherence to ART is key to the therapeutic success of ART and HRQoL is an important measure of treatment outcomes. The relationship between HRQoL and long-term adherence to ART is still unclear, especially in the South African resource-constrained context. This study aimed to investigate satisfaction with aspects of HRQoL and adherence to ART over time.
**Methods:** A sample of 431 HIV-positive patients were followed at four-monthly intervals, at two resource-constrained clinics, for a period of 12 months. Adherence and HRQoL data were obtained using a patient-reported adherence rating scale and WHOQOL-HIV BREF respectively. The adherence and HRQoL responses for the four study visits were pooled into a combined sample (n=1631; excluding baseline data for 93 treatment-naïve patients). Adherence and HRQoL scores were regrouped in four-monthly intervals according to the patient's actual duration on ART, ranging 1-120 months. Patients were split into adherent (≥95%) and non-adherent (< 95%) groups. The association between adherence and mean HRQoL at a specific time point on ART was investigated with a time-series analysis. Differences in mean HRQoL scores between adherent and non-adherent patients were compared with an independent sample *t*-test, with p< 0.05 considered statistically significant.
**Results:** Almost 73% of patients (n=431) reported ≥95% adherence over the 12-month study period, however only 41% of patients were consistently adherent (≥95% adherent at all study visits) throughout the study period. Time-series analysis revealed that irrespective of the time on ART, patients who reported ≥95% adherence experienced a better HRQoL in all domains, compared to non-adherent (< 95%) patients (p< 0.05 in nearly half of the four-monthly interval groups).
**Conclusions:** Results demonstrated a significant relationship between adherence and HRQoL, with higher adherence being related to better HRQoL. Achieving consistent long-term adherence to ART is still a serious concern, and requires focus and attention from health professionals and policymakers.

## THPEB074

### PATIENT-REPORTED BARRIERS TO ADHERENCE TO ANTIRETROVIRAL THERAPY AMONG ADULTS AND CHILDREN: A GLOBAL EVALUATION

Z. Shubber[1], P. Bock[2], E. Mills[3], E. Negussie[4], M. Penazzato[4], M. Doherty[4], N. Ford[4]
*[1]Imperial College, London, United Kingdom, [2]Stellenbosch University, Cape Town, South Africa, [3]Global Evaluative Sciences, Vancouver, Canada, [4]WHO, Geneva, Switzerland*
*Presenting author email: fordn@who.int*

**Background:** New global guidelines and targets call for treating all people living with HIV to reach and sustain virological suppression. Achieving these goals requires high levels of adherence to antiretroviral therapy (ART). A better understanding of barriers to adherence is required to inform the design and targeting of adherence interventions, particularly as people receive ART earlier in their disease progression.
**Methods:** We searched 3 databases up to 01 February 2015 to identify patient-reported barriers to adherence to ART word-wide. Data were pooled using random-effect models.
**Results:** 34 studies provided evaluable data on 6564 adult and 752 children on ART across 19 countries worldwide. The main patient reports barriers to adherence overall were changes to daily routine (34.2%, 95%CI 17.9-50.5%), forgetting (31.7%, 25.9-37.5%), being busy (26.3%, 20.3-32.2%), falling asleep (25.5%, 18.6-32.4%), and travel (23.5%, 18.8-28.1%). Feeling sick was a more commonly reported barrier to adherence than feeling well (16.5% vs 5.6%). The most commonly reported barrier among adults was change to routine (38.2%, 17.9-50.5%) while among caregivers of children secrecy/stigma was the most important concern (20.4%, 2.0- 38.7%).
**Conclusions:** These findings suggest that the main barriers to adherence relate to individual patient behaviour, and may be amenable to intervention, including counselling and reminder devices. Initiating ART early may result in improved adherence compared to delayed ART initiation.

### DETERMINANTS OF THE EFFICACY OF 3-MONTH REINFORCEMENT OF ADHERENCE TO MAINTAIN SECOND-LINE ART IN HIV-INFECTED PATIENTS IN TREATMENT FAILURE, ANRS 12269 THILAO STUDY

R. Moh[1,2,3], A. Benalycherif[4], D. Gabillard[3], J. Lecarrou[3], S. Karcher[3], L. N'guessan[5], F. Ello[6], F. Eboumou[6], A. Anzian[7], M. Baila[8], J. Zoungrana[9], A. Sawadogo[9], I. *Presenting author email: rmoh73@gmail.com*

**Background:** Third-line treatment and biological monitoring (viral load and genotype test) are limited in Sub-Saharan Africa making adherence reinforcement a critical issue. This substudy of THILAO ANRS 12269 aims to assess the effectiveness of 3-month adherence reinforcement in HIV-infected adults who failed second-line ART without knowing genotypic resistance test results.

**Methods:** Thilao is a cohort study conducted in Burkina Faso, Côte d'Ivoire, Mali and Senegal. HIV-1-infected adults with virological failure on a second-line protease inhibitor based regimen after a first-line non-nucleoside reverse transcriptase inhibitor were included.

Adherence reinforcement measures were proposed at baseline (V0). After 3 months (V3), a viral load was performed. The second-line therapy was maintained if the viral load from baseline to V3 decreases by more than 2 log or below 400 copies/ml and a third-line Darunavir and Raltegravir-containing therapy was initiated if the viral load from baseline to V3 does not decrease by more than 2 log and was higher than 400 copies/ml.

We analyse the determinants of maintenance of a second line ART regimen in a multivariable analysis.

**Results:** 201 patients were included. Women: 69%, median age: 41 years old. Median CD4 count and viral load at pre-inclusion were 242/mm$^3$ and 4.5 log/ml; median time since ART initiation was 8 years and that since second-line protease inhibitor initiation: 3 years. 86% were seeking assistance in reinforcing adherence. The main choices of adherence measures were: pill organizer (93%), weekly phone calls (86%), alarm reminders on phones (74%), involvement of a member of the circle (62%), home visits (57%), SMS (48%). 24% chose 6 out of 10 proposed measures. After 3-month adherence reinforcement, 63% were maintained on second-line ART and 35% initiated third-line therapy. Age ≥ 40, a number of adherence reinforcement measures ≥ 6 and a viral load at pre-inclusion ≤ 5 log, were independently associated with maintaining the second-line therapy.

**Conclusions:** Reinforcing adherence helped maintain 63% of patients on second-line ART. Pending baseline genotypic resistance test results, a wide choice of combined adherence reinforcement measures, a lower baseline viral load and age above 40 years were associated with maintaining of second line ART.

# ETHICAL ISSUES IN CLINICAL TRIALS AND TREATMENT STRATEGIES

## THPEB076

### WHAT IS "TOO MUCH RISK" IN HIV CURE CLINICAL RESEARCH IN THE UNITED STATES?

J. Taylor[1], D. Evans[2], L. Sylla[3], L. Dee[4], B. Weiner[5], S. Greene[5], S.M. Rennie[6], K. Dubé[5]

*[1]Martin Delaney Collaboratory Community Advisory Board, Palm Springs, United States, [2]Delaney AIDS Research Enterprise, University of California San Francisco, San Francisco, United States, [3]defeatHIV Community Advisory Board, Seattle, United States, [4]Collaboratory of AIDS Researchers for Eradication, Baltimore, United States, [5]UNC Gillings School of Global Public Health, Chapel Hill, United States, [6]UNC Center for Bioethics, Department of Social Medicine, Chapel Hill, United States*

*Presenting author email: karinedube2003@gmail.com*

**Background:** We assessed perceptions of what is "too much risk" in HIV cure clinical research in the United States. Data inform possible risk thresholds and risky features that would make participants reluctant to join studies or regulators to approve them.

**Methods:** We implemented a cross-sectional survey among 400 HIV-positive adults in the United States in 2015. The sample was ethnically diverse and 38 U.S. states were represented. We also conducted key informant interviews with 36 people living with HIV, researchers, bioethicists, members of IRBs and regulatory agencies.

**Results:** Preliminary results revealed a high degree of variability in perceptions of what constitutes "too much risk" in HIV cure research. Activation of genes that would cause cancer (49% [95% CI: 44, 54%]; n = 358) and development of resistance to ARVs (37% [95% CI: 32, 42%]; n= 358) were the clinical factors most likely to discourage participation among HIV-positive volunteers. Perceptions of "too much risk" among this group ranged from first-in-human studies without underlying proof of concept, painful procedures, significant increases in viral load and decreases in CD4, interventions that would cause viral rebound, irreversible long-term side effects, damages to vital organs, immune system shut down, anything that would cause HIV to become unmanageable, progression to AIDS, hospitalization, debilitation or risk of death. Unacceptable social risks included drastic changes in quality of life, transmission of HIV to others, and inability to work or care for family. Financial risks included loss of disability income or insurance coverage. A minority did not place an upper limit on acceptable risk. For regulators, any intervention that would result in clinical hold or high likelihood of serious adverse events would be "too much risk." Clinicians-researchers provided examples of risky modalities such as stem cell transplants in cancer-free patients, studies using PD-1 blockers or latency-reversing agents without demonstrated substantial reductions in reservoir size with treatment interruptions.

**Conclusions:** Despite challenges of making risk determinations at this juncture, knowing what risks are unacceptable is important to inform study design and accrual as well as informed consent. We should strive to maintain public confidence in the HIV cure research enterprise.

## THPEB077

### UNANTICIPATED PARTICIPANT BENEFITS IN HIV CURE CLINICAL RESEARCH: A QUALITATIVE ANALYSIS

A. Gilbertson[1,2,3], S. Rennie[2,3], E. Kelly[4], J. Kuruc[1], J. Tucker[1,5,6]

*[1]University of North Carolina at Chapel Hill, Institute for Global Health and Infectious Diseases, Chapel Hill, United States, [2]University of North Carolina at Chapel Hill, UNC Center for Bioethics, Chapel HIll, United States, [3]University of North Carolina at Chapel Hill, Social Medicine, Chapel Hill, United States, [4]University of North Carolina at Chapel Hill, Gillings School of Global Public Health, Chapel Hill, United States, [5]International Diagnostics Centre, London, United Kingdom, [6]University of North Carolina at Chapel Hill, UNC Project-China, Guangzhou, China*

*Presenting author email: agilber@email.unc.edu*

**Background:** Early-phase HIV cure research involves substantial and often unknown risks, with no direct participant health benefits. During informed consent and subsequent study visits, researchers emphasize this lack of benefit with the intent of

minimizing misconceptions that undermine genuine consent. We explored what, if any, social, psychological, and/or emotional benefits exist for HIV cure study participants. Accordingly, we considered the significance of these often unrecognized benefits and how they may impact responsible conduct of research.
**Methods:** We conducted in-depth, semi-structured interviews with 33 adults, including 15 HIV cure research participants, ten research staff (e.g. participant screeners, research coordinators), and eight bench scientists or physician-researchers in Chapel Hill and Durham, North Carolina, USA. Interviews were audio-recorded, transcribed, and then coded and analysed using MAXQDA® to identify themes related to participants' experiences and perceptions of research benefits.
**Results:** The 15 HIV cure participant-interviewees were all men with a median age of 48 (range: 28-62 years). Most were white (13/15); one was Black, and one Latino. Ten of 15 participants self-identified as gay. All 15 participant-interviewees reported benefits related to cure research, including improved HIV knowledge/awareness (14/15); improved healthcare (12/15); improved personal relationships (8/15); and positive behavioural changes (6/15). Fourteen participant-interviewees described psychological/emotional benefits, including a sense of helping others. Other benefits included: sense of purpose, increased self-worth, and emotional support through interactions with research team members. Five participant-interviewees expressed intent to continue in cure research for as long as possible; two indicated that only death would stop them from participating in cure research. Among researchers and staff, social, psychological, and/or emotional participant benefits were only mentioned in roughly half of the interviews - suggesting less emphasis on these benefits.
**Conclusions:** We observed substantial unanticipated social, psychological, and emotional benefits associated with HIV cure research. These are important and are often the primary reasons participants continue to take part in studies. Participants felt they were taking part in something important and larger than themselves. These benefits, while subjective and contingent, should be considered when recruiting participants and are important for informed consent processes.

## Complementary and traditional medicines

## THPEB078

### Safety and tolerability of *Moringa oleifera* Lam. leaf supplementation by HIV-infected patients on antiretroviral therapy

T.G. Monera Penduka[1], C.C. Maponga[1], G.D. Morse[2], C. Musarurwa[3], C.F.B. Nhachi[4]
*[1]University of Zimbabwe College of Health Sciences, Drug and Toxicology Information Services, Harare, Zimbabwe, [2]State University of New York at Buffalo, Pharmacy Practice, Medicine and Paediatrics, Buffalo, United States, [3]University of Zimbabwe College of Health Sciences, Chemical Pathology, Harare, Zimbabwe, [4]University of Zimbabwe College of Health Sciences, Clinical Pharmacology, Harare, Zimbabwe*
*Presenting author email: moneratg@yahoo.co.uk*

**Background:** *Moringa oleifera* Lam. (Moringaceae) leaf powder is commonly taken by HIV infected patients in developing countries to enhance immunity and manage opportunistic infections. This study was conducted to assess its effect on the liver and kidney function of HIV infected patients on antiretroviral therapy.
**Methods:** A one sequence cross-over, open label, phase I/IIa study was conducted over 35 days. Nineteen HIV infected adult patients were asked to take only their antiretroviral therapy and stop taking any other herbs and supplements for 21 days. Serum biochemistries and urinalysis were performed on day 21. This was followed by administration of 2 teaspoons of moringa leaf powder daily for 14 days. Serum biochemistries and urinalysis were performed again on day 35. Adverse events were monitored by a clinician and participants were asked open-ended questions about their well being throughout the study. Pre- and post-moringa data were analyzed by descriptive statistics, paired t-tests and McNemar tests.
**Results:** Participants had a mean age of 44(±8)years. Sixty-eight percent (n=13) were female. Seventy-four percent reported an increase in appetite and an average weight gain of 0.74 kg (p= 0.03) was observed at the post moringa visit. Based on the Common Terminology Criteria for Adverse events version 4.0, there were no significant differences in the proportion of pre- and post- moringa biochemistry and urinalysis readings falling into toxicity ranges. All observed toxicities (15/296 readings) were grade 1. Eight were observed pre-moringa while seven were observed post-moringa. Exploratory sub-analysis indicated a non-toxic decrease in mean serum bilirubin (8.1 micro-mol/L, p=0.04) and total protein (10.8 g/L, p=0.02), with an increased mean estimated clearance (48.5 mL/min, p= 0.03).
**Conclusions:** *M. oleifera* leaf powder was well tolerated among HIV infected patients on antiretroviral therapy. It promoted weight gain and did not result in hepatic or renal toxicity. A larger clinical study to confirm the sub-clinical effects observed in this study and previously reported by other pre-clinical studies would be useful.

## THPEB079

### Use of non-prescription remedies by Ghanaian HIV-positive persons on antiretroviral therapy

A. Laar[1], A. Kwara[2], P. Nortey[3], A. Ankomah[1], M. Okyerefo[4], M. Lartey[5]
*[1]University of Ghana, School of Public Health, Department of Population, Family, and Reproductive Health, Accra, Ghana, [2]Warren Alpert Medical School of Brown University, Department of Medicine, Providence, United States, [3]University of Ghana School of Public Health, Department of Epidemiology and Disease Control, Accra, Ghana, [4]University of Ghana, Department of Sociology, Accra, Ghana, [5]University of Ghana School of Medicine & Dentistry, Department of Medicine, Accra, Ghana*
*Presenting author email: alaar@ug.edu.gh*

**Background:** Inappropriate use of non-prescription remedies by persons living with human immunodeficiency virus (PLHIV) may result in adverse events or potentiate the risk of non-adherence to prescribed medications. This study investigated non-prescription drugs use among PLHIV receiving antiretroviral therapy (ART) from four treatment centers in southern Ghana.
**Methods:** A mixed method design using quantitative and qualitative methods was used. This paper focuses on the quantitative survey of 540 respondents. Univariate analysis was used to generate descriptive tabulations of key variables. Bivariate analysis and logistic regression modeling respectively produced unadjusted and adjusted associations between background attributes of PLHIV and use of non-prescription remedies. P-value < 0.05 was considered statistical significant. All analyses were performed using IBM SPSS Statistics for Windows, Version 20.0.
**Results:** Three-quarters of the respondents were female. One out of three respondents reported the use of non-prescription medication at least once within three months of the survey. Most of these were locally made and included *concoctions from the Christian prayer centers, Garlic, and Mahogany syrups"*. These remedies were used concomitantly with antiretrovials (ARVs) (46%) or with ARVs but at different times (43%). Some of the remedies were reportedly prescribed by health workers (nurse prescribers), or self-initiated during periods of ARVs shortage or due to their perceived efficacy. Bivariate level analysis identified ART clinic site, place of residence, and ARV adherence monitoring to be significantly associated with non-prescription medication use (p < 0.05). Multiple logistic regression analysis controlling for covariates confirmed location of ART clinic as the only predictor of non-prescription medication use. Compared to clients at the large urban Teaching Hospital (Korle-Bu Fevers Unit ART center), those at the district level (Atua ART center) were 9-fold more likely to use non-prescription remedies (adjusted odds ratio [AOR] =8.84; 95%CI 2. 83 - 33.72). Those from a district level mission hospital (St Martin's ART center) were three-fold as likely to use these remedies (AOR= 2.610; 95% CI 1.074 - 9.120).
**Conclusions:** The use of non-prescription remedies by PLHIV on ART is common in Southern Ghana. Usage is mostly self-initiated because of perceived efficacy and was more common among clients attending rural ART clinics.

## THPEB080

### Exercise therapy for HIV/AIDS patients: guidelines for clinical exercise therapists: a review

J. Grace[1], S. Semple[2], S. Combrink[3]
*[1]University of KwaZulu-Natal, Biokinetics, Exercise & Leisure Sciences, Durban, South Africa, [2]University of Canberrra, Canberra, Australia, [3]University of Zululand, Empangeni, South Africa*
*Presenting author email: gracej@ukzn.ac.za*

**Background:** The human immunodeficiency virus (HIV) has infected more than 60 million people since its discovery and 30 million people have died from it since the pandemic began. Antiretroviral therapy has transformed HIV infection from an acute to a chronic disease, increasing life expectancy but also adding to the potential side effects associated with drug therapy and the co-morbidities accompanying longevity. Exercise can play a valuable role in the management of HIV/AIDS patients by addressing various symptoms and improving their quality of life but the optimum mode, intensity, frequency and duration of exercises that take the different clinical stages of the disease into consideration are inadequately known.
**Methods:** Searches of MEDLINE, EMBASE, CINAHL, HEALTHSTAR, PsycINFO, Cochrane Database of Systematic Reviews and Controlled Trials, Physiotherapy Evidence Database and SPORTDISCUS were conducted between 2000 and January 2014. Searches of published and unpublished abstracts were conducted, as well as a hand search of reference lists and tables of contents of relevant journals and books. Identified studies were reviewed for methodological quality. A total of 33 studies met the inclusion criteria.
**Results:** Evidence-based research indicates that exercise training (aerobic/ progressive resistive exercises and a combination thereof) by HIV-infected individuals is safe and positively influences side effects associated with the HIV disease itself as well as the cardio metabolic and morphological complications that may accompany HAART.

Author Index

Despite this, exercise guidelines currently available are generalized with significant gaps in knowledge as to the minimal and optimal duration, frequency, mode and intensity of exercise needed to produce beneficial changes. Most studies to which we refer have not approached the exercise program from the perspective of validating commonly used prescriptions for physical activity or from a dose-response perspective.

**Conclusions:** Our research has added to the body of knowledge of literature regarding exercise training for HIV-infected individuals by considering the specific clinical stages. It provides information that clarifies the optimal mode, duration, frequency and intensity of AE and PRE prescribed to the different clinical stages of HIV patients. The exercises we recommend have the potential to provide benefit to HIV patients and should be adopted by clinical exercise therapists.

**Background:** Low serum micronutrient concentrations in HIV positive persons are associated with higher morbidity and mortality, but the general role of supplements as adjunctive medical management of HIV remains unproven. The objective of this study was to assess high-dose micronutrient, mineral and antioxidant supplementation(K-PAX Ultra™) compared to standard recommended daily allowance (RDA) multivitamins and minerals slows immune deficiency or disease progression or the start of ART.

**Methods:** MAINTAIN (NCT00798772, CTN 238, doi:10.1371/journal.pone.0085607) is a two-arm double-blind randomized control trial closed in 2015, to evaluate the effect of high-dose supplements on measures of HIV immunodeficiency disease progression among ART-naïve people with HIV and CD4 count > 375 cells/µL. 171 volunteers in 15 Canadian sites received either a hi-dose or an identically looking RDA supplement. Primary outcome was a composite of time to first of CD4 T lymphocyte count below 350 cells/µL, AIDS-defining illness, or start of ART over two years. A Kaplan-Meier survival analysis using the log-rank test, and cox proportional analysis using hazard ratios (HR) and 95% confidence intervals (CI) were used to assess between group differences using an intention to treat analysis.

**Results:** Of 171 enrolled, 40% (68) had at least one outcome at interim analysis: 9 reached a CD4 count below 350 cells/mL alone, 39 started ART alone, 20 reached a CD4 count below 350 cells/mL and started ART, 1 reached an AIDS-related illness and started ART. There was no significant difference in time-to-outcome between treatments (p=0.806, log-rank test; cox PHR 0.83, 95% CI:0.51-1.34). We stopped trial accrual for futility, and have completed follow-up. CD4 T cell count trajectory was analysed by treatment group with censoring after ART: Mean CD4 decline per 3-months was 7.0 (RDA) and 8.9 cells/µL (hi-dose; difference -1.9 (-3.7, 7.5) p=0.5).

**Conclusions:** This well-designed rigorous RCT has identified no significant effect of high-dose micronutrient and anti-oxidant supplement in HIV immune deficiency disease progression and ART initiation, in comparison with a standard RDA micronutrient supplement.

## THPEB082

### EFFECTS OF PROGRESSIVE RESISTANCE EXERCISES COMPARED TO AEROBIC EXERCISES ON BONE MINERAL DENSITY IN PATIENTS ON HIGHLY ACTIVE ANTI-RETROVIRAL THERAPY (HAART) AND HAART NAIVE

S. Ibeneme[1], E. Asogwa[1], G. Fortwengel[2], G. Ibeneme[3], I. Okoye[4], W. Okenwa[5], O. Asogwa[6], Clinical Trial Consortium UNN & UNIRED HsH

*[1]University of Nigeria, Enugu Campus, Medical Rehabilitation, Enugu, Nigeria, [2]Hochschule Hannover University of Applied Arts & Sciences, Research & Epidemiology, German UNESCO Unit on Bioethics, Fakultät III, Hannover, Germany, [3]Ebonyi State University, Nursing Sciences, Abakaliki, Nigeria, [4]University of Nigeria, Radiation Medicine, Enugu, Nigeria, [5]Enugu State University Teaching Hospital Parklane, Surgery, Enugu, Nigeria, [6]Federal University Teaching Hospital, Physiotherapy, Abakiliki, Nigeria*

*Presenting author email: sam.ibeneme@extern.hs-hannover.de*

**Background:** One of the most significant clinical challenges in HIV/AIDS infection is a decline in bone mineral density (BMD), suggesting a tendency towards osteoporosis/and fracture. The side effects of the anti-retroviral drugs - Highly active anti-retroviral therapy (HAART) - may add to bone demineralization and other challenges of drug-drug interactions. Moderate intensity aerobic (MIA) exercises and progressive resistance (PRE) exercises were therefore considered as useful adjunct therapy considering their known benefits in improving bone turnover at menopause

**Methods:** A single-blind randomized controlled trial of 89 patients attending the HIV clinic at Enugu State University Teaching Hospital Parklane, Enugu, used pre and post-test data to observe the response of the BMD after 6 weeks of MIA exercises, PRE exercises and no exercises (control), which constituted the treatment groups, with sub-groups comprising patients on HAART and HAART naïve, respectively. Patients gave written informed consent as approved by ethical committee. They were taught effective use of Borg Scale of the Ratings of Perceived Exertion (RPE), and exercised at an RPE of 10-13, which is interpreted as light to somewhat difficult. Group differences in the collected data were determined using repeated ANOVA, and LSD for post-hoc comparison at p< 0.05

**Results:** There was a significant "between-subject" interaction effect for exercise condition and BMD (F=6.616, df= 2,p=0.002), and for HAART and BMD (F=12.502,df=1,p=0.001), respectively. Post-hoc analysis shows a significant increase in the BMD in MIA versus PRE exercises (p=0.004,CI=0.1676-0.8329) and between MIA exercises versus control (p=0.004,CI=0.1637-0.8409), respectively. The highest positive change factor (+76.82%) for BMD occurred with PRE group on HAART. The most negative change factor for BMD (-13.49%) was recorded for control group (without exercise) on HAART, respectively.

**Conclusions:** These results suggest that BMD may be influenced by exercise or lack of it in patients on HAART and HAART naïve, such that group differences in BMD may be accounted for by the interaction of HAART and exercise in the patients. Based on the change factor, progressive resistance exercises is recommended to improve the BMD in HAART and HAART naïve patient groups. Importantly, HAART should not be commenced without complimentary exercises considering its observed adverse effects on BMD.

# CLINICAL APPROACHES TO DRUG AND ALCOHOL DEPENDENCE TREATMENT:

## THPEB083

### LOWER BLOOD ALCOHOL CONCENTRATION (BAC) AMONG HIV-POSITIVE VERSUS HIV-NEGATIVE MSM AFTER EXPERIMENTALLY CONTROLLED ALCOHOL ADMINISTRATION

P.A. Shuper[1,2], N. Joharchi[1], P.M. Monti[3], J. Rehm[4,5,6]

*[1]Centre for Addiction and Mental Health, Social and Epidemiological Research (SER) Department, Toronto, Canada, [2]University of Toronto, Dalla Lana School of Public Health, Toronto, Canada, [3]Brown University, School of Public Health, Providence, United States, [4]Centre for Addiction and Mental Health, Social and Epidemiological Research (SER) Department, Campbell Family Mental Health Research Institute, PAHO/WHO Collaborating Centre for Mental Health & Addiction, Toronto, Canada, [5]University of Toronto, Dalla Lana School of Public Health, Department of Psychiatry, Graduate Department of Community Health and Institute of Medical Science, Toronto, Canada, [6]Technische Universität Dresden, Klinische Psychologie & Psychotherapie, Dresden, Germany*

*Presenting author email: paul.shuper@uconn.edu*

**Background:** HIV-related consequences, particularly impaired liver functioning, may result in higher levels of intoxication among HIV+ versus HIV- individuals after alcohol consumption. The present investigation entailed the first controlled alcohol administration experiment to assess whether level of objective intoxication differs by HIV serostatus.

**Methods:** HIV+ and HIV- social drinking men-who-have-sex-with-men (MSM) were recruited from a clinic in Toronto, Canada for an experiment on alcohol and sexual risk. In a specialized barroom laboratory, participants who had undergone a pre-fasting process followed a controlled alcohol administration protocol, in which those randomly assigned to the alcohol condition received 0.7g alcohol/kg body weight over a 15-minute timeframe (target blood alcohol concentration (BAC)=.080%). BAC was assessed via breathalyzer approximately 15-minutes post-consumption; followed by a series of breathalyzer tests continuing until detoxification (BAC< .040%).
**Results:** Among 283 participants (142 HIV+, 141 HIV-), 144 (77 HIV+, 67 HIV-) were randomly assigned to the alcohol condition (Mean age=43; 84% white). At the 15-minute assessment, BAC was significantly lower among HIV+ ($M$=.073, $SD$=.015) than HIV- participants ($M$=.079, $SD$=.014), $t$(143=2.71, $p$=.008. Similarly, HIV+ participants achieved a lower peak BAC ($M$=.084, $SD$=.012) than their HIV- counterparts ($M$=.089, $SD$=.013), $t$(142)=2.30, $p$=.023. In multiple regression models controlling for age, weight, race/ethnicity, and AUDIT score, HIV serostatus was the only significant predictor of both 15-minute BAC ($b$ =-.25, $t$(138)=2.99, $p$=.003) and peak BAC ($b$ =-.19, $t$(138)=2.19, $p$=.030). Time to detoxification did not differ by serostatus; with only weight being significant, $b$ =.59, $t$(138)=8.60, $p$=.000. Subjective intoxication did not significantly differ between HIV+ and HIV- participants. Among HIV+ participants, HIV viral load and taking ART were not significantly associated with BAC.
**Conclusions:** Contrary to predictions, HIV+ participants attained BACs that were 6%-7% lower than their HIV- counterparts. However, as time to detoxification did not differ by serostatus, BAC differences may therefore lie in absorption rather than metabolism or elimination of alcohol. Additional research is required to further delineate the possible mechanisms underlying this effect.

## Nutrition and HIV

### THPEB084

### Effect of a progressive resistance training program and whey protein intake on maximal strength in HIV-infected individual receiving antiretroviral therapy

T. Sookan[1], A. McKune[2,3], M. Ormsbee[1,4], J. Antonio[5], N. Magula[6], A. Motala[7], U. Lalloo[8]
*[1]University of KwaZulu-Natal, Biokinetics, Exercise & Leisure Sciences, Durban, South Africa, [2]University of Canberra, Discipline of Sport and Exercise Science, Canberra, Australia, [3]University of KwaZulu-Natal, Biokinetics, Exercise and Leisure Sciences, Durban, South Africa, [4]Florida State University, Institute of Sport Science and Medicine and the Centre for Advancing Exercise and Nutrition Research on Aging, Tallahasse, South Africa, [5]Nova South-Eastern University, Biology, Florida, United States, [6]University of KwaZulu-Natal, Internal Medicine, Durban, South Africa, [7]University of KwaZulu-Natal, Diabetes and Endocrinology, Durban, South Africa, [8]University of KwaZulu-Natal, Pulmonology, Durban, South Africa*
*Presenting author email: sookan@ukzn.ac.za*

**Background:** HIV-infected patients on ART may develop complications including sarcopenia and dynapenia. Resistance training (RT) in combination with protein-supplementation containing nutrition is effective in decreasing both conditions.
**Methods:** Forty HIV-infected participants (40.8 ±7.7 yrs, 70.8 ±16 kg, BMI 30.9 ±7.2 kg.m-$^{2}$) receiving ART (≥18 months) were randomly assigned to either a whey protein/progressive resistance training (PRT) group (n=18), placebo/PRT group (n=14) or control group (n=8). Participants received either 20g whey or placebo (maltodextrin) pre and immediately post each PRT workout. Whole body PRT was performed 2/week for 3 months with the loads progressing from 40-85% of the subject's one-repetition maximum (1RM). The 1RM was done before(T1), after 3 months (T2) PRT program and 3 months following (T3) the cessation of the PRT program. Statistical analysis was done using a two-way ANOVA and Sidak's multiple comparisons test in the intervention groups and a one-way ANOVA with repeated measures in the control group. Cohen's $d$ effect sizes (ES) were also calculated and classified by Hopkins. Alpha was set at P ≤ 0.05.
**Results:** There was no significant interaction or group effect for the PRT groups. All ES from T1 to T2 and T3 indicated an increase in maximal strength. Bench press showed a medium ES (T1 to T3) for the placebo/PRT ((p = 0.02), ES: $d$ = 0.9; 95% CI -0.2 - 1.6). Squat had the largest ES (T1 to T2) for both the placebo/PRT ((p = < 0.001), ES: $d$ = 1.5; 95% CI 0.8 - 2.3) and whey/PRT ((p = < 0.001), ES: $d$ = 1.2; 95% CI 0.4, 2). Results from T2 to T3 showed positive ES for all exercises except deadlift and right/left grip strength, indicating a further increase in maximal strength in the whey/PRT group. In the placebo/PRT the majority of the ES were negative for all exercise except the squat, indicating a drop in strength during the detraining period. The control group had no significant changes.
**Conclusions:** A 3 month PRT programme increased maximal strength regardless of whey protein intake. The detraining period (T2 to T3) demonstrated minimal strength loss suggesting maintenance of strength gains particularly for the whey group.

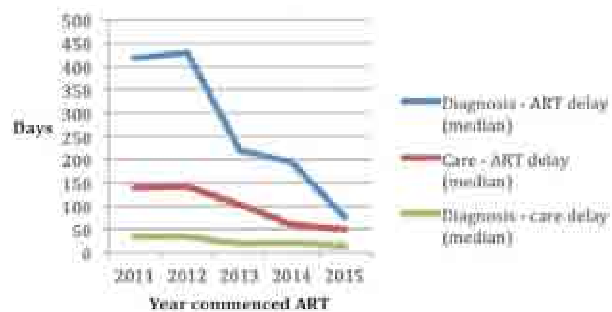
## Streamlining ART initiation

### THPEB085

### Dramatic fall in delay in initiation of antiretroviral from 2011 to 2015 in two large public HIV treatment centres in Melbourne, Australia

N. Medland[1], E. Chow[1], J. Hoy[2], J. Mcmahon[2], J. Elliott[2], C. Fairley[1]
*[1]Monash University, Melbourne Sexual Health Centre, Melbourne, Australia, [2]Monash University, The Alfred Hospital, Melbourne, Australia*
*Presenting author email: nmedland@mshc.org.au*

**Background:** Early linkage to care and initiation of antiretroviral therapy (ART) are targets for intervention to increase population antiretroviral therapy (ART) coverage. We examined the delay between diagnosis of HIV infection and engagement in care and ART initiation at the two largest public HIV treatment centres in Melbourne, Australia.
**Methods:** Records from patients commencing ART at the Melbourne Sexual Health Centre and The Alfred hospital from 2011 to 2015 were extracted. The intervals (in days) between date of diagnosis and first day of ART, between diagnosis and first day of entry into care, and between entry into care and ART were calculated. The median intervals were calculated and the Kruskal-Wallis test was used to compare the changes over time.
**Results:** A total of 729 patients commenced ART at the study sites. Median age was 35.7 years. 81% of those with known risk exposure reported male homosexual contact. The median delay between diagnosis and initiation of ART decreased significantly from 418 days (IQR: 91-1176) in 2011 to 77 in 2015 (IQR: 39-290) (p< 0.001). The median delay between diagnosis and entry into care decreased significantly from 34 days (IQR 9-346) to 14 (IQR 5-29) (p< 0.001) and between entry into care and ART was 140 (IQR 36-609.5) to 51 days (IQR 21-216) over time (p < 0.001).



[Delay in commencing ART 2011 - 2015]

**Conclusions:** Median delay in initiation of ART fell by more than half between 2011 and 2013 and then again between 2013 and 2015, suggesting a rapidly changing dynamics a decreasing size of the untreated population.

## Adherence among high CD4 persons

### THPEB086

### HIV-infected youth adherence through youth web-based peer support system

P. Gichangi[1], M. Thiongo[2], K. Michielsen[3], S. Wambua[2], J. Mwaisaka[2], M. Temmerman[4]
*[1]University of Nairobi and Ghent University and ICRHK, Nairobi, Kenya, [2]ICRHK, Mombasa, Kenya, [3]Ghent University/ICRH, Ghent, Belgium, [4]Ghent University, Ghent, Belgium*
*Presenting author email: gichangip@yahoo.com*

**Background:** Mother to child transmission of HIV remains an important source of youth and adolescent infections. Adolescents on HIV treatment usually remain adherent to treatment while under the supervision and care of their parents and guardians while in primary schools. Once this care is lost when they go to high schools, adherence is often lost due to several reasons. To address this, a web based youth led peer support system was developed targeting adolescents and youth aged 15-24 years. The objective was to develop and implement a peer system to support adherence to HIV treatment among adolescents and youth.
**Methods:** A quasi-experimental web based peer support study was developed. The web site was led by youth who were also HIV infected. Through peer mobilisation from the HIV clinics and other social places, the youth could access the website

Tuesday 19 July

Wednesday 20 July

Thursday 21 July Poster Exhibition

Friday 22 July

Late Breaker Posters

Author Index

from a centralized site with computers. They could also access the website from smart phones. Youth could access relevant information, ask questions and get clarification or referral.

**Results:** Ninety two HIV infected youth participated in the study with 48% being below 18 years with a mean of 18.4 years and mode of 17 years and median of 18 years. About half were girls. Reported behavior in relation to adherence improved in three months from the baseline. Importance of taking medications improved significantly. Confidence in taking medications also improved. Likelihood of missing doses of the medications reduced from 54% at baseline to 9% in three months (OR 12, 95%CI 4-42). Key external challenge was the reluctance of the parents and guardians to give consent for those below 18 years of age to participate in the study citing the need to maintain confidentiality.

**Conclusions:** Results from this pilot demonstrate the potential that the website peer support system can influence adherence to HIV treatment medications. Through this program we have demonstrated improved reported behaviour, we need to investigate whether the reported behaviour will likely translate to documented adherence, which will be the next phase of the study.

## CLINICAL ISSUES IN MEN WHO HAVE SEX WITH MEN

### THPEB087

### IMPLEMENTING UNIVERSAL ACCESS TO ANTIRETROVIRAL TREATMENT (ART) AMONG MEN WHO HAVE SEX WITH MEN IN ABUJA, NIGERIA: CHARACTERIZATION OF THE BASELINE ENGAGEMENT IN THE HIV CARE CONTINUUM

U. Clifford Ononaku[1], R. Nowak[2], H. Omuh[1], I. Orazulike[3], T.A. Crowell[4], H. Liu[5], S. Baral[6], M. Charurat[2]

*[1]Institute of Human Virology, Research, Abuja, Nigeria, [2]Institute of Human Virology Baltimore, Research, Baltimore, United States, [3]International Center for Advocacy on Rights to Health, Prevention, Human Rights and Management, Abuja, Nigeria, [4]U.S Military HIV Research Program, Research, Bethesda, United States, [5]Institute of Human Virology Baltimore, research, Maryland, United States, [6]John hopkins University, Public Health and Human Rights, Baltimore, United States*

*Presenting author email: alliance.uchenna@gmail.com*

**Background:** Nigeria has the second largest HIV epidemic in the world with the burden consistently high among key populations. Given this high burden of HIV, the National HIV Policy has made it a national priority to improve coverage of evidence-based HIV prevention, treatment, and care services for key populations including men who have sex with men (MSM). Here, we characterize the HIV treatment cascade and determinants of success in achieving viral suppression among MSM in Abuja, Nigeria.

**Methods:** From March 2013- November 2015, the TRUST cohort study used respondent-driven-sampling (RDS) to recruit 951 MSM into a treatment optimization study with clinical and community services co-located. Participants completed a structured survey instrument, HIV testing according to national guidelines, and CD4 and viral loads every three months for those testing positive (≤20 copies/ml at the latest follow-up visit was considered virally suppressed). Chi-squared test was used to compare differences between those engaged versus not engaged in the treatment cascade.

**Results:** A total of 951 MSM were recruited in this study with a median age of 24 years [IQR: 20-27]. About two thirds (73%) were tested for HIV. Among HIV testers, 44% (274) were living with HIV, 126 (46% of HIV-positive) were aware of their infection, 177 (65% of HIV-positive) were currently on or initiated ART, and 124 (70% of ART initiated) achieved viral suppression (≤20 copies/ml). Those who were not linked to HIV testing after screening were younger (16-24 years of age), less likely to have disclosed their sexual orientation to a health care worker, Muslim, and from later waves of RDS recruitment (after wave 12)($p < 0.05$). In addition, those who were Muslim and those who did not disclose their sexual orientation were less likely to initiate ART ($p < 0.01$).

**Conclusions: :** Perceived and enacted stigma continues to limit HIV testing and linkage to care even in the context of universal ART. Consequently, HIV prevalence and ultimately incidence among MSM in Nigeria is extremely high reinforcing the need to further investigate HIV treatment approaches while also scaling up novel HIV prevention approaches such as HIV Pre-Exposure Prophylaxis and improved STI management

### THPEB088

### PRIORITIZING MEN HAVING SEX WITH MEN (MSM) TO ACHIEVE ZERO HIV INCIDENCES AND ZERO STIGMA

M. Akolo[1], J. Kimani[2], L. Gelmon[2]

*[1]Kenya AIDS Control Project, CLINIC, Nairobi, Kenya, [2]University of Manitoba, UNITID, Nairobi, Kenya*

*Presenting author email: molly_akolo@yahoo.com*

**Background:** The Sex Workers Outreach Program (SWOP) opened its doors to all male and female sex workers operating within Nairobi County, Kenya in 2008. Among the services offered were STI/HIV screening, HIV-positives received care and treatment and positive health, dignity and prevention (PHDP) package while the HIV-negatives accessed a risk behavior reduction package that contained condom supply and every three monthly HIV testing. The SWOP program noticed that there were high numbers of MSM and MSWs with HIV and did a baseline survey with a three monthly follow-up for HIV test.

**Methods:** Baseline data was captured at enrollment on a quarterly basis for a period of one year from Jan-Dec 2015. The MSM that had tested HIV negative were retested after every 3 months and their HIV status documented. The parameters that were captured at baseline were: HIV prevalence, status disclosure, STI in the last three months, number of sex partners, correct and consistent condom use.

**Results:** 696 MSM participated in the survey. 71.2 % (495) reported to have been treated for an STI within the last three months prior to enrollment. 97.4% (678) agreed to HIV test and 24 .2% (163) tested HIV positive. Only 36.9% (60) of the HIV positive had disclosed their HIV status to their sex partners and only 66.3 % (103) of the HIV positives had enrolled for HIV care and treatment. 97.9 % (682) had multiple sex partners of which 48 % (334) had both male and female sex partners. 88.9% (619) were practicing either receptive anal sex or both receptive and insertive anal sex. 63.8% (445) reported condom use in their last sexual act but only 2.3% (16) demonstrated correct male condom use while 1.1% (8) demonstrated correct female condom use. At the end of the year, 13.4 % (69) of the 515 who had tested HIV negative on enrollment had sero-converted to HIV positive.

**Conclusions:** MSM sex workers are a key population that needs to be prioritized in HIV prevention strategies due to high STI and HIV prevalence, a very high HIV incidence, and risky behavior with multiple sex partners both male and female.

### THPEB089

### EXTREMELY LOW HEPATITIS C ANTIBODY PREVALENCE AMONG HIGH-RISK, HIV-POSITIVE AND HIV-NEGATIVE MEN WHO HAVE SEX WITH MEN AND TRANSGENDER WOMEN FROM COMMUNITY-BASED ORGANIZATIONS IN THAILAND

V. Sapsirisavat[1], A. Avihingsanon[1,2], D. Trachunthong[1], S. Kerr[1,3], J. Jantarapakde[4], S. Pengnonyang[4], S. Jitjang[4], R. Janamnuaysook[4], P. Mingkwanrungrueng[4], J. Ohata[1], A. Sohn[5], A. Katz[6], N. Phanuphak[4]

*[1]Thai Red Cross AIDS Research Centre, HIV-NAT, Bangkok, Thailand, [2]Chulalongkorn University, Department of Medicine, Faculty of Medicine, Bangkok, Thailand, [3]Academic Medical Center, University of Amsterdam, Department of Global Health, Amsterdam Institute for Global Health and Development, Amsterdam, Netherlands, [4]Thai Red Cross AIDS Research Centre, TRCARC, Bangkok, Thailand, [5]amfAR, The Foundation for AIDS Research, TREAT Asia, Bangkok, Thailand, [6]University of Hawai'i at Manoa, Department of Public Health Sciences, Honolulu, United States*

*Presenting author email: vorapot.s@hivnat.org*

**Background:** Globally hepatitis C (HCV) incidence is increasing among HIV-infected men who have sex with men (MSM). Whether anti-HCV should be part of the screening algorithm for MSM entering HIV treatment and prevention cascades is unclear.

This study aimed to estimate HCV antibody prevalence among MSM and transgender women (TG) in large urban centers in Thailand.

**Methods:** MSM and TG were enrolled at community-based organizations (CBOs) in Bangkok, Chiang Mai, Pattaya and Hat Yai into the Community-based Test and Treat Study during May-November 2015. Anti-HIV, anti-HCV, and syphilis serology were performed at study entry. We explored associations of anti-HCV prevalence with potential risk factors.

**Results:** Of 1025 participants (727 MSM and 298 TG), 853 were HIV-negative and 172 were HIV-positive. Median age was 25 (IQR 21-31) years; median monthly income was 280 USD. Positive anti-HCV tests were found in 7 (0.8%) HIV-negative and 1 (0.6%) HIV-positive participants. Five were MSM; 3 were TG. Compared to anti-HCV negative participants, anti-HCV positive persons were significantly older (median 34 [IQR 27-41] years; $P=0.005$), and more likely to have their highest educational attainment at or below junior high school (63% vs. 24%; $P= 0.03$). Although not statistically significant, anti-HCV-positive persons were more likely to be sex workers (50% vs. 26%; $P=0.2$) and to have used amphetamine-type stimulants in the past 6 months (25% vs. 8%; $P=0.1$). Both anti-HCV positive and negative persons

reported high rates of unprotected sex (≥80%) and multiple partners (≥58%) in the past 6 months. Syphilis infection was identified in 1 (12.5%) anti-HCV positive and 63 (6%) anti-HCV-negative participants.
**Conclusions:** Regardless of HIV status, anti-HCV prevalence was extremely low among MSM and TG who had reportedly high-risk behavior in our setting, which implies comparably low rates of chronic HCV infection. Our results do not support routine HCV testing of all MSM and TG in our setting. Targeted screening among MSM and TG who are sex workers or who have other behaviors known to be associated with HCV infection should be explored further.

## THPEB090

### RETENTION INTO CARE AND HEALTH BEHAVIOR PROGRAM: DOES WAVE OF RDS RECRUITMENT MATTER?

B. Kayode[1], H. Ramadhani[2], R.G. Nowak[2], H. Omuh[3], A. Gambo[2], H. Liu[4], T.A. Crowell[5,6], S.D. Baral[7], M.E. Charurat[8]
*[1]Institute of Human Virology Nigeria, Research, FCT, Nigeria, [2]Institute of Human Virology, School of Medicine Baltimore, Baltimore, United States, [3]Institute of Human Virology Nigeria, FCT, Nigeria, [4]University of Maryland School of Public Health, Baltimore, United States, [5]U.S. Military HIV Research Program, Walter Reed Army Institute of Research, Silver Spring, United States, [6]Henry M. Jackson Foundation for the Advancement of Military Medicine, Bethesda MD, Baltimore, United States, [7]Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, [8]Institute of Human Virology, School of Medicine Baltimore, IHV Division of Epidemiology and Prevention, Baltimore, United States*
*Presenting author email: bkayode.trust@gmail.com*

**Background:** The TRUST cohort study employed respondent-driven-sampling (RDS) to recruit men who have sex with men (MSM) into HIV/STI prevention and treatment services in Abuja, Nigeria. RDS has been demonstrated to be effective in reaching more marginalized populations. Here, we evaluate waves of RDS recruitment with health care engagement and ultimate retention in the study at 6 and 12 months of follow-up.
**Methods:** 951 participants were recruited between 03/13-11/15 from 5 seeds resulting in 27 waves of accrual. Accrual waves were categorized into three groups consisting of nine waves each (1-9, 10-18, 19-27). Comprehensive structured instruments were administered at baseline and every 3 months including up to 18 months of follow-up. Differences in engagement in healthcare and 6/12 month retention by wave category were evaluated using Chi-squared test and bivariate logistic regression.
**Results:** Later waves were significantly less likely to be 20 years or older, have a prior HIV test or disclose their sexual orientation to health care providers as compared to the earliest waves(p< 0.01). The participants who were of the earliest wave category had the highest proportion of retention at 6 months and 12 months (Table 1). Specifically, at six and 12 months of follow up, those recruited at wave 10-18 [(OR, 0.53; 95% CI, 0.38-0.72), and (OR, 0.37; 95% CI, 0.25-0.54), respectively] and wave 19-27 [(OR, 0.33; 95% CI, 0.19-0.56), OR, 0.37; 95% CI, 0.20-0.67), respectively] were less likely to be retained as compared to participants recruited at wave 1-9.
**Conclusions:** These data confirm the utility of RDS to engage a more marginalized population of MSM into a study offering universal ART for all those living with HIV. However, these more marginalized MSM are also the most difficult to retain in treatment strategies necessitating novel retention approaches to achieve sustained viral suppression.

| | | 6 months | | 12-months | |
|---|---|---|---|---|---|
| Waves categories | total | n | % | n | % |
| 1 - 9 | 382 | 123 | 32% | 92 | 24% |
| 10 - 18 | 434 | 87 | 20% | 45 | 10% |
| 19 - 27 | 134 | 18 | 13% | 14 | 10% |

*[Table 1. Six and twelve month's retention of MSM into care and care health behavior change program in Abuja, Nigeria 2013 -2015]*

## THPEB091

### THE PREVALENCE OF ALCOHOL DEPENDENCE AND ACTIVE AMPHETAMINE USE ARE SUBSTANTIAL AND ASSOCIATED COMORBID MENTAL HEALTH PROBLEMS AMONG MALE SEX WORKERS IN VIETNAM

V. Ngo[1], D. Colby[2,3], C. Oldenburg[4,5], T. Nguyen[6], E. Closson[5], K. Biello[4,5], K. Mayer[5,7,8], M. Mimiaga[4,5,9]
*[1]RAND Corporation, Santa Monica, United States, [2]Thai Red Cross AIDS Research Centre, SEARCH, Bangkok, Thailand, [3]Center for Applied Research on Men and Health, Ho Chi Minh, Vietnam, [4]Harvard Chan School of Public Health, Department of Epidemiology, Boston, United States, [5]Fenway Community Health, The Fenway Institute, Boston, United States, [6]Harvard Medical School AIDS Initiative in Vietnam, Ho Chi Minh, Vietnam, [7]Beth Israel Deaconess Medical Center, Department of Medicine, Boston, United States, [8]Harvard Chan School of Public Health, Department of Global Health and Population, Boston, United States, [9]Brown University School of Public Health, Department of Epidemiology and Behavioral & Social Health Sciences, Providence, United States*
*Presenting author email: vckyngo@gmail.com*

**Background:** Male sex workers (MSW) are a particularly vulnerable group due to the stigma they experience as a result of sex work and male-male sexual behavior, and have high rates of substance use. Mental health problems are often associated with substance use, which exacerbates sexual risk for HIV infection. However, little research on this topic exists among MSWs in Vietnam.
**Methods:** A survey was administered to 300 MSWs in Ho Chi Minh City using venue-based sampling stratified by how MSWs primarily meet clients, including sauna/massage, brothels, bicycle massage, street/parks, and callboys. We performed bivariate and multivariable logistic regression procedures to examine associations between psychosocial factors (i.e., clinically significant depressive symptoms, post-traumatic stress disorder (PTSD) symptoms, active suicidal ideation, poor self-esteem, history of childhood sexual abuse, adult sexual violence, and social isolation) and current substance use (alcohol dependency and ampethamine use in the past month).
**Results:** Median age was 21 (range 15-48). Participants identified as 51% homosexual, 32% bisexual, and 16% heterosexual. HIV risk behaviors were significant, with 33% reporting condomless anal intercourse in the past month, 35% had active alcohol dependency, and 15% reported amphetamine use in the past month. Mental health problems were common, with 47% having depressive symptoms, 37% PTSD symptoms, 30% active suicidal ideation, and 33% reported social isolation. In separated multivariable logistic regression models, factors independently associated with alcohol dependency were history of child sexual abuse (adjusted odds ratio (aOR)=2.2, 95% CI 1.0-4.8), amphetamine use (aOR=2.0, CI 1.0-4.0), suicidal ideation (aOR=1.9, CI 1.1-3.4) and PTSD related symptoms (aOR=1.7, CI 1.0-3.0), while depressive symptoms (aOR=2.6, CI 1.3-5.2) and alcohol dependency (aOR=2.2, CI 1.1-4.3) were associated with amphetamine use.
**Conclusions:** Vietnamese MSWs have high rates of mental health problems, substance use, and HIV sexual risk. Mental health problems appear to have different patterns of association with substance use, such that trauma may contribute more to alcohol dependency, while mood issues may be more linked to amphetamine use among MSMs. These findings not only have implications for HIV prevention efforts, but also demonstrate the need for mental health services and substance use treatment for MSWs in Vietnam.

# CLINICAL ISSUES IN PEOPLE WHO USE DRUGS

## THPEB092

### ENGAGEMENT IN HIV/AIDS CARE AND LIKELIHOOD OF VIRAL SUPPRESSION ARE UNAFFECTED BY HIGH-INTENSITY CANNABIS USE AMONG PEOPLE WHO USE ILLICIT DRUGS LIVING WITH HIV/AIDS

S. Lake[1,2], T. Kerr[1,3], P. Voon[1,2], E. Wood[1,3], J. Montaner[1,3], M.-J. Milloy[1,3]
*[1]British Columbia Centre for Excellence in HIV/AIDS, Vancouver, Canada, [2]University of British Columbia, School of Population and Public Health, Vancouver, Canada, [3]University of British Columbia, Department of Medicine (Division of AIDS), Vancouver, Canada*
*Presenting author email: pvoon@cfenet.ubc.ca*

**Background:** There is a growing interest in the use of cannabis to treat a variety of health conditions including HIV/AIDS-related symptoms and antiretroviral therapy (ART) side effects. Meanwhile, efforts to reform prohibitions on non-medical cannabis use are underway in many settings, including Canada. Previous research suggests that intense cannabis use negatively impacts HIV treatment outcomes. However, it

Author Index

is unknown if high-intensity cannabis use hinders treatment-as-prevention (TasP)-based efforts to scale-up access and adherence to ART.
**Methods:** Data for this study was derived from the ACCESS study, a prospective cohort of HIV-positive people who use illicit drugs (PWUD) in Vancouver, Canada, a setting with a community-wide TasP initiative, universal no-cost medical care, and de-facto decriminalized access to cannabis. Cohort data was confidentially linked to comprehensive clinical profiles, including records of all ART dispensations and viral load (VL) tests. We used generalized estimating equations (GEE) to estimate the longitudinal bivariable and multivariable relationships between ≥ daily cannabis use and two key TasP benchmarks: engagement in care (defined as being dispensed ≥ 1 day of ART in the previous 180 days) and achieving viral suppression (plasma HIV-1 RNA VL < 50 copies/mL), adjusting for various socio-demographic, socio-structural, behavioural, and clinical factors.
**Results:** Between December 2005 and June 2014, 845 HIV-positive PWUD (286 [34%] women) were included in this study and contributed a total of 6732 observations. At baseline, 203 (24%) reported at least daily use of cannabis. In total, 752 (89%) were engaged in HIV care at least once over the study period, and a further 623 (83%) of these individuals achieved viral suppression for at least one 180-day period. In multivariable analyses, ≥ daily cannabis use did not predict lower odds of ART engagement in the full sample (Adjusted Odds Ratio [AOR]: 1.02, 95% confidence interval [CI]: 0.76-1.38) or viral suppression among ART-exposed (AOR: 0.97, 95% CI: 0.75-1.26).
**Conclusions:** HIV-positive PWUD frequently use cannabis and constitute a key target population of many TasP-based interventions. In light of current reforms to facilitate legal access to cannabis, we did not observe evidence to suggest that high-intensity cannabis use compromises progress towards TasP-related goals.

## THPEB093

### METHADONE MAINTENANCE THERAPY AND VIRAL SUPPRESSION AMONG HIV-INFECTED OPIOID USERS: THE IMPACTS OF CRACK AND INJECTION COCAINE USE

M.E. Socías[1,2], E. Wood[1,2], W. Small[1,3], H. Dong[1], T. Kerr[1,2], J. Montaner[1,2], M.-J. Milloy[1,2]
*[1]BC Centre for Excellence in HIV/AIDS, Vancouver, Canada, [2]University of British Columbia, Department of Medicine, Vancouver, Canada, [3]Simon Fraser University, Faculty of Health Sciences, Vancouver, Canada*
*Presenting author email: esocias@cfenet.ubc.ca*

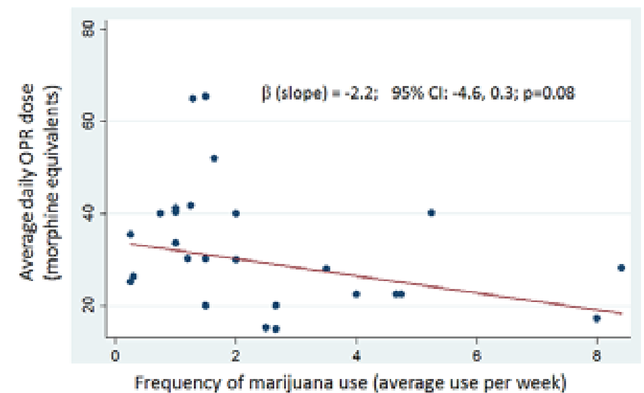
**Background:** Enrolment in opioid substitution treatment (OST) is associated with improved HIV/AIDS treatment outcomes among people who use drugs (PWUD). However, the extent to which these benefits are sustained in the context of ongoing stimulant use, especially cocaine use, is unclear. We assessed the potential differential impacts of methadone maintenance therapy (MMT) on suppression of plasma HIV-1 RNA viral load (VL) among HIV-positive opioid users in relation to discrete patterns of cocaine use.
**Methods:** Data was drawn from the AIDS Care Cohort to evaluate Exposure to Survival Services, a prospective cohort of HIV-positive PWUD in Vancouver, Canada. Generalized linear mixed-effects modeling was used to longitudinally investigate the independent effect of MMT across strata of frequency of cocaine injection and crack cocaine smoking (≥daily versus < daily) among HIV-positive, ART-exposed, opioid users, after adjustment for potential confounders.
**Results:** The analysis included 397 HIV-positive opioid users who completed ≥ 1 study interview between 2005 and 2014. At baseline, 304 (77%) reported participation in MMT, and 37 (9%) and 158 (40%) ≥daily cocaine injection and crack-cocaine smoking, respectively. In an adjusted analysis, enrollment in MMT remained independently associated with an increased odds of VL suppression in both strata of crack cocaine smokers (Adjusted Odds Ratio [AOR] = 3.11, 95% Confidence Interval [CI]: 1.86-5.21 and AOR = 1.48, 95%CI: 1.04-2.09, for ≥daily and < daily smokers, respectively), and in those injecting cocaine less than daily (AOR = 1.88, 95%CI 1.38-2.56), but not in those injecting cocaine ≥daily (AOR = 1.37, 95%CI 0.53-3.49).
**Conclusions:** We found that while exposure to MMT was associated with increased odds of VL suppression among HIV- positive opioid users regardless of crack cocaine use, this effect was not observed among frequent cocaine injectors. Our findings highlight the need to expand access to OST and develop effective pharmacotherapies for the treatment of cocaine dependence as a means of optimizing HIV/AIDS treatment outcomes among PWUD at both the individual and community levels.

## THPEB094

### RELATIONSHIPS BETWEEN MARIJUANA USE AND OPIOID PAIN RELIEVER USE AND DOSAGE IN PEOPLE LIVING WITH HIV

A. Kipp[1], W. Rogers[2], S. Bebawy[2], M. Turner[2], T. Sterling[2], T. Hulgan[2], P. Martin[3]
*[1]Vanderbilt University Medical Center, Medicine, Division of Epidemiology, Nashville, United States, [2]Vanderbilt University Medical Center, Medicine, Division of Infectious Diseases, Nashville, United States, [3]Vanderbilt University Medical Center, Psychiatry, Nashville, United States*
*Presenting author email: aaron.kipp@vanderbilt.edu*

**Background:** Marijuana use and chronic pain are more common among people living with HIV (PLWH). Medical or recreational use is now legal in many parts of the US, but it is unclear how potential increases in use would impact pain treatment or the prescription opioid epidemic: marijuana may boost analgesic effects of opioid pain relievers (OPR) and availability of medical marijuana appears to reduce risks of OPR overdose. Yet past or current substance abuse is common in patients receiving OPRs, increasing risks of overdose.
**Methods:** Medical records of HIV patients engaged in care at an academic HIV clinic in 2012 were reviewed for detailed information on OPR prescriptions. Prescription date, dose (converted to morphine equivalents), frequency, and duration were used to classify patients as no OPR use, short-term OPR use, and long-term OPR use (prescribed ≥120 days of OPRs in the calendar year). Patients with documentation of OPRs prescribed outside the medical center were excluded (n=171). OPR data were compared with self-reported marijuana use obtained at each clinic visit to determine if a) marijuana was more common among OPR users and b) more frequency marijuana use was associated with lower OPR doses.
**Results:** Among 1,765 patients included in the analysis, 344 (20%) received OPRs. There was no difference in marijuana use between long-term OPR users (19%), short-term OPR users (15.6%) and non-users (16.8%) and no difference in frequency of use. Among 30 long-term OPR users reporting concurrent marijuana use, more frequent marijuana use was associated with lower OPR daily doses (Figure).
**Conclusions:** More frequent marijuana use tended to be associated with lower daily doses of OPRs, yet marijuana use did not differ by OPR prescribing status in this HIV patient population. Further research should explore whether marijuana use may prevent escalation to higher OPR doses, thereby reducing risks of overdose.



*[Frequency of marijuana use associated with average daily dose of opioid pain relievers in patients with HIV (n=30)]*

## CLINICAL ISSUES IN TRANSGENDER POPULATIONS (INCLUDING ART-HORMONE INTERACTION)

## THPEB095

### A COMBINATION CONTINGENCY MANAGEMENT AND PEER HEALTH NAVIGATION INTERVENTION TO LINK, RETAIN AND ACHIEVE VIROLOGICAL SUPPRESSION AMONG TRANSGENDER WOMEN OF COLOR

C. Reback[1,2], K. Kisler[1], J. Fletcher[1]
*[1]Friends Research Institute, Inc, Los Angeles, United States, [2]University of California, Semel Institute for Neuroscience and Human Behavior, Los Angeles, United States*
*Presenting author email: reback@friendsresearch.org*

**Background:** HIV prevalence among trans women is estimated to be 50 times greater than that of non-trans adults, and yet HIV-positive trans women exhibit low rates of linkage to and retention in HIV care. In response to this health disparity, this study

combines an innovative application of contingency management (CM), in conjunction with Peer Health Navigation (PHN), to improve linkage to and retention in HIV care, and achieve viral load suppression, among trans women of color.
**Methods:** Between February 2014 and December 2015, 112 HIV-infected trans women of color were enrolled (enrollment ends August 2016 with a target sample size of 140). During the 18-month intervention, participants earn CM rewards for confirmed linkage to HIV primary care, retention in HIV care, and reaching HIV milestones (i.e., medication adherence as confirmed by log reductions; VL suppression). If a participant attends all HIV care visits and reaches each verified HIV milestone, she can earn $500 USD in CM rewards over the 18-month intervention.
**Results:** Most participants identified as African American/black (46.5%) or Hispanic/Latina (25.0%), the mean age was 36.1 years (SD=9.7 years). 58.0% graduated from high school (and 70.5% reported at least one period of homelessness in the past six months. Participants commonly reported substance use, including marijuana (63.3%), methamphetamine (60.8%), amphetamine (35.4%), cocaine (30.4%), and crack cocaine (27.8%); 42.9% reported sex while high and 43.8% reported sex work in the previous 6 months. Seven participants were unaware of their HIV status at baseline (new HIV positivity rate=6.3%). At baseline, 27.7% had dropped out of HIV care, 37.5% were not prescribed ART, and 55.4% were prescribed ART but were non-adherent. To date, 50.0% have been linked into HIV care with an overall average enrollment-to-linkage time of 53.3 days (SD=84.4; range=0-420 days). Currently, 23.4% of the participants have achieved VL suppression. The intervention continues through August 2017.
**Conclusions:** Data indicates that the combined CM and PHN intervention is effective in linking and retaining trans women of color into HIV care. Longitudinal data on retention and ART adherence will provide further indication of whether this intervention can produce sustained VL suppression.

## THPEB096

### HIV+ TRANSGENDER WOMEN: DISPARITIES IN THE CARE CONTINUUM AT AN URBAN COMMUNITY HEALTH CENTER

A. Radix[1,2], P. Carneiro[2], P. Meacher[2], S. Mosher[2], S. Stephanos[2], S. Doubleday-Stern[2], I. Evans-Frantz[2], F. Brigham[2], V. Inada[2], U. Belkind[2], A. Fortenberry[2], D. Perry[2], R. Vail[2], S. Weiss[2]
*[1]Columbia University, Mailman School of Public Health, Epidemiology, New York, United States, [2]Callen Lorde Community Health Center, New York, United States*
*Presenting author email: asa.radix@gmail.com*

**Background:** Transgender women (TGW) are disproportionately affected by HIV infection with reported prevalence of 19% globally. Data on engagement and retention in care for HIV+ TGW is limited however studies have indicated lower ART adherence as a result of multiple structural and individual-level barriers. The Callen-Lorde Community Health Center (CLCHC) predominantly serves the lesbian, gay, bisexual, transgender (LGBT) communities, and is the largest New York community-based provider of HIV care, with approximately 3500 HIV+ clients. As part of quality improvement, we were tasked with identifying and responding to gaps in the HIV care continuum for our patients.
**Methods:** Data were extracted from the electronic health records for all HIV+ patients in care between 2/1/2015 and 2/2/2016, including demographics (race, ethnicity, age, sex at birth, gender identity) and HIV viral loads. Chart reviews ascertained antiretroviral (ART) use. Associations between viral load results and demographic factors were assessed using chi-square, student t-test. A logistic regression model was derived.
**Results:** 3485 HIV+ ethnically diverse patients, including 330 (9.5%) TGW, were engaged in care. Patient demographics: 51% white, 38% black, 4% multiracial, 6.1% Asian/Pacific Islander; 27% Hispanic/Latino ethnicity). The average age was 42 years (21-81). Overall virological suppression (< 200 copies/mL) at last laboratory measure was 88.7%. 20% of TGW failed to achieve suppression compared with 10.4% of nontransgender persons (p< 0.000). TGW had a higher mean viral load (13,168 copies vs. 3866 copies, p< 0.000). In the multivariate analysis, white race, adjusted odds ratio, (aOR) 1.39 (95% CI:1.08, 1.79), p=0.011, being transgender aOR 0.58 (0.41, 0.84), p=0.004, and increasing age aOR 1.04 (1.03, 1.06) predicted viral suppression. A chart review revealed that 57 (86%) of TGW with detectable viral loads had received a prescription for ART.
**Conclusions:** In our clinic, significant differences in virological suppression rates and mean viral load were seen between TGW and non-transgender clients. A high proportion of TGW who had been prescribed ART had detectable viral loads, possibly indicating adherence issues or drug-drug interactions that lower treatment efficacy. Cohort-specific treatment cascades are useful for identifying disparities among subpopulations that then facilitate targeted interventions to be developed.

# CLINICAL ISSUES IN OTHER KEY POPULATIONS

## THPEB097

### INDIVIDUAL AND POPULATION LEVEL IMPACT OF KEY HIV RISK FACTORS ON HIV INCIDENCE RATES IN DURBAN, SOUTH AFRICA

S. Moonsamy[1], N. Abbai[1], H. Wand[2], G. Ramjee[1,3,4]
*[1]South African Medical Research Council, HIV Prevention Research Unit, Durban, South Africa, [2]University of New South Wales, National Center for HIV Epidemiology and Clinical Research, New South Wales, Australia, [3]London School of Hygiene & Tropical Medicine, Department of Epidemiology and Population Health, London, United Kingdom, [4]University of Washington, Department of Global Health, School of Medicine, Washington DC, United States*
*Presenting author email: suri.moonsamy@mrc.ac.za*

**Background:** It's well documented that one of the key population groups are adolescent girls and young women with high reported HIV incidence rates. To advance our understanding of the high incidence rates in young women, we aimed to estimate the individual and joint impact of age, marital status and diagnosis with sexually transmitted infections (STIs) on HIV acquisition among young women at a population level in Durban.
**Methods:** We conducted a prospective observational analysis by combining 3,978 HIV seronegative women who were recruited for 4 biomedical intervention trials from 2002-2009. Point and interval estimates of partial population attributable risk (PAR) were used to quantify the proportion of HIV seroconversions which can be prevented if a combination of risk factors is eliminated from a target population. We particularly focused on 1 unmodifiable risk factor (age) and 2 modifiable risk factors (cohabitation status and incidence of STIs). Hazard ratios and 95% CIs for HIV incidence rates were calculated using Cox regression models. PAR and their 95% CIs were calculated for individual risk factors and their combinations using Cox regression models. We also created a "highest risk" category for "< 25 years". Analyses were performed using SAS statistical software, version 10
(SAS Inc., Cary, NC).
**Results:** Approximately 41% of women in the study population (n=3978) were < 25 years old. A total of 318 HIV incidence cases were observed. HIV incidence was significantly higher among younger women compared to older women. More than 71% of the observed HIV seroconversions (95% CI: 68, 73) were collectively attributed to 3 risk factors: younger age (< 25 years old), unmarried and not cohabiting with a stable/regular partner and diagnosis with STIs. Their partial contributions to the HIV incidence were 23% (95% CI: 18,27) for < 25 years old, 59% for unmarried and not cohabiting with a stable/regular partner and 18% for being diagnosed with an STI.
**Conclusions:** To our knowledge this study is the first to investigate the PAR of HIV risk factors in Durban, SA. An effective intervention is needed which encourages all sexually active young women to either marry or cohabit and prevent STIs through safe sex behavior.

# COVERAGE OF PREVENTION SERVICES AMONG KEY POPULATIONS

### HIV TESTING AMONG MEN WHO HAVE SEX WITH MEN IN BAMAKO, MALI: IDENTIFYING FACTORS TO ADDRESS A CRITICAL UNMET TESTING NEED

A. Hakim[1], P. Patnaik[2], T. Ballo[3], A. N'Dir[4], N. Telly[5], B. Traore[3], J. Knox[2], S. Doumbia[5], M. Lahuerta[2,6], W. Hladik[1]
*[1]US Centers for Disease Control and Prevention, Division of Global HIV/AIDS, Atlanta, United States, [2]ICAP at Columbia University, Mailman School of Public Health, New York, United States, [3]Cellule Sectorielle de Lutte Contre le SIDA (CSLS), Ministry of Health, Bamako, Mali, [4]US Centers for Disease Control and Prevention (CDC), Bamako, Mali, [5]International Center for Excellence in Research (ICER), University of Bamako, Bamako, Mali, [6]Mailman School of Public Health, Columbia University, Epidemiology, New York, United States*
*Presenting author email: hxv8@cdc.gov*

**Background:** HIV prevalence is 13.7% among men who have sex with men (MSM) in Bamako, Mali; 8 times that of men in the general population (prevalence 1.6%). Increasing HIV testing among MSM is critical for reducing the burden of HIV in this priority population. We identified correlates of HIV testing among MSM in order to inform HIV service provision and work towards the achievement of the UNAIDS 90-90-90 targets.
**Methods:** We conducted a cross-sectional survey using respondent-driven sampling among 552 MSM from October 2014 to February 2015. Eligibility criteria included age ≥18 years, residence in Bamako or its suburbs in the past 6 months, and hav-

Author Index

ing had sex with another man in the last 6 months. Participants were interviewed face-to-face and tested for HIV-1 antibodies. Weighted data analysis was conducted using RDS-A and SAS. Multivariate analyses were used to identify factors independently associated with HIV testing.
**Results:** More than a quarter (28.5%) of MSM had never tested for HIV. Only 47.1% of MSM tested in the past year and only 13.3% of HIV-positive MSM were aware of their HIV status. Factors associated with testing for HIV in the past 12 months include: having met with a peer educator in the past 12 months (aOR: 11.5, 95% CI: 5.0-26.7), ever giving something in exchange for sex (aOR: 4.1, 95% CI: 1.9-8.6), internalized homophobia (higher vs. lower than average) (aOR: 2.4, 95% CI: 1.1-5.5), and social cohesion (higher vs. lower than average) (aOR: 2.2, 95% CI: 1.0-4.8).
**Conclusions:** A significant proportion of MSM had never tested for HIV; the majority had not tested within the past year. A large majority of HIV-positive MSM in Bamako were unaware of their HIV status. Interacting with a peer educator in the last 12 months was strongly correlated with HIV testing even though peer educators do not provide HIV testing in Bamako. MSM with greater internalized homophobia may test as a consequence of their auto-stigmatization. Peer educators could boost HIV testing by tailoring messaging to build community and strengthen social cohesion. Peer educators have a pivotal role in facilitating HIV testing in Bamako and their numbers should be increased.

## THPEC099

### FACTORS ASSOCIATED WITH ANTIRETROVIRAL TREATMENT UTILIZATION AMONG HIV-POSITIVE FEMALE SEX WORKERS IN JOHANNESBURG, CAPE TOWN, AND DURBAN

P. Muusha[1], T. Osmand[2], A. Marr[2], E. Van Rooyen[1], T. Lane[2]
*[1]Sex Worker Education and Advocacy Taskforce (SWEAT), Cape Town, South Africa, [2]University of California, San Francisco, Center for AIDS Prevention Studies/Medicine, San Francisco, United States*

**Background:** New 90-90-90 HIV treatment targets to help end the epidemic seek to close the treatment gap among HIV-positive individuals. When the WHO recommended universal treatment in 2015, many countries faced new structural and financial challenges in expanding antiretroviral treatment (ART) to HIV-positive constituents. To better characterize the existing treatment gap among FSW in South Africa, we analyzed factors associated with the utilization of ART.
**Methods:** Using respondent driven sampling (RDS), we recruited 2,180 FSW in Durban, Cape Town and Johannesburg into an integrated biological-behavioral surveillance (IBBS) survey. The IBBS assessed HIV-testing and ART utilization history. Eligible FSW completed behavioral interviews and rapid HIV-testing, and provided blood samples for laboratory analysis. This analysis is restricted to the sub-sample analysis of 866 FSW self-reporting HIV-positive status, and used SPSS for data analysis. We present pooled, unweighted analyses, and multivariate modeling with adjusted odds ratios (aOR) and 95% confidence intervals (CI).
**Results:** Of the 866 FSW, 343 (39.6%) were from Johannesburg, 126 (14.6%) from Cape Town, and 397 (45.8%) from Durban; 43.1% of FSW were on ART of which 47.2% were 25 years and above. Bivariate associations with ART included age, hazardous drinking, substance use, physical abuse, and any birth within the last five years, whereas correct knowledge of HIV and ART was not. In multivariate analysis, FSW who were between 16-24 years old (aOR=0.34, 95%CI 0.22-0.51), were classified as hazardous drinkers (aOR=0.65, 95%CI 0.47-0.88), used any illegal substances (aOR=0.54, 95%CI 0.38-0.79), and reported any physical abuse (aOR=0.76, 95%CI 0.57-1.02) were less likely to be on ART.
**Conclusions:** Achieving optimal results across the continuum of care is premised on timely testing and linkage to care, particularly among high-risk key populations. Closing this existing treatment gap for FSW in South Africa may benefit from incorporating evidence-based brief interventions to address hazardous drinking and substance use, and by empowering FSW regarding victim rights. To further enhance ART utilization, we urge the South African government to adopt treatment at diagnosis guidelines as recommended by the WHO, in key populations in general, and FSW in particular, as soon as possible.

# PREVENTION FOR VERTICAL TRANSMISSION

## THPEC100

### GESTATION IN ADOLESCENTS INFECTED BY HIV THROUGH VERTICAL TRANSMISSION

D. Bertolini, E. Galano, M.A. Silva, D. Oliveira, C. Bruniera Domingues
*Centro de Referência e Treinamento em DST/Aids - Programa Estadual São Paulo, Pediatric Infectious Disease, São Paulo, Brazil*
*Presenting author email: danielabertolini@hotmail.com*

**Background:** Advancements in HIV treatment through new antiretroviral drugs (ARV) as well as more effective prophylactic and monitoring measures have made aging possible in the pediatric population with infectious diseases. Today, more than 80% of cases treated in infectious diseases clinics in Brazil are adolescents. Pediatricians face new challenges, such as the growing number of gestations within this group and the birth of the third generation of patients with HIV. Understanding the particularities of these patients is fundamental to assuring good care is provided.
**Objective:** Description of a cohort of gestational adolescents infected by HIV through vertical transmission.
**Methods:** Data collected by chart analysis and epidemiological data in 2015, of gestational adolescents infected with HIV by vertical transmission who received assistance at HIV/STD Clinics in São Paulo - Brazil.
**Results:** Out of the 44 adolescents in childbearing age followed up in these clinics, 23 pregnancies were identified in 14 patients (8 had 1 pregnancy, 3 had 2 pregnancies, and 3 had 3 pregnancies each, including one abortion), between 2006 and 2015 (18 of them within the last 5 years). The average age for the first pregnancy is 18.9 years (youngest being 14). 100% of them received prenatal care and ARV during pregnancy and labor. 17/22 pregnant adolescents (77.2%, excluding the abortion) presented a detectable viral load (47% of those presented over 10,000 cp/ml) and 7/22 (31.8%) had CD4 lower than 200cells/mm3. In relation to birthing methods, 20/22 were cesarean and 2/22 were vaginal. 100% were living newborns (NB), with 27.3% (6/22) premature. One adolescent and five NB (22.7% - 5/22) died, including four neonatal and one 2 month-old due to SIDS. 11/17 living babies were uninfected by HIV and 6/17 are in follow up.
**Conclusions:** This topic deserves attention from the AIDS clinics, particularly since it has not been researched within the population of seropositive adolescent females and due to the high rate of unfavorable results in our sample. Teams must be better prepared and teenagers must be educated in the subject of sexual and reproductive rights, facilitating their adequate access to contraceptive and family planning methods.

## THPEC101

### HIV TESTING AS A BOTTLENECK TO ELIMINATION OF MOTHER TO CHILD TRANSMISSION IN THE SOUTH-EAST ASIA REGION

R. Pendse, S. Gupta, D. Yu
*WHO South-East Asia Region, New Delhi, India*
*Presenting author email: somyagupta17@gmail.com*

**Background:** Countries in South-East Asia region of World Health Organization have committed to elimination of mother-to-child transmission of HIV. All countries in the region recommend provider initiated testing and counseling for pregnant women (PW) in antenatal care (ANC) clinics. But this region is far from achieving the elimination target.
We look at the strategy for and coverage of HIV testing for PW in seven priority countries.
**Methods:** An extensive review was conducted on the prevention of mother-to-child transmission (PMTCT) programmes in seven countries in October 2015, which was based on reported data and questionnaire survey to countries. From this review, we present the HIV testing strategy for PW and latest available data on ANC coverage (one or more visits), HIV testing rates in PW, and proportion of the estimated HIV-positive PW diagnosed.
**Results:** Of the seven countries, universal HIV testing is provided in three countries (India, Myanmar, and Thailand). ANC coverage is almost 98% in Thailand; nearly all PW received HIV testing (2014) and 96% of the estimated HIV-positive PW were diagnosed. In India and Myanmar, ANC coverage is high but only 38% and 51% PW received HIV testing (2014), respectively. As a result, only 35% of the HIV-positive PW were diagnosed in India in 2014. Three countries (Indonesia, Nepal and Sri Lanka) have prioritized HIV testing for PW in high prevalence areas. Between 6-45% of PW received HIV testing in these countries and >70% of HIV-positive PW were unaware of their HIV status (2014 data). Bangladesh follows geographical prioritization with risk assessment approach for HIV testing in PW, provided in three medical colleges. Less than 1% PW were tested for HIV in 2014 and 25 tested positive, accounting for 18% of the estimated HIV-positive PW.

**Conclusions:** Regardless of the HIV testing strategy, HIV testing in ANC is low in all countries except Thailand, posing a unique challenge for scaling up of PMTCT services. Targets of elimination of mother to child transmission of HIV are unlikely to be achieved in all countries except Thailand. Urgent scale-up of HIV testing in ANC is needed to address the critical bottlenecks for ensuring a HIV free generation.

## THPEC102

### The cascade of care of pregnant women on the highly active antiretroviral therapy in South Africa: implications for elimination of mother to child transmission

V. Oladele Adeniyi[1], N. Selanto-Chairman[2], D. Goon[3], I.A. Ajayi[3], C.R. Carty[4], J.S. Lambert[5]
*[1]Walter Sisulu University, East London, South Africa, [2]Eastern Cape Health, Obstetrics, East London, South Africa, [3]University of Fort Hare, East London, South Africa, [4]University of Oxford, Department of Social Policy and Intervention, Oxford, United Kingdom, [5]University College Dublin, Dublin, Ireland*
*Presenting author email: ccarty@therelevancenetwork.com*

**Background:** To achieve complete elimination of mother-to-child transmission, it is important that HIV-infected pregnant women are diagnosed, linked to and remained in care, initiated and remained on the highly active anti-retroviral therapy (HAART) and reached virological suppression throughout the period of pregnancy, labour and delivery, and breastfeeding. This study aimed to evaluate the implementation of the lifelong HAART and the impact on the cascade of care of HIV-infected pregnant women attending maternal services in the Eastern Cape Province, South Africa.
**Methods:** An electronic point of care database for monitoring of treatment outcomes of HIV-infected pregnant women was implemented across three maternity services in Eastern Cape. We obtained relevant data on the demographics, time of HAART initiation, and type of HAART regimen, prior defaulting of HAART, CD4 count at booking, viral load at booking and viral load at delivery. Primary outcome measure is the peri-partum viral response categorised as suppressed viral load (VL < 20 RNA copies/ml), low viraemia (VL=20-999 RNA copies/ml) and high viral load (VL≥1000RNA copies/ml). We performed univariate and multivariate analyses to identify the significant predictors of peripartum suppression viral suppression.
**Results:** Of the total participants (n=675); the peripartum virological suppression rate was 66.9%. Significant proportions of peri-partum women had low viraemia (10.3%) and high viral load (22.8%). The majority of individuals with high viral load were 20-29 years old (27.2%), single (26.2%), live in rural residence (31.4%), unemployed (25.5%), consumed alcohol during pregnancy (29.7%), did not disclose HIV status to sexual partner (28.4%), non-adherent by self-reporting (48.7%) and failed to pick up pills on time (36.1%) and had prior history of defaulting of HAART (57.6%). After adjusting for confounding factors in the model analysis, on-time pick up of pills (p=0.03), booking CD4 count < 200 cells/mm$^3$ (p=0.000), previous VL≥1000 RNA copies/ml (p=0.000) and prior defaulting of HAART (p=0.01) were the only independent and significant determinants of high peri-partum viral load in the cohort. Of the women who chose exclusive breastfeeding (n=605); 24.3% had high viral load.
**Conclusions:** High peri-partum viral load during delivery and breastfeeding constitute significant risk of infant transmission. Complete suppression with HAART will require programmatic re-engineering by focusing on addressing the determinants.

## THPEC103

### Infant feeding practices at 14 weeks among HIV-infected and uninfected mothers in KwaZulu-Natal (KZN), South Africa

S. Phakathi[1], L. Haskins[1], B. Sartorius[2], L. Spies[3], R. Brown[1], M. Grant[1], C. Horwood[1]
*[1]University of KwaZulu Natal, Center for Rural Health, Durban, South Africa, [2]University of KwaZulu Natal, College of Health Sciences, Durban, South Africa, [3]KwaZulu Natal Depart of Health, Pietermaritzburg, South Africa*
*Presenting author email: phakathis@ukzn.ac.za*

**Background:** Exclusive breastfeeding (EBF) for the first six months of life is crucial for child development, health and survival. Previous estimates suggest that rates of EBF in South Africa are very low. For HIV infected mothers repeated changes to guidelines for prevention of mother-to-child HIV transmission (PMTCT) in recent years has led to conflicting and confusing infant feeding advice, and provision of free formula milk in government health facilities. As a result many HIV infected mothers chose to formula feed their infants. Current PMTCT guidelines strongly promote EBF for six months.
This study investigated infant feeding practises among caregivers in all 11 districts in KZN.
**Methods:** All caregivers aged >14 years attending with an infant aged 13- <16 weeks at 99 randomly selected primary health care clinics were eligible to participate. All participants provided written informed consent. Structured interviews were conducted to investigate infant feeding practices.
**Results:** 3661 interviews were conducted with mothers between June 2014 and March 2015. 3569/3661 (97.5%) reported having been previously tested for HIV. Of whom 1274 (35.7%) reported themselves HIV positive, of whom 1139 (89.4%) were on antiretroviral treatment at the time of interview. Infant feeding practises are shown in table 1.

| | HIV positive | HIV negative | P value | All |
|---|---|---|---|---|
| | n=1274 | n=2295 | | n=3569 |
| Never breastfed | 212 (16.6) | 123 (5.4) | P<0.0001 | 335 (9.4) |
| Stopped Breastfeeding | 223 (17.5) | 367 (16.0) | P=0.0347 | 590 (16.5) |
| Any breastfeeding now | 839 (65.9) | 1805 (78.7) | P<0.0001 | 2644 (74.1) |
| Mixed breastfeeding | 142 (11.1) | 635 (27.7) | P<0.0001 | 777 (21.8) |
| Currently exclusive breastfeeding | 699 (54.9) | 1172 (51.1) | P=0.425 | 1871 (52.4) |

*[Infant feeding practices among HIV positive and HIV negative mothers]*

**Conclusions:** Rates of EBF were high in both infected and uninfected mothers, but HIV infected women were more likely to choose to formula feed their infants compared to HIV uninfected women. However HIV infected breastfeeding were less likely to mixed feed. More advocacy is required to ensure optimal feeding practices for HIV exposed infants.

# Prevention for the general population

## THPEC104

### Systematic review and meta-analysis of HCV infection and HIV viral load: insights into epidemiologic synergy

J. Ross[1], N. Petersdorf[2], H. Weiss[3], R. Barnabas[4], J. Wasserheit[4], HCV and HIV Transmission Working Group
*[1]University of Washington, Division of Infectious Diseases, Seattle, United States, [2]London School of Economics, London, United Kingdom, [3]London School of Hygiene and Tropical Medicine, Department of Infectious Disease Epidemiology, London, United Kingdom, [4]University of Washington, Departments of Medicine and Global Health, Seattle, United States*
*Presenting author email: jross3@uw.edu*

**Background:** Hepatitis C virus (HCV) and HIV infection frequently co-occur due to shared transmission routes. Co-infection is associated with higher HCV viral load, but less is known about the effect of HCV infection on HIV viral load and risk of onward transmission. Other HIV co-infections such as acute malaria, herpes simplex-2, and tuberculosis increase HIV viral load, likely through inflammatory-mediated mechanisms. HIV viral load is the key determinant of HIV transmission and consequently, these HIV co-infections have the potential to increase the probability of HIV transmission through significant increases in viral load.
**Methods:** We undertook a systematic review of articles indexed in PubMed and Embase comparing i) HIV viral load among ART-naïve, HCV co-infected individuals versus HIV mono-infected individuals and ii) HIV viral load among treated versus untreated HCV co-infected individuals. We performed a random-effects meta-analysis and quantified heterogeneity using the $I^2$ statistic. We followed Cochrane Collaboration guidelines in conducting our review and PRISMA guidelines in reporting results.
**Results:** We screened 3,337 articles and identified 16 relevant publications. Fourteen studies addressed the impact of HCV infection on HIV viral load, while two studies examined the impact of HCV treatment on HIV viral load. The majority of the studies classified participants based on HCV antibody testing alone without RNA confirmation of active viremia. Only four studies found strong evidence of association (p< 0.05) between HIV-HCV coinfection and HIV viral load, with all four pointing towards higher HIV viral load among mono-infected patients than among co-infected patients. A meta-analysis found no evidence of increased HIV viral load associated with HCV co-infection or between HIV viral load and HCV treatment with pegylated interferon-alpha-2a/b and ribavirin.
**Conclusions:** In our systematic review, HCV infection was not associated with an increase in HIV viral load among adults with HIV infection. This is a striking contrast to the increases in HIV viral load observed with other systemic infections. This finding presents opportunities to elucidate the biological pathways that underpin epidemiological synergy in HIV co-infections and may enable prediction of which co-infections are most important to epidemic control.

### EVALUATING THE ACCEPTABILITY OF HOME-BASED TESTING AS AN APPROACH TOWARDS ACHIEVING UNIVERSAL KNOWLEDGE OF HIV STATUS: FINDINGS FROM A CASE-CONTROL STUDY NESTED WITHIN THE HPTN 071 (POPART) TRIAL

K. Sabapathy[1], C. Mulubwa[2], J. Kasonda[2], K. Shanaube[2], A. Schaap[1,2], S. Floyd[1], S. Fidler[3], H. Ayles[1,2], R. Hayes[1], HIV Prevention Trials Network 071 (PopART) Study Group

[1]*London School of Hygiene and Tropical Medicine, London, United Kingdom,* [2]*Zambart, Lusaka, Zambia,* [3]*Imperial College London, London, United Kingdom*

**Background:** The HPTN 071 (PopART) trial is being conducted in 21 communities in Zambia and South Africa to examine the impact of a combination prevention package including universal testing and treatment on community-level HIV incidence. Among community members consenting to the PopART intervention (and not self-reporting HIV-infection) 67% (142,922/212,819) accepted home-based HIV-testing and counselling (HB-HTC). We describe the findings of a nested case-control study to examine factors associated with acceptance of HB-HTC in the 8 intervention communities in Zambia.

**Methods:** Random samples of individuals who declined HB-HTC (cases) and those who accepted HB-HTC (controls) (equal numbers of men and women from each community), were questioned about socio-demographic and behavioural factors and asked direct questions about factors which encouraged or discouraged them from accepting HB-HTC, irrespective of whether they accepted it. Logistic regression was used to estimate odds ratios comparing cases and controls.

**Results:** The study recruited 495 participants in Zambia - 240 cases and 255 controls (52% and 46% males, respectively). There were no notable differences in demographic characteristics between cases and controls (eg. age, marital status, socio-economic status, education), nor in several behaviours examined (including sexual or health-seeking behaviour), except that cases were less likely to be mobile (recently spent nights away from home) (adjusted odds ratio (AOR):**0.64**;95%CI:0.42-0.97). The groups differed in perceptions held about HB-HTC. Cases were less likely to cite as reasons in favour of HB-HTC - convenience of testing at home (AOR:**0.36**;95%CI:0.24-0.55); accepting advice of community health-worker to test (AOR:**0.35**;95%CI:0.23-0.53); wanting to confirm HIV-negative status (AOR:**0.52**;95%CI:0.28-0.97). Cases were more likely to state recent testing (AOR:**1.76**;95%CI:1.04-2.96) and male cases, fear of an HIV-positive result (AOR:**3.23**;95%CI:1.55-6.73) as reasons against HB-HTC. Acceptance was not associated with wanting to test because of having an HIV-positive partner nor with concerns about confidentiality.

**Conclusions:** These novel data on reasons for and against uptake of HB-HCT, from a study nested within the largest ongoing trial of treatment as prevention, suggest broad acceptability across population sub-groups. They highlight perceptions which should be addressed when tailoring messaging to promote HB-HTC, in efforts towards attaining the first of the UNAIDS 90-90-90 targets and achieving universal knowledge of HIV status.

## THPEC106

### HIV INCIDENCE OVER TWO YEARS AMONG MEN WHO WERE AND WERE NOT CIRCUMCISED IN A NATIONAL VMMC ROLL-OUT IN ZIMBABWE

D. Kasprzyk[1], M. Tshimanga[2], D.T. Hamilton[3], D.E. Montaño[1]

[1]*University of Washington, Department of Family and Child Nursing, Seattle, United States,* [2]*University of Zimbabwe, College of Health Sciences, Department of Community Medicine, Harare, Zimbabwe,* [3]*University of Washington, Center for Studies on Demography and Ecology, Seattle, United States*

*Presenting author email: kasprzyk@uw.edu*

**Background:** Three randomized control trials (RCTs) demonstrated at least 60% protection of voluntary medical male circumcision (VMMC) for adult male HIV acquisition. VMMC has also been shown to be protective against the acquisition of ulcerative STIs, and HPV, providing important reproductive health benefits to men. However, this positive impact may be offset by risk compensation (RC). No studies have determined whether VMMC continues to be protective under the auspices of a national Male Circumcision (MC) program, where circumcised men are not given free condoms, and are not exposed to repeated safe sex messages as they were in the RCTs. We assessed HIV incidence in a longitudinal study of circumcised vs. not circumcised men in the Zimbabwe MC Programme.

**Methods:** We enrolled a cohort of 2379 HIV-negative men age 18-40 in two urban districts in Zimbabwe, 1196 recently circumcised and 1183 not circumcised. Men were surveyed, at baseline, 6, 12, and 24-months, with HIV testing at 24-months. Men did not differ on sexual behavior at baseline, but differed on marital status, education, and income. We compared the two cohorts on HIV incidence at 24-months, also controlling for demographic differences at baseline. 134 uncircumcised arm men who got circumcised during the study were excluded.

**Results:** Mean age = 25.3; mean age at first sex = 19.3; mean lifetime sexual partners = 6.0. After excluding crossovers, 1745 completed the 24-month survey (78% of cohort). 1560 (89%) agreed to HIV testing at 24-months. There were 16 seroconversions, 12 in the uncircumcised, 4 in the circumcised group. Overall 2-yr incidence = 1.03%; 1.65% in uncircumcised men; 0.48% in circumcised men (p< .05), corresponding to a reduction of acquiring HIV of 71%. Baseline cohort group differences (marital status, income, education) were not significantly associated with sero-conversion. Analyses controlling for them still found significantly less sero-conversion among circumcised men.

**Conclusions:** These findings indicate that in Zimbabwe circumcision appears to be protective among men circumcised through the National VMMC Programme, even if there is increased sexual risk behavior. This extends the RCT findings to programmatic roll-out of MC in countries, and provides important support for continued implementation of national VMMC programs.

# PREVENTION FOR YOUTH AND ADOLESCENTS

## THPEC107

### ARE SCHOOL-BASED SEX EDUCATION INTERVENTIONS EFFECTIVE IN PREVENTING STI/HIV IN SUB-SAHARAN AFRICA? A SYSTEMATIC REVIEW AND META-ANALYSIS OF EVALUATED INTERVENTIONS

A.S. Sani[1], C. Abraham[1], S. Denford[1], S. Ball[2]

[1]*University of Exeter, University of Exeter Medical School, Exeter, United Kingdom,* [2]*NIHR CLAHRC South West Peninsula (PenCLAHRC, University of Exeter Medical School, Exeter, United Kingdom*

*Presenting author email: a.sadiq@exeter.ac.uk*

**Background:** School-based sex education is the most comprehensive, uniform and effective way of promoting sexual health among adolescents and young adults. We systematically reviewed evaluations of school-based sex education interventions in sub-Saharan Africa to determine effectiveness of the interventions in promoting condom use and preventing sexually transmitted infections (STIs) including Human Immunodeficiency Virus (HIV). We also examined features in the design and implementation of the interventions that may be associated with effectiveness.

**Methods:** We searched electronic databases, key journals and reference lists of included studies for school-based interventions that promote condom use in sub-Saharan African schools. We extracted data on intervention characteristics, quality, implementation details and outcomes. Results were synthesized using random effect meta-analysis. The statistical difference in the occurrence of features that may be associated with effectiveness between the effective and ineffective interventions was determined using Chi-Square test.

**Results:** Thirty two evaluated interventions met our inclusion criteria. Overall, interventions had a significant effect on condom use in the short and medium term (OR = 1.62, 95% CI = 1.03-2.55,

*p* = 0.04 and OR = 1.40, 95% CI = 1.16-1.68, *p* = 0.0004 respectively). However, only few evaluations measured STI/HIV and the interventions showed no statistically significant effect in preventing HIV

(OR = 1.16, 95% CI = 0.87-1.54, *p* = 0.31) or HSV2 (OR = 1.08, 95% CI = 0.94-1.24, *p* = 0.27) infections. Only 11 out of the 32 interventions reported implementation details. 15 features that may be associated with effectiveness were identified; with "adapting programs from pre-existing interventions" and "extending activities outside the school environment" significantly differed between the effective and ineffective interventions. Interventions are more likely to be effective if six or more of the 15 features are included.

**Conclusions:** School-based sex education showed some effectiveness in promoting condom use among adolescents and young adults in sub-Saharan Africa. The effectiveness of future interventions can potentially be improved by including six or more of the features identified to be associated with effectiveness. However, more work is needed to implement and evaluate interventions with measurable effects on STI/HIV in addition to reporting details of the implementation processes.

## THPEC108

### PREPEX SAFETY AND EFFICACY STUDY FOR ADOLESCENT MALES WITH CONTRAINDICATED SUBJECTS

M. Vincent
*Rwanda Biomedical Center, Research, Kigali, Rwanda*
*Presenting author email: mutabazivincent@gmail.com*

**Background:** Following the WHO Framework for Clinical Evaluation of Devices for Male Circumcision the PrePex device was added to the pre-qualification list for use in adults above the age of 18. The WHO Framework also recommends studies to assess device safety in a wider range of subjects than those in previous studies, bridging studies are required to extend use of PrePex to age groups younger than those included in the pre-qualification, adolescents under the age of 18 years.
The primary objective to assess safety of device in adolescents.
**Methods:** The study was conducted at Rwanda Military Hospital between August to October 2015, recruiting adolescents ages 10-15 years. The study was evaluated and approved by the Rwanda National Ethics Committee on March 23rd, 2015, approval number 091/RNEC/2015. Nurses and physicians did the procedures and data was collected using Case Report Forms (CRFs).
**Results:** Out of the 96 participants undergoing PrePex, 50% presented one or two contraindications.
The majority contraindications presented were adhesions, 41/96 subjects, about 42% while only 8/96, about 8% presented narrow foreskin / tight phimosis.
All contraindicated subjects undergone a successfully standard PrePex placement after having their contraindication resolved in a non-surgical manner as described above.
For 12 /48 participants with contraindications oozing was observed as a result of the resolution, in all cases oozing was slight and mostly seen on the provider gloves or gauze. No compression or intervention was required before continuing with the Placement procedure, only disinfection with Povidone Iodine.
**Conclusions:** PrePex non-surgical procedure is feasible, effective and safe on men ages 10-14 that have contraindications such as phimosis or preputial adhesions. There were no AEs in our study related to the contraindication resolution methods, 5% Lidocaine cream was found to be safe and efficient pain mitigation for the contraindication resolution.

## THPEC109

### HIV PREVENTION SERVICES AND EDUCATION AMONG ADOLESCENT MEN WHO HAVE SEX WITH MEN

O. Anene, S. Braunstein, L. Starbuck
*New York City Department of Health and Mental Hygiene, Bureau of HIV, Queens, United States*
*Presenting author email: oanene@health.nyc.gov*

**Background:** Many intervention programs have been developed to target adult men who have sex with men (MSM). However, few effective interventions targeting young MSM (YMSM) have been developed, and access for adolescent MSM may be limited due to cultural and structural barriers.
**Methods:** The National HIV Behavioral Surveillance YMSM Pilot Study was conducted among young males ages 13 -18, who were sexually attracted to or had sexual contact with other males and who resided in the New York City area. Participants were recruited using respondent-driven sampling and venue-based sampling, and interviewed using Computer Assisted Personal Interviews over a 13-month period. Survey topics included sexual behavior, sex education, and HIV prevention service use.
**Results:** Overall, 232 persons responded. Of these, 81.4% (n=189) learned about HIV in school but only 66.4% (n=138) learned how to use a condom. Furthermore, only half were instructed about condom use for oral or anal sex. About 52.6% (n=122) learned about sexual orientation in schools, with 50.8% (n=62) reporting the tone as positive. Respondents were grouped for analysis by early sexual debut (by age 15) (n=83, 35.8%) versus later or no debut (n=149, 64.2%). Those with early debut were significantly more likely to have obtained free condoms within the past 12 months (90.4% vs. 71.1%, p< .05), as well as to have obtained them from a clinic or LGBTQ organization (70.0% vs. 43.0%, p< .05). Furthermore, YMSM with early debut were also more likely to have obtained individual or group HIV prevention counseling from LGBTQ organizations (49.4% vs. 23.5%, p< .05).
**Conclusions:** While many YMSM have access to relevant sexual health services, school-based sexuality education does not adequately target specific needs of YMSM. Most YMSM with early sexual debut were able to obtain free condoms and many are connected with LGBT services. However, specific gaps remain in reaching adolescent MSM; future studies should compare needs of YMSM to other adolescents. Tailored comprehensive sexuality education in schools is needed to reduce future HIV risk in this population. Non-conventional platforms for sexual health services and information should be considered, as well as ways to reduce legal barriers to access for adolescents.

## THPEC110

### HIV RISK ASSOCIATED WITH SUICIDE ATTEMPTS AMONG A PROSPECTIVE COHORT OF STREET-INVOLVED YOUTH

B. Barker[1,2], T. Kerr[1,3], H. Dong[1], E. Wood[3], K. DeBeck[1,4]
*[1]BC Centre for Excellence in HIV/AIDS, Urban Health Research Initiative, Vancouver, Canada, [2]University of British Columbia, Interdisciplinary Studies Graduate Program, Vancouver, Canada, [3]University of British Columbia, Division of AIDS, Dept of Medicine, Vancouver, Canada, [4]Simon Fraser University, School of Public Policy, Vancouver, Canada*

**Background:** Street-involved youth, experience elevated rates of HIV risk, infection and mortality. However, less is known about the relationship between markers of HIV risk and mental illness, particularly suicide, among this population. This study sought to longitudinally evaluate if markers of HIV-related risk were associated with recent suicide attempts among street-involved youth.
**Methods:** Data were derived from the At-Risk Youth Study, a prospective cohort of street-involved youth who use illicit drugs in Vancouver, Canada. Multivariable generalized estimating equation analyses were employed to examine risk factors associated with recent reports of attempted suicide.
**Results:** Between September 2005 and May 2014, 1050 street-involved youth were recruited into the cohort, of whom, 139 (13.2%) reported attempting to commit suicide in the last six months at some point during the study period. These participants contributed to a total of 4026 observations, with 172 (4.3%) observations involving a report of attempted suicide. The median number of study visits was 3 (interquartile range: 1 - 5). In multivariable analysis, engagement in sex work (adjusted odds ratio [AOR]=2.15; 95% confidence interval [CI]: 1.40-3.29), experiencing intimate partner violence (AOR=2.31; 95% CI: 1.36-3.93), having a history of childhood maltreatment (AOR=1.71; 95% CI: 1.03-2.86), and being depressed (AOR=2.87; 95% CI: 1.80-4.57) were all positively and significantly associated with recent suicide attempts.
**Conclusions:** Our study findings indicate a number of known HIV risk factors, including engaging in sex work and experiencing intimate partner violence, are associated with recent suicide attempts among street-involved youth. Findings point to opportunities to integrate HIV prevention and testing initiatives with mental health services that are accessible to youth. Future research should explore the gendered vulnerabilities of HIV risks on street-involved youths' mental health.

### YOUNG KEY POPULATIONS IN EGYPT: RISKY SEXUAL BEHAVIOR PATTERNS

M. Abdel Malak[1], G. Tawakol[1], C. Khoury[1], S. Elkamhawi[1], O. Abaza[1], W. Elbeih[2], H. Ramy[3], E. Elkharrat[4], N. Sanan[5], N. Elkot[6], S. Kozman[7], C. Soliman[1]
*[1]FHI 360, Cairo, Egypt, [2]Drosos Foundation, Cairo, Egypt, [3]Ain Shams University, Cairo, Egypt, [4]Freedom, Cairo, Egypt, [5]Befrienders, Cairo, Egypt, [6]Hayat, Cairo, Egypt, [7]YAPD, Alexandria, Egypt*
*Presenting author email: mabdelmalak@fhi360.org*

**Background:** Egyptian youth are estimated to be about one-quarter of the general population. Although young people represent around 14% of the newly detected HIV cases, related data are scarce (NAP, 2015). Due to the conservative society, Young Key Populations (KPs) lack knowledge about Sexual and Reproductive Health including information about HIV/AIDS, and have limited access to youth specific Harm Reduction (HR) services.
**Methods:** The Network of Association for Harm Reduction (NAHR) was established with support from Drosos Foundation, Ford Foundation, and FHI 360 to offer a package of HR services to KPs through its Comprehensive Care Centers (CCCs). Data

regarding demographics and sexual behaviors of young KPs aged 16 to 24 were collected from six CCCs and analyzed between March 2013 and November 2015 in Greater Cairo and Alexandria.

**Results:** A number of 2857 Young KPs was outreached, while 2965 visited the centers. The males constituted the majority of the CCC visitors (93.7%). Almost 20% have received some university education. Regarding engaging in sexual activities, 97.6% reported ever having sex, and about 30% had sex with a same sex partner. As for sex exchange in the past year, 27.6% engaged in commercial sex, and 14% exchanged sex for drugs. Only around 5% reported having an STI in the last six months. As for condom use, 87% didn't use it during last sexual activity with a non-steady partner. However, about 85% expressed willingness to use condoms. Out of the visiting beneficiaries, 2798 received Voluntary Counseling and Testing. For 88.6% of the visitors, engaging in risky behavior was the reason for visiting the VCT, and around 65% were concerned about their new sexual relations. Out of the 2664 who tested for HIV, 2.5% were detected positive.

**Conclusions:** With almost all young KPs reported ever having sex, along with low condom use, there is risk of HIV transmission among them. A situation analysis integrated with the national Demographic and Health Survey to assess sexual behavior trends among young people is recommended. Additionally, there is a need to expand the HR approach of NAHR to other programs targeting the sexual health of youth.

## THPEC112

### SEXUAL LEARNING IN EAST AFRICA: IMPLICATIONS FOR HIV PREVENTION AMONG ADOLESCENTS

A. Knopf[1], H. Al-Khattab[1], K. Mcnealy[1], L. Carter-Harris[1], U. Oruche[1], V. Naanyu[2], C. Draucker[1]
*[1]Indiana University, School of Nursing, Indianapolis, United States, [2]Moi University, School of Medicine, Department of Behavioral Sciences, Eldoret, Kenya*
*Presenting author email: asknopf@iu.edu*

**Background:** Kenya, Tanzania, and Uganda together account for 20% of the world's HIV-infected adolescents. By 2020, the United Nations aims to reduce new infections among adolescents by 75% through a four-pronged strategy that includes comprehensive sexual and reproductive health education. This effort could be informed by a synthesis of existing research about the formal and informal sexual education of adolescents in high-prevalence countries. The purpose of this study was to describe the process of sexual learning among East African adolescents.

**Methods:** Qualitative meta-synthesis, a systematic procedure for integrating the results of multiple qualitative studies of a similar phenomenon, was used. Fourteen electronic databases were searched for peer-reviewed papers that
(a) were published in English between 2003-2014,
(b) used qualitative methodology,
(c) included 13-20 year-old adolescents in Kenya, Tanzania, or Uganda, and
(d) addressed topics related to sexual health.
Through a systematic review process, 31 papers were determined to meet study criteria and were analyzed in four steps: appraisal of the papers, classification of the findings, synthesis of the findings, and construction of a framework depicting the process of sexual learning in this population.

**Results:** The framework includes four phases of sexual learning:
1) being primed for sex,
2) making sense of sex,
3) having chosen, coerced, or violent sex, and
4) living with the consequences of sex.
Adolescents were primed for sex through gender norms, cultural practices, and economic structures as well as through informal and formal instruction. They made sense of sex by acquiring information about sexual practices, relationships, and HIV - although their knowledge was often limited - and by developing a variety of beliefs and attitudes about sex. While some adolescents described having sex to meet their own wants and needs, many described having sex that was coerced or violent. Their sexual experiences had intrapersonal and interpersonal consequences for themselves, their families, and their communities.

**Conclusions:** The four phases of sexual learning interact to shape adolescents' sexual lives and their risk for HIV infection. This framework will contribute to the development of sexual and reproductive education programs that address risk within the broader context of sexual learning.

## THPEC113

### TRANSACTIONAL SEX AND RISK FOR HIV INFECTION IN SUB-SAHARAN AFRICA: A SYSTEMATIC REVIEW AND META-ANALYSIS

J. Wamoyi[1,2], T. Abramsky[3], K. Stoebenau[4], N. Bobrova[3], C. Watts[3]
*[1]National Institute for Medical Research, Mwanza, Tanzania, United Republic of, [2]National Isntitute for Medical Research, Sexual and Reproductive Health, Mwanza, Tanzania, United Republic of, [3]London School of Hygiene and Tropical Medicine, London, United Kingdom, [4]American University, Washington, United States*

**Background:** Young women aged 15-24 in sub-Saharan Africa have continued to be disproportionately affected by HIV, which may, at least in part be driven by transactional sex. Despite this speculation, little has been done to understand the contribution of transactional sex to this disproportionate HIV risk. We therefore set out to systematically review studies that assess the relationship between transactional sex and HIV among men and women in sub-Saharan Africa and to summarize the findings through a meta-analysis.

**Methods:** A systematic review of cross-sectional and longitudinal studies was carried out for studies on women and men who engage in transactional sex published up to 2014. Random effects meta-analysis was used to examine the relationship between transactional sex and prevalent HIV infection across a subset of studies with the same exposure period. Analyses were conducted separately for men and women.

**Results:** Nineteen studies met our inclusion criteria. Of these, 14 provided data on women; and 10 on men. We find a significant, positive, unadjusted or adjusted association between transactional sex and HIV in 10 of 14 studies for women; and two of 10 studies for men. Unadjusted meta-analysis findings are significant for women (n=4; pooled OR=1.54, 95%CI 1.04 - 2.28; $I^2$=42.5%, p=0.156), but not for men (n=4; pooled OR=1.47, 95%CI 0.85-2.56; ($I^2$=50.8%, p=0.107).

**Conclusions:** Transactional sex is associated with HIV among women, while male findings were heterogeneous. However, there is a need for better measurement of the practice of transactional sex and; longitudinal studies to establish the causal pathways between transactional sex and HIV.

## THPEC114

### FACTORS INFLUENCING HIV DISCLOSURE BY YOUNG PEOPLE (10-24 YEARS) LIVING WITH HIV: STUDY RESULTS IN ZIMBABWE

J. Mavudze[1], L. Chingandu[2], R. Eghtessadi[2], R. Nyatsnza[3],
Young people aged 10-24 years living with HIV
*[1]SAfAIDS, Research Monitoring and Evalaution, Harare, Zimbabwe, [2]SAfAIDS, Harare, Zimbabwe, [3]Oxfam Canada in Zimbabwe, Harare, Zimbabwe*
*Presenting author email: jabumavudze@gmail.com*

**Background:** SAfAIDS in partnership with Oxfam conducted a study to examine the factors influencing HIV disclosure to and by young people born and living with HIV and how the dynamics of disclosure affect HIV prevention, treatment adherence and the psychosocial well-being of HIV-positive young people aged 10-24 years.

**Methods:** Data was collected through focus group discussions with young people living with HIV and their primary caregivers separately, in-depth interviews with key informants, participatory exercises such as the use of mock gossip and life story telling to share one's lived experiences, and oral administration of a structured questionnaire on young people. Data was collect in Zvishavane and Bulawayo in Zimbabwe.

**Results:** 54% (107) of the young people had disclosed their HIV-positive status to someone. Disclosure rates were higher among female (65%) than male (40%). Seventy-three percent of support group members had disclosed their status compared to only 41% among non-support group members. Disclosure was also highest among respondents who had received information on disclosure (62%) compared to 32% among those who had not. 77% of the people who indicated that disclosure information received was adequate had disclosed their status. Of the 93 who had not disclosed, 76% indicated that it was due to stigma and discrimination, fear of rejection (20%) and lack of confidence (17%).Young people dominantly felt that HIV status disclosure was best timed if done on or before 14 years (79%). Attitudes towards HIV status disclosure were generally positive, with 90% of the respondents feeling more positive after disclosing than before disclosing their status. Girls and young women expressed an attitude sufficiently positive to urge others to follow their examples of disclosing their HIV at a higher rate of 61% than boys and young men (57%).

**Conclusions:** Stigma and discrimination, perceived number of youths in a similar situation, fear of rejection, preparedness of an HIV-positive caregiver to disclose own status to their children, age, knowledge on disclosure and sexuality activity were identified as the main HIV disclosure determinants.

## THPEC115

### THE SITUATION OF HIV AND AIDS IN PRIMARY, SECONDARY AND HIGH SCHOOLS AND WAYS TO LOWER NEW INFECTIONS: CASE OF DAR ES SALAAM, TANZANIA

H. Lila[1], H.F. Hamisi[2], Z. Abel[1]
*[1]Tanzanian Training Centre for International Health (TTCHI), Ifakara, Morogoro, Tanzania, United Republic of, [2]Research and Evaluation Unit, BRAC Tanzania, Dodoma, Tanzania, United Republic of*
*Presenting author email: 2658808@myuwc.ac.za*

**Background:** HIV infection is believed to be high among adolescences and youngsters studying in schools in Dar Es Salaam, Tanzania. These adolescences and youths are more at risk of getting infected compared to their counterparts living in rural and suburban areas. We selected this particular location due to high prevalence of HIV/AIDS.
**Methods:** This study uses mixed research approach. We used qualitative method research approach to get in-depth understanding of the subject matter. An in-depth face to face interview and focus group discussion with the students in their schools compounds were applied. The project reached nearly 1070 male and female adolescents and youth in schools aged 12 - 24 year from 7 primary schools, and 2 secondary and high schools. In quantitative approach we used secondary data from Measure TDHS (Tanzania Demographics and Health Survey) of 2011/2012 that collected data on varieties of population issues including attitudes, knowledge towards HIV/AIDS, contraception usage and sexual practices.
**Results:** From auxiliary data shows that, an average of 16.8 years of girls start to engage in sexual intercourse with minimum age of 8 years. For recent sexual activities we have almost 70% had sex in the last 4 weeks, while remaining percentages 11% and 17% are not active because they are postpartum and not postpartum respectively. Percentage using condoms as means of contraceptive is only 1.8% which means exposure to STIs and HIV/AIDS is actually high.
**Conclusions:** HIV prevalence in Tanzania is about 5%. The prevalence is marginally higher among women in the reproductive age and even higher for adolescences and youths living in urban areas like Dar Es Salaam. Many have been tempted to lower infections yet there are nearly higher percentages of new infections. We propose measures like parents engagement, peer education (educate both boys and girls) to lower HIV infection rates.

## THPEC116

### VOLUNTARY MEDICAL MALE CIRCUMCISION AMONG ADOLESCENTS: A MISSED OPPORTUNITY FOR BEHAVIORAL INTERVENTION?

M. Kaufman[1], K. Dam[2], K. Hatzold[3], L. Van Lith[2], G. Ncube[4], G. Lija[5], C. Bonnecwe[6], W. Mavhu[3], C. Kahabuka[7], K. Seifert-Ahanda[8], A. Marcell[9], L. Mahlasela[10], M.E. Figueroa[2], E. Njeuhmeli[8], E. Gold[2], A. Tobian[9], Adolescent VMMC Technical Advisory Group
*[1]Johns Hopkins Bloomberg School of Public Health, Department of Health, Behavior & Society, Baltimore, United States, [2]Johns Hopkins Center for Communication Programs, Baltimore, United States, [3]Population Services International, Harare, Zimbabwe, [4]Ministry of Health and Child Welfare, Harare, Zimbabwe, [5]Ministry of Health and Social Welfare, Dar es Salaam, Tanzania, United Republic of, [6]National Department of Health, Pretoria, South Africa, [7]CSK Research Solutions, Dar es Salaam, Tanzania, United Republic of, [8]United States Agency for International Development (USAID) Washington/Global Health Bureau/Office of HIV/AIDS, Washington, DC, United States, [9]Johns Hopkins University School of Medicine, Baltimore, United States, [10]Centre for Communication Impact, Pretoria, South Africa*
*Presenting author email: egold6@jhu.edu*

**Background:** Voluntary medical male circumcision (VMMC) is one of the first venues for adolescent boys in many African countries to interact with the health care system. This study explored the messages and approaches used during VMMC counseling for adolescents and whether such strategies maximize opportunities for broader HIV prevention, adolescent sexual and reproductive health, and linkages to HIV care.
**Methods:** Ninety-two semi-structured qualitative interviews were conducted with VMMC clients ages 10-19 years in South Africa, Tanzania, and Zimbabwe 6-8 weeks post-procedure. An additional 55 interviews were conducted with VMMC counselors. Discussions explored HIV prevention counseling, HIV testing services received before VMMC, and counselors' approaches to HIV testing and disclosure of test results. Audio recordings were transcribed, translated into English, and coded by two independent coders using a thematic approach. Coders discussed discrepancies until at least 85% agreement was reached. Coded text was then assessed for themes.
**Results:** Male adolescents stated that limited information was provided to them about HIV prevention and care. While VMMC protocols require opt-out HIV testing, some adolescents discussed having blood taken without knowing the purpose, not receiving their test results, nor completely understanding the link between VMMC and HIV. Most boys interviewed assumed they had tested negative because they were subsequently circumcised. Identified themes among counselors included spending little time talking about HIV prevention with male adolescents. Counselors rarely discussed masturbation and expressed frustration over their lack of skills in counseling or disclosing HIV positive results to adolescents. Counselor discussions also revealed inconsistencies with regards to working with HIV infected adolescents, with some providers not wanting to circumcise HIV-positive adolescents, whilst others proceeding with the VMMC to avert stigmatization.
**Conclusions:** VMMC for adolescents appears to be a missed opportunity to engage in further HIV prevention and care. Counselors require training in counseling HIV positive adolescents, how to link them to care, and whether to offer VMMC to these clients. Counselors could spend more time focused on delivering prevention messages, further limiting the spread of HIV as adolescent males become sexually active.

## THPEC117

### FEASIBILITY AND ACCEPTABILITY OF THE "OUR FAMILY OUR FUTURE" INTERVENTION: A PILOT STUDY OF A FAMILY-BASED INTERVENTION FOR PREVENTING ADOLESCENT HIV RISK BEHAVIOR

C. Kuo[1,2,3], C. Mathews[2,4], L. Cluver[2,5], D. Operario[1,3], M. Atujuna[2,6], W. Beardslee[7,8,9], J. Hoare[2], D. Stein[2], L. Brown[3,10]
*[1]Brown University School of Public Health, Department of Behavioral and Social Sciences & Center for Alcohol and Addiction Studies, Providence, United States, [2]University of Cape Town, Department of Psychiatry and Mental Health, Cape Town, South Africa, [3]Lifespan/Tufts/Brown Center for AIDS Research, Providence, United States, [4]South African Medical Research Council, Health Systems Research Unit, Tygerberg, South Africa, [5]Oxford University, Department of Social Policy and Intervention, Oxford, United Kingdom, [6]Desmond Tutu HIV Foundation, Cape Town, South Africa, [7]Judge Baker Children's Center, Boston, United States, [8]Boston Children's Hospital, Boston, United States, [9]Harvard Medical School, Department of Psychiatry, Boston, United States, [10]Alpert Medical School of Brown University, Department of Psychiatry and Human Behavior, Providence, United States*
*Presenting author email: caroline_kuo@brown.edu*

**Background:** Family-based interventions are developmentally appropriate for early adolescents (13-15 years), a key population for HIV prevention. Yet, few empirically supported family-based interventions exist in generalized epidemic settings and specifically address prevention needs linked to family mental distress. We tested acceptability and feasibility of "Our Family Our Future", an intervention integrating HIV prevention-mental health resilience, and adapted to South Africa from existing best-evidence models for HIV prevention and mental health resilience.
**Methods:** Nearly 800 families were screened for eligibility through systematic house-to-house sampling in Khayelitsha, South Africa from 2015-2016 and included if adolescents were 13-15 years, and if adolescent-parent dyads scored 9-15 on the Centers for Epidemiologic Studies Depression Scale. In total, N=76 dyads (152 participants) were randomized to intervention or wait-list control. Outcomes were collected via smartphones with audio computer-assisted self-interviewing at baseline, 1 month, and 3 months post-intervention. We examined feasibility through fidelity and retention. We examined acceptability through likert scales and open-ended responses. Descriptive data were analyzed in SPSS. Brown University and University of Cape Town provided ethical approvals.
**Results:** Adolescents were predominantly female (56%), Black African (100%), and an average of 14 years. Parents were predominantly female (96%), Black African (100%), and an average of 40 years. Adolescent lifetime sexual behavior included vaginal (17.6%) and anal sex (6.8%). Among sexually active adolescents, 24.6% tested for HIV, 35.6% had 5 or more partners, and 30.8% never used condoms. In the preceding three months, 30.8% inconsistently used condoms, and 30.0% had sexual partners of unknown HIV status. Feasibility and acceptability of a future trial is high. Facilitators were adherent (>95%) to the intervention protocol. All families (100%) were retained in ongoing post-intervention outcome assessments. All families (100%) were satisfied with intervention content and facilitators. The majority (>90%) were satisfied with intervention format and ranked material as relevant, enjoyable, and would recommend to others. Areas for refinement include addressing challenges of dyadic attendance, safe transport, hunger, and childcare.
**Conclusions:** Our Family Our Future is a promising family-based intervention for adolescent HIV prevention. High acceptability and feasibility of this developmentally tailored adolescent intervention indicates the need for a future randomized controlled trial.

## THPEC118

### INTERACTION BIAS AMONG COUNSELORS WORKING WITH ADOLESCENT VOLUNTARY MEDICAL MALE CIRCUMCISION (VMMC) CLIENTS IN SUB-SAHARAN AFRICA

A. Tobian[1], M. Kaufman[2], K. Dam[3], K. Hatzold[4], L. Van Lith[3], G. Ncube[5], G. Lija[6], C. Bonnecwe[7], W. Mavhu[4], C. Kahabuka[8], K. Seifert-Ahanda[9], A. Marcell[1], L. Mahlasela[10], M.E. Figueroa[3], E. Njeuhmeli[9], Adolescent VMMC Technical Advisory Group
*[1]Johns Hopkins University School of Medicine, Baltimore, United States, [2]Johns Hopkins Bloomberg School of Public Health, Department of Health, Behavior & Society, Baltimore, United States, [3]Johns Hopkins Center for Communication Programs, Baltimore, United States, [4]Population Services International, Harare, Zimbabwe, [5]Ministry of Health and Child Welfare, Harare, Zimbabwe, [6]Ministry of Health and Social Welfare, Dar es Salaam, Tanzania, United Republic of, [7]National Department of Health, Pretoria, South Africa, [8]CSK Research Solutions, Dar es Salaam, Tanzania, United Republic of, [9]United States Agency for International Development (USAID) Washington/Global Health Bureau/Office of HIV/AIDS, Washington, DC, United States, [10]Centre for Communication Impact, Pretoria, South Africa*
*Presenting author email: kdam@jhu.edu*

**Background:** Male adolescents represent the majority of individuals seeking voluntary medical male circumcision services (VMMC) services in sub-Saharan Africa. VMMC counselors interact with adolescents of various developmental stages and sexual experience. This study assessed the counseling adolescents receive and evaluated counselors' knowledge and any biases when working with adolescent clients.
**Methods:** Qualitative interviews were conducted with 55 VMMC counselors and 92 adolescent clients in South Africa, Tanzania, and Zimbabwe. Interviews with counselors focused on describing the VMMC counseling process, their knowledge and training, and opinions and attitudes towards adolescent clients. Adolescent interviews focused on the content of counseling received, their feelings during the sessions, and perceptions of counselors' attitudes. Audio recordings were transcribed, translated into English, and thematically coded.
**Results:** Counselors expressed hesitation in communicating complete information—including HIV prevention, future sexual partners, and abstinence from sex or masturbation during the wound healing period—with younger males (< 15 years) and/or those assumed to have no sexual experience. Counselors also discussed the limitations of current guidelines and training in providing parameters on how to engage in adolescent-appropriate counseling. Many counselors discussed not assessing an adolescent client's sexual experience in order to gauge appropriate counseling content. Counselors reported giving full information, per VMMC protocols, to older adolescents since the counselors are not as hesitant in talking about sexual topics with them as compared with younger adolescents. Adolescents reported counseling content focused primarily on VMMC procedures or wound care. Finally, counselors discussed a preference for counseling younger adolescents with their parents/guardians to ensure adherence to wound care instructions. Some younger adolescents expressed reservation with this approach; they felt they would be unable to disclose personal experiences, including sexual ones, if parents/guardians are present.
**Conclusions:** VMMC counselors appear biased in how much information they communicate to younger versus older adolescent clients and sexually experienced versus inexperienced clients. VMMC may be more effective in providing complete HIV prevention and care messaging if all adolescents are given age and sexual experience-appropriate information during counseling sessions. Strengthening VMMC counselors' interpersonal communication and counseling skills requires guidelines and training to fully address the range of adolescent client needs.

## THPEC119

### GENDERED PREVALENCE AND PREDICTORS OF POTENTIALLY TRAUMATIC EXPERIENCES OF YOUNG MEN AND WOMEN IN SOWETO, SOUTH AFRICA

K. Closson[1,2], J. Dietrich[3,4], B. Nkala[4,5], A.B. Musuku[1], Z. Cui[2], J. Chia[2], G. Gray[4], N.J. Lachowsky[2,3], R.S. Hogg[1,2], C.L. Miller[1], A. Kaida[1]
*[1]Simon Fraser University, Faculty of Health Sciences, Burnaby, Canada, [2]British Columbia Centre for Excellence in HIV/AIDS, Epidemiology and Population Health, Vancouver, Canada, [3]University of British Columbia, Faculty of Medicine, Vancouver, Canada, [4]Perinatal Research Unit, University of the Witwatersrand, Johannesburg, South Africa, [5]University of the Witwatersrand, Faculty of Humanities, Johannesburg, South Africa*
*Presenting author email: kvenditt@sfu.ca*

**Background:** In many global settings, adolescents face high rates of HIV incidence, which has been linked with multiple exposures to traumatic experiences. We measured prevalence of exposure to potentially traumatic events (PTEs) by gender and assessed factors associated with experience among adolescents living in Soweto, South Africa.
**Methods:** We analysed baseline survey data from adolescents (aged 14-19) recruited from formal and informal townships in Soweto. "Ever" experience of trauma was assessed via an adapted version of the Traumatic Event Screening Inventory (TESI), including violent and non-violent experiences of trauma (19 items, study alpha=0.63). We assessed number of traumatic events experience, stratified by experience with violent and non-violent trauma, and by gender. Stratified by gender, multivariable logistic regression was used to assess independent correlates of high-PTEs experience (defined as ≥7 TESI-events, out of a possible score of 19).
**Results:** Of 830 participants (57.2% female; median age= 17 [IQR:16-18 ]), 767 (92%) answered all TESI scale-items. Majority of participants (99.7%) experienced at least one PTE. Median number of PTEs was 7 [Q1,Q3: 5,9], with no significant difference by gender (p=0.19). Young men reported more experiences and perpetration of violent PTEs (e.g. deliberately inflicted harm on someone), whereas females experienced more psychological PTEs (e.g. family member or someone close dying from HIV/AIDS).
High PTE score was independently associated with high food insecurity among both adolescent men and women (aOR=2.63, 95%CI=1.35-5.12; aOR=2.57, 95%CI=1.55-4.26, respectively). For young men, high PTE score was independently associated with older age (aOR=1.39/year, 95%CI=1.20-1.62); living in Soweto for < 5 years versus 'since birth' (aOR=2.84, 95%CI=1.17-6.90). Among young women, high PTE score was independently associated with probable depression (aOR=2.00, 95%CI=1.31-3.03, using CES-Depression score) and inconsistent condom use compared with no sexual experience (aOR=2.69, 95%CI=1.66-4.37).
**Conclusions:** Adolescents in Soweto experience a concerning number of PTEs. Exposure to PTEs were distributed along social and gendered axes. Among adolescent women, high PTE exposure was associated with mental health and HIV-related risks. Prevention science among adolescents in South Africa should consider structural and community-level interventions to reduce and address exposure to PTEs in young people as well as improve access to supportive mental health services post-exposure to PTEs.

## THPEC120

### ASSOCIATIONS BETWEEN SELF-ESTEEM, HIV-LITERACY AND SEXUAL BEHAVIOUR: A CAUSAL PATHWAY FOR HIV PREVENTION AMONG ADOLESCENT GIRLS IN KWAZULU-NATAL, SOUTH AFRICA

P. Strand[1,2], A. Agardh[3]
*[1]University of KwaZulu-Natal, HEARD, Durban, South Africa, [2]Star for Life, Scientific Advisor, Hluhluwe, South Africa, [3]University of Lund, Department of Social Medicine and Global Health, Lund, Sweden*
*Presenting author email: per@perstrand.com*

**Background:** Teenage pregnancies trap adolescent girls in poverty and increased risks of HIV infection due to discontinued education and exploitative relationships with unsafe sexual behavior. The intervention 'Star for Life' reported evidence of a 30% lower pregnancy rate in its programme schools in the UMkhanyakude district in KwaZulu-Natal (KZN) in 2013. There is little research on HIV prevention interventions that can identify behaviour change effects in individual-level data. The aim of this study was to assess a plausible causal pathway from 'self-esteem' through 'HIV literacy' to 'sexual behaviours' among adolescent girls.
**Methods:** Twenty-five percent of students (n=5556, 53% female) from 43 intervention schools in South Africa and Namibia provided self-reported data through a questionnaire in 2015. A series of correlation analyses (Pearson's *r*) were conducted with control for relevant structural and demographic variables. Comparisons were made depending on students' level of active engagement with the programme - a 'dose' effect. Indicators of 'sexual behaviour' included 'sexually active', 'condom use', 'multiple concurrent partners' and 'pregnancy'.
**Results:** The results were valid for all female students, but were particularly strong among female students in KwaZulu-Natal. For these girls, the 'dose' of the programme was positively correlated with their level of self-esteem (.204**), which was linked to their level of HIV literacy (.351**). Students' self-esteem and HIV literacy were both significantly associated with safe sexual behaviours. The intervention appears to empower also the girls who live with extreme poverty.
**Conclusions:** The research found that the notion of self-esteem was associated with HIV literacy and sexual behaviours in ways that strengthen our understanding of how to affect behaviour change for HIV prevention and a reduction in teenage pregnancies. These findings will assist efforts to formulate a best-practise model for interventions to empower individual adolescent girls and reach collective aspirational targets for HIV prevention within this key population.

## THPEC121

### INTEGRATION OF ADOLESCENT-FRIENDLY SEXUAL AND REPRODUCTIVE HEALTH (SRH) SERVICES INTO HIV PREVENTION, TREATMENT, CARE AND SUPPORT

K. Ngámbi[1], M. Silukena[2]
*[1]Pride Community Health Organization, Kafue, Zambia, [2]Southern African AIDS Trust (SAT), Lusaka, Zambia*
*Presenting author email: masausokenanngambi@yahoo.com*

**Background:** Integration of HIV prevention services into reproductive health, care support and treatment programs can potentially increase the uptake of FP, dual protection and reduce vertical transmission of HIV. Pride Community Health Organization supports Adolescent Sexual Reproductive Health Services targeting young people in the age group of 10 - 19 and 20 - 24 years. An average of 65 young people each month access information and services in the "One Stop Shop" including Peer Supporter Program for Adolescents and Children Living with HIV to improve HIV treatment and care outcomes for peers.
**Methods:** To improve access to, and uptake of Adolescent Sexual Reproductive Health Services, HIV counselling and Testing, FP and referrals were integrated in the counselling process at the Youth Friendly Corner site with specific emphasis on dual protection and condom use. Peer Educators in the age group of 10 - 19 and 20 - 24 girls and boys implemented sexual and reproductive health programs at Estates Clinic which did not have youth friendly services at that time. A room was secured to be used for provision of Adolescent - Youth Friendly sexual and reproductive health services at Estate Clinic. Peer educators disseminate HIV and AIDS information and refer young people for services to the ART and TB nurses who are permanently located within the "One Stop Shop." Peer educators also conduct community awareness meetings in schools, bars and taverns.
**Results:** From January 2015 to December, 2015: 889 adolescents received HIV and AIDS information and 441 were tested for HIV, and 40 clients were referred for ART services. A total of 47 were also referred for STI screening, and 101 were referred for Voluntary Medical Male Circumcision. A total of 17, 238 condoms were distributed at the "One Stop Shop".
**Conclusions:** "One Stop Shop" provides a friendly space where young people can access information and increases uptake to ASRH services. Adolescents peer educators create demand for adherence and retention support, mitigation of stigma and discrimination. Health care providers work is easier and waiting periods reduced. Adolescents specific interventions increase access SRH and HIV services.

## THPEC122

### IS AGE REALLY JUST A NUMBER? FACTORS ASSOCIATED WITH HAVING SIGNIFICANTLY OLDER MALE SEXUAL PARTNERS AMONG YOUNG RURAL SOUTH AFRICAN WOMEN (HPTN 068)

T. Ritchwood[1], A. Pettifor[2], L. Jennings[3], J. Hughes[4], A. Selin[2], K. Kahn[5], B. Williamson[6], F.X. Gómez-Olivé[7], C. MacPhail[8]
*[1]Medical University of South Carolina, Public Health Sciences, Hillside, United States, [2]UNC-CH, Chapel Hill, United States, [3]Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, [4]University of Washington, Fred Hutchinson Cancer Research Institute, Seattle, United States, [5]University of the Witwatersrand, Johannesburg, South Africa, [6]University of Washington, Seattle, United States, [7]MRC/Wits Rural Public Health and Health Transitions Research Unit, Agincourt, South Africa, [8]University of New England, Armidale, United Kingdom*
*Presenting author email: ritchwoo@musc.edu*

**Background:** AIDS is the leading cause of death among youth within sub-Saharan Africa, with South Africa reporting more new cases of HIV than any other country in the world. There are significant gender inequities in HIV infection within South Africa and young women aged 15-24 have HIV rates that are three times higher than their male counterparts. While it is clear that a combination of socio-behavioral, structural, and biological factors contribute to the African epidemic, there has been increasing attention given to sexual liaisons between older men and younger women, which have been linked to greater risk of HIV acquisition. This study aims to: 1) examine the association between partner age discordance and young South African women's sexual behavior; and 2) to identify socio-behavioral differences between those reporting age-discordant partnerships (partner ≥ 5 years older) compared with those reporting age-concordant partnerships (all others).
**Methods:** We used generalized estimating equations to analyze responses from 679 sexually-experienced females (aged 13-20 years) from rural Mpumalanga province participating in baseline data collection for an intervention trial.
**Results:** Partner age discordance was associated with greater odds of reporting both more frequent sex (adjusted odd ratio [aOR] = 1.77, 95% CI 1.20-2.60) and having a partner with concurrent partnerships (aOR = 1.77, 95% CI 1.22-2.57). Regarding socio-behavioral differences, young women reporting age-discordant partnerships were more likely to report: casual partnerships (aOR 1.50, 95% CI 1.06-2.13), having a partner with concurrent partnerships (aOR 1.71, 95% CI 1.19-2.46), 3 or more lifetime sexual partners (aOR 2.29, 95% CI 1.52-3.45), and frequent intercourse (i.e., having sex at least 2 or 3 times per month) (aOR 2.04, 95% CI 1.39-3.00). Moreover, they were less likely to report condom use at last sex (aOR 0.70, 95% CI 0.50-0.98) and less likely to report always using condoms (aOR 0.53, 95% CI 0.32-0.88).
**Conclusions:** Overall, our findings suggest that, among young South African women, the link between partner age discordance and HIV risk may be more strongly related to the characteristics of women who form these partnerships than to the young women's age-discordant partner.

## THPEC123

### BREAKING THE SILENCE ON EGYPTIAN YOUTH VULNERABILITY TO HIV/AIDS

N. Abdel-Tawab[1], D. Oraby[1], S. Saher[2], S. Ismail[3]
*[1]Population Council, Reproductive Health and HIV, Cairo, Egypt, [2]USAID, Cairo, Egypt, [3]Population Council, Consultant, Cairo, Egypt*
*Presenting author email: doraby@popcouncil.org*

**Background:** Despite the fact that Egypt's conservative culture may have contributed to slowing down the progress of the HIV epidemic, traditional norms do not fully protect Egyptian youth. An increase in the number of detected HIV infections among youth was observed where 14.1 % of new cases were aged 15-24 years at the end of 2009. Youth are considered more vulnerable to HIV than other age groups being more sexually active and more likely to engage in risky behavior, however, the culture of silence around discussion of sexuality and the stigma around HIV/AIDS have limited our understanding of factors increasing vulnerability. This study offers an evidence-based description and interpretation of the HIV-related risks and vulnerabilities faced by different sub-groups of youth in Egypt and provides relevant policy recommendations.
**Methods:** The study entailed 28 in-depth interviews (IDIs) with young people practicing risky behaviors, namely people who inject drugs (PWID) of both sexes, female sex workers (FSW) and men who have sex with men (MSM) in addition to street children of both sexes and married adolescent girls. Additional 21 interviews were conducted with key informants and stakeholders. The study also included eight focus group discussions with young people aged 15-18 years, 18-24 years and HIV infected youth of both sexes.
**Results:** The study revealed that several factors increase Egyptian youth vulnerability to HIV including sociocultural, economic and legal factors in addition to limited access to SRH information and services. HIV related stigma and discrimination prevent youth from seeking HIV counseling and testing services. Poverty and unemployment prevent youth from fulfilling their sexual desires through marriage. Cultural norms forbid young people from receiving SRH information or services until after they get married. Additionally, legal barriers prevent PWID, FSW and MSM from seeking health services or disclosing their high risk behavior.
**Conclusions:** The study recommended a comprehensive approach to facilitate youth access to SRH information and services. Efforts must be made to eliminate HIV related stigma as well as creating a supportive enabling environment for youth SRH. In addition, policy and legal reforms are needed in relation to key populations.

## THPEC124

### PREP FOR YOUTH: A MULTI-DISCIPLINARY APPROACH TO REDUCE BARRIERS TO ACCESS

U. Belkind[1], A. Radix[2], A. DeSimmone[1], P. Carneiro[2], P. Meacher[2], F. Brigham[2], R. Vail[2], S. Weiss[2]
*[1]Callen-Lorde Community Health Center, Health Outreach to Teens (HOTT), New York, United States, [2]Callen-Lorde Community Health Center, New York, United States*
*Presenting author email: ubelkind@callen-lorde.org*

**Background:** Daily oral antiretroviral pre-exposure prophylaxis (PrEP) has been shown to be highly effective in preventing HIV acquisition. In the US, high cost and access to prescribers knowledgeable about PrEP can become barriers to access for youth.
**Description:** This is an overview of PrEP experiences from a multi-disciplinary, youth-focused, urban community health center based in New York City, Health Outreach to Teens (HOTT). HOTT serves approximately 1200 individual patients/year aged 13-24 years. Aside from HIV services, we provide comprehensive transgender care, and general reproductive health services to a largely MSM population. Our PrEP program consists of clinicians, case management, nursing, outreach coordination, a PrEP specialist, and administrative staff. PrEP candidates are either self-referred or identified by one of the above providers. Patients are prescribed PrEP HIV/STD screening, risk assessment of acute HIV infection, and baseline labs. Uninsured patients are referred to the PrEP specialist who completes necessary documentation for government or medication assistance programs (MAP).

After PrEP initiation patients are seen or called in 2 weeks to assess for barriers to access or adherence and seen by the clinician in 4 weeks to repeat HIV testing and 3 monthly thereafter.
From 10/2013 to 10/2015 we have written 148 prescriptions for PrEP for patients 18-24 years. The racial breakdown (55% white, 14% black, 7% multiracial, 24% other or declined to answer; ethnicity 32% Hispanic) differs from our overall patient population (21% white, 27% black; 36% Hispanic). 87% identify as male and the rest as transgender (TG) women (9%), TG men (2%), or other (2%). Most patients identify as gay/MSM (83%). Commercially insured patients account for half of PrEP patients, government-issued insurance 27% and uninsured 23%; this also differs from our overall patient population where nearly 60% are uninsured.
**Lessons learned:** PrEP is a viable option for youth but barriers to care such as lack of insurance, cost of medication and complexity of aid programs can hinder its access and are better addressed by a multi-disciplinary team.
**Conclusions/Next steps:** We will continue to develop strategies to decrease disparities based on racial, transgender, and insurance status when accessing PrEP for patients at risk of acquiring HIV.

## THPEC125

### USE OF COMMUNITY LEVEL EVIDENCE INFORMED BEHAVIORAL INTERVENTIONS (EBIS) AS A STRATEGY FOR HIV RISK-REDUCTION IN YOUNG PEOPLE: RESULTS FROM COUNTIES SERVED BY APHIA*PLUS* KAMILI IN KENYA

J. Mutegi[1], J. Kanyi[2], D. Okubasu[1], M. Kitheka[3], M. Njeru[1]
*[1]Jhpiego Kenya, Monitoring Evaluation and Research, Nairobi, Kenya, [2]PATH, Behavior Change and Communication, Nairobi, Kenya, [3]Jhpiego Kenya, Management, Nairobi, Kenya*
*Presenting author email: dunkuba@gmail.com*

**Background:** According to KAIS 2007 and KDHS 2008- 09 surveys, young women aged 15-24 years are 4 times more likely to be HIV- infected than men (6.1% compared to 1.5%). APHIA*PLUS* KAMILI project is a five year USAID funded project in 11 counties focusing on improving quality health service delivery. The project is implementing Evidence informed Behavioral Interventions (EBIs) such as Sister to Sister and SHUGA in tertiary institutions, churches, MNCH clinics, youths out of school groups and youth friendly centers as a strategy to reduce HIV infection. Sister to Sister provides culturally sensitive health information to empower and educate women preferably clinical settings; help women understand the behaviors that put them at risk of HIV and other STDs and enhance their knowledge, beliefs, motivation, confidence, and skills. SHUGA is an innovative partnership resulting in a mass multimedia behavior change communication initiative targeting youth aged 15 to 24 with HIV prevention messages and linking them to vital services.
**Description:** The project has implemented “Sister to sister” within community setting rather than clinical setting. 64 facilitators aged 15-24 years were trained in September 2014 using the sister to sister curriculum. The facilitators had a target of reaching 5 young women aged 15 to 24 years daily. Videos were used during one on one session to build women’s self-efficacy and condom efficacy to empower them on safe sex. SHUGA is implemented in tertiary institutions and formal groups that can complete the minimum four sessions each lasting 1 and half to 2 hours.
**Lessons learned:** Between October 2014 and September 2015, 125,620 young women (3,916 and 121,704 through Shuga (October 2014 to June 2015) and Sister to Sister intervention respectively) were reached out of 105,013 targeted by the project. 96,113 received adolescent sexual reproductive health services, 1,896 received HTC services, and 423 took up a family planning method. Similarly 232,996 male and 15,002 female condoms were distributed.
**Conclusions/Next steps:** Shuga being friendly and serving both education and entertainment needs of the youngsters and Sister to sister intervention implemented within community setting rather than clinical setting are feasible, cheap approach which can be scaled up to reach the vulnerable groups.

## THPEC126

### CHURCH-BASED MARRIAGE COUNSELLORS KNOWLEDGE, PERCEPTION AND PRACTICES RELATING TO HIV COUNSELLING AND TESTING FOR INTENDING COUPLES IN IBADAN SOUTH-WEST LOCAL GOVERNMENT AREA, NIGERIA

A. Daramola[1], A. Ogunwale[1,2], F. Oshiname[1]
*[1]University of Ibadan, Department of Health Promotion and Education, College of Medicine, Ibadan, Nigeria, [2]Oyo State College of Agriculture and Technology, Department of General Studies, Igboora, Nigeria*
*Presenting author email: tayoogunwale@yahoo.com*

**Background:** This study investigated the knowledge, perception and practices concerning HCT among Church-based Marriage Counsellors (CMC) in Ibadan South-West Local Government Area (LGA), Nigeria.
**Methods:** The cross-sectional study involved the use of a three-stage random sampling technique to select 660 CMC from Christian Association of Nigeria districts, denominational categories and parishes in the LGA. A pre-tested semi-structured questionnaire which included 34-point HIV/AIDS and 13-point HCT knowledge scales as well as questions on HCT related perception and practices, was used for data collection. Descriptive statistics, T-test and F-test were used to analyse the data at p=0.05.
**Results:** Respondents’ age was 45.0±8.6 years, 60.3% were male, 84.1% had tertiary education and 65.0% performed only CMC roles; 35.0% were pastors as well. The HIV/AIDS and HCT knowledge scores were 25.6±3.3 and 9.3± 2.6, respectively. Majority (84.7%) perceived mandatory HCT as morally justifiable while 88.6% opined that churches should make HCT compulsory for Intending Couples (IC). Majority (88.0%) stated that pre-marriage courses for IC with infused HIV related topics existed in their churches. About two-third (63.2%) revealed that medical investigations which IC are advised to undergo include HCT. However, 50.0%, stated that a positive HIV test is never used to prevent marriage solemnisation. A combination of prayer and counselling (74.9%) topped the list of forms of support for IC with sero-positive status. Mean knowledge score of CMC without pastoral roles (9.2 ± 2.4) was not significantly different from the score (9.4±2.7) obtained by those with pastoral duties. Knowledge scores of females and males on HCT were 9.4±2.6 and 9.2±2.6, respectively with no significant difference. Knowledge scores on HCT by respondents with primary, secondary and tertiary education were 6.8±4.4, 8.2±2.9, and 9.5±2.4 with a significant difference.
**Conclusions:** There are HIV related educational opportunities for intending couples in many of the churches. However, inadequate knowledge and misperception of HIV counseling and testing existed among the counsellors. Training programmes aimed at upgrading respondents’ knowledge on HIV counseling and testing, implications of a sero-positive test result for intending couples and the importance of accessing treatment once a positive test is established are recommended.

## THPEC127

### ASSOCIATION OF EARLY SEX DEBUT AND SUBSTANCE USE WITH UNPROTECTED SEX AMONG YOUNG PEOPLE IN THREE COUNTRIES OF EASTERN EUROPE

A. Liubimova[1], K. Eritsyan[2,3], V. Odinokova[4], M. Rusakova[2,3,4], N. Usacheva[2], O. Kolpakova[2]
*[1]NGO Stellit, Social Research, Saint-Petersburg, Russian Federation, [2]NGO Stellit, Saint-Petersburg, Russian Federation, [3]Saint Petersburg State University, Saint-Petersburg, Russian Federation, [4]The Sociological Institute of the Russian Academy of Science, Saint-Petersburg, Russian Federation*
*Presenting author email: alexandra.lyubimova@gmail.com*

**Background:** In Eastern Europe HIV presents a significant threat for young people. There is an increasing of the role of sexual route of HIV transmission in the region. In this study we aimed to describe prevalence and correlates of sexual debut at early age among young people.
**Methods:** Data was collected by group-administered questionnaires in three countries: Russia (Saint-Petersburg and Kaliningrad), Latvia (Riga) and Warsaw (Poland). A total of 1596 participants aged 15 - 24 were recruited in vocational schools, dependency treatment clinic, social support youth and family centers and sports center. The study locations were selected to represent youth at greater risk of getting HIV, by the opinion of at least three local experts. Logistic regression models were used to find significant correlates of sexual debut before the age of 15.
**Results:** Early sex debut was twice more prevalent among males than females (17.6% vs. 8.2%; p≤0,001). In logistic regression sex debut before the age of 15 was associated with being male (AOR=2.08, 95%CI=1.46 - 2.98), living in St. Petersburg (AOR=2.25, 95%CI=1.41 - 3.60), being brought up at an orphanage (AOR=1.97; 95%CI=1.21 - 3.21), drug use prior to sexual debut (AOR=3.38, 95%CI=2.11 - 5.40) and early age of first alcohol intake (AOR=1.56, 95%CI=1.08 - 2.25). Early sex debut had more chances to be unprotected (AOR=2.23, 95%CI=1.52 - 3.27) and happen under influence of drugs (AOR = 3.18, 95%CI=1.49 - 6.79). Early sex debut in this study was independently associated with non-consistent condom use during last 12 months (AOR=2.15, 95%CI=1.38 - 3.36).

**Conclusions:** Study results might have important policy implications. Our data suggest the need for special attention to increasing the age of sexual debut since it's associated with significant immediate and postponed HIV risks, as well as adequate sex education for adolescents. Also, there is a clear need to link the prevention efforts aimed on reducing of drug experimentation and those focused on sexual behaviors which are usually run separately. Acknowledgments: National Institute for Health and Welfare, Finland; Social AIDS Committee, Poland; Baltic HIV Association, Latvia and Young Leaders Army (YLA), Russia; **Russian Foundation for the Humanities (15-03-00356).**

## THPEC128

### THE IMPACT OF THE *ZAZI* MASS MEDIA CAMPAIGN ON CONTRACEPTIVE UPTAKE AND HIV PREVENTION BEHAVIOUR AMONG 15-24 YEAR OLD YOUNG WOMEN IN SOUTH AFRICA

L. Mahlasela[1], B. Goldblatt[1], R. Braz[2], A. Squara[2]
*[1]Centre for Communication Impact, Pretoria, South Africa, [2]IPSOS, Johannesburg, South Africa*

**Background:** Young women aged 15-24 years old are considered among the most vulnerable groups at risk of HIV in South Africa and elsewhere. A campaign known as *Zazi* was launched in May 2012 with the aim of empowering young women with knowledge and skills to "*Zazi*- know themselves" and built their self-esteem to reduce HIV risk and increase uptake of contraception. An advertisement focused on promoting dual protection through increased dialogue and support by older women to younger women was broadcast on national television.
**Methods:** Between September and October 2015, a nationally representative survey of 3 763 men and women aged 15 years and over was conducted as part of the IPSOS Khayabus survey. Demographic, knowledge, attitudinal and behavioural outcomes (KAB), contraceptive use and exposure to the *Zazi* campaign was collected through face-to-face computer assisted personal interview (CAPI). The association between the KAB outcomes and exposure to the campaign was analysed for a subset of men young women aged 15- 24 (n=421), who are the primary audience of the campaign.
**Results:** 68.3% of young women reported condom use at last sex. Of these, 68% were at the highest level of exposure to the campaign, compared to 11.5% at no exposure. Use of contraceptives in the past 12 months was 26.9% (of whom 48.3% were in the high exposure vs. 14% with some exposure and 22.5% with no exposure). Average contraceptive plus condom use (dual contraceptive) in the past 12 months was 25%. Of these, 74% were in the highest exposure vs. 4.3% in the no exposure category. Reported discussions about contraceptives were as follows: 32.3% talked to spouse/partner, 18% grandmother, 16.2% sister and 13.3% mother. Ninety-eight percent of those using contraceptives, access them from government facilities and reported receiving 'excellent' or 'good' services.
**Conclusions:** The *Zazi* campaign plays a critical role in generating demand for HIV prevention and contraceptive (dual protection) among young women as well as promoting discussions with partners/family. With health services reported as mainly 'excellent' or 'good', there is an opportunity to engage with more young women to improve uptake of these services.

## THPEC129

### BARRIERS AND OPPORTUNITIES FOR PROMOTING CONDOM USE AMONGST YOUNG MEN IN SOUTH AFRICA

N. Orr
*Centre for AIDS Development, Research and Evaluation, Research, Johannesburg, South Africa*

**Background:** The 2012 South African National HIV Prevalence, Incidence and Behaviour Survey, found declines in condom use in almost all age groups and low general knowledge of transmission and risky behaviour (Simbayi et al, 2012).
This study's objectives were to explore current condom practices amongst males and females to understand patterns of condom use, and to identify barriers and enablers of condom use. Findings will inform *Brothers for Life* ongoing communication campaigns to promote condom use.
**Methods:** A qualitative approach was taken to the research. Fifteen focus groups and eight in-depth interviews were conducted with 123 participants. Participants were young people aged 18- 34 from urban, peri-urban and rural localities from KwaZulu-Natal, Gauteng, Mpumalanga and Free State.
**Results:** The study found high levels of self-reported risky sexual behavior, such as not using condoms once trust and love develops, removing condoms mid sexual intercourse and engaging in coitus interruptus during unprotected sex. Condom use was associated with being 'sick' and age disparate relationships were characterized by low condom use. Availability of antiretroviral treatment contributed to views that HIV infection is less 'scary' and perceptions that non-condom use is less risky.
Significant factors emerged that encourage condom use: acceptance of condoms to prevent pregnancy; openness by male partners to use condoms if prompted by their female partners, and both males and females supporting a shifting gender norm that normalizes women's proactive behaviour with condoms. Other factors supporting condom use included the desire to protect the main partner from diseases, and knowledge of HIV status. Medical male circumcision was identified seen as an opportunity to further promote and strengthen condom messaging.
**Conclusions:** There is a need for ongoing public communication drives and prevention interventions to increase knowledge of HIV sexual transmission and to promote condom use. Targeted campaigns and programmes that address specific barriers to condom use that drive the epidemic are needed. HIV prevention communication should address both emotional and physical aspects that lead to non-condom use and increase knowledge of sexual transmission and risky behavior. The agency of female sexual partners in facilitating and enhancing condom use should be promoted.

## THPEC130

### DOES HIV PEER EDUCATION LEAD TO PROMISING OUTCOMES AMONG OUT-OF-SCHOOL YOUTH IN THE NIGER DELTA? AN EVALUATION OF A PROGRAMME IN FOUR LGAS IN RIVERS STATE, NIGERIA

C. Ogbonna-Uchenwoke[1,2], V. Ayodele[2], B. Bona[2], J. Umo-Otong[2], T. Odeniyi[2], F.E. Anyiam[3], N. Odu[2], N.D. Briggs[2], S. Babatunde[1,3]
*[1]University of Port Harcourt, Department of Preventive and Social Medicine, Port Harcourt, Nigeria, [2]Youth PRO-FILE, Port Harcourt, Nigeria, [3]Centre for Health and Development, University of Port Harcourt, Port Harcourt, Nigeria*
*Presenting author email: seyebabs@gmail.com*

**Background:** HIV and AIDS are among the most complex health problems in the world. Young people are at a high risk of infections and are, therefore, in need of targeted prevention. HIV peer education among out-of-school youth is an effective way to prevent the spread of HIV/AIDS infections among youth.
**Methods:** Youth PRO-FILE, a non-governmental organization (NGO) had identified and trained 85 Peer Educators who in turn, recruited 5,235 out-of-school youth aged 15-24 years in four Local Government Areas in Rivers State by snowballing over 12 months in batches/cohorts of 13-15 in 2014/2015. The FMoH National Peer Education Curriculum of six modules on HIV prevention messages was used. Each session lasted 90 minutes and was held 1-week apart in the communities. Supervisors from the NGO monitored the peer sessions. Using a quasi-experimental design, pre-/post-intervention assessments (without a control group) were conducted on behaviour intent, attitudinal change and, knowledge gained. Data was collected using a facilitated, self-administered semi-structured questionnaire.
**Results:** Findings are reported on a total of 424 matched pairs of completed pre-/post-intervention questionnaires. The mean age was 19.57±2.77 years. About half (54.25%) were males and 45.75% were females ($\chi2$=1.87, P-value=0.171). Reported sexual activity rate was 73.4% (n=311) before and 74.5% (n=316) after ($\chi2$=0.15, p=0.695). Intent to use condom at next sexual contact increased from 58.49% to 67.92% ($\chi2$=8.11, P-value=0.004), while those reporting that they would "definitely" not be pressured into having sex changed from 41.98% to 72.64% ($\chi2$=81.46, P-value=0.001). Positive attitude toward HIV issues changed from 26.65% to 96.93% ($\chi2$=310.59, P-value=0.000). Responses to each of the knowledge questions were given numeric scores on an ordinal scale; 60.38% had good knowledge at pre-intervention, and increased to 100% post-intervention (P-value=0.000).
**Conclusions:** This evaluation showed that HIV Peer Education succeeded in improving attitudes towards people living with HIV/AIDS, and showed potential to lead to change in sexual behaviour among out-of-school youths. Government and international agencies should intensify and scale up HIV peer education programmes in more areas, to increase the effects of providing opportunities to equip vulnerable youth with accurate information for informed decision-making.

## THPEC131

### UNDERSTANDING YOUNG MEN'S PERCEPTIONS OF THEIR ROLE IN TEENAGE PREGNANCY AND HIV/STI TRANSMISSION

T. Bessenaar[1], P. Letsoalo[2]
*[1]Ibis Reproductive Health, Johannesburg, South Africa, [2]Ibis Reproductive Health, Pretoria, South Africa*
*Presenting author email: pletsoalo@ibisreproductivehealth.org*

**Background:** South Africa has made major strides in reducing prevalence of HIV. However the HIV incidence among young women (113 000 in women aged 15-24) and persisting teenage pregnancies call for a renewed strategy and the involvement of young men. This study explores the perceptions of young men and their role in safer sex strategies.

Wednesday 20 July

Thursday 21 July Poster Exhibition

Friday 22 July

Late Breaker Posters

Author Index

**Methods:** The sample was drawn using non-probability snowballing method. A total of 75 young men aged 18-25 across three provinces (Limpopo, Western Cape, and Gauteng) in South Africa were interviewed and completed a survey. A mixed method approach was adopted. In addition to analysing focus group discussions, univariate and bivariate analysis were used to test for associations.
**Results:** This study has shown the persistent nature of sexual risk taking among young men in the form of multiple sexual relations, trends to impregnate older women to prove manhood, and inconsistent use of condoms. Approximately 44% of participants reported having had one sexual partner in the last 12 months and 50.7% of the participants indicated that they always use contraceptives. Results indicate that family members are a good source of SRHR information and schools are a poor source. The focus group results reveal a missing link—despite a high level of knowledge (92%) about contraceptives, inconsistent use and sexual risk taking is persistent among young men, who believe that the responsibility for using contraceptives lies with women. The results also revealed that participants who discussed contraceptive use with their partners were significantly older (20; IQR: 19-22) than those who do not (19; IQR: 18-20) (p-value=0.003). This puts both young male and females at risk of unplanned pregnancies and contracting HIV/STIs.
**Conclusions:** This study has indicated that overall young men in this sample are aware of contraceptive use, the risk of STIs, and the responsibilities that come with impregnating a girl. However there is a gap in the application of the knowledge. There is a need to focus on younger males in future studies to distinguish the characteristics that promote consistent use of contraceptives and safer sexual practices.

## THPEC132

### GET YOUR LIFE: EVIDENCE-BASED INTERVENTION FOR BLACK AND LATINO YOUNG MEN WHO HAVE SEX WITH MEN (ADOLESCENT SEXUAL MINORITY MALES)

T. Kordic
*Los Angeles Unified School District, Health Education Program, HIV/AIDS Prevention Unit, Los Angeles, United States*
*Presenting author email: timothy.kordic@lausd.net*

**Background:** Los Angeles Unified School District (LAUSD) is the nation's second largest school district, with an annual enrollment of 655,716 K-12 students at 1,015 schools; nearly 5 million people live within the district's boundaries. Like Los Angeles County (LAC) as a whole, the LAUSD is incredibly diverse; over 90% of LAUSD students are young people of color, including 73.4% Latino and 10.0% African-American students. In 2011, 2.0% of male LAUSD HS students identified as gay, 3.0% as bisexual and 3.2% as unsure. Among HS students, 6.0% of males reported having had sexual contact with other males, including 8.1% of male African-American students and 4.7% of male Latino students. YMSM reported substantially higher risk behaviors than the general population of HS students,
**Description:** The U.S. CDC Division of Adolescent School Health funded a school-centered project in a Los Angeles school district targeting black and Latino adolescent sexual minority males (YMSM). The goal was to reduce STI and HIV infection by reducing risk behaviors, increasing resiliency through the Get Your Life evidence-based intervention (EBI). It is a sexual health intervention modified from 3MV, a black MSM EBI. The intervention was done in partnership with a community agency. The district focused on supporting specific priority schools with greatest need using several research-based core approaches and social media strategies.
**Lessons learned:** Our project completed focus groups with male youth, which gave us some interesting information about their perspective on social media and their friends. The project implemented 3 cohorts of the Get Your Life evidence-based interventions. We found the experience to be transformative for the young men. However, we have learned that recruitment for the youth into the project was much more difficult than expected and the promotional and marketing shifts needed to be made to increase participation.
**Conclusions/Next steps:** - Develop better promotional and marketing materials
- Use appropriate social media campaigns and messages
- Modification is necessary for black versus Latino populations

# PREVENTION FOR PEOPLE WHO USE DRUGS, INCLUDING HARM REDUCTION

## THPEC133

### PATTERNS OF HARM REDUCTION SERVICE UTILIZATION AND HIV INCIDENCE AMONG PEOPLE WHO INJECT DRUGS (PWIDS) IN UKRAINE: A TWO-PART LATENT PROFILE ANALYSIS

D. Ompad[1,2,3], J. Wang[3], K. Dumchev[4], J. Barska[5], M. Samko[5], O. Zeziulin[4], T. Salyuk[5], O. Varetska[5], J. DeHovitz[6]
*[1]New York University, College of Global Public Health, New York, United States, [2]New York University, Center for Drug Use and HIV Research, New York, United States, [3]New York University, Center for Health, Identity, Behavior and Prevention Studies, New York, United States, [4]Ukrainian Institute on Public Health Policy, Kiev, Ukraine, [5]Alliance for Public Health Ukraine, Kiev, Ukraine, [6]SUNY Downstate Medical Center, Department of Medicine, Brooklyn, United States*
*Presenting author email: dco2@nyu.edu*

**Background:** We describe program utilization patterns within the large network of Alliance for Public Health (APH) Ukraine-affiliated harm reduction NGOs and determine the relationship between utilization patterns and HIV incidence while taking into account oblast-level HIV incidence, ARV coverage, and syringe coverage.
**Methods:** Data for these analyses were extracted from APH-Ukraine's SyrEx database (Jan 2011-Sep 2014), with a final sample of 327,758 clients. We conducted a latent profile analysis on the mean number of condoms, syringes, and services (i.e., testing, information and counseling sessions) PWIDs received monthly over the entire period. For HIV-seronegative clients, we used data from the most recent year. For those who seroconverted to HIV during the study period, we used data from the year prior to seroconversion. Multivariable Cox proportional hazards models were used to determine the relations between HIV seroconversion and utilization class membership.
**Results:** In the final 4-class model, 34.0% of the participants are in class 1, who on average received 0.1 HIV tests, 1.3 syringes, 0.6 condom and minimal counseling and information sessions per month; 33.6% of participants are in class 2, who received 8.6 syringe, 3.2 condoms, 0.5 HIV tests, and counseling and information sessions; in class 3, 19.1% of participants received 1 HIV test, 11.9 syringes, 4.3 condoms, and 0.7 information and counseling sessions; 13.3% of participants in class 4 received approximately 1 HIV test, 26.1 syringes, 10.3 condoms and 1.8 information and 1.9 counseling sessions. In multivariable Cox proportional hazards regression models with HIV seroconversion as the outcome and latent class membership as the main exposure, class 4 clients had significantly decreased risk for HIV seroconversion as compared to those in class 1, after controlling for oblast-level characteristics.
**Conclusions:** Recent analyses of local data suggest that the Ukrainian HIV epidemic is slowing. However, injection drug use continues to be a major cause of HIV transmission. In light of the uncertain harm reduction funding environment in Ukraine, it is important to understand the role of harm reduction in HIV incidence among PWIDs. These analyses suggest that receiving more syringes and condoms was associated with decreased risk of HIV acquisition.

## THPEC134

### HIGH-FUNCTIONAL PAIN INTERFERENCE IS ASSOCIATED WITH ACTIVE INJECTION DRUG USE AMONG A COHORT OF HIV-POSITIVE PEOPLE WHO USE ILLICIT DRUGS IN VANCOUVER, CANADA

P. Voon[1,2], T. Kerr[1,3], J. Montaner[1,3], E. Wood[1,3], M.-J. Milloy[1,3]
*[1]British Columbia Centre for Excellence in HIV/AIDS, Vancouver, Canada, [2]University of British Columbia, Faculty of Medicine, School of Population and Public Health, Vancouver, Canada, [3]University of British Columbia, Department of Medicine, Division of AIDS, Vancouver, Canada*
*Presenting author email: pvoon@cfenet.ubc.ca*

**Background:** Despite the high prevalence of pain among people living with HIV/AIDS (PLWHA), the correlates of pain among PLWHA who use illicit drugs remains poorly understood. This study examined the relationships between functional pain interference (FPI) and illicit drug use behaviors, health service utilization, and other clinical and socio-demographic characteristics in a community-recruited cohort of PLWHA who use illicit drugs in Vancouver, Canada.
**Methods:** Bivariable and multivariable logistic regression was used to evaluate factors associated with high FPI among HIV-seropositive participants reporting major persistent pain in the AIDS Care Cohort to Evaluate Access to Survival Services (ACCESS). High FPI (>=5 versus <5) was ascertained using average interference scores from the Brief Pain Inventory.
**Results:** In total, 313 participants were eligible for this analysis, of whom 32% were female. The median age was 51 years (interquartile range: 45-55). 126 (40%) participants had high FPI. Compared to participants with low FPI, there were significantly higher proportions ($p$<0.05) of current physical disability, active injection drug use, perceived undertreated pain, recent hospitalization, recent denial of prescription

analgesia by a care provider, self-management of pain, recent non-medical prescription opioid use, and recent use of an emergency room among participants with high FPI. In the multivariable analysis, active injection drug use (Adjusted Odds Ratio [AOR]: 3.33, 95% Confidence Interval [CI]: 1.90-5.84), perceived undertreated pain (AOR: 1.82, 95%CI: 1.07-3.11), and current physical disability (AOR: 5.40, 95%CI: 2.95-9.87) remained positively and independently associated with high FPI. We did not observe FPI to be associated with differences in HIV viral load suppression, CD4 count or ART adherence.

**Conclusions:** A high prevalence of elevated FPI was observed in this cohort of PLWHA, which was associated with higher levels of acute health service utilization, illicit drug use behaviors, undertreated pain, and self-managed pain. The independent association between high FPI and active injection drug use is particularly concerning given the risks for HIV transmission, morbidity and mortality, and use of high-cost acute care services related to this high-risk behavior. These findings illustrate the need for increased efforts to improve function, quality of life, and pain management among PLWHA.

## THPEC135

### COMPREHENSIVE INTERVENTION PROGRAM HAS EFFECTIVELY DECREASED THE INCIDENCE RATE OF HIV AMONG INJECTION DRUG USERS IN PAST 10 YEARS: A CASE FROM GUANGDONG, CHINA

M. Wang, T. Wang, C.-Y. Chen
*Zhongshan Center for Disease Control and Prevention, Infectious Disease, Zhongshan, China*
*Presenting author email: 123784249@qq.com*

**Background:** Zhongshan, a city located in the Pearl River Delta region, Guangdong, Southern China, its HIV epidemic was primarily driven by injection drug use (IDU), and it was also the earliest city which identified the HIV epidemic among IDU. The first local HIV case transmitted by IDU was identified in 1998. From 1998 to 2006, over 1000 cases infected by IDU were identified. To control the HIV epidemic in IDU, comprehensive intervention program was gradually implemented since 2007. HIV incidence rate was estimated to accurately evaluate the effectiveness of the comprehensive intervention program.

**Description:** Since 2006, in those detention places, health education about HIV knowledge and anti discrimination was administered to all the detained drug users and police officers, and the released drug users were followed for medical service and assistance. At the same time, 2 methadone maintenance treatment clinics and 7 needle change clinics were implemented to reduce needle sharing in the community. HIV screening was administered to all the detained drug users and those involved in MMT and needle change programs to identify the cases more early and sensitively. For all the identified cases, they were followed for routine medical education and CD4 test and transferred to treatment clinics if they met the treatment criteria.

**Lessons learned:** The surveillance system showed that the prevalence rate among IDU has declined from 11.4% in 2004 to 4.9% in 2014, and the annual reported number of cases from 161 in 2004 to 14 in 2014. According to the estimates form the Spectrum/EPP model, the HIV incidence rate declined from 1.25% in 2001 to 0.23% in 2014. During 2010 to 2014, among 1971 repeat HIV testers in the open cohort based on the detained drug users, 4473 person-years were followed with 4 of them became HIV sero-conversion, and the HIV-incidence was 0.09 (95%CI: 0.01 - 0.18) per 100 person-years.

**Conclusions/Next steps:** he comprehensive intervention program effectively decreased the HIV incidence among injection drug users in Zhongshan city, Guangdong China.

## THPEC136

### INTERACTION BETWEEN PROVIDERS AND CLIENTS IN METHADONE MAINTENANCE CLINICS IN CHINA

X. Cao[1], L. Li[2], S. Comulada[2], C. Lin[2], C.-W. Lan[2], Z. Wu[1]
*[1]Chinese Center for Disease Control and Prevention, National Center for AIDS/STD Control and Prevention, Beijing, China, [2]University of California at Los Angeles, Semel Institute for Neuroscience and Human Behavior, Los Angeles, United States*
*Presenting author email: xiaobincao@hotmail.com*

**Background:** Provider-client interaction is an integral of clinical practice and central to the delivery of high quality medical care. This paper examines factors related to the provider-client interaction in the context of methadone maintenance treatment (MMT).

**Methods:** Data were collected from 68 MMT clinics in five provinces of China. A total of 418 service providers participated in an assessment using Computer-Assisted self-interview (CASI) method. Linear mixed effects regression models were performed to identify factors associated with provider-clients interaction measures including minutes spent with each client per day.

**Results:** It was observed that negative attitude towards drug users was associated with lower level of provider-client interaction and less time spent with each client. Other factors associated with lower level of interaction included being female, being younger, being a nurse versus a doctor and another type of provider, and fewer years in medical field. There was a trend towards higher provider-client interaction being associated with provider reported job satisfaction.

**Conclusions:** The findings of this study call for a need to address provider negative attitudes that can impact provider-client interaction and the effectiveness of MMT. Future intervention efforts targeting MMT providers should be tailored by gender, provider type, and medical experiences.

Funding source: National Institute on Drug Abuse/NIH (R01DA033130).

## THPEC137

### EXPOSURE TO VARIOUS COMBINATIONS OF HARM REDUCTION STRATEGIES IN RELATION TO HIV AND HCV INCIDENCES AMONG PWID IN MONTREAL, CANADA

J. Bruneau[1,2], D. Jutras-Aswad[2,3], G. Zang[2], É. Roy[4,5]
*[1]Université de Montréal, Department of Family and Emergency Medicine, Montreal, Canada, [2]CRCHUM, Montreal, Canada, [3]Université de Montréal, Department of Psychiatry, Montreal, Canada, [4]Université de Sherbrooke, Department of Community Health Sciences, Faculty of Medicine and Health Sciences, Longueuil, Canada, [5]Institut National de Santé Publique du Québec, Montreal, Canada*
*Presenting author email: julie.bruneau@umontreal.ca*

**Background:** While a decrease in HIV incidence was attributed to harm reduction (HR) approaches among people who inject drugs (PWID), HCV transmission has remained high in Montreal. A comprehensive HR approach is recommended to control HCV transmission among PWID. Evidence of its effectiveness for HCV prevention is, however, not well established. The objectives were to estimate HIV and HCV incidences (primary and reinfection), and to examine the association between HIV, HCV and exposure to various combinations of HR strategies (injection material coverage (IMC) and Opioid Agonist therapy (OAT)).

**Methods:** PWID were recruited into a prospective cohort study between 2004 and 2014. At each semi-annual visit, participants completed interview-administered questionnaires and provided blood samples. Rates of infection were estimated among initially anti-HCV negative participants (HCV primary infection), anti-HCV-positive/HCV-RNA-negative participants (HCV reinfection), and HIV-negative individuals (HIV). Among PWID eligible to OAT, exposure to IMC (100% safe sources (full) vs. no) and to OAT (0, < 60 mg methadone or suboxone, ≥60 mg methadone) were used to assess HR coverage. Full HR coverage was defined as OAT ≥60 mg methadone and full IMC, minimal HR as no OAT and < 100% safe sources IMC, and partial HR as other combinations. Time-to-event methods were used to estimate incidence rates. Time-updated Cox regression models evaluated associations between incident HCV and HR strategies.

**Results:** Overall, 1451 PWID were included in analyses (83% males; mean age 38 (SD 10.0)). Results are summarised in the following table:

| | HIV (N participants=839) | HCV Primary Infection (N participants=313) | HCV Reinfection (N participants=230) |
|---|---|---|---|
| Number of events/total years follow-up time | 19/3308 | 121/699 | 39/709 |
| Incidence per 100 p-years (95% CI) | 0.6 (0.4, 0.9) | 17.3 (14.4, 20.6) | 5.5 (4.0, 7.4) |
| **Incidences and Hazards Ratios according to Harm Reduction exposure*** | | | |
| | Incidence (95% CI) | Incidence (95% CI) / aHR adjusted for age and gender | |
| Minimal HR coverage | 0.3 (0.01, 1,2) | 24.6 (15.7, 36.9)/ aHR: 1.0 (ref category) | 11.8 (4.3, 26.3)/ aHR: 1.0 (ref category) |
| Partial HR coverage | 0.8 (0.4,1,2) | 22.3 (18.0, 27.4)/ aHR: 1.02 (0.6, 1.7) | 7.0 (4.8, 9.9) / aHR: 0.69 (0.3, 1.8) |
| Full HR coverage | 0.0 (no event) | 7.0 (3.4, 12.8) / aHR: 0.36 (0.2, 0.8) | 1.7 (0.4, 4.5) / aHR: 0.16 (0.1, 0.7) |
| *Including only visits where participants were eligible for HR strategies (excluding visits of participants who stopped injecting). | | | |

*[HIV and HCV Incidence rates and Hazard ratios of HCV according to Harm Reduction exposure]*

**Conclusions:** HIV incidence rate is low in Montreal, attesting to the positive effect of available HR strategies. HCV primary and reinfection rates remain, however, high. Relative to minimal HR, full HR coverage achieved 64% and 84% reductions of infection rates for primary and reinfection, respectively. Our data suggests that enhancing injection material coverage and OAT programs using adequate dosing treatments is essential to better control HCV.

## THPEC138

### MAPPING PEER SOCIAL NETWORKS AND HIV RISK AMONG WOMEN WHO INJECT DRUGS RECRUITED USING RESPONDENT DRIVEN SAMPLING IN THREE INDONESIAN CITIES

C. Stoicescu[1], M.M. Mahanani[2], P. Smynov[3]
*[1]University of Oxford, Department of Social Policy and Intervention, Oxford, United Kingdom, [2]HIV/AIDS Research Centre of Atma Jaya University, Jakarta, Indonesia, [3]International HIV/AIDS in the Ukraine, Kyiv, Ukraine*
*Presenting author email: mmediestya@gmail.com*

**Background:** Women who inject drugs in Indonesia remain a hard-to-reach population by standard outreach methods employing professional outreach workers. National surveillance data on drug injecting and HIV prevalence is rarely gender-disaggregated, and when it is, samples of women are often too small to draw any solid conclusions. Perempuan Bersuara, a quantitative research study investigating sexual and injecting HIV risk among women who inject drugs conducted by Oxford University in collaboration with Atma Jaya University and Indonesian Drug Users Network, mapped the social networks of this population.
**Methods:** 731 women were recruited from urban locations in Jakarta, West Java and Banten provinces using respondent driven sampling (RDS) between September 2014 and May 2015. Network data and characteristics including HIV status, engagement in sex work, location, and age were recorded using a modified version of SyRex, a monitoring and evaluation database tool used by HIV prevention programmes. Social network mapping was conducted using NetDraw, an open source social network analysis and visualization software.
**Results:** Numbers of female injecting drug users recruited via peer networks significantly exceeded mapping estimates based on existing records of women reached by harm reduction services. The Greater Jakarta area, Bandung and Banten were home to approximately 60%, 30-35% and 5-10% respondents respectively. Mean age among participants was 31.3 years (standard deviation [SD]=5.1). Approximately 65.3% (N=477) of the sample had completed high school and almost half (N=324, 44.3%) were unemployed. 34.3% (N=250) of sexually-experienced study participants reported engaging in transactional sex. Self-reported HIV prevalence in the sample was 46.6% (N=341).
**Conclusions:** Peer networks can be effectively mobilised to improve access to traditionally "hard-to-reach" populations such as women who inject drugs. Existing outreach methods have limited reach among women who inject drugs in the Indonesian context. The Perempuan Bersuara study suggests that mobile RDS is an appropriate method for recruiting this population group. Further research is needed to determine how HIV prevention programmes in Indonesia can integrate social network mapping methods and peer driven outreach to attain broader reach and coverage.

## THPEC140

### OPIATE INJECTION AMONG YOUNG ADULT MULTIDRUG USERS IN THE CLUB SCENE

S. Kurtz, M. Buttram
*Nova Southeastern University, Center for Applied Research on Substance Use and Health Disparities, Miami, United States*
*Presenting author email: mance.buttram@nova.edu*

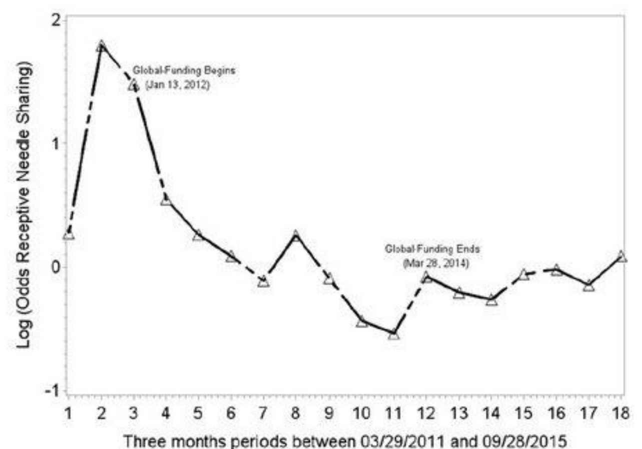
**Background:** The evolving and intertwined epidemics of heroin and prescription (Rx) opioid abuse in the US have most severely impacted young adults. We examined demographic, health and social characteristics of young adult participants in the nightclub scene in Miami, Florida who inject opiates (PWIO).
**Methods:** Participants (n=498) were: enrolled in a behavioral intervention trial; ages 18 to 39; reported recent multidrug use; and endorsed regular attendance at large nightclubs. Data were collected using standardized health and social risk assessments, which included past 90 day Rx and illicit drug use history. Chi-square and *t* statistics were calculated to examine subgroup characteristics.
**Results:** Median age was 24; 45% were female; 64% Hispanic, 21% Black, 12% White. Recent opiate injection was reported by 11% (n=55) of the sample. PWIO were more likely than others to be non-Hispanic White (p< ,.001) and not non-Hispanic Black (p=,003); gender, age and education differences were not observed. Of PWIO, 44 (80%) initiated opiate use with Rx opioids, 9 (18%) with heroin, and one case was indeterminate. Heroin initiators reported much less education (8.7 vs 12.0 years; p=.009) than Rx opioid initiators. Both groups reported similar levels of current use of both Rx opioids and heroin; only 5 cases reported exclusive use of either opiate form. The primary route of access to Rx opioids was club- or street-based drug dealers. Of PWIO, 82% believed their risk of becoming infected with HIV in the future was zero or unlikely. Needle sharing was reported by 47%. Five PWIO reported infection with HCV, four cases of which were diagnosed in the prior 12 months. No cases of HIV were reported by PWIO at baseline; there was one seroconversion at 12 month follow-up.
**Conclusions:** The large majority of young adult PWIO in our sample initiated with Rx opioid abuse, and almost all PWIO reported current use both Rx opioids and heroin. Needle sharing practices are common and HIV risk perceptions are low. Although HIV in our sample was limited, HCV infection was more prevalent. Interventions to reduce needle risks and increase HIV/HCV testing are needed to prevent transmission among young adult PWIO.

## THPEC141

### END OF GLOBAL FUND SUPPORT AND ITS ASSOCIATION WITH RECEPTIVE NEEDLE SHARING AND HIV INCIDENCE AMONG PEOPLE WHO INJECT DRUGS (PWID) IN TIJUANA, MEXICO

S.A. Strathdee[1], D. Abramovitz[2], M.G. Rangel[3], L. Beletsky[2], T.L. Patterson[2], P. Gonzalez-Zuniga[4], N.K. Martin[2], C. Magis-Rodriguez[5]
*[1]UC San Diego, Medicine, La Jolla, United States, [2]UCSD, Medicine, La Jolla, United States, [3]United States - Mexico Border Health Commission, Tijuana, Mexico, [4]UCSD, Division of Global Public Health, La Jolla, United States, [5]Censida. Secretaría de Salud, Mexico City, Mexico*
*Presenting author email: pgonzalez-zuniga@ucsd.edu*

**Background:** During 2011-2013, >2.5 million syringes were exchanged in Tijuana, a Mexico-U.S. border city, through federal, state and Global Fund (GF) support. GF support ended in December 2013, when Mexico became designated as an upper-middle income country, and since then, syringe access has dramatically decreased. We studied trends in receptive needle-sharing, and risk factors associated with HIV seroconversion among PWID in Tijuana.
**Methods:** Since 2011, 734 PWID in Tijuana were recruited through street outreach and undergo semi-annual interviews and HIV testing. Mixed effects logistic regression was used to estimate the mean log odds of receptive needle-sharing during eighteen 3 month consecutive calendar time periods, with the first three corresponding to pre-GF (Mar 29, 2011 to Jan 13, 2012), next nine during GF (Jan 14, 2012 to Mar 28, 2014) and last six post-GF (Mar 29, 2014 to Sep 28, 2015). Segmented regression was then used to predict trends in receptive needle-sharing within periods and from one GF period to the next. Cox regression was used to identify predictors of HIV seroconversion through Sept 2015.
**Results:** As shown in the Figure, during the pre-GF period, there was a 60% increase in mean log odds of receptive needle-sharing (p=0.01). During the GF period, there was a 71% decrease in mean log odds of receptive needle-sharing (p=0.005). During the post-GF period, there was a marginally significant, 15% increase in mean log odds of receptive needle-sharing (p=0.07). Factors independently associated with HIV seroconversion were reporting difficulty obtaining syringes (AdjHR:3.46;95%CI:1.24-5.64), purchasing drugs in pre-loaded syringes (AdjHR:2.93;95%CI:1.04-4.11), ever experiencing forced sex (AdjHR:5.30; 95%CI:1.85-9.65) and methamphetamine as the first drug injected (AdjHR:3.26;95%CI:1.01-3.93).
**Conclusions:** Since Global Fund support ended in Mexico, limited syringe access is leading PWID to return to injecting behaviors that are fueling HIV transmission. Sustaining sterile syringe coverage in limited resource settings remains challenging.



*[El Cuete Needle Sharing]*

## THPEC142

### FACTURES THAT INFLUENCE OR IMPEDE LOW DEAD SPACE SYRINGES USE AMONG PEOPLE WHO INJECT DRUGS IN VIETNAM

K. Green[1], B. Vu Ngoc[1], M. Tran Hung[2], H. Vu Song[2], H. Tran[1], G. Ha[1]
[1]PATH, Hanoi, Vietnam, [2]CCIHP, Hanoi, Vietnam
*Presenting author email: kimberlyegreen@icloud.com*

**Background:** Low dead space syringes (LDSS) may dramatically reduce HIV transmission among people who inject drugs (PWID) if used consistently. The government of Vietnam has included LDSS promotion in its national harm reduction program. The most consistently available LDSS on the market is the 1ml B.Braun Omnican. While LDSS use has been reported as high in the south of Vietnam, utilization remains limited in the north where HIV transmission persists. We sought to identify factors that encourage and impede PWID use of LDSS to inform local manufacturing of LDSS products and demand generation.
**Methods:** We conducted a cross-sectional study from April-June 2015 with 1,296 PWID across six provinces. Sample size was calculated utilizing PWID size estimations. Participants were recruited through respondent-driven sampling. Respondents were asked questions related to needle and syringe use and preferences, reasons why they would or would not use LDSS available on the market and willingness to pay (WTP) for LDSS.
**Results:** PWID interviewed averaged 9.9 years of injecting, and injected 59.7 times a month. A quarter of PWID (25.4%) used LDSS the last time they injected with use significantly weighted towards southern provinces (Ho Chi Minh City: 91.6%, CanTho: 38.6%) (p< 0.001). In the four northern provinces, use of LDSS at last injection ranged from 1.0-3.6%. For PWID that primarily used LDSS, the most important features were less pain when injecting (61.3%), delivering the maximum quantity of drug (54.7%), and a small (1ml), detachable needle (35%). Overall 35.3% of PWID preferred a 1ml syringe (primarily PWID in the south) while 26.4% preferred 2ml and 38.2% 3ml (predominately northern PWID). Primary reason for not wanting to use the 1ml LDSS was the syringe size not allowing for mixing heroin with other drugs and the needle being too small. 51.2% of respondents reported WTP for LDSS. WTP was associated with greater wealth, and having a secondary school degree or above (p< 0.001).
**Conclusions:** LDSS could play a significant role in reducing new HIV infections among PWID. For wide-scale utilization to occur, 2-3ml LDSS syringes need to be made available by local or international manufacturers at affordable prices, accompanied by intensive demand creation.

## THPEC143

### IMPACT OF OPIOID SUBSTITUTION THERAPY ON HIV PREVENTION BENEFIT OF ANTIRETROVIRAL THERAPY OUTCOMES: A SYSTEMATIC REVIEW, META-ANALYSIS AND MODELLING

C. Mukandavire[1], A. Low[1], M.T. May[1], G. Mburu[2], A. Trickey[1], N. Welton[1], C. Davies[1], C. French[1], K. Turner[1], K. Looker[3], H. Christensen[1], S. McLean[4], T. Rhodes[5], L. Platt[3], A. Guise[6], M. Hickman[1], P. Vickerman[1]
[1]University of Bristol, School of Social and Community Medicine, Bristol, United Kingdom, [2]Lancaster University, Lancaster, United Kingdom, [3]University of Bristol, Bristol, United Kingdom, [4]International AIDS Alliance, Brighton, United Kingdom, [5]London School of Hygiene and Tropical Medicine, London, United Kingdom, [6]University of California, San Diego, United States
*Presenting author email: christinah.chiyaka@bristol.ac.uk*

**Background:** A systematic review, meta-analysis and modelling was undertaken to assess the effect of OST on ART outcomes and the impact of the possible synergism between OST and ART on HIV prevention benefit of ART.
**Methods:** We searched multiple databases for studies between 1996-2014 that report the impact of OST compared to no OST on ART outcomes. Outcomes were: coverage and recruitment onto ART; adherence; viral suppression on ART; and attrition from ART. Meta-analyses were conducted using random effects modelling that informed two mathematical models. First, a static model evaluated the extent to which OST may increase the average efficacy of ART for reducing the infectivity of PWID, while accounting for PWID on and off ART. Second, a dynamic model projected how OST may improve the population-level effectiveness of ART for different OST and ART coverage levels.
**Results:** The systematic review identified 4685 articles and 32 studies were included. OST was associated with a 69% increase in recruitment onto ART (HR=1·69, 95% confidence interval (CI):1·32-2·15), a 54% increase in ART coverage (OR=1·54; 95%CI:1·17-2·03), a two-fold increase in adherence (OR=2·14, 95%CI:1·41-3·26), a 23% decrease in attrition (OR=0·77, 95%CI:0·63-0·95), and a 45% increase in viral suppression (OR=1·45, 95%CI:1·21-1·73).
Because OST increases the likelihood of a PWID being on ART and being virally suppressed, static modelling suggests that being on OST could increase the average relative effectiveness of ART for reducing an individual's infectivity, by 44% for a low baseline coverage of ART (20%), and 20% for a high baseline coverage of ART (60%). At the population-level, the dynamic model suggests similar impact could be achieved if OST is scaled-up to high coverage, with 60% OST coverage increasing the effectiveness of ART by 45% for 20% baseline coverage of ART, and 21% for 60% baseline coverage of ART. Although less population-level impact is achieved for lower OST coverage levels, impact at the individual level is maintained.
**Conclusions:** These findings strengthen the evidence base for the benefits of OST in HIV treatment and prevention, and support strategies to integrate OST with HIV services in order to improve the HIV treatment cascade amongst HIV-positive PWID.

## THPEC144

### IMPROVING ADHERENCE TO ART AMONG PEOPLE WHO INJECT DRUGS IN RESOURCE-LIMITED SETTINGS

J. Muema[1], P. Macharia[2], P. Wawire[1], M. Karanja[3], T. Njonjo[3], J. Ochieng[3], H. Musyoki[2], M. Sirengo[2], T. Ogato[3], F. Odhiambo[1], E. Koech[1], S. Ojoo[3], A. Baghazal[4], F. Ibrahim[5], S. Bertrand[6], E. Mwamburi[7], S. Abdallah[6]
[1]University of Maryland Programs (Kenya), Nairobi, Kenya, [2]Ministry of Health, National AIDS & STIs Control Programme, Nairobi, Kenya, [3]Ministry of Health, Mathari Teaching and Referral Hospital, Nairobi, Kenya, [4]Ministry of Health, Coast General Hospital, Mombasa, Kenya, [5]Ministry of Health, Malindi Sub-County Hospital, Malindi, Kenya, [6]United Nations Office on Drugs & Crime (UNODC, ROEA), Nairobi, Kenya, [7]USAID Kenya, Nairobi, Kenya
*Presenting author email: paulmachariah@gmail.com*

**Background:** There are an estimated 20,000 (PWIDs) in Kenya with an overall HIV 18% prevalence and who contribute 3.8% of incident HIV infection (KAIS 2012). Adherence to antiretroviral therapy (ART) among IDUs is often suboptimal estimated at 19.3%. The University of Maryland's Baltimore (UMB), with CDC-funding has been collaborating with Mathari Teaching and Referral Hospital to provide HIV prevention, care and treatment services since 2011. From December 2014, UMB began providing comprehensive 8-point harm reduction package for PWID including Medically Assisted Therapy (MAT) an intervention reducing dependence on opioid drugs, as well as improve adherence and treatment outcomes among the PWID. HIV-infected patients on ART are counselled intensely and ART provided through directly Observed Therapy (DOT).
**Methods:** The objective of this analysis was to determine the role of integrating ART services into MAT clinic, DOT approach and Methadone treatment in improving HAART adherence among HIV infected PWIDs. A descriptive analysis of routine data collected in this clinic was carried out for all clients enrolled in the clinic between December 8 2014 and 31 December, 2015. Self-reporting and viral load testing were used to assess adherence to ART.
**Results:** During this period, 554 clients were enrolled in the MAT clinic; 84% male of whom432 (78%) were retained in care. At enrolment 90 (16%) were HIV+ of who 45 (50%) had been initiated on ART previously with 37% adherence to ART. Baseline viral load ranged from 0% to 91%. Overall, 86(96%) of HIV+ clients received a CD4+ test and 71% of these were found to be eligible for ART and subsequently 67(89%) were started on HAART with 50(85%) on directly administered antiretroviral therapy (DAART). Adherence among those on DAART improved from 37% to 100% while those not on DAART remained at 37%.
**Conclusions:** The model of integrated services including ART in a one-stop shop approach to PWID led to a high uptake of adherence to ART among PWID. Prescription of methadone may have contributed to the increased adherence to ART among HIV-infected PWIDs. Reducing the negative impact of stressful life-events through psychosocial interventions should also be considered, even for those who have stopped using drugs.

## THPEC145

### INCREASED UPTAKE OF HIV PREVENTION SERVICES AMONG PEOPLE WHO INJECT DRUGS: FINDINGS FROM THE HRIDAYA IMPACT ASSESSMENT STUDY IN INDIA

V. Arumugam, C. Sharma, S.W. Beddoe, S. Mehta, J. Robertson
*India HIV/AIDS Alliance, New Delhi, India*
*Presenting author email: aviswanathan@allianceindia.org*

**Background:** Injecting drug use remains a significant route of HIV transmission in India. The Indian government currently reports the population of people who inject drugs (PWID) to be approximately 200,000, with an estimated HIV prevalence of 7.14% (NACO, 2011). India HIV/AIDS Alliance operates the Hridaya programme in five Indian states as part of the international, Dutch government funded Community Action on Harm Reduction (CAHR) initiative. The programme strengthens harm reduction services for PWID and their close contacts by providing additional services along with government-supported Targeted Interventions for HIV response.

Author Index

**Methods:** Cross-sectional baseline (2012) and impact assessment (2014) surveys were conducted following three years of programme implementation. PWID were selected for interviews through systematic random sampling using client information from partner NGOs at selected sites. A total of 600 semi-structured interviews and 50 case studies involving PWID were conducted.
**Results:** Respondents received services from Hridaya for an average of 12 months. Impact assessment report showed significant increases in utilization of HIV testing (76% to 88%), ART registration among HIV+ PWID (86% to 92%), education/diagnosis of TB (51% to 81%), OST (46% to 51%) and de-addiction services (47% to 57%) in the past year. Family support to PWID has increased significantly from 12% to 61% through Hridaya's added family outreach services. An association between family support and service utilisation was also observed.
**Conclusions:** Complementary services resulted in increased uptake of HIV prevention, care, support and treatment services including family support to PWID. Comparison with baseline figures shows a progressing trend; continued efforts in this direction will ensure that additional services reach those in need.

## THPEC146

### GENDER DIFFERENCES IN CHALLENGES FACING FAMILY MEMBERS OF PEOPLE WHO USE DRUGS IN VIETNAM

S.-J. Lee[1], L. Li[1], C. Lin[1], T.A. Nguyen[2], T.A. Le[2]
*[1]University of California, Los Angeles, Psychiatry and Biobehavioral Sciences, Los Angeles, United States, [2]National Institute of Hygiene and Epidemiology, Hanoi, Vietnam*
*Presenting author email: lililili@ucla.edu*

**Background:** There has been widespread evidence that the negative consequences of drug abuse are not limited to People Who Use Drugs (PWUD); rather, they significantly impact the families of PWUD. Although family members of PWUD frequently have been studied, there has been little recognition of the caregiver role played by family members. In addition, limited studies have examined the impact of gender differences in challenges of family members of PWUD.
In this study, we examined gender differences in depressive symptoms, coping with stress, and caregiver burden of family members of PWUD in Vietnam.
**Methods:** This study used a cross-sectional baseline data were collected from a randomized controlled intervention trial with 600 family members of PWUD recruited from sixty communes in Phu Tho and Vinh Phuc Province, Vietnam. Depressive symptoms, coping with stress, and caregiver burden were collected at baseline.
**Results:** Family members of PWUD reported high levels of depressive symptoms (mean=19.5), sense of entrapment (mean=27.9), and caregiver burden (mean=58.85). The gender breakdown of family members was as follows: 140 male vs. 460 female. When we examined depressive symptoms, sense of entrapment, and caregiver burden by gender, we found that female caregiver reported significantly higher levels of depressive symptoms (mean=19.6), compared to male family members (mean=17.6; p=0.004). In addition, females reported higher sense of entrapment (mean=28.1 vs. 27.1; p=0.10) and higher caregiver burden (mean=59.2 vs. 57.6; p=0.10), compared to their male family members.
**Conclusions:** Family members of PWUD face significant challenges, including depressive symptoms, coping with stress, and caregiver burden. Our study underscores the importance of addressing the gender differences in family members of PWUD around these challenges. Gender differences of family members should be taken into account when developing future interventions tailored to the needs of family members of PWUD.

## THPEC147

### HIV COUNSELLING AND TESTING DECREASES RISK OF HIV SEROCONVERSION AMONG PEOPLE WHO INJECT DRUGS IN UKRAINE

T. Saliuk[1], K. Dumchev[2], D. Ompad[3], Y. Barska[4], O. Varetska[1], M. Samko[4]
*[1]Alliance for Public Health, Monitoring & Evaluation, Kyiv, Ukraine, [2]Ukrainian Institute on Public Health Policy, Kyiv, Ukraine, [3]New York University, New York, United States, [4]Alliance for Public Health, Kyiv, Ukraine*
*Presenting author email: tetyanas@gmail.com*

**Background:** HIV epidemic in Ukraine was estimated to be one of most rapidly growing in Europe and was driven primarily by people who inject drugs (PWID). Since 2003 Ukraine has been implementing nationwide prevention program for PWID which covers about 60% of population annually. The massive HIV counselling and testing (HCT) program among PWIDs has been launched in 2010. About 80,000 tests cover this population each year.
The study explores the impact of HCT as a part of prevention services package on the HIV incidence among PWIDs.
**Methods:** Respondent driven sampling was used in 11 regions representing different parts of Ukraine to involve HIV negative PWIDs into the cohort study. Total sample of 2157 participants was enrolled 2013. All participants had to be registered as prevention program clients prior to enrolment. Three follow-up rounds of assessment were done within the period of 6 month. Testing for HIV and HCV was conducted at each follow-up. Programmatic data collected through the client and service tracking database "SyrEx" were merged with the results of cohort study by means of unique identifier code. Bivariate analysis and Cox Regression were used to assess the influence of prevention services, including HCT on the HIV incidence.
**Results:** 52 seroconversions were registered at all follow-ups. Annual HIV incidence rate observed in the prospective cohort study among PWIDs was 1.81%. The number of new HIV positive results has been declining with each next follow- up measurement.
Average number of HIV tests received in lifetime (excluding the tests done in the study) was 2.87 for those who seroconverted compared to 3.45 among those who stayed HIV-negative (t-test p-value 0.037). In multivariate analysis, controlling for the effect of age, sex, other service use, each additional test was decreasing the risk of HIV seroconversion by 36.4% (aHR=0.636).
**Conclusions:** HCT remains one of core components of prevention services for PWIDs and should be further extended. Access of PWIDs to HCT should be properly monitored trough bio-behavior surveillance. Additional studies should be done in order to assess the quality of counseling and reasons for not being tested.

## THPEC148

### HARM REDUCTION AMONG INJECTING DRUG USERS IN SERBIA: LESSONS LEARNED AND EFFECTS FROM ENDING THE GF PROGRAMS IN COUNTRY

K. Boras, N. Maksimovic
*Yugoslav Youth Association Against AIDS, Belgrade, Serbia*
*Presenting author email: karloboras@yahoo.com*

**Background:** On 29 July 2002, the Médecins du Monde (MdM), France launched the first needle and syringe exchange project in Belgrade which NGO Veza continued to carry out until recently. After MdM had left, GF project overtook financing when Serbia received grants in Round 6 and Round 8. The GF project included spreading of the program to other towns in the country. On average, NGO sector provides support to 2.000 drug users annually. Approximately 1.000 of them are HIV tested. It is estimated that in Serbia there are around 13.000-30.000 IDUs. Program was carried out until the end of 2014 when it was closed down in all the towns in Serbia.
**Description:** NEP achieved a significant success in Serbia in terms of HIV prevention. Decrease in the number of HIV positive individuals among population was rapid through implementation of harm reduction program and resulted in almost totally suppressing the epidemic among IDU, a group under most risk until the end of the 90's. For that reason, in 1991, total percentage of IDU among newly infected people was 70%, 16% in 2002, while in 2014 it was 4%. (According to the 2014 Annual Report of Serbian National Institute for Public Health).
**Lessons learned:** HR program in Serbia was exceptionally successful. During more than 10 years, NEP covered over 7.000 users offering needle replacement program, advice and testing. After GF had left, these programs were not able to find an alternative source of financing by other donators, while at the same time the state did not recognize such a financing as of interest. There is a very profound conviction among professional community in Serbia that ending of harm reduction activities will lead to significant increase in the number of newly HIV infected persons among IKD in the coming years.
**Conclusions/Next steps:** It is an urgent need for Serbia to re-establish a harm reduction program for IDU, especially the NE program to prevent increase in the number of newly-infected IKD and to continue a positive trend in decrease of IDU in total number of HIV positive population in the country.

## Prevention for male, female and transgender sex workers

### THPEC149

### How might new HIV prevention products change financial incentives for risk in commercial sex work? Exploring the stated preferences of female sex workers in South Africa

M. Quaife[1,2], F. Terris-Presthol[1], M. Cabrera[2], R. Eakle[2], S. Delany-Moretlwe[2], P. Vickerman[3]
*[1]London School of Hygiene and Tropical Medicine, Global Health and Development, London, United Kingdom, [2]Wits RHI, University of the Witwatersrand, Johannesburg, South Africa, [3]University of Bristol, School of Social and Community Medicine, Bristol, United Kingdom*
*Presenting author email: matthew.quaife@lshtm.ac.uk*

**Background:** New HIV prevention products are a priority for key populations including sex workers. In many settings, unprotected sex can attract large price premiums. To date, the impact of new HIV prevention products on the economics of commercial sex has generally not been considered. This study used a repeated discrete choice experiment (DCE) to explore how introducing an effective HIV prevention product may affect FSW preferences for pricing, sex-act and client characteristics.
**Methods:** From September to December 2015 we surveyed 122 consenting female sex workers from Ekurhuleni, South Africa using respondent driven sampling**.** All respondents were HIV negative by self-report, and were asked to choose between two unique, hypothetical commercial sex acts, over ten choice-sets. Acts were described by their price, condom use, sex-act type, and whether a client was thought to have a sexually transmitted infection (STI) or be HIV positive. Participants were subsequently asked to answer these same questions, but with the assumption that they were using a highly effective HIV prevention product. A random parameter logit model was used to analyse choice data.
**Results:** The median age was 30, 84% worked in an indoor setting, and the median amount charged for each of the last three vaginal sex acts was ZAR50. 95% of respondents chose at least one unprotected act in the DCEs. Estimates suggest that the amount of unprotected sex supplied could increase by 120% after the introduction of an effective HIV prevention product, assuming demand for unprotected acts remained constant. Results suggest that most respondents understood the framing of the DCE as client HIV status became a non-significant influence on choice (p=0.07), whilst price, condom use and the type of sex provided were all significantly influential in both DCEs (p< 0.01).
**Conclusions:** This study suggests that the price premium of unprotected sex would decrease with the introduction of a fully efficacious HIV prevention product, potentially increasing the number of unprotected sex acts supplied. With partial HIV, STI, or pregnancy prevention efficacy, product impact may be reduced. There is a need for clear messaging around the efficacy of products, alongside encouragement for continued and consistent condom use.

### THPEC150

### HIV correlates among mothers engaged in sex work, with and without children at home

S. Beckham[1], A. Wirtz[2], V. Mogilniy[3], A. Peryshkina[3], C. Beyrer[2], M. Decker[4]
*[1]Johns Hopkins School of Public Health, Health, Behavior and Society, Baltimore, United States, [2]Johns Hopkins School of Public Health, Epidemiology, Baltimore, United States, [3]AIDS Infoshare, Moscow, Russian Federation, [4]Johns Hopkins School of Public Health, Population, Family and Reproductive Health, Baltimore, United States*
*Presenting author email: sarah.beckham@jhu.edu*

**Background:** Many sex workers are mothers, but little is known about how having children may affect HIV-related risk behaviors among female sex workers (FSW). Previous work indicates mothers may increase sexual risk behaviors, but also may adopt protective behaviors (STI care, demanding condom use) for their children's sake. Additionally, mothers who live with their children may be more likely to adopt protective behaviors. Using data from FSW in three cities in Russia, we explore the relationships between having children, the child(ren)'s residential status (with or away from the mother), and HIV-related risk behaviors.
**Methods:** FSWs (n=754) from Tomsk, Krasnoyarsk, and Kazan were recruited using respondent-driven sampling for a cross-sectional survey in 2011. Using logistic regression, we explore the HIV-risk related correlates of having children either at home or living away, and those relationships to HIV-related risk behaviors (inconsistent condom use, accepting more money for condomless anal or vaginal sex, experience of sexual or physical violence).
**Results:** 754 FSW were categorized into non-mothers (n=422) and mothers (n=332); mothers were further categorized into non-residential mothers (live separately from children, n=156), and residential mothers (live with children, n=176). Mothers vs. non-mothers were significantly older, more educated, and were more likely to be married/partnered. Overall, mothers were not significantly different from non-mothers in bivariate and multivariable analysis, with the exception of increased likelihood of lifetime HIV testing (aOR 2.12 [95%CI:1.07-4.21]). Residential mothers were protected against accepting more money for condomless vaginal (aOR 0.57 [95%CI:0.40-0.82]) and anal (aOR 0.37 [95%CI:0.15-0.93]) sex compared to non-mothers. This was also true of residential vs. non-residential mothers for anal sex (aOR 0.40 [95%CI:0.18-0.90]), though there was no statistical difference for vaginal sex (aOR 0.63 [95%CI:0.35-1.14]). Residential mothers had lower odds of having experienced sexual violence from clients (aOR 0.42 [95%CI:0.22-0.80]) relative to non-mothers, as well as compared to non-residential mothers (aOR 0.49 [95%CI:0.23-1.01]).
**Conclusions:** Having children at home had a protective effect on HIV-related risk behaviors, highlighting how the broader contexts of FSW's lives may, in part, influence their risk in the work environments. Holistic understanding of FSW's family contexts and reproductive needs can inform programmatic response to co-occurring health concerns.

### THPEC151

### What are the factors determining recent HIV testing among female entertainment workers in Cambodia?

S. Yi[1], S. Tuot[1], P. Chhoun[1], K. Pal[1], K. Chhim[1], C. Brody[2]
*[1]KHANA, Center for Population Health Research, Phnom Penh, Cambodia, [2]Touro University California, Center for Global Health Research, Vallejo, United States*
*Presenting author email: siyan@doctor.com*

**Background:** In Cambodia, women account for half of all HIV infections, and female entertainment workers (FEWs) are considered a high-risk group. Reaching this population with prevention services such as regular HIV testing is a high priority in the country. This study aims to identify factors associated with recent HIV testing among FEWs in Cambodia to inform future prevention activities.
**Methods:** This cross-sectional study was conducted in May 2014 among FEWs randomly selected from a list of entertainment venues in the capital city of Phnom Penh and Siem Reap province using probability proportional to size sampling. A structured questionnaire was developed using standardized tools for face-to-face interviews. A multivariate logistic regression model was constructed to identify independent determinants of recent HIV testing.
**Results:** Data were collected from 667 FEWs, of which 81.7% reported ever having had an HIV test, and 52.8% reported having had an HIV test in the past 6 months. Of those who had ever had an HIV test, 53.0% obtained their test through community/peer-initiated testing and counseling, 22.0% at private facilities, 12.8% at public facilities, 8.6% at VCCT centers and 3.6% at other locations. Respondents who had been tested for HIV in past six months were significantly more likely to live in Phnom Penh (AOR=2.17, *p*<0.001), to have received HIV education in past six months (AOR=3.48, *p*<0.001), to report condom use in the last sex with a non-commercial partner (AOR=0.48, *p*=0.02), to agree that 'Getting tested for HIV helps people feel better' (AOR=0.31, *p*=0.02) and to disagree that 'I would rather not know if I have HIV' (AOR=2.15, *p*< 0.001).
**Conclusions:** FEWs with greater knowledge and more positive attitudes towards HIV prevention got tested for HIV more frequently than those with lesser knowledge and less positive attitudes. These findings suggest that future interventions should focus on disseminating tailored behavior change messages around testing practices as well as specific topics such as condom use with non-commercial partners. In addition, efforts to reduce stigma around HIV testing and knowing one's HIV status may improve attitudes towards HIV testing and therefore may be important areas for future programming for FEWs in Cambodia.

### THPEC152

### Not what we agreed: examining male sex workers' experiences of physical and sexual violence from their clients in Mombasa, Kenya

J.E. Mantell[1], T.B. Masvaure[1], J.U. Tocco[1], T. Sandfort[1], S.V. Chabeda[2], A. Restar[3], P. Gichangi[2], Y. Lafort[4]
*[1]HIV Center for Clinical & Behavioral Studies, NYS Psychiatric Institute & Columbia University, Psychiatry, New York, United States, [2]International Centre for Reproductive Health, Mombasa, Kenya, [3]Mailman School of Public Health, Columbia University, Sociomedical Sciences, New York, United States, [4]International Centre for Reproductive Health, Ghent University, Ghent, Belgium*
*Presenting author email: jem57@cumc.columbia.edu*

**Background:** Sexual and physical violence are known risk factors for HIV infection. However, few studies have examined physical and sexual violence in male sex work in Africa. We investigated experiences of violence among male sex workers

(MSWs) in Mombasa and the circumstances under which violence occurred.
**Methods:** We conducted semi-structured interviews with 25 MSWs recruited from 18 bars/nightclubs in Mombasa. Eligibility criteria were being ≥18 years, regular patron of the venue, having solicited for anal intercourse with a client at that venue in last 3 months, willingness to be audio-recorded, and being visibly sober.
**Results:** All but two of the MSWs in our study had experienced sexual or physical violence from their clients. Rape, rough sex and being forced to engage in condomless sex were the most common forms of sexual violence reported. Physical violence took the form of beatings, non-payment for sexual services rendered and having one's phone confiscated by clients. MSWs reported that incidents of violence typically occurred when clients changed the terms of the sexual encounter, e.g., some clients refused to use condoms despite having previously agreed to their use. Other clients demanded more rounds of sex than they had paid for or they demanded more services, such as kissing, foreplay and different sexual styles than previously agreed upon or that MSWs were not comfortable performing. A number of MSWs had also been forced to have sex, for no additional payment, with men they found already waiting at a client's home. Violence typically ensued when a MSW requested additional payment or refused to acquiesce to the new demands. Most violence occurred at a client's home or at a client's hotel; hence most MSWs preferred venues that they had chosen. No MSW reported incidents of violence to the police for fear of arrest. A few, however, reported that they fought back, albeit unsuccessfully.
**Conclusions:** MSW are frequently victims of violence from their clients. These incidents often go unreported because sex work and same-sex practices are illegal and highly stigmatized in Kenya. Structural interventions that simultaneously advocate for the rights of sex workers *and* of men-who-have-sex with men should be prioritized.

## THPEC153

### DEVELOPING A TYPOLOGY OF THE LATINO SEX INDUSTRY TO IDENTIFY HIV RISK REDUCTION RESEARCH AND PROGRAM NEEDS IN AN EMERGING IMMIGRANT RECEIVING CITY IN THE UNITED STATES

S. Dolwick-Grieb[1], A. Flores-Miller[2], C. Zelaya[3], S. Sherman[3], K. Page[4]
*[1]Johns Hopkins School of Medicine, Center for Child and Community Health Research, Baltimore, United States, [2]Baltimore City Health Department, Baltimore, United States, [3]Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, [4]Johns Hopkins School of Medicine, Division of Infectious Diseases, Baltimore, United States*
*Presenting author email: sgrieb1@jhmi.edu*

**Background:** Despite the high use of female sex workers (FSWs) and the potential implications for HIV transmission among Latino and Latina immigrants, little is known about the structure and context of sex work within this population, or the nature of HIV risk for FSWs and their clients. Efforts developed to address HIV risk within other sex industries in the U.S. may not be applicable to this population as a result of their unique political, economic, social and individual position in the U.S.
**Methods:** We conducted a total of 38 in-depth interviews (14 foreign-born Latina FSW, 18 foreign-born Latino clients and 6 key informants) to identify the range of sex industry activities and locations, the breath of lived experiences and the interactions between the social actors within the sex industry. A rudimentary typology of sex venues within the local sex industry was created. Additionally, interview transcripts were analyzed using a modified constant comparative approach to identify themes.
**Results:** The "venues" identified include brothels (*casa de citas*), weekend hotels, bars, street, online and independent casual workers. The risk environment varies between venue. Important general themes include the normalization of transactional sex in the local Latino immigrant community, the distinction between "decent women" who sell sex and "prostitutes" and low perceived risk for HIV infection. Despite past violent experiences, sex workers did not perceive themselves at risk for violence. Finally, some bar and casual sex workers perceived greater control of their life in the U.S. through participation in sex work.
**Conclusions:** Variability in the structure and context of engagement in, and with, sex work results in a spectrum of HIV risk. Although the use of directed interventions related to sex work have been demonstrated to be cost effective, developing appropriately targeted interventions requires a comprehensive understanding of the local sex industry. Our findings identify variations in risk between venues as well as common broad and venue-specific themes related to sex work. Together these serve as a first step in the development of risk reduction efforts aimed at foreign-born Latina FSWs and their foreign-born Latino clients in the U.S.

## THPEC154

### MOTHERHOOD AND HIV RISK AMONG FEMALE SEX WORKERS IN THE US-MEXICO BORDER REGION

A. Servin Aguirre[1,2], J.G. Silverman[3], C. Magis Rodriguez[4], S.A. Strathdee[2], K.C. Brouwer[2]
*[1]University Xochicalco, Tijuana, Mexico, [2]University of California San Diego, Division of Global Public Health, La Jolla, United States, [3]University of California San Diego, Center on Gender Equity and Health, La Jolla, United States, [4]Centro Nacional para la Prevencion y el Control del VIH/SIDA, Mexico City, Mexico*
*Presenting author email: argentinanoelle@gmail.com*

**Background:** The need to financially support children has been well documented as a major reason for initiating sex work among women. However, few studies have examined if motherhood also increases women's vulnerability to HIV/STIs among sex workers in this region.
**Methods:** From August 2013 to October 2014, 603 female sex workers (FSWs) >18 years of age were recruited to participate in a study assessing HIV risk environments in the border cities of Tijuana and Ciudad Juarez, Mexico. Surveys conducted via ACASI assessed FSW socio-demographics, motherhood, sexual behaviors and substance abuse.
**Results:** Findings from logistic regression models indicate that FSWs who reported having dependent children < 18 were significantly more likely to report a high client volume (adjusted odds ratio [AOR]= 1.97; 95% confidence interval (CI) 1.31-2.96), more likely to report always using alcohol right before or during sex with clients (AOR=1.87; 95%CI 1.27-2.76). In contrast to these previous findings, they were more likely to report consistent condom use for vaginal or anal sex with clients (AOR- 1.53; 95% CI 1.02-2.28), less likely to report using drugs right before or during sex with clients (AOR=0.42; 95%CI 0.20-0.88) and less likely to have tested positive for HIV/STI (AOR=0.58; 95% CI: 0.40-0.86) compared to FSWs who did not report having dependent children.
**Conclusions:** Given the high proportion of FSWs who are mothers and financially responsible for their children, HIV intervention and prevention efforts should consider the multifaceted aspects of sex workers' lives and how these aspects intersect and affect women's sex work and risk for HIV.

## THPEC156

### SCALING UP HIV TESTING SERVICES TO FEMALE SEX WORKERS: "WHOLESALE VS. RETAIL" APPROACHES

J. Chanda[1], M. Phiri[1], L. Chingumbe[1], A. Mwanza[1], A. Malumo[1], S. Malambo[1], W. Jaskiewicz[2]
*[1]IntraHealth International, Lusaka, Zambia, [2]IntraHealth International, Chapel Hill, United States*
*Presenting author email: jchanda@intrahealth.org*

**Background:** Zambia has high adult HIV prevalence at 13.3%. IntraHealth International implements the CDC-funded HIV Testing and Counseling (HTC) Project in high prevalence provinces: Lusaka (16.3%), Western (15.4%), and Southern (12.8%). Female sex workers (FSWs) are drivers of the HIV epidemic in Zambia. In southern Africa, FSWs have HIV prevalence 10-20 times higher than the general population (65-68%). Transactional sex is criminalized in Zambia, resulting in stigma, discrimination and reduced access to HIV prevention services for FSWs. Risk factors for HIV infection among FSWs include multiple sex partners, unprotected sex, intimate partner violence, and drug and alcohol abuse.
**Description:** Initially, FSWs were provided HTC services using a *"Retail approach"* where lay counselors (LCs) targeted individual FSWs whom they encountered. In June 2015, IntraHealth implemented an innovative *"Wholesale approach"* to reach more FSWs. This approach identified "hot spots" frequented by FSWs (e.g., truck stops, nightclubs) and engaged FSW leaders ("*Queen Mothers"*) and groups working with FSWs (*Tasintha; MARCH Zambia*) and oriented them on HIV prevention services and HTC. IntraHealth trained 13 "Queen Mothers" as peer mobilizers and 66 FSWs as LCs. The Queen Mothers mobilized fellow FSWs and the LCs provided group counseling and individual HTC in "safe spaces," along with condoms, STI/TB screening, and referral to care/treatment services.
In the first 32 months of the project, using the *"Retail approach,"* few FSWs accessed HTC services: 608 were tested, of whom 16.6% were HIV-positive; 64% of those testing HIV-positive initiated ART. In just 7 months (June - Dec 2015) after implementing the *"Wholesale approach,"* 7,490 FSWs were tested (12-fold increase), of whom 18.3% were HIV-positive. Among those testing positive, 80% initiated ART; 93% of HIV-positive FSWs were screened for TB, of whom 26% were TB-suspect and referred for further diagnosis.
**Lessons learned:** Despite legal barriers, "wholesale" peer approaches among FSWs, with HTC conducted in "safe spaces," can increase acceptability and uptake of HIV services.
**Conclusions/Next steps:** Advocacy to the government must be ongoing on the issue of provision of non-discriminatory services to FSWs.

## THPEC157

### INVOLVING TRICYCLE AND CAB OPERATORS IN LOCATING MOST-AT-RISK POPULATION FOR PROGRAMMING: EXPERIENCE FROM LAGOS, NIGERIA

A. Ojoye[1], O. Oderinde[2], J. Ibitoye[3], A. Shittu[2], S. Ikani[3]
*[1]Society for Family Health, Senior State Program Officer (Lagos Field Office), Lagos, Nigeria, [2]Society for Family Health, Programs (SHiPS for MARPs), Lagos, Nigeria, [3]Society for Family Health, Research Measurement and Results, Lagos, Nigeria*
*Presenting author email: adewunmiojoye@gmail.com*

**Background:** The Most at risk population including the female sex workers (FSW), Men who have sex with men (MSM) and people who inject drugs (PWID) continue to contribute significantly to the spread of HIV in Nigeria; recording higher prevalence than the general population. Identifying the location and estimating the population of MARPs is a key consideration in planning, implementing and evaluating HIV prevention interventions tailored to the MARPs. To identify the location and estimate the population of FSWs in Lagos, the USAID-funded Strengthening HIV Prevention Services (SHiPS) for Most at Risk Populations (MARPs) project in Nigeria conducted a population-based study in Lagos and 6 other states and FCT in 2015.
**Description:** A total of 40 trained data collectors conducted 6114 key informant interviews across the 20 local government areas (LGAs) in Lagos State and the study lasted for twelve weeks. Secondary Key informants (KIIs) including drivers, petty shop owners, artisans, students, bar men, hotel operators, security guards, students were contacted for interview regarding the location of FSW hotspot and the estimate of the population size based on their experience. A list of the mentioned 5,272 hotspots was compiled. Each hotspot was visited and an FSW at each of the hotspot was interviewed to validate the information provided by secondary KIIs; FSWs were found to operate at 2,534 of the spots. It was found that 92% of the 1,320 FSW hotspots mentioned by tricycle or cab operators were active and the information provided on the number of FSW and time of operation were accurate when compared with information obtained from FSW at the venue.
**Lessons learned:** Tricycle and Cab operators are highly knowledgeable about the location and mode of operations of the FSWs and engaging them in identifying FSW hotspots will safe cost and make the initial mapping of hotspot that precedes program implementation easier for implementers.
**Conclusions/Next steps:** For comprehensive coverage of MARPs in intervention communities, HIV prevention programs should consider involving Tricycle and cab operators in locating venues of operation of FSWs. Involving them(Tricycle and cab operators) in implementation could also be explored and piloted.

## THPEC158

### USING GEOSPATIAL ANALYSES TO STREAMLINE TARGETED SAMPLING OF FEMALE SEX WORKERS

S. Allen, K. Footer, S. Sherman
*Johns Hopkins University, Baltimore, United States*
*Presenting author email: sean.travis.allen@gmail.com*

**Background:** Targeted sampling was one of the first rigorous recruitment strategies employed to sample members of hidden populations (e.g., sex workers) at risk for HIV. This method is characterized by the use of ethnographic data, triangulated with secondary sources, to identify specific venues and times in which members of the target population may be encountered. Targeted sampling is not employed as regularly as other sampling strategies given the intensity of its methods. We aimed to describe how a series of geospatial analyses of secondary data sources were used to streamline targeted sampling efforts and reduce dependence on ethnographic data in a study examining police's role in shaping the HIV risk environment of sex workers in Baltimore, MD.
**Methods:** Geospatial data of prostitution charges were abstracted from a publicly available dataset created by the Baltimore Police Department and imported to ArcMap. Data were analyzed at the census block group- and block-level to inform ethnographic data collection. Other data were abstracted from a website where persons discussed their interactions with sex workers.
After conducting a series of optimized hot spot analyses, prostitution reports to a 911 call center were abstracted to identify specific days and times of sex work activity in the hot spots.
**Results:** Initial mapping of the prostitution charge data suggested sex work activity was racially segregated and dispersed across multiple census block groups. Given logistical constraints and to achieve a more balanced sample, a series of optimized hot spot analyses were conducted by race and sex to identify precise venues of sex work activity for each demographic. These hot spots were aggregated into a single map that was reflective of hot spots of sex work activity overall and within specific demographics, and triangulated with data from the sex work website. The prostitution reports to a 911 call center were triangulated with other data sources and formed the basis of the day and time components of our sampling frame.
**Conclusions:** Geospatial analyses can be an advantageous component of a targeted sampling strategy for HIV-related study recruitment by reducing dependence on ethnographic data and allowing for significant fiscal and temporal cost-savings by streamlining participant recruitment.

# PREVENTION FOR MSM

## THPEC159

### ACTIVE TARGETED HIV TESTING AND LINKAGE TO CARE AMONG MEN WHO HAVE SEX WITH MEN ATTENDING A GAY SAUNA IN THAILAND

T. Khawcharoenporn[1], A. Apisarnthanarak[1], N. Phanuphak[2]
*[1]Thammasat University, Infectious Diseases/Internal Medicine, Pathumthani, Thailand, [2]The Thai Red Cross AIDS and Research Center, Bangkok, Thailand*

**Background:** Limited data exists on the feasibility of HIV testing and counseling (HTC) service and linkage to care among Thai men who have sex with men (MSM) in hotspots.
**Methods:** A prospective study of active targeted HTC program and linkage to care among MSM (≥18 years old) was conducted at a gay sauna in Thailand from November 2013 to October 2015. HIV risks and risk perception were evaluated through an anonymous survey. Participants were categorized as having low, moderate or high risk for HIV acquisition based on pre-defined risk characteristics. Participants who accepted HTC underwent HIV testing with result notification at the sauna. HIV care appointment for antiretroviral therapy (ART) initiation was arranged by the counselor for HIV-infected participants whose care engagement was subsequently assessed.
**Results:** There were 358 participants; median age was 30 years and 58% were at high-risk for HIV acquisition. Of the 358 participants, 148 (41%) accepted HTC, all of whom either had prior negative HIV tests [98/148 (66%)] or had not known their HIV status [50/148 (34%)]. The three most common reported reasons for not accepting HTC were prior HIV testing within 6 months (48%), not ready (19%), and perceiving self as no risk (11%). Among the 262 moderate- and high-risk participants, 172 (66%) had false perception of low HIV risk. Having false perception of low risk was significantly associated with no HTC acceptance. Of the 148 participants undergoing HTC, 25 (17%) were newly-diagnosed of HIV infection. Independent factors associated with HIV positivity included having false perception of low risk (P=0.004) and age < 30 years (P=0.02). Only 12 of the 25 HIV-infected participants (48%) had established HIV care with the median time of 24 days (range 4-255 days) since knowing HIV results, all of whom received immediate ART.
**Conclusions:** The active targeted HTC program and HIV care establishment was feasible among MSM attending the gay sauna. False perception of low HIV risk was the important factor associated with no HTC acceptance and HIV infection. Strategies to improve HIV risk perception and linkage to care are urgently needed among this high-risk population.

## THPEC160

### SEXUAL PRACTICES AMONG MEN WHO HAVE SEX WITH MEN AND TRANSGENDER WOMEN IN THE ANTIRETROVIRAL PRE-EXPOSURE PROPHYLAXIS TRIAL IN CHIANG MAI, THAILAND

A. Tangmunkongvorakul[1], S. Chariyalertsak[1,2], K.R. Amico[3,4], M. Guptarak[5], P. Saokhieo[1], V. Mcmahan[4], R. Grant[4]
*[1]Chiang Mai University, Research Institute for Health Sciences, Chiang Mai, Thailand, [2]Chiang Mai University, Faculty of Medicine, Chiang Mai, Thailand, [3]University of Connecticut, Center for Health, Intervention and Prevention, Connecticut, United States, [4]University of California, San Francisco, Gladstone Institute of Virology and Immunology, San Francisco, United States, [5]Chiang Mai University, Faculty of Nursing, Chiang Mai, Thailand*
*Presenting author email: arunrat@rihes.org*

**Background:** The study aimed to gain a comprehensive understanding of participation in a blinded antiretroviral pre-exposure prophylaxis (PrEP) clinical trial on sexual practices of men who have sex with men (MSM) and transgender women.
**Methods:** The study utilized both quantitative and qualitative methodology. Quantitative data relied on questionnaires from the parent study, Pre-exposure Prophylaxis Initiative (iPrEx) in Chiang Mai, conducted between 2009 and 2014. Data included reported PrEP medication adherence and sexual risk among all 114 study participants. Forty-six participants took part in the qualitative data collection, with 32 interviewed, and 14 participating in one of three focus group discussions. A semi-structured guide explored experiences with study medication and sexual lifestyles. For quantitative data analysis, average study medication adherence was

Tuesday 19 July
Wednesday 20 July
Thursday 21 July Poster Exhibition
Friday 22 July
Late Breaker Posters
Author Index

calculated. Change in sexual risk was based on number of sex partners and incidents of sex without a condom. For qualitative data, content analysis was used to identify repeated normative themes, some of which arose spontaneously from interview interaction and some in response to open-ended questioning.
**Results:** The quantitative data indicated that on the whole, participants at the Chiang Mai site reported good adherence to the study medication. The data also suggested that the sexual risks taken by these participants were reduced at their final study visit though this was unrelated to level of adherence. While the data on sexual risk related to anal and vaginal sex needs to be regarded with caution given the low number of respondents, overall the pattern appeared to be one of reductions in partners and condomless events. Nevertheless, qualitative findings described sexual practices that were highly contextual and use of risk assessments to determine safe sex practice. Condoms were, for example, used with casual partners but not necessarily with primary partners.
**Conclusions:** Findings suggest that while PrEP is an exciting new development for future HIV interventions, it must be paired with behavioral interventions to fully address sexual risk among this population - interventions that provide this population with skills to negotiate condom use with their primary partners as well as in situations in which their sexual partners do not support condom use.

## THPEC161

### APPLICATION OF THE SAN DIEGO EARLY TEST SCORE TO PREDICT HIV INFECTION AMONG MEN WHO HAVE SEX WITH MEN, BANGKOK, THAILAND

S. Pattanasin[1], T.H. Holtz[1,2], B. Raengsakulrach[1], S. Winaitham[1], S. Yafant[1], W. Sukwicha[1], S. Lertpruek[1], C. Ungsedhapand[1], P. Sirivongrangson[3], E.F. Dunne[1,2]
*[1]Thailand MOPH - U.S. CDC Collaboration, Nonthaburi, Thailand, [2]Centers for Disease Control and Prevention, Division of HIV/AIDS Prevention, Atlanta, United States, [3]Ministry of Public Health, Department of Disease Control, Nonthaburi, Thailand*
*Presenting author email: vpv6@cdc.gov*

**Background:** The San Diego Early Test score (SDET) was developed and validated to identify target populations for HIV interventions, such as pre-exposure prophylaxis (PrEP) among men who have sex with men (MSM) and transgender women (TGW). We applied the SDET method to predict HIV acquisition among MSM enrolled in the Bangkok MSM Cohort Study (BMCS), and to consider use of the risk score for prioritizing who receives PrEP.
**Methods:** We enrolled sexually-active Thai MSM and TGW aged ≥18 years in the BMCS from 2006-2010, with follow-up every four months for 5 years. At each visit, participants answered questions on HIV risk behavior in the past four months, and were tested for HIV infection using oral fluid and a rapid test algorithm. If negative, HIV Nucleic Acid Amplification Test (NAAT) was performed. HIV infection diagnosed by either test was considered to be acute. We retrospectively randomized participants by a 2:1 ratio to a derivation and validation dataset, respectively. Using the derivation dataset, behavioral predictors reported prior to HIV acquisition were assigned a point value that was close to its hazard ratio from a multivariable Cox regression. A diagnostic odds ratio (DOR) was calculated from the validation dataset to evaluate the validity of the cutoff score.
**Results:** Among 1,372 HIV-uninfected participants, 111 (8%) were lost to follow-up, and 225 acquired HIV infection by rapid test (n=215), or NAAT (n=10). Overall, HIV incidence was 4.6 per 100 person years (PY): 4.5 and 4.7 per 100 PY in derivative (n=906) and validation (n=466) dataset, respectively (p = 0.14). Three predictors were independently associated with HIV acquisition: more than four partners; condomless receptive anal intercourse; and attendance at sex parties. We used these predictors to calculate the SDET score: 3 points for condomless receptive anal intercourse, and 2 points for the other two predictors. A cutoff score of 3 significantly predicted HIV acquisition (DOR 2.5; 95% confidence interval: 2.0-3.0).
**Conclusions:** An SDET score cutoff of 3 can be used to identify MSM and TGW at greatest risk for HIV acquisition, and may be useful in identifying those in need of PrEP in Bangkok, Thailand.

## THPEC162

### HIGH LEVELS OF PREP ENGAGEMENT AMONG MSM/TGW FROM BRAZILIAN PREP DEMONSTRATION STUDY (PREP BRASIL)

B. Hoagland[1], R.I. Moreira[1], I. Leite[2], R. De Boni[1], E. Kallas[3], J.V. Madruga[4], N. Cerqueira[3], R.S. Nogueira[4], A.Y. Liu[5], P.L. Anderson[6], V.G. Veloso[1], B. Grinzstejn[1], PrEP Brasil Study Group
*[1]INI Evandro Chagas/Fiocruz, Rio de Janeiro, Brazil, [2]Fiocruz, Rio de Janeiro, Brazil, [3]Universidade de São Paulo, São Paulo, Brazil, [4]Centro de Referência e Treinamento de São Paulo, São Paulo, Brazil, [5]University of California, San Francisco, United States, [6]University of Colorado Anschutz Medical Campus, Colorado, United States*
*Presenting author email: brenda.hoagland@ipec.fiocruz.br*

**Background:** Clinical trial data support use Pre-exposure prophylaxis (PrEP) with FTC/TDF for HIV prevention in high risk populations. Adherence is a critical factor associated with PrEP efficacy. In low/middle income countries with concentrated HIV epidemics, both the demand for and the adherence to PrEP are unknown outside of a clinical trial setting. We characterized the spectrum of PrEP engagement at week 4 and potential predictors among MSM/TGW in PrEP Brasil study.
**Methods:** 48 weeks multicenter, open-label, PrEP demonstration project to assess the feasibility of PrEP implementation (using daily FTC/TDF) provided at no cost in high risk MSM/TGW in the context of the Brazilian public health system, enrolled at 3 sites in Rio de Janeiro and São Paulo. Engagement to PrEP was assessed testing TFV-DP and FTC-TP in dried blood spots using LC/MS/MS for all study participants at week 4. PrEP engagement was a 3-level ordinal variable classifying participants as TFV-DP < 350 (< 2 pills/week), ≥350-699 (2-3 pills/week) or ≥700 fmol/punch ( ≥ 4 pills/week; highly protective range). Predictors of engagement were assessed using ordinal logistic regression model. Only variables statistically significant at 5% in the unadjusted model were included in the multivariate analysis.
**Results:** 450 participants enrolled, 437 (97%) initiated PrEP and 425 (94%) attended week 4 visit. At week 4, TFV-DP concentrations were highly protective range (≥700 fmol/punch) among 78% of participants and 89% had FTC-TP detectable, indicating dosing within the last 48 hours. Higher educational level, unprotected receptive anal intercourse and study site were associated with higher drug levels.
**Conclusions:** Over 3/4 of the participants had drug concentrations associated with high protection levels at week 4. PrEP engagement was higher among participants reporting higher risk sexual practices which is expected to increase the impact and cost-effectiveness of PrEP. These results provide evidence of the feasibility of PrEP implementation in Brasil.

| Characteristics* | Number of Participants | Adherence Level based on TFV-DP concentrations (%) | | | OR (95%IC) | aOR (95%IC) |
|---|---|---|---|---|---|---|
| | | < 2 pills/ week | 2-3pills/ week | > 4 pills/ week | | |

## THPEC163

### EXPANDING TEST AND TREAT FOR HIV PREVENTION IN MSM IN KISUMU, KENYA. THE ANZA MAPEMA STUDY: BASELINE PARTICIPANT CHARACTERISTICS AND RISK BEHAVIOURS

F.O. Otieno[1], D. Okal[1], C. Kunzweiler[2], S. Mehta[2], S. Graham[3], D. Emusu[4], B. Nyunya[4], R. Bailey[2]
*[1]Nyanza Reproductive Health Society, Research, Kisumu, Kenya, [2]University of Illinois at Chicago, Epidemiology, Illinois, United States, [3]University of Washington, Global Health, Seattle, United States, [4]Centres for Disease Control and Prevention, Division of Global HIV/AIDS and Tuberculosis, Nairobi, Kenya*
*Presenting author email: fotieno@nrhskenya.org*

**Background:** HIV testing and treatment are among the most effective HIV prevention interventions to date and programs that specifically target individuals at increased risk of HIV, including men who have sex with men (MSM), are critical if we are to impact HIV transmission and acquisition. The Anza Mapema Study is targeting 700 MSM to be offered a comprehensive HIV prevention and care package designed to improve diagnosis, reduce treatment initiation delays, and retain patients on treatment. The purpose of this analysis is to present interim baseline characteristics and risk behaviours of a high-risk, vulnerable population in Kisumu, Kenya.

**Methods:** MSM underwent screening for eligibility followed by HIV testing, behavioural interviews as well as medical examination with collection of blood, urine and rectal swab specimen. Testing was conducted for hepatitis, gonorrhoea (NG), chlamydia (CT), syphilis and HSV-2. Additionally, CD4, viral load, haematology and biochemistry was done for all HIV positive participants. All HIV positive participants were started on ART regardless of viral load and/or CD4.
**Results:** As of December 2015, 473 participants had been enrolled. Median age was 23 (18-53), with 79% having more than primary education and 39% currently living with a male sex partner. Bisexuals were 29% while homosexuals were 49%. Those reporting transactional sex were 67% and 11% never used condoms during anal intercourse (AI). HIV prevalence was 9.1% with 64 % newly diagnosed and 74% of all HIV-positive being in WHO stage 1. Mean viral load was 39,648 copies/mL (95% CI: 15,071-64,224) and mean CD4 555.2 (95% CI: 469.2 - 641.2) with 6 individuals having undetectable viral loads and 90% of all HIV positive participants reporting being ART naïve. Among HIV positives, mean creatinine was 55.1 (95% CI: 45.8 - 64.4 and mean ALT was 44.7 (96% CI: 35.5 - 53.9). STI prevalence were; HSV-2 - 18.4%, Syphilis - 2.3%, CT - 22.2% and NG - 13.9%. Prevalence for Hepatitis B was 30% and Hepatitis C 0%.
**Conclusions:** HIV prevalence lower than expected due to eligibility exclusion and the cohort had a higher risk with high rates of transactional sex and STIs. All HIV positives enrolled in test and treat.

## THPEC164

### EQUITY OF ACCESS TO HEALTH RIGHTS: EMPOWERING MSMS TO LEAD HEALTHY LIVES, CASE STUDY OF HOYMAS, NAIROBI COUNTY, KENYA

J. Kerubo[1], J. Anthony[2], B. Ogwang[3], J. Kioko[3], H. Musyoki[4], J. Mathenge[5]
*[1]Partners for Health Development in Africa, Technical Support Unit, Nairobi, Kenya, [2]University of Manitoba, Nairobi, Kenya, [3]Partners for Health and Development in Africa, Key Population Division, Nairobi, Kenya, [4]Ministry of Health, National AIDS and STI Control Program, Nairobi, Kenya, [5]HOYMAS, Nairobi, Kenya*
*Presenting author email: fonairobikenya@gmail.com*

**Background:** In a three storey building in a middle class neighbourhood in Nairobi County, there sits a crowd of young men in a circle having a seemingly serious discussion, others are seen busy on the internet trying to network with their peers. Meanwhile, a long queue is patiently waiting to receive services from the health providers at the clinic which is on the same floor. These men share three things in common; they all identify as men having sex with men (MSM), they are all looking for a place where they can speak freely about their sexual orientation and seek HIV and other health related services. In a society that is homophobic, such a safe space is not common.
**Description:** With an estimate of about 10,000 MSMs in Nairobi county, Health options for young men against HIV, AIDs and STIs (HOYMAS) is a community led program that works with MSMs by offering MSM friendly and peer led HIV combination prevention interventions. The program uses M&E tools that helps the program to understand individual MSM HIV risks along with individualized responses. They have also contributed in developing the National guidelines for key populations in 2014 and this guides the program implementation.
**Lessons learned:** Quarterly uptake of Contacts and HIV services have increased from 62% to 84% (Mar2015 to Sept, 2015). Quarterly HIV testing and counselling improved from 3% to 18%, Quarterly STI Screening improved from 4% to 25% with the positivity rate for STIs reducing significantly from 68% - 8% during the same period. MSMs have formed a violence mitigation group and 76% of all violence cases have been addressed by them.
**Conclusions/Next steps:** It is fundamental that the right to health is made equitably accessible for all MSMs. As MSM programs scale up in Kenya and Africa, it is critical that planners and policy makers ensure that MSM programs are friendly and community led. By creating safe spaces where they can freely access HIV and other health services in a society that is still homophobic, translates to more MSMs coming out and seeking services in safe and familiar settings thus improving their health status.

## THPEC165

### AN EXPLORATORY QUALITATIVE INVESTIGATION INTO THE USES AND ROLE OF SOCIAL MEDIA FOR DESIGNING PUBLIC HEALTH INTERVENTIONS AMONG RWANDAN MEN WHO HAVE SEX WITH MEN

J. Chaudhry[1], V. Patel[1], J.D. Sinayobye[2], B. Asiimwe-Kateera[3], G. Murenzi[2], A. Gitembagara[2], P. Castle[1], L. Muteesa[3], K. Anastos[1], J. Palefsky[4], A. Adedimeji[1]
*[1]Albert Einstein College of Medicine, Epidemiology and Population Health, New York, United States, [2]Rwanda Military Hospital, Kigali, Rwanda, [3]University of Rwanda, Kigali, Rwanda, [4]University of California, Medicine, San Francisco, United States*
*Presenting author email: adebola.adedimeji@einstein.yu.edu*

**Background:** There is renewed impetus in decreasing burden of HIV and STIs amongst "at-risk" populations in Rwanda. Of particular importance are Men who have Sex with Men (MSM), who experience social stigma and discrimination, which negatively impact their rights and access to services. Information about the social milieu of Rwandan MSM is vital in designing effective interventions to address their health needs.
**Methods:** We interviewed 31 Rwandan MSM using an exploratory qualitative design. Participants, selected by purposive and snowball sampling, provided information regarding patterns of social networking including use of social media applications, dating sites, private MSM-only house parties, friendship networks and participation in LGBT organizations. Data were analyzed using standard qualitative analysis procedures.
**Results:** Respondents, equally divided between members and non-members of LGBT associations, were 18 to 40 years and had all completed primary school education. About 70% were unemployed, the rest were self-employed, but mostly low income. An environment of intense stigma pervades the daily lives of Rwandan MSM leading to strong reliance on mobile phone applications and, to a lesser extent, non-technology means for social networking, advocacy, arranging transactional sex within and outside Rwanda and to identify/access MSM-friendly sexual health services. Most Rwandan MSM are unfamiliar with popular dating websites such as "*Grindr*" but "*Facebook*", "*What's App*" and SMS were often mentioned as avenues for social interaction, educational activities and campaigning for LGBT rights. Young, single, better-educated and employed respondents are more social media savvy than older and less educated respondents. There is almost universal consensus that social media plays a vital role in enhancing social interaction between Rwandan MSM.
**Conclusions:** Knowledge of the means through which Rwandan MSM are able to organize and participate in social networks is critical in understanding their social experiences, promoting rights and spreading information about STIs including HIV/HPV. Although still limited in use, the existence of social media will facilitate the dissemination of targeted information about public health interventions aimed at promoting sexual and social wellbeing of this population and will aid government and civil society efforts to decrease the burden of diseases and increase access to services for marginalized populations.

## THPEC166

### AGE COHORT DIFFERENCES IN SEXUAL BEHAVIORS AMONG RECENTLY INCARCERATED BLACK MSMW IN LOS ANGELES

D. Dangerfield II[1], N. Harawa[2], J. Lauby[3], H. Joseph[4], S. Hosek[5], H. Guentzel Frank[6], I. Fernandez[7], R. Bluthenthal[1]
*[1]University of Southern California, Los Angeles, United States, [2]Charles R Drew University of Medicine and Science, Los Angeles, United States, [3]Public Health Management Corporation, Philadelphia, United States, [4]Centers for Disease Control and Prevention, Atlanta, United States, [5]Stroger Hospital, Chicago, United States, [6]University of California, Los Angeles, United States, [7]Nova Southeastern University, Fort Lauderdale, United States*
*Presenting author email: ddangerf@usc.edu*

**Background:** Many studies of Black men who have sex with men (MSM) do not differentiate between MSM only and MSM who also have sex with women (MSMW). Differences in identification and behaviors create distinct sexual health risk profiles for HIV among Black MSMW groups. Little attention has been paid to associated behavioral risk factors for HIV and STI infection for Black MSMW with respect to age. We examined the prevalence of sexual risk behaviors between two Black MSMW groups: ages 40 and under compared to over the age of 40 who represent the first two generations affected by the HIV/AIDS epidemic.
**Methods:** Analysis was conducted on baseline data from a CDC-sponsored multi-site intervention study focused on Black MSMW in Los Angeles, Chicago, and Philadelphia and limited to men who reported at least one male and one female partner in the prior 3 months (n=550). Pearson's chi-square tests were conducted to evaluate the association between age groups and selected behavioral outcomes. Logistic regression was used to evaluate the odds of behavioral outcomes by age

group, adjusted for sexual orientation and stratified by HIV status.
**Results:** Results showed that HIV-positive MSMW over the age of 40 had 2.67 times the odds of having a casual female partner of HIV-negative or unknown status compared to HIV-positive MSMW ages 40 and under (OR 2.67, 95% CI 1.12, 6.31). Among HIV- negative MSMW, the older group was 63% less likely to have condomless IAI with most recent main male partner (OR 0.37, 95% CI=0.17, 0.81) and were 60% less likely to have a concurrent partnership while in relationship with most recent main female partner (OR 0.40, 95% CI=0.44- 0.99). Additionally, for HIV-negative MSMW, odds of condomless IAI with most recent main male partner decreased 7% for each year of age increased (OR 0.93, 95% CI=0.90, 0.97).
**Conclusions:** Older HIV-positive Black MSMW demonstrated higher risk for HIV transmission to female partners compared to the younger group; older HIV negative MSMW demonstrated lower risk for infection. Prevention efforts should consider the varying levels of exposure to HIV prevention information between these age groups of Black MSMW.

## THPEC167

### USING SOCIAL MEDIA AS A PLATFORM TO DIRECT YOUNG BLACK MEN WHO HAVE SEX WITH MEN TO AN INTERVENTION TO INCREASE HIV TESTING

T.A. Washington[1], S. Applewhite[2]
*[1]California State University, Long Beach, College of Health and Human Services, Long Beach, United States, [2]Borough of Manhattan Community College, Sociology, New York, United States*
*Presenting author email: alex.washington@csulb.edu*

**Background:** HIV prevention and testing remain a high priority for reducing HIV infections among young black men who have sex with men (BMSM), and interventions to increase HIV testing tailored for this population are crucial (CDC, 2015). Social networking technology is a widely used feature among this population (Wilkerson, 2011). Thus, examining the utility of highly used technology and social networking sites as a method for delivering interventions to motivate HIV testing among young BMSM is a worthy endeavor. The purpose of the present study was to examine the feasibility of implementing an HIV testing intervention to motivate HIV testing uptake among BMSM delivered online using Facebook.
**Methods:** A small randomized intervention/control pilot study was conducted with BMSM (N=142) aged 18 to 30 (Mean=23, SD=3.4), who at baseline were unaware of their HIV status and had not tested for HIV in at least the past six months, residing in Los Angeles County, California. Participants were recruited online and at community-based agencies. The intervention group participants were asked to review five 60 second intervention videos, weekly, and post reflections using a chat feature. The video content was informed by findings from a formative project with young BMSM regarding barriers and challenges to, and recommendations for, motivating HIV testing uptake among young BMSM. Each video's scene included young BMSM characters delivering the content as a vignette. Participants in the control group viewed standard HIV text information. Both groups completed a baseline and six-week follow-up survey regarding last HIV test/HIV testing history and other behavioral factors.
**Results:** Retention rates were adequate for both the intervention and control groups, 71% and 78%, respectively. Logistic regression revealed that those receiving the intervention were 7 times more likely to have tested for HIV than those in the control group at six-weeks follow-up (OR=7.00, 95% CI=1.72-28.33, P=.006).
**Conclusions:** Data suggest that the video intervention was feasible for delivery using social media. Our findings also provide evidence that a peer informed online video-based intervention with chat features are useful for providing HIV prevention knowledge, knowledge about the importance of testing, and motivating HIV testing uptake among young BMSM.

## THPEC168

### ORAL HIV PRE-EXPOSURE PROPHYLAXIS (PREP) AMONG HIV-NEGATIVE MEN WHO HAVE SEX WITH MEN IN SWITZERLAND: ACCEPTABILITY ACCORDING TO CURRENT GUIDELINES AND POSSIBLE FUTURE ADAPTIONS

S. Nideröst, B. Hassler, F. Uggowitzer, P. Weber, D. Gredig
*University of Applied Sciences Northwestern Switzerland, School of Social Work, Olten, Switzerland*
*Presenting author email: sibylle.nideroest@fhnw.ch*

**Background:** Due to the high proportion of newly diagnosed HIV-infections among men who have sex with men in high-income countries, the WHO recommended in 2014 offering oral PrEP to men who have sex with men (MSM). Although PrEP has not been approved in Switzerland, it is discussed as an additional prevention method for MSM. However, little is known about the acceptability of PrEP among MSM in Switzerland. Furthermore, the ongoing clinical research could change the current PrEP guidelines in near future. Therefore, this study tried to determine the acceptability of PrEP among HIV-negative MSM living in Switzerland according to current guidelines and possible future adaptions.
**Methods:** In a cross-sectional study, we surveyed a convenience sample of 556 MSM living in Switzerland by using anonymous, standardized self-administered online and paper-and-pencil questionnaires. Participants were gathered through different gay-specific sites. The current and future acceptability of PrEP was measured by six items about the intention to use PrEP according to current guidelines and possible adaptions (e.g. event-driven PrEP, 100% effectiveness, side-effects, etc.). Answers ranged from 1="completely disagree" to 7="completely agree". We carried out descriptive statistics and conducted Wilcoxon signed-ranks tests.
**Results:** Among the participants were 88% gay and 11% bisexual men. Mean age was 40.6 years (SD=11.9). Forty-four percent obtained a university degree. About 44% were singles. Forty-eight percent have had a sexual encounter with a casual partner during the past six months. The intention to use PrEP according to the current guidelines was moderate (Mdn=3, IQR=2-6). But the participants' acceptability increased with the possibility to obtain a drug with less side-effects (Mdn=6, IQR=4-7, Z=-13.05, p< .001) or with 100% effectiveness (Mdn=6, IQR=5-7, Z=-14.52, p< .001). Also the option of an event-driven regimen (Mdn=5, IQR=2-7, Z=-5.79, p< .001) or a full financial coverage by health insurance (Mdn=6, IQR=3-7, Z=-12.06, p< .001) significantly increased the acceptability of PrEP.
**Conclusions:** Results indicated that the moderate acceptability of PrEP increased according to future adjustments of PrEP. Especially having a drug with less side-effects and a higher effectiveness is of importance. Moreover, financial coverage by health insurance will increase the acceptability. Before implementing PrEP in Switzerland, these issues should be considered.

## THPEC169

### EXPLAINING THE INTENTION TO USE HIV PRE-EXPOSURE PROPHYLAXIS AMONG HIV-NEGATIVE MEN WHO HAVE SEX WITH MEN IN SWITZERLAND: A THEORY-BASED ANALYSIS

F. Uggowitzer, S. Nideröst, B. Hassler, P. Weber, D. Gredig
*University of Applied Sciences Northwestern Switzerland, School of Social Work, Olten, Switzerland*
*Presenting author email: sibylle.nideroest@fhnw.ch*

**Background:** Almost half of the 500 to 700 HIV infections yearly diagnosed in Switzerland are among men who have sex with men (MSM). Although HIV pre-exposure prophylaxis (PrEP) has not been approved in Switzerland, there is a discussion about its potential and adequacy as an additional prevention method especially for MSM.
Therefore, the aim of the study was to explain the intention to use PrEP among MSM by developing and empirically testing a model based on the Unified Theory of Acceptance and Use of Technology (UTAUT). This model considering performance expectancy, effort expectancy, social influence, and age has been modified by including additional predictors, like concerns about PrEP, attitudes towards condoms, experiences in condom use, sexual risk behavior, expected stigma, income, and educational background.
**Methods:** The study design was cross-sectional. During a 9-month period, a convenience sample of 556 MSM was gathered through different channels. We collected the data using a self-administered standardized questionnaire, either online or paper-and-pencil. We analyzed the data by descriptive and bivariate statistics and conducted a three stage hierarchical multiple regression analysis of intention to use PrEP.
**Results:** The mean age of the respondents was 41 years (SD=11.9). Almost half (44%) of the participants held a university degree. The median annual income was between CHF 91'001 and CHF 104'000. About 84% have had sex with a casual partner during the past 6 month. Fifty-three percent have always used a condom when having sex with these casual partners.
The hierarchical multiple regression analysis revealed an explained variance in intention to use PrEP of 50% (F= 48.80, p<.001). Performance expectancy (β=0.23, p<.001), effort expectancy (β=-0.18, p<.001), social influence (β=0.29, p<.001), and concerns (β=-0.20, p<.001), significantly affected the intention to use PrEP, whereas the other variables showed no significant influence.
**Conclusions:** The findings indicate that a higher social influence, a higher performance expectancy, less concerns, and a lower effort expectancy, increase the intention to use PrEP among respondents. These results contribute to the discussion about the potential of PrEP in MSM.

## THPEC170

### SEXUAL PARTNER CONCURRENCY AMONG PARTNERS OF MSM WITH RECENT HIV INFECTION

H. Pines[1], M. Karris[2], S. Little[2]
[1]University of California, San Diego, Division of Global Public Health, Department of Medicine, La Jolla, United States, [2]University of California, San Diego, Division of Infectious Diseases, Department of Medicine, La Jolla, United States
Presenting author email: hpines@ucsd.edu

**Background:** Sexual partner concurrency indirectly exposes an individual's partners to each other, and thus may facilitate HIV transmission during recent (acute or early) HIV infection. Given that men who have sex with men (MSM) are disproportionately affected by HIV globally, we determined the prevalence and correlates of concurrency among partners of recently HIV-infected MSM.
**Methods:** From 2002 to 2015, 298 recently HIV-infected MSM (i.e., index subjects) in San Diego, California completed computer-assisted self-interviews providing information on up to 3 partners in the past 3 months, including the timing of sexual intercourse with reported partners. When the dates of sexual intercourse with different partners of an index subject overlapped, these partners were considered concurrent. We used logistic generalized linear mixed models to identify factors associated with concurrency at the partner level.
**Results:** Index subjects were predominantly White, non-Hispanic (62%), well educated (90% completed ≥some college), had a mean age of 34.4 years (standard deviation [SD]=10.2), and had been HIV-infected for a mean of 85.2 days (SD=47.0). Index subjects reported on 697 sexual partners in the past 3 months (mean relationship duration=0.8 years; SD=1.8), of which 388 (56%) were concurrent to ≥1 other partner reported by the same index subject. After adjusting for partner age, race/ethnicity, HIV status, relationship type, condomless anal intercourse (CAI), and substance use during sex, the odds of concurrency were higher among partners that index subjects met on the Internet (odds ratio [OR] = 1.8, 95% confidence interval [CI]: 1.1-2.8) and partners with whom index subjects had been in a relationship for a longer duration (in years) (OR = 1.2, 95% CI: 1.1-1.4). CAI was more frequently reported with longer (≥1 year) than shorter (<1 year) term partners (60% vs. 49%; p-value=0.04).
**Conclusions:** Indirect exposure to concurrent sexual partners is common among partners of recently HIV-infected MSM, suggesting that concurrency may be critical to sustaining HIV transmission among MSM. The impact of concurrency may be minimized via enhanced risk reduction counseling for MSM who meet partners on the Internet and MSM with long term partners who may not perceive themselves to be at risk of HIV.

## THPEC171

### PREP AWARENESS, ATTITUDES AND UPTAKE AMONG RACIALLY/ETHNICALLY DIVERSE YOUNG MEN WHO HAVE SEX WITH MEN IN CALIFORNIA

C. Pulsipher[1], I.W. Holloway[2], J. Gildner[2], S. Beougher[2], P. Curtis[3], A. Plant[4], J. Montoya[4], A. Leibowitz[2]
[1]AIDS Project Los Angeles, Government Affairs, Los Angeles, United States, [2]University of California, Luskin School of Public Affairs, Los Angeles, United States, [3]AIDS Project Los Angeles, Los Angeles, United States, [4]Sentient Research, West Covina, United States
Presenting author email: cpulsipher@apl.org

**Background:** The World Health Organization now recommends that all people at substantial risk of HIV should be offered pre-exposure prophylaxis (PrEP). While PrEP awareness has generally increased, actual PrEP usage among young men who have sex with men (YMSM) has been limited. The present study seeks to understand PrEP awareness, attitudes, and uptake among racially/ethnically diverse YMSM.
**Methods:** An online survey was conducted using several popular geosocial networking applications and websites to understand PrEP awareness and usage, attitudes, and perceived barriers and facilitators to PrEP uptake among YMSM in California (ages 18-29). The majority of respondents (n= 602) were YMSM of color (40% Latino, 30% African American) and the majority were low income. Multivariate regression was used to assess awareness, usage, and likelihood of using PrEP across demographic categories, and included measures for accessibility, affordability, health coverage, and sexual risk.
**Results:** About 1 in 10 respondents reported having used PrEP (9.6%). PrEP use was significantly higher among whites (13.9%) compared to Latinos (6.6%). Among those who had not used PrEP (n=544), the majority were aware of PrEP (73.0%). African-Americans were less likely to report PrEP awareness compared to their white counterparts (OR=0.41). Latinos were less likely to report *having enough information* about PrEP and *knowing where to get PrEP* compared to whites. Over half of participants indicated being extremely (or very) likely to take PrEP if it were made available to them (55.9%). Ethnicity, income, region, employment status, condomless anal sex, having enough information about PrEP, knowing where to get PrEP, and some attitudes were significantly associated with the likelihood of taking PrEP. Social media (56.7%), online or the Internet (49.4%), and friends (46.6%) were primary sources for PrEP information.
**Conclusions:** PrEP usage remains limited among YMSM. Among African Americans and Latinos, lack of awareness and access to information are barriers to using PrEP. Education efforts should be tailored to African American and Latino YMSM and include information about where to access PrEP, particularly for those without a regular health care provider. Social media may be an especially useful tool for increasing PrEP awareness among YMSM of color.

## THPEC172

### INTEGRATED SERVICE DELIVERY MODEL WITH HIGH-RISK MEN WHO HAVE SEX WITH MEN

D. Johnson, L. Wigfall, F. Marshall
Quality Home Care Services, Prevention, Charlotte, United States
Presenting author email: djohn210@uncc.edu

**Background:** Black MSM is the only population that continues to see increases in new HIV infections. This group has the most barriers to accessing prevention and care services. To reduce the number of HIV infections among Black MSM a multifaceted approach that includes effective HIV prevention programs designed to reduce risk behaviors, increase knowledge of HIV status, promote successful use of anti-retroviral medications (ARV) for those who are already positive must be integrated into a single model.
**Description:** A CDC-funded safe space specific to Black MSM in the southern region of North Carolina was created by using an integrated HIV service delivery model. Quality Home Care Services used this model to enhance HIV prevention and care techniques among Black MSM. Members of the target population were vital in the conception, development, and implementation of the program. Data was collected on venue selection, use of new technology, community spaces, and social networks to inform the potential barriers of prevention and care access.
**Lessons learned:** An integrated service model is essential to providing HIV services to young Black MSM. These young men are sometimes socially rejected which creates barriers for health care engagement. Addressing stigma, homophobia, and racism in a multifaceted approach is important for eliminating barriers for Black MSM. Comprehensive health programs should not only educate young MSM about HIV risk, but also address sexuality in the context of young men's lives. Venue spacing, marketing, and technology are also critical to reaching the target population. Community resources are important for organizations using this model, as cost can be a barrier for HIV service organizations.
**Conclusions/Next steps:** Moving forward, Quality Home Care Services will use these data to strengthen the integrated model. Continuous quality improvement will be incorporated into the service model, in addition to bi-annual assessments from members of the target population. It is important to address the structural barriers of this population, improve access to prevention and care services, decrease new HIV infections, and continue to provide safe spaces for Black MSM.

## THPEC173

### BARRIERS, ASSETS, AND PATHWAYS TO HIV PREVENTION FOR MEN WHO HAVE SEX WITH MEN IN GHANA: PERSPECTIVES FROM PATIENTS AND HEALTHCARE PROVIDERS

S. Kushwaha[1], L. Nelson[2,3], L. Wilton[4,5], A. Ogunbajo[6], T. Agyarko-Poku[7], Y. Adu-Sarkodie[7]
[1]University of Toronto, Faculty of Medicine, Toronto, Canada, [2]University of Rochester, Rochester, United States, [3]University of Toronto, Toronto, Canada, [4]State University of New York at Binghamton, Binghamton, United States, [5]University of Johannesburg, Johannesburg, South Africa, [6]Yale University, New Haven, United States, [7]Kwame Nkrumah University of Science and Technology, Kumasi, Ghana
Presenting author email: sameer.kushwaha@mail.utoronto.ca

**Background:** The overall prevalence of HIV in Ghana is 1.3%, compared to 17% among men who have sex with men (MSM). There is currently limited empirical data on the current healthcare climate for MSM and its impacts on the HIV crisis. We sought to understand MSM perspectives regarding the healthcare system and service providers. We also explored healthcare providers' (HCP) attitudes towards MSM, and the perceived roles of both groups in meeting HIV prevention needs for MSM.
**Methods:** We conducted focus groups (n=22) with peer social networks of MSM and conversational interviews (n=25) with individual HCP between March and June 2012 from a cross-sectional non-probability sample. The study was conducted in three Ghanaian communities (Accra, Kumasi, Manya Krobo). Qualitative content analysis was performed using NVivo 10 software.

Tuesday 19 July
Wednesday 20 July
Thursday 21 July Poster Exhibition
Friday 22 July
Late Breaker Posters
Author Index

**Results:** We identified four main themes:
1) HCP understanding of HIV prevention needs are framed by broader social views towards same-gender sexual practices between men,
2) HIV prevention for MSM is impeded by low access to basic prevention tools and by negative attitudes towards HIV risk-reduction and testing behaviors,
3) MSM avoid healthcare interactions in which they anticipate that they will be stigmatized and
4) improving HIV/STI knowledge must be the foundation of HIV prevention strategies for MSM.
Although HCP sought to provide optimal patient care, their behaviors reflected views and misconceptions in the general population that MSM find to be stigmatizing. Limited accessibility (cost/availability) and poor condom quality (easily broken/non-pleasurable) were frequently cited as barriers to use. Fear or indifference towards knowing one's HIV status were common reasons for avoiding HIV testing. Stigmatizing interactions with the healthcare system were disincentives to establishing relationships with HCP for individual MSM, as well as their peer social network.
**Conclusions:** MSM in Ghana are exposed to negative healthcare climates, where condom utilization, HIV testing rates, and sexual health education for MSM are undermined by a generally unsupportive cultural and social context. These findings contribute to community stakeholder knowledge to inform development of HIV prevention interventions for MSM in Ghana, such as culturally appropriate sexual health education, and digital technology to connect individuals with resources supportive of MSM.

## THPEC174

### DELAYED HIV TESTING AMONG MEN WHO HAVE SEX WITH MEN IN AUSTRALIA HAS IMPROVED BUT REMAINS AN ISSUE

H. Zou[1], X. Meng[1,2], Z. Xu[1,2], D. Callander[1], B. Donovan[1], A. Grulich[1], M. Chen[3], C. Fairley[3], C. O'Connor[1], M. Hellard[4], R. Guy[1]
*[1]University of New South Wales, Kirby Institute, Kensington, Australia, [2]Wuxi Center for Disease Control and Prevention, Wuxi, China, [3]Melbourne Sexual Health Centre, Melbourne, Australia, [4]Burnet Institute, Centre for Population Health, Melbourne, Australia*
*Presenting author email: rolfe1234@gmail.com*

**Background:** Guidelines in Australia and other countries recommend regular HIV testing for men who have sex with men (MSM) and up to 3-monthly for MSM at higher risk of HIV transmission. We determined trends and factors associated with delayed HIV testing in among MSM attending Australian sexual health clinics.
**Methods:** Longitudinal data from MSM attending 42 sexual health clinics in the Australian Collaboration for Coordinated Enhanced Sentinel Surveillance (ACCESS) from 2007-2014 were analysed. Patients were assigned "high-risk" status if they had >5 partners in the past 3 months or >20 partners in 12 months or a sexually transmissible infection in the past 2 years. Delayed testing status was defined as having no retest or re-testing outside of the guideline time intervals (6 months for high-risk men, 12 months for non-high-risk men). Mixed effects logistic regression models were used to determine factors associated with delayed testing status.
**Results:** A total of 54,139 MSM had 102,317 HIV tests during 2007-2014. At first visit, 35.9% (19,416) of men were categorized as high-risk. The proportion of high-risk MSM assigned delayed HIV testing status decreased from 73.3% in 2007 to 63.2% in 2013 (p for trend< 0.001). The proportion of non-high-risk MSM with delayed HIV testing also decreased year-on-year (p-trend< 0.001). Delayed HIV testing was more likely in men who lived in regional and remote areas (OR=2.00, 95% CI: 1.76-2.28); were Indigenous (1.44, 1.04-2.00); and older (>29 years vs ≤29 vs: 1.98, 1.82-2.15). Delayed test was less likely in men born overseas (0.72, 0.65-0.79); and categorised as high-risk (0.39, 0.36-0.42).
**Conclusions:** Delayed HIV testing is common among MSM in Australia, although declining over the past 8 years. Efforts are needed to further decrease delayed HIV-testing among MSM, particularly men who are Indigenous and those living outside of urban areas.

## THPEC175

### HOW TO USE SOCIAL MEDIA CELEBRITIES AND INFLUENCERS TO MOBILISE HIGHLY ENGAGED ONLINE MSM COMMUNITIES

C. James, T. Mukiwa, C. McSwiggan
*Terrence Higgins Trust, Health Improvement, London, United Kingdom*
*Presenting author email: cary.james@tht.org.uk*

**Background:** A survey commissioned by Variety magazine in 2014 revealed that social media celebrities are more influential to young audiences than mainstream celebrities. YouTubers- popular online personalities who upload regular video content to YouTube- can have millions of highly engaged followers who value their opinions and trust their recommendations. Many of these YouTubers are gay/bisexual (MSM) or have large followings in those communities. Terrence Higgins Trust recognised the potential YouTubers have in promoting HIV testing and HIV prevention messages and initiated a strategy to engage them for England's National HIV Testing Week in 2015.
**Description:** THT began by reaching out to the LGBT+ YouTube personalities with the largest MSM audiences by engaging with these influencers on social media. This was then followed up by sending them a comprehensive influencer pack highlighting the need for HIV prevention campaigns and the ways in which they can help make a difference. It also included a t-shirt, stickers and a message board which could be used in videos. Ongoing support was given to help them create content which delivered the key messaging of the event in a genuine and impactful way.
**Lessons learned:** 31 YouTubers provided social media support during National Testing Week 2015, providing 92 pieces of photo and video content which the campaign promoted through Facebook, Twitter and YouTube. This generated over 170,000 views on YouTube, had a potential reach of over 15,000,000 highly engaged people, and generated a large amount of media interest and multiple pieces of press coverage. All of this significantly increased the number of HIV postal home sampling tests ordered, increased our reach on YouTube by 126% and further raised the profile of National HIV Testing Week which achieved 89% audience recognition in a post event evaluation.
**Conclusions/Next steps:** Engaging YouTube influencers can be an extremely efficient, impactful and cost effective way to reach MSM. It must be done collaboratively and be mutually beneficial to both the campaign and the personality. This should be done as part of a larger and more holistic approach alongside other pre-existing marketing methods to achieve maximum impact.

## THPEC176

### STRUCTURAL VIOLENCE REDUCES QUALITY OF LIFE AMONG GLOBAL SAMPLE MSM: COMMUNITY ENGAGEMENT MODERATES SOME NEGATIVE IMPACTS

S. Arreola[1,2], G.-M. Santos[3,4], G. Ayala[1]
*[1]Global Forum on MSM & HIV, Research, San Francisco, United States, [2]California Institute of Integral Studies, Human Sexuality PhD Program, San Francisco, United States, [3]University of California, San Francisco, United States, [4]San Francisco Department of Public Health, San Francisco, United States*
*Presenting author email: sarreola@msmgf.org*

**Background:** Structural violence (SV), (childhood sexual abuse, sexual stigma, violence, discrimination, and provider stigma) significantly increases psychological distress, which has been shown by other researchers to be associated with HIV risk, use of HIV services and adherence to HIV treatment among men who have sex with men (MSM). Less well understood are how SV impacts various facets of quality of life among MSM globally, and the role of community engagement in ameliorating negative associations between SV and QoL. We sought to evaluate the impact of SV on physical, psychological, social and environmental indicators of quality of life (QoL), and explore the role of community engagement in ameliorating negative impacts.
**Methods:** Data were collected from MSM who completed the online Global Men's Health and Rights survey between July and October 2014, in seven languages. We fitted GEE logistic regression models with robust standard errors, accounting for clustering by country, among 2316 MSM. We used World Health Organization's (WHO) standardized measures of QoL.
**Results:** Table 1 indicates that MSM who experienced higher levels structural violence had significantly lower QoL (physical, psychological, social and environmental QoL) and higher odds of suicide attempts and suicidal ideation.

| *Quality of Life Measures* | Physical* | Psychological* | Social* | Environment* | Suicide Attempts | Suicidal Ideation |
|---|---|---|---|---|---|---|
| ***Structural Violence Measures*** | Coef.; (95%CI); *p* value | Coef.; (95%CI); *p* value | Coef.; (95%CI); *p* value | Coef.; (95%CI); *p* value | OR; (95%CI); *p* value | OR; (95%CI); *p* value |

*[Structrual Violence and Quality of LIfe of MSM iglobally]*

Community engagement moderated the associations between 1) violence and: psychological QoL (Coef.=.32; 95%CI=.10 to .53; *p*< .005); and social QoL (Coef.=.37; 95%CI=.03 to .72; *p*< .04); and 2) CSA and: overall QoL (Coef.=-.18; 95%CI=-.34 to -.02; *p*< .03); and environment QoL (Coef.=-.59; 95%CI=-1.18 to -.00; *p*< .05).
**Conclusions:** Structural violence significantly reduces quality of life of MSM globally across all four QoL domains. Community engagement moderated the negative associations between SV and QoL across a few domains and warrants further exploration. In addition to offering services that addrss QoL needs, reducing SV should be a priority toward improving QoL and reducing barriers to sexual and HIV health of MSM.

## THPEC177

### NETWORK VIRAL LOAD: A CRITICAL METRIC FOR HIV ELIMINATION

B. Skaathun, J.A. Schneider
*University of Chicago, Health Studies, Chicago, United States*
*Presenting author email: brittsl@uchicago.edu*

**Background:** An aggregate viral load measure, the community viral load (CVL) is associated with increases in new HIV infections. The CVL, however, is prone to ecologic fallacy due to the presumption that transmission is geographically bounded. In this paper, we develop a more precise metric, the Network Viral Load (NVL) that accounts for the composite viral loads of the risk partners of an HIV- individual. We test its association with HIV infection among a cohort of Young Black Men who have sex with Men (YBMSM).
**Methods:** We examined the relationship between NVL and HIV infection among YBMSM in Chicago. Networks were generated using Respondent Driven Sampling. NVL, the sum of the viral loads in one's risk network, were calculated and divided into 3 categories, 100% HIV- network, NVL of 0-99k copies/mL, NVL of 100k+ copies. Multiple logistic regression was used to assess the relationship between NVL and individual HIV seroprevalence. A generalized structural equation model was fit to account for potential measurement error in the NVL calculation due to the possible incomplete assessment of one's personal network.
**Results:** Of the 409 respondents, 100% were Black, median age was 23, and 32% were unemployed. HIV prevalence was 34%. After controlling for network size, age, substance use during sex, and # of anal sex partners in the past 6 months, we found increased odds of HIV infection with increased NVL score. The odds of HIV infection with a NVL of 0-99k copies/mL were 2.04 times that of a network with all HIV- members (OR 2.04; 95% C.I. 1.26-3.30), the odds for a NVL of ≥100k copies/mL were 2.85 times that of a HIV- network (OR 2.85; 95% C.I. 1.31-6.22).

| | | OR | 95% CI | p-value |
|---|---|---|---|---|
| Age | (Continuous) | 1.13 | 1.05-1.22 | 0.002 |
| # Male anal sex partners (6 months) | (Continuous) | 1.23 | 1.06-1.44 | 0.008 |
| Sex Drug Use | No<br>Yes | 1.00<br>1.60 | 0.99-2.55 | 0.051 |
| NVL | 0 | 1.00 | - | - |
| (copies/mL) | 1-99K | 2.04 | 1.26-3.30 | 0.004 |
| (copies/mL) | 100k+ | 2.85 | 1.31-6.22 | 0.009 |
| Degree | | 0.99 | 0.83-1.14 | 0.70 |

*[Multiple Logistic Regression, Association between HIV Serostatus and NVL: uConnect Study (n=409)]*

**Conclusions:** NVL could have substantial public health implications as it could be used for targeting HIV prevention interventions, such as PrEP, towards those who would benefit most.

## THPEC178

### HIV-DISCLOSURE AND UNKNOWN HIV-STATUS AMONG GAY COUPLES IN LIMA, PERU

K.A. Konda[1,2], B.M. Fazio[2], M.J. Bustamante[2], G.M. Calvo[2], S.K. Vargas[2], H. Sanchez[3]
*[1]UCLA, Division of Medicine, Lima, Peru, [2]Universidad Peruana Cayetano Heredia, Center for Interdisciplinary Research in Sex, AIDS and Society, Lima, Peru, [3]Epicentro, Lima, Peru*
*Presenting author email: kkonda@mednet.ucla.edu*

**Background:** HIV sero-disclosure is an important part of HIV prevention, especially between established couples. We conducted a study with gay couples in Lima, Peru to explore HIV disclosure and its relationship to HIV status.
**Methods:** This study was conducted in 2015 at a gay community center, which also participates in research studies. Recruitment used posters, a facebook page, and word of mouth. All participants completed a computer-based survey and provided a blood sample for HIV testing. Couples were encouraged to participate with their partner, though this was not mandatory only data from participants where both members of the couple participated are included herein. Unknown HIV-status was evaluated for couples, based on comparing self-reported HIV status and HIV testing results. Characteristics associated with couples being of unknown HIV-status were evaluated using multivariable poisson regression to estimate adjusted prevalence ratios (aPRs).
**Results:** Our study included 93 gay couples (n=186 individuals). The median relationship duration was 1.9 years (interquartile range 4 months to 2 years). Among the couples with complete HIV testing results (91 couples, n=182), 52% were HIV-concordant negative, 29% were HIV-discordant, and 19% were HIV-concordant positive. Among the couples, 152/186 (82%) reported that both had disclosed their HIV status to one another. However when based on HIV testing, 78% of the couples were unaware of their HIV-status as a couple, this was true for 100% of the HIV-discordant couples, 59% of the HIV-concordant positive couples, and 32% of the HIV-concordant negative couples. In multivariable regression, unknown couple HIV-status was significantly associated with having sex outside of the partnership vs. not (aPR 0.70, p-value=0.029), being HIV-discordant (aPR 3.03, p-value< 0.001) or HIV-concordant positive (aPR 1.76, p-value=0.002) vs. HIV-concordant negative; and never having an HIV test (aPR 2.33, p-value< 0.001). Most participants (63%) were highly supportive of couples HIV testing and counseling (CHTC).
**Conclusions:** HIV prevention in Peru focuses on individuals; existing partnerships between gay men are not taken into account. The high prevalence of unknown HIV sero-discordancy and unknown HIV-status warrants interventions to improve HIV testing and CHTC to address gay couples should be explored.

## THPEC179

### ASSOCIATION BETWEEN DEPRESSION AND ANXIETY AND ADHERENCE TO ANTIRETROVIRAL THERAPY AMONG NEWLY DIAGNOSED HIV-INFECTED MEN WHO HAVE SEX WITH MEN IN CHINA

J. Tao[1], Y. Ruan[2], B. Shepherd[3], A. Kipp[4], K.R. Amico[5], Y. Shao[2], H.-Z. Qian[6], S. Vermund[6]
*[1]Vanderbilt University, Vanderbilt Institution for Global Health, Nashville, United States, [2]Chinese Center for Disease Control and Prevention, Beijing, China, [3]Vanderbilt University, Department of Biostatistics, Nashville, United States, [4]Vanderbilt University, Department of Epidemiology, Nashville, United States, [5]University of Michigan, Ann Arbor, United States, [6]Vanderbilt University, Vanderbilt Institute for Global Health, Nashville, United States*
*Presenting author email: sten.vermund@vanderbilt.edu*

**Background:** Adherence to antiretroviral therapy (ART) is crucial to achieve successful viral suppression. Depression and anxiety are potential barriers to adherence to treatment. Little is known about their effects on adherence to ART among Chinese men who have sex with men (MSM) with newly diagnosed HIV infections.
**Methods:** Of 367 Chinese MSM participants in a randomized clinical trial, 228 initiated ART during 12 months follow-up, and were included in this analysis. The Hospital Anxiety and Depression Scale (HADS) was used to measure depression and anxiety at baseline, 6 months, and 12 months. ART adherence was self-reported once every three months (perfect or no missing dose in the past three months vs. imperfect adherence or at least one missing dose in the past three months). Mixed-effect logistic regression assessed the effects of depression and anxiety on ART adherence over time while adjusting for age, intervention, site, education, social support, substance use, and HIV stigma in the model 1. We excluded substance

Tuesday 19 July
Wednesday 20 July
Thursday 21 July Poster Exhibition
Friday 22 July
Late Breaker Posters
Author Index

use in the model 2. Because substance use can have an impact on depression and anxiety, vice versa.

**Results:** Adherence to ART declined from 92% at 3 months to 88% at 12 months. A one-unit increase in depression score was associated with a 16% increase in the odds of reporting imperfect ART adherence (adjusted odds ratio [aOR] 1.16; 95% confidence interval [CI] 1.02-1.32). A one-unit increase in anxiety score was associated with a 17% increase in the odds of reporting imperfect ART adherence (aOR 1.17; 95% CI 1.03-1.33). When depression and anxiety were categorized at suggested cut-points, associations with imperfect ART adherence were large but non-significant, except for likely anxiety (aOR 4.79; 95% CI 1.12-20.50).

**Conclusions:** Depression and anxiety are risk factors for imperfect ART adherence among Chinese MSM with newly diagnosed HIV. Intensive intervention on depression and anxiety beyond regular post HIV-testing counseling may increase ART adherence and improve HIV treatment outcomes.

| Depression | Adjusted odds ratios (95% confidence interval) | Adjusted odds ratios (95% confidence interval) |

### COMMUNITIES AND FAMILIES CONSTRUCT HIV TREATMENT SCHEMAS, ENABLING GAPS IN HIV CARE FOR MSM IN MPUMALANGA, SOUTH AFRICA

K. Maleke[1], J. Daniels[2], H. Struthers[3], J. McIntyre[3], T. Lane[4], T. Coates[5]
*[1]ANOVA Health Institute, Research, Johannesburg, South Africa, [2]UCLA, Department of Community Health Sciences, Fielding School of Public Health, Los Angeles, United States, [3]ANOVA Health Institute, Johannesburg, South Africa, [4]UCSF, Centre for Aids Prevention, San Franscisco, United States, [5]UCLA, Centre of World Health, Infectious Diseases, David Geffen School of Medicine, Los Angeles, United States*
*Presenting author email: kabie.kabelo@gmail.com*

**Background:** Men who have sex with men (MSM) in general and especially rural and peri-urban MSM in South Africa were largely neglected in HIV prevention efforts until 2007 when the national government designated them as a key population. However, there is limited understanding of their HIV prevention and care seeking behaviors since this new HIV prevention strategy was implemented.

**Methods:** We conducted a 16-month research project with 61 MSM in two districts in Mpumalanga Province, South Africa. The study was designed to understand the social, behavioural and knowledge factors that influenced HIV prevention and care decision-making. Focus group discussions and individual interviews utilized semi-structured protocols. All focus groups and interviews were audio-recorded, transcribed and translated into English. We used the cultural schema theory to analyse the data.

**Results:** There are distinct cultural schemas that influence MSM's health and health-seeking behaviours in Mpumalanga that are developed within families and in communities. These schemas reflect a history of previous HIV deaths in the MSM community and previous HIV education efforts that were directed towards the general, heterosexual population. There were three major schemas found that delayed HIV care-seeking behaviour: MSM were not considered to be at elevated risk for HIV transmission, self-diagnoses processes involved family; and traditional healers remain a part of the healthcare seeking process.

**Conclusions:** The prevailing cultural schemas around HIV and STIs in Mpumalanga negatively affect the route of healthcare seeking for MSM. This creates a gap in HIV care for MSM that is based on community and family informed healthcare decision-making processes that involve predesignated ideas about when an illness lasts too long and whether to go to traditional healers before going to a clinic. Community- and family-based education about HIV risk for MSM may shorten the time between a positive HIV diagnosis and HIV care-seeking behaviours, improving HIV health outcomes for MSM in these settings.

## THPEC181

### SUPPORTIVE VERSUS STIGMA-BASED COMMUNICATION REGARDING SEXUAL HEALTH TOPICS INCLUDING PREP: YOUNG BLACK GAY/MEN WHO HAVE SEX WITH MEN TALK WITH THEIR CLOSE FRIENDS IN TWO U.S. REGIONS

M. Mutchler[1,2], B. Lichtenstein[3], T. Winder[4,5], E. Boyd[1], K. Nogg[2], M. Caton[2,4], I. Klinger[1], S. Kegeles[6]
*[1]California State University Dominguez Hills, Sociology, Carson, United States, [2]AIDS Project Los Angeles, Community Based Research, Los Angeles, United States, [3]University of Alabama, Department of Criminal Justice, Tuscaloosa, United States, [4]University of California, Los Angeles, Sociology, Los Angeles, United States, [5]REACH LA, Los Angeles, United States, [6]University of California San Francisco, Center for AIDS Prevention Studies, San Francisco, United States*
*Presenting author email: mmutchler@csudh.edu*

**Background:** HIV infection rates among young Black gay/men who have sex with men (YBGMSM) in the United States of America are critically high. It is important to better understand how YBGMSM talk with their close friends about sexual health topics related to HIV since perceptions of peer norms influence their safer sex beliefs and behaviors.

**Methods:** We conducted 48 dyadic qualitative interviews (N=96) in Los Angeles, California and Birmingham, Alabama (a state in the "Deep South" in which high HIV infection rates are increasing). The interviews explored how YBGMSM and their close friends discuss sexual health topics. Interviews were coded and analyzed using a modified grounded theory approach, reaching at least 80% inter-rater reliability.

**Results:** We found that YBGMSM and their close friends do support peer norms for safer sex and HIV testing. However, conversations about safer sex topics often were characterized by what we coined as stigma-based communication, or communication that is based in judgmentalism. At the same time, some conversations contained what we identified as support-based communication or communication that supported the friend and peer norms on safer sex in a non-judgmental manner. YBGMSM tended to shut-down and stop talking about their sexual experiences if their friend used stigma-based conversations, while supportive conversations led to more productive conversations. Participants had widely divergent levels of knowledge about Pre Exposure Prophylaxis (PrEP), a new biomedical intervention that may help reduce HIV infections. We specifically noted PrEP-related stigma as a theme in those conversations that addressed PrEP.

**Conclusions:** The findings suggest a need for working with YBGMSM and their close friends to increase supportive sexual communication and to counter judgmental sexual communication, especially PrEP-related communication. Using interventions to counter misconceptions and address barriers could reduce HIV infections and support sexual health, while helping YBGMSM and their friends make informed decisions about HIV prevention options.

Further research is needed to examine how supportive versus stigma-based communication may influence YBGMSM's beliefs and behaviors related to sexual health topics such as condom use and PrEP.

## THPEC182

### "YOU HAVE TO ALMOST LIKE BE ME TO UNDERSTAND": YOUNG BLACK MEN WHO HAVE SEX WITH MEN'S EMIC STRATEGIES FOR MAINTAINING AN HIV-NEGATIVE STATUS

M. Wharton
*University of Rochester, School of Nursing, Rochester, United States*
*Presenting author email: mitchell_wharton@urmc.rochester.edu*

**Background:** Young (age 13-24) Black men who have sex with men (MSM) in the United States account for 54% of all male-to-male acquired HIV; 3x higher than White and 2x higher than Hispanic peers (CDC,2014). Despite the continued deployment of targeted prevention interventions, their effectiveness in this population appears to have plateaued. Additionally, PrEP uptake has been particularly slow among Black MSM in the US. In order to develop new and complimentary prevention strategies for those most at risk, the perspectives of sexually active HIV-negative young Black MSM (YBMSM) must be understood.

**Methods:** 31 HIV-negative YBMSM were recruited from community-based organizations and health clinics in New York state. Subjects were required to have engaged in sexual intercourse within preceding 12 months and test negative for HIV within the

preceding 3 months. Data were generated through semi-structured individual interviews (n=24) and one focus group (n=7). Quantitative measures (a demographic/behavioral health inventory, and the HIV-Knowledge Questionnaire for Young Men of Color who have Sex with Men) were administered to provide complementary data. Qualitative data were analyzed using content analysis, while descriptive statistics were used to analyze quantitative data.
**Results:** YBMSM (N=31; African=1, African American=22, Caribbean=3, Afro-Latino=3, and Mixed Race=2) ranged between 16 - 24 years of age (mean=20.06), and demonstrated a mean HIV knowledge score of 76% correct. Mean sexarche was 14.81 years (range= 5-18years) and mean number of partners was 2.19 partners over 3 months and 4.55 partners over 12 months. Among the thematic findings were: 1) YBMSM were consciously engaged in a process of self-preservation facilitated by integration of racial and sexual identities and the tensions that arose from resolving bi-cultural expectations, 2) YBMSM who actively pursued self-preservation saw themselves as role models and were working to alter the image of BMSM, and 3) Exposure to pornography in early adolescence was integral to the sexual socialization of YBMSM.
**Conclusions:** Existing and future behavioral-based prevention interventions, as well as efforts to encourage PrEP awareness and uptake among Black MSM should be mindful to include elements that acknowledge and affirm young Black MSM's innate strategies for remaining HIV-negative.

## THPEC183

### VIOLENCE AGAINST MEN WHO HAVE SEX WITH MEN IN CAMEROON: CORRELATES WITH HIV RISK, INFECTION AND ACCESS TO HEALTH SERVICES AND JUSTICE

C. Lyons[1], M. Decker[1], S. Billong[2], U. Tamoufe[3], S. Baral[1]
*[1]Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, [2]Comité National de Lutte contre le Sida (CNLS), Ministère de la Sante Publique (MINSANTE), Yaoundé, Cameroon, [3]Global Viral, Yaoundé, Cameroon*
*Presenting author email: clyons8@jhu.edu*

**Background:** Men who have sex with men (MSM) are recognized as a high-risk population for discrimination and violence, in addition to HIV. Little is known about how physical and sexual violence may affect HIV risk behavior, and access to health care and justice among MSM. Qualitative reports highlight severe violence, stigma, and discrimination in Cameroon, where the policy environment enables violence and discrimination against MSM.
**Objectives:** We describe physical and sexual violence among MSM in Cameroon, and associations of violence with HIV risk behavior, self-reported HIV infection, and barriers to accessing health services and justice.
**Methods:** In 2014, a total of 1,606 MSM were recruited via snowball sampling in seven cities, and completed a cross-sectional survey. Physical violence and sexual violence were evaluated separately. Following descriptive analysis, logistic regression evaluated associations of physical and sexual violence, respectively, with each outcome.
**Results:** Overall, 13.67% of participants reported physical violence due to MSM status, and 27.29% reported sexual violence. Physical violence was associated with self-reported positive HIV status (AOR 2.05, 95% CI 1.17, 3.60). Both physical violence, and sexual violence, respectively were associated with having been denied health service due to MSM status (AOR 2.90, 95% CI 1.71, 4.90); (AOR 1.75, 95% CI 1.08, 2.83), respectively. Physical violence was associated with reporting police failure to protect (AOR 3.63, 95% CI 2.32, 5.66), and having been jailed (AOR 6.05, 95% CI 3.55, 10.30).
**Conclusions:** MSM in Cameroon experience prevalent physical and sexual violence, which is associated with HIV risk, and barriers to accessing health services and justice. Same sex relations are currently criminalized in Cameroon, and laws against rape in Cameroon are not inclusive of male victims. Decriminalization of consensual, adult, same sex relations has been recommended globally. However, decriminalization alone will not be effective, and must be accompanied with legal protection for MSM against discrimination and violence, and removal of barriers to accessing health services. The high prevalence of violence and associated HIV risks indicates the need to address violence within HIV programming.

## THPEC184

### SOCIAL NETWORKS OF MEN WHO HAVE SEX WITH MEN IN LARGE AND SMALL CITIES IN TANZANIA

M. Ross[1], M. Larsson[2], J. Nyoni[3]
*[1]University of Minnesota, Family Medicine, Minneapolis, United States, [2]Lund University, Global Health, Malmo, Sweden, [3]University of Dar es Salaam, Anthropology & Sociology, Dar es Salaam, Tanzania, United Republic of*
*Presenting author email: mwross@umn.edu*

**Background:** Men who have sex with men (MSM) in sub-Saharan Africa remain hidden and hard to reach for involvement in HIV and STI services. The aim of the current study was to investigate MSM network size, homophily and complexity in a large and a small Tanzanian city.
**Methods:** Data were collected in 2012 (Dar es Salaam) and 2013 (Tanga) from a cross-sectional survey of 200 MSM in Dar es Salaam and 100 in Tanga, using Respondent Driven Sampling. Five seeds were recruited and in total six waves in Dar es Salaam and seven in Tanga were conducted during a period of nine respectively two months.
**Results:** Mean network size was 11.3±14.1 in Dar es Salaam and 7.6±8.1 in Tanga. Most participants reported that the person from whom they received the recruitment coupon was a sexual partner, close friend or acquaintance (195 [98%] in Dar es Salaam; 91 [92%] in Tanga), that they typically saw their recruiter at least once per month (192 [97%] Dar es Salaam and 97 [98%] Tanga), and that they had known their recruiter for at least six months (168 [85%] Dar es Salaam; 96 [97%] Tanga). Homophily was significant for age (1.29; 1.07), "gay openness" (0.042) and HIV status (0.018) in Dar es Salaam, while it was significant for sexual identification (0.019), solely, in Tanga.
**Conclusions:** HIV networks are probably transmission-related since 92% were unaware they were HIV positive. In the large city, some organization of networks around personal characteristics had developed. The personal network sizes and existence of moderately connected networks make it possible to use peer-driven interventions to reach MSM for HIV/STI interventions in large and smaller Sub-Saharan African cities.

## THPEC185

### CLIENT CENTERED CARE COORDINATION (C4) UTILIZATION AND PREP ACCEPTANCE AMONG BLACK MEN WHO HAVE SEX WITH MEN IN 3 CITIES IN THE U.S.

D. Wheeler[1], L. Nelson[2], S. Fields[3], L. Wilton[4], M. Magnus[5], L. Hightow-Weidman[6], S. Shoptaw[7], G. Beauchamp[8], L. Emel[9], Y. Chen[9], E. Piwowar-Manning[10], P. Watkins[11], J. Lucas[11], K. Mayer[12,13], HPTN073 Study Team
*[1]University at Albany State University of New York, Social Welfare, Albany, United States, [2]University of Rochester, Nursing, Rochester, United States, [3]Charles Drew University, Nursing, Los Angeles, United States, [4]Binghamton University, Binghamton, United States, [5]George Washington University, Washington, United States, [6]University of North Carolina, Chapel Hill, United States, [7]University of California Los Angeles, Los Angeles, United States, [8]Statistical Center for HIV/AIDS Research & Prevention (SCHARP), Seattle, United States, [9]Fred Hutchinson Cancer Research Center, Seattle, United States, [10]Johns Hopkins University, Baltimore, United States, [11]FHI 360, Durham, United States, [12]The Fenway Institute, Boston, United States, [13]Harvard University, Cambridge, United States*
*Presenting author email: dwheeler@albany.edu*

**Background:** The HPTN 073 Study utilized a client-centered care coordination (C4) model to support initiation of PrEP as part of comprehensive risk reduction plans individually-tailored for Black men who have sex with men (BMSM) in three US cities.
**Methods:** The HPTN 073 Study enrolled 226 HIV-uninfected BMSM in three US cities, including Los Angeles, CA, Washington DC, and Chapel Hill, NC, between August 2013 and September 2014. All study participants were offered once daily oral FTC/TDF combined with C4, and followed-up for up to 12 months, with scheduled clinical visit at 13 week intervals. At each visit, participants were evaluated for C4 utilization and PrEP acceptance, in addition to side effects, renal toxicity, adherence, risk behavior and HIV seroconversion.
**Results:** Among the total 226 enrolled participants, 221 (97%) participants had at least one C4 encounter, with an average encounter length (minutes) 29 (95 %CI 28-30). For those who initiated PrEP, 176 out of 178 (99%) participants had at least one encounter with an average encounter length 31 (95 %CI 29-33). For those who didn't initiate PrEP, 42 out of 48 (88%) participants had at least one encounter with average an encounter length 32 (95 %CI 27-38). Compared to those who declined PrEP, participants who initiated PrEP were more likely to use C4 (OR = 12.6; 95% CI: 2.45-64.5, p=0.0024). A logistic regression model, including additional predictors, employment, sex with a male partner, shows an adjusted OR to be 9.6(95% CI:1.7-48.15 p= 0.0087).

**Conclusions:** Most HPTN 073 participants used C4 on at least one occasion. Client-centered care coordination was acceptable to Black MSM and highly associated with their initiation of PrEP. Use of a culturally appropriate, theory driven, client-centered approach can support PrEP uptake and adherence within highly vulnerable BMSM populations.

**Background:** Improved understanding of social network structures can contribute to the introduction and dissemination of new HIV prevention technologies within socially marginalized populations. This formative study explored social network formations and patterns of communication, trust, and behavioral influence among transgender women (TW) in Lima, Peru to inform future roll-out of HIV bio-behavioral prevention efforts.
**Methods:** Between May-July 2015, semi-structured in-depth interviews were conducted with 15 TW community members and 5 TW community leaders. TW leaders were identified during previous ethnographic research. Community members were recruited through snowball sampling within existing social networks from diverse geographic areas. Interviews were conducted in Spanish, recorded, transcribed, and analyzed using an immersion-crystallization approach.
**Results:** Participants described various layers of social influence from multiple actors within their social networks. The majority identified a single close relative (e.g., mother, sibling) as their primary source of trust and support with whom they discussed emotions, desires, and personal secrets. However, key issues related to transgender identity, sexual intimacy, relationship issues (primarily with male partners), and sex work were typically avoided with this individual. Participants described close circles composed of 2-3 TW friends that formed the core of their social network structure, with whom they would socialize regularly and share both private and practical information about gender identity, body modification, and sexual partners, but would not discuss potentially stigmatizing issues like an HIV diagnosis. Density of links and number of nodes within networks was greatly influenced by occupation (e.g., whether participants engaged in sex work and frequented commercial sex venues) and living arrangements (e.g., communal housing arrangements among groups of TW). Narratives regarding organization of TW communities broadly differentiated between political leaders/activists (who advocated for TW rights) and social leaders (who introduced young women to norms and practices of the trans community, commercial sex--if applicable, hormone therapy, and body modification techniques).
**Conclusions:** TW in Lima described highly influential, diverse social networks composed of a range of social and familial ties, with corresponding differences in patterns of interaction, communication, trust, and influence. Detailed qualitative and quantitative analysis of these networks will contribute to implementation and acceptability of new HIV prevention technologies like PrEP.

### THPEC187

### LOCAL CONTEXT IS EVERYTHING: A STUDY OF TRANSVESTITE, TRANSSEXUAL AND TRANSGENDER WOMEN IN NORTH-EAST BRAZIL

I. Dourado[1], S. MacCarthy[2], L. Magno[3], C. Cerqueira[1], S. Brignol[4], M. Lopes[1], A. Prates[1], L.A.V. da Silva[5], PopTrans Study Group
*[1]Federal University of Bahia, School of Public Health, Salvador, Brazil, [2]RAND Corporation, Los Angeles, United States, [3]Bahia State University, Department of Life Sciences, Salvador, Brazil, [4]Fluminence Federal University, School of Public Health, Niteroi, Brazil, [5]Federal University of Bahia, Institute of Humanities, Arts and Sciences, Salvador, Brazil*
*Presenting author email: ines.dourado@gmail.com*

**Background:** There is growing recognition that transgender populations do not fit any simple characterization. In Brazil, the terms transvestite, transsexual, and transgender are commonly used by the communities themselves and can describe having an assigned sex at birth that differs from their current gender identity or expression. Though fluid and dependent on context, 'transvestite' can relay differing levels of performance as a woman whereas 'transsexual' and 'transgender' can relay different degrees of transitioning. And recently, some prefer to be identified as 'women' to reflect their completed transition from their sex assigned at birth. It remains unknown if the disproportionate burden of HIV and other STIs varies among these self-identified groups. Therefore we describe preliminary results of a study on rates of HIV/STIs among these groups in Northeast Brazil.
**Methods:** We mapped spaces/venues where they meet: street locations, bars, nightclubs, gay parades, community based organizations and virtual media (Facebook, Skype, Whatsapp), to conduct a cross-sectional survey utilizing Respondent Driven Sampling (RDS) to test for HIV and syphilis.
**Results:** To date 126 participants were recruited and 46.8% identified as transvestites, 39.7% transsexual, 3.1% transgender, 10.3% women. Though the demographics did not differ by gender identity, HIV status differed substantially: 57% transvestites, 28% transsexuals, 7% transgender women and 7% women were HIV-infected. Further, 49% transvestites, 38% transsexuals, 13% women, and no transgender women tested positive for syphilis.
**Conclusions:** Differences in terminology may have implications for addressing HIV/STIs and other health problems among these groups. The desire for universal nomenclature may not capture realities of local culture. While terms such as 'transvestite' and 'transsexual' may have negative connotations in some contexts, the local context in which this research has been conducted highlighted the importance of engaging with a range of terms that participants themselves used to define a diversity of preferences and experiences.

### THPEC188

### TRANS INCARCERATION EXPERIENCES, CYCLE OF VIOLENCE AND INCREASED RISK OF HIV INFECTION: RESULTS FROM MURIEL PROJECT, SAO PAULO, BRAZIL

M.A. Veras[1], A. Cezaretto[2], L.F. Deus[1], J.L. Gomez[1], D. Barros[1], G. Saggese[1], S. MacCarthy[3], C. Barros[4], M.R. Giovanetti[5], R. Martins[5], Muriel Study Group
*[1]Faculdade de Ciências Médicas da Santa Casa de São Paulo, São Paulo, Brazil, [2]Universidade de São Paulo, São Paulo, Brazil, [3]Rand Corporation, Los Angeles, United States, [4]Universidade Católica de Santos, Santos, Brazil, [5]Centro de Referencia e Treinamento DST/AIDS, São Paulo, Brazil*
*Presenting author email: zeluisjunior@gmail.com*

**Background:** Transgender people are subjected to constant discrimination and violence in different social contexts. In Brazil, the penal system is being reported as a major player in the denial and violation of basic human rights. Historically, among inmates, transgender people are one of the main targets for arbitrary arrests and physical violence. Being in prison poses several risks, including HIV infection. Our objective was to analyze the experience of imprisonment in a study among transgender people in Sao Paulo, Brazil.
**Methods:** A consecutive quota sampling of transgender people was implemented in health care or social welfare services. A semi-structured questionnaire was used in face-to-face interviews. Socio-demographic characteristics, education, employment status, migration, access to health care, violence and discrimination experiences and self-reported HIV status among transvestites and transsexuals (FtM/MtF) were assessed in 7 municipalities of the State of Sao Paulo. Descriptive statistics and Chi-square tests were performed to analyze selected variables.
**Results:** Among the 673 participants, 19.6% (N=132, 129 MtF and 3 FtM) self-reported having been imprisoned. Those who experienced imprisonment are older (33.6±10.1 *vs.* 31.6±9.8, p=0.042), less educated (91.7% *vs.* 79.3%, p< 0.001) and more frequently self-reported as black/multi-racial (68% *versus* 56%, p=0.016), compared to those who were not incarcerated. Also, they are more likely to be unemployed (37% *vs.* 22%, p=0.001) and less prone to have a formal employment (3% *vs.* 13.3%, p< 0.001). 43.5% self-reported HIV-infection (*vs.* 22.8%, p< 0.001) and 81.1% reported physical violence. Excluding the 3 FtM, 75% of the transwomen

reported being incarcerated with men, 58.3% could not dress accordingly to self-identified gender, 22% had their hair cut, 78% suffered physical violence by other inmates and 77.3% were assaulted by guards or other employees of the correctional system.
**Conclusions:** Compared to the general population in Brazil, transgender people were 36 times more likely to be incarcerated. Elevated frequencies of imprisonment experiences in the transgender community, aggregated to other determinants, such as physical violence and reduced work opportunities, strengthen a cycle of violence, reinforcing vulnerabilities and increasing risk of HIV-infection. Health policymakers should address attention to trans incarceration in order to warrant human rights and access to integral health care.

## PREVENTION FOR MIGRANTS, MOBILE AND DISPLACED POPULATIONS

### THPEC189

### UNDERSTANDING/ADDRESSING HIV/AIDS WITH YOUNG ASYLUM SEEKERS FROM KP IN MENA

N. Badran[1], L. Hammad[2]
*[1]Soins Infirmiers et Developpement Communautaire - SIDC, HIV/AIDS/ Harm Reduction, Beirut, Lebanon, [2]SIDC/American University of Beirut, Public Health, Beirut, Lebanon*
*Presenting author email: nadiabadran@hotmail.com*

**Background:** UNHCR Global Appeal 2015, the humanitarian living conditions of migrants/refugees have implications for the region's HIV epidemic responses, these groups are subject to abuse/ assault/ sexual harassment/violence. Data show that 2 million fled Syria,1.1 million of which have located in Lebanon.
SIDC USAID - LMG Project, assessed the knowledge, attitudes, and practices related to sexual health, HIV, STIs/drug use among Syrian asylum (15-30yrs) from LGBT communities among which Sex workers and Drug Users, to develop appropriate HIV prevention interventions.
**Methods:** Data was collected analyzed/validated with key informants&group of professional.
**Results:** Despite good knowledge on HIV/STIs, responses confirmed that LGBT perceived themselves at risk of contracting STIs due to their sexual practices (90%) during their asylum period; MSM engage in SW (up to 30%) among which 30% aged between 15-21 years old, use social media sites to meet clients and selling sexual services; others consume drugs (up to 10%) and exchanging sex for drugs; condom use is low and negotiations skills insufficient. 60% of Syrian LGBT are not aware about services & don't benefit from any. Respondents stated have faced problems due to their sexual orientation or sexual activity, 39% subjected to psycho, violence and 49% abused in Lebanon.
**Conclusions:** The growing numbers of Syrian LGBT demanding services from SIDC and other civil society organizations when they are approached through outreach activities, confirms the need for an urgent response, adding the challenge of providing access to quality health care for Syrian refugees especially when it comes to areas related to sexuality and harm reduction that are considered taboo, and considering that asylum seekers have less access to health care settings and are reluctant to disclose these issues. Despite ongoing HIV-prevention efforts by national and humanitarian partners, it is important to ensure that needs of the Syrian KP are prioritized in the humanitarian and national HIV response. This requires a tailored strategic response where sexual health, HIV, and STI care are positioned and integrated within the humanitarian agenda for this population. This would not be possible without integrating peer education, tailored care services and specific training for providers & promotion activities enhancing a tolerant environment.

### THPEC190

### CHANGING THE PARADIGM: HIV RISK AND VULNERABILITY OF LOCAL COMMUNITIES DUE TO MINING AND INTERNAL MIGRATION IN UGANDA

D. Mafigiri[1], M. Martini[2], C. Lynch[3], L. Ghilardi[3], D. Nyanzi[4], M. Odie[1], F. Mulekya[5]
*[1]Makarere University, School of Social Science, Kampala, Uganda, [2]International Organization for Migration-IOM, Migration Health Division, Nairobi, Kenya, [3]London School of Hygiene and Tropical Medicine LSHTM, London, United Kingdom, [4]Makarere University, Kampala, Uganda, [5]International Organization for Migration-IOM, Migration Health Division, Kampala, Uganda*
*Presenting author email: michelamartini@hotmail.com*

**Background:** Mining communities in Uganda experience rapid population influx and internal mobility dynamics rendering them vulnerable to ill health including HIV and AIDS. We examined social and behavioral dynamics that increase vulnerability to HIV among mine host communities.
**Methods:** mix-methods cross sectional study was among 228 randomly selected migrants and members of the host communities conducted from February to December 2015 in extractive industry sites across 3 regions of Uganda. Qualitative interviews were held with migrants and members of the host communities, health care workers and other key stakeholders. Logistic regression for association between migrant status and HIV risk behavior/outcomes was performed using STATA 13..[MM1] Qualitative data were analyzed using a content and thematic approach.
**Results:** Migrants compared to local mining community members were of a better socioeconomic status -higher education level, higher qualified jobs and employed in larger industrial mines. Only 15% of participants reported condom use during last sex in the past 12 months. Migrants were twice as likely to report sexually transmitted infections (OR 2.7, 95% CI 1.19-6.22, p=0.01) and had more knowledge of where to access an HIV test (0.11, CI 0.02-0.55) than community members. Migrants identified themselves 2.9 times more at HIV risk than mining communities (OR 2.97, 95% CI 1.62-5.44, p< 0.001). , non-migrants overall had more risky behaviours than the general population (Uganda DHS data).- Vulnerability to HIV among local host community members stems from emergence of sex-work activities in areas surrounding mining sites; inconsistent condom use; alcohol and substance abuse; and poor access to HIV prevention and treatment services in mining communities. Whereas miners and extractive industry workers display high-risk sexual behaviors known to predispose people to HIV, migrants seem largely aware of the risk, have access to information and better health services (including health insurance) and are of higher social status than the mine host communities.
**Conclusions:** Current prevention efforts should be more focused to addressing internal mobility dynamics and reducing HIV vulnerability in local communities in mining sites while embracing a "space of vulnerability" approach to migration-affected areas.

*[1]African and Caribbean Council on HIV/AIDS in Ontario, Toronto, Canada, [2]Women's Health in Women's Hands Community Health Centre, Toronto, Canada, [3]St Michael's Hospital, Department of Family and Community Medicine and Li Ka Shing Knowledge Institute, Toronto, Canada, [4]Ontario HIV Treatment Network, Toronto, Canada, [5]Centre for Addiction and Mental Health, Toronto, Canada, [6]University of Toronto, Department of Psychiatry; Institute of Health Policy, Management and Evaluation; Institute of Medical Science, Toronto, Canada, [7]Institute for Work and Health, Toronto, Canada, [8]St Michael's Hospital, Toronto, Canada, [9]AIDS Committee of Toronto, Toronto, Canada, [10]University of Toronto, Department of Medicine, Toronto, Canada, [11]McMaster University, Department of Pathology and Molecular Medicine, Toronto, Canada, [12]University of Ottawa, Ottawa, Canada, [13]Women's College Hospital, Toronto, Canada, [14]Ministry of Health and Long-Term Care, Toronto, Canada, [15]The Hospital for Sick Children, Division of Infectious Diseases, Toronto, Canada, [16]Ottawa Public Health, Ottawa, Canada, [17]Regional HIV/AIDS Connection, London, Canada*
*Presenting author email: wangari@whiwh.com*

**Background:** In Canada, people from countries with generalized HIV epidemics in Africa and the Caribbean have higher rates of HIV compared to the general population. From 2009 to 2013, African, Caribbean and Black (ACB) people represented about 5% of the population of Ontario but 25.2% of new HIV diagnoses. The objective of this analysis was to establish a socio-demographic profile of ACB people living with HIV in care in Ontario, Canada.

**Methods:** The Ontario HIV Treatment Network Cohort Study (OCS) is an open, observational and voluntary cohort collecting data on people living with HIV through clinical chart reviews and annual questionnaires. ACB participants who had completed at least one questionnaire between 2008 and 2013 were included in this analysis. We compared socio-demographic characteristics between ACB participants and other OCS participants using chi-square tests. We conducted similar comparisons between ACB women and men.
**Results:** There were 3898 people in the sample, of whom 674 (17.3%) were ACB people. Compared to non-ACB participants, ACB people were more likely to be female (50.2% vs. 11.7%) (p< 0.0001), heterosexual (75.6% vs. 26.9%) (p< 0.0001), seeking employment (13.7% vs. 4.3%) (p< 0.0001), and be parents (62.4% vs. 26.1%) (p< 0.0001). They were also more likely to have completed college (27.6% vs. 20.02%) but less likely to have a university education (18.9% vs. 28.9%) (p< 0.0001), be Canadian-born (8.9% vs. 81.2%) (p< 0.0001), and reside in Canada for 10 years or more (52.4% vs. 85.2%) (p< 0.0001). Compared to ACB men, women were more likely to be parents (75.1% vs. 49.7%) (p< 0.0001) and have completed college (32.9% vs. 22.3%) but less likely to have a university education (12.2% vs. 25.6%) (p< 0.0001), be Canadian-born (5.0% vs. 12.8%) (p< 0.0001), and reside in Canada for 10 years or more (46.2% vs. 59.3%) (p< 0.001).
**Conclusions:** This is the first project establishing a profile of ACB people living with HIV in care in Ontario. Our results show that ACB people differ from other Ontario residents receiving HIV care. Additionally, some heterogeneity was found between ACB men and women. These results reinforce some of the programmatic work targeting ACB communities in Ontario.

## THPEC192

### EXPLORING HIV VULNERABILITY AMONG MIGRANT WORKERS AND THEIR SPOUSES IN EGYPT

D. Oraby, N. Abdel-Tawab
*Population Council, Reproductive Health and HIV, Cairo, Egypt*
*Presenting author email: doraby@popcouncil.org*

**Background:** Egypt sends more than two million migrant workers to work abroad apart from internal migration from rural to urban areas. Research from other countries showed an increased vulnerability of migrant workers to HIV infection due to increased stressors and lack of social support. In the Middle East North Africa region, most women who are infected with HIV reported not engaging in risky behavior of their own suggesting contracting the infection through having unprotected sex with their husbands. The study aimed to understand risk factors faced by migrant workers and women married to migrant workers in Egypt.
**Methods:** In- depth interviews were conducted with 20 external migrant workers, 20 internal migrant workers and 20 women married to migrants (external or internal). This study examined the perception of HIV risk for themselves and wives, disclosure of risky behavior to wives, experience with the health system and dynamics of the marital relationship. The study was implemented in a number Egyptian Governorates that send men to work in Western or Gulf countries in addition to touristic attractions with prevalent internal migrants.
**Results:** Migrant workers (specifically internal ones working in touristic attractions and external migrants in Western countries) were practicing multiple risky behaviors, having limited HIV related information and negative attitudes towards condoms. None of them knew about HIV testing services available in Egypt and were afraid to approach such services because of HIV related stigma. Women married to migrant workers did not perceive themselves at risk for acquiring HIV. Their vulnerability was further exacerbated by prevalent gender norms and economic dependence on their husbands that render them powerless to discuss their husbands' risky behavior or negotiate condom use.
**Conclusions:** Targeted interventions should be directed at both internal and external migrants and should focus on HIV awareness-raising, safer sex through consistent and correct condom use, and creating a cadre of peers that could provide psychosocial support and HIV counseling to migrant workers. Concurrently, efforts should be made to raise HIV awareness of women and empower them (eg. micro-loans, vocational training) as well as addressing inequitable gender norms among both men and women.

## THPEC193

### LESSONS LEARNED FROM A CROSS-BORDER COOPERATION FOR HIV/AIDS PREVENTION AND IMPACT MITIGATION, SOUTHERN CAUCASUS AND RUSSIAN FEDERATION

A. Sahakyan[1], V. Sargsyan[2], A. Yimam[3]
*[1]World Vision Armenia, Operations Department, Yerevan, Armenia, [2]World Vision, MEER, Development, Learning and Impact, Yerevan, Armenia, [3]World Vision International, Sustainable Health, Mbabane, Swaziland*
*Presenting author email: adugna_kebede@wvi.org*

**Background:** The project was initiated in response to the alarming situation of high migration rates contributing to the spread of HIV/AIDS in the Southern Caucasus. It was implemented from April 2012 to May 2014. Among other things, the project aims at strengthening HIV/AIDS services, especially to migrant workers, All the four countries have experienced increasing problems concerning HIV and migration e.g. Armenia has estimated 50-60,000 seasonal migrants every year and 75% of new cases of HIV are reported from seasonal migrants.
**Description:** The project's main activities included: establishing a regional working group with the participation of Government, NSA's and international organizations; facilitate capacity building training's, review a set of existing HIV/AIDS education materials before distribution and facilitate the development and implementation of regional action plan and the design and implementation of 23 advocacy campaigns.
**Lessons learned:** The project address the link between HIV and migration involving countries where migrants are coming from and the country serving as a destination. This helped to find a joint solution for a regional problem. The project was effective in reaching families of migrant workers that resulted in an increase in testing levels. One notable contribution of the project was its influence in the inclusion of migrants as vulnerable groups in the Azerbaijan National AIDS strategy. The project produced several documents, such as Policy and Service Gap Analysis, which helped to address the problems of HIV and migration in the region. Some of the hindering factors addressed by the project include:
(1) the high cost of travel to testing centres and stigma associated with HIV in Armenia and elsewhere in the region.
(2) Migrants in the Russian Federation often avoided getting tested officially, for fear of losing their legal residential status in the event of a positive test results.
**Conclusions/Next steps:** Government and civil society should utilize the regional network created within this project in future programmatic plans, since strong ties have already been established and the network can be extremely powerful in mobilizing communities and channeling their experience in delivering programmatic goals. Regional cooperation among nations for HIV prevention will significantly contribute to access to health services to migrant workers.

# PREVENTION FOR HIV SERODISCORDANT COUPLES

## THPEC194

### SEXUAL NETWORKS AND GENETIC LINKAGE OF HIV TRANSMISSION FOR HIV SEROCONCORDANT COUPLES FROM A RURAL PREFECTURE OF EASTERN CHINA

H. Lin[1,2], Q. Ding[3], W. Zhang[3], X. Chen[1], Y. Ding[2], X. Liu[2], N. He[2]
*[1]Taizhou Prefecture Center for Disease Control and Prevention, Taizhou, China, [2]School of Public Health, Fudan University, Epidemiology, Shanghai, China, [3]Health and Family Planning Commission of Taizhou Prefecture, Taizhou, China*
*Presenting author email: 84800166@qq.com*

**Background:** A large number of HIV infections occur within married couples in China. The aim of this study is to combine information of both epidemiological and genetic scales to characterize and analyze the potential HIV transmission within married couple among treatment-naïve HIV infections.
**Methods:** A total of 27 HIV seroconcordant positive couples were investigated in Taizhou prefecture, China. HIV transmission pairs within-couples were determined by the combination of both sequences of the protease and reverse transcriptase coding regions based on HIV *pol* gene and behavioural analysis.
**Results:** Of 27 spouses first diagnosed, 12 were defined HIV late diagnosis, 26 were identified through HIV testing during medical care or HIV testing before surgery. Male spouses were more likely to report having two or more sexual partners in the past year prior to HIV diagnosis than female spouses (88.9% vs. 37.0%). 24 of 27 sexual networks were determined to be HIV transmission pairs (20) or potential transmission pairs (4), three couples were subtyped with discordant HIV subtypes or large genetic distance and thus had different sources of HIV transmissions.
**Conclusions:** The findings of this study underscore the importance of integration of behavioral and molecular evidence to identify HIV transmission pairs and reconstruct the HIV transmission network within married couples.

The results provide enhanced evidence for urgently developing tailored prevention strategies for network-based preventive measures, such as couple based HIV counseling and testing (CHCT) services for HIV-discordant mixed couples to reduce HIV secondary transmission.

## THPEC195

### THE POWER HEALTH PROGRAM: A NOVEL, ONLINE, MULTI-MODAL EDUCATIONAL INTERVENTION FOR HIV-NEGATIVE WOMEN AND THEIR MALE PARTNERS

S. Weber[1], Y. Oseguera-Bhatnagar[2], C. Watson[2], K. Oza[3], K. Koester[4]
[1]*University of California, Family & Community Medicine, San Francisco, United States,* [2]*HIVE, San Francisco, United States,* [3]*HIVE/UCSF, San Francisco, United States,* [4]*Center for AIDS Prevention Studies, UCSF, San Francisco, United States*
*Presenting author email: y.oseguera.bhatnagar@gmail.com*

**Background:** Many women and men in HIV serodifferent relationships want to experience parenthood. Advances in HIV treatment and prevention, such as pre-exposure prophylaxis and treatment as prevention, can facilitate safer conception within the context of serodifferent relationships. Despite these advances, many couples are unaware of and/or are unable to navigate medical systems to gain access to safer conception options.
**Description:** The Positive Outcomes for Women Engaged in Reproductive (POWER) Health program consists of a web-based, multi-modal educational curriculum catering to HIV-affected male/female couples and aims to empower couples to take control of their reproductive and sexual health.
Harnessing the growing number of technological tools now available, the POWER Health team reaches their audiences using a web portal [www.hiveonline.org] containing an array of materials such as patient and provider educational brochures as well as leveraging social media outlets e.g., Facebook, Twitter, Google+ Hangouts in novel ways.
We routinely film videos depicting interviews with sexual and reproductive health experts including providers and researchers as well as filming videos with patients, writing blogs, and creating brochures using accessible language. All patient materials are reviewed by consumers and published in both English and Spanish.
**Lessons learned:** From February 2015 - January 2016, 47 unique POWER Health educational "pieces" were developed and posted online. These pages reached 4079 views across 5 continents (North/South America, Africa, Australia, Europe). The most widely accessed pages included: "My TasP Conception Story" (420 views), "Ben Banks Thriving and Fatherhood with HIV" (860 views) and "Sex Workers in Nigeria Need PrEP" (387 views).
As the year progressed, the number of viewers grew exponentially signaling gaining in popularity. For example, one viewer wrote "This gives me hope…" - a sentiment expressed in the comments that viewers offered in reaction to blogs, videos or social media conversations.
**Conclusions/Next steps:** The POWER Health project is reaching its intended audience of HIV-affected male/female couples. We do so by championing the voices and stories of people that are often silent or hidden. POWER Health educational materials are raising awareness about reproductive health options as well as breaking down social isolation often felt by members of serodifferent couples.

## THPEC196

### ANTIRETROVIRAL THERAPY INITIATION IS NOT ASSOCIATED WITH RISKY SEXUAL BEHAVIOR AMONG EAST AFRICAN HETEROSEXUAL HIV-1 INFECTED PERSONS IN SERODISCORDANT PARTNERSHIPS

A. Mujugira[1], C. Celum[1], K. Thomas[1], K. Ngure[2], E. Katabira[3], J. Baeten[1],
Partners PrEP Study Team
[1]*University of Washington, Seattle, United States,* [2]*Jomo Kenyatta University of Agriculture and Technology, Nairobi, Kenya,* [3]*Makerere University, Kampala, Uganda*
*Presenting author email: mujugira@uw.edu*

**Background:** Few prospective studies have assessed whether antiretroviral therapy (ART) use is associated with changes in sexual risk behavior of HIV-1 infected persons in known HIV serodiscordant partnerships.
**Methods:** We conducted a longitudinal analysis of 4747 HIV-1 infected persons with known uninfected partners from Kenya and Uganda enrolled in the Partners PrEP Study. ART use and self-reported sexual behavior were ascertained every 3 months. Urine pregnancy testing for HIV-1 uninfected women was performed monthly. Testing for sexually transmitted infections (STIs) was performed at enrollment, annually, and when clinically indicated. We assessed the effect of ART use on sexual risk behaviors using zero-inflated negative binomial regression. Primary outcomes were condomless sex acts, pregnancy incidence and new STI diagnoses.
**Results:** Of 1,817 partners who initiated ART during follow-up, 58% were women, the median age was 34 years, and most (98%) were married. At enrollment, HIV-1 infected partners reported a median of 4 sex acts (IQR 2-8) with HIV-1 uninfected partners in the prior month and 6% of HIV-1 infected men reported condomless sex with other partners. *Trichomonas vaginalis* was the most prevalent STI, detected in 10% of women and 2% of men. HIV-1 infected partners were followed for 864 person-years before ART initiation and 771 person-years after ART. Median CD4 and plasma viral load at ART initiation were 277 cells/µL and 4.18 $\log_{10}$ copies/mL, respectively. ART use was associated with a significant decrease in condomless sex acts with HIV-1 uninfected partners (0.8 vs. 0.4 per month; adjusted decrease 36%; 95% CI: 25%, 45%; p< 0.001), but not condomless sex acts with other partners (1.6 vs 1.1 per month; adjusted change 6.2%; 95% CI: -27%, 20%; p=0.62). Pregnancy incidence was lower after ART (13.2 vs 8.4 per 100 person-years; HR 0.71, 95% CI: 0.60-0.84, p< 0.001). Incident STI diagnoses were similar (8.3 vs 8.7%; OR 1.05; 95% CI: 0.86-1.29; p=0.63).
**Conclusions:** Risky sexual behavior, as indicated by unprotected sex and pregnancy incidence significantly decreased after ART initiation among East African HIV-1 infected persons with known HIV-1 uninfected partners. These data are reassuring that substantial risk compensation does not immediately follow ART initiation.

## THPEC197

### PREVALENCE AND FACTORS ASSOCIATED WITH DISCLOSING HIV STATUS TO WIFE AMONG MARRIED HIV-POSITIVE MEN WHO HAVE SEX WITH MEN AND WOMEN IN CHINA

W. Cao[1], J. Lau[2], P. Mo[2]
[1]*Chinese University of Hong Kong, Division of Behavioral Health and Health Promotion, Hong Kong, Hong Kong,* [2]*Chinese University of Hong Kong, Hong Kong, Hong Kong*

**Background:** Men who have sex with men and women (MSMW), functions as the bridge in transmitting HIV from high-risk group (MSM) to low-risk group (general female). A large proportion of them would enter into marriage eventually, especially in the Chinese Setting. Due to the double-stigmatized identity, few of them disclosed HIV status to their wives. To date, factors associated with disclosing HIV to wife are highly under-investigated among HIV positive MSMW in China. We aimed to investigate factors associated with HIV disclosure to wife among HIV positive MSMW in China.
**Methods:** We conducted a cross-sectional anonymous survey among HIV positive MSMW, who ever married with a female, and aged 18 years or older from four cities of China between January to August, 2015. Participants' recruitment was facilitated by local collaborators. After telephone screening by CDC staffs and MSM peers, all eligible participants were invited to join. Formal written consent was obtained before the face-to-face interview. We used individually structured questionnaire to measure characteristics of the HIV positive MSMW and their wives, as well as factors about their relationship and backgrounds.
**Results:** Our analysis included data for 259 HIV positive and married MSMW. Prevalence of disclosing HIV status to wife was 61.4%. For the HIV positive MSMW, the majority were older than
35 years old (74.0%) and on antiretroviral therapy (ART) (84.7%). With regard to wife, very few were HIV positive (6.6%); 68.3% kept this relationship for over four years; half (44.8%) had inconsistent condom use in the past month; one fifth (22.8%) already disclosed homosexual identity to wife. After adjusting for significant backgrounds (living with wife), participants were more likely to disclose HIV to wife, with clinical symptoms related to HIV/AIDS (AOR=2.59, P< 0.05), on ART
(AOR=4.65, P< 0.001), already disclosing homosexual identity (AOR=12.69, P< 0.001), known HIV status of wife (AOR =4.70, P< 0.001). No association was found between inconsistent condom use and disclosing HIV.
**Conclusions:** Less than half of the HIV positive Chinese MSMW still hide their HIV status from their wives. Interventions to encourage HIV status disclosure should target at identifying HIV related symptoms and promoting partner to do HIV testing.

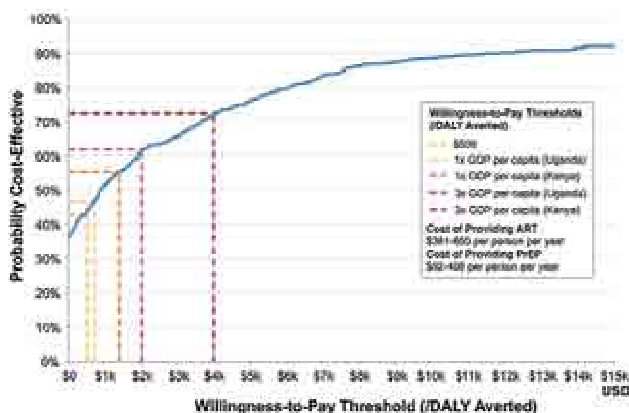
### PRE-EXPOSURE PROPHYLAXIS CAN BE COST-SAVING FOR HIGH-RISK HETEROSEXUAL HIV SERODISCORDANT COUPLES

B.L. Jewell[1], J.M. Baeten[2], J.E. Haberer[3], I. Cremin[1], M. Pickles[1], C. Celum[2], A. Chaturvedula[4], C.W. Hendrix[5], T.B. Hallett[1]
*[1]Imperial College London, Infectious Disease Epidemiology, London, United Kingdom, [2]University of Washington, Global Health, Seattle, United States, [3]Massachusetts General Hospital, Boston, United States, [4]University of North Texas, Health Science Center, Fort Worth, United States, [5]The Johns Hopkins University, Baltimore, United States*
*Presenting author email: b.jewell@imperial.ac.uk*

**Background:** For HIV-serodiscordant couples, providing pre-exposure prophylaxis (PrEP) for the HIV-uninfected partner as a "bridge" to antiretroviral therapy (ART) initiation for the HIV-infected partner reduced incidence by 96% in the Partners Demonstration Project. The cost-effectiveness of PrEP has not been estimated given realistic adherence, which was high but imperfect in the Demonstration Project.
**Methods:** We used an individual-based mathematical model of HIV transmission among serodiscordant couples in Kenya and Uganda that includes HIV transmission according to viral load, daily PrEP adherence from electronic monitoring data, tenofovir pharmacokinetics/pharmacodynamics, external sexual partners, and empirical cost estimates. PrEP use was simulated for the HIV-uninfected partner until six months after the partner's ART initiation under three scenarios (ART at CD4 counts <350 cells/µl, <500 cells/µl, or universal ART). We estimated the incremental cost-effectiveness ratio (ICER) for a PrEP intervention over the couples' lifetimes and constructed a cost-effectiveness acceptability curve to determine the probability of cost-effectiveness under a range of circumstances and the potential cost to identify each couple for PrEP use.
**Results:** Our best estimates are that PrEP targeted to high-risk couples is cost-saving (ICER <$0/disability-adjusted life-year [DALY] averted) when implemented with ART <500 cells/µl or universal ART and cost-effective ($371/DALY averted) with ART <350 cells/µl. PrEP use in conjunction with ART <500 cells/µl has an estimated 36% probability of being cost-saving and up to a 72% probability of being cost-effective, depending on the willingness-to-pay threshold. To maximize impact, couples must be found early, and PrEP use would remain cost-effective (at a threshold of $500/DALY averted) if an additional $58-148 was required to identify each couple.



*[Cost-effectiveness acceptability curve for PrEP use in conjunction with ART at CD4 counts <500 cells/µl]*

**Conclusions:** Providing PrEP for the HIV-uninfected partner in a high-risk serodiscordant couple as a bridge through six months after ART initiation for the HIV-infected partner has a high probability of being cost-effective in Kenya and Uganda.

## THPEC199

### COMMUNITY-BASED PARTNERS HIV TESTING AND SERODISCORDANCY IN NAMIBIA'S HIGHEST PREVALENCE REGION, 2014-15

K.M. Banda[1], A.M.-A. Agovi[2], A. Maher[3,4], M.R. Chipadze[5], T. Nakanyala[1], C. Ntema[5], A. Wolkon[2], N. Mutenda[1], D. Prybylski[2], I. Pietersen[1], I. Mabuku[1], S. Chaturvedi[6], D. Lowrance[2], E. Dzinotyiweyi[1], W. McFarland[7], S.V. Patel[2]
*[1]Ministry of Health and Social Services, Directorate of Special Programmes, Windhoek, Namibia, [2]U.S. Centers for Disease Control and Prevention, Windhoek, Namibia, [3]University of California, San Francisco, United States, [4]Global Health Sciences, Windhoek, Namibia, [5]Development Aid People to People, Total Control of the Epidemic, Windhoek, Namibia, [6]University of California San Francisco, Global Health Sciences, San Francisco, United States, [7]University of California, Global Health Sciences, San Francisco, United States*
*Presenting author email: sjp5@cdc.gov*

**Background:** Partners HIV testing and counseling (PHTC) can facilitate informed decisions about HIV treatment, prevention, and reproductive health. Immediate antiretroviral treatment (ART) of the HIV-positive partner in a serodiscordant couple can prevent imminent transmission. We estimated community-level rates of couples PHTC and serodiscordancy in the highest prevalence region of Namibia.
**Methods:** A cross-sectional, household-based survey was integrated into the routine activities of a community-based HIV testing and case management program from 12/2014 - 7/2015 in five selected sites of Namibia's Zambezi region. Adults (age ≥ 15 years) completed behavioral interviews and received HIV testing if they were not previously diagnosed. Previous HIV diagnosis was measured through self-report and verified in patient-carried health records. Participants who were married or cohabitating were invited to PHTC. The serostatus of each participant's partner was captured on that partcipant's survey form, but not all partners participated in the study. Therefore, the individual participant, not the couple is used as the unit of analysis.
**Results:** We enrolled 2,163 adults, 503 (23.2%) of whom received PHTC. Among those who received PHTC, 333 (66.2%) were seroconcordant negative with their partner, 91 (18.1%) were seroconcordant positive with their partner, 44 (8.7%) were seronegative discordant with a seropositive partner and 35 (7.0%) were seropositive discordant with a seronegative partner. Serodiscordant partnerships were significantly higher among urban participants (AOR: 1.96, P = 0.05). More than half (59.6%) of positive partners in serodiscordant relationships were not on ART.
**Conclusions:** Approximately 15% of individuals who received PHTC in our survey were serodiscordant with their partner. More than half of seronegative adults with a seropositive partner were at high risk for infection because their partner was not on ART. If rapid linkage to treatment for seropositive partners can be ensured, PHTC can have substantial prevention benefit to seronegative partners. Community-based approaches - which in our study reached nearly 25% of adults with PHTC - may facilitate rapid linkages to treatment and prevention interventions for serodiscordant couples. Our results also suggest that many serodiscordant couples may benefit from temporary pre-exposure prophylaxis (PrEP), which is given to a seronegative individual until the positive parnter initiates ART and achieves viral supression.

# PREVENTION FOR OTHER VULNERABLE POPULATIONS

## THPEC200

### COMMUNITY LEADER'S ENGAGEMENT TO BRIDGE THE GAP OF PMTCT IN POST CONFLICT ZONES OF BAKASSI IN THE SOUTH-WEST REGION OF CAMEROON

N.B. Lundi Anne Omam[1], O.N. Esther[2], M.H. Efesoa[2]
*[1]Reach Out Cameroon, Health Department, Buea, Cameroon, [2]Reach Out Cameroon, Buea, Cameroon*
*Presenting author email: lundianne@reachoutcameroon.org*

**Background:** With a population of 19.4 million inhabitants, Cameroon faces one of the most severe HIV epidemics in West and Central Africa with prevalence amongst pregnant women being 7.8%, and much higher prevalence in hard to reach post conflict communities. In Bakassi, the prevalence amongst women is reported to be above 20% and thus a call for concern. We sought to pilot a project which engages community leaders as pace setters to influence, educate, and bridge the gap of PMTCT between the community and health facilities in Bakassi.
**Description:** A community centered approach was used in the project. The project areas were; Bamusso, Isangele and Kombo Abedimo councils and entailed (1) conducting a qualitative research in 21 communities to ascertain the difficulties faced by women in post-conflict areas in accessing PMTCT services; (2) training of community leaders; (3) raising community awareness on PMTCT through educative and home visits; and (4) creation of community health task forces (CHTF). The project ran from April 2014 - December 2015

**Lessons learned:** The research results revealed the presence of constant threat of kidnapping attacks, difficulty in accessibility to health facility causing pregnant women to give birth at home or in churches, poor communication network, cultural/religious beliefs that impede PMTCT access. 100 community leaders were trained to become leaders in PMTCT. A total of 10,718 persons were reached with education on different PMTCT topics. Of this number, 835 were pregnant women (PW), 5,046 men, and 4,837 women of child bearing age. Of the PW sensitized, 518 attended ANC 1 with 505 tested for HIV. All HIV positive PW were linked to care and treatment. 15 exposed babies had their PCR information documented at six weeks; of whom two tested positive. 66 male partners attended ANC with their spouse. 3 CHTF were created to serve as watch dogs in the community and assist in overseeing project activities.
**Conclusions/Next steps:** Community leaders form an indispensable cadre within communities having a vital role to play in the HIV response. Thus a need to strongly involve them in preventing mother to child transmission of HIV in post conflict zones.

## THPEC201

### ASSESSING THE IMPACT OF A VIDEO-BASED MODEL TO ENGAGE AN URBAN PSYCHIATRIC INPATIENT COHORT IN THE PROCESS OF HIV TESTING AND EDUCATION

H. Sharma-Cooper[1,2], U. Gadde[1], Y. Calderon[1,2,3], D. Rolle[1], J. Leider[2,3], E. Cowan[2,3], E. Coupet[3], J. Zahn[3], M. Popiel[2,3]
*[1]North Central Bronx Hospital, Bronx, United States, [2]Albert Einstein College of Medicine, Bronx, United States, [3]Jacobi Medical Center, Bronx, United States*
*Presenting author email: uttara.gadde@nbhn.net*

**Background:** Several studies have shown that a large proportion of mentally ill adults exhibit high risk factors for contracting HIV. However, testing rates and knowledge about HIV among this population are low. This project was implemented to develop a new model to engage high-risk patients in an urban inpatient setting in the process of HIV testing and education using a behavioral skills video.
**Description:** During weekly small group sessions held by a staff nurse and trained PHA (Public Health Advocate), psychiatric patients were given a pre-video survey to determine baseline HIV knowledge, risk factors, perceived risk, and HIV test acceptability. A short behavioral skills video developed by Project B.R.I.E.F was then screened. After watching the video and participating in a small group discussion, patients were asked to complete a post-video survey asking the same questions as at baseline.
**Lessons learned:** 17 psychiatric inpatients participated in the educational video screening. 53% of participants were male, and 41.2% of patients were homeless in the past six months. Risk factors, as per CDC criterion, were: multiple sex partners (35.3%), injection drug use (17.6%), sex for commodities (17.6%), or having a sexually transmitted disease (23.5%). Common psychiatric diagnoses were: Schizophrenic/Psychotic/Affective (41.2%), Depression (17.6%), and Bipolar (17.6%). HIV testing acceptability increased from a baseline of 50% to 61% after the video screening. Participation in the group session was associated with improved HIV knowledge (as shown by the survey indicators in the table).

| | Baseline | Post-Intervention |
|---|---|---|
| Measure* (N=17) | Mean | Mean |
| HIV-related knowledge questions | 5.41 | 6.11 |
| Intention | | |
| To use condoms during every future sexual occasion | 4.88 | 5.05 |
| To use condoms after drinking | 5.12 | 5.00 |
| To insist on condom use with resistant partners | 4.53 | 5.12 |
| To discuss HIV/AIDS with sexual partners | 5.06 | 5.35 |
| To use condoms during the next sexual occasion | 4.82 | 5.12 |
| *Scores on knowledge about HIV were based on the number of correct responses to 9 true or false questions. Intention responses were on a 6 point scale ranging from 1, strongly disagree to 6, strongly agree (adapted from Kalichman et al., 1992). | | |

*[Mean Survey Scores of HIV Knowledge and Intention to Reduce HIV Risk Behavior]*

**Conclusions/Next steps:** A video-based HIV educational intervention, in conjunction with targeted group sessions, can be implemented in an inpatient psychiatric setting to promote HIV testing and improve HIV knowledge among a mentally ill cohort. These preliminary findings support further continuation of the program to target a larger inpatient audience. Future analysis should include prospective evaluation of the model in its ability to change behavior in this high-risk population.

## THPEC202

### PTSD SYMPTOMS AND HIV RISK BEHAVIORS IN A MARGINALLY-HOUSED, MENTALLY ILL POPULATION: FINAL ANALYSES

J. Berger-Greenstein[1], S. Brady[2], C. Mainville[3], M. Richardson[1], J. Bacic[4], K. Reid[3]
*[1]Boston University School of Medicine, Psychiatry, Boston, United States, [2]Boston University School of Medicine, Mental Health Counseling and Behavioral Medicine Program, Boston, United States, [3]Boston Medical Center, Psychiatry, Boston, United States, [4]Boston University School of Medicine, School of Public Health, Boston, United States*
*Presenting author email: sbrady@bu.edu*

**Background:** PTSD and trauma have been consistently associated with increased risk for HIV, including increased sexual acts, sexual partners, and proportion of unprotected/protected sex (Radcliffe et al., 2011; Sikkema et al., 2009). Recent literature suggests that specific symptoms of PTSD are associated with HIV risk. Specifically, Criterion C (avoidance/numbing) symptoms are predictive of increased risk behaviors (Berna et. al, 2012; Myers & Wyatt, 2010). In our midtrial analysis we found that Criterion B symptoms were positively associated with risky sex acts and IDU use with in a 3-month period and findings for other variables associated with PTSD were trending toward significance.
This current study looks at the relationship between PTSD symptoms and HIV risk behavior on our final dataset.
**Methods:** As a sub-study of a larger NIH-funded HIV prevention study (NIH-NIMH R01 MH 084696-01-A2 PI: Brady), we used a cross-sectional design and regression analyses to examine baseline data for relationships between PTSD diagnosis and several measures of HIV risk behaviors. Data represent 240 participants (109 female [45%], 61% heterosexual, 64% homeless/marginally-housed), mean age of 42.6 (42% African American, 34% Caucasian, 9% Hispanic/Latino), and 18% known to be HIV+. Instruments included a Demographic Inventory, the Timeline Followback (TLFB; Sobell & Sobell, 1992) to assess sexual activity, sex trade, drug/alcohol use, and the Structured Clinical Interview for the DSM-IV (First et al., 2010) to assess PTSD symptoms.
**Results:** Criterion B symptoms were positively associated with the following HIV risk behavior in a 3-month period: total sex (t=3.08, p=.002), total unprotected sex (t=3.23, p=.001), total vaginal sex (t=2.03, p=.04), total oral sex (t=2.54, p=.01), total unprotected oral (t=2.69, p=.008). In each case, those individuals meeting criterion B participated in approximately one additional sex act per 90-day period compared to those not meeting for criterion B. PTSD diagnosis, as well as Criterion C (Avoidance) and D (Negative Mood/Cognitions), were not associated with risky sex and IDU acts in a 3-month period.
**Conclusions:** This relationship suggests that sex can lead to re-experiencing for a population with a trauma history. This finding has clinical implications for HIV prevention and mental health care.

## THPEC203

### SEXUAL RISK REDUCTION INTERVENTION FOR PSYCHIATRIC PATIENTS: OUTCOME OF A LARGE, MULTI-SITE, RANDOMIZED CONTROLLED TRIAL IMPLEMENTED WITHIN A LOW-RESOURCE PUBLIC MENTAL HEALTH SYSTEM

M. Wainberg[1], A. Norcini-Pala[1], K. McKinnon[1], C. Mann[2], M. Crosland Guimarães[3], D. Pinto[4], K. Elkington[1], P. Mattos[5], A. Medina-Marino[6], F. Cournos[7]
*[1]Columbia University/NYSPI, Psychiatry, New York, United States, [2]Fiocruz, Rio de Janeiro, Brazil, [3]Federal University of Minas Gerais, Belo Horizonte, Brazil, [4]UNIRIO, Rio de Janeiro, Brazil, [5]Universidade Federal do Rio de Janeiro/IPUB, Psychiatry, Rio de Janeiro, Brazil, [6]Foundation for Professional Development - FPD, Research Unit, Pretoria, South Africa, [7]Mailman School of Public Health, Columbia University, New York, United States*
*Presenting author email: andrewmedinamarino@gmail.com*

**Background:** Implementing behavioral interventions in low-resource settings is challenging, especially when targeting vulnerable, high-risk populations like people with mental illness. HIV prevention trials have been conducted outside psychiatric treatment settings in high-resource countries, with small samples and weak control groups. We conducted a large, multi-site, HIV prevention RCT among adults with mental illness in the public mental health system of Rio de Janeiro to examine changes in sexual risk behaviors over time.
**Methods:** 3,811 outpatients were screened at 4 community mental health clinics and 4 psychiatric hospitals in low-resource settings. Among the 1,348 who were sexually active in the last 3 months, 464 underwent randomized treatment assignment (HIV Prevention vs. Control-Health Promotion). Participants were assessed for diagnoses (Mini International Neuropsychiatric Interview-PLUS) and sexual risk behaviors (Sexual Risk Behavior Assessment Schedule); a sexual risk index (SRI) composite score of past-3-months unprotected sex occasions with steady, casual and exchange partners was calculated. SRI ranged from 0 to 6 and was recoded into a

categorical variable: No-risk (0); Moderate-risk (>0 and ≤1); and High-risk ≥2). We compared the intervention and control groups on SRI change from baseline to 3 months FU by bivariate analysis at baseline and 3-Month FU ($\chi^2$ test), and linear growth model (LGM; Mplus 7.4) using Maximum Likelihood with Robust standard error (MLR) estimator.
**Results:** Demographic and clinical characteristics and HIV-risk behaviors of the two arms did not differ (successful randomization). Participants were female (56.0%), with a mean age of 43.3 years; multiracial (47.4%), white (32.8%), or black (20.3%); 46.1% married/long-term relationship, 34.7% single, and 18.5% separated/divorced/ widowed. The majority (72.4%) of participants had diagnoses consistent with severe mental illness: schizophrenia (35.3%); bipolar disorder (21.1%); depression with psychosis (9.3%); schizoaffective disorder/psychosis NOS (6.7%); and common mental disorders (27.6%); 1.9% had comorbid substance use disorders. At 3-Month FU, the proportion of High-risk was lower in the HIV compared to the control group. The LGM showed that patients in the HIV group were less likely to report High-risk compared to the control group (Beta=-.27, p=.03).
**Conclusions:** Investing in behavioral interventions in low-resource settings is feasible and worthwhile. Our findings highlight opportunities for global implementation.

## THPEC204

### USE OF DENTAL DAMS AMONGST WOMEN WHO HAVE SEX WITH WOMEN (WSW) COMMUNITIES IN BOTSWANA, LESOTHO, MALAWI, NAMIBIA, SOUTH AFRICA, SWAZILAND, ZAMBIA AND ZIMBABWE: A QUALITATIVE STUDY

A. Spilka[1], O. Odumosu[1], M. Ricardo[2], B. Langen[2]
*[1]COC Netherlands, Pretoria, South Africa, [2]COC Netherlands, Amsterdam, Netherlands*

**Background:** Despite the pervasive belief that WSW are a low-risk group, WSW are vulnerable to HIV/STI infection through sexual and gender based violence, sex with men, and to a lesser extent, sexual contact with HIV positive WSW. Barrier methods remain the most effective method of reducing HIV risk during sexual intercourse. Dental dams are the barrier method marketed to WSW. This pilot study sought to explore motivation for use or non-use of dental dams amongst WSW communities in 8 Southern African countries.
**Methods:** .Thirteen LGBTI organisations in Southern Africa, distributed 10,000 dental dams to approximately 5% of their existing WSW clients. IEC material on dental dam use was also provided. Convenience sampling was used to recruit individuals who access the organisation's services, who identify as lesbian, bisexual, transgender or gender non-conforming women, and who agreed to participate in the pilot study. Data was collected via a self-report questionnaire (n=100). Furthermore, a self-report questionnaire was administered to outreach workers who distributed the dental dams (n= 13). Data was analysed using thematic content analysis with a set of a priori concept-driven codes.
**Results:** The majority of participants reported feeling motivated to use dental dams out of a desire to protect themselves and use them for oral sex. Many cited difficulties in using dental dams, dams being too small, a desire for pleasure and intimacy weighted above safety needs, knowing a partner's status, and trusting a partner as reasons motivating non-use. Most indicated hearing about dental dams from LGBTI organisations but that widespread unavailability and not knowing where to get one from are issues prohibitive to use.
**Conclusions:** Southern African LGBTI organisations should consider inclusion of dental dams in WSW programmes and should lobby government for inclusion of dental dams in national WSW interventions. Interventions should simultaneously provide mechanisms for WSW to learn about dental dam use and modes of HIV transmission amongst WSW. Further research is needed to improve product design of dental dams and to ascertain levels of use amongst MSM.

## THPEC205

### MEASURES TO ASSURE QUALITY AND ACCURACY OF COMMUNITY-BASED HIV TESTING ON A LARGE SCALE: LESSONS LEARNT IN THE HPTN 071 (POPART) TRIAL IN ZAMBIA

C.R. Phiri[1], M. Limbada[1], B. Kosloff[1,2], A. Schaap[1,2], S. Floyd[2], S. Griffith[3], S. Fidler[4], R. Hayes[2], K. Shanaube[1], H. Ayles[1,2]
*[1]Zambart, University of Zambia, Lusaka, Zambia, [2]London School of Hygiene and Tropical Medicine, London, United Kingdom, [3]FHI 360, Durham, United States, [4]Imperial College, London, United Kingdom*
*Presenting author email: comfort@zambart.org.zm*

**Background:** Community-based HIV testing must be expanded if we are to reach the UNAIDS target of 90:90:90 by 2020. However to ensure the accuracy of test results, quality assurance (QA) programmes must be scaled up and monitor all aspects of HIV testing. Zambia had no guidelines for monitoring the quality and accuracy of HIV testing in community settings, and so a comprehensive QA programme was developed within the Zambian HPTN 071 (PopART) sites. This analysis presents details of that programme and the lessons learned so far in its implementation.
**Methods:** A comprehensive QA programme for community HIV provider (CHiP) HIV testing was developed which included: training and supervision of CHiPs in HIV testing; temperature monitoring of test kits; quality control (QC) of test kits; and annual HIV proficiency testing using blinded samples. Standard Operating Procedures (SOPs) were developed to guide HIV counselling and testing, with checklists for monitoring.
**Results:** Training- 412 CHiPs and 19 CHiPs supervisors were trained and certified in finger-prick HIV rapid testing. Quarterly refresher training of HIV testers was conducted.
Supervision- Each CHiP supervisor performed up to 3 accompanied visits per week in order to observe HIV counselling and testing procedures, and ensuring that each CHiP was observed at least 12 times per year.
***Temperature Monitoring***- When temperatures rose above the recommended storage temperature of 27°C for more than 3 consecutive days, QC of test kits at the affected sites was performed. In the 3 (of 8) sites where this occurred during the review period, the pass rate was 100%.
QC- QC was performed on 4,534 HIV test kits with 100% pass-rate (Table 1).

| District (No. communities) | Started performing QC of test kits | Determine (100 tests per kit) | | Unigold (20 tests per kits) | |
|---|---|---|---|---|---|
| | | Tests performed/kits received | Number of lots | Tests performed/kits received | Number of lots |
| Central store | September, 2013 | 228/4555 | 10 | 1163/385 | 13 |
| 1(2 communities) | February, 2014 | 429/398 | 5 | 306/467 | 8 |
| 2(1 community) | January, 2014 | 234/90 | 7 | 227/407 | 7 |
| 3(1 community) | January, 2014 | 281/74 | 8 | 207/140 | 9 |
| 4(2 communities) | January, 2014 | 1215/794 | 10 | 871/1918 | 14 |
| 5(2 communities) | March, 2014 | 247/479 | 7 | 173/539 | 12 |
| Total | | 2634/6377 | | 1900/7888 | |
| QC score - Total tests passed QC for both Determine and Unigold was 4534 tests with 100% pass | | 2634/2634 (100%) | | 1900/1900 (100%) | |

*[Table 1: QC of HIV Testing Kits per District]*

***Proficiency testing***- Internal proficiency testing was passed by 426/442 (96.4%) CHiPs, while external QA by national reference laboratory was passed by 424/439 (96.6%). TheCHiPs who failed HIV proficiency panel testing were retrained and subjected to second test which recorded 100% pass
**Conclusions:** Developing, implementing and sustaining a quality assurance programme for HIV rapid testing under field conditions in resource-limited settings is feasible. Success depends on high-quality materials and training, adherence to SOPs, excellent supervision and communication, and dedicated staff.

## THPEC206

### PRELIMINARY EVALUATION OF A PARENTAL HIV DISCLOSURE INTERVENTION AMONG PARENTS LIVING WITH HIV/AIDS IN CHINA

X. Li[1], S. Qiao[1], Y. Zhou[2], Z. Shen[2]
*[1]University of South Carolina, SC SmartState Center for Healthcare Quality, Columbia, United States, [2]Guangxi CDC, Institute of HIV/AIDS Prevention and Control, Nanning, China*
*Presenting author email: shanqiao@mailbox.sc.edu*

**Background:** Disclosing parents' HIV serostatus to children (parental HIV disclosure) can benefit HIV-infected parents in term of medicine adherence and mental health and also improve children's psychosocial adjustment to parental disease. However, parental HIV disclosure is still a big challenge for parents living with HIV/AIDS (PLH). There is a dearth of evidence-based disclosure interventions to assist PLH in making appropriate disclosure plan and strategies. We have launched a theory-based HIV disclosure project for PLH in China in 2013. The current study aims to report the effectiveness of the intervention based on preliminary evaluation.
**Methods:** A longitudinal randomized controlled trial among 791 PLH with children aged 6-15 years was implemented in Guangxi, China. The intervention for parents included five 2-hour sessions with focuses on positive coping to HIV and self-care, decision-making of disclosure, developing appropriate disclosure plan and strategies, and accessing social support and post-disclosure counseling. The participants were asked to complete an assessment each 6 month. The data come from baseline and two follow-ups with average follow-up rate of 91%. Mixed regression models were used to track the change of disclosure-related variables over time and examine the effect of intervention in the trajectories.
**Results:** Intervention group reported decreasing level of worries about disclosure, increasing level of self-efficacy in planning and conducting disclosure to children, and higher score of developing disclosure strategies, while the control group showed a stable trajectory or mixed trends in the three variables. Controlling for demographic characteristics, the coefficient of intervention group-by-time interaction suggested that rate of decline in worries was faster in intervention group (β=-.179, p< .0001). Similarly, intervention group showed a faster rate of increasing in disclosure-related self-efficacy (β=.111, p=.044) and development of disclosure strategies (β=.122, p=.012). The intervention might also increase the medicine adherence although the coefficient did not reach the statistical significance (β=-.032, p=.071).
**Conclusions:** In near future, we need to examine the impacts of the intervention on parents' mental health and clinical outcomes. However, the positive effect of the intervention on disclosure-related variables and medicine adherence may imply a promising approach for future intervention among PLH.

# MALE CIRCUMCISION

## THPEC207

### THE ROLE OF INTERPERSONAL COMMUNICATION IN VMMC KNOWLEDGE ACQUISITION AND MOBILIZATION

J.J. Lawrence[1], M. Mhazo[2], L. Mulenga[2], E. Anyachebelu[2], T.H. Maringa[1], S. Magwaza[1], A. Bere[1], N. Gupta[1]
*[1]Centers for Disease Control and Prevention, HIV Prevention Branch, Pretoria, South Africa, [2]Society for Family Health South Africa, Pretoria, South Africa*
*Presenting author email: ymq1@cdc.gov*

**Background:** Voluntary Medical Male Circumcision (VMMC) has been identified as a priority by the South African Government in the combination HIV prevention strategy. Demand creation remains a major challenge in achieving the goal of 4.2 million circumcisions by 2017. To maximize impact of demand creation activities, the most effective strategies to mobilize men for circumcision should be identified and prioritized.
**Methods:** From May-July, 2015, VMMC knowledge acquisition and mobilization data were routinely collected from men presenting to the PEPFAR VMMC program. For this analysis we examined only available data from one of five NGO's in five provinces: KwaZulu Natal, Mpumalanga, Gauteng, and Free State. Descriptive statistical analysis was conducted using Microsoft Excel.
**Results:** Among 10,476 overall participants, 69.4% reported hearing about VMMC through NGOs, with 6,267 (59.8%) learning through community-based social mobilizers and an additional 1,008 (9.6%) through other NGO activities. Patients also reported knowledge acquisition of VMMC from a friend (13.6%) or family member (5.6%). Less than 2% reported hearing about VMMC either from TV or radio,. A subset of patients (n=8,252), were asked what motivated them to come in for VMMC on their procedure day. The majority reported externally motivating factors: encouragement by an NGO social mobiliser (47.2%), encouragement by a friend or family member (8.1%), or having the financial means for transport and missed work (6.4%). Fewer patients reported internal motivations: 12.6% reported either "I was ready today" or "I just decided to come," and 25.7% reported various other factors.
**Conclusions:** Our results show that interpersonal communication, particularly through community-based social mobilizers, remains the predominant means by which men learn about and are prompted to seek VMMC and should be prioritized in program planning. Patient communication with family and friends also served as an important motivator, and additional exploration of how this support can be utilized to promote VMMC is needed. Despite ongoing national multimedia VMMC campaigns during this timeframe, these were rarely cited as the predominant motivating factor for men presenting to VMMC clinics. More investigation is warranted to examine the role of media in VMMC patient decision-making, as an additive effect of internal and external factors is likely.

## THPEC208

### FACTORS ASSOCIATED WITH UPTAKE OF EARLY INFANT MALE CIRCUMCISION BY MOTHERS AND FATHERS IN WESTERN KENYA: MTOTO MSAFI MBILI STUDY

R.C. Bailey[1], F. Adera[2], M. Young[3], F. Otieno[4], S. Nordstrom[5], W. Jaoko[6], S. Mehta[1]
*[1]University of Illinois at Chicago, Epidemiology, Chicago, United States, [2]Nyanza Reproductive Health Society, Kisumu, Kenya, [3]Emory University, Obstetrics and Gynecology, Atlanta, United States, [4]Nyanza Reporductive Health Society, Kisumu, Kenya, [5]University of Illinois at Chicago, Obstetrics and Gynecology, Chicago, United States, [6]University of Nairobi, Medical Microbiology, Nairobi, Kenya*
*Presenting author email: rcbailey@uic.edu*

**Background:** As countries in sub-Saharan Africa scale up medical male circumcision (MMC), they are considering long term sustainable strategies, including early infant male circumcision (EIMC). This study tests two models of integrating EIMC with existing maternal child health structures in Kenya.
**Methods:** A standard delivery package (SDP) included training health providers in four health facilities to deliver safe EIMC and all health facility staff to educate, promote and mobilize mothers in antenatal, maternal child health and immunization clinics and surrounding communities. A SDP-PLUS model included all SDP activities in four facilities plus provision of EIMC services in the community by trained domiciliary midwives. A weighted random sample of mothers over age 15 years bringing sons to facilities for OPV-1 were interviewed and, with mother's consent, fathers were contacted and interviewed. Parents whose sons were circumcised and not circumcised were compared on demographic variables, reasons for choosing or declining EIMC, involvement of spouse in the decision, and circumcision status of the father in univariate and multivariate analyses.
**Results:** Among 987 mothers, 255 (26%) had their sons circumcised. There were no differences between mothers who had their sons circumcised and those who did not in age (median=24 yrs), ethnic origin (96% Luo), primary reason for circumcising the baby (HIV/STI prevention) nor HIV status (30% positive). Mothers with post-secondary education (PR=1.5; 95%CI:1.1-2.1), who were unmarried (PR=1.6; 95%CI:1.3-2.0), received prior information about EIMC (PR=10.6;95%CI:3.5-32.6), had a circumcised husband (PR=1.7;95%CI:1.4-2.1), and were in the SDP-PLUS community (PR=1.3;95%CI:1.1-1.6) were more likely to have their son circumcised. In multivariable analyses, unmarried mothers (PR=1.5), those with circumcised husbands (PR=1.3) and those in the SDP-PLUS community (PR=1.3) were significantly (p< 0.01) more likely to have their sons circumcised. Among 634 fathers, after adjustment for age, marital status and education, those who were circumcised (PR=2.3;95%CI:1.8-2.9) and in the SDP-PLUS community (PR=1.3;95%CI:1.1-1.6) were more likely to have their sons circumcised.
**Conclusions:** A community-based versus facility-based education and services model results in greater uptake of EIMC. Acceptance of EIMC is likely to increase as more adult men in a population become circumcised. These results contribute evidence needed as countries transition from adult toward infant circumcision.

## THPEC209

### SEQUENTIAL CROSS-SECTIONAL SURVEYS IN ORANGE FARM, A TOWNSHIP OF SOUTH AFRICA, REVEALED A LOW VOLUNTARY MEDICAL MALE CIRCUMCISION UPTAKE AMONG ADULTS DESPITE MASS CAMPAIGNS AND HIGH ACCEPTABILITY

E. Marshall[1], R. Rain-Taljaard[2], M. Tsepe[2], C. Monkwe[2], F. Hlatswayo[2], D. Xaba[2], T. Molomo[2], M. Thobile[2], S. Tsahabalala[2], S. Khela[2], L. Xulu[2], A. Puren[3], B. Auvert[4]
*[1]INSERM-CESP, Epidemiology, Villejuif, France, [2]Progressus, Johannesburg, South Africa, [3]NICD-WITS, Johannesburg, South Africa, [4]UVSQ-INSERM, Epidemiology, Versailles, France*
*Presenting author email: bertran.auvert@uvsq.fr*

**Background:** WHO recommends a male circumcision (MC) prevalence higher than 80% to have a substantial impact on the HIV-AIDS epidemic in Eastern and Southern Africa. Orange Farm, a township in South Africa, has a voluntary medical male circumcision (VMMC) clinic that since 2008 offers free MC. The MC prevalence in 2008 was around 10%. Ongoing and past VMMC campaigns focused on youth with school talks, and adults at community level. The objectives were to assess among adults aged 18-49 years the change in MC prevalence in the past 5 years, the annual uptake rate of MC, and the characteristics of the uncircumcised men.
**Methods:** Cross-sectional surveys (ANRS-12126-12285) were conducted among random samples of 3182 and 522 adult men in 2010 and 2015 respectively. MC status and characteristics of participants were collected through a genital examination and face-to-face questionnaire. Multivariate Poisson regression allowed comparing circumcised men with uncircumcised men.
**Results:** MC prevalence among young adult men aged 18-19 years increased markedly from 61.2% (95%CI; 57.4% to 65.0%) in 2010 to 87.5% (76.0% to 94.6%) in 2015 (p< 0.001). In the same period, among men aged 18-49 years, MC prevalence varied little (p=0.60) from 55.4% (53.6% to 57.1%) to 56.7% (52.4% to 60.9%).
In 2015, 84.9% (79.2% to 89.5%) of uncircumcised adult men reported that they were willing to be circumcised. However, we estimated that only 4.6% (11/237; 2.5% to 7.9%) of the uncircumcised men became circumcised in 2015. In 2015, in comparison with circumcised men, uncircumcised men were younger, less educated, and more often lived in OF for less than 5 years. Most frequent reported reasons for not being circumcised were that MC was not cultural practice: 27.6% (21.5% to 34.3%) and fear of pain: 18.4% (13.3% to 24.4%).
**Conclusions:** In Orange Farm, VMMC campaigns were successful among the youth and led to a sufficiently high MC prevalence to have a substantial impact in the future on the HIV-AIDS epidemic. However, despite high acceptability and a free VMMC service, VMMC campaigns have failed to increase MC prevalence among adults above 80%. These campaigns should be revisited.

## THPEC210

### IS A HIGH VOLUNTARY MEDICAL MALE CIRCUMCISION UPTAKE OBTAINABLE AMONG ADULTS IN A SHORT TIME? A PROSPECTIVE OBSERVATIONAL INTERVENTION STUDY CONDUCTED IN THE TOWNSHIP OF ORANGE FARM (SOUTH AFRICA)

R. Rain-Taljaard[1], E. Marshall[2], M. Tsepe[1], C. Monkwe[1], F. Hlatswayo[1], D. Taljaard[3], D. Xaba[1], T. Molomo[1], M. Thobile[1], S. Tsahabalala[1], S. Khela[1], L. Xulu[1], A. Puren[4], B. Auvert[5]
*[1]Progressus, Johannesburg, South Africa, [2]INSERM-CESP, Epidemiology, Villejuif, France, [3]CHAPS, Johannesburg, South Africa, [4]NICD-WITS, Johannesburg, South Africa, [5]UVSQ-INSERM, Epidemiology, Versailles, France*
*Presenting author email: bertran.auvert@uvsq.fr*

**Background:** WHO recommends a male circumcision (MC) prevalence higher than 80% to have a substantial impact on the HIV-AIDS epidemic in Eastern and Southern Africa. The objective of the study was to assess whether a novel intervention can lead to a high voluntary male medical circumcision (VMMC) uptake among adults in a short time.
**Methods:** This prospective observational intervention study was conducted in the township of Orange Farm (South Africa). In this semi-urban area MC prevalence among adults aged 18-49 years was stable between 2010 and 2015 at 55%-57%, despite regular VMMC campaigns at community level, and the presence of a VMMC clinic that offered free VMMC.
The intervention took place in a random sample of 983 households where 512 men aged 18-49 years were identified. Among the 226 uncircumcised men, 212 accepted to be enrolled in the intervention study. At household level the intervention consisted of a discussion with the members. A personal MC adviser trained on interpersonal communication skills was assigned to each uncircumcised participant. The MC advisers were trained to explain the risks and benefits of VMMC and to discuss 24 possible reasons given by men for not being circumcised. Participants where followed up for 9 weeks. Each participant had a maximum of 3 motivational talks at home. Participants who decided to be circumcised received time compensation in cash equivalent to 2.5 days of work at the minimum South African salary rate.
**Results:** Among the 212 uncircumcised men, 69.3% (147/212; 95%CI; 62.9% to 75.3%) agreed to be circumcised, which corresponds to the uptake. The MC prevalence of the sample increased from 56.9% (296/522) to 84.9% (443/522; 81.6% to 87.7%), p< 0.001. The reported reasons for accepting circumcision were motivational talks with the MC adviser (83.0%), and time compensation (40.0%).
**Conclusions:** High VMMC uptake can be obtained in a short time among male adults but requires an intense intervention centred on uncircumcised men at an individual level and time compensation. The effect of this novel intervention should now be tested elsewhere.

## THPEC211

### GETTING MEN INTO 90-90-90: THE POTENTIAL ROLE OF MEDICAL MALE CIRCUMCISION SERVICES IN KWAZULU NATAL, SOUTH AFRICA

C.M. Searle, A. Ramkissoon
*Maternal, Adolescent & Child Health Systems (MatCH), School of Public Health, University of Witwatersrand, Durban, South Africa*
*Presenting author email: csearle@match.org.za*

**Background:** Meeting the UNAIDS targets for 90:90:90 will require strategies to reach more men with HIV counselling and testing and ART services. In South Africa men have lower rates of HIV testing, more men are unaware of their HIV positive status than women (62% versus 45%) (Shisana, Rehle et al; 2014) and men tend to access HIV services in the public sector later and with poorer health outcomes (Ramkissoon et al,2011). Medical male circumcision (MMC) services have the potential to provide an entry point to HIV care for males.
**Description:** Routine data on 68,627 men accessing MMC services during October 2012-September 2015 in 4 districts in KwaZulu-Natal was reviewed to determine uptake of HIV testing, men newly diagnosed as HIV positive, geographic location and acceptability of services.
**Lessons learned:** Of the 68,627 men accessing services, 64,900 (95%) were either tested on site (70%) or had been tested within the last 3 months (25%). Only 5% of males refused the voluntary HIV test. 4% were newly diagnosed as HIV positive. Most (97%; n=66,299) of those accessing services underwent MMC procedures, 91% of whom were HIV negative, 4% HIV positive and 5% did not know their status. 80% of males accessing MMC services were 10-24 years. 94.1% received services at a public sector hospital/clinic, 5.5% at a general practitioner and 0.4% in a correctional service. Prevalence rates were highest among prison populations (38.5%) and in informal settlements (7.88%).
**Conclusions/Next steps:** Men are willing to attend free MMC services in the public sector or at general practitioners and the majority consented to HIV screening services as part of this package. This is an opportunity to screen males for TB, STI and refer men for CD4 tests and ART. MMC services provide a feasible and acceptable way of getting males into HIV services and should be scaled up.

## THPEC212

### DESCRIBING THE ROLE OF WOMEN IN PROMOTING MEDICAL MALE CIRCUMCISION TO ADULT MEN IN A PERI-URBAN CLINIC OF SOUTH AFRICA: FINDINGS FROM THE IMBIZO STUDY

C.M. Chetty-Makkan[1], J. Grund[2], R. Munyai[1], V. Gadla[1], R. Ramatsa[1], S. Shezi[1], S. Charalambous[1]
*[1]Aurum Institute, Research, Gauteng, South Africa, [2]Centers for Disease Control and Prevention, Atlanta, United States*
*Presenting author email: cchetty@auruminstitute.org*

**Background:** HIV prevalence is high (20.9%) in South Africa among men aged 25-49 years. Medical male circumcision (MMC) reduces the risk of HIV infection in men from heterosexual sex. Few studies have assessed women's role in promoting MMC. Baseline qualitative data are summarised from a study conducted in a peri-urban setting in Ekurhuleni North, South Africa from April - September 2014 that aimed to increase MMC uptake among older men.
**Methods:** Adult men (25-49 years) and women (≥18 years) were interviewed in English, Sepedi or Zulu. Interviews were digitally-recorded, transcribed, and translated. Through a standard iterative process, a codebook was developed for each sex and used to thematically code the interviews using MAXQDA 10 (males) and QSR NVIVO 10 (females). Inductive thematic analysis was used. Descriptive statistics were calculated.
**Results:** A total of 35 men and 30 women were interviewed. Men described women as better communicators than men and better equipped to discuss MMC. Some men felt that it is helpful for female sexual partners to recommend MMC for shy men, and most agreed that men would be more likely to pursue MMC if women introduced it. A minority of men felt that women promoting MMC means that the

man is weak and an embarrassment. Women felt that they should use indirect methods of introducing the topic of MMC with their partner, which could include mentioning a magazine article, newspaper report, pamphlet, or media advert while talking to him in a respectful and calm manner. Women emphasized being patient and the use of different opportunities to direct his attention to available MMC information. Some women were also concerned that discussing the topic of MMC with their partners might make them suspicious about their fidelity. Women also perceived educated females as being less constrained when talking about MMC to their partners when compared to those who followed exclusive traditional roles.
**Conclusions:** Innovative approaches to demand creation to increase MMC uptake among men aged 25-49 years are especially important given the high HIV prevalence and low MMC uptake in this age group. Men and women are largely supportive of women promoting MMC.

## THPEC213

### ARE MEN AT HIGH-RISK LIKELY TO ACCEPT VOLUNTARY MEDICAL MALE CIRCUMCISION (VMMC)? A COMPARISON OF VMMC CLIENTS AND DEMOGRAPHIC AND HEALTH SURVEY (DHS) PARTICIPANTS IN TANZANIA

M.C. Wambura[1], H. Mahler[2], N. Larke[3], J.M. Grund[4], R. Hayes[3], J. Changalucha[1], H.A. Weiss[3], Tanzania Male Circumcision Group
*[1]NIMR, Mwanza, Tanzania, United Republic of, [2]Jhpiego Tanzania, Dar es Salaam, Tanzania, United Republic of, [3]London School of Hygiene and Tropical Medicine, London, United Kingdom, [4]Centers for Disease Control and Prevention, Division of Global HIV/AIDS, Atlanta, United States*
*Presenting author email: wmwita@yahoo.com*

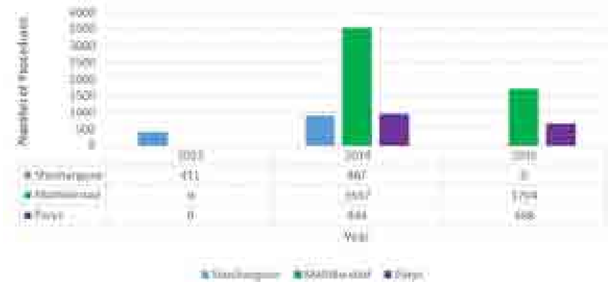
**Background:** We conducted a cluster randomised trial to evaluate an intervention to increase VMMC uptake among men aged 20-34 years in Tabora and Njombe regions, Tanzania. Findings showed that the intervention increased the uptake of VMMC in men for all age groups in the 10 intervention clusters compared to the 10 control clusters. The aim of this sub-study was to compare the behaviour risk profile of a sample of the VMMC clients to that of uncircumcised men in the general population in Tanzania.
**Methods:** Approximately 20% of the VMMC clients aged 20-34 years participating in the study were randomly selected to complete an interviewer-administered questionnaire which addressed risk behaviour, user costs, and decision-making around VMMC. The behaviour parameters were compared with similar parameters collected in the last DHS survey (2010) from uncircumcised men in the 12 VMMC priority regions in Tanzania.
**Results:** A total of 331 men aged 20-34 years participated in the sexual behaviour survey, and 195 in the 2010 DHS. VMMC clients were younger than the DHS participants, and after adjusting for age, they were more likely to report two or more sexual partners (adjusted OR=2·73, 95%CI 1.85-4.02;
p< 0.001), and to report unprotected sex with non-marital and non-cohabiting partners in the past 12 months (adjusted OR=1·81, 95%CI 1·12-2·93; p=0·003). The mean age at first intercourse was 17.7 years in the behavioural survey participants and 16.7 years among DHS participants (age adjusted test of significance p< 0.001).
**Conclusions:** Men who accepted VMMC reported more risky sexual behaviour compared to men in the general population. These findings suggest that VMMC is reaching men at a relatively high risk of HIV, and increasing uptake of VMMC through demand creation activities in adult men will continue to reduce HIV acquisition and transmission.

## THPEC214

### EFFECTIVENESS OF MOBILE CLINICS OFFERING VMMC IN MARGINALISED COMMUNITIES AS AN HIV PREVENTION INTERVENTION

S. Abdulla[1], S. Frade[1], R. Ndhlovu[2], D. Rech[3], D. Taljaard[1]
*[1]Centre for HIV and AIDS Prevention Studies, Johannesburg, South Africa, [2]Innovo Mobile Healthcare, Johannesburg, South Africa, [3]The Centre for HIV and AIDS Prevention Studies, Johannesburg, South Africa*
*Presenting author email: saira@chaps.org.za*

**Background:** Evidence shows that a large number of males would have to undergo VMMC in order to have a population level impact on HIV prevalence in South Africa. The challenge lies in increasing VMMC uptake in South Africa, especially in marginalised communities with limited healthcare facilities. Mobile clinics offering free VMMC services aim to increase uptake in hard-to-reach areas.
**Description:** The mobile clinic is a basic medical clinic inside a container van that travels directly to the community and remains static for a limited period of time, before moving to another area. The mobile clinic site was first located in Shoshanguve, Gauteng (October 2013-March 2014). After identifying areas where there was little to no VMMC coverage, the team moved to Mathibestad, Northwest Province (April 2014), and Parys, Free State, (July 2014). In Mathibestad, the mobile clinic is situated next to a public clinic.
**Lessons learned:** From 2013 to present, the mobile clinics program cumulatively circumcised 8151 males (see figure). The advantage of the mobile clinic is its mobility to move to and within communities. However, the mobile clinic remains static in the community as a result of the large size of the mobile clinic. This requires the outreach team to travel within the community and recruit clients, as well as offer transportation to bring clients to the mobile clinic site.



*[VMMC Procedures Performed Using Mobile Clinics]*

**Conclusions/Next steps:** Although mobile clinics have contributed to VMMC uptake, the effectiveness of the mobile clinics would increase by using smaller mobile clinics that can move within the area, compared to large mobile clinics that remain static and therefore require transportation for clients. The relationship between the public healthcare facilities and mobile clinics is critical in ensuring that clients feel safe knowing that the public clinic is associated with the mobile clinic; as well as for referrals to the mobile clinic.

## THPEC215

### DOES MALE CIRCUMCISION INDIRECTLY REDUCE FEMALE HIV RISK? EVIDENCE FROM FOUR DEMOGRAPHIC AND HEALTH SURVEYS

A. Fox[1,2], A.A. Nocon[3]
*[1]The State University, New York City, United States, [2]Ichan School of Medicine, New York City, United States, [3]Ichan School of Medicine at Mt. Sinai, Clinical Research, New York, United States*

**Background:** Although the World Health Organization now recommends routine male circumcision to reduce risk of HIV infection, studies of whether male circumcision (MC) reduces HIV transmission to their female partners indicate no additional protective effect. However, women are theorized to indirectly benefit from increased rates of MC as rates of transmission will be lower overall. To date, there has been limited research directed at exploring the influence of MC on the women's HIV risk, and there are currently are no estimates that account for the indirect protective effect of MC for women. This study examines the potential benefit of MC for women accounting for individual and population level risk factors using couples data from Demographic and Health Survey (DHS) collected between 2003-2010.
**Methods:** This study assessed HIV risk among women from a sample of 11,621 couples from Kenya (2003, 2008), Lesotho (2004, 2009), Malawi (2004, 2010), and Zimbabwe (2006, 2010). We examined the relationship between a woman's HIV status, her partner's circumcision status and regional rates of male circumcision using multivariate regression models. We then adjusted all models for male and female sexual behaviors (multiple partners) and demographic characteristics (age, wealth, and education).
**Results:** Neither regional rates of male circumcision nor their partner's circumcision status were associated with lower odds of HIV infection in women once individual's sexual behaviors and demographic characteristics were accounted for. Having multiple partners was associated with higher odds of HIV infection in women [OR=2.32, p< 0.01] as was having an older male partner [OR=1.03, p< 0.01]. Women whose male partners had other partners also had a higher odds of HIV [OR=1.43, p< 0.01].
**Conclusions:** After adjustment, we found no association between MC and female HIV risk either directly or indirectly though having multiple partners was strongly associated with increased odds of HIV risk. These results suggest that programs aimed at expanding MC may need to be pay additional attention to how the benefits of MC may be offset by the presence of multiple partnerships.

### PATTERNS AND PREDICTORS OF ADVERSE EVENTS OVER SIX YEARS OF THE VMMC PROGRAM IN TANZANIA

A. Hellar[1], H. Mandali[1], D. Boyee[1], A. Christensen[1], K. Curran[2], J. Reed[3], M. Machaku[1], E. Mlanga[4], E. Njeuhmeli[5], V. Kiggundu[5], G. Lija[6]
*[1]Jhpiego, VMMC, Dar es Salaam, Tanzania, United Republic of, [2]Jhpiego, HIV, Washington DC, United States, [3]Jhpiego, AIDSFree, Washington DC, United States, [4]USAID, Dar es Salaam, Tanzania, United Republic of, [5]USAID, Washington DC, United States, [6]Ministry of Health and Social Welfare, Natinal AIDS Control Program, Dar es Salaam, Tanzania, United Republic of*
*Presenting author email: augustino.hellar@jhpiego.org*

**Background:** Modeling shows that scaling-up voluntary medical male circumcision (VMMC) services in sub-Saharan Africa to reach 20 million men will avert 3.4 million HIV infections by 2025. As countries scale up VMMC services, patterns and predictors of Adverse Events (AEs) remain unclear. Factors associated with AEs during six years of program implementation in Iringa, Njombe and Tabora, Tanzania are described.
**Methods:** A retrospective review of moderate/severe AEs was conducted using client-level data to analyze age of clients, types/severity of AEs, service modalities and surgical techniques. Chi-square test was used for statistical significance and mhodds test to adjust for age. Mild AEs were excluded.
**Results:** A total of 497,871 clients were circumcised from 2009-2015. There were 274/497,871 (0.06%) clients with intra-operative AE(s); out of 365,957 clients who returned for at least one visit, 1182 (0.33%) were reported to have post-operative AE(s). Across all age groups, the most common intraoperative AEs was excessive bleeding; among clients 10-14 years, the most common was glans injury (18/30=67%). All clients with glans injuries had been circumcised using the forceps-guided (FG) method. Across all age groups, the most common postoperative AEs were infections (58%), hematomas (21%) and excessive bleeding (11%).
AE rates were higher during campaigns (1,192/368,590=0.33%) compared to routine services (139/48,799=0.29%) (p < 0.001). AEs were highest in 15-29 year old clients (193/218,272=0.09% for intra AE; 686/152,950=0.45% for post AE and lower in older and younger age groups (p< 0.001). AE rates were higher amongst clients who were circumcised using the FG technique (271/437,927=0.06% for intra AE; 1,115/316,960 = 0.36% for post AE) compared to dorsal slit (DS) (3/58,364= 0.01% for intra AE; 66/48,232=0.14% for post AE. (p< 0.001). Clients were less likely to have an AE when circumcised with DS compared to FG, even after adjusting for age (AOR = 0.50 p value< 0.001).
**Conclusions:** Although overall AE rates were low, higher rates during the campaigns need to be addressed. Higher rate of glans injuries among 10-14 year-olds when using the FG method, coupled with lower intraoperative AE rate for DS compared to FG underscores the need to adhere to PEPFAR policy guidelines on age appropriate-methods for VMMC.

## THPEC217

### SAFETY OF EARLY INFANT MALE CIRCUMCISION IS IN PILOT SETTING IN RURAL TANZANIA

A. Hellar[1], A. Christensen[1], K. Curran[2], D. Boyee[1], K. Ngonyani[1], H. Mziray[1], T. Ashengo Adamu[2], V. Kiggundu[3], E. Njeuhmeli[3], E. Mlanga[4], G. Lija[5]
*[1]Jhpiego, VMMC, Dar es Salaam, Tanzania, United Republic of, [2]Jhpiego, HIV, Washington DC, United States, [3]USAID, Washington DC, United States, [4]USAID, Dar es Salaam, Tanzania, United Republic of, [5]Ministry of Health and Social Welfare, Natinal AIDS Control Program, Dar es Salaam, Tanzania, United Republic of*
*Presenting author email: augustino.hellar@jhpiego.org*

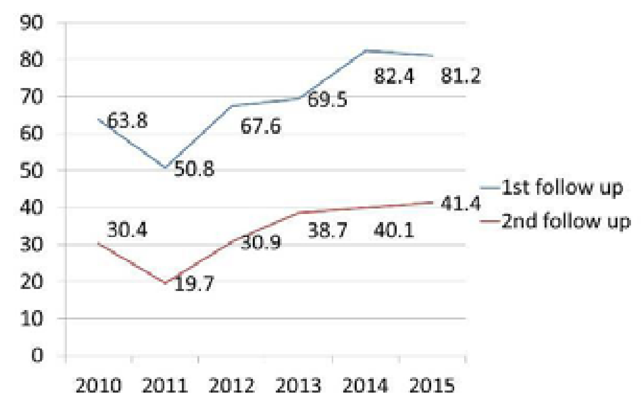
**Background:** Voluntary Medical Male Circumcision (VMMC) reduces female to male HIV transmission by at least 60%. Although adult VMMC has been widely scaled up in most priority VMMC countries, Early Infant Male Circumcision (EIMC) has enjoyed little progress in just a few isolated places. Yet EIMC is easier and quicker to perform, the circumcision site heals faster, and it is more cost efficient compared to VMMC. In 2013, the Tanzanian Ministry of Health introduced EIMC as a pilot in Iringa Region, performed primarily by nurses, on the back of a well-established VMMC program. The safety of EIMC in this region is described.
**Methods:** We conducted a secondary review of the EIMC client level database from 2013-2015. Data were summarized in tables and appropriate frequencies calculated. Wilcoxon Rank Sum test was used to compare the mean age and body weight between infants with AEs and those without AEs, because the adverse event group had a very small sample size.
**Results:** A total of 3,308 infants were circumcised using the Mogen clamp between 2013 and 2015.3,123 (94%) clients returned for first follow-up. The intraoperative AE rate was 0.27% (9/3308) and post-operative AE rate 0.03% (1/3,213). Majority of the AEs were mild (6) or moderate (3) with only 1 severe AE. Intraoperative AEs reported included bleeding and excessive skin removal while the postoperative AE was insufficient skin removal. The severe AE was due to excessive skin removal which required surgical intervention by stitching.
There was no difference in intraoperative AE occurrence by age of the infant (p=0.982) or body weight at circumcision (p=0.613).
**Conclusions:** The AE rate in the EIMC pilot program in Iringa, Tanzania was low and similar to other programs in the region. Majority of the AEs occurred in the intra-operative period, contrary to the VMMC program where most AE are post-operative. Emphasis on the surgical skills may reduce the intraoperative AEs. EIMC scale-up is safe in rural resource-limited settings where nurses have taken the lead to provide this important and sustainable HIV prevention intervention.

## THPEC218

### FOLLOW-UP RATE TRENDS IN A FULLY SCALED VMMC PROGRAM IN TANZANIA

H. Mandali[1], A. Hellar[1], A. Christensen[1], H. Mahler[2], K. Curran[3], J. Reed[3], E. Mlanga[4], V. Kiggundu[5], E. Njeuhmeli[5], J. Lija[6]
*[1]Jhpiego, AIDSFree, Dar es Salaam, Tanzania, United Republic of, [2]Jhpiego, HIV, Dar es Salaam, Tanzania, United Republic of, [3]Jhpiego, HIV, Washington DC, United States, [4]USAID, HIV, Dar es Salaam, Tanzania, United Republic of, [5]USAID, HIV, Washington DC, United States, [6]MOHSW, NACP, Dar es Salaam, Tanzania, United Republic of*
*Presenting author email: hamid.mandali@jhpiego.org*

**Background:** Tanzania is scaling up VMMC in 12 priority regions. USAID, through the AIDSFree project supports VMMC in three regions of Iringa, Njombe and Tabora. Approximately 500,000 VMMCs have been conducted in these regions to-date. WHO recommends clients return at 48-hours and 7-day post-circumcision to assess healing and reinforce HIV prevention messages including abstinence during healing. Ensuring high follow-up rates is challenging in rural settings. Various interventions were introduced to improve return visits. The analysis reviews follow-up rates in five years of program implementation.
**Methods:** De-identified data from the VMMC client-level database was reviewed from September 2009- September 2015. Analysis was performed on the follow-ups by year, age of clients and service modality. 48-hour and 7-day follow-up rates were calculated and statistical tests performed as appropriate.
**Results:** 497,259 clients received VMMC services from 2009-2015. Of these, 365,957 (73.5%) returned for the 48-hour visit and 170,268 (34.2%) for the 7-day visit.
For both visits, follow-up rates were slightly higher for 10-14 years olds (76.3% for 48hrs visit and 36.6% for 7-day visit) and lower amongst 15-19 year olds (68.8% and 30.8% respectively). The follow-up rates increased gradually with age in the age group >20 years (73.8% and 33.4% respectively) (p < 0.001). Follow-up rates were significantly higher during mobile services followed by campaigns and lowest in routine services (p < 0.001). There was a significant increase in the follow-up rates over the six-year program (figure 1).
**Conclusions:** Follow-up rates improved gradually over the six-year period. This improvement may be related to the mix of strategies deployed to improve follow up rates including: client education through a post-operative brochure, sending SMS reminders, special training to providers and data clerks on follow-up/AEs and use of data dashboards to improve services at site level. Cumulatively, these innovations may have improved the follow-up rates over time.



*[Figure 1. Follow up trend among VMMC clients in Tanzania 2010-2015]*

## THPEC219

### ADVERSE EVENTS FOLLOWING CIRCUMCISION WITH THE PREPEX DEVICE IN TANZANIA

H. Mandali[1], A. Hellar[1], A. Christensen[1], S. Koshuma[2], R. Scherer[3], S. Ehrhardt[3], K. Curran[4], T. Adamu[4], E. Mlanga[5], V. Kiggundu[6], E. Njeuhmeli[6]
*[1]Jhpiego, AIDSFree, Dar es Salaam, Tanzania, United Republic of, [2]MOHSW, Iringa Regional Hospital, Iringa, Tanzania, United Republic of, [3]JHU, HIV, Baltimore, United States, [4]Jhpiego, HIV, Washington DC, United States, [5]USAID, HIV, Dar es Salaam, Tanzania, United Republic of, [6]USAID, HIV, Washington DC, United States*
*Presenting author email: hamid.mandali@jhpiego.org*

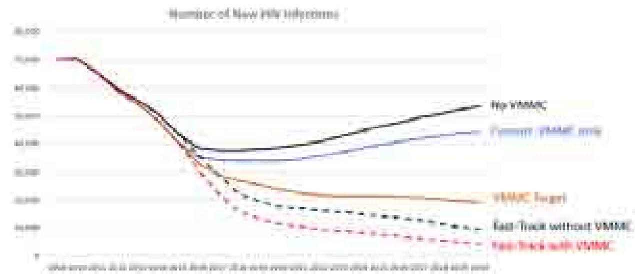
**Background:** The Voluntary Medical Male Circumcision (VMMC) program in Tanzania started in 2009, and is being implemented in 12 priority regions, with a goal of circumcising 2.1million adolescents and men by 2017. Up to December 2013 more than 780,000 VMMCs had been conducted with support from PEPFAR. Achieving this target needs innovative ways such as introduction of circumcision devices to accelerate scale up. Jhpiego, supported by USAID, therefore implemented the first safety and acceptability study for the PrePexTM device in the country. Safety of the procedure will take precedence as the new method is being introduced.
**Methods:** A single-arm, open-label, prospective, cohort study was conducted from June-October 2014 across 9 sites in three regions of Iringa, Njombe and Tabora, Tanzania. The study received IRB approval from JHU and the local IRB authority. Clients were aged 18-49 and fulfilled all study inclusion criteria. Analysis on adverse events was performed and adverse event (AE) rates calculated using clients returning for follow-up as a denominator. Mild adverse events were excluded from this analysis.
**Results:** 869 clients were eligible for circumcision using the PrePex device during the study period. Of these, placement was successful in 862 clients. All clients returned for follow-up (100% return rate). There were a total of 22 moderate and severe adverse events reported (AE rate 2.5% %). Of these, 13 (59%) were moderate and 9 (41%) severe. Ten commonest adverse events (in descending order of frequency) related to device circumcision included: pain, hematoma, swelling, early removal, bleeding, infection, difficulty removal, delayed healing, device displacement and wound dehiscence. Most AEs (61.5%) occurred with the device in situ followed by 32.1% during removal, 3.9% during follow-up and 2.5% during placement.
**Conclusions:** The AE rate in this study was low and similar to other safety and acceptability studies in sub -Saharan Africa. Pain was found to be the commonest adverse event highlighting the need to explore pain management alternatives. Clients need to be appropriately and adequately educated on signs and symptoms of common AEs after placement of the device since majority of AEs occur while the client is wearing the device.

## THPEC220

### EVALUATING THE IMPACT OF THE VOLUNTARY MEDICAL MALE CIRCUMCISION (VMMC) PROGRAM IN ZIMBABWE

J. Stover[1], S. Xaba[2], N. Gertrude[2], M. Mahangara[2], M. Ngwenya[2], D. Klein[3], T. Hallett[4], E. Korenromp[5], L. Abu Raddad[6], A. Akullian[3], A. Bershteyn[3], S. Awad[6]
*[1]Avenir Health, Center for Modeling and Analysis, Glastonbury, United States, [2]Ministry of Health and Child Welfare, VMMC, Harare, Zimbabwe, [3]Institute for Disease Modeling, HIV, Seattle, United States, [4]Imperial College London, Modeling, London, United Kingdom, [5]Avenir Health, Center for Modeling and Analysis, Geneva, Switzerland, [6]Weill Cornell Medical College, Modeling, Qatar, Qatar*
*Presenting author email: jstover@avenirhealth.org*

**Background:** Zimbabwe adopted VMMC as a priority prevention strategy in 2007 and began service delivery in 2009 with a target of circumcising 1.3 million men by 2017. The program reached over 500,000 men through mid-2015; 42% under the age of 15. The purpose of this activity is to evaluate the cost and impact of the program achievements to date using multiple mathematical models.
**Methods:** We collected statistics on the number of VMMC performed through a review of client intake forms and site registers and conducted on-site verification and Internal Quality Audits. Four modeling groups (Avenir Health, Imperial College London, Institute for Disease Modeling, Weill Cornell Medical College) independently initialized mathematical simulation models that replicated historical trends in HIV infection. We compared actual trends in new infections with those that would have occurred if the VMMC program had not existed. A modeling workshop reviewed model results and reached a consensus on the most likely impact of the program.
**Results:** Results indicate that 4,000 - 8,000 infections have already been averted by the VMMCs conducted to date. The longer term impact will be much greater as these men will be protected throughout their sexually active lives. The contribution of already performed VMMCs will amount to 73,000-75,000 infections averted through 2030. If the VMMC target is reached by 2017 then the program will avert 240,000 - 310,000 new infections through 2030 -- 30% of all new infections -- at a cost of $500 - $1300 per infection averted. Total savings by 2025 will be $110-$250 million.
**Conclusions:** The VMMC program in Zimbabwe will have a substantial impact in the coming years. The cost per infection averted is low compared to the costs of treatment. Using multiple models and a stakeholders' workshop led to strong evidence for action being generated.



*[Number of new infections by scenario]*

## THPEC221

### SUTURELESS ADULT VOLUNTARY MALE CIRCUMCISION WITH TOPICAL ANAESTHETIC: A RANDOMIZED FIELD TRIAL OF UNICIRC, A SINGLE-USE SURGICAL INSTRUMENT

J.T. Shenje
*University of Cape Town, SATVI, Worcester, South Africa*

**Background:** The World Health Organization has recommended voluntary medical male circumcision (VMMC) as an essential component of HIV prevention in countries with high a HIV burden. Current VMMC methods are relatively expensive and have limitations when it comes to scaling up at a national level, this has led a number of promising new VMMC methods. One such method is the Unicirc method, a closed procedure which uses a disposable surgical instrument which can used with a topical anaesthetic and cyanoacrylate tissue adhesive.
**Methods:** The study was a non-blinded randomized controlled field trial with 2:1 allocation ratio comparing open surgical circumcision under local anesthetic with suturing versus Unicirc disposable instrument under topical anesthetic and wound sealing with cyanoacrylate tissue adhesive. Seventy five men seeking VMMC were recruited by posters and word of mouth from three clinics associated with Andrew Saffy Memorial hospital, serving the Lonmin group of platinum mines, situated in Rustenberg, North West Province, South Africa, from July 15 and August 7, 2015. The primary outcome was intraoperative time, while the secondary outcomes were intra-operative pain, post-operative pain, incidence of adverse events, proportion of wounds that had healed at four weeks, patient satisfaction and cosmetic result.
**Results:** The intra-operative time and blood loss were less with the Unicirc method, median duration 12 versus 25 min ($p<0.001$) and median blood loss 1.5 versus 40 ml ($p<0.001$). The Unicirc method had a greater proportion of participants with a healed wound at four weeks when compared to the open surgical method 90.7% versus 69.6% (p value 0.04) and cosmetic results were superior in the Unicirc group, while the incidence of adverse events and patient satisfaction were similar in both groups.
**Conclusions:** VMMC with Unicirc under topical anaesthetic and wound sealing with cyanoacrylate tissue adhesive is rapid, had less blood loss, more rapid healing, superior cosmetic results, and was potentially safer than the open surgical VMMC.

## THPEC222

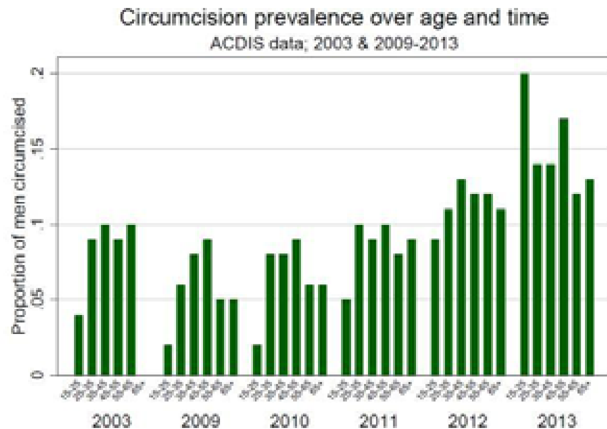
### PREDICTORS OF CIRCUMCISION UPTAKE FOR A HIGH HIV PREVALENCE POPULATION IN KWAZULU-NATAL, SOUTH AFRICA

K. Ortblad[1], J.A. Salomon[1], S. Masters[2], C. Oldenburg[1], T. Barnighausen[1,3]
*[1]Harvard T.H. Chan School of Public Health, Global Health and Population, Boston, United States, [2]UNC Gillings School of Global Public Health, Chapel Hill, United States, [3]Africa Centre for Population Health, Mtubatuba, South Africa*
*Presenting author email: katrina.ortblad@mail.harvard.edu*

**Background:** Voluntary medical male circumcision (VMMC) reduces HIV transmission and has been encouraged in a number of high HIV prevalence countries, but uptake among males remains low. In KwaZulu-Natal, South Africa HIV prevalence is around 30% and circumcision among males is uncommon. Understanding predictors of circumcision uptake in this region is important for the promotion of public health campaigns for men at risk of HIV acquisition.
**Methods:** A population-based cohort in KwaZulu-Natal, South Africa was followed longitudinally from 2003 to 2013. Self-reported circumcision status was collected for all individuals in 2003 and annually from 2009-2013. An individual was assumed to be newly circumcised if their status switched from uncircumcised to circumcised

across survey years. A multivariable logistic regression model including demographic and geographic variables was used to assess predictors of circumcision uptake.

**Results:** 16,892 unique men reported their circumcision status (median age 22 years, IQR: 18-37 years). From 2003 to 2013 circumcision prevalence rose from 5.8% to 17.4% for all males, with the greatest gains in the 15-24 year age group (4.0% to 20.0%). Men in all ten-year age groups 25-34 and above had reduced odds of circumcision uptake compared to the reference age group of 15-24 years. Men in higher asset index quintiles had greater odds of circumcision uptake, and this increased proportionally by each increase in asset index quintile compared to the most deprived. The odds of circumcision uptake decreased with each kilometer from the nearest health facility by 0.89 (95% CI: 0.86 - 0.92).



*[Figure 1. Circumcision prevalence among males in KwaZulu-Natal, South Africa in 2003 and from 2009-2013, by 10-year age groups]*

**Conclusions:** In the past 10 years, circumcision prevalence has increased dramatically in this high HIV prevalence population. While circumcision has increased, this analysis shows that circumcision uptake has been concentrated in certain populations, primarily young men and men of higher SES. Innovate interventions are needed to reach those men still yet to get circumcised.

## THPEC223

### FACTORS THAT MAY EXPLAIN POST-OP WOUND INFECTIONS AMONG ADOLESCENT VOLUNTARY MEDICAL MALE CIRCUMCISION (VMMC) CLIENTS: QUALITATIVE FINDINGS FROM ZIMBABWE

K. Hatzold[1], W. Mavhu[2], M. Kaufman[3], K. Dam[3], L. Van Lith[3], M. Mapingure[1], G. Ncube[4], K. Seifert-Ahanda[5], A. Marcell[3], E. Njeuhmeli[5], A. Tobian[3]
*[1]Population Services International, Harare, Zimbabwe, [2]CESSHAR Zimbabwe, Harare, Zimbabwe, [3]Johns Hopkins University, Baltimore, United States, [4]Ministry of Health and Child Care Zimbabwe, Harare, Zimbabwe, [5]USAID, Washington DC, United States*
*Presenting author email: khatzold@psi.org*

**Background:** Greater than 10 million males have been circumcised through voluntary medical male circumcision (VMMC) programs in sub-Saharan African countries. Although adverse events (AE) have remained low, WHO has reported an increase in severe infection-related AEs and has emphasized the need to mitigate post-VMMC infection risk, including proper wound management by clients. This study explored reasons that hinder adolescents' proper wound management in order to inform risk-reduction strategies.

**Methods:** Between August and September 2015, 20 in-depth interviews were conducted with VMMC adolescent clients (10-19 years) 6-8 weeks post-procedure. Eight focus group discussions (FGDs) were also held with male (n=4 FGDs) and female (n=4 FGDs) parents/caregivers. Discussions explored adolescents' wound care practices and reasons for non-adherence to wound care instructions. Audio recordings were transcribed, translated into English, and thematically coded.

**Results:** Data suggested that although wound care instructions were adequately articulated and comprehended during counseling, younger adolescents (10-14) failed to recall these instructions. Parents/guardians described having to phone or visit VMMC sites to obtain proper instructions. Adolescents reported misrepresenting instructions to parents/guardians in a bid to avert possible pain from having to dip the wound in saline water for recommended periods. Parents/guardians (mostly female) were often deceived by their sons who pretended to have undertaken proper wound care and only found out when an infection had occurred. Some adolescents reported disregarding clinicians' instructions and adopting their own/peer-recommended instructions such as using methylated spirit and other substances to "quicken" wound healing. Conversely, adolescents reported parents/guardians disregarding clinicians' wound care instructions and recommending, for example, larger salt quantities based on their past experiences of caring for non-MC wounds. Both parents and adolescents reported unsafe practices such as boys displaying/touching their fresh surgical wounds with the intention to prove to others that they had been circumcised.

**Conclusions:** This study identified possible explanations for the rising numbers of infections in adolescents. Involving parents/guardians during some of the counseling for younger adolescents and creating age-appropriate materials on wound care will likely be important factors in curbing these infections. Minimizing VMMC-related AEs, including post-operative ones, is important to ensure the overall acceptability and sustainability of the intervention.

## THPEC224

### DEVICES, AN ALTERNATIVE FOR SURGICAL MALE CIRCUMCISION WITH ADOLESCENTS AGES 13-17 YEARS IN ZIMBABWE?

K. Hatzold[1], W. Mavhu[2], E. Dhodho[1], R. Dhlamini[1], K. Chatora[1], O. Chatsama[1], S. Xaba[3], G. Ncube[3], O. Mugurungi[3], F. Cowan[2]
*[1]Population Services International, Harare, Zimbabwe, [2]CESSHAR, Harare, Zimbabwe, [3]Ministry of Health and Child Care, Harare, Zimbabwe*
*Presenting author email: khatzold@psi.org*

**Background:** The safety and efficacy of the PrePex™ device for voluntary medical male circumcision (VMMC) has been demonstrated in studies in sub-Saharan Africa, leading to the conditional prequalification of the device for use in adults. WHO has recommended that use of the device could extend to eligible 13-17 year-olds, but only under active surveillance. We present preliminary findings from active surveillance of the device among adolescents in Zimbabwe.

**Methods:** Between October 2015 and January 2016, PrePex circumcisions were conducted at three VMMC clinics. Adolescents circumcised using PrePex during routine service delivery were actively followed up. Outcome measures for the active surveillance included percentage of i) adolescent men seeking VMMC who chose PrePex over the surgical procedure, ii) PrePex clients failing to return to the clinic for scheduled visits on days 7, 14 and 49, iii) PrePex clients returning to the clinic for each scheduled visit after receiving reminders and iv) adverse events (AEs).

**Results:** A total of 562 men (ages 13-17) were circumcised across the three active surveillance sites. Of these, 256 (45.5%) opted for PrePex but only 168 were eligible. The 88/256 (34.4%) that were ineligible were surgically circumcised. Reasons for ineligibility included: adhesions/tight foreskin/frenulum (n=58, 65.9%), mostly in 13 (n=40/58, 69%) and 14 year olds (n=10/58, 17.2%); presence of sexually transmitted infections (n=2, 2.3%); urinary tract infection (n=1, 1.1%). In 27 adolescents (30.7%), the available PrePex device sizes were too large mostly in boys aged 13 (n=18, 66.7%) and 14 years (n=8, 29.6%). 161/168 (95.8%) of the PrePex clients returned for the scheduled removal visit on day 7, six (85.7%) reported on day 8 and 1 (14.3%) on day 10. AEs included one moderate AE due to pain requiring early removal and 2/168 with mild edema.

**Conclusions:** These preliminary results suggest that the device is both safe and acceptable when used with adolescents 13-17 years in routine service delivery. Significant preference of surgical circumcision and high medical ineligibility suggest that both VMMC methods need to complement each other in programs targeting adolescent men. Smaller device sizes need to be available especially for the younger adolescents (13-14 years).

## THPEC225

### THE IMPACT OF THE BROTHERS FOR LIFE MASS MEDIA CAMPAIGN ON MEDICAL MALE CIRCUMCISION

L. Mahlasela[1], R. Delate[1], B. Goldblatt[1], A. Squara[2], R. Braz[2], B. Pearce[1]
*[1]Centre for Communication Impact, Pretoria, South Africa, [2]IPSOS, Joburg, South Africa*

**Background:** Voluntary medical male circumcision (VMMC) has been promoted in high epidemic countries as part of a combination prevention approach since the release of WHO Guidelines in 2007. South Africa has been implementing VMMC nationally, with demand creation an integral part of the programme. This study evaluated a mass media campaign; Brothers for Life "Salon advert" to investigate its impact on the uptake of VMMC.

**Methods:** Between September and October 2015, a nationally representative survey of 3 763 men and women aged 15 years and over was conducted as part of the IPSOS Khayabus survey. Demographic, knowledge, attitudinal and behavioural outcomes (KAB), self-reported circumcision status (traditional and medical) and exposure to the Brothers for Life HIV communication and VMMC campaign was collected through face-to-face computer assisted personal interview (CAPI). The association

between the KAB outcomes and exposure to the campaign was analysed for a subset of men aged 15- 30 (n=763), who are the primary audience of the campaign.
**Results:** Of the 763 men interviewed, 63% reported that they were circumcised. Exposure to the campaign was reported as 46%, i.e. have seen the advert. The likelihood of being circumcised increased monotonically with exposure to the campaign, from 15% at none to 54% at the highest level of exposure. Further behavioural outcomes observed in relation to campaign exposure are: 73% of men reported condom use at last sex (15% at no exposure vs. 51% at the highest level of exposure) and testing for HIV is 43.8% (50.5% at highest exposure vs. 14.1% at none). Knowledge of circumcision benefits as well as post-circumcision care is highest in men who have the highest exposure to the campaign (81% knowing HIV risk reduction benefits at highest exposure vs. 72% at no exposure and 71% 'wait six weeks' at highest exposure vs. 67% at no exposure).
**Conclusions:** The importance of demand creation through mass media cannot be underscored as shown by the findings of this study. Brothers for Life campaign is an important contributor to the uptake of circumcision and other HIV prevention behaviours such as condom use and HIV testing.

## Strategies for identifying key populations

### THPEC226

#### Identifying unaware HIV-positive status among HIV-positive Black men who have sex with men in the United States

S. Meanley[1], L. Bukowski[1], D. Matthews[2], M. Uzzi[1], L. Eaton[3], R. Stall[1],
POWER Study Team
*[1]University of Pittsburgh Graduate School of Public Health, Behavioral and Community Health Sciences, Pittsburgh, United States, [2]University of Pittsburgh Graduate School of Public Health, Infectious Disease and Microbiology, Pittsburgh, United States, [3]University of Connecticut, Human Development and Family Studies, West Hartford, United States*

**Background:** Improving HIV testing uptake to identify unaware HIV-positive individuals is critical to reduce the alarming incidence rates of HIV among Black men who have sex with men (BMSM) in the United States. Understanding demographic, social, and mental health differences between HIV-positive BMSM who know their status and those who do not may help elucidate potential pitfalls in community HIV testing outreach efforts.
**Methods:** We include observational data collected from the first two years (2014-2015) of the *Proving Our Worth, Equality, & Resilience* (POWER) Study. Using time-location sampling, POWER recruited BMSM who attended Black Pride events in six major U.S. cities. Participants completed a behavioral health survey consisting of demographic, behavioral, and psychosocial measures in addition to being offered an on-site anonymous HIV test. Unaware HIV-positive BMSM were identified if they reported a *negative* HIV status within the survey, but provided a *positive* HIV antibody screening test result obtained from on-site testing. Differences in positive status (aware versus unaware) were evaluated using logistic regression, adjusting for demographic, psychosocial, and mental health variables.
**Results:** Our analytic sample included 894 HIV-positive BMSM who provided complete responses in our behavioral health survey. Over a third (38.3%) were not aware of their status. Among unaware positives, over two-thirds (67.8%) had been tested for HIV in the prior 6 months. In our bivariate analyses, unaware positive status was associated with lower age and internalized homophobia as well as reporting bisexual identity, low education, and intimate partner violence. Using logistic regression, we found that the odds of being an unaware positive were higher among bisexual BMSM (AOR=2.15, 95% CI: 1.41, 3.31) compared to gay-identified BMSM. Additionally, age (AOR=.96, 95% CI: .95, .98) was associated with decreased odds of unknown status whereas internalized homophobia (AOR=1.33, 95% CI: 1.01, 1.04) was associated with increased odds of an unaware HIV-positive status.
**Conclusions:** Our results show that greater than 1 in 3 HIV-positive BMSM are unaware of their status. Given our significant findings, we identified a number of factors that may inform new approaches to improve outreach efforts and engage BMSM in routine HIV testing practices.

### THPEC227

#### Improving HIV case-finding through integrating hot spot-based outreach and peer-driven recruitment models

M. Avery[1], M. Cassell[2], S. Pengnonyang[3], P. Chanlern[4], R. Ruenkumful[5],
T. Sattayapanich[1]
*[1]FHI 360, Bangkok, Thailand, [2]USAID Regional Development Mission Asia, Bangkok, Thailand, [3]Thai Red Cross AIDS Research Centre, Bangkok, Thailand, [4]Mplus Foundation, Chiang Mai, Thailand, [5]Caremat, Chiang Mai, Thailand*
*Presenting author email: mavery@fhi360.org*

**Background:** Although HIV testing is the critical entry point for antiretroviral treatment and pre-exposure prophylaxis (PrEP) among men who have sex with men (MSM), fewer than half of MSM in Asia know their HIV status, and outreach-based test promotion has achieved low testing uptake and yield. The USAID-funded LINKAGES program, implemented by FHI 360 in Thailand, introduced an enhanced peer mobilizer (EPM) model to increase rates of HIV testing and counseling (HTC) and to strengthen case finding and access to ARV treatment for HIV-positive individuals.
**Methods:** EPM was implemented by community-based organizations Mplus Foundation and Caremat as part of a three-year program for MSM in Chiang Mai, Thailand. Under EPM, a small team of trained, salaried Community-Based Supporters (CBS) manage a wider, informal network of incentivized Peer Mobilizers (PMs) to recruit clients from their social networks. Data on client demographics, risk behaviors, and referrals are collected and shared via a digital, mobile data collection system. CBS are informed when a referral is successful and can respond proactively to losses to follow-up.
**Results:** From July to December 2015, 657 clients were registered under the EPM model and 4,791 were reached via traditional outreach. Clients reached via EPM were significantly more likely to receive an HIV test (72.6% versus 34.4%, p=0.00). Bivariate analysis identified that, under the EPM, clients recruited by PMs via social networking (n= 424) did not differ significantly to clients recruited by CBS via hot spot-based outreach (n=266) with regards to self-reported risk behavior, but were more than twice as likely to be HIV positive (10.6% HIV+ compared to 4.9%, p=0.01). Furthermore, 76.7% (n=43) of those diagnosed HIV+ in both groups initiated ART through proactive case management by the organizations. Initiation rates were higher for social network clients than for hot spot clients (81% v. 58%, p=0.02).
**Conclusions:** Social network recruitment through an informal pay-for-performance cadre that compliments a standard outreach workforce can expand reach, HIV case yields, and ART initiation. Expanded more widely, this outreach model offers a more sustainable and cost-efficient approach to HIV testing and ARV treatment initiation than traditional outreach models.

## Combination prevention approaches (including interventions on gender-based violence, cash transfers and poverty)

### THPEC228

#### Can cash grants and care break the cycle of vulnerability? A study of young children in HIV-affected communities across Malawi and South Africa

L. Sherr[1], I. Hensels[2], S. Skeen[3], M. Tomlinson[3], L.D. Cluver[4], A. Macedo[1]
*[1]UCL, Infection and Population Health, London, United Kingdom, [2]UCL, London, United Kingdom, [3]Stellenbosch University, Psychology, Stellenbosch, South Africa, [4]Oxford University, Oxford, United Kingdom*
*Presenting author email: l.sherr@ucl.ac.uk*

**Background:** Cash transfers have been used to alleviate dire poverty and enhance child HIV outcomes (Pettifor et al 2014). Recent data has shown that cash, and then cash plus care, can reduce adolescent HIV risk behaviours for both girls and boys (Cluver et al 2013,2014). Educational risks are a precursor to sexual risk behaviours (Orkin et al 2014). For younger children cash, or cash plus care, may interrupt negative educational outcomes and thereby divert HIV-infection risk pathways for the future.
**Methods:** Consecutive children and caregivers (n=854; 115 HIV+ve) were recruited. Children were coded as in receipt of any of 6 government cash grants. Care was defined as good parenting on a 10 point composite measure. Educational risk comprised five binary variables - incorrect grade for age, irregular school attendance, slow learner, struggling in school, and missing school recently. Cognitive testing used standardized Digit span and Draw a person tests. Associations between grant receipt and educational variables (adjusted and unadjusted for cognitive ability) were tested using logistic regressions and linear regression, and were repeated for care and cash+care.

Friday 22 July
Late Breaker Posters
Author Index

Tuesday 19 July
Wednesday 20 July
Thursday 21 July Poster Exhibition
Friday 22 July
Late Breaker Posters
Author Index

**Results:** Children with HIV were significantly less likely to receive grants (57.3%-vs -75.6% $\chi^2$=17.21, *p*< .001). Controlling for cognitive ability, grants were associated with beneficial educational outcomes. 21.0%(n=179) did not receive cash or care, 61.4%(n=524) received either cash or care, and 17.7%(n=151) received both cash and care. In a linear regression model controlled for general cognitive ability, receiving cash, care or a combination of both was negatively associated with educational risk in a stepwise manner (B=-0.13, t(811)=2.03, p=.043).
**Conclusions:** Overall, receiving a grant 'cash' or good parenting 'care' was associated with beneficial educational outcomes: higher enrolment rates, higher odds of being in the correct class for age and higher odds of regular attendance for both girls and boys. Receiving cash plus care did not improve educational outcomes over and above receiving either cash or care alone. For younger children cash grants and good quality care may interrupt the cycle of elevated educational risks shown to increase HIV sexual risks in adolescence. Children with HIV should be specifically included in cash and care provision.

## THPEC229

### PROJECT SHIKAMANA: COMMUNITY EMPOWERMENT BASED COMBINATION HIV PREVENTION AMONG FEMALE SEX WORKERS IN IRINGA, TANZANIA

D. Kerrigan[1], S. Likindikoki[2], N. Galai[3], S. Beckham[1], A. Mwampashi[2], C. Shembilu[2], A. Mantsios[4], A. Leddy[1], W. Davis[3], J. Mbwambo[2]
*[1]Johns Hopkins University, Health, Behavior & Society, Baltimore, United States, [2]Muhimbili University of Health and Allied Sciences, Psychiatry, Dar es Salaam, Tanzania, United Republic of, [3]Johns Hopkins University, Epidemiology, Baltimore, United States, [4]Johns Hopkins Bloomberg School of Public Health, Health, Behavior & Society, Baltimore, United States*
*Presenting author email: amantsi1@jhu.edu*

**Background:** Combination HIV prevention demonstrates significant promise in reducing the impact of HIV. Yet, to maximize its effectiveness, it must be tailored and targeted to those at heightened risk of acquisition and transmission. Community empowerment approaches have been found to be effective in responding to HIV among female sex workers (FSW). No rigorous evaluations of these approaches have been evaluated in sub-Saharan Africa. In response, we are conducting a Phase II trial of community empowerment-based combination HIV prevention among FSW in Iringa, Tanzania.
**Methods:** A Phase II randomized controlled trial is underway in the high prevalence Iringa region of Tanzania to evaluate the effectiveness of a community empowerment-based response among HIV- and HIV+ venue-based FSW. The project is rooted in efforts to address structural constraints to achieving optimal HIV outcomes by promoting social cohesion and community mobilization to address stigma, discrimination, violence and financial insecurity. Intervention elements include peer-led community education and HIV treatment service navigation, HIV counseling and testing and linkages to care, SMS adherence reminders and support for HIV+ FSW and sensitivity training among HIV care providers. Cohort members are surveyed and screened for HIV and viral load annually.
**Results:** To date, 254 FSW have been enrolled into an ongoing longitudinal cohort. Baseline HIV prevalence was 39.4%. Only 14% of FSW had contact with a peer educator and less than half had been tested for HIV in the last 6 months at balseine. Among those testing positive, just 37.6% reported being previously aware of their HIV status, and only 27% of those were enrolled in HIV care or on ART%, indicating important gaps in the HIV care continuum. HIV and sex work-related stigma, discrimination and violence were prevalent with over half (52%) of the cohort having experienced physical violence and almost a quarter (22%) experiencing sexual violence from a client in the last 6 months.
**Conclusions:** Community empowerment-based combination prevention which addresses biomedical, behavioral and structural drivers of HIV holds significant promise among FSW in underserved areas of sub-Saharan Africa, where FSW continue to face high disease burden, limited access to HIV services, and stigma, discrimination and violence.

## THPEC230

### WHERE DO THE CHILDREN PLAY? ALARMING LEVELS OF SEXUAL AND GENDER-BASED VIOLENCE IN TOWNSHIP SCHOOLS IN THE WESTERN CAPE: BASELINE DATA FOR A JOINT GRASSROOT SOCCER AND SOUL CITY INTERVENTION

B.F. Sanders[1,2], C. Barkley[1], N. Advani[1], S. Goldstein[3], C. MacLeod[4], I. Lynch[5], T. Morison[6], S. Swartz[5], F. Timol[7], N. Gqomfa[5]
*[1]Grassroot Soccer South Africa, Cape Town, South Africa, [2]University of the Western Cape, Cape Town, South Africa, [3]Soul City Institute for Health and Development Communication, Johannesburg, South Africa, [4]Rhodes University, Grahamstown, South Africa, [5]HSRC, Cape Town, South Africa, [6]HSRC, Johannesburg, South Africa, [7]HSRC, Durban, South Africa*
*Presenting author email: bsanders@grassrootsoccer.org*

**Background:** Sexual and gender-based violence (SGBV) is recognised as a major public health threat and key driver of the HIV epidemic in South Africa. An external HSRC baseline evaluation was conducted of a joint Grassroot Soccer and Soul City programme to tackle Sexual Violence in Schools in South Africa (SeVISSA).
**Methods:** Baseline surveys were delivered to male and female learners (n=2881; female = 1684; male = 1197) in twenty intervention schools (n=10 primary, n= 10 secondary) and four control schools (n=2 primary, n= 2 secondary) in Khayelitsha, Cape Town to ascertain exposure to SGBV and determinants of SGBV. Sample sizes were stratified by school and grade size. A separate survey was conducted with educators (n=140; female = 107; male = 33) capturing attitudes and knowledge of school policies towards SGBV. All surveys were conducted on mobile phones using Open Data Kit.
**Results:** 70% of students reported exposure to violence at home and 60% felt at risk of violence within their communities. Safety on the way to school was of concern to students and educators. 32% of high school students in relationships experienced intimate partner violence (IPV) in the past 12 months. 33% of all high school students experienced non-partner SGBV. 49% indicated perpetrating SGBV, with alcohol and drugs as a key feature of this violence. Non-partner violence was mostly perpetrated by a learner or teacher at school.
Primary school students were less likely to be in relationships, but 48% of those in relationships reported IPV. 65% of primary school students reported perpetration of non-partner related SGBV.
66% of educators felt schools are safe but only 50% indicated their school has a policy on SGBV. 33% felt corporal punishment is acceptable while 25% knew of others that use corporal punishment.
**Conclusions:** Learners report alarming levels of SGBV, whether in relationships or not. Primary school learners report higher levels of IPV and non-partner related SGBV than high school learners, reflecting the need for intervention at a young age, while many educators do not know how to respond to SGBV. These results will inform a joint Grassroot Soccer and Soul City intervention to reduce SGBV in schools.

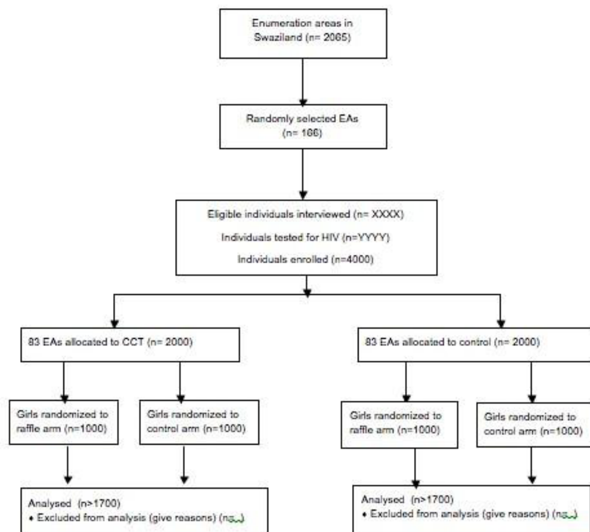
## THPEC231

### SITAKHELA LIKUSASA IMPACT EVALUATION PROTOCOL: A RANDOMIZED CONTROL TRIAL TO EVALUATE THE EFFECTIVENESS OF INCENTIVES TO IMPROVE HIV PREVENTION OUTCOMES FOR YOUNG WOMEN IN SWAZILAND

M. Gorgens[1], A.F. Longosz[1], F. Dennis-Langa[2], K. Sikwibele[3], K. Mabuza[2], P. Harimurti[4], A. Low[5], D. Wilson[1], D. de Walque[6]
*[1]The World Bank, Washington, United States, [2]National Emergency Response for HIV/AIDS, Mbabane, Swaziland, [3]IHM Africa, Mbabane, Swaziland, [4]The World Bank, Jakarta, Indonesia, [5]Columbia University, New York, United States, [6]The World Bank, Development Research Group, Washington, United States*
*Presenting author email: ddewalque@worldbank.org*

**Background:** Swaziland has the highest HIV prevalence in the world, estimated at 26.5% of the adult population (15-49) in 2012, and high HIV incidence (4% amongst adolescent girls and young women [AGYW]). Cash transfers and other financial incentives have been proposed as a tool for HIV prevention. Results of impact evaluations have been mixed, with some studies showing promising results while others have failed to measure a statistically significant impact.
**Methods:** This abstract presents the protocol for the Sitakhela Likusasa Impact Evaluation, a cluster randomized control trial in Swaziland using a 2 X 2 factorial design to create four study arms: 1) cash transfers conditional on school enrolment and attendance (>80% over last school term ) randomized at the enumeration area level, 2) raffle enrolment conditional on testing negative for curable STIs (*Trichomonas vaginalis,* syphilis) randomized at the individual level, 3) cash transfers conditional on school enrolment and attendance (>80% over last school term), and raffle enrolment conditional on testing negative for curable STIs, and 4) a control group with neither intervention.
**Results:** The primary endpoint is the impact of incentives on HIV incidence among HIV-negative AGYW aged 15-22 at baseline. Figure 1 describes expected sample sizes, and recruitment will aim at enrolling an equal proportion of participants cur-

rently attending school and out-of-school. Secondary study endpoints include the prevalence of curable STIs, self-reported sexual behaviors, HSV-2 prevalence at endline, and educational outcomes.



[Figure 1: Expected flow chart of participants]

**Conclusions:** This study is designed to test the following hypotheses:
1) cash transfers paid to the household conditional on school enrolment and attendance will encourage school participation and reduce HIV incidence;
2) financial incentives provided as raffle tickets to girls conditional on a negative curable STI status will reduce HIV incidence; and 3) the combination of both interventions offers complementarities reinforcing their impact.

## THPEC232

### ADAPTING COMBINATION PREVENTION AND CARE CONTINUUM FRAMEWORKS IN A CULTURALLY-COMPETENT MODEL TO ADDRESS LOCAL NEEDS AND REDUCE HIV INFECTIONS AMONG GAY AND BISEXUAL MEN

J. Hecht, T. Patriarca, S. Gibson, M. Discepola, J. Auerbach
*San Francisco AIDS Foundation, San Francisco, United States*
*Presenting author email: jhecht@sfaf.org*

**Background:** In San Francisco (SF), gay/bi men report HIV/STIs, depression, sex and dating, social support, and substance use as their greatest needs. Citywide 5000 HIV+ MSM are virally unsuppressed and 300 new infections occur annually. San Francisco AIDS Foundation (SFAF) recently opened a center, called Strut, to address gay/bi men's needs and to reduce HIV transmission in SF by combining prevention and care programs in an integrated model.
**Description:** SFAF developed a program model that adapts major frameworks, including combination prevention, the continuum of care, and resilience research to build coping skills and social support to reduce HIV risks. Balancing local epidemiology, identified needs, and evidence-based research, SFAF integrated biomedical and behavioral services as well as community mobilization to develop the Strut model (see figure). Strut will serve one third of MSM in San Francisco (~20,000) annually, providing HIV/STI screening, substance use treatment, mental health counseling, case management and linkage to HIV care, PrEP, and benefits counseling. Strut currently has 800 MSM on PrEP, provides over 10,000 HIV tests annually, and builds social support and coping skills through activities from monthly art openings to weekend-long support seminars for MSM newly-diagnosed with HIV. Clients are 71% Caucasian, 15% Latino, 4% African-American, and 16% API/Native American. Mean age is 38 years.
**Lessons learned:** Over 5 years, SFAF aims to directly reduce HIV transmission by 33%, as a result of increasing viral suppression, increasing PrEP use, reducing transmission risk and unknown HIV status. We used a published mathematical model to project 100 infections averted due to increased investment in Strut. At ~$60,000 per infection averted, this center will cost well under the $380,000 per infection averted that CDC recommends for cost-saving programs in the US.
**Conclusions/Next steps:** Community-based organizations can adapt combination prevention and continuum of care frameworks to fit their local needs in culturally competent ways. For gay/bi men, continued engagement in HIV prevention and care requires addressing key barriers, including social isolation, mental health, and substance use. Bringing multiple programs together enables full support for individuals to reduce HIV transmission and to help HIV+ individuals achieve viral suppression, as well as building individual and community resilience.

# REDUCING PRE-PARTUM AND INTRA-PARTUM TRANSMISSION TO INFANTS

## THPEC233

### RALTEGRAVIR CONTAINING ANTIRETROVIRAL THERAPY FOR PREVENTION OF MOTHER TO CHILD TRANSMISSION IN A HIGH RISK POPULATION OF HIV-INFECTED PREGNANT WOMEN IN BUENOS AIRES, ARGENTINA: MATERNAL AND NEONATAL OUTCOMES

D.M. Cecchini[1], M. Martinez[2], L. Morganti[1], C. Rodriguez[1]
*[1]Hospital Cosme Argerich, Infectious Diseases Unit, Buenos Aires, Argentina,*
*[2]Hospital Cosme Argerich, Neonatology Unit, Buenos Aires, Argentina*
*Presenting author email: diegocec@gmail.com*

**Background:** Mother-to-child-transmission of HIV-1 in Buenos Aires remained high (4-7%) in recent years: novel strategies for reduction are needed. There is limited information regarding the use of raltegravir (RAL) in subpopulations of HIV-infected pregnant women (HIPW) with high transmission rates (late presenters [LP] and those with detectable antepartum viral load [VL] despite antiretroviral therapy [ART]). We aimed to evaluate:
1) trends in RAL prescription in HIPW in our institution;
2) maternal/neonatal outcomes after RAL exposure.
**Methods:** Retrospective study in a general hospital in Buenos Aires, Argentina (2009-2015).
**Results:** A total of 239 HIPW were assisted; 31 received RAL-containig ART (12.9%): 8/130 (6.15%) in period 2009-2012 vs. 23/109 in 2013-2015 (21%) ($p < 0.001$ OR: 4, 95%CI:1.7-9.5). Clinical scenarios: 1) intensification (INS): addition of RAL to current ART because of detectable antepartum VL, 13 (41.9%); 2) LP: standard ART + RAL as fourth drug, 15 (48.4%); 3) treatment of resistant-HIV: 3 (9.7%).
The median (interquartile range) of age, baseline VL and CD4 T-cell count were: 23 years (19-32); 6840 copies/mL (2445-66650) and 300/µL (197-436), respectively. Ten (33.3%) acquired HIV perinatally (the rest, sexually). Median gestational age at RAL initiation was 34 (29-36) weeks and median exposure was 30 days.
In INS-group median VL decrease was 1.48 $\log_{10}$ (0.98-1.77) and 70% had peripartum VL < 50. In LP-group, median VL decline was 2.15 $\log_{10}$ (1.40-2.85); 45.5% and 100% had peripartum VL < 50 and < 400, respectively. No clinical adverse events or maternal intolerance attributable to RAL were observed; 1 had moderate transaminases elevation. One patient had a stillbirth. Elective cesarean section was done in 51.7%; 18.5% of births were preterm. Neonatal prophylaxis: AZT in 57.1% (the rest, combined prophylaxis). Mild elevation of transaminases was observed in 35% of neonates; 14.8% required phototherapy. No vertical transmission was documented to date (all infants had a negative PCR in the first week, 70% at >2 months and 23% had negative 18-month ELISA).
**Conclusions:** RAL prescription in HIPW increased in the recent years in our institution, mainly in high risk populations. A rapid maternal virological response with RAL containg ART was observed, without major cautionary signals or perinatal transmission.

## THPEC234

### ADHERENCE TO ANTIRETROVIRAL THERAPY DURING AND AFTER PREGNANCY IN THE MALAWI "OPTION B+" PROGRAMME

A.D. Haas[1], M.T. Msukwa[1,2], J.J. van Oosterhout[3,4], A. Jahn[5,6], L. Tenthani[1,6], H. Tweya[1,7,8], O.J. Gadabu[2], L.P. Salazar-Viscaya[1,9], J. Estill[1], F. Chimbwandira[5], M. Egger[1,10], O. Keiser[1]

*Presenting author email: olivia.keiser@ispm.unibe.ch*

**Background:** While adherence to ART during pregnancy and breastfeeding is crucial for PMTCT/ART success, robust data on adherence in African Option B+ women are rare.
**Methods:** We did a cohort study of women starting ART between Sep 2011 and Mar 2014 at 12 facilities with complete electronic medical records. We estimated adherence across three groups: pregnant and breastfeeding Option B+ (OB+) patients and women who started ART for their own health (AOH). Based on drug dispensing records, we considered patients as "non-adherent" if they had insufficient pill supply in the interval between visits. We expressed cumulative medication adherence (CMA) as the percentage of days a patient had sufficient pill supply. We used flexible parametric survival models to compare non-adherence between patient groups.

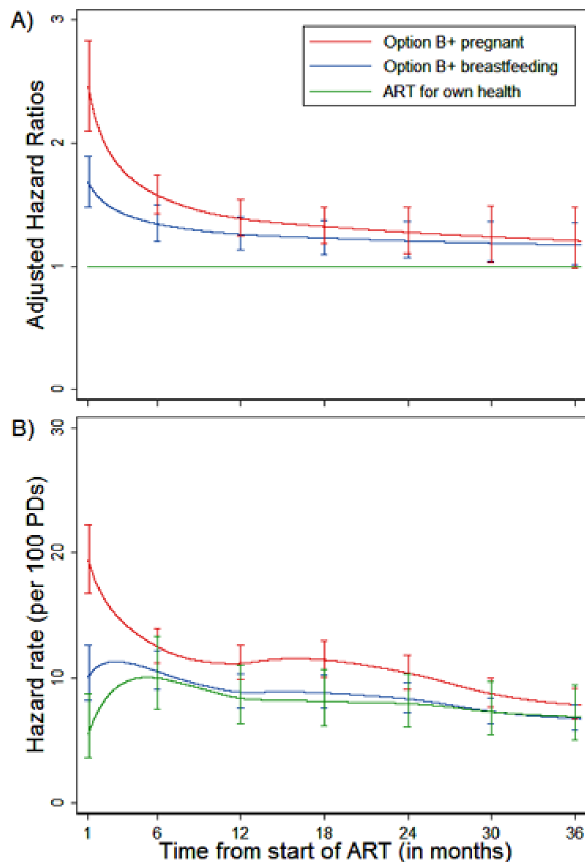
One facility had viral load data for 678 patients and we compared CMA with viral suppression rates (< 400 copies/ml) in this subgroup using logistic regression (adjusted for age, patient group and time on ART).

**Results:** We included 10,385 patients (OB+ pregnant: 5,589; OB+ breastfeeding: 1,689; AOH: 3,107). One month after start of ART, pregnant and breastfeeding OB+ patients were 2.46 and 1.68 times more likely to be non-adherent than AHO. Risk of non-adherence in OB+ patients declined rapidly during the first year, but remained slightly higher than in AOH patients (Figure A). Among 1,667 patients with ≥3 years of follow-up, OB+ pregnant, breastfeeding and AOH patients skipped doses on 18%, 11% and 7% of days within the 2nd month on ART, respectively. Levels of non-adherence rapidly improved during the first six month on ART in OB+ pregnant patients (Figure B). CMA was linearly associated with virological suppression (p=0.0018).

**Conclusions:** Option B+ patients had challenges to adhere to ART during pregnancy, especially early on, but adherence improved during breastfeeding and remained stable thereafter.



*[A) Hazard ratios for non-adherence for women starting ART, B) Hazard rates for non-adherence per 100 person-days (PDs) for women retained >3 years]*

## THPEC235

### RISK FACTORS ASSOCIATED WITH PRETERM AND LOW BIRTH WEIGHT AMONG INFANTS BORN TO HIV-INFECTED MOTHERS IN FIVE TERTIARY HOSPITALS IN CHINA, 2009-2014

L. Wang[1,2], H. Zhao[1], J. Tao[3], X. Wen[3], W. Cai[4], Q. Zhao[5], L. Sun[6], C. Shepard[2], A. Kourtis[7], F. Zhang[1]

*[1]Beijing Ditan Hospital, Capital Medical University, Beijing, China, [2]Division of Global HIV/TB-China Office, U.S. Centers for Disease Control and Prevention (CDC), Beijing, China, [3]Liuzhou Maternal and Child Health Hospital, Liuzhou, China, [4]Guangzhou No.8 People's Hospital, Guangdong, China, [5]Zhengzhou No.6 People's Hospital, Zhengzhou, China, [6]Beijing Youan Hospital, Capital Medical University, Beijing, China, [7]Division of Reproductive Health, U.S. Centers for Disease Control and Prevention (CDC), Atlanta, United States*

*Presenting author email: liming.wang@outlook.com*

**Background:** Highly active antiretroviral therapy (HAART) has been reported in some, but not all, studies, to be associated with preterm delivery and low birth weight among infants born to HIV-infected mothers. Information is particularly limited in Asian populations.

**Methods:** A cross-sectional medical chart review was conducted in five HIV treatment tertiary hospitals in China. HIV-infected pregnant women who delivered between 2009-2014 and their infants were included in the study. Maternal demographic and medical information was collected. The outcome measures were preterm delivery (delivery gestation age <37 weeks) and low birth weight (LBW) (<2500g). Logistic regression was performed to assess risk factors for these outcomes adjusting for potential confounders including maternal age, hemoglobin, CD4 count, body mass index (BMI) before delivery, time of maternal HIV diagnosis, time of HAART initiation, and delivery mode (vaginal vs. Cesarean section).

**Results:** There were 736 mother-infant pairs included in the analysis. The preterm delivery rate was 12.0% (88/736); 13.1% (69/525) in infants prenatally exposed to HAART vs. 9% (19/211) among infants unexposed to ART (P=0.12). The LBW rate was 18.1% (133/736) among all infants; 19.4% (102/525) in the HAART-exposed group vs. 14.7% (31/211) in the unexposed group (P=0.13). In the multivariable analysis, prenatal use of HAART was not associated with an increased risk of LBW (aOR= 1.64, 95% CI, 0.93-2.88) nor preterm delivery (aOR= 1.43, 95% CI, 0.73-2.80). However, when focusing on women starting HAART during pregnancy, a protease inhibitor (PI, Lopinavir/Ritonavir) based regimen was associated with nearly two-fold risk of preterm delivery (aOR=1.84, 95% CI, 1.06-3.18), compared with a non-nucleoside reverse transcriptase inhibitor (Efavirenz or Nevirapine) based regimen. Maternal BMI≤20 before delivery was significantly associated with LBW (aOR=3.70, 95% CI, 1.29-10.56) and preterm delivery (aOR=3.40, 95% CI, 1.06-10.98) regardless of HAART use during pregnancy.

**Conclusions:** Prenatal exposure to HAART was not associated with an increased risk of either preterm delivery or LBW in this population. Use of a PI-containing HAART regimen initiated during pregnancy may be associated with increased risk for preterm delivery. Malnutrition with low maternal BMI was an independent risk factor for both low birth weight and preterm delivery in HIV-infected pregnant women.

## THPEC236

### THE IMPACT OF HIV/AIDS SPENDING ON PREVENTION OF MOTHER TO CHILD TRANSMISSION IN NIGERIA BETWEEN 2011 TO 2014

A. Kenneth[1], O.M. Kayode[1], A. Greg[2], A. James[1], Y. Monday[1], U. Samuel[1], A. Matthias[1], A. Ronke[1]

*[1]NACA, SKM Department, Abuja, Nigeria, [2]NACA, Strategic Knowledge Management, Abuja, Nigeria*

*Presenting author email: kennethalau@yahoo.com*

**Background:** The National AIDS Spending Assessment (NASA) is a comprehensive and systematic resource tracking method developed by UNAIDS that describes the financial flow, actual disbursements and expenditures for HIV/AIDS by identifying financing sources, agents, service providers and beneficiary populations. In Nigeria, NASA tracks the AIDS spending of the HIV response including prevention of mother to child transmission (PMTCT). The effect of the HIV/AIDS spending on PMTCT in Nigeria cannot be over emphasis due to the low PMTCT coverage (30%) and effect on in the population.

**Methods:** NASA uses top-down approach to track sources of funds from donor reports, commitment reports, and Government budgets whilst the bottom-up tracks expenditures from service providers' expenditure records, facility level records and governmental department expenditure accounts. The assessment focused on tracking national level HIV expenditure available at central level and 10 States. The assessment did not include household out-of-pocket expenditure on HIV and AIDS.

**Results:** The outcome from the AIDS spending assessment showed an increased PMTCT spending from $12,400,238 in 2011 to $58,114,134 in 2014. These translate to 63% effort increase in coverage from 18.3% in 2011 to 29.9% in 2014. Also, the annual infections averted by PMTCT increased by 119% from 6,790 to 14,844. Deaths averted by PMTCT also increased by 94% (from 3,685 to 7,167). In addition, new child infections due to mother to child transmission decline by 17% (from 67,960 - 58,331).

**Conclusions:** PMTCT coverage still remains low though an increase was noticed in the last three years. This underscores the need to invest more in this area and to intensify PMTCT interventions to eliminate transmission from mother to child.

## THPEC237

### VIRAL SUPPRESSION AMONG HIV-POSITIVE WOMEN STARTING ANTIRETROVIRAL THERAPY (ART) BEFORE OR DURING PREGNANCY IN LESOTHO

M.M. Gill[1], Y. Nelson[2], A. Tiam[3], S. Mohale[3], M. Mokone[3], S. Kassaye[4], L. Mofenson[1], L. Guay[1,2]
*[1]Elizabeth Glaser Pediatric AIDS Foundation-Global, Washington, United States, [2]George Washington University, Milken Institute School of Public Health, Washington, United States, [3]Elizabeth Glaser Pediatric AIDS Foundation - Lesotho, Maseru, Lesotho, [4]Georgetown University, Washington, United States*
*Presenting author email: lmofenson@pedaids.org*

**Background:** Reaching maximal viral suppression is critical for preventing perinatal transmission. One hypothesized benefit of lifelong ART for all HIV-positive women (Option B+) is improved viral suppression in subsequent pregnancies.
**Methods:** This is an observational prospective cohort study of HIV-positive pregnant women conducted at 13 clinics in three Lesotho districts. Factors associated with HIV viral load (VL) suppression were assessed. VL was obtained between June 2014-November 2015 in 104 women at enrollment (any ANC visit) and delivery. Three women were excluded because of missing ART dates; 13 were excluded because delivery VL was obtained ≥3 weeks post-delivery. Undetectable VL was defined as <20 c/mL (Roche CAP/CTM v2). Adherence was measured by seven-day self-reported recall. Logistic regression analysis was conducted to detect an association between ART initiation timing and undetectable VL.
**Results:** All women received NNRTI-based ART (85.2% Efavirenz-based); 75/88 (87.2%) reported 100% adherence. Mean ART duration was 40.8 months in women starting ART prior to pregnancy (n=43) and 4.1 months for those starting during ANC (n=45); only 3/88 (3.4%) had <4 weeks ART. Enrollment VL was undetectable in 26/43 (60.5%) women starting ART pre-pregnancy and 10/45 (22.2%) starting during-ANC. Delivery VL was undetectable in 32/43 (74.4%) women on ART pre-pregnancy and 18/45 (40.0%) of women who started ART during-ANC. Of 52 women with detectable enrollment VL, 18 (34.6%, 9 pre-pregnancy, 9 during-ANC) achieved undetectable VL by delivery. Four women with undetectable enrollment VL experienced a VL increase by delivery
(3 pre-pregnancy, 1 during-ANC). Women starting ART pre-pregnancy were 5.4 and 4.3 times more likely to have undetectable VL at enrollment (p<0.0001) and delivery (p<0.001), respectively, than those starting during-ANC. Fifty women (56.8%) had delivery VL < 20 c/mL, 19 (21.6%) had 20-999 c/mL and 19 (21.6%) had >1,000 c/mL.
**Conclusions:** Most women received >4 weeks ART and reported high adherence. However, only 56.8% achieved profound viral suppression to <20 c/mL; 78.4% reached suppression to <1,000 c/mL. While women starting ART pre-pregnancy were more likely to have undetectable VL than those starting during-ANC, almost one quarter still had VL >20 c/mL at delivery, with 11.6% having VL >1,000 c/mL.

## THPEC238

### ENGAGING COMMUNITIES TO ACCELERATE CHILDREN'S ACCESS TO HIV PREVENTION, TREATMENT CARE AND SUPPORT SERVICES

B. Mubita[1], Y. Mulenga[1], P. Koni[2], J. Musonda[3], C. Makoane[4]
*[1]Project Concern International (PCI), Programs, Lusaka, Zambia, [2]Project Concern International, Monitoring and Evaluation, Lusaka, Zambia, [3]Project Concern International, Management, Lusaka, Zambia, [4]Project Concern International (PCI), HIV/AIDS, Washington DC, United States*
*Presenting author email: bmubita@pciglobal.org*

**Background:** The HIV prevalence rate among women in Zambia is higher at 15% compared to men at 11%, increasing the risk of mother-to-child transmission of HIV (MTCT). Although global gains have been made in reducing MTCT, progress has been much slower in countries with a high burden of HIV like Zambia, with less than 40% of new infections averted. Many low resource settings affected by a critical shortage of health care workers are task shifting delivery of prevention of mother to child transmission (PMTCT) services to community health workers (CHWs).
**Description:** Between October 2013 and September 2015, PCI prioritized 5 sites with a high burden of HIV and scantly staffed health centers to implement a community PMTCT program with strong linkages to facility-based PMTCT services. A community PMTCT register was developed to allow for longitudinal postpartum/postnatal follow up of mother/baby pairs to the end of breastfeeding. The register contained variables to ensure linkage of women to treatment as prevention/Option B+, early infant diagnosis for exposed infants, retesting for breastfed exposed infants, breastfeeding and adherence counseling for the mother, and defaulter tracing. Fifty CHWs (10 per site) were trained on delivering services as per register guidelines.
**Lessons learned:** A total of 428 HIV positive pregnant women were identified (217 in 2014 and 211 in 2015). The percentage of women linked to Option B+ increased from 52% (113) in 2014 to 100% (211) in 2015. The rate of HIV exposed infants born from HIV positive women who were tested for HIV increased from 41.5% (90/217) in 2014 to 86.7% (183/211) in 2015. The HIV positive rate in HIV exposed infants identified and tested reduced from 15.5% (14/90) in 2014 to 2.7% (5/183) in 2015. All HIV negative and breastfed infants retained their status at the close of September 2015.
**Conclusions/Next steps:** In resource limited settings, engaging CHWs in pediatric HIV testing, facility linkage, care and support programs and providing them with clear documentation tools increases children's access to life-saving HIV prevention and treatment services. Research is needed to explore how CHWs can effectively be engaged, motivated and retained to deliver key HIV and child survival services.

## THPEC239

### HAS AUSTRALIA ELIMINATED MOTHER TO CHILD TRANSMISSION OF HIV? AN ANALYSIS OF 30 YEARS OF NATIONAL SURVEILLANCE DATA

S. McGregor[1], J. Costello[1], M. Deverell[2], J.B. Ziegler[3,4], J. Kaldor[1], R. Guy[1]
*[1]UNSW Australia, The Kirby Institute, Sydney, Australia, [2]The Kids Research Institute, Australian Paediatric Surveillance Unit, Westmead, Australia, [3]Sydney Children's Hospital, Department of Immunology and Infectious Diseases and the HIV Service, Sydney, Australia, [4]UNSW Australia, School of Women's & Children's Health, Sydney, Australia*
*Presenting author email: smcgregor@kirby.unsw.edu.au*

**Background:** The internationally endorsed strategy of early testing and treatment has the potential to eliminate mother-to-child-transmission (MTCT) of HIV in countries where treatment coverage is high. We examined long-term time trends in MTCT rates in Australia and progress towards World Health Organization (WHO) elimination targets; < 50 cases per 100 000 live births AND MTCT rate of < 2% in non-breastfeeding populations (for at least 1 year) AND >95% treatment coverage (for at least two years).
**Methods:** Data from the Australian Paediatric Surveillance Unit (APSU) which flows into the Australian Perinatal HIV Surveillance System were analysed. Paediatricians and other child health professionals participating in the APSU notify infants born to HIV-positive mothers. Further information is then sought including demographics of infant and mother, maternal HIV exposure risk, HIV prevention interventions used (antiretroviral therapy (ART), mode of delivery, breastfeeding status) and the infant's HIV status. We assess time trends in the treatment coverage during pregnancy and MTCT rate over a 30-year period, using logistic regression.
**Results:** Between 1985 and 2014, there were 701 infants born in Australia to HIV positive mothers, 27 in 1985-1989 increasing to 238 in 2010-2014. Over a third (39%) of mothers were born in Sub-Saharan Africa or South-East Asia, increasing from 14% in 1985-1989 to 49% in 2010-2014 (p< 0.001). In mothers with information recorded on use of ART during pregnancy, the proportion on treatment was 17% prior to 1995 increasing to 98% in 2010-2014 (p< 0.001). In the last 5-year period, treatment coverage was >95% each year. Overall 66 (9%) were notified as HIV positive and the MTCT rate declined from 37.0% in 1985-1989 to 1.7% in 2010-2014 (p< 0.001). In the last 5-year period, there were 4 transmissions recorded (3 in 2012 and 1 in 2010), equating to MTCT rates of 4.1% and 1.9% respectively or 0.97 and 0.34 cases per 100 000 live births respectively, and 0% in all other years.
**Conclusions:** Australia has expanded services to provide significantly more HIV-positive women with interventions to avoid HIV transmission during pregnancy. The high treatment coverage and very low MTCT rates in the past two years meet WHO elimination targets.

## THPEC240

### HIV VIRAL LOAD MONITORING IN HIV-INFECTED PREGNANT WOMEN ESTABLISHED ON ANTIRETROVIRAL THERAPY IN CAPE TOWN, SOUTH AFRICA

P. Tsondai[1,2], T. Phillips[1,2], N.Y. Hsaio[3], G. Petro[4], E. Abrams[5], L. Myer[1,2]
*[1]University of Cape Town, Centre for Infectious Diseases Epidemiology & Research, Cape Town, South Africa, [2]University of Cape Town, Division of Epidemiology & Biostatistics, Cape Town, South Africa, [3]University of Cape Town, Division of Medical Virology, National Health Laboratory Services, Cape Town, South Africa, [4]University of Cape Town, Department of Obstetrics & Gynaecology, New Somerset Hospital, Cape Town, South Africa, [5]ICAP, Columbia University, New York, United States*
*Presenting author email: priscilla.tsondai2@gmail.com*

**Background:** Use of viral load (VL) monitoring is increasing across Africa however there are few insights into VL monitoring strategies during pregnancy. We describe public sector VL monitoring practices in a cohort of HIV-infected pregnant women established on antiretroviral therapy (ART) in Cape Town, South Africa. Annual VL monitoring has been routine in this setting since 2010, with two consecutive VL results >1000 copies/mL used to diagnose virologic failure.
**Methods:** We enrolled consecutive pregnant women on ART for at least 4 months and making their first visit to a primary care antenatal clinic between March 2013 and June 2014. All women received a research ultrasound to determine gestation

and estimated date of conception, and then used laboratory systems to follow-up routine VL testing practices from 15 months before the estimated date of conception to 6 weeks after delivery.
**Results:** Among 538 women the median age was 31 years and the median duration of ART use was 31 months [IQR, 17-59 months]. In the 15 months before the estimated date of conception, 64% (n=327) had at least one VL test done in routine adult ART services, and 9% of these results (n=28) were >1000 copies/mL. During the pregnancy, 81% (n=437) of women had at least one VL test done and 12% (n=53) of these results were >1000 copies/mL. Pregnant women with elevated VL were more likely to report missed ART doses in pregnancy (p=0.036) and be on a PI-based regimen (p=0.054). Among women with VL ≥1000 copies/mL during pregnancy, 62% (n=33) had a repeat VL test done at a median of 4 months after the initial test (IQR 2-5 months) and 48% of women (n=16) had a VL ≥1000 copies/mL on this second test.
**Conclusions:** While coverage of VL monitoring appears high in this setting, VL testing during pregnancy occurs less frequently. A substantial fraction of women with elevated VL in pregnancy are never retested, and the time to retesting appears unusually long. With increasing numbers of HIV+ women using ART, greater attention is needed to design and implement effective strategies for VL monitoring in pregnancy.

## THPEC241

### Predictors of neurocognitive outcomes among a cohort of 12-month old infants from Uganda of mixed HIV-exposure status

I. Familiar[1], S. Collins[2], A. Sikorskii[3], H. Ruisenor[1], B. Netamba[4], D. Achidri[5], H. Achola[5], D. Onen[5], M. Boivin[1], S. Lewise Young[2]
*[1]Michigan State University, Psychiatry, East Lansing, United States, [2]Cornell University, Program in International Nutrition, Department of Population Medicine and Diagnostic Scieences, Ithaca, United States, [3]Michigan State University, Statistics and Probability, East Lansing, United States, [4]Harvard T. H. Chan School of Public Health, Epidemiology, Boston, United States, [5]Prenatal Nutrition and Psychosocial Health Outcomes Uganda, Kampala, Uganda*

**Background:** Conflicting evidence exists concerning the effects of perinatal exposure to both antiretrovirals (ARVs) and HIV on early infant cognitive development. We therefore aimed to evaluate whether maternal HIV status, maternal ARV treatment status, and demographic characteristics were predictive of infant cognitive development in the first year of life.
**Methods:** Postpartum Ugandan women (n=244) of reproductive age (mean 24.9y±5.2) with known HIV status were enrolled from the Prenatal Nutrition and Psychosocial Health Outcomes (PRENAPS) study, a longitudinal pregnancy cohort, at a 2:1 HIV-infected:uninfected ratio. Maternal socio-demographic and physical and mental health parameters were collected at multiple study visits. We assessed neurocognitive development of infants at 6 and 12-months of age using Mullen Scales of Early Learning (MSEL). Linear regression models for repeated measures (mixed effects) were used to relate MSEL scores to maternal age, education, HIV-status, ARV regimen, socioeconomic status, and social support.
**Results:** Repeated measures were available for 215 mother-child dyads. At baseline, 147 women (65%) were HIV-, 57 (27%) were HIV+ receiving ARVs, and 18 (8%) were HIV+ not receiving ARVs. In multivariate models, HIV-unexposed infants had higher Mullen Composite (ß=3.9, SE=1.8, p=.03) and Gross Motor scores (ß=2.9, SE=1.3, p=.03) than HIV and ARV exposed but uninfected children. Infants from HIV+ mothers receiving ARVs had higher Mullen Composite scores compared to infants from HIV+ mothers not receiving ARV's, but statistical significance was not reached, possibly due to smaller size of no ARV group. Greater postnatal maternal social support was associated with higher Mullen Composite scores at 6- and 12-months (ß=0.37, SE=0.14, p=.01).
**Conclusions:** These data suggest that HIV-exposure is associated with lower cognitive development scores in the first year of life, but that ARV regimen is not. Further, increasing maternal social support may be an effective strategy to improve early cognitive development. Examination of the effects of maternal and pediatric ARV-exposure on child cognitive development beyond 1 year are warranted.

# Reducing post-partum transmission in infants

## THPEC242

### Predictors of uptake of early postnatal care among HIV exposed and unexposed infants in South Africa

A. Larsen[1], M. Cheyip[1], M. Mogashoa[2], N. Ngandu[3], T.-H. Dinh[4], D. Jackson[5,6], A. Goga[3,7]
*[1]US Centers for Disease Control and Prevention, Epidemiology and Strategic Information Branch, Pretoria, South Africa, [2]US Centers for Disease Control and Prevention, Care and Treatment Branch, Pretoria, South Africa, [3]South African Medical Research Council, Health Systems Research Unit, Pretoria, South Africa, [4]US Centers for Disease Control and Prevention, Atlanta, United States, [5]United Nations Children's Fund (UNICEF), Pretoria, South Africa, [6]University of Western Cape, Bellville, South Africa, [7]University of Pretoria, Department of Paediatrics, Pretoria, South Africa*
*Presenting author email: kze8@cdc.gov*

**Background:** Almost half of annual global deaths among children under 5 take place during the first 28 days of life, yet many infants do not receive the minimum WHO recommendation of three postnatal care (PNC) visits during their first six weeks of life. This study aims to identify predictors of uptake of early postnatal care among HIV-exposed and unexposed infants in South Africa, with the ultimate goal of increasing coverage and reducing infant deaths.
**Methods:** We analyzed data from the South African prevention of mother-to-child transmission (PMTCT) of HIV effectiveness through cross-sectional national surveys in 2010, 2011/12, and 2012/13. Research nurses interviewed mothers/ caregivers and collected dried blood spots (DBS) from 4-8 week old infants (n= 28,095 mother-infant pairs). DBS samples were tested for maternal antibodies using enzyme linked immunosorbent assay tests and, if positive, we defined the baby as HIV-exposed. Multivariable logistic regression was used to identify predictors of uptake of early postnatal care using STATA 12.0. Unweighted preliminary results are presented.
**Results:** Of the 28,095 mother-infant pairs, only 13.74% (n=3,861) received the recommended three PNC visits during the first 6 weeks of life, with 15.06% (n=1,258) of HIV exposed infants and 13.19% (n=2,603) of HIV unexposed infants achieving the recommendation. Predictors of receiving recommended PNC visits were HIV-exposure (Adjusted Odds Ratio (AOR): 1.14, 95% CI: 1.05 - 1.24), four or more ANC visits (AOR: 1.36, 95% CI: 1.22 - 1.51), and health facility delivery (AOR: 1.19, 1.05 - 1.38). The multivariable model also included maternal age and education, infant birth weight, formula feeding, and timeliness of first ANC visit.
**Conclusions:** Antenatal, labor and delivery care interactions with the health system were shown to significantly improve uptake of PNC services during the first 6 weeks of life. Therefore, efforts to improve uptake of vital early PNC should include health education that stresses the importance of four or more ANC visits, facility delivery, and three PNC visits within the first six weeks of life. Analysis weighted for sample realization and population live births will be conducted in the near future.

## THPEC243

### Prevalence of HIV infection among children born to HIV-infected mothers after the implementation of Option B+ in Rwanda

B. Hyman[1], E. Remera[2], J.O.T. Rwema[2], J.D.D. Ntwali[2], P. Mugwaneza[2], D.J. Riedel[1]
*[1]University of Maryland School of Medicine, Institute of Human Virology (IHV), Baltimore, United States, [2]Rwanda Biomedical Center, Kigali, Rwanda*
*Presenting author email: brooke.hyman@som.umaryland.edu*

**Background:** Prevention of mother-to-child transmission (PMTCT) of HIV is an important component of the global fight against HIV/AIDS. In 2011, the World Health Organization (WHO) recommended Option B+ for PMTCT, which provides lifelong triple antiretroviral therapy (ART) for all HIV-positive pregnant women, regardless of CD4 count. Rwanda implemented the program nationwide in November 2011.
**Methods:** Efficacy of Option B+ in Rwanda was evaluated through a pre/post quasi-experimental study comparing 18-month HIV-positivity rates among infants born to HIV-positive women before and after program implementation. Routinely collected data available through the TRACnet database system were used to analyze outcomes for infants in three birth cohorts before and after the implementation of Option B+. Only infants whose mothers accessed antenatal care/ PMTCT services at least once during pregnancy were included.
**Results:** Of the 6,768 infants whose mothers were enrolled in Option B+, 121 (1.8%) infants tested HIV positive, 6,368 (94.1%) infants tested HIV negative and 279 (4.1%) infants did not receive an HIV test due to death, loss to follow up or transferred out. 68% of HIV-positive infants first tested positive at 6 weeks, while 20% and 12% tested positive at 9 and 18 months, respectively. In the years 2007 - 2009, the HIV prevalence among infants at 18 months with known HIV status was 3.3%.

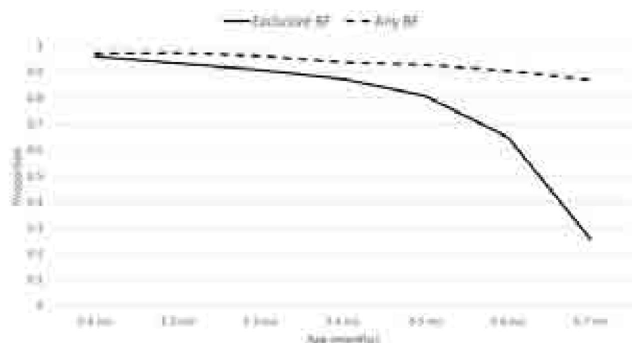
**Conclusions:** The HIV prevalence among infants whose mothers were enrolled in the PMTCT program has decreased by more than 40% since the implementation of Option B+ in Rwanda, from 3.3% to 1.8%. Further, the decreased proportion of infants identified as infected at the 9 and 18 month test dates shows declining HIV transmission during the breastfeeding period. Currently, the majority of infants who become infected with HIV are infected sometime during pregnancy, delivery, or within the first six weeks of life. Continued improvements are possible and necessary to prevent all infants from becoming infected, including increased awareness of HIV status among women of childbearing age, immediate initiation of ART at the time of HIV diagnosis prior to pregnancy, and increased follow up care.

## THPEC244

### EXCLUSIVE BREASTFEEDING AMONG HIV-POSITIVE MOTHERS RECEIVING LIFELONG ART FROM PMTCT CLINICS IN KIGALI, RWANDA

G. Ndayisaba[1], L. Adair[2], K. Riggle[2], D. Ndatimana[1], E. Bobrow[3], P. Mugwaneza[4], J. Condo[5], A. Asiimwe[6]
*[1]Elizabeth Glaser Paediatric AIDS Foundation, Kigali, Rwanda, [2]University of North Carolina, Chapel Hill, United States, [3]Elizabeth Glaser Paediatric AIDS Foundation, Washington DC, United States, [4]Rwanda Ministry of Health, Kigali, Rwanda, [5]College of Medicine and Health Sciences, University of Rwanda, Kigali, Rwanda, [6]Rwanda University Teaching Hospitals, Kigali, Rwanda*
*Presenting author email: ebobrow@pedaids.org*

**Background:** In low-resource countries with unsafe replacement feeding options, HIV-infected women are advised to exclusively breastfeed (EBF) for the first six months while on a regimen of antiretroviral therapy (ART). The Kabeho (Kigali Antiretroviral and Breastfeeding Assessment for the Elimination of HIV) Study is an observational prospective study of 24 month HIV-free survival of infants born to HIV-positive women attending antenatal clinics participating in the Rwanda National Prevention of Mother-To-Child Transmission (PMTCT) program, implementing lifelong ART, ('Option B+'). These analyses evaluated individual and facility factors associated with duration of EBF to 6 months postpartum.
**Methods:** HIV-positive women from 14 health facilities in Kigali were followed at monthly clinic visits. Self-reported infant feeding practices were recorded at each visit. We estimated longitudinal logistic regression models of EBF including all observations up to 6.5 months of age (n=3295 observations, 590 infants surviving>2 days). We considered individual and facility-level factors.
**Results:** Overall, 97.6% of mothers initiated breastfeeding; however, EBF declined rapidly after first 3 months postpartum. By 6.5 months, less than half (43%) of infants were exclusively breastfed (Figure 1). Likelihood of EBF was significantly lower among women with higher education, living in households with higher socioeconomic status, and with a twin or cesarean delivery. A higher facility factor score (more staff training related to infant feeding) and provision of infant feeding counseling were strongly associated higher likelihood of EBF across all ages.
**Conclusions:** Results show that adherence to 6 months of EBF rapidly declined after 3 months postpartum in Kabeho mothers. Given the strong association of facility factors with EBF, Option B+ programs should focus on improving infant feeding counseling at facilities by staff well-trained in comprehensive infant feeding and support.



*[Figure 1. Prevalence of any and exclusive breastfeeding among Kabeho infants]*

## THPEC245

### PRENATAL DEPRESSION EFFECTS ON EXCLUSIVE BREASTFEEDING PRACTICE AMONG HIV-INFECTED WOMEN IN KWAZULU-NATAL, SOUTH AFRICA

E. Tuthill[1,2,3], J. Pellowski[4], S. Young[5], L. Butler[6,7]
*[1]University of Connecticut, School of Nursing, Storrs, United States, [2]University of Connecticut, Center for Health, Intervention and Prevention, Storrs, United States, [3]University of California, School of Nursing, San Francisco, United States, [4]Warren Alpert Medical School of Brown University, Department of Psychiatry and Human Behavior, Providence, United States, [5]Cornell University, Department of Population Medicine and Diagnostic Science, Ithaca, United States, [6]Harvard Medical School, Department of Pediatrics, Boston, United States, [7]Boston Children's Hospital, Department of Medicine, Division of General Pediatrics, Boston, United States*
*Presenting author email: jennifer_pellowski@brown.edu*

**Background:** Exclusive breastfeeding (EBF) provides infants with optimal nutrition in early life, and together with appropriate antiretroviral therapy has also been shown to decrease the rate of mother-to-child transmission of HIV from 45% to less than 1%. However, rates of EBF are particularly low in South Africa, where rates of HIV are some of the highest in the world. Determining the barriers and facilitators of EBF among postpartum women living with HIV is necessary to identify possible points of intervention. Although perinatal depression has been identified as a potential barrier to EBF, we understand very little about perinatal depression rates among HIV-infected women, and its impact on EBF.
**Methods:** A cohort study was conducted as part of a pilot randomized controlled trial examining the effect of a information, motivation and behavioral skills-based intervention promoting EBF among Black South African women living with HIV in their third trimester (28-42 weeks) of pregnancy. Women were recruited from two antenatal clinics near Pietermaritzburg, South Africa. At baseline, participants were interviewed on demographic variables, prenatal depression symptoms (PHQ-9), and their intentions to EBF. Postpartum, women were asked about their depression symptoms (PHQ-9) and breastfeeding behavior. Multivariate logistic regressions were built to determine predictors of EBF at six-weeks postpartum.
**Results:** A total of 68 women (34 intervention, 34 control) were enrolled and 58 women completed both assessments. Most (80.9%) of the sample reported symptoms of depression prenatally. Rates of depression were lower postpartum (47.1%). In multivariate models, higher prenatal depression scores significantly predicted lower rates of EBF at six weeks postpartum after adjusting for demographics, condition, and intentions (AOR=0.68, $p < 0.05$). However, postpartum depression was not a significant predictor of EBF rates (AOR=0.96, p=0.995). Compared to women who did not live with their mother, women who lived with their mother had greater odds of EBF (AOR=51.77).
**Conclusions:** These findings demonstrate the negative impact of prenatal depression on breastfeeding behavior. Future interventions focused on depression are warranted and depression screening/interventions during pregnancy could identify those at risk for sub-optimal EBF. Improving maternal psychosocial well-being could be a new frontier to improving IYCF and reducing peri/postnatal transmission.

## THPEC246

### PERFORMANCE OF OPTION B+ IN A POSTPARTUM COHORT OF HIV-SEROPOSITIVE WOMEN IN NAIROBI, KENYA

E. Muriuki[1,2], J. Kiarie[3,4,5], G. Mwende Ngwei[2], C. Farquhar[1], A. Roxby[1]
*[1]University of Washington, Seattle, United States, [2]University of Nairobi, Nairobi, Kenya, [3]World Health Organization, Human Reproduction Program, Geneva, Switzerland, [4]University of Nairobi, Obstetrics and Gynaecology, Nairobi, Kenya, [5]Kenyatta National Hospital, Obstetrics and Gynaecology, Nairobi, Kenya*
*Presenting author email: ericmcire@yahoo.com*

**Background:** Option B+ for prevention of mother to child HIV transmission (PMTCT) is being implemented to streamline women's access to antiretroviral therapy (ART) during and after pregnancy and reduce maternal HIV RNA levels. During widespread rollout, it is important to examine Option B+ performance in real-world settings, especially given concerns over postpartum adherence to ART.
**Methods:** Option B+ rollout occurred during an ongoing observational cohort study of 66 HIV-seropositive postpartum women at a maternal child health clinic. Women's participation in the PMTCT care cascade, ART adherence, CD4 counts and HIV RNA levels were assessed after 6 weeks postpartum.
**Results:** We included 49 HIV-seropositive women who engaged in PMTCT at least 3 months after Option B+ rollout. Median postpartum CD4 count was 558 cells/mm$^3$ (interquartile range: 407). The PMTCT care cascade was functioning well: 100% of women reported enrolling in the on-site ART clinic, 98% reported maternal cotrimoxazole, 95% reported infant ART at delivery, 98% reported infant breastfeeding ART prophylaxis, 98% of women initiated ART, and 100% of women were exclusively breastfeeding at 6 weeks postpartum. Most women (94%) reported receiving adherence counseling. Self-reported adherence was high; 5 women reported missing 1-2

doses/month and 3 women reported missing 1-2 doses/week. However, among 46 women with plasma tested, 18 women (39%) had detectable HIV RNA. Specifically, 7 women had < 1,000 copies/ml detected, 2 women had 1,000 - 9,999 copies/ml and 9 women (20%) had >10,000 copies/ml (range 11,706 copies/ml - 201,974 copies/ml). No women reported drug stockouts. Efavirenz-containing regimens were used by 42 women (85%) and were equally distributed among virally suppressed and non-suppressed women.
**Conclusions:** Among postpartum women taking Option B+ ART at a public PMTCT clinic, one-quarter of women had plasma HIV levels consistent with virologic failure (>1,000 copies/ml). This occurred despite a high-performing PMTCT care cascade, women reporting ART medication adherence, no drug stockouts, and despite use of efavirenz-based regimens which are highly effective. Postpartum HIV RNA testing should be implemented to protect breastfeeding infants whose mothers are not virally suppressed.

## STRATEGIES TO INCREASE HIV TESTING IN PREGNANT WOMEN AND THEIR PARTNERS

### THPEC247

#### RAPID POINT-OF-CARE HIV AND SYPHILIS TESTING INCREASES UPTAKE OF TESTING AMONG AMONG PREGNANT WOMEN ATTENDING ANTENATAL CLINICS IN CHINA

Q. Wang, PMTCT study group
*National Center for Women and Children's Health, China CDC, Prevention Mother to Child Transmission, Beijing, China*
*Presenting author email: qianawang@chinawch.org.cn*

**Background:** WHO recommends combined screening for syphilis and HIV among pregnant women using rapid tests to reduce delays in diagnosis and accelerate early treatment. The usual turnaround time from screening to results in the national antenatal programme ranges from 1 to3 days. We assessed the feasibility and acceptability of using dual HIV/syphilis rapid tests (RDT) with same day results.
**Methods:** Pregnant women attending antenatal clinics in 21 rural and urban township hospitals, in two counties of Guangdong and Anhui were included. Free dual RDT was offered in addition to the routine obstetric blood tests that included HIV and syphilis. Outcomes include testing uptake before and with concurrent dual RDT use, including feasibility and acceptability. Regression modelling examined predictors for acceptance of RDT testing.
**Results:** In total, 1787 pregnant women attending antenatal care were enrolled. Testing uptake among pregnant women in their first and second trimester increased from 76.0% (2438/3269) before the study to 90.1% (1626/1787) with concurrent RDT use ($\chi^2$=197.1, $P$<0.001). Positive RDT screening results for HIV and syphilis were 0.06% (1/1787) and 1% (18/1787), respectively. RDT results were 100% concurrent with national confirmatory tests. Regression analysis indicated that women who did not receive syphilis or HIV testing before were less likely to receive dual RDT (OR=0.28, 95% CI [0.10, 0.75]). Acceptance for dual RDT testing at the second or third antenatal visit was less likely compared to the first visit (OR=0.37, 95% CI [0.15, 0.94]). Interviews of the pregnant women showed RDTs use with same day results was feasible.
**Conclusions:** Dual HIV/syphilis RDT with same day results increased uptake of HIV and syphilis testing among pregnant women, at decentralized health facilities. Given the diversity of testing capacities among health services especially in rural areas, the dual RDT is feasible to implement and is a tool to improve testing services in antenatal care.

### THPEC248

#### MALE PARTNER INVOLVEMENT IS ASSOCIATED WITH IMPROVED ART RETENTION AND ADHERENCE IN MALAWI'S OPTION B+ PROGRAM

A. Wesevich[1,2], T. Mtande[1], F. Saidi[1], C. Stanley[1], M. Hosseinipour[1,3], I. Hoffman[1,3], W. Miller[4], N.E. Rosenberg[1,4]
*[1]UNC Project, Lilongwe, Malawi, [2]Washington University, St. Louis, United States, [3]University of North Carolina, Chapel Hill, United States, [4]University of North Carolina, Department of Epidemiology, Chapel Hill, United States*
*Presenting author email: nora_rosenberg@unc.edu*

**Background:** Through Malawi's Option B+ program, all HIV-infected pregnant women are offered free lifelong antiretroviral therapy. Within Option B+, mother to child transmission is negligible among women who remain in care and adherent to drugs. However, many women face challenges with retention and antiretroviral therapy (ART) adherence, and it is not known whether male partner recruitment programs could enhance retention and adherence.
**Methods:** From March 2014 to January 2015, a randomized controlled trial was conducted in the antenatal clinic at Bwaila District Hospital in Lilongwe, Malawi. The trial compared two strategies for helping HIV-infected pregnant women recruit their male partners for couple HIV testing and counseling (HTC): invitation only versus invitation plus phone and community tracing. This analysis was conducted among the entire cohort (N=200) of HIV-infected pregnant women, irrespective of randomization status. We assessed whether those who presented for couple HTC in the four weeks after diagnosis were more likely to be retained in ART care one month later. Retention was based on clinical records. Among these women, we assessed whether ART reminders by male partners were associated with ART adherence. ART adherence was dichotomized into those who had taken >90% versus ≤90% of their pills based on clinician pill count.
**Results:** Two-hundred HIV-infected pregnant women were included in this analysis; 126 of their partners presented to the clinic for couple HTC (52 in the invitation only arm, 74 in the invitation plus tracing arm). Median age of women was 26 years. Most women (86.5%) were retained; of these 69.3% had >90% adherence. Women who received couple HTC with their partners had 4.2 times the odds of being retained (95% CI 1.8, 9.9 ). Among these women, those with partner reminders had 2.0 times the odds of >90% adherence (95% CI 1.0-4.1).
**Conclusions:** Couple HTC was associated with substantially higher retention in care for HIV-infected pregnant women. Many of these male partners reminded women to take pills, and this, in turn, supported better adherence. Partner recruitment programs could play an important role in improving Option B+ retention and adherence.

### THPEC249

#### EXPERIENCES AND PERSPECTIVES OF HOME-BASED HIV TESTING AMONG PREGNANT COUPLES IN KENYA: A QUALITATIVE STUDY WITHIN A RANDOMIZED CLINICAL TRIAL

D. Krakowiak[1], A. Osoti[1,2], P. Makabong'o[3], M. Goyette[1], J. Kinuthia[2,4], V. Asila[3], M.A. Gone[3], C. Farquhar[1,5,6]
*[1]University of Washington, Department of Epidemiology, Seattle, United States, [2]Kenyatta National Hospital, Department of Obstetrics and Gynecology, Nairobi, Kenya, [3]University of Nairobi, Nairobi, Kenya, [4]Kenyatta National Hospital, Department of Research and Programs, Nairobi, Kenya, [5]University of Washington, Department of Medicine, Seattle, United States, [6]University of Washington, Department of Global Health, Seattle, United States*
*Presenting author email: alfredos@uw.edu*

**Background:** Testing men for HIV as part of antenatal care has been identified as an important but difficult component of prevention-of-mother-to-child transmission (PMTCT). Home-based testing has been explored as a method of engaging male partners. The objective of this qualitative study was to better understand participant experiences and perspectives of the Home-based Partner Education and Testing (HOPE) intervention.
**Methods:** The HOPE Study randomized pregnant women attending the antenatal clinic at the Kisumu County Hospital in Kenya to home-based couple HIV testing (HOPE) (n=306) or to clinic invitation for partners (INVITE) (n=295) and followed them to 6 months postpartum. Couples who received the HOPE intervention and had not yet exited the study were eligible to participate in individual and couple in-depth interviews. Twenty-one couples were purposively sampled based on HIV status (9 seroconcordant negative, 8 serodiscordant, 3 seroconcordant positive, 1 seroconcordance status unknown). Two coders created a codebook, independently coded, reconciled codes and identified major themes.

| |
|---|
| „It [home testing] is a good method. That is the only way you could reach out to those who are afraid [...] she brings you along the way my wife did and you found me in the house because most men do not escort their wives to the clinic. That is the only way you could reach the other villagers when their wives are expecting." (P6, concordant negative male, age 39) |
| „I think that [home-based couple testing] was also good because there are some people who don't disclose their status to their spouses so if you are tested together the woman knows and the husband also." (P18, discordant positive male, age 26) |
| „The experience was nice, because you know you are free, you are in the house, you know at the hospital you fear those who are there, the nurses and the doctors, you will fear they may know that you are positive, or know your status and maybe they know you they will go to advertise, unlike in the house." (P11, concordant negative female, age 27) |
| „It [being part of the home testing visit] was easy, I have had it easy considering the thoughts I had before this visit, after we were tested and knew our HIV status, we had many thoughts, but after the education we got from the visit, all these days, I lost the thoughts and felt light." (P1, discordant negative male, age 23) |
| „It [the visit] has brought a good one [difference] because we are now staying with peace because everyone knows each other's status so we live well." (P17, concordant positive female, age 27) |
| „I would not like someone from the community, because they come out with it openly. They would put it in a different way to spoil your name. I prefer someone who comes from a place where I don't know [a stranger]. Someone who knows you will speak about it [your status] to others but those who come from outside [far from the community] will keep your secret." (P21, discordant positive male, age 28) |

*[Representative quotes for home-based couple HIV testing facilitating partner testing and disclosure, affording privacy, and improving relationships]*

**Results:** Several major themes emerged: home-based couple testing facilitated partner testing and disclosure, was preferred over clinic-based testing due to privacy and quality time, helped participants overcome their fear of testing, and improved relationships following disclosure. These themes were present in both individual and couple interviews and irrespective of gender or seroconcordance status. These qualitative results explain quantitative outcomes of a greater than 2-fold increase and 85% uptake of testing and rates of disclosure when comparing HOPE vs. INVITE in the parent study. Couples overwhelmingly gave positive feedback for the HOPE intervention, although when asked about being visited by a local community health worker instead of a non-local health worker, most were opposed due to concerns of confidentiality.
**Conclusions:** Home-based couple HIV testing was highly acceptable to both men and women. Home testing was regarded as more private and better at engaging male partners than clinic testing; however, concerns of confidentiality pertaining to type of health worker will need to be considered when scaling up this intervention.

# INCREASING COVERAGE AND QUALITY OF PREVENTION OF VERTICAL TRANSMISSION PROGRAMMES

## THPEC250

### TIMELY DELIVERY OF ANTIRETROVIRAL PROPHYLAXIS DURING PREGNANCY EFFECTIVELY REDUCES HIV MOTHER TO CHILD TRANSMISSION IN HIGH HIV PREVALENCE AREAS IN CHINA: A PROSPECTIVE OBSERVATIONAL STUDY DURING 2004-2011

Q. Wang, PMTCT Study Group
*National Center for Women and Children's Health, China CDC, Prevention Mother to Child Transmission, Beijing, China*
*Presenting author email: qianawang@chinawch.org.cn*

**Background:** China has drastically scaled up HIV surveillance, care and treatment since 2004. This study investigates the improvement of the prevention of mother-to-child transmission of HIV (PMTCT) over the period of 2004-2011.
**Methods:** An institution-based prospective study was conducted among HIV-positive pregnant women and their children in eight counties across China. Information of HIV transmission and antiretroviral prophylaxis (ARV) were collected. Associated factors of mother-to-child transmission was analyzed using regression analysis.
**Results:** A total of 1,387 HIV+ pregnant women and 1,377 HIV-exposed infants were enrolled. The proportion of pregnant women who received HIV testing increased significantly from 45.1% to 98.9% during the study period 2004-2011. Among these women, the proportion that received ARV prophylaxis increased from 61% to 96%, and the corresponding coverage in children increased from 85% to 97% during the same period. Notably, 87.7% of HIV+ pregnant women are receiving multi-ARVs in 2011, significantly improved from 2.8% in 2004. In contrast, the proportion required a made-up ARV regimen during delivery declined substantially from 97.9% to 12.7%. As a result, vertical transmission of HIV in this population significantly declined from 11.1% in 2004 to 1.2% in 2011. Regression analysis indicated that women who had vaginal delivery (in comparison with emergency Caesarian-section (OR=0.46; 0.23-0.96) and mothers on multi-ARVs (OR= 0.11; 0.04-0.29) were less likely to transmit HIV to their newborns.
**Conclusions:** Increasing HIV screening among pregnant women and exposed children has improved timely HIV care and prophylaxis to reduce vertical transmission of HIV. Early and consistent treatment with multi-ARVs during pregnancy is vital for PMTCT.

## THPEC251

### INTEGRATING PREVENTION OF MOTHER TO CHILD TRANSMISSION OF HUMAN IMMUNODEFICIENCY VIRUS, SYPHILIS AND HEPATITIS B VIRUS: CHINA'S STEP-WISE SUCCESS MODEL

A. Wang[1], Y. Qiao[1], F. Wang[1], L. Wang[2], X. Jin[1], J. Qiu[3], L. Fang[2], X. Wang[1], Q. Wang[1], J. Wu[1], Y. Yang[4], R.W. Scherpbier[4], L. Song[3]

*Presenting author email: ailing@chinawch.org.cn*

**Background:** Elimination of mother-to-child transmission (EMTCT) of HIV and syphilis is a global public health priority. To address the challenge of preventing vertical transmission of HIV, syphilis and hepatitis B virus (HBV), China developed a step-wise approach, integrated within the existing health system: the integrated prevention of mother-to-child transmission of HIV, syphilis and HBV (iPMTCT) model.
**Description:** China's PMTCT of HIV programme was initiated in one rural county in 2003, expanded to include three vertically-transmitted diseases (HIV, syphilis and HBV) in 2010, and gradually scaled-up to all counties by 2015. Integrated within the existing maternal and child health (MCH) system, free testing was provided to pregnant women accessing antenatal care (ANC) services, with free iPMTCT interventions for all infected pregnant women and exposed children. The adjusted mother-to-child-transmission rate of HIV was 6% in 2014, an 82% reduction since iPMTCT inception. From 2011 to 2014, reported congenital syphilis decreased by 30%, while the number of HBV-exposed neonates receiving Hepatitis B immunoglobulin (HBIG) increased by 172% (Table 1).

| Characteristic | 2009 | 2010 | 2011 | 2012 | 2013 | 2014 |
|---|---|---|---|---|---|---|
| Millions of PW attending ANC | 4.4 | 5.5 | 9.4 | 12.1 | 13.1 | 13.8 |
| Millions of PW tested for HIV (%) | 3.7 (85.4) | 4.8 (88.8) | 8.7 (93.0) | 11.6 (96.4) | 12.7 (97.3) | 13.6 (98.2) |
| No. of PW diagnosed with HIV (%) | 3 662 (0.10) | 4 146 (0.09) | 5 313 (0.06) | 5 779 (0.05) | 5 973 (0.05) | 6583 (0.05) |
| MTCT rate of HIV (%) | 8.1 | 7.9 | 7.4 | 7.1 | 6.7 | 6.1 |
| Millions of PW tested for syphilis (%) | NA | NA | 7.3 (85.0) | 11.5 (95.1) | 12.6 (96.4) | 13.7 (99.5) |
| No. PW diagnosed with syphilis (%) | NA | NA | 14 822 (0.20) | 24 307 (0.21) | 30 520 (0.24) | 31 757 (0.23) |
| No. reported congenital syphilis | 10 032 | 12 477 | 13 294 | 12 166 | 10 032 | 9 252 |
| Millions of PW tested for HBV surface antigen (%) | NA | NA | 7.7 (89.3) | 11.7 (97.1) | 12.7 (97.4) | 13.6 (98.9) |
| No. of HBV exposed neonates received HBIG (%) | NA | NA | 301 048 (86.2) | 599 071 (94.4) | 774 916 (97.7) | 819 211 (98.7) |

*[Table 1. China's iPMTCT model, 2009-2014]*

**Lessons learned:** The iPMTCT-model proved to be feasible and effective in China. National laws and strategic plans were released to create an enabling environment, Government investments increased 220-fold from USD 973,000 in 2003 to USD 215 million USD in 2015. To promote equitable access to MCH and PMTCT services, iPMTCT was included in the National Essential Public Health Programme in 2009, while the National Cooperative Medical Scheme helped increase timely utilization of MCH services among the most vulnerable population.
**Conclusions/Next steps:** Government commitment and a step-wise approach were critical for the success of China's iPMTCT-model. To achieve global EMTCT goals, China's iPMTCT-model will need to focus on further reducing provincial disparities in coverage and quality of care, and strengthening iPMTCT surveillance.

## THPEC252

### THE LAST MILE IN ELIMINATING MOTHER TO CHILD TRANSMISSION OF HIV: ADDRESSING REMAINING LEAKAGES IN THE PREVENTION OF MOTHER TO CHILD TRANSMISSION (PMTCT) CASCADE IN RURAL KWAZULU-NATAL, SOUTH AFRICA

H.M.N. Yapa[1], T. Chetty[1], C. Herbst[1], T. Bärnighausen[1,2]
*[1]Africa Centre for Population Health, University of KwaZulu-Natal, Mtubatuba, South Africa, [2]Harvard T S Chan School of Public Health, Boston, United States*
*Presenting author email: myapa@africacentre.ac.za*

**Background:** With the UNAIDS call for virtual elimination of mother-to-child transmission by 2015, PMTCT interventions are high on the international health agenda, but health systems imperfections lead to large numbers of vertical transmission in

Tuesday 19 July
Wednesday 20 July
Thursday 21 July Poster Exhibition
Friday 22 July
Late Breaker Posters
Author Index

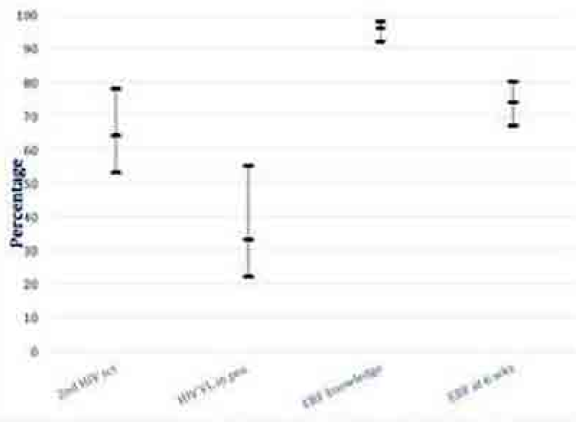
many countries. Despite recent PMTCT successes in South Africa, HIV seroconversions and inadequate HIV virologic suppression during pregnancy remain a concern. Repeat HIV testing and viral load (VL) monitoring are therefore key process elements in optimising PMTCT programmatic success.

**Methods:** The Africa Centre for Population Health is located in a rural socio-economically deprived area of uMkhanyakude district, KwaZulu-Natal. There are 7 primary health care facilities in the Africa Centre Demographic Surveillance Area (DSA). Ethical approval for the study was obtained from the University of KwaZulu-Natal Biomedical Research Ethics Committee and National Department of Health.

We photographed routine antenatal clinic data from maternity case records (MCRs), infant road-to-health booklets (RtHB), and interviewed locally resident women aged ≥18 years from delivery to 6 weeks postpartum.

Data extracted were *HIV screening practices* of HIV-negative women from first antenatal booking, *HIV VL testing* of HIV-infected pregnant women, *knowledge of early infant feeding* and *self-reported feeding practices*. We present the first 2 months of data collected between 15 July 2015 and 15 September 2015.

**Results:** We recruited 250 participants. HIV prevalence amongst all antenatal clients aged ≥18 years was 48 % (95% CI 41-54%), similar to previous DSA studies. Other results are depicted in Figure 1.



*[Figure 1: Potential leakages in PMTCT cascade at 7 primary health care facilities in rural KwaZulu-Natal]*

**Conclusions:** Repeat HIV screening of pregnant women in this very high HIV-prevalence setting is inadequate. Very low HIV VL testing rates may reverse PMTCT programmatic successes. However other potential gaps in infant feeding knowledge and practice were not found. Health systems innovations, including quality improvement interventions (e.g. MONARCH study ongoing at DSA clinics), are urgently needed to bridge final gaps in achieving complete elimination of MTCT.

## THPEC253

### DOES BIRTH HIV-PCR DIAGNOSTIC TESTING OF HIV-EXPOSED INFANTS REDUCE FOLLOW-UP FOR HIV-PCR DIAGNOSTIC TESTING AT 4-14 WEEKS OF AGE?

E. Kalk[1], M. Kroon[2,3], A. Boulle[1,4], M. Osler[1], J. Euvrard[1], K. Stinson[1,5], V. Timmerman[1], M.-A. Davies[1]

*[1]University of Cape Town, Centre for Infectious Disease Epidemiology and Research, Cape Town, South Africa, [2]Mowbray Maternity Hospital, Cape Town, South Africa, [3]University of Cape Town, Department of Paediatrics, Cape Town, South Africa, [4]Provincial Government of the Western Cape, Department of Health, Cape Town, South Africa, [5]Médecins Sans Frontières, Cape Town, South Africa*

*Presenting author email: emma.kalk@uct.ac.za*

**Background:** Routine or targeted HIV-PCR testing of HIV-exposed infants at birth could improve early infant diagnostic (EID) yield. Those testing negative at birth require repeat testing approximately 3 months later to detect intrapartum transmission. Receipt of a negative birth test result may reduce repeat testing rates. We examined whether a negative birth result decreases follow-up testing at 4-14 weeks.

**Methods:** We included live infants born to HIV-infected women who received antenatal care (ANC) and/or delivered at a Midwife Obstetric Unit in Cape Town, South Africa between February 2014 and March 2015. In August 2014 targeted birth testing was introduced for infants at "high risk" for HIV transmission (< 3 months maternal ART, maternal viral load >1000 copies/ml, no ANC, infant < 37 weeks gestation or birth weight < 2.5kg). Using logistic regression we examined whether a negative birth result was associated with reduced follow-up for routine testing at 4-14 weeks, adjusting for other predictors of EID.

**Results:** The cohort included 870 mother-infant dyads; 540 (62%) met ≥1 "high risk" criterion of whom only 16% received birth EID. Overall vertical transmission was 1.2%; 3.96% of birth tests were positive versus 0.31% at 4-14 weeks. Birth EID was significantly more likely with the following characteristics: HIV diagnosis at first ANC, seroconversion after first ANC, <3 months maternal ART, infant <37 weeks gestation or birth weight <2kg. EID at 4-14 weeks was performed in 74% of infants. Those with negative birth test results were less likely to test at 4-14 weeks (aOR 0.53; 95%CI: 0.34-0.84).

| | All infants (n = 870) | | Birth test (n = 870) | | | 4 - 14 week test (n=866) (excludes 4 infants who were diagnosed as HIV-infected at birth) | | | |
|---|---|---|---|---|---|---|---|---|---|
| Mother/infant characteristic | n | % | no (n=769) | yes (n=101) | p-value | no (n=229) | yes (n=637) | p-value | aOR (95%CI) |
| Maternal age ≥35 years | 149 | 17% | 17% | 18% | 0.844 | 12% | 19% | 0.02 | 1.76 (1.11-2.78) |
| ≥1 antenatal visit | 743 | 85% | 89% | 85% | 0.202 | 82% | 87% | 0.058 | 1.51 (0.99-2.30) |
| Known HIV-infected at first ANC | 581 | 67% | 70% | 46% | <0.001 | 60% | 69% | 0.017 | not included |
| Seroconverted after first ANC | 27 | 3% | 3% | 7% | 0.029 | 5% | 2% | 0.031 | 0.41 (0.18-0.91) |
| On ART for <3 months | 294 | 34% | 31% | 57% | <0.001 | 37% | 32% | 0.288 | not included |
| Infant <37 weeks gestation | 36 | 4% | 3% | 12% | <0.001 | 7% | 3% | <0.023 | 0.52 (0.26-1.05) |
| Infant birth weight <2kg | 31 | 4% | 2% | 14% | <0.001 | 7% | 2% | <0.002 | not included |
| Negative birth test result | | | | | | | | | 0.53 (0.34-0.84) |

*[Table. Characteristics of mother-infants dyads grouped by timing of EID and association with testing at 4-14 weeks adjusted for variables as listed]*

**Conclusions:** In this cohort, >60% of infants had ≥1 high risk criterion for HIV transmission, with nearly 4% of birth tests being positive. Receipt of a negative birth test result was associated with reduced follow-up testing. Strengthened follow-up systems are needed to ensure adequate EID coverage.

## THPEC254

### EFFECTIVENESS OF OPTION B+ IMPLEMENTATION ON PREVENTION OF VERTICAL TRANSMISSION OF HIV IN RURAL HAITI: A CASE-CONTROL STUDY

K. Redden[1], M. Armony[2], L. Merry[1], J. Tuck[1], F. Dieudonne[2]

*[1]McGill University, Montreal, Canada, [2]Zanmi Lasante, Port-au-Prince, Haiti*

*Presenting author email: kara.redden@mail.mcgill.ca*

**Background:** In 2013, the WHO supported new protocols for prevention of vertical transmission of HIV, referred to as Option B+. There has been limited evidence to support its effectiveness in HIV endemic settings with programmatic constraints. We assessed the extent to which Option B+ was implemented officially in the Haitian context for infants and their mothers since 2013 and, whether implementation of Option B+ was associated with vertical transmission.

**Methods:** A case-control design with chart review was performed with infants born to HIV+ mothers between 2011 and 2014 at three clinical sites in rural Haiti. All accessible cases (HIV+ infants) were selected. Controls (HIV- infants) were selected using systematic sampling. Option B+ treatment for infant-mother pairs were categorized based on level of implementation (full, partial, poor) (Table 1). Descriptive analysis measured extent of eligible Option B+ implementation since 2013 in both cases and controls. Logistic regression was used to identify the association between Option B+ implementation and vertical transmission.

**Results:** Data were gathered for 28 cases and 99 controls. Of 49 infant-mother pairs pregnant after implementation in 2013 and eligible for Option B+, 16.7% of cases and 32.4% of controls had received full implementation and 33.3% of cases and 59.5% of controls had received partial implementation.

Multivariate analyses showed that full implementation (aOR=.230, 95% CI= .064-.826) and partial implementation (aOR = .291, 95% CI = .108-.782), compared to no implementation of Option B+, were not associated with an increased risk of HIV vertical transmission.

**Conclusions:** Continuing to promote Option B+ would benefit the reduction of vertical transmission in HIV endemic countries. Emphasis on improving the implementation of Option B+ in settings with programmatic constraints is warranted.

| IMPLEMENTATION OF COMPONENTS OF OPTION B+ | Full implementation (Score: 2) | Partial implementation (Score: 1) | No/Poor Implementation (Score: 0) |
|---|---|---|---|
| Component 1: ART coverage for pregnant and breastfeeding women | Full coverage without interruption once confirmed eligible per Option B+ | Coverage with interruption at any point during pregnancy, delivery or after delivery | No coverage during pregnancy or after delivery |
| Component 2: ARV prophylaxis for infant | Received fully recommended prophylaxis | Received at least some of recommended prophylaxis | Did not receive prophylaxis |
| Component 3: Infant feeding method | Exclusive breastfeeding for first 6 months | Breastfed at any point during, but not exclusively for, first 6 months | No breastfeeding at any point during first 6 months |
| **OVERALL IMPLEMENTATION OF OPTION B+** | SCORE 5-6 | SCORE 3-4 | SCORE 0-2 |

## THPEC255

### EVALUATING FACILITY INFRASTRUCTURE FOR THE PMTCT OF HIV: A 2015 SURVEY OF MAJOR DELIVERY HOSPITALS IN ATLANTA, GA

S. Smith[1], A. Chahroudi[1], A. Camacho-Gonzalez[1], M. Badell[2], S. Gillespie[1], A. Swartzendruber[3], P. Wortley[4], R. Chakraborty[1]

*[1]Emory University School of Medicine, Department of Pediatrics, Division of Infectious Diseases, Atlanta, United States, [2]Emory University School of Medicine, Department of OBGYN, Atlanta, United States, [3]Emory University, Rollins School of Public Health, Atlanta, United States, [4]Georgia Department of Public Health, HIV Surveillance, Atlanta, United States*

*Presenting author email: somer.smith@emory.edu*

**Background:** Elimination of MTCT of HIV can be achieved if each step of the perinatal HIV prevention cascade is followed. However, preventable transmission events continue to occur with 35 perinatal infections reported in Georgia [GA] (USA) between 2010-2014, and a national transmission rate of 3.1%. The objectives of this study were to assess institutional infrastructure for compliance to US guidelines for PMTCT of HIV at major delivery units in Atlanta metropolitan statistical area (MSA).

**Methods:** We conducted on-site assessments and surveys with 70 healthcare providers from 11 delivery hospitals in 2015 to evaluate institutional infrastructure and policies for PMTCT. These 11 hospitals (2 university-affiliated and 9 private) deliver 40,000 infants annually, which represents 52% of deliveries in Atlanta MSA. We assessed compliance to national recommendations through surveys addressing opt-out HIV testing in the 3rd trimester, rapid HIV testing for pregnant women with unknown status at delivery, routine testing of HIV-exposed infants, and the availability of zidovudine and nevirapine for infant prophylaxis.

**Results:** On-site surveys were completed by obstetricians, neonatologists, pediatricians, nurses and pharmacists. Based on these and evaluation of protocols and policies, 73% (n=8/11) of hospitals had limitations in PMTCT infrastructure and 36% (4/11) reported no standardized policies for care of HIV-infected pregnant women. Three units utilized opt-in HIV testing. 59% (24/41) of obstetricians did not routinely offer rapid testing at delivery to women without a 3rd trimester HIV test, 78% (32/41) omitted to offer testing at delivery if the woman declined antenatal testing. Furthermore, one facility, with over 14,000 annual births, did not have the capacity to provide rapid testing at delivery for women with unknown HIV status. Only 53% (8/15) of neonatologists and NICU nurses reported that NAAT testing of HIV-exposed infants occurred in their facility. For infant prophylaxis, oral zidovudine was available in all units, but 64% (7/11) of hospitals did not stock nevirapine suspension.

**Conclusions:** In this study we identified several infrastructure deficits that may have contributed to perinatal HIV transmission events in Atlanta MSA. There is an urgent need to address these healthcare gaps if we are to eliminate MTCT of HIV in the US.

## THPEC256

### TIMING OF PRESENTATION FOR ANTENATAL CARE AMONG HIV-INFECTED WOMEN IN CAPE TOWN, SOUTH AFRICA

A. Ronan[1], T. Phillips[1], K. Brittain[1], G. Petro[1], A. Zerbe[2], E. Abrams[2], L. Myer[1]

*[1]University of Cape Town, Cape Town, South Africa, [2]ICAP, Columbia University, New York, United States*

*Presenting author email: agnes.ronan@uct.ac.za*

**Background:** As with other maternal health interventions, effective prevention of mother-to-child transmission (PMTCT) benefits from early presentation to antenatal care (ANC). However, delayed presentation is common in South Africa. We examined the timing of ANC presentation and associated risk factors in HIV-infected (HIV+) women.

**Methods:** As part of a larger study of maternal HIV care and treatment, we enrolled consecutive HIV+ women making their first ANC visit at a primary care facility in Cape Town, South Africa. All women underwent research ultrasonography for pregnancy dating and completed a structured questionnaire. We analysed factors associated with presentation in tertiles of < 17, 17-24, and 25+ weeks' gestation; logistic regression was used to examine independent predictors of presentation >25 (late) versus ≤24 (early) weeks gestation.

**Results:** Among 1518 women, median gestational age at booking, was 21 weeks, median age was 29 years, with 40% presenting during the third trimester. Lower socioeconomic status, not being married/cohabiting and having an unplanned pregnancy increased the odds of booking late. (Table 1). Being newly HIV diagnosed in the current pregnancy was strongly associated with later booking gestation, but among women previously diagnosed, antiretroviral therapy (ART) use was not associated with booking time. In multiple logistic regression, having an unplanned pregnancy, being unemployed and having no PMTCT history were predictors of late booking (aOR 0.55; 95% CI: 0.41-0.74, aOR 0.60; 95% CI: 0.44-0.80, aOR 1.68; 95% CI: 1.18-2.39, respectively).

| | ≤17 weeks | 18-24 weeks | ≥25 weeks | Total | p-value |

| Median CD4 cell count (IQR) | 383 (257-535) | 359 (249-500) | 392 (255-542) | 383(257-534) | 0.0247 |
| Median natural logarithm of HIV viral load at enrolment (IQR) | 7.29 (3.66-9.58) | 8.22 (3.66-10.12) | 7.56 (3.66-9.53) | 7.75 (3.66-9.78) | 0.0072 |

*[Table 1: Characteristics of 1518 HIV-infected women at the time of ANC booking stratified by three categories of booking gestational age]*

**Conclusions:** Despite the availability of effective interventions, late ANC presentation remains a significant barrier to the success of PMTCT programs. These results will assist in strengthening existing interventions to ensure maximum duration of ART use during pregnancy, particularly in those newly diagnosed, who may be particularly vulnerable. There is opportunity for improved integration of HIV and reproductive care services to ensure women test regularly and access ANC services as early as possible.

## THPEC257

### INCREASING ACCESS TO VMMC SERVICES THROUGH PRIVATE PARTNERSHIP

M. Ntsupa[1], M. Mokoena[1], R. Kakaire[1], M. Tsenase[2], V. Kikaya[3]

*[1]Jhpiego - an affiliate of Johns Hopkins University, VMMC program, Maseru, Lesotho, [2]Ministry of Health, Disease Control, Maseru, Lesotho, [3]Jhpiego - an affiliate of Johns Hopkins University, Maseru, Lesotho*

*Presenting author email: mamokete.ntsupa@jhpiego.org*

**Background:** Lesotho has the second highest HIV prevalence in the world, in an effort to curb the incidence of HIV; VMMC services were initiated in early 2012 and scaled up to 14 government hospitals in the first two years of program implementation. Services were however, not accessed by some men who expressed concerns with their privacy, the usually long queues and crowded waiting areas at public facilities. In an effort to reach out to these clients, Jhpiego approached private doctors to provide VMMC free of charge

**Methods:** The objective of the partnership was to determine the feasibility of VMMC and HIV testing at the private clinics. Private clinics capacity to provide high-volume VMMC was done using the Lesotho VMMC site assessment tool. Three Clinics were assessed in 2014 and met the required standards and criteria partnered

Tuesday 19 July

Wednesday 20 July

Author Index

with Jhpiego from June 2014. An additional five clinics were assessed and partnered with Jhpiego in 2015. Jhpiego provided VMMC training to teams, each comprising of a doctor, two nurses and a counselor, from the partner clinics. Jhpiego contributed with MC kits, as well as mentorship and compensated for the time worked by private providers.
**Results:** Through this partnership, 697 clients were circumcised at three private clinics between June and December 2014. This number contributed 3.6% to the 19,543 achieved during the 2014 winter campaign. A total of 835 males were circumcised at eight clinics during the winter campaign of 2015, bringing to 1,532 the number of men reached through this approach during both campaigns. Of these, 478 males were aged between 15-29 years. This translates to 31% of adult males who received services. The model improved the number of men testing at the private clinics during these periods with 100 men (6.5%) testing HIV positive and 52 were successfully linked to care and treatment.
**Conclusions:** Access to VMMC/ HIV services can be improved by using independent providers. This is an opportunity in a context such as Lesotho where men have raised concern in the quality of customer care at public facilities. Active participation of private practitioners increases uptake of VMMC services.

## PREVENTION OF VERTICAL TRANSMISSION SERVICES FOR MARGINALIZED GROUPS

#### PREGNANCY, HIV, AND DENIAL OF ANTENATAL CARE AMONG FEMALE SEX WORKERS IN SOUTHERN TANZANIA: IMPLICATIONS FOR ELIMINATION OF VERTICAL TRANSMISSION

S. Beckham[1], S. Likindikoki[2], N. Galai[3], A. Mwampashi[4], C. Shembilu[4], A. Mantsios[1], A. Leddy[1], W. Davis[3], J. Mbwambo[2], D. Kerrigan[1]
*[1]Johns Hopkins School of Public Health, Health, Behavior and Society, Baltimore, United States, [2]Muhimbili University of Health and Allied Sciences, Psychiatry, Dar es Salaam, Tanzania, United Republic of, [3]Johns Hopkins School of Public Health, Epidemiology, Baltimore, United States, [4]Muhimbili University of Health and Allied Sciences, Dar es Salaam, Tanzania, United Republic of*
*Presenting author email: sarah.beckham@jhu.edu*

**Background:** Female sex workers (FSW) are more likely to be discriminated against in health care settings, limiting access to HIV services, including prevention of mother-to-child transmission (PMTCT). Prior qualitative research in Iringa, Tanzania found FSW and other unmarried women were denied HIV testing and ANC services if they did not bring their husbands/partners to the clinic. Here we describe FSW's pregnancy experiences in the context of their HIV risk and quantify prior qualitative findings related to access to ANC.
**Methods:** A Phase II randomized-controlled trial is being conducted in Iringa, Tanzania to evaluate the effectiveness of community empowerment-based combination HIV prevention among venue-based FSW. Venue-day-time sampling was used to recruit FSW, who were consented, tested for HIV, and surveyed for baseline. Logistic regression was used to compare pregnancy and ANC access by HIV-serostatus.
**Results:** Approximately 40% of participating FSW (101/254) were HIV seropositive at baseline. HIV+ women were significantly older (p-value=0.000) and had higher odds of being formerly married
(OR 2.86 [95% CI 1.58-5.18]). Ninety-four percent of the sample had previously been pregnant, 3% were currently pregnant; and 19% were trying to conceive (35% of those HIV+). About 58% of recent pregnancies were unintended, and this was lower among HIV+ women, but statistically insignificant (OR 0.73 [95% CI 0.43-1.23]). There was no difference by HIV status in seeking ANC for most recent pregnancy. Significantly fewer HIV-seropositive mothers had been told to bring a husband/partner to ANC for HIV testing (OR 0.40 [95% CI 0.17-0.97]). Thirty women (13.6% of 220), including 11 who tested seropositive at baseline, were denied ANC because they did not bring husbands to the clinic. Being unmarried was not associated with denial of ANC (0.90 [0.38-2.17]), but unmarried women had lower odds of seeking ANC (91% vs. 98%, p-value=0.08).
**Conclusions:** Given the high HIV-risk contexts in which FSW work, including risk of unintended pregnancy, reproductive health services including ANC must be tailored to fit FSW's needs. Denial of ANC and thus PMTCT to unmarried women is an alarming and counterproductive practice which hurts the most at-risk women and their future children.

### THPEC259

#### INTIMATE PARTNER VIOLENCE AND VERTICAL HIV TRANSMISSION: CAUSAL PATHWAYS AND PROTECTIVE FACTORS FOR PMTCT ADHERENCE

A. Hatcher[1,2], N. Christofides[3], H. Stöckl[4], C. Pallitto[5], N. Woollett[1], C. Garcia-Moreno[5], J. Turan[6]
*[1]University of the Witwatersrand, Wits Reproductive Health and HIV Institute, Johannesburg, South Africa, [2]University of California, San Francisco, United States, [3]University of the Witwatersrand, School of Public Health, Johannesburg, South Africa, [4]London School of Hygiene and Tropical Medicine, London, United Kingdom, [5]World Health Organization, Department of Reproductive Health and Research, Geneva, Switzerland, [6]University of Alabama Birmingham, Birmingham, United States*
*Presenting author email: ahatcher@wrhi.ac.za*

**Background:** Although prevention of mother-to-child transmission (PMTCT) can virtually eliminate vertical HIV transmission, only 65% of women complete all PMTCT steps. The PMTCT coverage gap may be related to intimate relationships, yet little is known about how partner dynamics influence HIV-related health behaviors around the time of pregnancy.
**Methods:** We conducted 32 qualitative interviews with HIV-positive pregnant and postpartum women who also experienced intimate partner violence (IPV). IPV was assessed through the WHO Multi-country Study instrument and in-depth interviews covered topics related to the woman's pregnancy, HIV testing, the PMTCT cascade, and intimate relationships. Interviews were transcribed verbatim, double-coded and thematically analysed using Dedoose software.
**Results:** Women reported physical, sexual, and emotional violence in pregnancy and postpartum. IPV negatively impacted PMTCT behaviors through several key pathways. A predominant pathway was mental health, with IPV causing feelings of depression and hopelessness that resulted in views that "life is not worth living" and led to skipped medication. Fear of partner disclosure was a second pathway, with women choosing not to disclose because they anticipated a violent reaction. Some women found ways to take daily medication by hiding it, disguising it as other medicine, or moving out from their partner's home. A third pathway was partner control and isolation, where men's abusive strategy of reducing a woman's access to friends and family had concomitant negative effects on her HIV behaviors. Overall, self-reported PMTCT uptake was high, partly due to protective factors. Women reported "striving for motherhood" as a coping technique, reminding themselves that their own health was important for the wellbeing of the baby. The desire to protect one's infant seemed to overcome some of the PMTCT adherence risks related to IPV.
**Conclusions:** Adherence to PMTCT is essential to prevent vertical HIV transmission, but women living with IPV face multiple pathways to non-adherence: mental health challenges, partner non-disclosure, and isolation. Protective factors like striving for a healthy baby and motherhood may attenuate the negative relationship between violence and PMTCT. Addressing IPV in antenatal care can ensure the health of mothers and infants and may enhance PMTCT coverage in this marginalized group.

### THPEC260

#### ASSESSING THE CONCORDANCE OF SUPERVISED SELF-TESTING USING AN ORAL FLUID-BASED HIV RAPID TESTING METHOD AMONG PREGNANT WOMEN IN RURAL INDIA

P. Verma Shivkumar[1], A. Sarkar[2], G. Mburu[3], P. Sharma[2], R. Durgan[2], J. Behera[2], S.K. Mishra[2], S. Mehra[2]
*[1]Mahatma Gandhi Institute of Medical Sciences, Wardha, India, [2]MAMTA Health Institute for Mother & Child, New Delhi, India, [3]International HIV/AIDS Alliance, Brighton, United Kingdom*
*Presenting author email: archanas@mamtahimc.org*

**Background:** HIV self-testing offers the potential to increase coverage of essential HIV services. This study aimed to establish concordance of supervised HIV self-testing through inter-rater agreement among pregnant women and rural community health workers (CHWs) in rural India.
**Methods:** A cross-sectional mixed methods study was conducted among 202 consenting pregnant women in a rural Indian hospital for six months. Participants were provided with instructions on how to self-test, and subsequently asked to self-test supervised by community health worker (CHW), using OraQuick® HIV antibody test. Test results were observed and interpreted first by participants in a private room and then by the health worker independently. To determine the ability of women to interpret the test results accurately, participants were provided with three pictorial model test results (positive, negative, and an invalid result). Subsequently, the CHWs recorded both their own as well as participants' interpretations of results. Instruction guides available with each OraQuick® test kit were used to orient the CHWs on the procedures of testing and interpreting results. To orient participants on self-testing, a simplified version of the self-testing protocol with pictorial representation was used. Concordance for self-testing was reported as the measure of agreement of the test result interpretation between a participant and a health

worker, quantified as a percentage agreement and with the Cohen's Kappa (k) inter-rater agreement. All statistical analyses were performed using IBM SPSS Statistics v.22.
**Results:** Overall, 92.6% participants reported that the instructions for the test were easy to understand, 18.7% required the assistance of a supervisor to self-test. Concordance of test result interpretation between community health workers and participants was 98.5% with a Cohen's Kappa (k) value of k=0.566 with p< 0.001 for inter-rater agreement. Two test results were deemed as HIV positive by both participants and CHWs. According to participant's interpretation, 198 tests were HIV negative and two test results were invalid which were in fact negative. One test result was deemed invalid by CHW.
**Conclusions:** High concordance rates of result interpretation with moderate inter-rater agreement between participants and trained healthcare workers indicate potential of feasibility for scaling up HIV supervised self- testing among pregnant women.

## INTEGRATION OF FAMILY PLANNING AND HIV SERVICES

### THPEC261

### FEASIBILITY AND CHALLENGES OF INTEGRATION OF FAMILY PLANNING AND HIV SERVICES AT A RURAL SETTING IN EASTERN UGANDA

E. Fomum[1], B. Logose[1], L. Hamid[1], S. Okoboi[2], P. Olupot-Olupot[3]
*[1]The AIDS Support Organisation (TASO), Medical, Mbale, Uganda, [2]The AIDS Support Organisation (TASO), Research, Kampala, Uganda, [3]Busitema University, Faculty of Health Sciences, Mbale Campus, Mbale, Uganda*
*Presenting author email: efomum@yahoo.com*

**Background:** Family planning (FP) is one of the four pillars in the reduction of HIV transmission from mother to child. In 2015 however family planning uptake in Uganda was still low with a contraceptive prevalence rate of 30% and a total unmet FP need of 41%. TASO Mbale in collaboration with the Ministry of Health integrated family planning services as part of comprehensive HIV care with the aim of making family planning services more accessible for PLHIV.
**Description:** We identified five frontline staff who were given intensive training on FP for one month and on return trained staff and expert clients. We integrated FP services at all HIV clinic outlet points. Both short and long term FP methods are provided at site. Patients who chose permanent methods are referred and linked to the Mbale Regional Referral hospital. We retrospectively reviewed and analyzed FP data from TASO Mbale information management system for January to December, 2015.
**Lessons learned:** During the period, 1010 female patients received FP services of which 432/1010 (43%) were newly enrolled and 578/1010 (57%) were re-attendants from former years. Most, 756/1010 (75%) were 25 years and above; 110/1010 (11%) were between 20-24 years and 141/1010 (14%) were adolescents aged 10-19 years. The FP methods used were as follows: injectable (DMPA) (78.7%); Implants ( Jadelle and implanon) (12%); oral contraceptives (microgynon) (7%) and 1% had IUDs inserted, 1.3% were referred and linked for BTL. There were no referrals for vasectomy throughout the year. A total of 51 patients (5%) had their implants expire and were removed while two (0.1%) had their IUD removed, one because of pain and the other due to expiry. Thirty one percent (313/1010) were on dual protection. Only 7% ( 23/314) of dual FP users requested for female condoms; (219/314) 93% requested for male condoms.
**Conclusions/Next steps:** Integration of family planning services into HIV Clinics is feasible and highly acceptable to female patients. Male interest and involvement in family planning needs to be encouraged.

### THPEC262

### PROMOTING ACCESS TO SEXUAL REPRODUCTIVE HEALTH AND RIGHTS FOR WOMEN LIVING WITH HIV THROUGH INNOVATIVE SUPPLY SIDE APPROACHES

N.J. Poojary[1], K. Apte[1], S. Mapa[2], A. Singh[3]
*[1]Family Planning Assocation of India, IPPF South Asia, HIV, Mumbai, India, [2]International Planned Parenthood - Central Office, HIV, London, United Kingdom, [3]International Planned Parenthood - South Asia, HIV, New Delhi, India*
*Presenting author email: nisha@fpaindia.org*

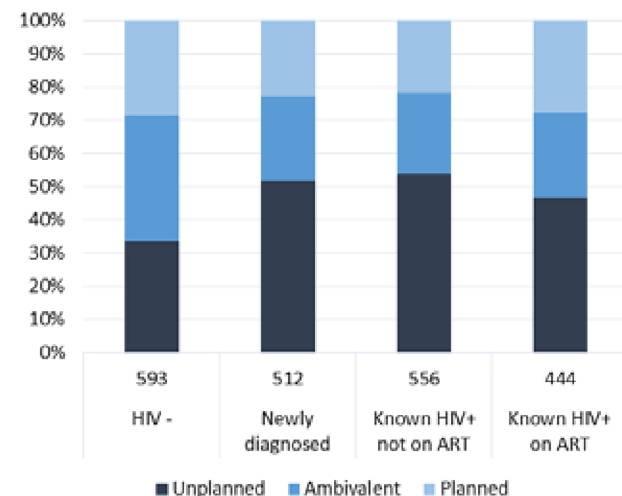
**Background:** Most of the existing HIV prevention programmes fail to address the SRH needs of PLHIV. With treatment & care becoming increasingly available, PLHIV live longer & plan for their futures. Providing integrated SRH/HIV information/services through mentor peer-mothers will result in improved decision making process and uptake of services among PLHIV.
**Description:** FPA India implemented a pilot project from May 2013-April 2015 at - Bangalore, Belgaum, South Kanara, Bijapur, Hyderabad and Solapur supported by Japan Trust Fund for HIV and Reproductive Health. The project used a few innovative supply side approaches to supplement and support the national response to eliminate MTCT. Women Living with HIV were engaged as Mother2Mother (M2M) Peer Educators to share experience of motherhood. Couple counselling empowered newly diagnosed with HIV couples on making choices about their pregnancy & safe delivery of the baby. Male involvement increase through Access Cards system. M2M followed up to ensure ART adherence & safe delivery until 18 months after delivery. End line evaluation done to assess the impact using a combination of utilization-focused, mixed-method, participatory evaluation approach.
**Lessons learned:** The findings showed 36,782 women & girls including 440 pregnant women living with HIV received information on SRH/HIV. SRH services were accessed by 83% women & girls. Out of 440 pregnant women living with HIV 74% were put on ART as per the WHO new guidelines. 75 couples opted for safe abortion and 365 continued their pregnancy. 95% pregnant women were followed up by M2M and other support group members to ensure adherence of ART. 297 women had safe delivery and 78% have accepted contraceptives. 65 children completed 18 months and tested HIV negative. Services such as safe abortion, FP which are not provided by the government system was much appreciated. Couple counselling, male involvement and travel/nutritional support empowered women to go through safe motherhood.
**Conclusions/Next steps:** Build partnership and trust among networks. Promote greater awareness of the structural issues affecting the SRH by strengthening communication and counselling skills on FP & SRH issues. Empower communities to understand & address their needs and rights & to raise voice when the rights are violated.

### THPEC263

### PREVALENCE AND DETERMINANTS OF UNPLANNED PREGNANCY IN HIV-INFECTED AND UNINFECTED PREGNANT WOMEN SEEKING ANTENATAL CARE IN CAPE TOWN, SOUTH AFRICA

V.O. Iyun[1], T. Phillips[1], S. Le Roux[1], J.A. McIntyre[2], E.J. Abrams[3], L. Myer[1]
*[1]South Africa Centre for Infectious Diseases Epidemiology & Research, University of Cape Town, Division of Epidemiology & Biostatistics, Cape Town, South Africa, [2]ANOVA Health Institute, University of Cape Town, South Africa Division of Epidemiology & Biostatistics, Johannesburg, South Africa, [3]International Center for AIDS Care and Treatment Programs, Columbia University, Mailman School of Public Health, New York, United States*
*Presenting author email: toyiniyun@gmail.com*

**Background:** Prevention of unplanned pregnancy is a crucial aspect of preventing mother-to-child HIV transmission (PMTCT). However, we have little understanding of how HIV status and antiretroviral therapy (ART) may modify pregnancy planning. There are few data on pregnancy planning in HIV-infected (HIV+) South African women, and no comparative data with HIV-uninfected (HIV-) women.
**Methods:** We conducted a cross-sectional study of 2105 pregnant women (1512 HIV+; 593 HIV-) ages 18-44 making their first antenatal clinic visit at a primary-level health care facility in Gugulethu, Cape Town. All women completed structured questionnaires including the London Measure of Unplanned Pregnancy (LMUP); a 6-item scale that categorizes pregnancies into planned, ambivalent and unplanned. Analyses examined LMUP results across 4 groups of participants: HIV+ established on ART; known HIV+ but not currently on ART; newly diagnosed HIV+; and HIV-.



*[Distribution of pregnancy intentions among HIV-infected and uninfected women]*

Tuesday 19 July
Wednesday 20 July
Thursday 21 July Poster Exhibition
Friday 22 July
Late Breaker Posters
Author Index

**Results:** Overall, the mean age was 29 years, 43% of women were married/cohabiting and 20% were nulliparous. The LMUP performed well across all groups (Cronbach's α=0.84). Levels of unplanned pregnancy were higher in HIV+ versus HIV- women (50% vs 33%, p<0.001); and highest in women not on ART (Figure 1).
Overall, 69% of women reported contraceptive use in the year before pregnancy; this was strongly associated with unplanned pregnancy (p<0.001). Compared to HIV- women, HIV+ women had significantly higher odds of unplanned pregnancy, after adjusting for age, parity and cohabiting status. The odds were greatest among women newly-diagnosed with HIV and previously diagnosed but not on ART (OR: 1.61; 95% CI: 1.17-2.23 and OR: 2.04; 95% CI: 1.44-2.89, respectively). Increased parity and age <24 years were strongly associated with unplanned pregnancy (OR 3.42; 95% CI: 2.13-5.47 and OR 2.05; 95% CI: 1.34-3.16 respectively).
**Conclusions:** These data indicate high levels of unplanned pregnancy in a high HIV prevalence setting, highlighting missed opportunities for PMTCT through improved family planning services.

## MEN WHO HAVE SEX WITH MEN

### THPED264

#### EMPOWERING KEY POPULATIONS (KPS) TO EFFECTIVELY DEMAND FOR EQUAL HIV/AIDS SERVICES

S. Atuhura[1,2,3]
[1]*Action Group for Health, Human Rights and HIV/AIDS (AGHA) Uganda, Research, Monitoring and Evaluation, Kampala, Uganda,* [2]*THETA, Kampala, Uganda,* [3]*Marps Network Limited, Kampala, Uganda*
*Presenting author email: atuhuras@gmail.com*

**Background:** AGHA in partnership with THETA and MNL with funding from CDC is implementing a Local Capacity Initiative project aimed at building capacity of CSOs working with KPs in Mukono, Kampala and Wakiso to advocate for improved HIV services. In Uganda, HIV prevalence among the general population stands at an average of 7.3% while among SWs is 35-37% and MSM at 13.7% between the age of 18-24.Over 40-50% of the new infections come from KPs (UAC/MOH 2014, Cranes survey 2010).Programs targeting KPs continue to be characterized by limited coverage, poorly linked care, treatment and referral services. The project has increased capacity of 15 CSOs to demand accountability from government on national commitments on KPs; increased capacity of KPs to identify the legal and policy framework that impede equitable access, increased participation and representation of community leaders and KPs living with HIV in the governance structures that influence health services delivery.
**Description:** The project equipped KPs with skills to generate issues on the delivery of HIV/AIDS services using social accountability approaches like the community scorecard in six government hospitals. The scorecard assessed the extent to which government has met its commitment towards achieving zero new infections, discrimination and HIV/AIDS related deaths within the national HIV/AIDS response. The findings showed high stigma and discrimination of KPs by health workers, no peer led services, no commodities like lubricants and condoms, criminative laws and policies.
**Lessons learned:** 10 peers from each KPs category have been trained on ART adherence, home based care, HTC, health rights and advocacy.
3 Joint district planning meetings have been conducted in which issues affecting HIV service delivery for KPs have been prioritized.
Capacities of 50 health workers have been built on dealing with stigma and discrimination.
**Conclusions/Next steps:** Uganda's response has had challenges in the recent past due to limited priority in Prevention, treatment and programming for KPs and yet research shows KPs are the leading avenue for new infections. As a consortium, we continue to contribute to influence the national response through advocacy and community dialogue with duty bearers to enable KPs access HIV services and empower them in voicing out their demands.

### THPED265

#### DISCRETIONARY VENUES: ONLINE HOOK UP CULTURE, HIV VULNERABILITY AND VIOLENCE AMONG SEXUAL AND GENDER MINORITIES IN ABIDJAN, CÔTE D'IVOIRE

M. Thomann[1], A. Grosso[2], M.A. Chiasson[1,2]
[1]*Columbia University, Mailman School of Public Health, New York, United States,*
[2]*Public Health Solutions, Research and Evaluation, New York, United States*
*Presenting author email: mt3019@columbia.edu*

**Background:** Despite the Internet's global importance as a sex-seeking venue for men who have sex with men (MSM), little is known about this topic outside of the US and European contexts. In this mixed methods, ethnographic study, we explore participants' experiences with and attitudes towards online sex-seeking venues with a focus on violence and individual risk-reduction strategies.
**Methods:** In 2015, survey and ethnographic research was conducted with MSM in Abidjan, Côte d'Ivoire recruited on- and offline. In-depth interviews were conducted with 21 of the 105 survey participants. Survey data were analyzed in Stata/SE 14.1 using bivariate logistic regression and interviews were coded in Dedoose.
**Results:** 46% of survey respondents reported finding their partners primarily online and 91% reported ever having found a partner online. Qualitative data revealed that primary motivations for using online venues included discretion and anonymity, ease and accessibility, and making social connections beyond sex. While participants who reported usually finding their partners online were more likely than those who primarily found partners offline to disclose and discuss HIV with online partners (26% vs. 11%, OR 2.67, *all p-values < .10), such risk-reduction did not extend to their practices with partners they met offline. Participants who usually met partners online were more likely to report receptive anal sex with no condom in the past 6 months with their online partners (19% vs. 4%, OR 6.39). Though interview participants perceived online venues as providing a degree of protection against stigma and violence, survey data showed that participants who primarily found their partners online were more likely to report having experienced extortion and/or blackmail with sexual partners (20% vs. 10%, OR 4.93) and stigma or violence because of being gay or bisexual (47% vs. 29%, OR 2.20).
**Conclusions:** These findings are important for current HIV prevention programming in Abidjan and other African cities where use of online sex-seeking venues is widespread among MSM. Further research should be conducted on the online and offline contexts of MSM lives outside of the global North, as their experiences may differ in important ways.

### THPED266

#### DEMOGRAPHIC AND SEXUAL PROFILING OF MEN WHO HAVE SEX WITH MEN IN LAGOS NIGERIA

O. Babawarun[1], S. Iwuagwu[1], C. Ekerete Udofia[1], U. Nwafor[1], G. Enwerem[1], T. Oderinde[2], J. Ibitoye[2]
[1]*Center for the Right to Health, Strengthening HIV Prevention Services for Most at Risk Populations (SHIPS for MARPs), Lagos, Nigeria,* [2]*Society for Family Health, Strengthening HIV Prevention Services for Most at Risk Populations (SHIPS for MARPs), Lagos, Nigeria*
*Presenting author email: tobwesley@yahoo.com*

**Background:** Men who have Sex with Men (MSM) are known to have an increased risk for HIV infection and are also mainly responsible for heterosexual HIV transmission. An innovative and effective strategy aimed at a reduction in transmission of HIV among this population is needed. However, little is known about the demographic and sexual profiles of this group due to discriminations and current laws in the country (Anti same sex law of January, 2014). The study aimed to profile the demographic and sexual characteristics of MSM in Lagos, Nigeria.
**Methods:** This was a cross sectional study carried out between July to September 2015 in Lagos State, Nigeria. A total of 3501 MSM were drawn from identified hotspots in the twenty local governments in the state using the capture and recapture method. Following informed consent An interviewer administered questionnaire was used to elicit information on the socio demographic and sexual profile of respondents. Epi-Data (v3.1) was used for data entry while SPSS (v20) was used for analysis with relevant descriptive statistics generated.
**Results:** Majority of the respondents (72.4%) were between the ages of 20-29 years and have never been married (77.6%). About 54.6% of the respondents had tertiary education while 44.7% were currently students and 25% were employed. A total of 1851 men (52.9%) had engaged in commercial sex with a man in the last 12 months. Among this population, condom use was reported by 63.7%. Also, about 45.2% of the study population reported having sex with a woman in the last 12 months.
**Conclusions:** The results show the MSM population in the state consists mainly of youths. It also revealed the existence of risky behaviour among the study population. There is the need for youth friendly HIV/AIDS behavioural change interventions aimed at prevention and transmission of HIV not only among the study population but also among their heterosexual partners.

## THPED267

### SYNDEMIC FACTORS ASSOCIATED WITH CONDOM USE AND HIV-POSITIVE SEROSTATUS AMONG YOUNG MEN WHO HAVE SEX WITH MEN IN JAMAICA

C. Logie[1], N. Jones[2], Y.-T. Huang[1], K. Levermore[2], P.A. Newman[1]
*[1]University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, ON, Canada, [2]Jamaica AIDS Support for Life, Kingston, Jamaica*
*Presenting author email: p.newman@utoronto.ca*

**Background:** Worldwide young gay, bisexual and other men who have sex with men (MSM) experience social inequities that contribute to elevated rates of HIV. Homosexuality is criminalized in Jamaica and there are reported HIV infection rates of 28% among young MSM. Syndemic approaches explore the co-occurrence of psychosocial and health issues, and their interaction with HIV vulnerabilities. We examined syndemic factors associated with condom use and HIV incidence among young MSM in Jamaica.
**Methods:** Cross-sectional survey data were analyzed for young MSM (≤ 35 years) enrolled in a respondent-driven community-based research study in Kingston, Ocho Rios, and Montego Bay, Jamaica. Logistic regression was conducted to identify factors associated with condomless anal sex in the past 3 months and HIV-positive serostatus.
**Results:** Of 556 participants (mean age: 25.5, SD: 5.78; sexual orientation: 67% gay; 30% bisexual; 3% heterosexual/other), 28% reported condomless anal sex in the past 3 months and one-tenth (11.5%) were HIV-positive. Condomless anal sex in the past 3 months was associated with: food insecurity (OR: 1.69, CI: 1.16-2.47); forced sex in adulthood (OR: 2.29, CI: 1.11-4.74); childhood sexual abuse (OR: 2.16, CI: 1.02-4.56); childhood domestic violence exposure (OR: 3.75, CI: 1.62-8.68); alcohol use (OR: 1.42, CI: 1.12-1.82); lower safer sex self-efficacy (OR: 0.77, CI: 0.68-0.88); and lower empowerment scores (OR: 0.86, CI: 0.76-0.98).
Participants who were HIV-positive were older (OR: 1.05, CI: 1.01-1.10) and reported: sexual stigma (OR: 1.07, CI: 1.02-1.13); housing insecurity (OR: 3.32, CI: 1.53-7.21), including living outside (OR: 11.82, CI: 2.59-53.82); food insecurity (OR: 1.68, CI: 1.24-2.26); lower self-rated health (OR: 0.50, CI: 0.35-0.71); lifetime history of STI (OR: 8.63, CI: 3.73-20.00); alcohol use (OR: 1.24, CI: 1.02-1.51); and depression (OR: 1.32, CI: 1.10-1.58).
**Conclusions:** Findings highlight the salience of a syndemics approach to addressing HIV prevention and care with young MSM in Jamaica. Condomless anal sex was associated with social inequities (i.e. poverty, sexual violence) and substance use. HIV-positive young MSM reported increased poverty, stigma, and poorer health outcomes in comparison with HIV-negative MSM. Interventions to increase access to the HIV prevention and care continuum among young Jamaican MSM should address the interplay between poverty, stigma and mental health.

## THPED268

### LESSONS LEARNED OF SETTING UP A COMMUNITY-BASED HIV-RELATED HUMAN RIGHTS MONITORING AND RESPONSE SYSTEM IN UGANDA

R.S. Lusimbo
*Sexual Minorities Uganda (SMUG), Research, Kampala, Uganda*
*Presenting author email: rlusimbo@gmail.com*

**Background:** In Uganda, discrimination, violence and criminalisation of LGBTI people is mounting. This creates barriers to accessing essential HIV and other health services for men who have sex with men, transgender people at higher risk of HIV. Yet there is growing evidence that we need to address those barriers and uphold the right to health for all if we want to end AIDS.
**Description:** Given this context, LGBTI organisations in Uganda set up REAct (Rights-Evidence-Action), a community-based documentation system that was developed by the International HIV/AIDS Alliance. The REAct system helps monitor and respond to human rights-related barriers in accessing HIV and health services. The information is encrypted and logged in the information management tool, Martus, and is analysed for the following purposes:
• Crisis response to individual emergencies: The system facilitates identifying and prioritising rapid resource mobilisation and assistance to avert or respond to specific individual crisis and/or emergency situations.
• Evidence for advocacy: Implementing Organisations use REAct to compile information from beneficiaries, clients and individuals that produces quantitative and qualitative evidence to substantiate their advocacy.
Between May 2014 and December 2015, Ugandan LGBTI organisations using REAct documented 264 cases of HIV related human rights abuses. Over 65% were responded to through individual emergency responses or referrals to human rights programmes. Most cases related to harassment or intimidation by or with inaction from law enforcement officers (over 70% of cases attended) followed by denial of health services (15%) and termination of employment and house eviction (10%).
**Lessons learned:** - A community-based human rights monitoring system must have full ownership of the community and be flexible to be able respond to its specific needs expressed through full participation.
- Any human rights monitoring system must also help provide individual support to those it collects information from and ensure that implementing organisations have the necessary resources to implement the system.
**Conclusions/Next steps:** REAct as a tool is one that can be adopted by anyone and it posses high levels of security. In Uganda REAct is being extended to other member organisations of SMUG and other countries under the International HIV AIDS Alliance family.

## THPED269

### OPENING PANDORA'S BOX: LESSONS FROM MSM HIV PREVENTION POLICIES AND PROGRAMMATIC EFFORTS IN GHANA

A.O. Gyamerah
*Columbia University, Sociomedical Sciences Department, New York, United States*
*Presenting author email: agyame@gmail.com*

**Background:** A growing number of national AIDS policies in Africa over the past decade have widened their category of key populations at risk for HIV to include men who have sex with men. These policy changes however are taking place in contexts that criminalize/stigmatize male same-sex acts and have an affect on HIV prevention efforts and their impact.
**Methods:** This paper draws on data from a 12-month qualitative study on Ghana's emerging role as a model country in Africa for HIV prevention efforts among MSM and how these are implemented and experienced by the men. I present findings from participant observations, 43 interviews with policymakers, key informants, HIV service-providers, 'sasoi'/MSM, and group discussions with 18 peer-educators on the government shift to include MSM in the National Strategic Plan, what MSM HIV prevention activities exist and their scope, and challenges/successes/impact of these efforts.
**Results:** The Ghanaian government, through collaborative/strategic work with non-state key-stakeholders consisting of multi-pronged interventions, has made significant progress but with some challenges, in addressing HIV among MSM, a group with 17% HIV-prevalence. Successes include incorporation/implementation of a human rights framework, buy-in of president, involvement of the diverse stakeholders, expansion of prevention programs, and inclusion of sasoi/MSM. Criminalization of 'homosexuality', stigma, and insufficient funding/resources remain key challenges to prevention efforts. MSM and peer educators are content with increased prevention efforts by the government but feel excluded from some areas of work and think programs fall short of addressing distal risk-factors like poverty/anti-gay violence. Moreover, they feel key-stakeholders are more interested in the funding accompanying MSM programs than meaningfully addressing the epidemic among the men. Finally, complex political/sociocultural dynamics shaping and arising from the efforts have produced a backlash against MSM as posing a threat to the public and against lay health-workers for the nature of their work with the men.
**Conclusions:** Ghana has made important progress in addressing HIV among MSM, however, challenges remain. More studies are needed to evaluate prevention efforts for their impact not just in terms of outlined programmatic objectives on HTC, for example, but also on the social/legal context they're carried out in and for their unintended consequences.

## THPED270

### AN INNOVATIVE APPROACH TO ENGAGING MSM LIVING WITH HIV IN HIV CARE CONTINUUM IN MALAYSIA: TREATMENT AND ADHERENCE SUPPORT PROGRAMME BY MSM FOR MSM

S. Chandrasekaran, P. Ellan, T. Kurusamy
*Malaysian AIDS Council, Programme Division, Sentul, Malaysia*
*Presenting author email: shamala@mac.org.my*

**Background:** While the HIV care continuum posits that early identification and treatment of HIV infection coupled with information and education about antiretroviral treatment (ART) and adherence, emotional management and healthy living with HIV could markedly decrease onward HIV transmission, men who have sex with men (MSM) living with HIV in Malaysia are undoubtedly challenged with stigma and discrimination in addition to prohibitive legal and socio religious environment that negatively impact their access to treatment, care and support services.
**Description:** For the very first time in Malaysia, the Malaysian AIDS Council through its Partner Organisation implemented the Treatment Adherence Peer Support Programme (TAPS) specifically designed and targeted for MSM living with HIV in Malaysia. TAPS is unique in its approach of engaging peer workers who themselves are MSM living with HIV adhering to treatment to provide informal counseling and social support, serve as a role model to help clients adhere to ART, provide practical tips for managing ART and adherence, help clients navigate the health system and facilitate communication with other related service providers.

**Lessons learned:** Since its inception in 2014, TAPS had reached out to a total of 768 MSM in two government hospitals from two different states with high HIV prevalence rate among MSM. Also, a total of 107 training sessions focused at equipping newly diagnosed young MSM with important information to help prepare themselves for treatment was carried out. The ultimate aim of these sessions that benefitted more than 700 newly diagnosed MSM are to ensure treatment adherence and retention among them.
**Conclusions/Next steps:** Exemplary is this approach in addressing poor engagement of MSM living with HIV in treatment, support and care services. However similar effort needs to be replicated widely in Malaysia to further witness a significant change in their engagement in HIV care continuum.

## THPED271

### THE POWER OF PRINCIPLES: THE LONG-TERM EFFECT OF STRONG PERSONAL NORMS ON CONDOM USE AMONG MSM

W. Van den Boom[1], I.G. Stolte[1], M. Prins[1,2], T.G.M. Sandfort[3], U. Davidovich[1]
*[1]Public Health Service Amsterdam, Department of Infectious Diseases Research and Prevention, Amsterdam, Netherlands, [2]Academic Medical Center, Department of Infectious Diseases, Amsterdam, Netherlands, [3]Columbia University and New York State Psychiatric Institute, Department of Psychiatry, Division of Gender, Sexuality and Health, New York, United States*
*Presenting author email: udavidovich@ggd.amsterdam.nl*

**Background:** Principles, or strong personal norms, are one's internalized personal values or "inner convictions" to (not) perform a given behavior. We hypothesized that principles predict condom use over longer periods of time than behavioral intentions do. We investigated the association of baseline principles and intentions to use condoms with casual partners with actual condom use over a 4-year period (January 2011-December 2014) among HIV-negative men having sex with men (MSM) of the Amsterdam Cohort Studies (ACS).
**Methods:** We included men with at least two ACS visits at which condom use with casual partners was reported. Principles and intentions were measured at baseline using 3 items, Cronbach's alpha = 0.91 and 0.73, respectively. Two logistic regression models examined condom use (yes/no). The first for condom use measured at 6 months post-baseline and the second for the last visit. We used bivariate and multivariate models; the latter was corrected for age, educational level, nationality, having a steady partner, and follow-up time (median=3.5 years (IQR=3.2-3.6) between first and last visit.
**Results:** 260 MSM (mean age=39; SD=8.2) were included. Bivariate analyses revealed that men with strong baseline principles (OR=13.4; 95%CI=4.0-44.4) and strong baseline intentions (OR=28.3; 95%CI=7.7-103.9) were significantly more likely to report condom use at their first post-baseline visit than men with weak principles and intentions. At the last visit, the OR decreased to 9.3 (95%CI=2.8-30.7) and 6.6 (95%CI=2.3-18.5) for baseline principles and intentions, respectively. Multivariate analyses revealed that men with strong baseline principles were significantly more likely to use a condom at the last visit (OR=4.8; 95%CI=1.2-19.0); the effect for baseline intentions did not hold in the multivariate model (OR=3.1; 95%CI=0.9-10.7).
**Conclusions:** Having strong principles predicted long-term condom use whereas intentions did not. Our finding suggests that principles regarding condoms use are core cognitions that retain their association with behavior over time, in contrast to strong intentions that may determine behavior over a shorter time frame. In order to develop effective strategies to influence risk behavior, HIV prevention should try to facilitate the formation of strong principles regarding the implementation of effective risk-reduction strategies. Although not an easy task, it may have long-term benefits.

## THPED272

### CONFRONTING VIOLENCE AND DISCRIMINATION AGAINST MEN WHO HAVE SEX WITH MEN (MSM) AND FEMALE SEX WORKERS (FSW) IN MALI IN 2014 AND 2015

G. Sidibé[1], C. Trout[2]
*[1]NGO Soutoura, Bamako, Mali, [2]Boston University School of Public Health, Chino, CA, United States*
*Presenting author email: soutoura.souko@gmail.com*

**Background:** While neither homosexuality nor sex work are mentioned specifically by law in Mali, MSM and FSW report widespread stigma, rejection, discrimination, violent attacks and the inability to access justice. Mali has adopted the UNAIDS objective of Zero Discrimination and the 2013-2017 National Strategic Plan against AIDS aims to reduce discrimination and violence against key populations.
**Description:** The non-governmental organization Soutoura piloted a program funded by USAID to document and respond to violence and discrimination against MSM and FSW. Staffs were trained to document cases using a form developed by the National Committee for HIV Prevention for Key Populations. Results for the first two (2) years of implementation, from October, 2013-September 2015 are presented here.
Forty-Seven (72) cases of violence and discrimination were documented (33 against FSW and 46 against MSM). Perpetrators included the general population, particularly groups of youth (41 cases), police (28 cases) and families (13 cases).
Cases of violence against MSM included verbal insults (17), battery (13), arbitrary arrests (8),attempts to sodomize the MSM with foreign objects (5), expulsion from family homes (4), loss of employment (3), intense family stigma (2), expulsion from school (1) and destruction of a business (1). Documented cases of violations against FSW included battery (8), gang rape (10), having to pay bribes to police (13), expulsion from the family (1) and destruction of possessions (1). MSM peer educators reported being insulted and attempts to seize their prevention materials.
In addition to medical and psychosocial support to victims, field staff (physicians and MSM/FSW peer educators) intervened successfully with perpetrators, including reintegrating the MSM expelled from their homes, calming agitated groups of youth, and advocating with a religious leader and a radio personality who then stopped inciting violence.
**Lessons learned:** MSM and FSW in Mali are at high risk of physical and sexual violence and stigma and discrimination, which contributes to their extreme vulnerability. However, interventions by respected community members with perpetrators can be effective to deescalate these situations and promote tolerance.
**Conclusions/Next steps:** HIV prevention programs should include interventions to address key populations' structural/environmental vulnerability to HIV such as violence and discrimination.

## THPED273

### EVALUATING COMPLIANCE OF KEY POPULATIONS (PWID, MSM AND FSW) WITH QUARTERLY HIV COUNSELING AND TESTING (HCT) ACCESSING CARE AT A COMMUNITY HEALTH CENTRE, KADUNA, NIGERIA

A.O. Abimbola, S. Wayo, E. Ogudoro, J. Njab, S. Adebajo
*Population Council, HIV/AIDS, Abuja, Nigeria*
*Presenting author email: aabimbola@popcouncil.org*

**Background:** Quarterly HCT, as recommended by the World Health Organization (WHO), is important for early detection of HIV and curb of HIV transmission among key populations (KPs) - People Who Inject Drugs, Men who have Sex with Men and Female Sex Workers because of the risky behaviours they engage in which predispose them to HIV infection and other STIs.
This study evaluated compliance of key populations accessing care at a Community Health Centre (CHC) in Kaduna, Nigeria with quarterly HCT.
**Methods:** The data used for the evaluation were obtained from the clinical records of KPs attending the CHC from October 2014 to September 2015. Multivariate analysis was conducted.
**Results:** A total of 1,687 KPs - 233 PWID, 1,141 MSM and 305 FSW accessed HCT at the CHC during period under review. More than two thirds were aged 18-25 years, 78% had secondary school education, 22% were employed and 59% were students. About 17% (24% of MSM, 20% of FSW and 7% of PWID) had HCT **at least twice**; about 9% (10% of MSM, 13% of FSW and 4% of PWID) had HCT **at least three times**; and none of the KPs had HCT **four times** within a one-year period. Overall HIV prevalence among the KPs was 6.4% (PWID - 2%, MSM - 11% and FSW - 16%).
**Conclusions:** This study revealed that compliance of KPs with quarterly HCT was very poor in the Kaduna region of Nigeria. Specific interventions should be designed that will address the health needs and improve compliance of KPs with WHO recommended quarterly HCT in Nigeria in order to reduce the transmission of HIV among key populations and subsequent cross-infection to the general population.

## THPED274

### EVALUATION OF HIV PREVENTION KNOWLEDGE AND HIGH RISK BEHAVIORS AMONGST MSM IN NIGERIA

O. Abdullrahman Orosanya
*Concern Conscience International and IRMA, Programs, Lagos, Nigeria*
*Presenting author email: ccingong@gmail.com*

**Background:** This study was conducted by the concern Conscience International and International Rectal Microbicide Advocates (Nigeria) to assess knowledge, attitude and behaviors of the MSM community towards HIV prevention issues.

**Methods:** Structured discussion groups incorporating anonymous exit questionnaires were conducted in secure locations in Lagos, Ogun and Ibadan in Nigeria. Analysis of transcribed proceedings located thematic dimensions pertaining to knowledge, attitudes, sexual activities, health care including HIV testing, and social, cultural and religious norms within largely hard-to-reach and secretive communities of MSM
**Results:** About two-thirds of the 55 men who participated, (65%) self-identified as bisexual, 7% as homosexual and 25% as gay; 93% reported sex with a man in the previous 6 months. Of these, 65% also reported sex with women during the same time period. Median number of male and female sex partners was 3 and 1 respectively. The experiences of participants to stigma and discrimination from family and the larger community were diverse, with ethnic, religious and class distinctions strongly structuring sexual behavior. Community networks were hidden, with social activities taking place in non-commercial, private venues. Knowledge of HIV, safer sex practices and related issues was low and misconceptions about HIV were common. Access to HIV testing was seldom available and treatment for those infected with HIV and STIs were inaccessible.
**Conclusions:** The realities with regards to HIV risk for MSM and their male and female partners in Nigeria are critical due to social isolation by culture, religion, family and political will. HIV risk behaviors are high and knowledge of HIV prevention is low despite high levels of education and employment. The implications for public health policy within a nation which is culturally rich and religiously devout are complex, yet these research findings suggest that immediate action is vitally required to mitigate the impacts of HIV and AIDS amongst high risk MSM.

### SEX WORK AND HIV VULNERABILITY AMONG BRAZILIAN TRANSGENDER WOMEN

A. Brandelli Costa[1], P. Fagundes Pase[1], H.T. da Rosa Filho[1], A.M. Vaitses Fontanari[2], A. Mueller[2], D. Cardoso[2], B. Soll[2], K. Schwarz[2], M.A. Schneider[2], D.A. Mori Gagliotti[3], A. Saadeh[3], M.I. Rodrigues Lobato[2], H.C. Nardi[4], S.H. Koller[1]
*[1]Universidade Federal do Rio Grande do Sul, Psychology, Porto Alegre, Brazil, [2]Universidade Federal do Rio Grande do Sul, Gender Identity Program (PROTIG), Hospital de Clinicas de Porto Alegre (HCPA), Porto Alegre, Brazil, [3]Universidade de São Paulo, Transdisciplinary Gender Identity and Sexual Orientation Service (AMTIGOS-NUFOR), Hospital de Clinicas da Faculdade de Medicina da Universidade de São Paulo (HCFMUSP), São Paulo, Brazil, [4]Universidade Federal do Rio Grande do Sul, Social Psychology, Porto Alegre, Brazil*
*Presenting author email: brandelli.costa@ufrgs.br*

**Background:** Studies of HIV prevalence in transgender women in various countries, including Brazil, have shown that this population is one of the most vulnerable to infection. However, studies that have been conducted in Brazil so far have focused on segments of the community without taking into account the complexity of the epidemics. Therefore, the objective of this study was to assess the HIV status and associated factors, HIV related healthcare access barriers for Brazilian transgender women.
**Methods:** Trans Health Research Project is a hospital and web-based cross-sectional survey that was built with input from the medical and transgender communities to assess the healthcare needs of and access barriers for transgender and gender nonconforming people (TGNP) resident in two Brazilian states: Rio Grande do Sul and São Paulo. Seven hundred and one TGNP answered the survey during two time periods: July-October 2014 and January-March 2015. Of those, 439 met the inclusion criteria for this study. Their average age was 27.5 years (95% CI [26.7, 28.4], ranging from 18 to 61 years.
**Results:** 72.70%(n=245, N=337) reported HIV-testing at least once. Most participants, 47.28%(n=113, N=239), reported last testing in the least 6 months. Regarding serological status, 16.53%(n=40, N=242) reported being HIV-positive, 74.38%(n=180) HIV-negative, 6.20%(n=15) did not know, and 2.89% (n=7) preferred not to say. 106(40.76%, N=260) participants reported history of sex work. Of these, 66.98%(n=71, N=106) said that the reason for doing so was to pay their bills, 37.73%(n=40) because it paid well, and 36.79%(n=39), to pay trans-related expenses. History of sex work was associated with more than one sexual partner, inconsistent condom use and drugs and alcohol use during sex. History of sex work increased HIV prevalence in 5.83 times (95%CI [2.36, 14.42]). Finally, 68.60%(n=225, N=328) participants did not know what post-exposure prophylaxis was, 28.35%(n=93) knew what it was, but never used and 3.5%(n=10) used it.
**Conclusions:** This study points to a combination of factors involved in the high prevalence of HIV among Brazilian transgender women. It also points to the urgent need of a programmatic framework that guarantees TGNP fundamental rights and provides affirmative actions to minimize transgender women vulnerability for HIV infection.

## THPED276

### CONTRADICTORY INFLUENCES OF COMMUNITY NETWORKS AND SEXUAL PARTNERSHIPS ON HIV RISK: RESULTS OF IN-DEPTH INTERVIEWS WITH TRANSGENDER WOMEN OF COLOR (TWOC) IN NEW YORK CITY

B. White[1], W. Elwood[2], P. Kobrak[3]
*[1]National Institutes of Health, Office of Behavioral and Social Sciences Research, Bethesda, United States, [2]National Institutes of Health, Office of the Director, Office of Behavioral and Social Sciences Research, Bethesda, United States, [3]NYC Department of Health and Mental Hygiene, Bureau of HIV/AIDS Prevention and Control, New York, United States*
*Presenting author email: bali.l.white@gmail.com*

**Background:** HIV prevalence was found to be 19.1% in TW worldwide, 27.7% in the U.S., and in NYC 49.6% for TW of Latin American origin, 48.1% of African descent (compared to 3.5% for white). NYC, a destination for sexual and gender minorities, is home to over 10,000 TW.
**Methods:** We conducted semi-structured, in-depth interviews with TWoC and sexual partners, focused on social and cultural context of risk, in support groups, shelters, and clinics. In a hybrid qualitative approach, field notes were annotated by interviewers, combined in an overall narrative of risk and life experiences, with verbatim transcription of key passages, thematic analysis and cross-case analysis by a TW of African descent, and two white, cisgender men fluent in Spanish.
**Results:** 45 TW and 6 male cisgender partners were interviewed. 96% and 100% respectively were Black and/or Latino; average ages were 33 yrs. and 42yrs.
In the interviews participants described four main themes.
The first was that remaining connected with racial/ethnic communities—lower SES neighborhoods aware of previous identity—caused tension, and provided scarce financial opportunities. Communities ostracize men involved with TW.
The second was related to support networks: TWoC often created “mother/daughter/sister” relationships to deal with tension from family, and public environments. These support networks however often encouraged sex work.
Thirdly, partners reported equal attraction to and sexual relationships with non-TW. Social fallout impacted TW-relationships.
Lastly, sex served multiple purposes: a survival tool for income, housing, food, safety, and medical resources—91% had sex to make money, only 7% formally employed; reinforced female identity and peer confirmation, though stressful and dangerous; reflected a search for intimacy and validation, without condoms.
**Conclusions:** Living in poor neighborhoods—with concomitant low education and high violence rates—TWoC transition faster, and in any way possible to be sexually appealing, thereby mitigating transphobic targeting. Learning how to create lives as women from established/older TW who are sex workers, messages on health and risk contradict those from health professionals. Access to and cultivating truly supportive networks is key, as are interventions that highlight education and job readiness—in safer environments—as a way for TWoC to become self-sufficient individuals.

## THPED277

### FACTORS RELATED TO SUICIDALITY AND MENTAL HEALTH AMONG HIV POSITIVE AND NEGATIVE TRANSGENDER WOMEN IN MEXICO CITY

E.H. Vega-Ramirez[1], A. Colchero[2], V. Rodriguez-Perez[1], G. Hernandez-Heimpel[1], J.B. Cruz-Islas[1], M.A. Cortes-Ortiz[2], N. Lopez-Juarez[3], C. Ramirez-Renteria[3], S. Diaz[4], A. Gonzalez-Rodriguez[5]
*[1]Condesa Clinic, Mental Health Programme, Mexico City, Mexico, [2]National Institute of Public Health, Cuernavaca, Mexico, [3]Social Security Mexican Institute, Mexico City, Mexico, [4]Condesa Clinic, Prevention and Information Department, Mexico City, Mexico, [5]Condesa Clinic, Mexico City, Mexico*
*Presenting author email: hamid.vega@gmail.com*

**Background:** Transgender women (TW) have been poorly studied in Mexico. Qualitative studies suggest that TW experience throughout their lifetime conditions of vulnerability and marginalization that expose them to higher risk of disease -HIV, substance abuse, poor mental health.
The objective of this study was to estimate the socio-demographic and health factors associated with history of suicidality and ill being in a population-based sample in Mexico City.
**Methods:** This study was part of the first *Health Survey with Seroprevalence in Transgender Women in Mexico City*. The survey was implemented in three strata: detention centers, meeting places and at a free HIV care clinic in Mexico City. After signing informed consent, they completed a questionnaire with socio-demographic questions, substance misuse, mental health status, complications from sex generic transformations, and barriers related to health care access. Suicidality history was measured with WHO’s international interview, CIDI 2. Logistic regressions were use to estimate factors associated with suicidal thoughts and attempts.

Tuesday 19 July

Wednesday 20 July

Thursday 21 July Poster Exhibition

Friday 22 July

Late Breaker Posters

Author Index

**Results:** The total sample was 585 TW. Mean age was 34.4 years old, only 36.9% had completed high school or higher education and 30.8% were sex workers. Almost 37.9% had ever had serious suicidal thoughts and 20.3% suicidal attempts and 26% had minor, moderate or server ill being. We found higher possibilities of experiencing suicidal ideation and attempts and ill being among those who had ever lived in the street. Consumption of legal drugs was associated with a higher possibility of suicidal ideation and attempts and a lower possibility among those who reported having HIV. Stigma and discrimination was associated with higher possibilities of suicidal ideation and ill being.
**Conclusions:** TW have, by far, a higher prevalence of suicidality than the general Mexican population (2.8%). These findings suggest that poor social support and misuse of substances are associated with suicidality. Mental health care systems should be adapted and available to this population to help to build up HIV prevention strategies.

## THPED278

### LAUNCH OF THE JOURNAL OF THE INTERNATIONAL AIDS SOCIETY SPECIAL ISSUE ON TRANSGENDER HEALTH AND HIV: NEW DATA, NEW OPPORTUNITIES

T. Poteat[1], J. Keatley[2], C. Schwenke[3], R. Wilcher[4]
*[1]Johns Hopkins School of Public Health, Epidemiology, Baltimore, United States, [2]University of California at San Francisco, Center of Excellence for Transgender Health, San Francisco, United States, [3]Independent Consultant, Olney, United States, [4]FHI 360, Durham, United States*
*Presenting author email: tpoteat@jhu.edu*

**Background:** Transgender (trans) people, particularly trans women who have sex with men, face a disproportionate burden of HIV. Yet, they are severely underserved in the global HIV response. The WHO 2014 *Consolidated Guidelines on HIV Prevention, Diagnosis, Treatment and Care for Key Populations* describe essential elements of HIV programming for trans people. However, these recommendations rely on research among non-transgender MSM. In collaboration with the Journal of the International AIDS Society (JIAS), leaders in transgender health and human rights sought to expand the evidence base specific to HIV and trans people to better enable funders, policymakers, and implementers to develop HIV policies and programs based on the most current trans-specific knowledge.
**Description:** An editorial team invited data-driven abstract submissions on: HIV clinical and prevention issues; epidemiologic and behavioral data; research and practice addressing social and structural issues; evaluations of interventions to improve engagement in the HIV continuum of care; and policy and programmatic case studies. Submissions by trans authors were strongly encouraged. More than 80 abstracts were received. Based on quality, regional representation, and trans authorship, editors selected15 abstracts for full manuscript submission. Thirteen manuscripts were submitted for peer review. These manuscripts represent research in West Africa, East and South Asia, Latin America, and the Middle East. Data on trans MSM as well as trans youth are included. Topics include the impact of stigma on healthcare seeking and service access, human rights and health implications, community-led approaches to reaching trans populations, and new tools for trans program implementation, among others.
**Lessons learned:** The volume and geographic diversity of abstracts indicate significant interest in trans health and HIV around the world. Trans people are engaged in conducting and presenting research as well as leading the HIV response in their communities. Trans women continue to face stigma, extreme constraints on livelihood choices, and diminished agency that impede their engagement in HIV prevention, care, and treatment. However, where opportunities exist, successful programs have been implemented.
**Conclusions/Next steps:** The JIAS special issue on transgender health and HIV brings global visibility to new trans-specific epidemiological, behavioral, and programmatic evidence from around the world.

## THPED279

### *BLUEPRINT FOR THE PROVISION OF CARE FOR TRANS PEOPLE AND TRANS COMMUNITIES IN ASIA AND THE PACIFIC* - A CONTEXTUAL MAP FOR THE REGIONAL HIV AND HEALTH RESPONSE

J. Wong[1], J. Byrne[2], H. Boonyapisomparn[3], A. Verster[4], R. MacInnis[5], R.C. Wolf[6], E. Settle[7], D. Adams[8]
*[1]Asia Pacific Transgender Network, Bangkok, Thailand, [2]Consultant, Auckland, New Zealand, [3]Thai Transgender Alliance, Bangkok, Thailand, [4]World Health Organization, Department of HIV/AIDS, Geneva, Switzerland, [5]Health Policy Project, Washington, D.C., United States, [6]U.S. Agency for International Development, Office of HIV/AIDS, Washington, D.C., United States, [7]United Nations Development Programme, Bangkok, Thailand, [8]Johns Hopkins Bloomberg School of Public Health, Department of Epidemiology, Center for Public Health and Human Rights, Key Population Program, Baltimore, United States*
*Presenting author email: joe.wong@weareaptn.org*

**Background:** Trans women in Asia and the Pacific are disproportionately affected by HIV. Little data is available on HIV among trans men and other gender non-conforming people. There are insufficient programmes and services targeted to meet trans-specific needs. Regionally, legal gender recognition is available in few countries with limited implementation. Violence is a daily reality. A consortium of stakeholders collaborated between October 2014 and September 2015 to address this gap and develoed the *Blueprint for the Provision of Care for Trans People and Trans Communities in Asia and the Pacific.* This is a contextual map demonstrating where to strengthen policy-related, clinical and public health responses for trans people.
**Description:** The consortium included Asia Pacific Transgender Network, the United Nations Development Programme, and the USAID-funded Health Policy Project. Regional consultations were held in Nepal and Thailand with trans community leaders, and included Pacific representation. Sixty-six individuals and organisations submitted feedback, including an expert medical review from providers of trans health in the region. The content encompasses human rights, comprehensive HIV and health care, working with gender-diverse youth and children and a guide on hormone administration, monitoring and use.
**Lessons learned:** The *Blueprint* fills knowledge gaps and can promote dialogue between trans people, health professionals, governments, and others to address HIV, health inequality, violence, and legal gender recognition. Diverse, varied trans identities exist in Asia and the Pacific and required specific case studies, terminology and considerations. Participants and reviewers identified overarching policy recommendations, which include ensuring participation of trans people in research, advocacy and policy; improving access to and quality of health services and public health; ending violence against trans people; passing protective laws for trans people and promoting legal gender recognition. The *Blueprint* has been translated into Chinese and Bahasa Indonesia and informs the new AIDS strategy in China and social protection policies and programming in Indonesia.
**Conclusions/Next steps:** The *Blueprint* is a tool for advocacy, strategic planning, training and programme design. Governments, donors and programme planners can use the *Blueprint* to guide the trans health and HIV response in Asia and the Pacific. Regional roll-outs are planned including policy briefs, provider training, and coordinated dialogues.

## THPED280

### PREVALENCE OF CONDOMLESS RECEPTIVE ANAL INTERCOURSE WITH REGULAR AND NON-REGULAR NON-COMMERCIAL MALE SEX PARTNERS AMONG TRANSGENDER WOMEN SEX WORKERS IN SHENYANG, CHINA

J. Lau[1], Z. Wang[1], T. Ma[2], Y. Liu[2]
*[1]Chinese University of Hong Kong, Centre for Health Behaviours Research, Hong Kong, Hong Kong, [2]Shenyang Consultation Centre of AIDS Aid and Health Service, Shenyang, China*
*Presenting author email: jlau@cuhk.edu.hk*

**Background:** Transgender women sex workers (TSW) are at high risk of HIV/STD transmission. Many TSW were having condomless sex with non-commercial male sex partners. A sizeable population of TG women in China engaged in transactional sex serving men in feminine dressing. This study was to investigate the prevalence and associated factors of comdomless receptive anal intercourse (CRAI) with regular male sex partners (RP) and non-regular male sex partners (NRP) among TSW in Shenyang, China.
**Methods:** The inclusion criteria were:
1) self-reported gender identity as a transgender or transsexual woman (pre- or postoperative),
2) aged ≥18 years old,
3) having had anal intercourse with at least one male client in the last three months and;
4) feminine dressing during transactional sex with men.

220 participants were recruited with the help of an NGO. Appointments were made for an anonymous face-to-face interview conducted by trained NGO staff in settings with privacy ensured.

**Results:** Among all participants, prevalence of self-reported or tested being HIV positive was 25.9%. The prevalence of CRAI with RP and NRP was 25.0% and 23.8% in the last month, respectively. Such prevalence did not differ by their HIV sero-status. Adjusted for significant background variables, having CRAI with male clients in the last month, scored higher in UCLA Loneliness Scale and Self-stigma Scale, and poorer mental health status (depressive symptoms and anxiety symptoms measured by CESD-20 Scale and GAD-7 scale, respectively) were associated with higher likelihood of CRAI with RP and with NRP, while perceived self-esteem was negatively associated with CRAI with RP and with NRP. Perceived social support was associated with CRAI with RP but not CRAI with NRP.

**Conclusions:** Prevalence of CRAI with non-commercial male sex partners was high and did not differ by HIV sero-status among TSW in China. They may form a bridge population transmitting HIV/STD from high risk population (their male clients) to relative low risk population (their non-commercial male partners). Interventions are warranted but lacking. Factors associated with CRAI with RP and with NRP were similar. It is important to reduce psychological problems such as depression/anxiety and to improve self-esteem.

## THPED281

### THE FORCED STERILISATION OF TRANSGENDER PEOPLE IN SINGAPORE: A RESEARCH EXPLORING GENDER IDENTITIES OF TRANSGENDER AND GENDER NON-CONFORMING INDIVIDUALS IN RELATION TO GENDER RECOGNITION LAWS IN SINGAPORE

V.X.H. Ho[1], S. Sherqueshaa[1], D. Zheng[2]
*[1]Project X, Singapore, Singapore, [2]Pink Dot, Singapore, Singapore*
*Presenting author email: projectx.sg@gmail.com*

**Background:** Singapore's current gender recognition law allows transgender people to change the sex marker (from M to F, or F to M) on their identification cards, only on the condition of full removal of reproductive organs. While there are some who are relatively satisfied, there are many who feel frustrated as a full sex reassignment surgery may not be desired. The study focused on intersectionalities concerning non-operative transgender people's choices specific to Singapore's societal, religious and familial contexts - and sought to fill a lacuna in the current research landscape, where emphasis on transphobia's root cause is lacking: the lack of legal gender recognition fuels the lack of understanding and diversity appreciation. The study also focused on consequential issues faced in employment, healthcare and housing opportunities.

**Methods:** An online survey was conducted between May and December in 2015. Follow up focus group discussions were also conducted with 20 out of 249 of the respondents. The survey was targeted at transgender and gender non-conforming individuals who are at various stages of transition.

**Results:** The study found that there are four main barriers for transgender individuals to undergo sex reassignment surgery: financial concerns, concerns from people around transgender individuals, physical and emotional fears related to surgery, and religion. The study also found that found that 65% of transgender people would like to be able to change the sex marker on their identification cards to match their gender identities. Out of this 65%, 85% of the respondents are pre-operative or non-operative individuals. The other 35% of the respondents would wish to have either "third gender", "X", their sex assigned at birth, or to have the sex category removed completely from their identification cards.

**Conclusions:** The inability to define for oneself how one is presented in the public sphere is a significant cause for the marginalization and discrimination of the transgender community. While Singapore remains progressive in recognizing post-operative transgender individuals, it is important to expand that recognition to people who have not or who do not wish to undergo surgery. Doing so will enable the community to be recognized as part of society.

## THPED282

### "THIRD GENDER" LEGAL RECOGNITION BUT NO ACCEPTANCE: A JOURNEY WITH FULL OF OBSTACLES BEING AS TRANSGENDER WOMAN IN PAKISTAN

T.-U. Rehman[1], H. Amjad[2]
*[1]Naz Male Health Alliance, Technical Support, Lahore, Pakistan, [2]Khwaja Sira Society-Community Based Organization, Lahore, Pakistan*
*Presenting author email: moon.ali@kss.org.pk*

**Background:** Transgender community in Pakistan has faced multiple levels of legal, institutional and societal discrimination, although they have got legal identity cards by the ruling of Supreme Court back in 2010, but rights are not being translated into laws. To identify the major gaps in laws and current status the research was designed by Naz Male Health Alliance and 28 FGDs were organized in Pakistan.

**Methods:** In this National level of qualitative research a total number of 28 FGDs, 14 In depth interviews & 10 key informant interviews were conducted in 14 major cities of Pakistan, the literature was thoroughly reviewed before initiating the research and it was part of the study design to recommend a policy brief, The study took almost 6 months before the final report was published and 10 case studies were also the outcome of this research, tools were developed by psychologist for FGDs, IDIs & KIIs.

**Results:** This study revealed that 35% TGs are illiterate and 42% does dancing for their income. Whereas 15% are involved in sex work and 12% are into begging. The legal recognition has failed to restore the respect in the society and it is a barrier in performing Hajj, the sexual and physical violence is still the same and almost 40% of TGs suffer from rape cases. Head shaving and beaten up during functions are also very common 80% never seek any kind of help and the HIV prevalence is almost 7%.

**Conclusions:** This research has identified crucial areas which need immediate attention of state and civil society organization to ensure the provision of basic human rights for TG women in Pakistan, There is a need to develop a law to ensure social & economic inclusion along with mechanisms for meaningful recognition with rights. The laws & policies for sexual and physical assault are not in place and there is ambiguity in the definition by the ID card issuing organization, there is a need for advocacy for respect & recognition, political visibility, legal support acceptance and positive role of media. The access to health care and justice also needs to be supportive by sensitization.

## THPED283

### THE IMPACT OF THE PROGRAM "TRANSCIDADANIA" IN THE SOCIAL INCLUSION OF TRANSGENDER PEOPLE IN THE CITY OF SÃO PAULO

D.A. Calixto[1], D. Souza[2]
*[1]UC Berkeley, HIV/Young and Adolescents, Brasília, Brazil, [2]Faculdades Cearenses, Fortaleza, Brazil*
*Presenting author email: callistodiego@gmail.com*

**Background:** The Program implemented in the city of São Paulo aims to promote human rights and citizenship and provide conditions and recovery trajectories of life opportunities for transvestites and transsexuals in socially vulnerable. The program has as a structural dimension to supply conditions for financial autonomy, through conditional cash transfers to the implementation of activities related to the completion of basic education, preparation for the world of work and vocational training, civic education. The sum of these actions is an institutional improvement exercise, with regard to the preparation of public services and equipment for qualified and humanized care.

**Description:** This project is proposed to strengthen job placement activities, social reintegration and recovery of citizenship for LGBTT people in vulnerable situations, served by CADS- Coordination of Sexual Diversity. Partnerships for its execution involving the Municipal Bureau of Human Rights and Citizenship - SMDHC and Municipal Secretary of Development, Labor and Entrepreneurship - SDTE. The program offered a monthly assistance amounting to R $ 827.40 (eight hundred and twenty-seven reais and forty cents) to a Daily schedule of six hours during the period from 10/21/2015 to 12/20/2015.

**Lessons learned:** Of the 100 participants in the first edition of the program, only 10% have left the course, number below the dropout meda youth and adults in Brazil, which is 36%, according to IBGE - Brazilian Institute of Geography and Statistics. The significant and positive number in relation to joining the program "Transcidadania" made the Secretariat for Human Rights, responsible for project management, expand the same for a new edition, comprising 150 participants, 50% more participants in the previous edition.

**Conclusions/Next steps:** The program "Transcidadania" is innovative and inclusive as it subsidizes and empowers transgender people in education and employment, generating social inclusion and providing a new future for the participants, since approximately 43% of participants live in hostels and were house expelled. It is also worth noting that 63% of participants are black and brown, aged between 31 and 40 years. Faced with such evidence it is concluded that the program needs to be expanded and offered in all the Brazilian territory.

### VULNERABILITIES, HUMAN RIGHTS AND HEALTH ISSUES AMONG TRANSGENDER PERSONS: A QUALITATIVE APPROACH WITH IN-DEPTH INTERVIEWS AND WORKSHOPS IN SÃO PAULO, BRAZIL

G. Saggese[1], M.A. Veras[1], B. Puccinelli[2], B.C. Barbosa[2], F. Teixeira[3], D. Barros[1], A. Cezaretto[4], R. Martins[5], J.L. Gomez[1], D. Ferreira[6], M.R. Giovanetti[5], L. Pelúcio[7], Muriel Study Group
*[1]Faculdade de Ciências Médicas da Santa Casa de São Paulo, São Paulo, Brazil, [2]Universidade de Campinas, Campinas, Brazil, [3]Universidade Federal de Uberlândia, Uberlândia, Brazil, [4]Universidade de São Paulo, São Paulo, Brazil, [5]Centro de Referencia e Treinamento DST/AIDS, São Paulo, Brazil, [6]Pontifícia Universidade Católica de São Paulo, São Paulo, Brazil, [7]Universidade Estadual Paulista, Bauru, Brazil*
*Presenting author email: gsrsaggese@gmail.com*

**Background:** The transgender population is one of the most vulnerable minorities globally. In Brazil, they are likely to be discriminated against and have less access to health and social care. Despite the existence of some rights and policies, their implementation is not warranted. The objective of this study, conducted in the State of Sao Paulo, was to investigate vulnerabilities that prevent or limit the access of transgender persons to services and rights.
**Methods:** The study used both quantitative and qualitative methods. Based on our survey sample (n=673), we selected 44 people among those who had agreed to be contacted to participate in the qualitative phase (28 of them for individual, in-depth semi-structured interviews and 16 to join the workshops). During the interviews, we deepened issues previously explored in our survey, such as sexual health, discrimination experiences and transitioning. For the workshops, we used group dynamics and memory exercises in order to identify and reflect on the most recurrent violations of rights among transgenders.
**Results:** Both during interviews and workshops, conducted between June and December of 2015, narratives involving situations of prejudice and discrimination (physical, verbal, psychological and/or extortion) were repeatedly reported and were present in almost all statements, albeit significant variations concerning their subjective perception. In both, but especially during the interviews, complaints and demands regarding health services and access to body changes (hormones and reassignment surgeries) were one of the main issues. During the workshops, the lack of job opportunities and the use of ID documents and public restrooms were reported as particularly problematic, illustrated by situations involving participants and their transgender acquaintances.
**Conclusions:** These results confirm difficulties in the access to health care, or even the lack of health services to assist specific needs of transgender persons. This situation is worsened by the recurrent discrimination this population is subjected to. It is well established that situations like these generate poor health outcomes and increase risk for HIV acquisition, although many other concerns appear to be at least as important for participants. A better understanding of these issues can help constructing public policies towards transgender people and minimizing the violation of their rights.

## THPED285

### HIV TESTING, INCIDENCE, AND SEX WORK INVOLVEMENT AMONG TRANSGENDER WOMEN IN JAMAICA

C. Logie[1], N. Jones[2], Y. Wang[1], K. Levermore[2]
*[1]University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, ON, Canada, [2]Jamaica AIDS Support for Life, Kingston, Jamaica*
*Presenting author email: logiech@yahoo.com*

**Background:** Globally stigma and discrimination are social drivers of HIV among transgender women. Transgender women are overrepresented in the Caribbean's HIV epidemic. Yet little is known regarding transgender women's HIV prevention and care needs in Jamaica—where there are reports of pervasive transgender stigma. We explored HIV testing, HIV incidence, and sex work involvement among transgender women in Jamaica.
**Methods:** Cross-sectional survey data were analyzed for transgender women enrolled in a respondent-driven community-based research study in Kingston, Ocho Rios, and Montego Bay, Jamaica. Multivariable logistic regression was conducted to identify factors associated with: ever having received an HIV test; HIV-positive serostatus; and sex work involvement in the past year.
**Results:** Among 150 transgender women (mean age: 24.35 [SD: 13.67]; median monthly income: $124 USD [range: 0-$2489]; residence: 64% Kingston, 22% Ocho Rios, 7% Spanish Town, 2% Montego Bay, 5% elsewhere), one-fifth (20%) reported full-time employment. Half (51%) reported sex work in the past year. Three-quarters (74%) had received a HIV test; of these, 17% were HIV positive. In multivariable analyses, HIV testing was associated with: perceived HIV risk (AOR: 2.03, CI: 1.23-3.35), childhood sexual abuse [CSA] (AOR: 3.13, CI: 2.28-8.30), lower HIV-related stigma (AOR: 0.96, CI: 0.93-0.99), and not getting drunk/high during sex (AOR: 0.46, CI: 0.24-0.90). Sex workers reported higher homelessness (AOR: 18.84, CI: 4.92, 72.13), unemployment (AOR: 6.24, CI: 2.42-16.13), forced sex (AOR: 2.76, CI: 1.36-5.58), depression (AOR: 1.55, CI: 1.24-1.93), perceived HIV risk (AOR: 1.50, CI: 1.07-2.11), and transgender stigma (AOR: 1.25, CI: 1.11-1.40). HIV-positive participants reported higher interpersonal violence (AOR: 5.88, CI: 2.19-15.74), homelessness (AOR: 5.06, CI: 1.14-22.49), unemployment (AOR: 4.40, CI: 1.11-17.52), forced sex (AOR: 3.37, CI: 1.31-8.69), CSA (AOR: 2.81, CI: 1.12-7.02), transgender stigma (AOR: 1.28, CI: 1.09-1.52), and lower self-rated health (AOR: 0.51, CI: 0.29-0.89).
**Conclusions:** Findings reveal HIV rates of 17% among transgender women in Jamaica, and half of participants reported sex work engagement. Sex workers and HIV-positive participants were more likely to experience homelessness, unemployment, forced sex, and transgender stigma. In the context of social inequities, HIV prevention and care continuum interventions for transgender women in Jamaica must address stigma, violence, mental health, and survival needs.

## THPED286

### HEALTH AND HUMAN RIGHTS VULNERABILITIES OF LGBT PEOPLE IN HUMANITARIAN EMERGENCIES

K. Knight[1], G. Jones[2], L. Stemple[3], J. Rosenberg[4]
*[1]Human Rights Watch, LGBT Rights, New York, United States, [2]UNAIDS, Humanitarian Adviser, Nairobi, Kenya, [3]UCLA School of Law, Law, Los Angeles, United States, [4]Women's Refugee Commission, Policy and Advocacy, New York, United States*
*Presenting author email: jonesg@unaids.org*

**Background:** While humanitarian systems have slowly become more fine-tuned to respond to the needs of marginalized populations, lesbian, gay, bisexual, and transgender people (as well as other sexual and gender minorities) continue to fall through the cracks at a policy level and in responses on the ground. Vulnerabilities related to lack of documentation, multiple checks on documents that don't match appearances (in the case of transgender people), or assumed family structures (in the case of same-sex couple-headed households), scapegoating, disrupted access to HIV and other health services, and the erosion of informal networks of care when crisis strikes all exacerbate the marginalization that LGBT people already face in daily life.
**Methods:** The European refugee crisis presents unique challenges in this vein. LGBT people from the Middle East and Africa have been claiming asylum in European countries for decades, but the influx of migrants to Europe and policy decisions by the EU and member states have taxed protection systems. What is more, political declarations about accepting LGBT asylum claims have been perceived as preferential treatment and caused (in some cases) violent backlash. One study found that half of LGBT refugees seeking asylum in Europe have engaged in commercial sex; yet the needs of those engaged in sex work have been largely overlooked in the humanitarian response. In Southern Africa, armed conflict and humanitarian crises have compounded challenges faced by the region already shouldering the world's heaviest HIV burden.
**Results:** While conflict-related sexual violence against women remains a significant problem, widespread sexual violence against men has barely been acknowledged by states, and the ways in which LGBT people experience conflict are widely overlooked.
**Conclusions:** Expanded understandings of gender and sexuality are necessary to a comprehensive response. The relationships between violence, migration, social marginalization and access to HIV services are complex; this presentation sheds light on what research to date can tell us about policy gaps, and suggests changes that should be urgently implemented to improve the health and human rights response for all people.

## THPED287

### "NOTHING FOR US WITHOUT US": THE IMPACT OF COMMUNITY PEER EDUCATORS' (PES) INVOLVEMENT TOWARDS ACHIEVING THE 90-90-90 TARGETS; SEX WORKERS OUTREACH PROGRAM (SWOP), NAIROBI, KENYA

R. Wanjiru[1], J. Kimani[2], P. Sore[1], L. Gelmon[3]
*[1]Sex Workers Outreach Program, Prevention, Nairobi, Kenya, [2]Sex Workers Outreach Program, Clinical, Nairobi, Kenya, [3]University of Mantoba Kenya/ SWOP, Nairobi, Kenya*
*Presenting author email: rhodakabuti@gmail.com*

**Background:** SWOP is the outreach arm for the University of Manitoba program in Nairobi and draws funding from CDC-PEPFAR. SWOP offers behavioral, structural and biomedical services with the aim of scaling up HIV prevention services among sex workers. A peer led hotspot based model in demand creation and mobilization as well as provision of safe spaces at the clinic is the hallmark of SWOP. A 2013 review of SWOP data showed that 75% of enrolments at the clinics were through the PEs and those clients had more knowledge on HIV transmission and prevention as compared to 25% who had not met a PE. Based on these results, a decision to involve PEs in all SWOP activities was made.
**Methods:** Groups of selected PEs were further trained as
(1) paralegals to sensitize stakeholders (SWs, law enforcers, bar owners) on sex worker rights,
(2) community Positive Health and Dignity Prevention champions(cPHDP) among those HIV positive to support disclosure and linkage to care,
(3) Sister to sister peer leaders to champion HIV/STI prevention and condom negotiation skills and
(4) Community advisory board (CAB) comprising of SWs who form a link between the community and the program.
Other PEs were trained as Outreach workers who are in charge of a number of PEs manning a cluster of hotspots. A comparative study was conducted comparing data before the community engagement 2012-2013 and after 2014-2015. The variables compared were retention, number of violence cases reported and addressed, and number of individuals receiving evidence based interventions( sister to sister, cPHDP).
**Results:** Enhanced community engagement through the specially trained PEs has improved linkage to care to 85%, Retention to 84% from 40% and, number of violence cases reported and addressed increased by 80%. Individuals receiving evidence based interventions increased by 54%. Repeat attendance for bio-medical services clinics also increased by 54%.
**Conclusions:** Involving the PEs in the program enhances activities which are key in achieving the 90-90-90 targets and create room for growth.

## THPED288

### ASSESSING THE SEXUAL AND REPRODUCTIVE HEALTH NEEDS OF FEMALE SEX WORKERS: HOW DOES U.S. FOREIGN ASSISTANCE MEASURE UP?

K. Boulton, B. Roose-Snyder, B. Cooper
*Center for Health and Gender Equity, Washington, United States*
*Presenting author email: broosesnyder@genderhealth.org*

**Background:** The U.S. government is a major donor to global health and supports a range of programming for key populations in the HIV epidemic, including female sex workers (FSWs). In recent years, emerging research and instruments such as the Sex Worker Implementation Tool (SWIT) have increased knowledge about evidence-based best practices to effectively address HIV in sex workers, and promote their broader sexual and reproductive health (SRH) needs. We evaluated the consistency of U.S. foreign assistance with best practices in order to propose recommendations to better promote sex workers' health and rights.
**Methods:** We reviewed the literature on the SRH needs of FSWs, including those related to HIV/AIDS, family planning, sexual health, maternal health and gender-based violence. We then conducted semi-structured interviews with key informants to assess how aspects of U.S. foreign assistance promote or impede the sexual and reproductive health and rights of FSWs based on best practices. Interviewees included U.S. officials, country-based implementers, researchers, sex workers and sex worker advocates, providers, and representatives from multilateral organizations.
**Results:** FSWs face a disproportionate burden of HIV but also experience significant unmet SRH needs related to safe pregnancy, contraception, and gender-based violence. Accessible, respectful, quality healthcare services remain the exception rather than the norm. Interviewees highlighted the challenges of addressing broader SRH needs within the HIV/AIDS agenda—funding for research among sex workers reflects the same siloing. Interviewees characterized the U.S. anti-prostitution loyalty oath (APLO) as a clear departure from best practice which interferes with the HIV/AIDS response. Many also identified criminalization more broadly as a continuing driver of HIV and poor SRH outcomes among sex workers. The need for approaches that are tailored to address sex workers' unique SRH needs was also emphasized, along with an inclusionary, rights-based, community-empowerment paradigm.
**Conclusions:** U.S. policies such as the APLO undermine the effectiveness of the HIV/AIDS response and are inconsistent with human rights principles. However, the U.S. is also well-positioned as both a funder of research and major international donor to promote a more inclusive HIV/AIDS agenda that addresses sex workers' broader SRH needs and priorities. Specific policy change recommendations are addressed.

## THPED289

### THE CONDOM QUANDARY: HOW LAW ENFORCEMENT ACTIONS IMPACT HIV PREVENTION STRATEGIES AMONG SEX WORKERS

T. Shen, G. Durrant
*Asia Catalyst, Beijing, China*
*Presenting author email: gdurrant@asiacatalyst.org*

**Background:** Sex work is illegal in China. It has been long reported that police use the possession of condoms as evidence of sex work to harass and punish sex workers. But the public debate on the impact of law enforcement on the HIV response is limited by the lack of substantiated data on the issue.
**Methods:** In 2015, Asia Catalyst worked with four sex worker organizations to conduct a research to understand how law enforcement practices affect sex workers' ability to access and carry condoms. The research conducted in three major Chinese cities, combined 517 questionnaire and 74 in-depth interviews with male, female and transgender sex workers, and 18 interviews with key informants including CBOs, staff of local health authorities, managers of sex work venues, and police officers.
**Results:** Among 517 respondents, 51.3% (265 /517) said they had been interrogated by police since engaging in sex work, and 42.9% (222/ 517) responded that they had been interrogated in the past year. Among the respondents, 35.4% (183/517), including female (133), male (23) and transgender (37) sex workers said they had experienced searches for condoms by the police. We compared condom use among respondents who had been interrogated by the police in the past year with those who had no such experience, and found that respondents who had experienced law enforcement action used condoms less consistently than those who had not experienced it: the rate of consistent condoms use among respondents who experienced interrogation is 47.7%, while it is 67.8% for respondents who have not had such an experience. Similar results came out for possession of condoms: 47.7% (106/222) of respondents who had been interrogated always carried condoms, a rate clearly lower than for those who always carried condoms but had not been interrogated (75.9%, 224/295). For both consistent condoms use and possession of condoms, the discrepancy was most evident among women.
**Conclusions:** We found that law enforcement practices have a negative impact on sex workers' possess and use of condoms. Police reform and community-police cooperation is crucial to HIV prevention among criminalized groups, and should be supported as a central part of HIV programming.

## THPED290

### PERCEPTIONS OF SEXUAL AND GENDER-BASED VIOLENCE BY FEMALE SEX WORKERS AND MALE CLIENTS IN MOMBASA, KENYA

S.V. Chabeda[1], P. Gichangi[1,2], A. Restar[3], J.U. Tocco[4], T.B. Masvaure[4,5], T. Sandfort[4], J.E. Mantell[4], Y. Lafort[6]
*[1]International Centre for Reproductive Health, Mombasa, Kenya, [2]University of Nairobi, Nairobi, Kenya, [3]Mailman School of Public Health, Columbia University, Sociomedical Sciences, New York, United States, [4]HIV Center for Clinical & Behavioral Research, NYSPI & Columbia University, Psychiatry, New York, United States, [5]Holy Cross College, Sociology and Anthropology, Worcester, United States, [6]International Centre for Reproductive Health, Ghent University, Ghent, Belgium*
*Presenting author email: peter@icrhk.org*

**Background:** Sexual and gender-based violence (SGBV) is common between female sex workers (FSWs) and their male clients (MCs). SGBV is associated with increased HIV risk, yet incidents often go unreported due to gender and economic power imbalances that characterize commercial sex. We examined the manifestations of SGBV from the perspectives of both FSWs and MCs to better understand the contexts in which SGBV occurs.
**Methods:** We conducted in-depth interviews with 25 FSWs and 25 MCs recruited from 18 bars/nightclubs in Mombasa. Interviews were audio-recorded, transcribed, and translated from Kiswahili to English. Transcripts were analyzed thematically using Dedoose.

Tuesday 19 July
Wednesday 20 July
Thursday 21 July Poster Exhibition
Friday 22 July
Late Breaker Posters
Author Index

**Results:** Most FSWs had experienced either verbal or physical manifestations of SGBV perpetrated by MCs; only six reported no SGBV incidents. The two most common forms of violence that FSWs reported were being beaten up by MCs or forced to engage in unprotected vaginal sex; one FSW had been raped anally. FSWs also encountered verbal abuse, which frequently occurred when MCs refused to pay for sexual services. Most MCs, in turn, reported that they had resorted to violence after FSWs stole their money or phones, tried to drug them or threatened to blackmail them if there was disagreement over payment. FSWs reported that it was easy for MCs to threaten, harm or refuse to pay them if sex occurred at MCs' homes. Guesthouses were therefore considered safe places because security personnel could intervene when conflicts arose. Few FSWs and MCs reported SGBV to police for fear of being ill-treated and possibly arrested. MCs also expressed fear of being blackmailed by FSWs or the police.
**Conclusions:** FSWs need to be better protected against SGBV and MCs need to be educated against resorting to physical violence with FSWs. FSWs could benefit from skills-based peer education about how to mobilize SGBV avoidance and management strategies. Police should be sensitized on handling reported SGBV from FSWs and MCs. In the long-run, strategies are needed to tackle male privileged power and gender norms that condone male violence; legalization of sex work might encourage FSWs and MCs to report incidents to the police.

## THPED291

### INCREASING ACCESS TO HIV PREVENTION SERVICES FOR FEMALE SEX WORKERS THROUGH MOONLIGHT OUTREACHES IN KIRINYAGA COUNTY, KENYA

J. Onyoni[1], J. Anthony[2], P. Njoroge[3], B. Ogwang[1], J. Kioko[1], H. Musyoki[4]
*[1]Partners for Health and Development in Africa, Technical Support Unit, Nairobi, Kenya, [2]University of Manitoba, Technical Support Unit, Nairobi, Kenya, [3]University of Nairobi, Nairobi, Kenya, [4]National AID/STI Control Programme, Nairobi, Kenya*
*Presenting author email: foeastern@gmail.com*

**Background:** Female sex workers (FSWs) often experience barriers in accessing health services. They also suffer additional barriers to access health services due to stigma; discrimination. Kirinyaga is one of the Counties in Kenya with 12 sub counties with an estimate of 4,000 FSWs. The adult HIV prevalence is 3.3% (NASCOP 2013). The program has employed 10 peer educators (PEs) to reach out to the estimated FSWs with HIV programs and services. The program has also established one drop in service centre which acts as a safe space for FSWs. In 2014, The Kenyan national guidelines for key populations which includes FSWs was revised and it recommended to use peer educators (PEs) in delivering routine HIV combination prevention interventions through planned community outreaches.
**Description:** During micro planning exercise hotspot listing was done which gave size estimates per hotspot. Hotspots are distinct places where FSWs solicit their clients. In order to improve access to HIV services, the program conducted routinely 20 moonlight clinics in a month in hotspots so as to increase the access of HIV services to FSWs who solicit clients in those hotspots. Services that were offered through moonlight clinics included HTC, screening and treatment of sexually transmitted infections, condom and lubricant distribution, health education, linkage to HIV care for those who tested HIV positive.
**Lessons learned:** The program quarterly uptake of contacts and HIV services have increased from Sept, 2014 to Sept 2015 with contacts increasing from 33% to 95% during the above period. HIV testing and counselling increased significantly from 15% to 35%, while STI screening increased from 52% to 95% with the STI positivity rate decreasing significantly from 10% - 1% during the same reporting period respectively.
**Conclusions/Next steps:** Structured outreaches with peer educators' involvement and improving access to HIV services through routine moonlights, increases services uptake among female sex workers. The program now plans to recruit more peer educators at the rate of one Peer educator to 60 FSWs to ensure that all the female sex workers are reached and ensure that a high number of FSWs are able to access HIV services.

## THPED292

### DEVELOPING COLLECTIVE LEADERSHIP IN HIV RESPONSE: AN INNOVATIVE APPROACH TO COMMUNITY-LED TRAINING ON SEX WORK, HIV AND HUMAN RIGHTS AMONG SEX WORKERS IN EUROPE

L. Stevenson, A. Dziuban
*International Committee on the Rights of Sex Workers in Europe, Amsterdam, Netherlands*
*Presenting author email: info@sexworkeurope.org*

**Background:** This presentation documents and reflects on community-led capacity building programme on 'Sex Work, HIV and Human Rights' developed by ICRSE. This programme was initiated in 2014 in order to address health needs of sex workers in Europe and to build sex workers' capacity to engage in the HIV response at the community, national and regional level.
**Description:** This innovative and multifaceted project consisted of a series of participatory trainings organised by ICRSE with the cooperation of sex worker collectives in Europe. A five-day regional workshop facilitated awareness-raising and knowledge-building efforts amongst sex workers and supported community engagement in advocacy for sex workers' health rights. Subsequently, leaders of 5 local sex worker organisations were supported in sharing knowledge from the training by conducting context-specific national workshops for their communities. These local workshops were accompanied by the development of the sex worker-only e-learning space through which particularly isolated sex workers could gain knowledge and interact with their peers from across Europe. Eventually, ICRSE published community training manual: a tool for organising and leading community trainings on issues related to sex workers' vulnerability to HIV and human rights.
**Lessons learned:** The community-led character of the workshops facilitated knowledge and experience sharing among the participants and allowed different communities of sex workers to openly voice their health concerns. In several countries, ICRSE workshops encouraged sex workers to advocate for their health rights despite initial fear of discrimination from health professionals. In others, trainings were successful in promoting community empowerment as a key component of HIV programming and an effective way to address structural factors increasing sex workers' vulnerability to HIV. Economic and social exclusion also constituted a serious barrier to sex workers' involvement in the programme, e.g. the loss of income while attending the workshops should to be taken seriously as a barrier for the most precarious sex workers.
**Conclusions/Next steps:** Community empowerment has been recognised by the UNAIDS and WHO as indispensable for the development of well-informed and effective HIV prevention programming. ICRSE training programme served as a tool to support community mobilisation in the region and facilitated sex workers' involvement and collective leadership in response to HIV/AIDS.

## THPED293

### ARE THE LEGAL AND POLICY CONTEXTS IN MALAWI FAVOURABLE TO EQUITABLE ACCESS TO TREATMENT, CARE AND SUPPORT SERVICES FOR FEMALE SEX WORKERS?

F. Msiska
*Badilika Foundation, Blantyre, Malawi*
*Presenting author email: badilika2006@gmail.com*

**Background:** The primary mode of HIV transmission in Malawi is unprotected heterosexual sex. Female sex workers are particularly vulnerable and this population tends to have a higher prevalence of HIV infection (70%) than the general population (10.6%) because they engage in behaviours that put them at a higher risk of becoming infected. The National HIV Prevention Strategy and the National HIV and AIDS Strategic Plan (2011-2016) were prepared to guide the implementation of HIV prevention interventions. But are these policies and strategies inclusive and favourable for female sex workers?
**Description:** From 2012 to 2015 Badilika Foundation has implemented a PMTCT project with funds from ViiV Healthcare aimed at reducing new HIV infections among FSWs and their clients and preventing unintended pregnancies with a focus on improving access to modern contraceptive methods. The project looked into promoting equitable access to quality HIV prevention, testing, treatment, care and support for FSWs from a human rights and public health based approach. Major activities included training peer educators on their role in project implementation; educating FSWs on safe sex practices and family planning, behavioural change communication, strengthening community networks, facilitating referrals, capacity development of rights holders and duty bearers on human rights of FSWs, and conducting mobile HTC clinics at hot spots.
**Lessons learned:** Our observation shows that many stakeholders including the police, health workers and FSWs themselves are not aware of the laws and provisions that protect the female sex workers' rights. Health facilities are not accessible and friendly to female sex workers. Health workers violate sex workers right to health by judging them and even denying them health services.

**Conclusions/Next steps:** The project enabled FSWs to make informed decisions about their sexual and reproductive health, reduced stigma and discrimination by service providers and has improved access to health services. But there are many policy gaps affecting FSWs. In future community engagement and empowerment requires involving FSWs in the design, research, implementation, monitoring, evaluation, of policies and programmes that affect their lives because without their active engagement and involvement efforts to provide access to HIV prevention, treatment, care and support will not be optimally effective.

## THPED294

### COMMUNITY COLLECTIVIZATION, FINANCIAL SECURITY AND HIV RISK BEHAVIORS AMONG FEMALE SEX WORKERS IN INDIA: FINDINGS FROM AVAHAN-III EVALUATION STUDY

R. Adhikary, M. Battala, S.K. Patel
*Population Council, New Delhi, India*
*Presenting author email: radhikary@popcouncil.org*

**Background:** Recent research studies show that community collectivization and financial security are crucial to defy HIV risk among female sex workers. This study assesses collective action and financial security among FSWs, and explores its association with their HIV risk behaviors in India.
**Methods:** Data were drawn from the Avahan-III baseline evaluation survey- 2015, conducted among FSWs (n=4098) in five states of India. Two stage cluster sampling approach was used to select the required number of FSWs for the survey. Adjusted odds ratios (AOR) and their 95% confidence intervals (CI), bivariate and univariate analysis were conducted to assess the relationships between collective action and financial security with HIV risk behaviors.
**Results:** Nearly half of the FSWs (48%) were having high level of collective action (e.g. community members came together for a problem), 68% had functional savings account either in a nationalized bank or post office, and 19% invested in insurance schemes or gold/land/business etc. FSWs, those who had high level of collective action (85% vs. 78%; AOR: 1.6) and had invested in insurances/gold/land/business (84% vs. 79%; AOR: 1.4) were significantly at higher chances of using condom consistently with both regular as well as occasional clients than others. The odds of using condom consistently with both regular and occasional clients were also higher among FSWs those had functional savings account at the time of the survey. Similarly, likelihood of using consistent condom use with non-regular partners were also higher among FSWs those had higher level of collective action than their counter parts.
**Conclusions:** Findings from the study show that there was a significant association between collective action and financial security with consistent condom use with different type of clients among FSWs. Maintenance of high level of consistent condom use is central to improve the sustainability of HIV prevention programs. However, more community outreach activities, research and advocacy are required to highlight these issues in a wider context in other high risk group population including FSWs.

## THPED295

### HIGH CO-OCCURRING STI AND HIV PREVALENCE AND THE POOR TREATMENT CASCADE AMONG FEMALE SEX WORKERS IN DURBAN, SOUTH AFRICA

L. Rambally-Greener[1], R. Greener[1], M. Beksinska[1], K. Sithole[1], Y. Lafort[2], J. Smit[1]
*[1]MatCH Research (Maternal, Adolescent and Child Health Research), University of the Witwatersrand, Durban, South Africa, [2]International Centre for Reproductive Health, Ghent University, Ghent, Belgium*
*Presenting author email: lrambally@matchresearch.co.za*

**Background:** National studies in South Africa have estimated HIV prevalence among Female Sex Workers (FSWs) to be between 46-69% significantly higher than the 13.3% HIV prevalence among women in the general population. In high prevalence settings or with key populations the World Health Organization recommends regular HIV testing, with linkage to care, however, there is insufficient information exploring FSWs HIV or STI testing behaviour or linkage to care.
**Methods:** The data reported in this paper were collected in 2012 using a cross sectional survey and HIV rapid testing, conducted for an ongoing multi-country research project among FSWs in India, Kenya, Mozambique and South Africa. Participants were recruited using respondent driven sampling, in total 400 FSWs participated. Data were entered into Intercooled Stata v.11 and descriptive analyses conducted. Ethics approval was attained from the Human Research Ethics Committee (Medical) of the University of the Witwatersrand, Johannesburg, South Africa (M120522).
**Results:** Participants are between 21-30 years of age; hold a primary education 69.4%. Estimated having between 1-7 partners a week (43.2). Few FSWs know the HIV status of their regular paying partners (12.2%) or their last non-paying partner (8.3% ). Condom use at last sex with a paying partner is estimated at 71% and lower with regular non-paying partners 63%. Additionally 65.3% of FSWs reported condom breakages in the last year. The biological data collected indicate that HIV prevalence among FSW in Durban is 66.9%. Of the FSWs who self-reported an HIV positive status 18% are currently accessing antiretroviral therapy (ART). Seventy percent of FSWs reported experiencing an abnormal discharge or genital ulcer within the last 12 months, of these 92% sought care, 47.7% were satisfied with the care they received. Unplanned pregnancies in the last 5 years were reported by 37.3% and 67% reported male condoms as their primary method of contraception.
**Conclusions:** There are multiple risk factors that increase FSWs risk of STI and HIV infection and transmission. These findings highlight the need and importance of integrating, providing and promoting family planning in addition to regular STI and HIV prevention, testing and treatment services for FSWs.

## THPED296

### SEX WORK AND THE CITY: A COMPARISON OF FEMALE SEX WORKERS IN TWO SOUTH AFRICAN CITIES

M. Radebe, M. Sibanyoni, M. Slabbert
*Wits Reproductive Health and HIV Institute, University of the Witwaterstrand, Johannesburg, South Africa*
*Presenting author email: mopolesh@gmail.com*

**Background:** The HIV prevalence in sex workers is significantly higher than in the general population. In order to achieve the 90-90-90 target set by UNAIDS, this hidden population must be accessed and effective programs implemented. The Wits Reproductive Health and HIV Institute provides healthcare services to sex workers in Hillbrow and Tshwane and the study was conducted to better characterize the drivers of the HIV epidemic and to inform more targeted and efficient HIV programming for sex workers at these sites.
**Methods:** Study participants (n=174) were women aged 18 years and older who self-identified as sex workers. A standardized questionnaire was administered in face-to-face interviews, which included questions on socio-demographic characteristics, sexual behaviour, sexual and reproductive health knowledge, risk behaviours and condom use. We used Chi square to compare the characteristics of FSW from the two sites.
**Results:** Of the 174 participants enrolled into the study, 124 were based in Hillbrow and 50 in Tshwane. Our data show that there are significantly more FSW of Zimbabwean origin working in Hillbrow than in Tshwane ($p< 0.01$) and FSW in Hillbrow tend to stay at the brothel where ($p< 0.001$). There was no significant difference in the level of education between the FSW at both sites ($p< 0.1$) and no significant difference in HIV status at between the two sites was observed (Hillbrow 39.5%, Tshwane 42.8%, $p< 0.44$). Although there were significantly more FSW who received information STI/HIV information in Tshwane, there were more STI cases reported in Tshwane than in Hillbrow ($p< 0.04$). Similarly, there were fewer cases of condom failure reported in Hillbrow than in Tshwane ($p< 0.019$). We observed no significant difference between the sites in the amount of FSW who are receiving treatment for HIV.
**Conclusions:** Although the two sites characterised in this study are both inner-city and both in Gauteng there are numerous important differences between these two populations. The study highlights the importance to consider the uniqueness in composition, migrancy, behaviours and health profile of individual sites when implementing services for sex workers.

## THPED297

### PARTICIPANT PERSPECTIVES ON ETHICAL CONSIDERATIONS FOR THE COLLECTION OF GEOGRAPHIC INFORMATION IN HIV AND SUBSTANCE USE RESEARCH

A. Rudolph[1], A. Robertson Bazzi[2], S. Fish[3]
*[1]Boston University, Epidemiology, Boston, United States, [2]Boston University, Community Health Sciences, Boston, United States, [3]Boston University, Biostatistics, Boston, United States*

**Background:** In substance use and HIV-related research, geographic information can help identify "hot spots" and "health service deserts", evaluate associations between proximity to health services and their use, and link contextual factors with individual-level data to understand environmental influences on risk/health-seeking behaviors. Technological advancements in the methods used to collect location data can improve the accuracy of contextually-relevant geographic data; however, they

Tuesday 19 July
Wednesday 20 July
Thursday 21 July Poster Exhibition
Friday 22 July
Late Breaker Posters
Author Index

have outpaced the development of ethical standards and guidance, particularly for research involving populations engaging in illicit/stigmatized behaviors. The purpose of this qualitative study was to
(1) explore participant comfort with and perceptions regarding privacy, confidentiality, and safety associated with different geographic data collection methods used in substance use and HIV-related research and
(2) determine the extent to which these concerns could influence study compliance and the validity of participants' responses.
**Methods:** Between November 2014 and April 2015, we recruited 15 Baltimore residents reporting recent drug use via flyers and peer-referral to complete in-depth qualitative interviews exploring perceptions regarding acceptability and ethics of three methods for collecting geographic data:
(1) surveys collecting self-reported addresses/cross-streets,
(2) surveys using web-based maps to find/confirm locations, and
(3) geographical momentary assessments (GMA), which collect spatiotemporally referenced behavioral data via mobile applications on GPS-enabled smartphones.
Content analysis identified concerns and perceived likelihood of participation and compliance in studies using these methods.
**Results:** Although the collection of geographic data was generally viewed as acceptable, participants raised concerns relating to confidentiality and comfort regarding providing exact addresses for illicit/stigmatized behaviors (e.g., purchasing/using drugs). Further, many felt that concerns about the confidentiality of such "sensitive" locations could influence the accuracy of the information provided. Specific to GMA studies, concerns included the burden of carrying/safeguarding study phones and responding to survey prompts, confidentiality issues, discomfort with being tracked, and noncompliance with study procedures (particularly while high/getting high).
**Conclusions:** Concerns raised by participants could result in differential study participation, differential compliance with data collection procedures, and questionable accuracy and validity of location data for sensitive behaviors. Additional research engaging this population is needed to develop and refine innovative methods for collecting accurate, real-time geographic information on substance use and related risk behaviors.

## THPED298

### SEXUAL VIOLENCE FROM POLICE AGAINST HIV-INFECTED WOMEN WHO INJECT DRUGS IN ST PETERSBURG, RUSSIA: A MIXED METHODS ANALYSIS OF PUBLIC HEALTH AND HUMAN RIGHTS IMPLICATIONS

K. Lunze[1], A. Raj[2], D.M. Cheng[3], E.K. Quinn[3], F. Lunze[4], J.M. Liebschutz[3], C. Bridden[3], A.Y. Walley[3], E. Blokhina[5], E. Krupitsky[5,6], J.H. Samet[3]
*[1]Boston University, Department of Medicine, Boston, United States, [2]University of California, San Diego, United States, [3]Boston University, Boston, United States, [4]Harvard University, Boston, United States, [5]Pavlov First State Medical University, St. Petersburg, Russian Federation, [6]Bekhterev Psychoneurological Research Institute, St. Petersburg, Russian Federation*
*Presenting author email: lunze@bu.edu*

**Background:** Police violence against people who inject drugs (PWID) is common in Russia and associated with HIV risks. Sexual violence from police against women who use drugs has been reported anecdotally in Russia. This study aims to evaluate police sexual violence against HIV-infected women who inject drugs via quantitative assessment of its prevalence and HIV risk correlates, and through qualitative interviews with police, substance users, and their providers in St. Petersburg, Russia.
**Methods:** Cross-sectional analyses with HIV-infected women who inject drugs (N=228) assessed the associations between police sexual violence victimization (i.e., having been forced to have sex with a police officer) and the following behaviors: current drug use, needle sharing, and injection frequency using multiple regression models. We also conducted in-depth interviews with 23 key informants, including PWID, police, civil society organization workers, and other stakeholders, to explore qualitatively the phenomenon of police sexual violence in Russia and strategies to address it. We analyzed qualitative data using content analysis.
**Results:** Approximately 1 in 4 women in our quantitative study (24.1%; 95%CI, 18.6%, 29.7%) reported sexual violence perpetrated by police. Victims reported more transactional sex for drugs or money than non-victims; however, the majority of those victimized were not involved in these forms of transactional sex. Victimization was not significantly associated with current drug use or needle sharing. However, victims reported more frequent drug injections (adjusted incidence rate ratio 1.43, 95%CI 1.04, 1.95). Qualitative data suggested that police sexual violence and coercion appear to be entrenched as a norm and are perceived insurmountable because of the seemingly absolute power of police. Police sexual violence are human rights violations and systematically add to the risk environment of women who use drugs in Russia.
**Conclusions:** Police sexual violence was common in this cohort of Russian HIV-infected women who inject drugs. Our analyses found more frequent injection drug use among victims, suggesting that the phenomenon represents an underappreciated human rights and public health problem. Addressing police sexual violence against women in Russia will require raising social awareness and instituting police trainings that protect vulnerable women from violence and prevent HIV transmission.

## THPED299

### PANGAEA GLOBAL AIDS AND CLINTON HEALTH ACCESS INITIATIVE BEST PRACTICE SERIES: REACHING KEY POPULATIONS AFFECTED BY HIV. THE GOVERNMENT OF MAURITIUS HARM REDUCTION PROGRAM FOR PEOPLE WHO INJECT DRUGS (PWID)

K. Taylor[1], M. Kaur[2], C. Sewraz[3], M. Rejbrand[1], I. Mahaka[4], C. Duncombe[1]
*[1]Pangaea Global AIDS, Oakland, United States, [2]Clinton Health Access Initiative, Bombay, India, [3]Government of Mauritius, Ministry of Health, Port Louis, Mauritius, [4]Pangaea Global AIDS, Harare, Zimbabwe*
*Presenting author email: ktaylor@pangaeaglobal.org*

**Background:** Pangaea Global AIDS, in partnership with CHAI, produced a series of case studies documenting and costing effective approaches to HIV service delivery in Sub-Saharan Africa. Mauritius has a concentrated HIV epidemic, predominantly among PWID, men who have sex with men, and sex workers.
**Description:** In response to the growing HIV epidemic among people who inject drugs (PWID), a partnership of civil society and the government of Mauritius initiated harm reduction practices in 2006 that includes methadone maintenance therapy (MMT) and needle and syringe exchange (NEP) in conjunction with the scale up of HIV testing and ART access. These activities were formally established under the Harm Reduction Unit (HRU) within the Ministry of Health in 2010.
**Lessons learned:** Since 2006, 7000 individuals have initiated MMT, 80% of whom received a HIV test. In 2014, 3078 individuals accessed NEP through fixed sites (47 sites in 2015), vans, backpack outreach workers, and peer educators. In 2013, 719,427 clean needles and syringes were distributed, representing 283 needles and syringes per person per year. The incidence of HIV among PWID in Mauritius declined from 68.1% in 2011 to 31.1% in 2014. New HIV infections peaked at 921 in 2005, the year prior to the harm reduction program implementation. There were 322 new infections in 2014. In 2014, MMT service delivery cost $267 per person per year, while needle exchange cost $49 per person per year.
**Conclusions/Next steps:** The harm reduction program in Mauritius is a successful, collaborative approach to a major public health problem that is based on evidence and respect for human rights. The case study provides an example of effective advocacy by civil society and political will by the government leading to a partnership that has reduced HIV transmission. The MMT program uses the harm reduction strategy as an entry point to other services, such as HIV testing and linkage to care. The outreach strategies have ensured that PWID are offered services they need while protecting them from harassment and prosecution. The HIV response in Mauritius provides an evidence-informed best practice that should be considered by other countries with HIV epidemics among PWID.

## THPED300

### SOCIAL AND STRUCTURAL FACTORS ASSOCIATED WITH GREATER TIME ABOVE AN HIV VIRAL LOAD OF 1500 COPIES/ML PLASMA AMONG ILLICIT DRUG USERS IN A CANADIAN SETTING

M.C. Kennedy[1,2], E. Wood[2,3], T. Kerr[2,3], J. Montaner[2,3], M.-J. Milloy[2,3]
*[1]University of British Columbia, School of Population and Public Health, Vancouver, Canada, [2]British Columbia Centre for Excellence in HIV/AIDS, Vancouver, Canada, [3]University of British Columbia, Medicine, Vancouver, Canada*

**Background:** Although previous studies have characterized temporary increases in plasma HIV-1 RNA viral load (VL) among HIV-positive people who use drugs (PWUD), factors associated with longer periods of time with heightened HIV transmission potential have not been investigated. Therefore, we examined factors associated with amount of person-time spent above a VL threshold that increases risk of transmission to others among HIV-positive PWUD in Vancouver, Canada.
**Methods:** Data were derived from the AIDS Care Cohort to evaluate Exposure to Survival Services (ACCESS), a long-running prospective cohort of HIV-positive PWUD linked to comprehensive clinical monitoring records. We used Poisson regression to longitudinally examine factors associated with person-time (in days) above a VL of 1500 copies/ml in the previous 180 days.
**Results:** Between December 2005 and May 2014, 845 participants were included in the study, including 581 (69%) males and 464 (55%) who self-reported Caucasian ancestry. Of these, 593 (70%) spent at least one day with a VL above 1500 copies/ml during the study period. In a multivariable model, homelessness (Adjusted Rate Ratio [ARR] = 1.50; 95% confidence interval [CI]: 1.36 - 1.65), and having no social support (ARR = 1.36; 95% CI: 1.23 - 1.49) were independently and positively as-

sociated with amount of time spent over 1500 copies/ml. Age (ARR =0.97; 95% CI: 0.97-0.98), enrollment in addiction treatment (ARR = 0.73; 95% CI: 0.65-0.82), and CD4 cell count (ARR = 0.81; 95% CI: 0.78 -0.85) were independently and negatively associated with time spent over 1500 copies/ml.
**Conclusions:** Among HIV-positive PWUD, periods of homelessness or lacking in social support were independently associated with greater time experiencing an elevated VL. Our findings suggest the need for targeted prevention efforts to address modifiable factors associated with risk of HIV transmission among PWUD.

## THPED301

### A decade of harm reduction and the projected impact of 10by20

C. Cook[1], C. Stoicescu[2]
*[1]Harm Reduction International, London, United Kingdom, [2]Harm Reduction International, Oxford, United Kingdom*

**Background:** Harm Reduction International (HRI), a leading non-governmental organisation working to promote and expand support for harm reduction, has been tracking developments in HIV and viral hepatitis related harm reduction worldwide since 2007. This paper highlights the key findings from a decade of information on harm reduction services across the globe, using mathematical modelling to illustrate the importance of investment in harm reduction for the reduction of HIV among people who inject drugs.
**Methods:** Information presented in this paper was sourced using international scientific and grey literature, reports from multilateral agencies, international non-governmental organisations, organisations of people who use drugs, biennial surveys to civil society and harm reduction networks, expert consultation from academics and those working on HIV, drug use and harm reduction. Using the body of available data HRI, in collaboration with the Kirby Institute, developed a mathematical model to map future projections of harm reduction scale up and the impact a small shift in spent from punitive measures related to drug control towards harm reduction could have on the HIV and HIV related deaths among PWID.
**Results:** Just 7% of what is currently required ($2.5 billion) to fund harm reduction is invested globally. 2.5% ($2.66 billion) of current estimated global spend on drug law enforcement would bring harm reduction coverage levels to mid-range coverage as advised within UN guidance. Modelling data projects a 78% reduction in HIV among PWID by 2030. Investment of 7.5% of enforcement spend ($7.66 billion) would see high coverage levels in all countries around the world, and a near eradication of HIV among people who use drugs.
**Conclusions:** Harm reduction is cost-effective and effective in reducing HIV and HCV among PWID. A small shift in investment from punitive measures towards drugs to harm reduction would ensure a near eradication of HIV among PWID.
PWID by 2030. Investment of 7.5% of enforcement spend ($7.66 billion) would see high coverage levels in all countries around the world, and a near eradication of HIV among people who use drugs.

## THPED302

### A sectoral approach to reach Indigenous Papuan workers with HIV information and services

G.M. Halim[1], R. Howard[2], G. Manurung[1], M. Licata[3], S. Mabhele[4], R. Ameur[5]
*[1]ILO Jakarta Office, ILOAIDS, Jakarta, Indonesia, [2]ILO Bangkok Office, ILOAIDS, Bangkok, Thailand, [3]International Labour Organization, Geneva, Switzerland, [4]ILO, Pretoria, South Africa, [5]International Labor Organization, pretoria, South Africa*
*Presenting author email: grace@ilo.org*

**Background:** Integrated Biological and Behavioural Surveillance in 2012 showed significant HIV prevalence among indigenous Papuans (2.3%) compared to other Indonesians (0.4%). Prior to project start up, a survey conducted showed 30% of Papuan Indigenous workers had never received HIV prevention information and 75% has never been offered HIV testing before the project began.
**Description:** The ILO and Department of Foreign Affairs and Trade (DFAT) Australia partnered with local government and private sector enterprises to deliver HIV prevention information, testing and treatment services to over 5000 indigenous workers.
The project built upon the existing health system to reach Indigenous Papuan working in palm oil plantation and port areas by strengthening collaboration between labour and health sectors.
The project provided HIV prevention information and provider initiated HIV testing on a routine basis over a one year period. The target group included 10000 workers; 72% were Indigenous Papuan workers aged 8-60 years old; 80% were men.
**Lessons learned:** After one year implementation, a total of 6500 workers in plantation and transport sectors received HIV prevention services and 2192 underwent HIV testing. 3.1% tested positive and, among those, 80% initiated HIV treatment. Private sectors and government allocate funding to ensure sustainability of the program.
**Conclusions/Next steps:**
- The private sector is an efficient means to extend HIV services to hard-to-reach indigenous peoples in remote areas
- Workplace interventions have strong potential to fill gaps in HIV responses and ensure sustainability and continued funding
- Workplace programs can ensure a rights-based approach by guaranteeing continued employment, confidentiality of medical status and access to health services in line with the ILO standard on HIV and AIDS in the Workplace.

## THPED303

### Refining the research response: Indigenous leadership in HIV research

R. Masching[1], C. Loppie[2], T. Prentice[1,2], M. Amirault[1], S. Pooyak[1], C. Worthington[2], P. Brownlee[1], K. Pendergraft[3], M. Loutfy[4], S. Greene[5], T. Howard[6], L. Calzavara[7]
*[1]Canadian Aboriginal AIDS Network, Halifax, Canada, [2]University of Victoria, Victoria, Canada, [3]CIHR Canadian HIV Trials Network (CTN), Vancouver, Canada, [4]Women's College Hospital, Toronto, Canada, [5]McMaster University, Hamilton, Canada, [6]Positive Living Society of British Columbia, Vancouver, Canada, [7]University of Toronto, Toronto, Canada*
*Presenting author email: reneem@caan.ca*

**Background:** Research can be a useful tool to better understand and address HIV. In Canada, HIV is epidemic in Indigenous communities, many of whom are joining researchers in seeking to inform effective responses to preventing new and co-infections, eliminating stigma and discrimination and reducing AIDS-related deaths. As a nationally recognized leader in Indigenous HIV Community-Based Research, the Canadian Aboriginal AIDS Network (CAAN) has partnered with some of Canada's top research institutions to develop a strategic research response to HIV that is Indigenous-led, grounded in community concerns, and relevant across scientific disciplines.
**Methods:** Our interdisciplinary research team, including social and biomedical scientists, have used a multi-method and phased approach to strategy development including:
1) a comprehensive literature review of existing Indigenous HIV research;
2) 19 in-person consultations across Canada with a broad range of stakeholders, including Indigenous people living with or affected by HIV, researchers, clinicians, health care and service providers, and Traditional Knowledge Keepers; and,
3) an online survey. In total, we spoke to 212 individuals, 60% of whom self-identified as Indigenous, about their HIV-related research needs and preferred approach to research. To ensure that our findings reflect the broadest range of stakeholders, we also attended eight HIV-related research meetings and 'member checked' our preliminary findings with three groups of Indigenous stakeholders.
**Results:** Strategic research priorities include: understanding and addressing the impacts of racism, colonization, and HIV-related stigma and discrimination on Indigenous peoples' health; facilitating access to health-care, including HIV testing, care, treatment and support; and the intersections of mental health, substance use, and social determinants. Findings confirm that successful HIV-related research with Indigenous communities must be Indigenous-led or partnered, and engage Indigenous communities and Indigenous people living with HIV in the research design, implementation, analysis and dissemination of results. This is true for all HIV research, regardless of discipline or research design.
**Conclusions:** Indigenous and non-Indigenous communities are mobilizing around the urgent need for Indigenous-led responses to issues that impact Indigenous communities, including HIV. Strategically identifying Indigenous HIV research priorities in a consolidated strategy that is evidence-based, Indigenous-led and grounded in community-identified need will increase the quality and relevance of new investigations.

### GLOBAL INDIGENOUS YOUTH: RECLAIMING CULTURAL AND LAND BASED METHODS CONCERNING STIGMA, SEXUAL HEALTH AND HIV/AIDS

I.A. Foote[1,2]
*[1]Global Indigenous Youth Council on Sexual Health and HIV, Kahnawake, Canada, [2]National Indigenous Youth Council on Sexual Health and HIV, Chair & Quebec Representative, Kahnawake, Canada*
*Presenting author email: iehente.f@gmail.com*

**Background:** The Panel will consist of four International Indigenous Youth leaders whom will be addressing a number of Indigenous global issues. Focused on resisting, reshaping, and remodeling new ways to educate their communities around stigma and shame. Stigma and Shame is highly prevalent in Indigenous communities related to HIV/AIDS and Sexual and Reproductive Health. The panel will lead a discussion addressing the Global Indigenous Youth Council on HIV/AIDS and Sexual and Reproductive Health Rights with ways of encouraging Indigenous Youth cooperation and global solidarity for the Indigenous HIV movement.
**Description:** This will be a panel discussion with grassroots young Indigenous youth who are taking up leadership in their communities. As role models they will share ways in which they address shame and stigma in culturally relevant ways within each of their communities. This panel will discuss the practical implementation of what reducing shame and stigma for so called 'marginalized' groups actually looks like globally in practice, through the lense of activism, resistance of settler colonialism, and solidarity of a global movement of Indigenous youth.
Reducing shame and stigma in young Indigenous peoples' because it includes a wide variety of openness that includes self-ID women, men, 2S, Queer, trans, ect youth. In this way, we can remain broad while sharing our own stories of resistance and resiliency within our own Native Nations while opening the conversations to be continued by others. Panelists include: Iehente Foote, Keioshiah Peter, Letishia Parter & Brent Huggins.
**Lessons learned:** We would assist the audience in actively being involved, supporting and taking the initiative to create and promote new health models, colonial models, whilst promoting conversations around accountability for creating further harm and violence against certain voices.
**Conclusions/Next steps:** Leaders and youth creating sustainable discourses among Indigenous communities through utilizing youth narratives that can be implemented in community-based organizations.
Furthermore, another expected outcome is the reduction of stigma of HIV in indigenous community through activism, raising awareness, and increasing solidarity of indigenous youth in the HIV movement. This will be accomplished through the audience participation, support, and promotion of new health models that provide accountability against harm and violence.

## THPED305

### UNDERSTANDING HEALTH CONSEQUENCES OF THE U.S. PRISON RAPE ELIMINATION ACT (PREA) FOR INCARCERATED TRANSGENDER WOMEN: IMPLICATIONS FOR SEXUAL ASSAULT AND HIV TRANSMISSION RISK

J. Hughto[1,2,3], S. Reisner[4,5,6], J. Pachankis[1,2]
*[1]Yale School of Public Health, Chronic Disease Epidemiology, New Haven, United States, [2]Yale University, Center for Interdisciplinary Research on AIDS, New Haven, United States, [3]The Fenway Institute, Epidemiology, Boston, United States, [4]Harvard Medical School/Boston Children's Hospital, General Pediatrics, Boston, United States, [5]Fenway Institute, Epidemiology, Boston, United States, [6]Harvard T.H. Chan School of Public Health, Epidemiology, Boston, United States*
*Presenting author email: jwhite@fenwayhealth.org*

**Background:** In the United States, transgender women are disproportionately at risk for HIV infection and incarceration relative to cisgender (non-transgender) women and men. Most U.S. correctional institutions house transgender women with men if they have not had gender reassignment surgery. While in male prisons, transgender women are targets of sexual assault, which place them at risk for HIV infection. The Prison Rape Elimination Act (PREA) was designed to protect the most vulnerable prisoners (e.g., transgender women) against sexual assault and HIV acquisition, yet the extent to which this policy is serving its intended purpose is unknown.
**Methods:** Phase 1: From June-August 2015, semi-structured interviews were conducted with 20 racially diverse, formerly incarcerated U.S. transgender women. Interviews assessed participants' sexual relationships, perceived risk for acquiring or transmitting HIV, and whether and how PREA was enforced in U.S. male prisons. Phase 2: A critical policy analysis was conducted to understand the health and human rights implications of PREA for transgender women in male prisons.
**Results:** Interviews with formerly incarcerated transgender women and the policy analysis revealed that PREA has failed to adequately protect transgender women against sexual assault and control the spread of HIV infection. Participants reported engaging in condomless consensual and non-consensual sex while in prison. Sex was often used for survival to ensure their physical protection or to receive goods in the absence of social and material support inside and outside of prison. Participants reported being penalized by prison staff for engaging in sexual behavior regardless of whether the sexual act was consensual or unwanted. Participants expressed concern about HIV acquisition while in prison, with several women reporting that they may have acquired HIV while incarcerated.
**Conclusions:** The transgender women sampled engaged in survival sex while in prison and were also the victims of sexual assault - unprotected sexual acts with consequences for HIV transmission and acquisition. While designed to protect the safety of incarcerated transgender women, our research suggests that PREA has not only failed to prevent sexual assault and control the spread of HIV, but has also had the unintended consequence of penalizing those whom it was intended to protect.

## THPED306

### THE ASSOCIATION BETWEEN HIV KNOWLEDGE AND HIV RISK AMONG PRISON INMATES IN LATVIA

S. Klavins
*AGIHAS (PLWHA Support Group), Riga, Latvia*
*Presenting author email: agihas@latnet.lv*

**Background:** Latvia holds the second highest incidence level of new HIV cases in Europe.
One fifth of people living with HIV (PLWH) in Latvia are prisoners. HIV-negative inmates are the risk group. HIV-positive prisoners need knowledge for not spreading the infection. Inmates and even doctors had poor knowledge about HIV/AIDS transmission, treatment and care. Previous prevention measures have not been sufficient, which led to an increase in the number of infections among prisoners. Extra information from outside was urgently needed.
**Description:** This situation motivated AIDS/NGO "AGIHAS" to start projects. During a 6 year period, four projects have been implemented in all the 15 prisons providing 72 seminars and 50 consultations to 2334 prisoners (median age: 31 years) and 7 lectures to personnel (n=124). The team consisted of a doctor, social worker and an HIV+ peer. Attendees were selected by administration. Among the inmates trained, 8% were women, most of the prisoners are Russians. Ethical considerations of PLWH (n=95) not wishing to reveal their status were met by providing answers via 346 mails. After the seminars, questionnaires were collected and later analysed.
**Lessons learned:** Ethnicity and sex had made no difference, according to evaluation from the questionnaires. It showed the following: inmates are better educated on AIDS issues than after the previous projects; some 4 are going to train their peers; some have changed their lifestyles; discrimination towards PLWH in prison settings has almost disappeared. The team noticed that PLWH are no longer hiding their status. Prisons' Administration concluded that after our seminars there are less hooligan activities, which has also a positive economic impact. To improve attendees' attentiveness, for future projects the audience should be limited to around 12 persons; correspondents should be provided with stamped envelopes for their replies.
**Conclusions/Next steps:** The feedback shows that inmates feel more comfortable with non-governmental prevention initiatives. Since prisoners have shown even a better AIDS knowledge, medical personnel should get trained also on AIDS medical aspects, not only on PLWH rights and obligations. Projects have positively influenced changes in prison policies. Our prevention and support activities should be continued, otherwise too many PLWH may feel double marginalized again.

## THPED307

### FACTORS SHAPING A HIGH PREVALENCE OF EVER AND RECENT INCARCERATION EXPERIENCE AMONG WOMEN LIVING WITH HIV IN CANADA

Y. Lin[1,2], R. Elwood Martin[3], M. Milloy[4,5], A. Carter[2,4], S. Patterson[2,4], K. Webster[2], M. Desbiens[6], D. Dubuc[7], V. Nicholson[2,8], N. Pick[9], T. Howard[8], L. Wang[4], S. Jabbari[4], K. Proulx-Boucher[7], A. Carlson[6], A. de Pokomandy[7], M. Loutfy[6], A. Kaida[2]
*[1]British Columbia Centre for Excellence in HIV/AIDS, Epidemiology and Population Health, Vancouver, Canada, [2]Simon Fraser University, Faculty of Health Sciences, Burnaby, Canada, [3]University of British Columbia, Collaborating Centre for Prison Health and Education, Vancouver, Canada, [4]British Columbia Centre for Excellence in HIV/AIDS, Vancouver, Canada, [5]University of British Columbia, Division of AIDS, Department of Medicine, Vancouver, Canada, [6]Women's College Research Institute, Toronto, Canada, [7]McGill University Health Centre, Montreal, Canada, [8]Positive Living British Columbia, Vancouver, Canada, [9]Oak Tree Clinic, Vancouver, Canada*
*Presenting author email: slin@cfenet.ubc.ca*

**Background:** Women with incarceration experience a disproportionate burden of HIV/AIDS, including poorer HIV treatment outcomes driven by prison-associated interruptions in antiretroviral therapy (ART). While prisons provide an opportunity for women living with HIV (WLWH) to engage in HIV care, they face numerous social and structural challenges in maintaining their HIV treatment in the community post-release. We aimed to describe the prevalence and correlates of ever and recent incarceration among WLWH in Canada.
**Methods:** We analyzed baseline survey data for 1,425 WLWH aged ≥16 years in the Canadian HIV Women's Sexual and Reproductive Health Cohort Study (CHIWOS), a prospective, community-based research study. Prevalence of 'ever' (but not in the last year), 'recent' (in the last year), and 'never' incarceration was assessed via self-report to a peer-administered survey. Women with incomplete responses were excluded. Multivariable logistic regression estimated factors associated with ever and recent incarceration.
**Results:** Of 1,422 participants, the median age was 43 years (IQR: 35-50); 41% identified as Caucasian, 29% as African, Caribbean or Black-Canadian, 22% identified as Indigenous. Prevalence rates of incarceration were 30% (ever) and 6% (recently). Factors independently associated with ever and recent incarceration (vs. never) included: Indigenous ethnicity (Recent: AOR=3.74 [95%CI: 1.76-7.96]); < $20,000 CDN annual income (Recent: AOR=3.01 [95%CI: 1.07-8.48]); living in unstable housing (Ever: AOR=1.27 [95%CI: 0.69-2.35]; Recent: AOR=2.82 [95%CI: 1.27-6.28]); current sex work (Ever: AOR=4.59 [95%CI: 1.92-10.96]; Recent: AOR=4.33 [95%CI: 1.48-12.69]); self-reported depression symptoms (Recent: AOR=3.78 [95%CI: 1.90-7.52]); Hepatitis C co-infection (Ever: AOR=3.88 [95%CI: 2.43-6.18]; Recent: AOR=2.86 [95%CI: 1.26-6.49]); and current injection drug use (Ever: AOR=8.36 [95%CI: 3.60-19.41]; Recent: AOR=24.55 [95%CI: 7.85-76.78]). Compared to never, ever and recently incarcerated women had increased odds of sub-optimal ART adherence (< 95%, by self-report) (Ever: AOR=1.48 [95%CI: 0.94-2.33]; Recent: AOR=3.14 [95%CI: 1.55-6.36]).
**Conclusions:** Over one-third of WLWH in this study have incarceration experience, with a higher prevalence observed across several social and structural inequities. The strong independent association between incarceration and sub-optimal adherence to ART underlines the urgent need for reductions in rates of incarceration among vulnerable and marginalized women living with HIV, as well as improvements in prison healthcare and transitional care plans.

## THPED308

### VULNERABILITIES TO HIV INFECTION AND SYPHILIS IN THE STATE FEMALE PRISON SYSTEM, SÃO PAULO, BRAZIL: A CROSS-SECTIONAL AND POPULATION-BASED SURVEY

T.R. Corrêa de Souza[1], A.N. Ramos Jr[2], M.A. Silva[1], S.M. Lamastro[1], W.A. Sparinger[1], A.L. Placco[1], M.T.F. Santos[1], S.M. Pongelupi[3], C.S.B. Domingues[1], M.C. Gianna[1]
*[1]Centro de Referência em DST/AIDS de São Paulo, Secretaria de Estado da Saúde de São Paulo, São Paulo, Brazil, [2]School of Medicine, Federal University of Ceara, Department of Community Health, Fortaleza, Brazil, [3]Secretaria de Administração Penitenciária do Estado de São Paulo, Departamento de Saúde, São Paulo, Brazil*
*Presenting author email: tania@crt.saude.sp.gov.br*

**Background:** The high increase of the female prison population in Brazil has brought challenges to STDs control. The state of São Paulo accounts for 30% of this population, and has develop strategies for assessment of individual, programmatic and social vulnerability. The aim of this study was to describe the vulnerability contexts to HIV infection and syphilis in women deprived of freedom.
**Methods:** A cross-sectional population-based survey conducted in all female prisons of the State of São Paulo. The study population consisted of a representative sample of 10% of the expected population. The demographic and epidemiological characterization of 1,099 women was based on the application of a structured instrument. The mean of age was 34.1 years. The mean detention time was 32.6 months, 82.5% of closed and semi-open regimes.
We use a descriptive analysis of the included aspects of the vulnerabilities.
**Results:** Most of the women are originally from South America (93.7%), and Brazil (91.8%) - São Paulo (91.2%). For international origin, Angola (15.6%), and South Africa (13.3%) predominated. Self-reported race/color in 44.5% was grayish-brown; 68.4% had completed only the elementary school. The predominated occupation/profession was maids (14.4%), and other works with lower training. 52.5% reported being single; 84.0% had children - 64.5% two or more. 20 (1.8%) women reported current existence of pregnancy; 66.5% had sex only with men. 31.3% reported never using condoms. 55.0% reported using contraception. 38% have an abortion history, and 500 (45.5%) present or have presented STDs - syphilis (26.0%), HIV/AIDS (11.6%), and condylomatosis (2.2%). Risk situations: have had or have sex without a condom (78.8%), already have used or use drugs (61.5%), have had or have multiple sexual partners (36.2%), partner have had or have many partners (33.4%), already have worked or work as sex worker (21.1%), and have been victims of sexual violence (18.6%).
**Conclusions:** This population-based survey reinforces the status of great individual, programmatic and social vulnerability of the women in the state penal system, both in urban and rural realities. Most women in prison are from socially marginalized groups. Gender inequality, migration, stigma, and discrimination increase imprisoned women's vulnerability to HIV infection and syphilis.

## THPED309

### PREVALENCE OF SYPHILIS IN THE STATE FEMALE PRISON SYSTEM OF SÃO PAULO, BRAZIL: A CROSS-SECTIONAL SURVEY AND THE IMPLEMENTED INTERVENTIONS

M.T.F. Santos[1], A.N. Ramos Jr[2], W.A. Sparinger[1], M.A. Silva[1], A.L. Placco[1], S.M. Lamastro[1], T.R. Corrêa de Souza[1], S.M. Pongelupi[3], C.S.B. Domingues[1], M.C. Gianna[1]
*[1]Centro de Referência em DST/AIDS de São Paulo, Secretaria de Estado da Saúde de São Paulo, São Paulo, Brazil, [2]School of Medicine, Federal University of Ceara, Department of Community Health, Fortaleza, Brazil, [3]Secretaria de Administração Penitenciária do Estado de São Paulo, Departamento de Saúde, São Paulo, Brazil*
*Presenting author email: tania@crt.saude.sp.gov.br*

**Background:** The epidemiological profile of syphilis in Brazil reinforces the high significance as a public health problem, especially in populations with greater risk and vulnerability. The female population of the national prison system is part of this perspective, bringing the need for systematic population-based studies. The aim of this survey was to estimate the prevalence of *Treponema pallidum* infection in women deprived of freedom in São Paulo state, and to describe the implemented interventions.
**Methods:** A cross-sectional seroepidemiological survey for syphilis conducted in all of the 19 female prisons of the State of São Paulo, with an estimated population basis of 11,530 women. This study was coordinated by the State Program of STD/AIDS in São Paulo and conducted from August 2012 to December 2013. The study stages include: reception, information about the intervention, guidance on the sexual transmitted diseases, free and informed consent to data collection, and the offer of testing syphilis and HIV. For the definition of *T. pallidum* infection status we used VDRL and TPHA tests, following the algorithms recommended by the Brazilian Ministry of Health. Data analysis was based on the estimated prevalence with calculation of confidence intervals.
**Results:** Of the total of 8821 (76.5%) addressed women, 8744 (99.1%) underwent the syphilis testing. The estimate prevalence of the infection by *T. pallidum* was 6.88% (95% confidence interval (CI): 6.35%-7.41%), corresponding to 602 women. The estimated prevalence ranges from 0%
(CRF Rio Claro) to 15.19% (CDP Franco da Rocha - 95% CI: 13.15% -17.23%). The integrated analysis identified coinfection (HIV and *Treponema pallidum*) in 36 women, estimated prevalence of 0.47% (95% CI: 0.33%-0.61%). Strategic actions were implemented in order to ensure counseling, treatment and follow-up of the participants who had diagnosed health problems.
**Conclusions:** The population-based survey reinforces the status of great vulnerability to syphilis for women in the State Penal System of São Paulo. This is the first study-based initiative in this state confirming the high prevalence of syphilis in this population. These initiatives could ultimately contribute to improve the quality of life of women with a neglected and vulnerable condition, integrating health attention and epidemiological surveillance.

## THPED310

### WOMEN'S EXPERIENCES OF HIV TESTING, COUNSELLING AND CARE IN JAIL AND PRISON IN THE DEEP SOUTH: AN EXPLORATORY QUALITATIVE STUDY AMONG WOMEN WITH HISTORIES OF VIOLENCE AND SUBSTANCE DEPENDENCE

C. Sprague[1,2], M. Scanlon[3], B. Radhakrishnan[1], D. Pantalone[4,5]
*[1]University of Massachusetts, Department of Conflict Resolution, Human Security & Global Governance, Department of Nursing, Boston, United States, [2]University of the Witwatersrand, Johannesburg, South Africa, [3]University of Massachusetts, Department of Conflict Resolution, Human Security & Global Governance, Boston, United States, [4]University of Massachusetts, Department of Psychology, Boston, United States, [5]Fenway Health Institute, Boston, United States*
*Presenting author email: courtenay.sprague@umb.edu*

**Background:** Individuals in jail and prison settings, globally, are a key-affected population with unmet needs for health and HIV care. Studies of justice-involved women with HIV are few. While HIV testing in jails and prisons is routine in many US states, justice-involved women typically have histories of violence, mental illness and substance use—facing significant barriers accessing HIV services while incarcerated and following release. Moreover, they are not identified within the *National HIV/AIDS Strategy*: indicating they are neglected in policy. Study objectives were to:
1) Explore women's experiences accessing HIV services in jail, prison and post-release in two Alabama cities where HIV incidence is high;
2) Identify the available HIV care continuum, linkage opportunities and gaps.
**Methods:** We employed a descriptive, exploratory design using qualitative methods; purposively selecting participants who were: female; HIV-positive; with multiple experiences of incarceration in jail/prison. Two CBO partners identified eligible potential participants. We conducted in-depth interviews (range of 34-134 minutes, average 74) with 28 participants in Birmingham and Montgomery during January 2014. Two researchers conducted independent coding, producing preliminary codes from transcripts using content analysis. We developed themes through an iterative process of verifying and refining final themes among the team.
**Results:**
(1) Pervasive stigma/discrimination in jail/prison based on HIV-positive serostatus, encompassing: segregation of HIV-positive women in designated dorms (part of Alabama policy until 2012); verbal abuse; food rationing; confinement; forced disclosure of HIV serostatus; tattooing with unsterilized instruments;
(2) Absence of counselling following initial HIV-positive diagnosis in jail/prison;
(3) HIV treatment hindered by:
a) delays;
b) interruption;
c) denial by corrections staff;
(4) Poor health conditions, overcrowding and infrequent medical care;
(5) Psycho-social support drawn from inmates, guards, church;
(6) Lack of discharge planning; (7) Few services post-release.
**Conclusions:** Four strategic opportunities remain unexploited for HIV care/support—comprising the care continuum for justice-involved, which may be relevant for other settings:
(1) On Entry: providing post-test counseling;
(2) During Incarceration: rapid and consistent treatment initiation;
(3) Discharge Planning: identifying community-based HIV, substance rehabilitation, housing, and mental health services;
(4) Post-Release: linking women to clinics and social services through partnerships between corrections departments and CBOs trusted by justice-involved women.

## THPED311

### PATIENT NAVIGATION IMPROVES LINKAGE TO COMMUNITY-BASED HIV CARE AND VIRAL SUPPRESSION AFTER RELEASE FROM PRISON

R. Westergaard[1], D. Kahn[1], K. Hochstatter[1], C. Schumann[2], T. Kuehl[2], J. Vergeront[2]
*[1]University of Wisconsin School of Medicine & Public Health, Department of Medicine, Madison, United States, [2]Wisconsin Division of Public Health, Madison, United States*
*Presenting author email: rpw@medicine.wisc.edu*

**Background:** Prior research has shown that while many patients successfully receive antiretroviral therapy (ART) while incarcerated in U.S. prisons, lapses in treatment and virologic failure are common after patients are released to the community.
**Methods:** We conducted a retrospective cohort study including all HIV-infected patients receiving ART and released from a Wisconsin state prison between 2011 and 2015. Starting in 2013, individuals planning to be released to one of the 2 largest cities in Wisconsin were offered enrollment in a patient navigation intervention that involved frequent phone contact, linkage to care and social services, and assistance with housing and transportation. Post-release HIV care and laboratory results were ascertained through database linkages between the Department of Corrections and the Wisconsin Enhanced HIV/AIDS Reporting System (eHARS). Using logistic regression with generalized estimating equations to account for intra-individual correlation, we compared post-release outcomes between intervention participants and non-participants with respect to
(1) linkage to care, defined as evidence of any HIV RNA test reported to eHARS during the first 6 months after release; and
(2) viral suppression, defined as having HIV RNA< 200 copies/mL.
**Results:** Between January 2011 and June 2015, 145 individuals were released from prison a total of 184 times Of these, 42 individuals were enrolled in the patient navigation intervention at the time of release, while 103 received only standard clinic-based case management. Overall, the sample was 92% male, 59% African American, and 36% reported a history of injection drug use (IDU); there were no significant differences in the demographic characteristics of participants and non-participants. Releasees were more likely to be linked to care within six months (92.8% vs 65.5%, p< 0.001) and were more likely to have viral suppression (85.7% vs 45.1%, p< 0.001) when participating in the patient navigation intervention. After adjusting for age, gender and IDU status, intervention recipients were significantly more likely to be virally suppressed six months after release
(adjusted OR=7.4, 95% CI = 3.0 - 18.2).
**Conclusions:** Patient navigation offering client-centered linkage to services and social support appeared to significantly improve linkage to community-based HIV care and viral suppression after release from prison.

## THPED312

### IMPROVING ACCESS TO JUSTICE FOR PRISONERS AS A KEY POPULATION AND ADVOCACY FOR HEALTH RIGHTS: UGANDA NETWORK ON LAW, ETHICS AND HIV/AIDS (UGANET) EXPERIENCE

B. Odur Lee
*Uganda Network on Law, Ethics and HIV/AIDS(UGANET), Legal, Kampala, Uganda*
*Presenting author email: bettylee292@gmail.com*

**Background:** HIV epidemic in Uganda continues to be a major health, human rights and development challenge despite fervent prevention efforts in prisons. HIV prevalence among inmates is 11.2%, making it almost twice as high as national prevalence rate estimated at 7.3%. The Uganda prisons Services accommodates over 2,000 inmates living with HIV&AIDS in 224 units. UGANET found it important to support inmates access justice and health services.
**Description:** UGANET established Legal Aid and Health Advocacy programs in collaboration with Uganda Prisons Service to champion HIV related human rights and broader Health issues for inmates and staff.
The objective was to engage policy makers on legal, health and HIV needs for prisoners, increase access to legal aid services, awareness raising and strengthen service systems to facilitate an enabling legal environment for improved HIV and human rights response. This project was implemented in *Luzira* and Kigo prisons in Uganda. During the implementation of this program, inmates were identified and trained to work as paralegals. UGANET lawyers provided legal aid services, conducted sensitizations on access to justice for prisoners living with HIV&TB and dialogues with key prisons staff on access to justice were held.
**Lessons learned:** A survey was conducted among 713 (455M,258F) inmates randomly selected in units of Murchison bay, Luzira women prison, Luzira Upper prison and Kigo men's prison. The findings were; 30%F and 25%M accessed justice and health rights. This was made possible through the availability of inmate paralegals who were trained on basic human rights and given skills to be focal persons for lawyers. The impact was realized through lodging 51%Notices of appeal in higher courts of law, 24%bail applications filed, 11%cases on indictment and committal cause listed. 11.2%of the inmates with health needs enrolled for TB&HIV screening and treatment. These results confirm the need to support inmates and staff with legal aid services and advocacy for better health.
**Conclusions/Next steps:** Providing and advocating for legal and health rights is critical for people in incarceration living with HIV&TB, it mitigates human rights violations and health challenges. Availability of lawyers who are willing to offer free legal services remains an issue of focus.

## THPED313

### DOUBLE JEOPARDY: ADVOCACY AT THE INTERSECTION OF CRIMINAL JUSTICE AND HIV IN THE UNITED STATES

M. McLemore
*Human Rights Watch, New York, United States*
*Presenting author email: mclemom@hrw.org*

**Background:** Louisiana is “ground zero” for the dual epidemics of HIV and incarceration in the United States. One-quarter of the nation’s jail population is located in Louisiana, and HIV rates are among the highest in the nation. Yet access to HIV testing, treatment and re-entry services in local jails range from limited to non-existent. Flawed bail procedures, excessive fines that result in incarceration and other failures of the criminal justice system ensure lengthy detention, exacerbating negative health consequences for PLWH in local jails and pushing people out of the continuum of care.
**Methods:** Following a mixed methods study in March 2016 that documented lack of access to HIV services in rural and urban Louisiana jails, an advocacy campaign was conducted to focus on reforms at the intersection of the criminal justice system and HIV. Specific policies are linked to specific harms and public health arguments are used to promote reform. For example, the need for reasonable bail, reduction of fees and costs that result in detention, and alternatives to incarceration for minor crimes such as drug possession are linked to longer periods without anti-retroviral medications fo for people living with HIV incarcerated in Louisiana jails.
**Results:** Key populations including people who use drugs, sex workers and transgender women become prisoners at alarming rates in the United States. Legislators, corrections officials and public health administrators responded positively to arguments at the intersection of criminal justice reform and HIV. Public health arguments can be used to promote criminal justice reform if specific policies are linked with documentation of specific harms. Fiscal arguments can promote alternatives to incarceration where treatment costs for key populations must be borne by local jails with few resources.
**Conclusions:** Advocacy linking specific policies to adverse health outcomes can reduce HIV risk from incarceration among key populations.

## MOBILE, MIGRANT AND DISPLACED POPULATION GROUPS

## THPED314

### A COMPARATIVE CASE STUDY OF THE YOUTH SEXUAL AND REPRODUCTIVE HEALTH INTERVENTIONS IN CHINA: BEST PRACTICES IN SCHOOLS, COMMUNITIES AND MIGRANT POPULATIONS OF 5 GEOGRAPHICALLY- AND ECONOMICALLY-DEFINED REGIONS

Y. Zhao[1], C. Li[2], H. Zhang[2], Z. Cheng[2], P. Hong[3], X. Liang[3], J. Gaoshan[4], L. Li[3], K. Tang[5]
*[1]Peking University, Institute for Medical Humanities, Beijing, China, [2]Peking University, School of Public Health, Beijing, China, [3]China Family Planning Association, Beijing, China, [4]United Nations Population Fund, Beijing, China, [5]Peking University, Department of Global Health, Beijing, China*
*Presenting author email: lichunyan@pku.edu.cn*

**Background:** Recognized as the most vulnerable population to reproductive health risks, Chinese youth need to receive multi-level interventions to tackle their reproductive challenges from families, communities, schools and other social infrastructures. However, the large disparities in geographic distributions, culture and socio-economic development levels have created strong barriers for the implementation of such educational interventions. This study aims to explore the best practices of youth sex and reproductive health (SRH) intervention programs through a qualitative analysis of five unique interventions in various settings and target populations, with a focus on the content (design and implementation), process (“how”) and outcome (efficiency, effectiveness, relevance).
**Methods:** The present study was designed as a multi-level case study with structural comparisons. Five cases of Youth Health Programs in Chongqing, Guangdong, Shanghai, Ningbo and Shenzhen were selected, including one school-based, two community-based, one workplace-based and one multi-sectional involvement program. Target populations included college students, community and migrant population, which best described SRH interventions in China. Research methods included: (a) semi-structural face-to-face interviews with key informants; (b) focus group discussion by all relevant stakeholders, and (c) retrospective analysis of local archives and program records.
**Results:** Evaluation of these cases revealed that six major factors facilitated successful implementation of the interventions, including:
(1) close cooperation with governmental departments and NGOs in areas of education, health, youth development to gain political and financial support;
(2) youth leadership development and strong involvement in program designing, implementation and evaluation;
(3) developing working force by recruiting and training local teachers and community health workers;
(4) locally-tailored programs by developing training materials suitable for community practitioners;
(5) improving working effectiveness through prioritizing target populations and SRH interventions;
(6) establishment of public-private-partnership that bridges government, civil society groups and private sectors to maximize resources and promote youth-friendly atmosphere.
**Conclusions:** Lessons learned from this study could provide vital evidence for policy makers and relevant service providers in terms of service model design and implementation. The best practices summarized in this study could also be replicated and scaled up in other middle- and lower-income countries of similar socioeconomic settings, as well as in other population-based health interventions.

## THPED315

### RISK BEHAVIOR AND MIGRATION: PERCEPTION OF WIVES AND THEIR MIGRANT HUSBAND IN RURAL INDIA

S. Roy, V. Nair, R.R. Singh
*MAMTA, New Delhi, India*
*Presenting author email: roy.suchismita@gmail.com*

**Background:** Little is known about sexual behaviors, knowledge about HIV/AIDS, S/RTI and condom use among wives of migrating husbands (WoM) and about their life and struggle which make them vulnerable to HIV. This study tried to explore sexual behaviors, condom use and perception about husband’s risk behavior among Wives of Migrant (WoM), and their husband’s knowledge regarding HIV/AIDS, R/STI, perception about their own and their wives’ risk.
**Methods:** Both quantitative and qualitative study was done in rural areas of 4 districts of two states in north and central India. We conducted this study among 896 wives of migrant workers (15-35 years) and 40 married migrant men through survey and IDI. Narratives came out during interview with WoM are also analyzed. Narratives from IDI were manually coded and analyzed under themes.
**Results:** According to majority of migrant husband, chances of HIV related risk, like having multiple sexual partners are low among their wives as they are staying with family. However, around 10% of the WoM reported physical relationship outside marriage and among those who disclosed the relationship that majority of these relations are initiated by family member. Lack of emotional and economical support, loneliness, lack of autonomy in absence of their husband make them dependent on other close male member of their family. Migrant husband also lack knowledge about HIV, S/RTI and contraceptives, reported low condom use with partner outside marriage and relationship with wives of other migrants. Only 42 WoM reported that they ever had used condoms with their husbands.223 respondents said their husband confessed about extra marital relationship. 694 respondents couldn’t identify any of the vulnerable group to HIV. 700 out of total respondents couldn’t answer any of the preventive measures of HIV. 38 respondents out of total 896 WOM said that they never heard about HIV. Only 105 respondents said they consider Migrants as vulnerable.
**Conclusions:** Intervention strategies in India should target WoM, as well as their husbands for increasing HIV knowledge, awareness and communication between partners. This research provides additional insight that may be used to develop effective HIV prevention strategies in rural areas of India among Migrants and their Wives.

## THPED316

### HIV-RELATED STIGMA AND HIV-TESTING BEHAVIOR AMONG SUB-SAHARAN MIGRANTS LIVING IN SWITZERLAND

S. Nideroest, C. Imhof, L. Jurt
*University of Applied Sciences Northwestern Switzerland, School of Social Work, Olten, Switzerland*
*Presenting author email: christoph.imhof@fhnw.ch*

**Background:** Currently about 82’000 migrants from Sub-Saharan Africa are living in Switzerland. In 2014, the number of newly diagnosed HIV-infections among these migrants was 15 times higher than in the general population. Nevertheless, the HIV testing-behavior among these Sub-Sahara migrants is low. One reason might be the stigmatization of HIV in most of Sub-Saharan-African Communities. Therefore, the aim of the study was to determine the HIV-related stigma and its effect on HIV-testing behavior among Sub-Saharan migrants living in Switzerland.

**Methods:** The study design was cross-sectional. A community-based research approach was used. Between December 2014 and February 2015, seven peer-researchers and two members of the research team interviewed a convenience sample of 201 Sub-Saharan migrants using a standardized paper-pencil questionnaire. HIV-related stigma was measured by using 8 items of stigmatizing attitudes towards HIV and PLWH. Answers ranged from 1="strongly disagree" to 4="strongly agree". HIV-testing behavior was measured by asking participants if they have ever been tested for HIV during their lifetime and during the past 12 months. Descriptive and inferential statistics were carried out.

**Results:** Mean age was 33.5 years (*SD*=9.8). Fifty-four percent were male (n=108). The mean duration of living in Switzerland was 8.8 years (*SD*=8.4). Twenty-three percent (n=46) had Swiss Nationality. Forty-one percent (n=82) were singles.
Twenty-three percent (n=47) have been tested for HIV during the past 12 months. Thirty percent (n=61) never had an HIV-Test during their lifetime. The HIV-related stigma was moderate (*M*=2.2, *SD*=0.8). On the other hand, 48% (n=96) considered HIV as a punishment for bad behavior and 51% (n=103) believed that people with HIV are promiscuous. About 66% (n=133) would be ashamed if they were infected with HIV and 49% (n= 98) if someone in their family would have HIV. The HIV-related stigma was negatively associated with HIV-testing behavior (r=-.20, p< .01).

**Conclusions:** The participants' HIV testing-behavior was low. Despite the HIV-related stigma was only moderate, it decreases the willingness to get tested for HIV. Prevention providers should engage in providing more information about living with HIV to reduce the HIV-related stigma and enable Sub-Saharan migrants to get tested without the fear of discrimination.

### ADDRESSING HIV STIGMA AND DISCRIMINATION: AN IMPORTANT PUBLIC HEALTH PRIORITY TO PREVENT HIV IN NEWLY ARRIVED CALD POPULATIONS IN SOUTH AUSTRALIA

L. Mwanri[1], A. Ziersch[2], G. Panagiotopoulos[2], E. Ouidh[3]
*[1]Flinders University, Discipline of Public Health, Adelaide, Australia, [2]Flinders University, Southgate Institute for Health, Society and Equity, Adelaide, Australia, [3]Relationships Australia of South Australia, PEACE Multicultural, Adelaide, Australia*
*Presenting author email: lillian.mwanri@flinders.edu.au*

**Background:** In Australia, culturally and linguistic diverse (CALD) migrants are disproportionately affected by HIV. It is well acknowledged that living with HIV can be associated with stigma and discrimination, but less is known about the experience of CALD populations within countries like Australia, and there is little data on how HIV related stigma and discrimination are experienced alongside other characteristics such as gender, ethnicity, and sexual orientation in these populations. Our study describes experiences of CALD communities of HIV stigma and discrimination living in South Australia and the impact of these experiences on health and wellbeing.

**Methods:** The study employed a qualitative approach, using in-depth interviews and focus groups. Fourteen CALD community leaders who were recruited through community networks participated in in-depth interviews about HIV stigma and discrimination and the wellbeing of their community. Eight staff members of a key organisation working with people with HIV from CALD backgrounds participated in 2 focus groups about working with CALD communities affected by HIV. Seven people with CALD backgrounds living with HIV were recruited through the organisation and interviewed about their experiences of living with HIV in their new country. Data were analysed thematically.

**Results:** HIV stigma and discrimination was seen to be experienced particularly acutely by CALD communities with negative impacts on individuals living with HIV, their families and also surrounding communities within collectivist traditions. Negative impacts included: loss of social support, stress, marginalisation and isolation, as well as potential delays to testing and access to treatment. These had implications for both mental and physical health. Gender, sexual orientation and visa status were important intersections of discrimination.

**Conclusions:** The higher than average rates of HIV in CALD populations and associated stigma are emerging public health issues in Australia. These findings reinforce the importance of implementing programs to address stigma and discrimination including the value of 'positive speakers' from within CALD communities and an understanding of intersecting factors. Likewise providing high quality, and culturally responsive services that build social capital and social support and work in conjunction with the different communities, is vital in addressing HIV in these communities.

## THPED318

### CERVICAL CANCER SCREENING INCREASES HIV AND FAMILY PLANNING UPTAKE IN REFUGEES SETTLEMENTS IN UGANDA

D. Bakomeza
*Reproductive Health Uganda, HIV, Kampala, Uganda*
*Presenting author email: dbakomeza@rhu.or.ug*

**Background:** Provision of integrated Sexual Reproductive Health services including cervical cancer screening, Family planning and HIV for persons in Humanitarian crisis is a critical component of any Humanitarian response. The implementation of the Minimum initial services package (MISP) has been promoted and supported for quality SRHR services for persons in Humanitarian crisis. Despite the mutual dependence of HIV and other reproductive Health packages, refugees were reluctant to access some of the services. As part of the implementation of MISP through the SPRINT initiative, RHU implemented a project to provide MISP in refugee settlements in Uganda.

**Description:** The project supported the provision of MISP and other SRHR package of services provided by RHU including Family planning and cervical cancer screening to refugees in five settlements in Uganda. Facility and community based integrated outreaches were conducted 5 refugee settlements in 3 months projects from March 2013 to October 2015. The program raised awareness and ownership of SRHR services through sensitization activities at community level and facility levels; increased uptake of SRHR services and facilitated bi-directional linkages and referral systems and mentored the quality of integrated SRHR service provision using specifically defined indicators. There was over 80% of female clients coming for services primarily and first because of cervical cancer screening.

**Lessons learned:** SRHR services were provided to 53,162 refugee populations including 36,501 Women in reproductive age. While mobilization for services always mentioned all range of services available and mobilisers mentioned HIV followed by family planning, 83% of Women in reproductive age reported that the primary reason for coming to the outreach was to access cervical cancer screening. This increased uptake of other services through the sensitization session and individual counseling during services provision. Theprovision of integrated SRHR services with cervical cancer screening increased uptake of other SRHR services.

**Conclusions/Next steps:** The concept of SRH/HIV integration can be adopted by implementing partners in crisis settings. SRHR integration creates opportunities to access WRA and provide them with information and many choose to take additional SRH services. Cervical cancer screening is a critical component of SRHR/HIV which should be made available to persons in Humanitarian situations.

## THPED319

### UNDERSTANDING UTILIZATION OF KEY SOCIAL AND HEALTH SERVICES AMONG FEMALE SEX WORKERS BY THEIR MOBILITY PATTERN IN ANDHRA PRADESH, INDIA

E. Suneetha[1], A. Subbaiah[2]
*[1]Annamalai University, Dept. Population Studies, Chidambaram, India, [2]Annamalai University, Chidambaram, India*

**Background:** Female sex workers, due to their nature of work, often move from one place to another. Most of their mobility pattern is due to discrimination at native places, lack of availability of customers, fear of disclosure of their identity. Despite many HIV prevention programs and social inclusion policies, their social status remains low. This study put efforts to understand how they utilize social and health services during their mobility.

**Methods:** The data were used for the study has been collected during April to August 2014 to fulfil the doctoral study. Mixed method approach has been used to collect primary data. Quantitative data has been collected from 156 female sex workers and qualitative data from female sex workers (19) and key stakeholders (10). Structured data collected from 156 FSWs used in this paper. Data was collected on migration mobility pattern, and violence and utilization of services. Univariate and bivariate and multivariate analysis has been used.

**Results:** Nearly Almost 89% of the FSWs were mobile in nature and migrated to various locations for practicing sex work. Nearly 30% expressed that they were 'not at all confident" in utilising health service during migration. The reasons cited are; fear of disclosure of identity (47%), discrimination (21%), hesitate to contact provider (85%) and expensive to consult (13%) provider. During migration 77% FSWs reported that they skipped skipping of any one service. Migratory status and duration were significantly associated with utilization of services among FSWs.

**Conclusions:** Despite availability of government health facilities at free of cost, many of the female sex workers are not approaching those, because of lack of confident, discrimination and disclosure of their identity which force them to depend on self medication or home remedies. A comprehensive approach should be embedded in to the ongoing HIV prevention programs to include social, financial and health security towards female sex workers population.

## THPED320

### FOLLOW-UP OF HIV TRANS-BORDER PATIENTS: THE CASE OF 'SAVE THE CHILDREN' IN SOUTH SUDAN

A. Fay[1], E. Males[2,3], D. Nyuma[4]
*[1]Save the Children UK, London, United Kingdom, [2]Save the Children, Juba, South Sudan, [3]MSH, Juba, South Sudan, [4]Save the Children, Nimule, South Sudan*

**Background:** In 2008 Save the Children initiated a program to provide assistance to People Living with HIV (PLHIV) across borders. The program was implemented in the Save the Children Nimule hospital ART clinic in South Sudan, near the border with Uganda. The clinic serves PLHIV within South Sudan and mobile populations from neighbouring districts in Uganda and Kenya, including long distance truck drivers, business men, and pastoralists.
**Description:** From 2009 to 2011, the program enrolled 776 (Male 365, Female 411) patients and 81 (42 Males, and 39 Females) of these were from Kenya and Uganda, and the remaining 695 were from South Sudan. There was significant difference in the defaulter rates between South Sudanese and foreigners, with South Sudanese patients having a defaulter rate of 2.3% (16 defaulters over 695 patients), while that of foreigners (non-South Sudanese) was 58% (47 defaulters over 81 patients).
**Lessons learned:** Based on this challenging experience, a number of measures were introduced in the program in 2012, to facilitate a more effective follow up patients across the borders:
- Conducted exchange visits with ART centres in Uganda
- Set up appointment calendar to track appointment dates and follow-ups.
- Formed a network of treatment supporters composed PLHIV from villages in Northern Uganda and South Sudan
- Distributed bicycles to facilitate the work of treatment
- Provided monthly incentives to support the treatment supporters.

**Conclusions/Next steps:** As a result of these measures, while the defaulter rate for South Sudanese patients remained stable that of trans-border patients reduced to 1.8% (16 defaulters over 176 patients). Communication and exchange of contacts for clients between cross-border ART clinics has made it easy to ensure ART treatment adherence amongst cross-border mobile populations, whereas the establishment and involvement of treatment supporters from across the border has also facilitated adherence to ART treatment through provision of treatment supports and ensure that clients that are lost to follow up are followed up and brought back to care as well as get feedback from clients who access ARTs on the other ART clinics across the border. This model could be replicated with success in similar situations.

# PEOPLE WITH DISABILITIES

## THPED321

### "THEY KNOW THEY HAVE THE RIGHTS TO SPEAK OUT": BREAKING THE SILENCE AND BUILDING RESILIENCE THROUGH COMPREHENSIVE SEXUALITY EDUCATION WITH LEARNERS WITH DISABILITIES

J. Hanass-Hancock[1], S. Nene[2], P. Chappel[3]
*[1]HEARD, Health Economic and HIV/AIDS Research Devision, Durban, South Africa, [2]University of KwaZulu-Natal, HEARD, Health Economic and HIV/AIDS Research Devision, Durban, South Africa, [3]Johannesburg University, Anthropology, Johannesburg, South Africa*
*Presenting author email: hanasshj@ukzn.ac.za*

**Background:** Young people with disabilities in South Africa are at increased risk of exposure to HIV as they lack access the sexuality education and information, health services and are at increased risk of sexual exploitation. This particular applies to girls with disabilities and those with intellectual disabilities. For boys with intellectual disabilities behavior such as masturbation in public is also reported as a challenge. Sexuality education has been amalgamated into the life orientation curriculum. Evidence shows that these learners are often excluded from sexuality and HIV education, and educators feel not equipped to provide sexuality education in accessible formats.
**Methods:** This paper presents the qualitative part of a formative evaluation of a curriculum innovation for educators of learners with disabilities in KwaZulu-Natal. It presents the experience of teachers with the implementation of the innovation. 100 teachers were trained during a three-day workshop and provided with the tools to implement comprehensive sexuality education in their schools. After a twelve-month implementing period in-depth interviews were conducted with teachers of learners with intellectual disabilities in eight schools. Data was transcribed and analyzed using conventional content analysis and NVIVO version 10.
**Results:** Implementing teachers experienced the training and tools as enabling to provide sexuality education in accessible formats and tackle difficult topics such as sexual orientation or masturbation. They reported improved awareness and assertiveness within their learners, who were able to *break the silence* and understand their sexual and reproductive health and rights. They felt enabled to tackle a number of myth and inappropriate behaviors (masturbation in public). Teachers identified the need to train a whole school, adjust to widely differentiating developmental stages of learners and separate girls and boys when addressing gender specific topics.
**Conclusions:** This project attempts to provide sexuality education to more severely disabled learners. It shows promise to improve teachers skills and confidence. Through its application within the South African mainstream Live Orientation curriculum it also lends itself for integration within inclusive settings. Further testing of this intervention is needed to identify how its tools can be used to enable access to comprehensive sexuality education for all learners.

# OTHER VULNERABLE SOCIAL GROUPS, INCLUDING IN SPECIFIC CONTEXTS

## THPED322

### HEALTH AND WELLBEING OF HIV POSITIVE AND NEGATIVE OLDER PEOPLE IN UGANDA

J. Mugisha Okello[1,2], M. Randell[3], E. Schatz[2], P. Kowal[4], J. Seeley[5,6]
*[1]Medical Research Council, Uganda Virus Research Institute, Epidemiology/Social Sciences, Entebbe, Uganda, [2]University of Missouri, Columbia, Health Sciences, Columbia, United States, [3]University of Sydney, School of Public Health, Sydney, Australia, [4]World Health Organization, WHO-SAGE, Geneva, Switzerland, [5]Medical Research Council, Uganda Virus Research Institute, Social Sciences, Entebbe, Uganda, [6]London School of Hygiene and Tropical Medicine, London, United Kingdom*
*Presenting author email: janet.seeley@mrcuganda.org*

**Background:** The population of older people including those living with HIV is increasing in Uganda. As people age, their disease burden tends to increase. It remains unclear how both ageing and HIV affect the health and wellbeing of older people in Uganda. We compared the health and wellbeing of HIV-positive and negative older people.
**Methods:** We analyzed survey data from the longitudinal WHO Study on global AGEing and adult health (SAGE)-Wellbeing of Older People Study (WOPS) in Uganda. This study was implemented in 2009-2010 (wave 1) and between 2012-2013 (wave 2), among people aged 50+ both HIV-positive and HIV-negative. Data on quality of life was captured using the World Health Organization Quality of Life (WHOQOL) questionnaire, and disability using the WHO Disability Assessment Schedule version 2. Hand grip strength was measured using a dynamometer. WHOQOL and disability scores were generated for each study participant based on standard methods. Mean hand grip strength was based on average of best result in both hands.
**Results:** A total of 510 study participants were included in SAGE-WOPS Wave 1, with a mean age of 65.8 years for men and 64.5 years for women. Almost 40% were HIV-positive. A total of 371 (72.7%) participants surveyed in wave 1 were followed up in wave 2. Of those that were lost to follow-up, 63 (12.4%) were known to have died, while the rest could not be traced.
All the HIV positive older people said they were accessing care. More than 50% of the HIV negative older people had taken more than one year without visiting health care centers. At each wave, HIV-positive older people had better WHOQOL and WHODAS scores as compared to their HIV negative counterparts. In addition, HIV-positive older people had higher mean hand grip strength compared to their HIV-negative counterparts.
**Conclusions:** These findings may not reflect better health in HIV-positive older people compared to their HIV negative counterparts, but may reflect better access to health care for HIV positive older people in. Better access to care in turn leads to better quality of life.

## THPED323

### YUMMY OR CRUMMY? HOW PILL BURDEN AND PALATABILITY AFFECT ART ADHERENCE AMONG HIV-POSITIVE ADOLESCENTS

R. Hodes[1,2,3], B. Vale[2], M. Thabeng[4], E. Toska[1,2], L. Cluver[2]
*[1]University of Cape Town, AIDS and Society Research Unit, Cape Town, South Africa, [2]Oxford University, Department of Social Policy and Intervention, Oxford, United Kingdom, [3]University of Cape Town, Historical Studies, Cape Town, South Africa, [4]UNISA, Pretoria, South Africa*
*Presenting author email: rebecca.hodes@gmail.com*

**Background:** Between 2005-2013, deaths among HIV-positive adolescents (aged 11 - 19) rose by 50% globally. AIDS is the second leading cause of death among adolescents worldwide, and the leading cause of death among adolescents in sub-Saharan Africa. Pill counts and biomarkers are established techniques for measuring ART adherence and exploring immunological outcomes. However, there is a lack of research on how pill burden and palatability affects ART non-adherence. This mixed methods research examines the experiential dimensions of ART adherence among the world's largest community-traced sample of HIV+ adolescents.
**Methods:** Research integrated quantitative and qualitative methods in design and implementation. Qualitative research guided the content of quantitative tools, while emerging quantitative findings framed the thematic focus of further qualitative research. The quantitative sample consists of N=1,059 (585 HIV-positive girls, 55.1%) ART-initiated adolescents from 53 government facilities who were traced to their communities. Qualitative interviews and other forms of participatory research (N=87, 67%) were combined with over 1,000 hours of participant observation. Novel, socio-behavioural research methods were triangulated to explore the effects of palatability and pill burden on ART adherence. Results from the qualitative research and emerging findings from the quantitative data, are presented here.
**Results:** Past-week self-reported ART non-adherence was 36%, and past-year inconsistent adherence was 48%. 'Adherence reporting' presented conceptual and cognitive difficulties for adolescents, and was often ambiguous and inconsistent. Adolescents' experiences of the taste, smell, size, colour and volume of their medicines were all associated with ART adherence. Inconsistent adherence was associated with pills that tasted bitter, were large, were specific colours (related to unpleasant side-effects), or exceeded a volume of two per day. ART adherence is a multidimensional and multisensory experience that extends beyond the 'pop-and-swallow' approach.
**Conclusions:** This research contributes to the limited literature on the experiential dimensions of ART adherence beyond clinical settings. Current pediatric formulations of ART are often ill-suited to the needs of adolescents. Poor palatability and heavy pill-burden are associated with ART non-adherence. Improving the taste, delivery and accessibility of ART, based on the insights and experiences of affected adolescents, is essential to improve adolescent adherence.

## THPED324

### EXPLORING THE QUALITY OF LIFE OF ORPHANS LIVING IN CHILD-HEADED HOUSEHOLDS IN ZIMBABWE

K.E. Munodawafa Chademana[1], B. van Wyk[1], S. Mfecane[2]
*[1]University of the Western Cape, School of Public Health, Cape Town, South Africa, [2]University of the Western Cape, Department of Sociology and Anthropology, Cape Town, South Africa*
*Presenting author email: emma.uwc@gmail.com*

**Background:** One of the long term and far reaching effects of the HIV epidemic is the burgeoning orphan crisis. The combination of this orphan crisis and intensified poverty has eroded traditional safety nets as the extended family can no longer take in these orphans. This resulted in the formation of child-headed households. In the absence of an adult and economically active guardian, these orphans often experience multiple deprivations which affect their quality of life.
This study investigated the quality of life of orphans living in child-headed households in Zimbabwe.
**Methods:** The study was conducted in 3 sites in urban and rural Zimbabwe. A mixed methods multi-phase design was employed between April 2013 and January 2016. The first phase was a focused situation analysis, a document review and in-depth interviews with 10 key stakeholders were conducted. A survey was conducted with 96 children living in child-headed households using the World Health Organization Quality of Life psychometric assessment tool. This was followed by an ethnographic study where interviews and observations were conducted with seven children selected from the survey. In the final phase a stakeholder meeting was conducted and guidelines for interventions to improve the quality of life of children in child-headed households were developed.
**Results:** Four social protection programmes supporting child-headed households were identified in the situation analysis. From the survey, 88% indicated that they did not have enough money; 62% did not have social support; and 58% indicated that they often experienced depression, despair and anxiety; only 32% indicated that they were satisfied with their life. The ethnography revealed that children experienced multiple stressors namely food insecurity, lack of school fees, stigma, depression and poor social support networks but showed considerable resilience as they adopted various coping strategies.
**Conclusions:** Quality of life in child-headed households is poor and characterised by multiple material deprivation. These vulnerabilities are not adequately addressed by existing social protection mechanisms, thus further exposing orphans to HIV. However, these orphans showed considerable resourcefulness and resilience as active agents and not passive victims. Therefore, interventions to support child-headed households should look beyond their vulnerabilities, to enhance protective factors and agency of orphans.

## THPED325

### CAPACITY NEEDS ASSESSMENT OF ADOLESCENT KEY POPULATIONS IN ASIA: A THREE-COUNTRY REPORT (CHINA, PHILIPPINES, THAILAND)

J. Acaba, L. Arpac, N. Zhang, P. Krisintu, J. Caparida
*Youth LEAD (Asia Pacific Network on Young Key Populations), Bangkok, Thailand*
*Presenting author email: jpacaba@gmail.com*

**Background:** Adolescents are more vulnerable to HIV than adults, with one in six new infections in 2013 occurred among 15-19 years olds according to UNAIDS. This is due to low level of awareness, exposure to sexual violence, and age-related barriers in accessing HIV testing and treatment. In contrast, HIV response to adolescents remains weak and inadequate. There has been little explicit focus on the particular needs of adolescents within key population groups.
**Methods:** With support from UNICEF EAPRO, this report aims to surface the issues of adolescent key populations including adolescents living with HIV to support better information towards programming in three countries: China, Philippines, and Thailand. A total of 6 national consultations as well as key informant interviews were organized. Interviews and consultations employed semi-structured, open-ended questionnaires.
**Results:** Adolescent key populations face stigma and discrimination because of misconceptions about HIV and being part of key population groups. In Thailand, for example, adolescents who are assumed to be living with HIV are excluded in schools. In China, adolescent gay boys are isolated from social circles. While some adolescents are willing to access HIV testing and/or treatment, the lack of support from families and a supportive legal environment hinder them from doing so. Further, health service provision in hospital facilities only admits those who are above the age of 18.
**Conclusions:** This report recommends adolescents to be involved in the planning, programming, implementation, monitoring, and evaluation processes. This can be achieved by supporting capacity-building leadership courses conducted by youth-led organizations, such as Youth LEAD's NewGeneration Leadership Training Course, to enable adolescents to participate in these different processes. Community-based organization (CBO)-led led initiatives that provide outreach to adolescent key populations should be scaled up. Building a supportive environment around families and custodians is also recommended to guarantee and support adolescents' access to HIV services.

## THPED326

### THE INVISIBLE VOICES: PORTRAYAL OF HIV/AIDS AFFECTED POPULATIONS IN UGANDA'S PRINT MEDIA

A. Napakol, R. Teer-Tomaselli
*University of KwaZulu-Natal, (UKZN), Center for Communication, Media and Society, (CCMS), Durban, South Africa*

**Background:** The study examined how *New Vision* and *Monitor* newspapers in Uganda portrayed people affected with HIV/AIDS. The populations of concern were Sex workers, women, clients of sex worker, People living With HIV/AIDS (PLWHA), care givers of PLWHA, truck drivers, men who have sex with men, people with disabilities and married couples. The study analyzed 20 years of HIV/AIDS coverage but was divided into four phases for lucid analysis and comparison between phases. Also state of social, economic, and political factors during these phases were examined. Social, economic and political factors such as education levels, war, poverty etc. affect HIV/AIDS in terms of prevention, prevalence rate, and magnitude of media attention.
**Methods:** This study was part of larger study which examined 20 years ,1992 to 2011, of HIV/AIDS coverage in two major newspapers in Uganda. Quantitative content analysis was used. 1510 news reports were coded by two researchers, whose inter-coder reliability was kappa=09085.

**Results:** The results of the study indicated low, albeit gradual increase in coverage and reference to the affected populations. However, as sources for media reports about HIV/AIDS, a disease that most affects them, their voices were invisible. For example, despite the high coverage of married people as risk group in phase four (n=76), only n=77 (14.7%) were considered as sources compared to 59% and 33.5% of HIV/AIDS experts and government sources.
**Conclusions:** What the media covers, and what/who the media gets information from shapes the content of the message that is eventually produced. Such messages should consider feedback from both the experts and people affected by HIV/AIDS given that their perspectives lend a humane experience and help to create information, or policies that are relevant. Agreement remains that the media does set both public and policy agenda therefore, in the long run, omitting the voice of affected people during coverage could undermine effective policy development and HIV/AIDS prevention efforts.

## THPED327

### DETERMINANTS OF EARLY INFANT DIAGNOSIS AMONG HIV-EXPOSED INFANTS IN BOTSWANA: ANALYSIS OF BOTSWANA AIDS IMPACT SURVEY IV SECONDARY DATA (2013)

E. Reetsang
*National AIDS Coordinating Agency, Gaborone, Botswana*
*Presenting author email: ereetsang@gov.bw*

**Background:** In 2013, it was estimated that 44.4% of HIV-exposed infants were tested for HIV by 8 weeks of age in Botswana (BAIS IV, 2013).The purpose of this paper was to investigate demographic and structural factors associated with Early Infant Diagnosis (EID) among HIV-exposed infants in Botswana.
**Methods:** BAIS IV was a national two stage sample survey conducted in 2013. Smart phone tablets were used to collect data. Data was analyzed using SPSS 22.0. The association between EID and demographic and structural factors was determined using bivariate analysis. To test for independent association logistic regression was applied.
**Results:** Age, employment status and level of education had a significant association with EID (p=0.000); younger women (15 and 24 years) were most likely to test their infants compared to older women (40-49 years), while more than half (54.1%) of women with primary education or less compared to 36.9% among those with tertiary education tested their infants. Women with primary education or less, were 3 times more likely to test their infants compared to those with tertiary education (OR= 3.017, 95% p=0.000) having controlled for age and employment status. Similarly, 47.7% of employed women compared to 40.0% among unemployed women took their infants for HIV test at ages 6 to 8 weeks. Women who were on treatment prior/during last pregnancy were 1.2 times more likely to test their HIV-exposed infants compared to those who were not on treatment. At the same time a higher proportion of women enrolled on PMTCT compared to those not enrolled, tested their infants (90.1% vs. 70.4%).
**Conclusions:** Demographic and structural factors being education, age and employment status had a significant association with EID. Contrary to expectation data showed that women with higher levels of education were less likely to test their infants compared to those with lower levels of education. More education needed among women with higher levels of education and are also who are employed. Women enrolled on PMTCT more likely to test their infants hence the need to educate and improve access to HIV/AIDS services. Linkages between PMTCT program and post natal will be strengthened because of these results.

## THPED328

### YOUTH NEEDS ASSESSMENT ON SEXUAL AND REPRODUCTIVE HEALTH SERVICES IN LOW-INCOME COMMUNITIES IN CAPE TOWN, SOUTH AFRICA

R. Pocock[1], L. Baerecke[2], S. Neves[1]
*[1]Salesian Life Choices, Cape Town, South Africa, [2]Creative Consulting and Development Works, Cape Town, South Africa*
*Presenting author email: robinpocock@gmail.com*

**Background:** A disproportionately high number of new HIV infections in South Africa are among individuals aged 15 to 35. This highlights the importance of increasing access to and utilization of health care services by youth. Research was conducted in Cape Town in order to ascertain the needs of the youth as well as their barriers and preferences related to health services.
**Methods:** Surveys were conducted in the Klipfontein health sub-district with youth in six schools (n = 268) whose ages ranged from 13 - 20 years ($M$ = 15.81, $SD$ = 1.37) where 33% were male and 67% were female. The data analysis consisted of descriptive statistics and frequencies which were analysed using SPSS (Statistical Package for the Social Sciences). The identified needs, barriers and preferences were ranked according to level of severity or saliency.
**Results:** Learners felt that they needed better access to health information and education (59%), specifically information on teenage pregnancy (52%), STIs (45%) and HIV (42%). They preferred to receive health information from teachers (66%), an organisation at their school (57.1%) and from their parents/family (53%). Participants also highlighted the need for access to contraception (49%) and HIV Counselling and Testing (49%). When accessing health services, learners said that the most important factors to them were privacy, friendly staff, confidentiality, convenient locations and convenient hours. The greatest barriers to accessing health services were negative attitudes of the staff, embarrassment about people knowing they are going to a clinic, the need to make an appointment, concerns about confidentiality, staff who do not show concern or respect, and a lack of knowledge about services available.
**Conclusions:** The survey results demonstrate a need for youth-friendly sexual and reproductive health services to be made accessible to learners in Cape Town. Based on youth recommendations, provision of school-based services may address learner needs and reduce barriers to access.

## THPED329

### EXPLORING HIV NEEDS AND CHALLENGES FOR ADOLESCENT KEY POPULATIONS IN INDIA: A STEP TOWARDS ADDRESSING INEQUALITIES IN HIV RESEARCH AND PROGRAMMING

T. Khanna[1], L. Uppal[2], S. Mehra[3]
*[1]MAMTA Health Institute for Mother & Child, Research, Delhi, India, [2]MAMTA, Delhi, India, [3]MAMTA Health Institute for Mother & Child, Delhi, India*
*Presenting author email: tina@mamtahimc.org*

**Background:** Globally, adolescent key populations (AKPs) are disproportionately affected by HIV. The post-2015 Sustainable Development Goals to end AIDS epidemic by 2030 can be achieved if solutions are developed for AKPs, responding to their HIV/SRH needs. India is the third largest contributor to HIV in the world, epidemic being concentrated largely in key populations. Due to inequity in HIV policy and programming, most interventions have targeted adults, and not addressed the risks faced by AKPs. Participatory structured consultations were held with AKPs, stakeholders and policy makers to understand needs, challenges and possible solutions.
**Methods:** Exploratory study was conducted using qualitative methods at Delhi in 2015. Methods included: mapping, FGDs (with 30 AKPs from 8 states) and KIIs (10 stakeholders). These discussions were digitally recorded, transcribed, translated, and then analysed using content analysis.
**Results:** Study findings indicate that AKPs indulge in high-risk behaviour, however only a few had knowledge on HIV/SRH issues. Findings reveal that structural factors including discriminatory policies/laws make AKPs vulnerable to HIV. AKPs report being subjected to self (guilt) and societal stigma (name calling, non-acceptance by family) and violence (bullying, coercive sex) that exacerbate HIV risks. Due to stigma and criminalizing laws, MSMs and TGs are fearful of disclosing their identities and hence do not seek services. AKPs also reported experiencing negative and judgemental attitude from healthcare providers (HCPs) on issues of sexuality. The need for training and skill building to deal responsibly with AKPs was felt by HCPs. For young FSWs, violence from clients in the form of coercive and group sex, and low condom use was the real challenge. Most AKPs identified peer-led outreach services as effective and acceptable means of working with them.
**Conclusions:** AKPs have largely been excluded from national HIV response. To improve their equity in HIV access and prevention, current research provides evidence to respond to AKPs needs and challenges in national programming. These include: empowering and building capacities of AKPs on HIV/SRH issues; training HCPs in developing non-judgmental attitudes and skills towards AKPs; addressing stigma, discrimination and violence; and piloting peer-led approaches as a strategy to work with AKPs in India.

## THPED330

### OPTIMISM ABOUT THE FUTURE PREDICTS BIOLOGICAL AND PSYCHOSOCIAL FUNCTIONS AMONG CHILDREN OF HIV-INFECTED PARENTS

J. Zhao[1], X. Li[2], G. Zhao[1], D. Lin[3], L. Chen[3]
*[1]Institute of Behavior and Psychology, Henan University, Kaifeng, China, [2]University of South Carolina, Department of Health Promotion, Education and Behavior, Columbia, United States, [3]Institute of Developmental Psychology, Beijing Normal University, Beijing, China*

**Background:** HIV/AIDS is a strongly-stigmatized disease, which has profound impact not only on the infected individuals, but also on their families. Children of the HIV-infected parents are particularly vulnerable to various negative outcomes, such as depression, problem behaviors and health problems. Research begins to identify effects of children's positive characteristics on their health outcomes. Optimism about the future, defined as the extent to which people be optimistic in their beliefs

about the future, is suggested to be beneficial for HIV-affected children's psychosocial function, but such benefit has not been examined using their health-relevant biomarkers. One of the key biomarkers related to early-life adversity is cortisol, which is the body's primary stress hormone, produced by the hypothalamic-pituitary-adrenal axis. This investigation examines whether optimism about the future could benefit both HIV-affected children's biological (diurnal cortisol rhythm) and psychosocial functions (internalizing and externalizing problems).
**Methods:** A sample of 645 children (8-15 years old; 48.1% girls) of HIV-infected parents was recruited from a rural county in central China. Participants provided saliva samples 4 times a day for three consecutive days: immediately upon waking, 30 minutes after waking, one hour before dinnertime, and bedtime to assess their diurnal cortisol patterns. Optimism about the future, depression, loneliness and problem behavior were assessed via self-report.
**Results:** Children who were more optimistic in their beliefs about the future showed higher cortisol levels at awakening, steeper cortisol slopes, lower total cortisol changes over time (area under the curve with respect to increase, $AUC_I$), lower loneliness and less problem behavior. These associations remained significant after we controlled for demographic factors and stressful life events. Optimism about the future was not associated with cortisol awakening response (CAR), total cortisol output (area under the curve with respect to ground, $AUC_G$), or depression.
**Conclusions:** These results suggest that optimism about the future is linked to favorable psychosocial outcomes and health-related biological functions, through which health outcomes might be influenced. Intervention efforts are needed to improve optimism about the future among children affected by HIV so as to improve their mental and physical health.

## THPED331

### USING MEDIA TO STRENGTHEN THE IMPLEMENTATION OF A PROGRAMME WORKING WITH YOUNG WOMEN

P.H. Baloyi
*Soul City Institute for Health and Development Communication, Provincial Programmes, Johannesburg, South Africa*
*Presenting author email: pulane@soulcity.org.za*

**Background:** The Soul City focuses on intensifying multi-media SBCC interventions through its programmes. The Rise Young Women's Clubs is a community based Behaviour Change Communication programme that aims to significantly reduce new HIV infections among young women of 15 to 24 years. The programme is aimed at building social cohesion amongst young women by mobilising them to participate in taking responsible action to shape their lives and the communities they live in. It is currently iimplemented in 7 of the 9 provinces in South Africa.The programme started in 2014.
**Description:** The Soul City institute developed and implemented media interventions informed by formative research conducted in 2014, to strengthen the implementation of this programme. The multi-media materials developed for this programme are (print, broadcast television, and social media).
Rise Talk Show is an inter-generational multi-host lifestyle show aimed at young women between the ages of 14-25 years, to create an open environment whereby they can be encouraged to spark bold debate, conversations and discussion on hard hitting gender issues without being apologetic. It also aims to encourage open and honest dialogue.
Rise Magazine is a theme-based publication that contains a mix of content, activities and ideas for collective community action by the clubs. The magazine is a resource for clubs to undertake projects on topic/features linked to the curriculum developed for the programme.
The Rise Monitoring App is a central data repository that allows for efficient monitoring and reporting of the club activities and projects.
Rise Young Women's Movement Mxit Reach App is a is free interactive and fun platform for all young women who want to share their issue, concerns, advice, stories and everything that affects them.
**Lessons learned:** Young women need easy access to information, space to interact - connect with friends and discuss issues, space to get advice and links to services and opportunities.
**Conclusions/Next steps:** Soul City conducted research on the talk show and on the magazine looking at how young women communicate. The findings were that drama, story, talk shows for young women by young women, and reality shows that show what other youth go through are mostly preferred.

# ADOLESCENTS AND YOUNG PEOPLE AND SEXUALITY AND RELATIONSHIPS

### SEXUAL AND REPRODUCTIVE HEALTH (SRH) EXPERIENCES OF ADOLESCENT MUSLIMS IN KAMPALA, UGANDA

R. Imakit[1], S. Ajok[2], D. Talima[2], A. Namakula[2]
*[1]Straight Talk Foundation, Research and Evaluation, Kampala, Uganda, [2]Straight Talk Foundation, Kampala, Uganda*
*Presenting author email: rmakit@gmail.com*

**Background:** Adolescence marks a journey from childhood to adulthood that is characterised by considerable biological, physical and cognitive changes. Exploration of one's sexuality and engaging in risky sexual behaviour are not uncommon for young people of both sexes in this phase of life, making adolescence a period of vulnerability as well as opportunity. This study therefore explores the sexual and SRH experiences of adolescent Muslims.
**Methods:** A cross sectional research design was adopted, qualitative in nature and the study was carried out in a Muslim school within Kampala suburbs. Participants were adolescent Muslims aged 12-19 years. Assent and consent were obtained from participants and guardians to the adolescents. 13 Focus group discussions were held with adolescent Muslims. A sequential exploratory approach was used in the data collection. Voice recorders were used to capture data thus data was transcribed and exported to Nvivo version 10 for data analysis.
**Results:** Adolescents reported lack of SRH informatiom from the Mosque/parents while service providers ask too many questions before providing a service. Adolescents reported to have experienced community stigmatisation as they reported that the communities think negatively of them if they used condoms or had unprotected sex. Adolescents lacked life skills to prevent themselves from sexual engagements with their partners as quoted: 'I *have tried to resist but sometimes the power of nature overcomes.'*The adolescents felt pressured by fellow peers into risky sexual behavior as quoted*; "I had a group of friends and they were all having boyfriends. I felt like maybe I was an outcast in the group, so I decided also to get a boyfriend".* Adolescents currently don't fear HIV quoting that "*Most people say AIDS is a normal disease; you can sustain it for a long period of time when you are on ARVS". Most girls don't worry about HIV, but rather pregnancy* thus a normal peer norm among girls consequently visioning sexual activity as a source of livelihood.
**Conclusions:** Scale up engagement with religious leaders/parents in SRH programming; build life skills among muslim adolescents and train service providers on youth friendly services but also engage partners on rights based programming.

## THPED333

### THE MISSING DISCOURSE OF SEXUAL PLEASURE IN HEALTH PROGRAMMES FOR YOUNG PEOPLE LIVING WITH HIV

M. Dunbar[1], G. Chapwanya[1], N. Willis[2], A. Gibbs[3], T. Mutasa-Apollo[4], L. Langhaug[5]
*[1]Pangaea Zimbabwe AIDS, Harare, Zimbabwe, [2]AFRICAID, Harare, Zimbabwe, [3]HEARD, University of Kwa Zulu Natal, Harare, Zimbabwe, [4]Ministry of Health and Child Care, Harare, Zimbabwe, [5]REPSSI, Harare, Zimbabwe*
*Presenting author email: mdunbar@pangaeaglobal.org*

**Background:** The push to integrate HIV and sexual and reproductive health (SRH) programmes for young people emphasizes the delivery of information and commodities to prevent pregnancy and treat illness. Programs do not generally acknowledge adolescent circumstances, including hormonal changes, and the onset of romantic and sexual desires that drive sexual decision-making; as such, they fail to meet the needs of adolescents, particularly those living with HIV. Findings from a qualitative study among young people living with HIV (YPLWH) suggest opportunities to leverage notions of sexual pleasure for improved impact.
**Methods:** YPLWH were trained (n=8) to undertake qualitative interviews with peers (aged 16-25) recruited from support groups (Zimbabwe, n=24) and clinics (South Africa, n=24). Discussions focused on experiences accessing SRH information and services and with sexual activity. English language transcripts were thematically analysed using participatory methods.
**Results:** Data showed that young people defined sex as 'bad and dangerous'; other negative themes emerged. First, young people framed HIV-acquisition as linked to having "misbehaved". Second, engaging in sexual activity - defined as intercourse - was perceived as 'perilous' and 'shameful' due to the risk of transmission. Forms of safer sex and other sensual activities (oral sex, kissing, touching) were not mentioned as alternatives. These sentiments were strongly held by health workers and young people alike. Stigma associated with having sex - both internalised and externalised - framed conversations about initiating sexual activity. This was especially true for YPLWH who had acquired HIV-vertically - as previously "blameless" virgins risked becoming "immoral" through initiation of sex. A final theme was the

emphasis on access to commodities (contraceptives, condoms) as being the route to SRH at the expense of non-judgemental discussions about romantic and sexual relationships.
**Conclusions:** Sex and SRH was framed in terms of risk and moral judgement, protection from disease and pregnancy, and overlapping HIV-related stigma and sexual taboos. Sexual pleasure was absent from discussions. Reframing SRH to leverage pleasure as a motivator to promote healthy romantic and sexual relationships may more widely support sexual health. Such re-framing could not only utilize health workers and facilities, but also youth-friendly media e.g., websites, mobile applications and pocket booklets.

## THPED334

### YOUNG WOMEN'S PERCEPTIONS OF TRANSACTIONAL SEX AND SEXUAL AGENCY IN THE CONTEXT OF RURAL SOUTH AFRICA

M. Ranganathan[1,2], C. MacPhail[3], A. Pettifor[2,4], N. Khoza[2], R. Twine[5], C. Watts[1], L. Heise[1]
[1]*London School of Hygiene and Tropical Medicine, Department of Global Health and Development, London, United Kingdom,* [2]*Wits Reproductive Health and HIV Institute (WRHI), Johannesburg, South Africa,* [3]*University of New England, School of Health, Armidale, Australia,* [4]*University of North Carolina at Chapel Hill, Department of Epidemiology, Chapel Hill, United States,* [5]*University of the Witwatersrand, School of Public Health, MRC/Wits Rural Public Health and Health Transitions Unit (Agincourt), Johannesburg, South Africa*
*Presenting author email: apettif@email.unc.edu*

**Background:** Evidence shows that the HIV prevalence among young women in sub-Saharan Africa increases almost five-fold between ages 15 and 24, with almost a quarter of young women infected by their early-mid 20s. Transactional sex or material exchange for sex is a relationship dynamic that has been shown to have an association with HIV infection.
**Methods:** Using five focus group discussions and 19 in-depth interviews with young women enrolled in the HPTN 068 conditional cash transfer trial, this qualitative study explores young women's perceptions of transactional sex within the structural and cultural context of rural South Africa. The analysis also considers the degree to which young women perceive themselves as active agents in such relationships and whether they recognise a link between transactional sex and HIV risk.
**Results:** The findings show that young women believe that securing their own financial resources will ultimately improve their bargaining position in their sexual relationships, and open doors to a more financially independent future. The findings also suggest that there appears to be a more nuanced relationship between sex, love and gifts where money has symbolic meaning, and where money transfers, as gifts, indicate to partners, a young woman's value and commitment from the man. This illustrates the complexity of transactional sex, and that the way it is positioned in the HIV literature ignores that "exchanges" serve as fulcrums around which romantic relationships are organised. Finally, young women express agency in their choice of partner, but their agency weakens once they are in a relationship characterised by exchange, which may undermine their ability to translate perceived agency into HIV risk reduction efforts.
**Conclusions:** This research underscores the need to recognise that transactional sex is embedded in adolescent romantic relationships, but certain aspects of it make young women vulnerable to HIV. This is especially in situations of restricted choice and circumscribed employment opportunities. HIV prevention educational programmes need to be coupled with income generation trainings, in order to leverage youth resilience and protective skills within the confines of difficult economic and social circumstances. This would provide young women with the knowledge and means to successfully navigate safer sexual relationships.

## THPED335

### A TAXONOMY OF BEHAVIORAL ADJUSTMENTS RELATED TO PRE-EXPOSURE PROPHYLAXIS (PREP) AMONG ADOLESCENTS IN SOUTH AFRICA

D. Operario[1,2], C. Kuo[1,2,3], K. Underhill[4,5], D. Giovenco[1,3], J. Pellowski[1], J. Hoare[6]
[1]*Brown University School of Public Health, Department of Behavioral and Social Sciences, Providence, United States,* [2]*Lifespan/Tufts/Brown Center for AIDS Research, Providence, United States,* [3]*Brown University School of Public Health, Center for Alcohol and Addiction Studies, Providence, United States,* [4]*Yale University, Center for Interdisciplinary Research on AIDS, New Haven, United States,* [5]*Yale Law School, New Haven, United States,* [6]*University of Cape Town, Department of Psychiatry and Mental Health, Cape Town, South Africa*
*Presenting author email: jennifer_pellowski@brown.edu*

**Background:** Risk compensation refers to adjustments in behavior based on changes in perceived levels of risk. There has been concern about the potential for risk compensation due to the clinically protective effects found in efficacy trials of oral antiretroviral (ARV) pre-exposure prophylaxis (PrEP). This concern is particularly expressed with regard to young people in HIV endemic settings, where PrEP scale-up is especially warranted. We conducted a mixed methods study to explore and identify types of PrEP-related behavioral adjustments that may occur among adolescents in the high-risk HIV context of Cape Town, South Africa.
**Methods:** HIV-positive and HIV-negative adolescent participants were recruited using convenience sampling in community and clinic settings; service providers were recruited using snowball sampling. Adolescents completed a survey about perceptions of PrEP efficacy, and took part in focus groups and individual interviews. Similarly, health service providers completed a survey about perceptions of PrEP efficacy and completed individual interviews. Focus groups and interviews were guided by a semi-structured protocol exploring perceptions about predicted behavioral adjustments among adolescents using PrEP. Quantitative data were analyzed using SPSS and qualitative data were analyzed thematically using NVivo. We obtained ethical approvals from University of Cape Town and Brown University.
**Results:** Adolescent participants included 24 Black Africans who completed grade 8 or higher, and 17 service providers working in adolescent clinics. Ninety percent of adolescents endorsed likelihood of PrEP use, and 100% of clinicians endorsed prescribing PrEP for sexually active adolescents in the future. Predicted behavioral adjustments among adolescents due to PrEP included greater disclosure of HIV-status to partners; greater likelihood for condomless sex among sexually active adolescents in a committed relationship; and increased uptake of HIV testing. We found little evidence suggesting that PrEP access would contribute to earlier sexual debut or greater numbers of sexual partners among adolescents.
**Conclusions:** Widespread ARV availability, adult PrEP implementation, and future adolescent PrEP may lead to a range of behavioral adjustments among adolescents in South Africa. Predicted PrEP-related behavioral adjustment among adolescents indicate a need for more research on behavioral counseling that is tailored to the developmental and age-specific needs of this group.

## THPED336

### BEYOND BEHAVIOR: THE ROLE OF SEXUAL ORIENTATION, GENDER IDENTITY AND ATTRACTION IN HIV INTERVENTIONS FOR YOUNG BLACK MSM AND TRANSGENDER WOMEN

L. Hightow-Weidman[1], K. Muessig[2], H. Kirschke-Schwartz[1], K. Soni[1], S.K. Choi[2], S. LeGrand[3]
[1]*Behavior and Technology Lab, Institute for Global Health and Infectious Diseases, University of North Carolina at Chapel Hill, Chapel Hill, United States,* [2]*University of North Carolina-Chapel Hill, School of Public Health, Health Behavior, Chapel Hill, United States,* [3]*Duke, Global Health Institute, Durham, United States*
*Presenting author email: lisa_hightow@med.unc.edu*

**Background:** HIV prevention efforts have traditionally focused on individual behaviors that place young black men who have sex with men and transgender women (YBMSM/TW) at risk for HIV, without sufficient attention to the role of sexual orientation and gender identity.
**Methods:** healthMpowerment.org (HMP) is a mobile-phone-optimized, Internet-based intervention for YBMSM/TW that provides information, resources, tailored feedback, and social networking platforms to offer and receive social support from peers. Baseline data from 474 YBMSM/TW enrolled in randomized controlled trial of HMP was analyzed to explore identity, attraction and behaviors.
**Results:** The mean age was 24.3 years, 39.5% were HIV-positive, 57.0% reported unprotected anal or vaginal intercourse in the prior three months. Most identified as gay 312 (65.8%), 87 (18.4%) as bisexual, 8 (1.7%) as straight and 67 (14.1%) as other. For many participants, there was lack of congruence between chosen identity, attraction and sexual behaviors in the past three months. Of those who identify as bisexual - only 18.4% reported moderate to high attraction to both males and females and engaged in anal or vaginal sex with both genders in the past 3 months. While most of the sample identified as male (95.6%), 7 (1.5%) participants identified as female, 10 (2.1%) as transitioning and 4 (0.8%) as undecided. One-tenth (n=48) reported being mis-gendered some, most or all of the time; 62.5% reported associated stigmatization. While 66.9% were open with others about their chosen sexual orientation, 21.5% wished they were not that orientation and 7.2% reported wanting professional help to change sexual orientation.

| | Attracted to men only | Attracted to women only | Attracted to both men and women | Not attracted to either gender |
|---|---|---|---|---|
| Gay | 279 (89.4%) | 0 (0%) | 29 (9.3%) | 4 (1.3%) |
| Bisexual | 26 (29.9%) | 3 (3.4%) | 57 (65.5%) | 1 (1.2%) |
| Straight | 2 (25%) | 6 (75%) | 0 (0%) | 0 (0%) |
| Queer/ Questionning/ Other | 45 (67.1%) | 4 (6.0%) | 18 (26.9%) | 0 (0%) |

*[Table 1: Relationship Between Preferred Identity and Attraction]*

**Conclusions:** A high proportion of participants reported incongruous sexual orientation, attraction and behavior. More nuanced understanding of the complexities of sexual orientation, gender identity and behavior among at-risk and HIV-positive YBMSM/TW is needed if HIV interventions are to provide appropriate tailoring and content to address the roles gender and sexuality may play in risk behaviors for HIV transmission.

## THPED337

### IMPROVING ACCESS OF HIV PREVENTION AND SEXUAL HEALTH SERVICES TO ADOLESCENT AND YOUNG MSM IN KARACHI, PAKISTAN

A. William
*Parwaz Male Health Society, Monitoring and Evaluation, Karachi, Pakistan*
*Presenting author email: awais.william86@gmail.com*

**Background:** Pakistan is officially an Islamic Republic, in practice Pakistani law is a mixture of both Anglo-Saxon colonial law as well as Islamic law, and both proscribe criminal penalties for homosexuality. Pakistan has an intense epidemic of HIV/AIDS where MSM form the biggest high risk group due to the intolerant social behavior. MSM live under great suppression and few programmatic interventions address to explore complex yet important socio-cultural factor which causes extreme stigma and discrimination to Adolescent and Young MSM. This abstract summarized multiple factors faced by MSM in service delivery and program design in Karachi, Pakistan; making them vulnerable and most key affected population among other marginalized communities.
**Description:** Secondary Quantitative data was collected from service delivery reports of Volunteer Counseling and Testing-VCT of PMHS from May 25, 2012, till December 31, 2015. Ethical, verbal and written consent and other ethical considerations, as per PMHS's Institutional Manual were followed. PMHS's service delivery package for prevention of HIV/AIDS among MSM includes VCT, STIs' management, BCC and Condom & Lube distribution through peer led outreach interventions. Descriptive statistical analysis of the data was done on SPSS.
**Lessons learned:** A total of 4590 MSM agreed to opt for VCT service, 43.83% were from 15 to 24 years (youth group), and 16.71% were from 10 to 19 years (Adolescent group) and they belong to very low income and educational background. In youth group 4.62% and in adolescent group 4.04% were found reactive on rapid test provided at PMHS. Analysis of sexual practice of both groups shows that 76% have multiple male partners and condom usage is also at very low i.e. 17%. Around 72% reported religion as a cause of guilt associated with MSM behavior and 65% are not aware of HIV/AIDS.
**Conclusions/Next steps:** HIV disproportionately affects adolescents and young adults compared with the overall population. There is urgent need for adolescent and youth friendly HIV prevention and Sexual Health Services in program design with emphasized rights driven movements by educating the youth through integrated approach that engaged, Government, Civil Society Organizations, Parents, Students, Media, Religious Scholars and Law enforcement Agencies.

## THPED338

### 'A DIFFICULT CONVERSATION': ADULTS' PERCEPTIONS OF THE BARRIERS TO TALKING ABOUT SEX AND HIV WITH ADOLESCENTS IN RURAL KWAZULU-NATAL, SOUTH AFRICA

L. Knight[1], N. Gillespie[2], N. Ngcobo[2], Z. Essack[2], T. Rochat[3], H. van Rooyen[3]
*[1]University of the Western Cape, School of Public Health, Cape Town, South Africa, [2]Human Sciences Research Council, Human and Social Development, Pietermaritzburg, South Africa, [3]Human Sciences Research Council, Human and Social Development, Durban, South Africa*
*Presenting author email: lknight@uwc.ac.za*

**Background:** Adolescent rates of HIV remain persistently high in South Africa. Adolescence is a period of potentially increased sexual risk, particularly for unwanted pregnancy and HIV. Parent-child communication about these issues can reduce risk but is often difficult for both parties. This paper aims to inform an intervention to encourage intergenerational communication about sex and HIV and also contribute to an in-depth understanding of the barriers from the adults' perspective, often missing in the literature.
**Methods:** Semi-structured qualitative interviews elicited data about perceptions of intergenerational communication. Eighteen adult representatives from within rural and peri-urban communities in Vulindlela, KwaZulu-Natal were purposively sampled to provide a caregiver's perspective. The sample also included 19 key informants, social workers, teachers and health care providers to provide a professional but also community perspective. Data was coded thematically in multiple iterations by two researchers to produce key themes about intergenerational communication.
**Results:** Adults framed young people's sexual activity in negative terms. Therefore discussions about sex were often aimed at instilling fear, focussed on risk and expected abstinence. Caregivers' had contradictory feelings, fearing the risk sex posed but also denying their children's sexual activity. Adults feared sensitive discussions, felt ill equipped for them and worried that discussions would encourage adolescents' sexual activity. Many respondents were influenced by traditional norms about intergenerational communication. Notably the influence of adults' experiences of and negotiations with personal risk in such a high risk and HIV prevalence context also emerged as a barrier.
**Conclusions:** The results highlight the need to equip caregiver's with the means to confidently and capably have a conversation about sex and HIV in order to overcome barriers such as fear, denial and traditional norms and beliefs, and shift the negative framing of young people and sex. The study uniquely highlights the fact that in such high prevalence contexts adults are grappling with personal risks, behaviours and fears that are wrapped up with intergenerational discussions about sex. Where adults are negotiating their own complex sexual relationships, risk and in some cases HIV status they need particular support and skills to be able to have intergenerational communication about sex and HIV.

## THPED339

### AMBIVALENCE AND CONTRADICTIONS: QUALITATIVE STUDY OF HIV PREVENTIVE BEHAVIORS AND THE NEED FOR DUAL PROTECTION AMONG YOUNG MEN AND WOMEN IN RURAL KWAZULU-NATAL, SOUTH AFRICA

L.E. Dainton Smith[1], A. LoVette[2], J. Pellowski[3], C. Kuo[2,4], A. Harrison[2,5]
*[1]Brown University, School of Public Health, Providence, United States, [2]Brown University, School of Public Health, Department of Behavioral and Social Sciences, Providence, United States, [3]Brown University, Warren Alpert Medical School, Department of Psychiatry and Human Behavior, Providence, United States, [4]University of Cape Town, Department of Psychiatry and Mental Health, Cape Town, South Africa, [5]University of Cape Town, School of Public Health and Family Medicine, Cape Town, South Africa*
*Presenting author email: abigail_harrison@brown.edu*

**Background:** South African women under the age of 25 experience a pattern of sustained high HIV incidence that has remained unmitigated for many years in spite of significant program investment. UNAIDS designates young women a 'key target population' for resources and more effective interventions. To gain a better understanding of intervention needs, this qualitative study explored young men's and women's narratives of HIV prevention experiences.
**Methods:** We conducted a qualitative meta-analysis of data from two studies of sexual risk behaviors among male and female adolescents and young adults aged 14-24 in rural KwaZulu-Natal, South Africa. The first study included N=76 in-depth interviews (IDIs), conducted at two time points, with participants aged 18-24 years. The second study included serial focus group discussions with 14-19 year olds (N=65). Coding within three broad themes (HIV/AIDS, preventive behaviors, pregnancy and reproduction) elicited four analytical categories: sexual risk behaviors; attitudes and beliefs about condoms; relationships and trust; and attitudes toward pregnancy.
**Results:** HIV preventive behaviors were strongly relationship-dependent and unintended pregnancy ('falling pregnant') was a primary concern for both young men and women. In casual partnerships, condom use was acceptable and therefore higher. Unintended pregnancy was especially feared with casual partners, who were not perceived as suitable life partners. However, dual method use to protect against both HIV and pregnancy was uncommon. In committed relationships, condom use was lower, and almost non-existent in relationships of several months or more. A strong cultural value placed on fertility among young men and women contributed to ambivalence about consistent condom use in long-term relationships. Pervasive fears of contraception - particularly injectable hormonal methods - resulted in condoms as a default prevention method, although condoms were equated simultaneously with a lack of trust. These ambivalent and contradictory perspectives led to inconsistent prevention practices, especially in condom use.
**Conclusions:** Young people's prevention needs are complex and multifaceted, with frequently conflicting objectives. Addressing multiple contexts of prevention - with tailored sexual and reproductive health approaches - would better address comprehensive prevention needs in this high HIV prevalence setting among the key population of adolescent and young adult men and women.

## SAME-SEX-ATTRACTED, BISEXUAL AND QUEER PEOPLE, INCLUDING YOUNG PEOPLE

### THPED340

### BI BEHAVIOR, BI IDENTITY, OR BOTH? INTERPRETING DISPARITIES AMONG BISEXUAL BLACK MEN IN THE U.S. ACROSS THE HIV PREVENTION AND CARE CONTINUUM: RESULTS FROM THE POWER STUDY

M. Friedman[1], L. Bukowski[2], D. Matthews[1], R. Stall[2]
*[1]University of Pittsburgh, Infectious Diseases and Microbiology, Pittsburgh, United States, [2]University of Pittsburgh, Behavioral and Community Health Sciences, Pittsburgh, United States*
*Presenting author email: mrf9@pitt.edu*

**Background:** Across the HIV prevention and care continuum in the U.S., bisexual men experience disparities. Although bisexual men have lower HIV prevalence compared with gay men, research has shown that they are less likely to have received HIV tests; more likely to be HIV-positive unaware; and less likely to achieve viral suppression when HIV-positive. However, little research has attempted to differentiate bisexual behavior and bisexual identity in examining these disparities, particularly among Black MSM, who experience the highest HIV incidence rates domestically.
**Methods:** We examined survey and serological data collected at Black Pride events in six U.S. cities between 2014—2015 (n=3426) from the Promoting Our Worth, Equality, and Resilience (POWER) study. Among Black men ≥18 years reporting past-year anal sex with other men (n=2824), we differentiated between gay-identified men who had sex with men only (gay MSMO: 73.6%); gay-identified men reporting past-year sex with men and women (gay MSMW: 7.8%); bi-identified MSMO (8.3%); and bi-identified MSMW (8.3%). Using gay MSMO as the reference category, we conducted logistic regressions contrasting these groups by HIV testing history and serostatus; PrEP use (HIV-negative MSM); being HIV-positive unaware, and viral suppression (HIV-positive MSM). HIV-antibody testing was conducted onsite. Models adjusted for sociodemographics, city sampled, year, and ≥2 past-year sexual partnerships.
**Results:** Compared with gay MSMO, gay MSMW ($p< .01$), bi MSMO ($p< .05$), and bi MSMW ($p< .01$) were less likely to have ever received HIV testing. Bi MSMO ($p< .05$) and bi MSMW ($p< .01$) were less likely to be HIV-positive. However, gay MSMW ($p< .05$), bi MSMO ($p< .05$), and bi MSMW ($p< .01$) were more likely to be HIV-positive unaware. Bi MSMW were less likely to report achieving viral suppression ($p< .05$). Gay MSMW were more likely to report taking PrEP ($p< .01$).
**Conclusions:** Our findings show that, across the HIV care continuum, significant disparities occur among MSM who identify and/or behave bisexually, with bi-identified MSMW experiencing the worst outcomes. An urgent need remains for biobehavioral intervention development specific to bisexual Black men that encourages regular HIV testing, PrEP use, and care linkage/retention, perhaps building on the hopeful findings of PrEP utilization among gay-identified MSMW.

### THPED341

### "LA SOLUCIÓN ES LA TIJERA": HIV PREVENTION PROGRAM FOR LESBIAN AND BISEXUAL WOMEN

D. Palma, L.T. Orcasita
*Pontificia Universidad Javeriana Cali, Social Sciences Department, Cali, Colombia*
*Presenting author email: dianapalma-23@hotmail.com*

**Background:** The inclusion of lesbian and bisexual women in health promotion agenda is scarce due to social, historical and cultural factors, especially in HIV prevention and research. However, the existing risks in their sexual practices have been scientifically recognized. The total figure of HIV+ LB women globally is unknown, even though there are nearly 7.000 in the United States.
**Description:** This paper presents the results of a program oriented to LB women from Cali, Colombia that aims to promote healthy sexual behaviors and the recognition of sexual and reproductive rights. It was built with a psychosocial framework that combined the Theory of gender and power (Wingood & DiClemente, 2000) and the Model for Social Change (Montero, 2003). It was a 6 session program in which 23 women, between 18 and 25 years old (X= 21.7; DS=1.78), participated. The program evaluation was conducted using mixed methodologies that include quantitative and qualitative tools.
**Lessons learned:** Participants reported a strengthened self-identity, a sense of empowerment in their sexuality, and an expanded knowledge about their sexual and reproductive rights.
However, corresponding with Latin-American and other international findings, the non-use of preventive methods and the lack of knowledge about HIV was reported. This gap could be the consequence of a health and education barrier in the LB community because agents such as family, teachers and health providers might not be trained to provide specialized information. Therefore, including the LB women in these education programs and raising awareness within this agent is mandatory. Moreover, interacting with other LB women and receiving accurate information about sexual health was highly valued by participants. Future programs must use strategies that promote empowerment, rights advocacy, access to community resources and social support networks.
**Conclusions/Next steps:** Programs oriented to LB women must address the way in which pleasure-seeking, risk perception, identity exploration, lack of knowledge, sexual abuse and drugs abuse create a particular vulnerability that sets this population at risk for HIV and other STDS. They should avoid exclusive biomedical perspectives that ignore the existence of social and structural factors that may increase this risk (Lindley & Walsemann, 2013; Logie, 2015).

### THPED342

### HIV KNOWLEDGE, ATTITUDES AND RISK PRACTICES & BEHAVIOR OF SEXUAL MINORITIES IN BOTSWANA

D.S. Rakgoasi[1], G.N. Tsheko[2], G. Jacques[3]
*[1]University of Botswana, Population Studies, Gaborone, Botswana, [2]University of Botswana, Educational Foundations, Gaborone, Botswana, [3]University of Botswana, Social Work, Gaborone, Botswana*
*Presenting author email: rakgoasi@mopipi.ub.bw*

**Background:** Much of the effort to prevent the spread of HIV and other types of support target the heterosexual population. While the existence of sexual minorities in Southern Africa is a reality, most countries do not have the policy and legislative framework that would allow them to specifically address the needs of such groups as research on sexual minorities is often rare and piecemeal.
**Methods:** This paper utilises Botswana data derived from a 2013 SADC cross sectional survey of sexual minorities in three countries, Zimbabwe, Botswana, and Zambia, aimed at exploring the sexual and HIV risk knowledge, attitudes, and practices of sexual minorities. Convenient sample of adults aged 18-65years across the country participated. Data are analysed in SPSS, using uni-variate and bi-variate techniques and descriptive statistics.
**Results:** A total of 189 Men who have sex with men( MSM) and 193 Women who have sex with women (WSW )young Batswana participated. Over two thirds of males in the sample (69.1%) classified themselves as gay while over a quarter (26.3%) self classified as bi-sexual. Among females, about three quarters (71.7%) classified themselves as lesbian and over a quarter (26.7%) as bi-sexual. A high proportion (96%) of men had engaged in anal sex, with almost three quarters (73%) indicating that their first sexual partner was older than themselves. A majority(77.2%) of the females had penetrative vaginal sex mostly with females about their age. However, just over a third (35.8%) indicated that they had had penetrative vaginal sex with a man. Use of condoms in these sexual encounters varies but generally condoms are not always used.
**Conclusions:** Same sex relationships are a reality and encouraging governments to take responsibility for all its citizens, regardless of cultural norms and values, has to be the mission of all. The design of programmes to this end will assist in enhancing the acceptability of divergent groups in the pursuit of the general good.

### THPED343

### 'SEXING IN THE CITIES': SEXUAL RISKS, PREVENTION KNOWLEDGE AND PRACTICES OF WOMEN WHO HAVE SEX WITH WOMEN IN SOUTH AFRICAN TOWNSHIPS

P. Mbasalaki
*Utrecht University, Gender Studies, Utrecht, Netherlands*
*Presenting author email: p.k.mbasalaki@uu.nl*

**Background:** Although the 'zero-risk' myth has made women who have sex with women (WSW) invisible in the HIV and sexually transmitted infections (STIs) research, policy and programmatic intervention activities in South Africa, I explored sexual practices and risk behaviours to STIs among lesbian and bisexual women. With the 2012 HIV survey[1] in South Africa highlighting the HIV prevalence among women, being twice as high as that of men, all women are at risk, including WSW.
[1] See http://www.avert.org/hiv-aids-south-africa.htm
**Methods:** This study, which was part of a doctoral research project with Utrecht University, in collaboration with the Triangle Project in Cape Town and the Forum for the Empowerment of Women in Johannesburg, was conducted in various townships of Cape Town and Johannesburg. Most participating women identified as lesbian (77%) and black. Data were collected via a mixed method approach of self-administered questionnaires (N=209), in-depth interviews (N=33) and focus group discussion (N=10) with women (18 years and older) who in the preceding year had had sex with women.

Tuesday 19 July
Wednesday 20 July
Thursday 21 July Poster Exhibition
Friday 22 July
Late Breaker Posters
Author Index

**Results:** Preliminary results show that 31.1% had more than 3 partners in the last 12 months, the majority of whom were concurrent. 36.8% stated they had had sex during menstruation, although a significant number (58.4%) knew about protection for WSW during sex, only a small fraction (9.6%) used it. Although the majority had tested for HIV (73.2%), about half did not disclose the results of the HIV test, but 4.3% disclosed they were HIV positive. Consensual heterosexual sex was reported at 12.4% and forced sex was reported at 17.2%.
**Conclusions:** These study findings show that despite the image of invulnerability, HIV is a reality among WSW with a number of risk factors, including forced sex as well as consensual heterosexual sex, but also evidently homosexual sex at play. The findings from this study will provide recommendations for policy and programmatic intervention on HIV and sexual health for WSW in South Africa.

## THPED344

### USE OF PRE-EXPOSURE PROPHYLAXIS AND ASSOCIATED SEXUAL AND SUBSTANCE USE BEHAVIORS AMONG A SAMPLE OF MSM IN THE UNITED STATES

R. Moeller[1], M. Seehuus[1], D. Siconolfi[2], I. Gratch[1], L. Wahl[1]
*[1]Middlebury College, Psychology, Middlebury, United States, [2]University of Pittsburgh, Pittsburgh, United States*
*Presenting author email: robmoeller@middlebury.edu*

**Background:** Increasing availability and use of PrEP among MSM has spurred questions about the impact of PrEP on sexual and substance use behavior between MSM PrEP users and non-users.
**Methods:** Survey data were collected in 2016 via advertisement on a social networking app for MSM. Participants completed a 15 minute survey exploring PrEP use, global measures of sexual behavior, and sexual and substance use behaviors during the most recent episode with a main and/or casual sexual partner.
**Results:** 1,758 participants completed the survey. 17.1% (n=214) HIV-negative men reported currently utilizing PrEP, and 37.9% of these men reported missing between 1-3 doses of PrEP in the past month, 62.1 reported missing no doses . There were significant differences in the age of men using PrEP (M=37.45, SD= 10.12) compared to those who do not (M=34.73, SD=12.20), t (1755) = -3.58, p < .001. Significant differences were reported in PrEP use across racial/ethnic groups $\chi^2$ (4, $n$=1,727) = 18.15, p = .001, with Black, Asian, and White men more likely to use PrEP than Latinos. PrEP users reported almost twice as many sexual partners in the past 3 months (M=9.69, SD=12.58) versus non-users (M=4.46, SD=6.89), p < .001. PrEP users reported more casual sexual partners with whom they had condomless anal intercourse (CAI) (M=5.57, SD=9.61) compared to non-users (M=2.19, SD=5.71), p < .001. MSM using PrEP were more likely to engage in condomless receptive anal intercourse (CRAI) compared with men who were not on PrEP $\chi^2$ (1, $n$ = 1,399) = 29.49, $p$ = .001 as well as engage in condomless insertive anal intercourse (CIAI) $\chi^2$ (1, $n$ = 1,398) = 11.44, $p$ = .001. No significant differences were found in substance use behavior during the most recent sexual episodes with main or casual partners.
**Conclusions:** Results from this study indicate among our sample, use of PrEP was associated with greater levels of CIAI and CRAI as well as having more casual sexual partners. However, participants also had generally high rates of self-reported adherence to PrEP, which may reduce the risk of HIV transmission.

## GENDER ISSUES AND GENDERED RELATIONSHIPS

## THPED345

### COMPARISON OF PREVALENCE AND CORRELATES OF INTIMATE PARTNER VIOLENCE AMONG HIV SERO-POSITIVE AND SERO-NEGATIVE PREGNANT WOMEN IN IBADAN, SOUTH-WESTERN NIGERIA

O.A. Sigbeku[1,2], M.O. Balogun[3], O. Adesina[4], O.I. Fawole[2]
*[1]University College Hospital, Department of Community Medicine, Ibadan, Nigeria, [2]University of Ibadan, Department of Epidemiology and Medical Statistics, Ibadan, Nigeria, [3]University of Ibadan, Department of Preventive Medicine and Primary Care, Ibadan, Nigeria, [4]University of Ibadan, Department of Obstetrics and Gynaecology, Ibadan, Nigeria*
*Presenting author email: kannesigbeku@gmail.com*

**Background:** Understanding the differences in Intimate Partner Violence (IPV) experience of HIV sero-positive and sero-negative pregnant women is important in describing the magnitude of the problem and guiding prevention programs. This study determined and compared the prevalence and correlates of IPV among HIV sero-positive and sero-negative pregnant women in Ibadan, southwestern Nigeria.
**Methods:** A hospital-based comparative cross-sectional study was carried out between October-December 2013. Data was collected using a semi-structured, interviewer administered questionnaire adapted from the WHO Multi-Country Study on Women's Health and Domestic Violence questionnaire-version 9. HIV- respondents from the ante-natal clinic of the University College Hospital (UCH) were selected using systematic random sampling technique while serial recruitment was used to select HIV+ respondents from the Prevention-of-Mother-to-Child-Transmission (PMTCT) clinics within the UCH and Adeoyo Maternity Hospital. Data was analyzed using SPSS version-19 and summarized as proportions. Chi-square test was used to determine associations between categorical variables. Predictors of experience of IPV in current pregnancy were determined using logistic regression. Level of statistical significance was set at 5%.
**Results:** A total of 688 respondents were interviewed (343 HIV+ and 345 HIV- pregnant women). The mean ages of the respondents were 31.1±4.7 and 30.2±4.6 years for HIV+ and HIV- respondents respectively. Majority of the respondents 88.1% were currently married. The lifetime prevalence of IPV was 62.5% (70.3% HIV+ vs. 54.8% HIV-, p< 0.001). The prevalence of IPV experienced in current pregnancy was 50.9% (57.4% HIV+ vs. 44.3% HIV-, p=0.001). The predictors of IPV in current pregnancy among HIV+ respondents were witnessing maternal violence in childhood [OR 2.09 (95% CI 1.07-4.11)], partner witnessing maternal violence in childhood [OR 2.18 (95% CI 1.07-4.43)], having attitude supportive of IPV [OR 3.48 (95% CI 1.99-6.09)] and having low relationship satisfaction [OR 1.96 (95%CI 1.02-3.77)]. Among HIV- respondents the only predictor of IPV in current pregnancy was witnessing maternal violence in childhood [OR 1.89 (95% CI 1.02-3.53)].
**Conclusions:** IPV was common in both groups but significantly higher among HIV sero-positive pregnant women. Interventions to prevent IPV should target changing socio-cultural beliefs that encourage violence in relationships and incorporating couple-centered counselling into HIV prevention programs therefore addressing issues on relationship quality.

## THPED346

### POSITIVE SEXUALITY: HIV, GENDER, POWER, INTIMACY AND THE LAW

A. Krüsi[1,2], K. Czyzewski[1], F. Ranville[1], L. Gurney[1], J. Shoveller[2], K. Shannon[1,2], on behalf of the SHAWNA Project
*[1]BC Centre for Excellence in HIV/AIDS, Gender and Sexual Health Initiative, Vancouver, Canada, [2]University of British Colulmbia, Faculty of Medicine, Vancouver, Canada*
*Presenting author email: akrusi@cfenet.ubc.ca*

**Background:** While a growing body of research points to the shortcomings of the criminal law in governing HIV transmission, there is very limited understanding of how women living with HIV (WLWH) negotiate their sexuality, intimacy and HIV disclosure. Given the ongoing criminalization of HIV non-disclosure and prevalence of gender-based violence, there is a critical need to better understand the gendered dynamics of negotiating sexuality and HIV disclosure among WLWH.
**Methods:** We conducted 53 qualitative interviews with WLWH in Vancouver, Canada between August and December 2015. The interviews were conducted by two experienced researchers, including a women living with HIV and were guided by a semi-structured interview guide, which was developed based on extensive consultation with WLWH and community organizations. Drawing on a feminist analytical framework and concepts of structural violence, the analysis sought to characterize the gendered dimension of negotiating sex and HIV disclosure among WLWH in a criminalized setting.
**Results:** For many women their HIV diagnosis initially symbolized the end of their sexuality due to fear of rejection and potential legal consequences. Women recounted that disclosing their HIV status shifted the power dynamics in their sexual relationships and many feared rejection, violence, and being outed as living with HIV against their will. These fears were exacerbated for women living in poverty, in dependent relationships and for women with a migration background. Even after disclosure of their HIV status, many WLWH feared legal consequences, when their partners refused condoms. WLWH whose partners refused condom use despite HIV disclosure worried about their partners' health status. For these participants their viral counts became to symbolize not only their own health status but also that of their partners.
**Conclusions:** Despite frequently being represented as a law that 'protects' women, our findings indicate that the criminalization of HIV non-disclosure constitutes a form of gendered structural violence that exacerbates risk for interpersonal violence among WLWH. In line with recommendations by international policy bodies, such as, the WHO, UNAIDS and the Global Commission on HIV and the Law, these findings demonstrate the negative impacts of regulating HIV prevention through the use of criminal law for WLWH.

## THPED347

### HUNGER, ALCOHOL USE AND LACK OF POWER IN RELATIONSHIPS EXPLAIN WOMEN'S EXPERIENCE OF RECENT INTIMATE PARTNER VIOLENCE IN URBAN INFORMAL SETTLEMENTS, IN DURBAN, SOUTH AFRICA

A. Gibbs[1], S. Willan[2], T. Khumalo[1], N. Ntini[1], E. Chirwa[2], Y. Sikweyiya[2], N. Jama-Shai[2], L. Washington[3], N. Mbatha[2], R. Jewkes[2]
*[1]Health Economics and HIV/AIDS Research Division, Durban, South Africa, [2]Gender and Health Research Unit, Medical Research Council, Pretoria, South Africa, [3]Project Empower, Durban, South Africa*
*Presenting author email: lwazie.n@gmail.com*

**Background:** Women's experiences of intimate partner violence (IPV) is a key risk factor for HIV-acquisition. Urban informal settlements are growing rapidly and have particularly high HIV-incidence. We sought to understand the prevalence of physical IPV and sexual IPV amongst young women in informal settlements and factors associated with experiencing any physical and/or sexual IPV in the past 12m.
**Methods:** We drew on cross-sectional data from 320 young women aged 18 to from in informal settlements in Durban, South Africa who comprised the control arm of a cluster randomised RCT. Questionnaires collected data on experiences of past year physical IPV and pas year sexual IPV using WHO validated scales, gender attitudes and socio-demographics. We built Guassian random effects regression models for any physical and/or sexual IPV in the past year, controlling for age, education and clustering.
**Results:** Women were young (mean 24.4 yrs CI23.5-25.3); only 34.7% (CI27.8-42.4) had completed schooling. Mean earnings in the past month were low (R166, CI106-225, US$16). 50.1% (CI45.6-54.7%) of women reported experiencing physical IPV in the past 12m; 30.7% (CI26.3-35.2%) reported sexual IPV in the past 12m; and 58.3% (CI53.3-63.2%) reported physical and/or sexual IPV in the past 12m. In adjusted models, recent experience of any IPV was associated with being in a more controlling relationship (aOR1.11, $p< 0.01$), experiencing greater hunger in the past month (aOR4.34, $p< 0.01$), increased alcohol use by women (aOR1.06, $p< 0.05$), experiencing emotional violence from an intimate partner in the past 12m (aOR8.4, $p< 0.001$) and experiencing economic violence from an intimate partner in the past 12m (aOR2.39, $p< 0.01$).
**Conclusions:** Young women in informal settlements experience extremely high levels of recent physical and sexual IPV, placing them at high risk of acquiring HIV. Women who experience this are likely to also experience other forms of violence including emotional and economic violence. Hunger, alcohol use and lack of power in relationships are key risk factors for physical and/or sexual IPV. Therefore, interventions to reduce IPV need to seek to reduce all forms of violence women experience, as well as work to strengthen women's economic power and social power in relation to their partners.

## THPED348

### GENDER, VIOLENCE, AND VERTICAL HIV TRANSMISSION IN LUSAKA, ZAMBIA: DOES INTIMATE PARTNER VIOLENCE AGAINST HIV-POSITIVE WOMEN AFFECT ADHERENCE TO PREVENTION OF MOTHER TO CHILD TRANSMISSION PROTOCOLS?

K. Hampanda
*University of Colorado Denver, Health and Behavioral Sciences, Denver, United States*
*Presenting author email: karen.hampanda@ucdenver.edu*

**Background:** Prevention of mother-to-child transmission (PMTCT) depends critically on HIV-positive women's adherence to antiretroviral drugs during and after pregnancy. Safe infant feeding practices among HIV-positive postpartum women also reduce the risk of vertical HIV transmission and promote infant survival. Adherence to such protocols, however, remains a challenge across sub-Saharan Africa. Qualitative research has indicated that power dynamics within couples, such as intimate partner violence, may reduce women's use of PMTCT in some contexts; however, a quantitative relationship between intimate partner violence and non-adherence to PMTCT has not been established. This study aims to determine if there is a quantitative relationship between intimate partner violence and non-adherence to PMTCT medication and safe infant feeding recommendations among HIV-positive women in domestic relationships in Lusaka, Zambia.
**Methods:** From March to August of 2014, we verbally administered a cross-sectional survey with closed-ended questions at a large public health clinic in Lusaka, Zambia. HIV-positive postpartum women (n=320), who were currently married or living with a man, provided information on their drug adherence during and after pregnancy, infant feeding practices, relationship dynamics with the husband/partner, and demographic characteristics. Drug adherence was measured based on women's self-reports using a visual analog scale developed by the primary investigator. Infant feeding and intimate partner violence were measured using questions directly from the Zambian Demographic and Health Survey, including the Domestic Violence Module. Multivariate logistic regression in Stata 12 determined the odds of adherence to PMTCT across the cascade of care by women's experiences with violence after adjusting for covariates, including HIV status disclosure to the partner.
**Results:** Experiencing intimate partner violence was associated with decreased odds of adherence to medication during and after pregnancy. Intimate partner violence also reduced the odds of women practicing exclusive breastfeeding for six months. Moreover, different forms of violence affected adherence differentially. Physical violence had a less pronounced affect on non-adherence than emotional and sexual violence. A dose-response relationship between intimate partner violence and non-adherence was also observed.
**Conclusions:** This study provides compelling evidence that intimate partner violence against HIV-positive women deserves increased attention within the global effort to eliminate mother-to-child transmission of HIV.

## THPED349

### GENDER, HIV AND VIOLENCE: A QUALITATIVE STUDY ASSESSING YOUNG PEOPLE'S PERCEPTIONS OF GENDER IN RURAL AND URBAN COMMUNITIES IN UGANDA

J. Okoth Okal[1], L. Vu[2], B. Zieman[2], C. Banura[3], E. Yam[2], Link Up Project
*[1]Population Council Kenya, HIV/AIDS Program, Nairobi, Kenya, [2]Population Council, HIV/AIDS Program, Washington DC, United States, [3]Makerere University, Kampala, Uganda*
*Presenting author email: jerryokal@gmail.com*

**Background:** Inequitable (or negative) perceptions of gender are often associated with poor health outcomes. Currently, there are global efforts to address inequitable gender attitudes at an early age before these norms become internalized. However, little is known about inequitable gender norms at an early age, their constructs, and how they may influence HIV-related outcomes in high HIV prevalence settings like Uganda.
**Methods:** Data are from a larger study assessing gender perceptions of young people in rural and urban communities near Kampala, Uganda. Twenty-four participants aged 15-24 participated in individual in-depth interviews from June - August, 2015. Interviews were audio recorded, transcribed and analyzed using thematic analysis.
**Results:** Traditional attitudes towards gender roles still exist, and participants affirmed that these are shaped by socially accepted messages and adult behavior on expected behaviors for boys and girls. Similarly, participants stated that media and other external sources (e.g school, print and electronic media) are increasingly becoming important in influencing gender norms. Responses from questions on ideal behavioral expectations reveal that from an early age boys and girls are assigned different duties. Boys are given outside work (e.g., drawing water and cattle rearing), while girls are given inside work (e.g cleaning or child care). Most participants believed that boys should initiate and dictate the terms of sex by determining when, how and with whom to have sex with. Close to half of the participants, more so the less educated, felt that that girls should avoid conflict with their partners and be available for sex on demand. Hence, some girls felt that they are at greater risk of contracting HIV because of their inability to control their sexuality. Although male violence against women, was common and practiced among married participants, most unmarried boys felt that it was "okay" to shout down or hit a girl to "discipline" them.
**Conclusions:** The findings reveal links between socialization processes and gender roles for young people specifically, and associated HIV risk and gender-based violence. These factors are typically not addressed in HIV prevention programs that serve young people and should be considered.

## THPED350

### USE OF GENDER TRANSFORMATIVE MAPPING TOOL IN HIV AND SRHR INTERVENTIONS TO ADDRESS GENDER INEQUALITIES AT COMMUNITY LEVEL IN SOUTHERN AFRICA: SAT CASE

S. Siphiwe Kaunda
*Southern African AIDS Trust (SAT), Johannesburg, South Africa*
*Presenting author email: kaunda@satmal.org.mw*

**Background:** Gender inequalities are a major driver of the HIV and tuberculosis epidemics, and they hinder effective responses to malaria. In the recent years, gender inequalities are rampant at community level. Gender transformative HIV programming therefore is a strategic approach in the HIV response as it changes existing structures, institutions, create the conditions whereby women and men can examine the damaging aspects of gender norms and experiment with new behaviors. SAT recognized the importance of community mapping process in the development of communities and integration of gender in such process. Gender transformative approaches can guide community mapping exercises and inform HIV programming in communities.

Tuesday 19 July
Wednesday 20 July
Thursday 21 July Poster Exhibition
Friday 22 July
Late Breaker Posters
Author Index

**Description:** Southern African AIDS Trust (SAT) designed a gender transformative community mapping Tool (GTCMT) for use during the programme planning, redesigning as well as for monitoring and evaluation. Its purpose was to systematically and thoroughly identify and analyze community problems and drivers related to SRHR, HIV and broader health issues as well as available resources within the community. Through integrating gender transformative programming, the GTCMT has been designed to assist in addressing social and cultural pressures that negatively impact women's health and adolescents SRHR. The Tool was used during community mapping exercises by SAT Partners in Tanzania, Zambia, Zimbabwe and Malawi.
**Lessons learned:**
· Gender transformative HIV programming is a very relevant and successful model in facilitating change in values, norms and behaviors thereby reducing vulnerability to HIV and mitigating the impact of AIDS and SRHR.
· Use of GTCMT can transform communities by changing mindsets, enabling them to find solutions to their problems.
· Effective application of the Gender transformative approach increases understanding of gender inequalities among community stakeholders.
Gender transformative programming for women and girls and adolescents guarantees social, legal and economic empowerment, improves access to sexual and reproductive health services.
**Conclusions/Next steps:** Gender transformative HIV programming is a very relevant and successful model in facilitating change in values, norms and behaviors thereby reducing vulnerability to HIV and mitigating the impact of AIDS and SRHR. Effective application of the Gender transformative approach increases understanding of gender inequalities among community stakeholders.

## THPED351

### REDEFINING THE ROLE OF MEN IN THE FIGHT AGAINST GBV AND HIV-MEN AS PROTECTORS CAMPAIGN ON ZERO DOMESTIC VIOLENCE AND HIV AMONG WOMEN IN MALAWI

E. Chikhwana
*SAfAIDS, Lilongwe, Malawi*
*Presenting author email: chikhwanaedward@gmail.com*

**Background:** Increased male involvement in interlinked GBV and HIV prevention programmes significantly contributes to reduced incidences of GBV and HIV among women and girls as well as access to HIV prevention and treatment services. Men have for a long time been regarded as perpetrators of domestic Violence and a group so promiscuous and responsible for HIV transmission. This kind of thinking and labelling has contributed to limited involvement and created a gap in GBV and HIV programming.**SAfAIDS, with support from United Nations Trust Fund (UNTF)** implemented a three year project that employed Men as Protectors Clubs as a strategy for male involvement in GBV and HIV prevention.
**Description:** The project was implemented from September 2011 to August 2014 and focussed on influencing change of cultural practices that fuel domestic violence and HIV among women and girls. The beneficiaries were **women** and **girls** (15 and 49) and targeted **traditional leaders, religious leaders, and men** as key change agents. It was implemented in 2 districts of **Phalombe** and **Nsanje** .The project employed the Men as Protectors **(MasP)** model where men were mobilized into their own clubs, MasP clubs were trained and clubs conducted men dialogues sessions, men speak out sessions, community awareness on GBV and HIV, referred survivors and former perpetrators to services delivery points.
**Lessons learned:** 8400 **men** were reached by MaSP Club members. A total of 3771 and 435 men received HTC and VMMC services respectively. **782 men** reported accompanying their wives to health clinics for various health services including Ant Natal Care (ANC), PMTCT and deliveries. ***Domestic violence cases were*** reduced in couples whose men are members of Men as Protectors Clubs i.e no cases were reported in Nsanje between January-June 2014 in T/A Ndamera in Nsanje district.
**Conclusions/Next steps:** Men need their own space to have conversations on issues affecting their lives, families and communities and labelling men as perpetrators of SGBV negatively affects their participation in GBV and HIV prevention efforts. Male participation should form part of GBV and HIV efforts and awareness on inter-linkages between GBV and HIV needs to be strengthened in GBV and HIV programmes.

## THPED352

### "HIDING OUR SEXUALITY IS THE MOST CHALLENGING PART OF OUR LIFE": THE ROLE OF GENDER NORMS ON LESBIAN, GAY, BISEXUAL AND TRANSGENDER YOUNG PEOPLE'S HIV EXPOSURE IN KINGSTON, JAMAICA

C. Logie[1], N. Lee-Foon[2], N. Jones[3], K. Levermore[3]
*[1]University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada,*
*[2]University of Toronto, Dalla Lana School of Public Health, Toronto, Canada,*
*[3]Jamaica AIDS Support for Life, Kingston, Jamaica*
*Presenting author email: nleefoon@gmail.com*

**Background:** Eteronormative views of gender roles cause LGBT youth in Jamaica to experience familial, societal, and institutionalized stigma, and violence. One LGBT community organization in Jamaica received 231 reports of incidents of anti-LGBT violence from 2009-2012. The aforesaid experiences lead many individuals to engage in self-protective strategies to avoid violence that may increase their exposure to HIV. As such, we explored the impact of gender roles, and self-protective strategies among LGBT youth in Kingston, Jamaica.
**Methods:** Seventy-three individual semi-structured interviews were conducted with young (aged 18-29 years) gay/bisexual men (n=20), transgender women (n=20), lesbian/bisexual women (n=20), and key informants working with LGBT populations (n=13) in Kingston, Jamaica. Additionally, we held three separate focus groups with young gay/bisexual men (n=10), transgender women (n=8), and lesbian/bisexual women (n=6) in Kingston. The interviews and focus groups were digitally recorded and transcribed verbatim. Narrative thematic analytic techniques were implemented to analyze themes in the data.
**Results:** Participant feedback indicated the societal view of heteronormative gender roles was incorporated into the intrapersonal (individual), interpersonal (relationships, family), community (religion) and institutional (employment, health care services) layers of LGBT youths' lives. Almost all participants discussed using self-protective strategies—assuming heteronormative gender roles on an occasional or frequent basis while in public. This strategy included changing one's physical appearance and mannerisms to match traditional views of masculinity and femininity and in some cases, engaging in anti-LGBT violence and stigma. Participants also noted anti-LGBT stigma prevented many youth from having meaningful, long-term romantic relationships due to the fear of being 'outed' by community members, and restrictions on public displays of affection. This stigma led many individuals to partake in anonymous sexual encounters with multiple partners which can augment exposure to HIV.
**Conclusions:** The findings denote LGBT youth implement self-protective strategies to reduce experiences of anti-LGBT stigma, and violence. While participants indicate these strategies are effective, they limit youth's ability for self-expression, and increase their exposure to HIV and mental health issues. Additional research must address the impact of gender norms on LGBT youths' sexual practices in Jamaica.

## THPED353

### MASS MEDIA AND GIRLS EMPOWERMENT: BRAZILIAN CAMPAIGN "MY FIRST HARASSMENT"

H. Malta[1], G. Ferreira Dealtry[2], J. de Farias[3], M. Malta[4]
*[1]Dulaney High School, Baltimore, United States, [2]Rio de Janeiro State University, Institute of Letters, Rio de Janeiro, Brazil, [3]Think Olga, Sao Paulo, Brazil, [4]FIOCRUZ, National School of Public Health, Department of Social Science, Rio de Janeiro, Brazil*
*Presenting author email: mmalta2@jhu.edu*

**Background:** Violence against women is by far the most notable form of violation of human rights in Brazil. Over the past three decades, more than 92.000 women were murdered. For every day that passes by, 15 women are killed for the sole fact of being women and every 15 seconds one woman is assaulted.
**Description:** In November, 2015, the Brazilian feminist group "Think Olga" launched an online campaign under the hashtag #meuprimeiroassedio (My First Harassment) — in which women described similar experiences. The campaign went viral, reaching more than 100,000 reports in a few weeks. The reports were organized and will be published as a book in 2016, as another strategy to empower Brazilian women and girls.
**Lessons learned:** As the revelations spread on Twitter, WhatsApp and Facebook and women shared the revulsion and even blame they had felt after being harassed or abused, many of them realized something else: that close friends and relatives had suffered similar incidents but never talked about them before. After the campaign, a high school student developed a smartphone app called Sai Pra Lá - roughly translated, "get off" or "leave me alone" - which uses GPS to register where harassment incidents took place.
**Conclusions/Next steps:** The campaign's success reflects the increasing activism of women in a deeply "macho" society, as is the case of Brazil. The internet made our voices visible and more powerful than ever. With social media we will never be alone, and our voice will be hear all over the world.

## FEMININITY, MASCULINITY AND TRANSGENDER ISSUES

### THPED354

#### "MAN 'FI' ACT LIKE A MAN": UNDERSTANDING THE INTERSECTIONALITY OF SEXUAL IDENTITY POLITICS, GENDER PRESENTATION, AND HIV VULNERABILITY FOR YOUNG JAMAICAN MSM

O. Harris[1], J. Tuttle[2], C. Sellers[2], A. Dozier[3], L. Dunn[4]
*[1]University California San Francisco, Center for AIDS Prevention Studies, Alameda, United States, [2]University of Rochester, School of Nursing, Rochester, United States, [3]University of Rochester, School of Public Health, Rochester, United States, [4]University of the West Indies, Mona Campus, Gender Development Studies, Kingston, Jamaica*
*Presenting author email: orlando_harris@urmc.rochester.edu*

**Background:** One-third of the 2,500 new HIV infections in 2012 were among young Jamaican men who have sex with men (JMSM). Jamaica, like other Caribbean islands, has well prescribed conceptualizations of maleness and masculinity. Men who deviate from such ascribed definitions of masculinity often face violent, sometimes deadly, homophobic condemnation. In this study we interrogated the intersectionality of sexuality, gender, homophobia, and HIV vulnerability for young gender-nonconforming JMSM.
**Methods:** In this qualitative descriptive study, we used semi-structured in-depth interviews with individuals and focus group discussions as the primary sources for data collection. Thirty young JMSM were recruited in spring 2013 from five parishes in Jamaica. All data were recorded, transcribed verbatim, and analyzed using thematic content analysis.
**Results:** Participants were aged 18-29 years and self-identified as gay or bisexual. The majority articulated to varying degrees a feminine gender presentation, based on a visual analog scale of gender identity, sexuality, and behavior. JMSM in this study lamented that maleness and masculinity were often defined and enforced by heterosexual, hyper-masculine inner-city men; religious ideology and pedagogy; and the selective spaces created by Jamaican popular culture. The ability for some JMSM to express their desired gender freely was restricted to their geo-economic, political, and social environments. For others, efforts to reconcile their feminine presentations with the cultural definitions of masculinity were often futile, leaving them no choice but to flee their communities, engage in commercial sex work or survival sex, or engage in other high risk sexual behaviors; all of which decreased familial social support and suitable employment prospects, increased their risk for HIV infection, and limited their access to vital public HIV prevention and treatment services.
**Conclusions:** Jamaican public health efforts aimed at curtailing the HIV epidemic must be inclusive of those MSM who are gender nonconforming. Accessing governmental and community-based HIV prevention and treatment resources may be difficult for some young JMSM due to the social and cultural constraints defining masculinity in Jamaica. In addition to creating culturally appropriate inclusive public health policies to reduce the HIV burden in Jamaica, nondiscrimination legislation that guarantees equal protection for JMSM is urgently needed.

## EXPERIENCES AND NEEDS FROM THE PERSPECTIVE OF SEX WORKERS

### THPED355

#### 'OUTDATED LAWS, OUTSPOKEN WHORES': DECRIMINALISING SEX WORK IN THE SOUTH AUSTRALIAN CONTEXT

R. Baratosy
*The Sex Industry Network, Research, Underdale, Australia*
*Presenting author email: roxanabaratosy@gmail.com*

**Background:** Sex workers globally advocate for the decriminalisation of sex work. It is evident from the literature that decriminalisation is the most appropriate model to govern sex work and has the greatest effect on the course of HIV and STI transmissions when compared to other regulatory models.
In South Australia, sex work is criminalised and consequentially sex workers are left behind; working under laws that impinge on both sex worker health and human rights.
**Methods:** This qualitative study was conducted in Adelaide, 2015. The first sample consisted of ten sex workers recruited from the Sex Industry Network. Interviews were transcribed verbatim. A theoretical thematic analysis was chosen to code the data, then further analysed at the latent level to gain an understanding of sex worker experiences working under criminal laws. The second sample was the parliamentary debates discussing the bill to decriminalise sex work. Again, the data was analysed using thematic analysis, followed by latent level analysis to uncover the barriers halting law reform and the attitudes towards sex work from members of parliament.
**Results:** There was a contrasting understanding of sex work between the samples. The first sample showed that, for sex workers, criminalisation has led to work concerns surrounding occupational health and safety, outreach, barriers to health services, and police involvement within the sex industry. All interviewees showed support for decriminalisation. Traditional morality, violence and trafficking were the major themes found to influence opposition to reform in the second sample and build a case for sex work being presented as problematic, therefore further stigmatising sex work and neglecting health and human rights.
**Conclusions:** Research in South Australia pertaining to sex work is nearly non-existent. The findings of this study therefore contribute to building understandings around the need for decriminalisation. Traditionally, sex worker voices have been silenced in research; this study honours sex worker voices and experiences, and thus makes a unique contribution to both decriminalisation and sex worker literature. Furthermore, decriminalisation has been shown to reduce the prevalence of HIV and STIs, and as such may have implications reducing the spread of these communicable diseases worldwide.

### THPED356

#### PRESENTING THE EVIDENCE: 20 YEARS OF DECRIMINALISATION OF SEX WORK IN AUSTRALIA

T. Powell, R. Baratosy
*Scarlet Alliance, Australian Sex Workers Association, Newtown, Australia*
*Presenting author email: international@scarletalliance.org.au*

**Background:** In Australia models of sex work regulation vary across each state & territory, providing a unique position to compare the effects of decriminalisation and other legal models. Sex work was decriminalised in New South Wales in 1995 in response to Royal Commission findings of systemic corruption within law enforcement. Decriminalisation removes police as regulators, removes criminal laws, and regulates sex work through a whole government approach utilising standard occupational, planning and industrial mechanisms. After 20 years of lived experience, we reflect on the lessons learned and our aims going forward.
**Description:** As the peak national organisation for sex workers, Scarlet Alliance collects data via national forums, working groups and surveys. Scarlet Alliance conducted a five-stage consultation process with our membership, including sex workers from a range of genders, experiences and backgrounds. We reviewed relevant literature, health research and government reports to examine policy successes and areas in need of reform.
**Lessons learned:** Decriminalisation of sex work in NSW has resulted in high rates of safer sex (Law and Sex Worker Health Study); low rates of sexually transmissible infections (Australia's National HIV and STI Strategies); improved Workplace Health and Safety (NSW Government Brothels Taskforce); few amenity impacts and no evidence of organised crime (Land and Environment Court). Sex workers in NSW can access free health services, free legal advice and have their industrial rights acknowledged and protected. In jurisdictions with licensing or criminal frameworks, sex workers do not have the same access to services, rights or justice.
**Conclusions/Next steps:** Decriminalisation is the best-practice model and is imperative to sex workers' health, safety and rights. It is the optimal model of sex work regulation, supported by the UNFPA, UNDP, UNAIDS, WHO and Amnesty as necessary for HIV prevention, anti-discrimination, human and labour rights. After 20 years of success, advocacy is necessary. Stigma, increasing political pressure to criminalise clients, hostile funding environments, and institutional discrimination remain significant barriers to the uptake of this model. Decriminalisation must be coupled with comprehensive human rights and anti-discrimination protections to be fully effective. The comparative experience of NSW offers an essential evidence base for governments, researchers, health sector and sex workers internationally.

### WHO DUNNIT? INTENTIONAL AND UNINTENTIONAL CONDOM BREAKAGE IN SEXUAL INTERACTIONS BETWEEN FEMALE AND MALE SEX WORKERS AND THEIR CLIENTS IN MOMBASA, KENYA

T.B. Masvawure[1,2], J. Mantell[1], J. Tocco[1], P. Gichangi[3], A. Restar[4], S. Chabeda[3], Y. Lafort[5], T. Sandfort[1]
*[1]HIV Center for Clinical and Behavioral Studies, NYSPI and Columbia University, Psychiatry, New York, United States, [2]College of the Holy Cross, Sociology and Anthropology, Worcester, United States, [3]International Centre for Reproductive Health, Mombasa, Kenya, [4]Columbia University, Mailman School of Public Health, New York, United States, [5]Ghent University, Gent, Belgium*
*Presenting author email: tmasvaure@yahoo.com*

**Background:** Condom breakage hinders HIV prevention efforts. We examined why condoms broke and what actions were taken after breakage by female and male sex workers (FSWs and MSWs, respectively) and their clients in Mombasa, Kenya.
**Methods:** We conducted 75 semi-structured interviews with sex workers and clients recruited from 18 bars/nightclubs in Mombasa to guide intervention development. Eligibility criteria were being ≥18 years, regular patron of venue, having solicited for vaginal/anal intercourse with sex worker/client at that venue in last 3 months, willingness to have the interview audio-recorded, and being visibly sober.
**Results:** Condom breakage was common among FSWs, MSWs and their clients, with most (61/75) having experienced breakage at least once or on numerous occasions. Sex workers blamed clients for most breakages, accusing them of deliberately tearing condoms, wearing condoms inside out or failing to remove the air bubble due to drunkenness. They also said clients generated “too much friction” during sex due to their “big” penises, thrusting too forcefully during sex, or taking too long to ejaculate. Some clients admitted to tearing condoms before sex and to using traditional herbs to increase sexual stamina and delay ejaculation. Other reasons that sex workers and clients mentioned for breakage were inadequate or non-use of lubricants, “dry vaginas,” and MSWs who “squeeze the penis tightly” during anal sex. Breakages were noticed by the majority of participants *during* sex but some only noticed the breakages *after* sex. Most participants in the former group immediately stopped sex and changed the condom. However, a number did not stop or notify sexual partners: clients did not want to interfere with their own sexual enjoyment and sex workers were too afraid to ask the client to change the condom. A number of clients and sex workers also went for HIV testing and/or took post-exposure prophylaxis following condom breakage.
**Conclusions:** Despite the use of condoms, HIV transmission between sex workers and clients might still occur due to frequent condom breakage, which sometimes is intentionally done by clients to enhance pleasure. Condom promotion for both groups should therefore go beyond simply encouraging use, but address user-related factors that contribute to breakages.

## THPED358

### *“LA VIDA ES BONITA, MEDIA VEZ UNO LA SEPA VIVIR”* (LIFE IS BEAUTIFUL ONCE YOU KNOW HOW TO LIVE IT): RESILIENCE AMONG FEMALE SEX WORKERS RECEIVING HIV/AIDS TREATMENT, GUATEMALA CITY

A. Rock[1,2], C. Barrington[1,2], I. Loya-Montiel[3], O.A. Paz-Bailey[3], S. Morales-Miranda[3]
*[1]UNC Gillings School of Global Public Health, Health Behavior, Chapel Hill, United States, [2]Carolina Population Center, Chapel Hill, United States, [3]Center for Health Studies, Universidad del Valle de Guatemala, Guatemala City, Guatemala*
*Presenting author email: ameliarock29@gmail.com*

**Background:** Maximizing retention in care and ART adherence among PLHIV within key populations is essential to improving their health and quality of life, and stemming onward transmission. Existing research on female sex workers’ (FSW) experiences along the HIV care continuum highlights barriers such as stigma and substance use, with little attention to how they overcome such barriers. We use an assets-based approach to investigate resilience among FSW living with HIV (FSWLH) - that is, strategies they use and resources within their socio-structural contexts they draw upon to maintain their care and adherence in the face of adversity.
**Methods:** We conducted individual in-depth interviews with 12 FSWLH in Guatemala City (March-May 2014). This purposive sample was recruited via referrals through a local FSW-led NGO. Most reported being in HIV care and ART adherent. We examined experiences living with HIV and across the care continuum. We analyzed interview transcripts in Spanish utilizing thematic analysis methods in Atlas.ti software (v1.0.2) and narrative summaries of their HIV care and treatment histories.
**Results:** Participants contested stigma and discrimination they faced by reconstructing the meanings of HIV, PLHIV, and sex work, drawing on empowering discourse in their talk, and through activism and community engagement. They thus guarded against impacts of internalizing stigma, such as low self-worth and depression, which negatively influence retention and adherence. Desire to support their children motivated them to continue their struggle, and friends, non-discriminatory family members, partners, and clients bolstered them emotionally and instrumentally. Many opted for a hopeful, positive perspective on life, which helped cope with anxiety and depression. Faith in God provided a sense of strength and obligation to take advantage of available treatment.
**Conclusions:** We show how FSWLH resist stigma and discrimination in their talk and activism, and access support and motivation through social ties and spirituality. These strategies and resources enable them to cope with adversity that undermines retention in care and adherence. HIV programs in the Guatemalan and other contexts can build on these insights. We counter common narratives around FSW within public health discourse that emphasize their vulnerability, often at the expense of learning from solutions they themselves have developed.

## THPED359

### SUCCESSFUL UPTAKE OF PREP BY FEMALE SEX WORKERS IN ZIMBABWE: THE IMPORTANCE OF PEER SUPPORT

T.M. Chiyaka[1], J. Busza[2], P. Mushati[1], S. Magutshwa[1], N. Ncube[1], F. Cowan[1,3]
*[1]CeSHHAR Zimbabwe, Sex Work Research Programme, Harare, Zimbabwe, [2]London School of Hygiene and Tropical Medicine, London, United Kingdom, [3]University College London, London, United Kingdom*
*Presenting author email: tarisai@ceshhar.co.zw*

**Background:** PrEP is now recommended for all eligible HIV-negative members of key populations. Sex workers in Zimbabwe are at high risk for HIV and often unable to negotiate condom use with clients and partners. The SAPPHIRE trial a matched-pair cluster-randomized trial, which is testing an enhanced combination prevention and treatment package for sex workers, offers Truvada in its 7 intervention sites with intensified community mobilization and adherence support.
**Methods:** We conducted 21 in-depth interviews in 3 locations with sex workers who had initiated PrEP in the first year of provision in order to understand women’s decision making process regarding uptake. We explored sex workers’ perceptions of risks and benefits, early experiences of taking Truvada, challenges to adherence, and support or resistance from friends, family members and peers.
**Results:** Most women had initial anxieties and some feared PrEP could be a ploy to harm sex workers. Women whose siblings, children, or other relatives urged them to try the drug reported being early adopters, while some were dissuaded at first by their family’s concerns. Discussions with other sex workers, particularly those taking antiretroviral for treatment, offered considerable reassurance, spreading the message that *all* sex workers now had a pill to take to meet their needs. Peer support could overcome barriers from resistant family members, and at least one woman reported breaking up with her partner when he opposed PrEP use. Sex workers used WhatsApp, text messages, and informal conversations in bars to share information about availability of PrEP, remind each other about clinic appointments, and help each other adhere. This was formalised through the “Adherence Sisters” programme in which paired sex workers attended 4 participatory workshops about PrEP and ART.
**Conclusions:** This study from the early stages of a PrEP demonstration project among sex workers in a high prevalence setting suggests this population is willing and able to initiate and maintain PrEP use if they receive adequate encouragement. While family members were instrumental in women’s uptake, peers appeared best placed to sustain women’s adherence. Programmes can facilitate positive communication between sex workers to strengthen mutual support.

## THPED360

### “NOBODY HELPS BECAUSE I AM A SEX WORKER”: SEX WORKERS’ BARRIERS TO HEALTHCARE SEEKING AND EXPERIENCES IN THE SOUTH AFRICAN CONTEXT

L. Rambally-Greener, M. Beksinska, K. Sithole, M. Kubeka, J. Smit
*MatCH Research, Witwaterstrand, Obstetrics and Gynaecology, Durban, South Africa*
*Presenting author email: lgreener@matchresearch.co.za*

**Background:** Female sex workers (FSW) are exposed to multiple HIV and SRH transmission risks. The criminalisation and stigmatisation of sex work has negatively affected access to healthcare services. Understanding barriers to access could help enhance healthcare seeking among this population.
**Methods:** A rapid needs assessment was conducted with purposively sampled FSWs working in Durban, South Africa in 2013, to establish the extent and scope of sex workers’ HIV and SRH healthcare seeking. Data collection comprised of semi-structured interviews (n=20) and focus group discussions (n=23). Qualitative data were analysed thematically with basic descriptives on the socio-demographic data.
**Results:** Average age of participants was 30 years; sexual debut was at 17 years. Two or more pregnancies were reported by 65.1%. A quarter reported using narcotic substances and 57.9% reported binge drinking. Over a month FSWs reported

18 paying clients and 2-5 non-paying partners. Most reported accessing services at NGO's however these services were limited to HIV testing and male condoms. Although public healthcare facilities had a wider range of services, participants, especially migrant FSWs found it difficult to access services. Services were available but problematic to access due to poor healthcare provider attitudes and experiences of breeches of patient confidentiality. *"...they call one another, saying 'come and see someone who is selling her body; does this person have to get help if she is like this?'"*. Although condoms were relied on for contraception, STI/HIV prevention they were used inconsistently: paying clients (90.2%) and regular partners (55%). Additional barriers were, police violence, as many reported instances of harassment or the confiscation of condoms, and clients often demanding unsafe sex. Those accessing HIV testing at NGO's (39%) reported limited linkage to care. Many accessed STI treatment at a clinic (42%), and services, such as family planning and pap smears, were noted as needed but not accessed (23.3%). Other needed services were TB services, ARTs, trauma counselling and alcohol rehabilitation.
**Conclusions:** In order to improve FSWs health seeking practices, issues such as stigma, ease of access, range of SRH and HIV services provided by NGOs, low use of contraceptive methods must be prioritised.

## THPED361

### MEASURING THE IMPACT OF INTERPERSONAL COMMUNICATION ON HIV TESTING IN MADAGASCAR

J.A. Raharinjatovo, S. Razakamiadana, B. Rahaivondrafahitra
*PSI Madagascar, Research, Antananarivo, Madagascar*

**Background:** Statistics show a low prevalence of HIV in Madagascar, 0.4% among 15-49 year olds, (UNAIDS, 2011) and 1.2% among female sex workers (Study on Bio-Behavioral Among Sex Workers, National Committee on Fight Against AIDS2013).
PSI Madagascar uses its network of socially franchised health clinics (Top Reseau) to offer HIV services to high risk populations such as sex workers. Peer educators in collaboration with Top Réseau clinics use interpersonal communication (IPC) to promote the availability of this service. This paper examines whether the IPC intervention activities led by peer educators for female sex workers is resulting in higher rates of HIV testing in Top Réseau facilities.
**Methods:** A quantitative survey was conducted among female sex workers in July 2014 in 8 Top Réseau sites. Sex workers were recruited using probability proportional to size from a sampling frame of hotzone (an area where sex workers wait for the clients) that was created prior to the the survey. A total of 1,041 female sex workers ages 18 to 49 years were interviewed in 8 Districts where PSI-franchised facilities Top Réseau are located. The analysis used prospective matching for exposed and unexposed individuals using coarsened exact matching (or CEM). Logistic regression and ANOVA procedures were conducted using STATA version 13.0 to determine the impact of interpersonal communication on HIV testing uptake.
**Results:** 74.4% of the sex workers reported ever testing for HIV. 76.8% among sex workers exposed to IPC interventions reported testing compared to 49.6% among those not exposed ($p < 0.001$).
IPC interventions were associated with increased perception of testing availability with 95.4% among exposed, compared to 84.8% among non-exposed ($p < 0.05$).
Those exposed were also more likely to report the ability on what to do to get to HIV testing services (91.2%) versus those sex workers not exposed (74.4%) ($p < 0.01$).
**Conclusions:** The findings show that IPC communication activities are an effective way to encourage HIV testing among female sex workers. The program has to develop an environment that supports the continued use of IPC for HIV testing.

## THPED362

### CHARACTERIZING THE PATTERNS OF HIV DISCLOSURE TO CLIENTS AMONG SOUTH AFRICAN FEMALE SEX WORKERS IN PORT ELIZABETH

C. Wells[1], S. Schwartz[1], N. Phaswana-Mafuya[2], C. Yah[1], A. Lambert[3], Z. Kose[2], M. Mcingana[3], S. Ketende[1], S. Baral[1]
*[1]Johns Hopkins Bloomberg School of Public Health, Key Populations Program, Department of Epidemiology, Baltimore, United States, [2]HSRC, Eastern Cape, South Africa, [3]TB/HIV Care Association, Cape Town, South Africa*
*Presenting author email: cwells24@jhmi.edu*

**Background:** Female sex workers (FSW) in South Africa have consistently been found to have a disproportionately high burden of HIV even in the context of the largest HIV epidemic in the world. Disclosure of HIV status is encouraged between couples; however, less is known about determinants of disclosure of HIV status between FSW and their male clients.
**Methods:** 410 adult FSW were recruited using respondent-driven-sampling (RDS) in Port Elizabeth, South Africa from October 2014-March 2015 and completed a structured survey instrument and HIV counseling and testing. Stata version 14.1 and Pearson's chi-square statistics were used to conduct the analysis.
**Results:** Of the 410 participants, 214 knew they were living with HIV and were included in the analysis. Of these known HIV+FSW, the mean age was 27.8 (SD=5.7) and 74 (34.7%) reported disclosing their HIV-positive status to paying clients. FSW were more likely to disclose if they also disclosed to non-paying partners (47.4% vs.25.5%, $p < 0.05$) or if they told their family they were practicing sex work (43.0% vs.29.1%, $p < 0.05$).
Communication about a paying client's HIV status was also associated with increased FSW disclosure to new (85.7% vs.26.3%, $p < 0.01$) and regular clients (92.6% vs.27.0%, $p < 0.01$). FSW were less likely to disclose to clients they met online (23.2% vs.40.2%, $p < 0.05$) or to those with whom they arranged sex in a hotel or guesthouse (29.5% vs.42.9%, $p < 0.05$), whereas they were more likely to disclose if they met clients at a brothel (54.2% vs.32.3%, $p < 0.05$).
There was no significant relationship found between disclosure behavior and the FSWs' HIV treatment, depression, violence, substance abuse or condom use with clients.
**Conclusions:** These results suggest that FSW are more likely to disclose their HIV status to clients if they have more open communication patterns with clients, non-commercial intimate partners and family, or are in a familiar environment.
Moreover, a safer sex work working environment combined with efforts to increase communication skills may be able to improve disclosure. Service delivery partners and government should work to create more supportive and safe environments to improve uptake of HIV prevention and treatment services.

## THPED363

### SELLING SEX THROUGH THE LENS OF THOSE LEFT BEHIND: YOUNG PEOPLE'S EXPERIENCES AND NEEDS

B. Vidovic[1], B. Markos[2], A. Abu El Ela[3], G. Abouzeid[3], B. Butale[4], O. Mpheke[4], H. Ndondo[5], M. Corral Estrada[6], W. Shamuyarira[6], S. Hendriks[7]
*[1]AIDS Fonds, Amsterdam, Netherlands, [2]NIKAT Charitable Association, Addis Ababa, Ethiopia, [3]Al Shehab Foundation for Comprehensive Development, Cairo, Egypt, [4]Sisonke Botswana Association, Gaborone, Botswana, [5]Sexual Rights Centre Zimbabwe, Harare, Zimbabwe, [6]HIV Young Leaders Fund, Amsterdam, Netherlands, [7]AIDS Fonds, Sex Work Programme, Amsterdam, Netherlands*
*Presenting author email: shendriks@aidsfonds.nl*

**Background:** Whilst since recent decades HIV responses are mobilized to support adult sex workers, research, funding and HIV-services for young people -foremost minors- who sell sex are lacking. Supported by Aids Fonds' Stepping Stones initiative, community-based organisations of sex workers and youth assessed the experiences and needs of young people selling sex in order to generate understanding of this group left behind.
**Methods:** Between 2014-2015, qualitative research entailing complementary in-depth interviews, focus-group discussions and questionnaires assessed the needs of young people - including minors - through a snowball sampling technique. Across Botswana, Egypt, Ethiopia, and Zimbabwe, along with regional assessments in Latin-America and East and Southern Africa, explorative studies analysed contexts of selling sex in relation to income generating activities, violence, knowledge of rights and access to (health)services in daily-life. Noteworthy, data collected among respondents above the age of eighteen includes experiences of selling sex below the age of eighteen.
**Results:** Among sample size N=635 (n=44 in Ethiopia),(n=41 in Botswana),(n=49 in Egypt),(n=250 in Zimbabwe),(n=125 across Kenya, South Africa, Uganda and Zimbabwe),(n=100 across Brazil, Colombia, Dominican Republic and Honduras) divided between age categories 14-18, 19-20 and 20-25, most respondents started selling sex before the age of 18, sell sex due to poverty, and conform to peer pressure to upgrade lifestyles. They face stigma and discrimination by healthcare providers and violence from clients and pimps. Specifically, knowledge of and access to sexual and reproductive health and rights is limited to non-existent, whilst existing services focus on exempting young people from selling sex. A large proportion conceals medical conditions or visits traditional healers. Before reaching legal adulthood, most are denied access to services without consent of an adult.
**Conclusions:** Needs of young people selling sex are to gain access to (health)services and knowledge of sexual and reproductive health and rights, regardless of age. Results imply to sensitize health care providers towards reducing stigma and discrimination and moreover to avoid sole emphasis on rehabilitation. A course forward implies for HIV responses to enable equity rights for young people selling sex, foremost minors, which may impede vulnerabilities to the pandemic by leaving no one behind.

## THPED364

### MIGRANT SEX WORKERS IN AUSTRALIA

J. Kim, M. Pittaya
*Scarlet Alliance, Australian Sex Workers Association, Migration Project, Newtown, Australia*
*Presenting author email: mpm@scarletalliance.org.au*

**Background:** Migrant sex workers are recognised as a priority population in Australia's HIV/STI strategies. The dearth of reliable research on migrant sex workers has led to poor policies and programs that create barriers to effective HIV prevention. This is exacerbated by damaging stereotypes, misinformation and increased stigma and policing wrought by the global anti-trafficking movement, undermining prevention efforts and creating harm.
**Description:** Scarlet Alliance in partnership with Australian Institute of Criminology conducted the first large-scale research of migrant sex workers across Australia. The research included non-migrant sex workers to enable comparisons in demographic profile, work conditions, condom use and access to services. The migration experiences and motivations for migrating were also examined. Importantly the research included critical input of migrant sex workers in every level of the research design, dissemination and analysis.
**Lessons learned:** Peer-led research was a great success with over 1000 predominantly female sex workers engaged, with small representation of male and trans sex workers, 594 surveys deemed valid for analysis. Added to valuable research data, employing peers in all critical aspects resulted in many benefits. This will be the first time the full findings of the research will be presented at a conference. Many of the results reinforced reliable research in the area such as data on condom use and English proficiency and education levels. Other data, challenged what is perceived in this area, notably around the use of contracts to enable migration and sex work, access to services and sources of support and information and the perpetrators of threat to migrant sex workers. Data on work, migration experiences, condom use, sources of information, access to services will be presented.
**Conclusions/Next steps:** Successful HIV-prevention efforts require a more holistic understanding of migration and mobility for sex workers. The lived realities of migrant sex workers in Australia contradict public and policy discourses. This misunderstanding has led to harmful interventions and programs that have created significant barriers to effective HIV-prevention. It is hoped the findings of this research will inform evidence based policy, practices and service delivery for migrant sex workers.

## OWNERS, MANAGERS AND MANAGEMENT OF SEXUAL SERVICES AND ESTABLISHMENTS

## THPED365

### SEX WORK AND LABOUR RIGHTS IN SOUTHEAST ASIA

H. Pham Thi Thanh[1], C. Por[2], R. Howard[3], A. Torriente[4], R. Ameur[5], S. Mabhele[6]
*[1]International Labour Organization, Hanoi, Vietnam, [2]International Labour Organization, Phnom Penh, Cambodia, [3]International Labour Organization, Bangkok, Thailand, [4]International Labour Organization, Geneva, Switzerland, [5]International Labour Organization, Pretoria, South Africa, [6]International Labour Conference, Pretoria, South Africa*
*Presenting author email: thanhhuyen@ilo.org*

**Background:** Sex workers in Asia face a range of labour rights violations such as harassment and violence, lack of labour contracts, excessive working hours and lack of health insurance and other forms of social protection. These violations increase the risk of HIV infection and create barriers for accessing HIV testing, treatment and support services.
**Description:** The ILO and community groups of sex workers carried out qualitative research on working conditions among sex workers in Cambodia, Thailand and Vietnam in 2014-2015 which identified instances of denial of labour rights and barriers to effective HIV service delivery. Sex workers led the research in collaboration with trade unions, employers and labour ministries.
**Lessons learned:** The ILO research identified numerous challenges sex workers face in seeking decent working conditions. The majority are in precarious employment and do not have labour contracts. Most are misled about their working conditions when they are hired and have little means to negotiate improvements with their employers. Violence was extremely common arising from employers, clients and police. The majority of workers are required to work over 10 hours a day, 7 days a week without breaks. Fines and penalties for absences to seek healthcare or attend to other personal or family needs are common.
Based on these findings, ILO supported sex worker organizations to advocate for improved labour policy and better working conditions in their workplaces. Advocacy has led to improved working conditions, which has in turn increased sex workers' access to HIV testing and treatment services. In Cambodia, the Ministry of Labour issued a policy that provided labour protection to establishment based sex workers.
**Conclusions/Next steps:** A sound evidence based and social dialogue between sex workers and government and can lead to concreate changes in national policy and improved working conditions.
Improved working conditions leads to increased access to health and HIV services.

## CLIENTS OF SEX WORKERS: EXPECTATIONS AND DEMANDS

## THPED366

### *'I FEEL SAFER, IT IS BUSINESS, NO COMMITMENTS'*: OPPORTUNITIES AND OBSTACLES FOR CONDOM USE AMONG MALE AND FEMALE SEX WORKERS IN MOMBASA, KENYA

E.K. Igonya
*Vrije University Amsterdam, Nairobi, Kenya*
*Presenting author email: igonyae@gmail.com*

**Background:** For more than three decades now, the place of condoms in the prevention of HIV and other STIs has dominated global discussions and the design and implementation of prevention programs. With the high prevalence of HIV among female sex workers (14.1%) and MSM (15.2%) being reported in Kenya (National AIDS Control Council [NACC] 2009), combination prevention programs have been rigorously implemented in the last six years. The objective is understand practices and discourses around HIV prevention and condom use among female sex workers and MSM sex workers.
**Methods:** The ethnography study used qualitative methods - observations of condom distribution in guest-houses; numerous conversations with clients of female sex workers, female and male sex workers and with key informants; three focus group discussions with female and male sex workers; 30 in-depth interviews with female sex workers; biweekly group discussions with economic diary participants; six-months daily life diaries of two MSM sex workers and two female sex workers; and numerous observations and discussions with a male and female sex worker on their daily experiences.
**Results:** While condoms were openly distributed to female sex workers in the company of their clients on paying for guest house room, the same was invisible amongst male sex workers. With condoms use, male clients of female sex workers felt more comfortable in embracing non-committal and safe casual sex relationships. Even though taking condoms does not equate to usage among female sex workers, it was clear that condom uptake is poor amongst MSM male sex workers, partly for the fear of one being suspected of being HIV positive and therefore lose clients/money.
**Conclusions:** Contrary to the notion that one may lose clients if they introduce condoms into casual sex negotiations, clients may, in fact, gain confidence and trust when condoms are introduced, discussed and used. Additionally, non-use of alcohol may contribute to increased condom use among female sex workers. There is need to engage clients of MSM sex workers in conversations on condom use.

# Violence, wellbeing and sex work

## THPED367

### Physical and sexual violence, perceptions of police, and barriers to condom use among women who started selling sex as minors in Lesotho

A. Grosso[1,2,3], S. Busch[2], T. Mothopeng[4], S. Sweitzer[2], J. Nkonyana[5], N. Mpooa[6,7,8], N. Taruberekera[9], S. Baral[2]
*[1]Public Health Solutions, Research and Evaluation, New York, United States, [2]Johns Hopkins University, Center for Public Health and Human Rights, Baltimore, United States, [3]The AIDS Museum, Newark, United States, [4]Matrix Support Group, Maseru, Lesotho, [5]Ministry of Health, Maseru, Lesotho, [6]Care for Basotho, Maseru, Lesotho, [7]Care-Lesotho, Maseru, Lesotho, [8]Jhpiego-Lesotho, Maseru, Lesotho, [9]Population Services International, Johannesburg, South Africa*
*Presenting author email: grossoas@gmail.com*

**Background:** In Lesotho HIV prevalence is among the highest globally, and four times higher among girls aged 15-17 than among boys. Sex work is criminalized, and HIV prevalence among female sex workers (FSW) is >70%. In addition, 86% of all women have experienced gender-based violence, and studies have called for more rigorous evidence on abuse and the exploitation of children. In this context, minors (< 18 years old) who sell sex may be particularly vulnerable to gender-based violence and HIV risks.
**Methods:** FSW aged 18+ (n=744) were recruited through respondent-driven sampling in Maseru and Maputsoe from February-September 2014. They completed an interviewer-administered survey including a question about the age at which they started selling sex. We examined correlates of selling sex as a minor through multivariable logistic regression analyses for each city.
**Results:** Specific numeric results are presented in Tables 1-2. Compared to those who started selling sex as adults, early initiators were more likely to have been raped and physically abused. They had higher odds of avoiding carrying condoms to prevent getting in trouble with police and buying all their condoms rather than receiving some or all for free. Early initiators were more likely to describe their relationship with the police as bad or good rather than neutral.

| | Started selling sex under 18 (23.6%, 96/407) | Started selling sex 18+ (76.4%, 311/407) | OR (95% CI) | aOR (95% CI) |

| Experienced physical violence ever | 41.5% (22/53) | 18.9% (51/270) | 3.05 (1.63-5.70) | 2.75 (1.40-5.42) |
| Notes: Analyses are not adjusted for respondent driven sampling weighting. Sensitivity analyses adjusting for number of years selling sex produced similar results. | | | | |
| The adjusted model includes variables that were statistically significant (p<0.05) in bivariate analyses. The Akaike Information Criterion was used to select the most parsimonious model. | | | | |

*[Prevalence and correlates of initiation of selling sex as a minor among female sex workers in Maputsoe, Lesotho]*

**Conclusions:** Funders of HIV prevention services have given increased attention to understanding specific vulnerabilities among adolescent girls. Minors who sell sex are a very vulnerable group whose determinants of risk can be studied retrospectively through research with adult FSW. Increased protection of these women and decreased enforcement of laws prohibiting selling sex represent an important component of a comprehensive response to decrease significant HIV acquisition and transmission risks observed here.

## THPED368

### Association between alcohol consumption and gender-based violence (GBV) among female sex workers (FSW) in Iringa, Tanzania

A. Leddy[1], J. Mbwambo[2], S. Likindikoki[2], C. Shembilu[2], S. Beckham[1], A. Mwampashi[2], A. Mantsios[1], W. Davis[1], N. Galai[1,3], D. Kerrigan[1]
*[1]Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, [2]Muhimbili University of Health and Allied Sciences (MUHAS), Dar es Salaam, Tanzania, United Republic of, [3]University of Haifa, Haifa, Israel*
*Presenting author email: aleddy3@jhu.edu*

**Background:** Female sex workers (FSW) in Tanzania experience very high levels of gender-based violence (GBV) (i.e. physical and sexual violence). In 2013, 52% of FSW in Tanzania experienced physical violence and 47% experienced sexual violence in the past 6 months. Violence can increase women's risk for HIV directly through sexual assault/forced sex, and indirectly through risk behaviors including unprotected sex. Studies from other countries in sub-Saharan Africa suggest that GBV against FSW often occurs in the context of heavy alcohol consumption, suggesting that alcohol consumption may place FSWs at increased risk for GBV.
**Methods:** A Phase II randomized controlled trial of a community empowerment-based combination HIV prevention intervention is being conducted in Iringa, Tanzania. By January 2016, 254 FSW were enrolled into an ongoing longitudinal cohort. Women completed an interviewer-administered baseline survey that measured GBV, HIV status, general alcohol consumption, alcohol consumption during sex work, and socio-demographic characteristics. Using multivariable logistic regression, we conducted two separate analyses assessing the association between both, alcohol consumption in general, and alcohol consumption during sex work, with experiencing any GBV in the past 6 months.
**Results:** Approximately 42% reported experiencing any GBV in the past 6 months. Alcohol use was high with 73.3% engaging in heavy alcohol consumption in the past month. Twenty-seven percent (27%) reported never/rarely consuming alcohol during sex work, while 44% sometimes, and 28% always/almost always consumed alcohol during sex work. Adjusting for marital status, age, and frequency of sex work in the past 30 days, heavy alcohol consumption was associated with twice the odds of experiencing GBV in the past 6 months (aOR= 2.0; p< 0.05). Additionally, FSWs who always/almost always consumed alcohol during sex work were 2.6 times more likely to have experienced GBV in the past 6 months compared to FSWs who rarely/never drink alcohol during work (aOR=2.6; p< 0.001).
**Conclusions:** Our findings demonstrate that heavy alcohol consumption in general and during sex work are significantly associated with recent experience of GBV. These findings indicate the need to incorporate alcohol harm reduction approaches into HIV interventions for FSW in Tanzania to prevent future violence, and ultimately reduce HIV risk.

## THPED369

### Understanding factors associated with HIV infection amongst female sex workers in Soweto: a proof of concept study

J. Coetzee[1], R. Jewkes[2], G. Gray[3], SSWP Study Group
*[1]Perinatal HIV Research Unit (PHRU), Key Populations, Sandton, South Africa, [2]Medical Research Council of South Africa, Pretoria, South Africa, [3]Medical Research Council of South Africa, Cape Town, South Africa*
*Presenting author email: coetzeej@phru.co.za*

**Background:** Globally, sex workers (SWs) bear a disproportionate HIV burden. Despite South Africa entering its 5th decade of the HIV epidemic, very little is understood about the determinants of HIV amongst female sex workers (FSWs).
This study aims to describe HIV infection, psychosocial and behavioural risk factors for HIV amongst FSWs in Soweto, South Africa as part of a proof of concept pilot study to evaluate a targeted peer led HIV prevention and treatment intervention.
**Methods:** The study used a cross sectional, respondent driven sampling (RDS) methodology amongst 40 FSWs. Participants completed a comprehensive survey and were tested for HIV, CD4 and viral load.
**Results:** Our findings show that the majority (83%) of the 64% of FSW, who were HIV infected, knew their status. Of those who knew their status 55% were on ARVS, and only 8/11 reporting adherence were virally suppressed. Just under a half of FSW (41%) reported a sexual assault in the preceding 12 months. Depression(84%)

Author Index

and post traumatic stress disorder (56%) were frequently reported mental health issues. Condom use was low, with 21% stating that they consistently used condoms with clients.
**Conclusions:** Our study demonstrated the urgent need for innovative interventions to combat the unacceptable high rates of HIV , violence exposure and mental health issues in FSW. The lack of HIV viral suppression despite treatment points to the need for tailored adherence support to minimise resistance and onward transmission. There was support by FSW for peer led interventions. Our work demonstrates the need to design targetted interventions that address the specific needs of this vulnerable population.

### QUALITATIVE STUDY OF COPING STRATEGIES USED BY HIV-POSITIVE KENYAN FEMALE SEX WORKERS EXPERIENCING INTIMATE PARTNER VIOLENCE

G.H. Wanje[1], K. Wilson[2], L. Adala[1], W. Jaoko[3], R.S. McClelland[1,4], J. Simoni[5]
*[1]University of Nairobi, Institute of Tropical and Infectious Diseases, Nairobi, Kenya, [2]University of Washington, Department of Global Health, Seattle, United States, [3]University of Nairobi, Department of Medical Microbiology, Nairobi, Kenya, [4]University of Washington, Departments of Medicine, Epidemiology, and Global Health, Seattle, United States, [5]University of Washington, Department of Psychology, Seattle, United States*
*Presenting author email: gwanje@uw.edu*

**Background:** Intimate partner violence (IPV) is an important health and human-rights problem for HIV-positive women, and may compromise their ability to reduce the risk of secondary HIV transmission. We aimed to understand coping strategies used by HIV-positive Kenyan female sex workers (FSWs) who experience IPV.
**Methods:** Between November 2013 and August 2014, we purposefully selected HIV-positive FSWs in Mombasa, Kenya. Participants reported having experienced IPV from a current or most recent regular emotional partner who was not a casual partner or a client. We conducted 11 two-part interviews including an initial intensive interview and a brief follow-up interview, and 2 focus-group discussions. Data were coded and analyzed using content analysis. We employed the ecological framework of violence against women to understand women's adaptive strategies to cope with IPV. Results were presented to a modified member check, which included FSWs who had not participated in the interviews or focus-groups.
**Results:** Despite experiencing recurrent IPV, all women intended to stay with their abusive emotional partner. They employed a range of strategies to cope with IPV. Consistent with the ecological framework, avoidance was a common theme on the personal level. Women avoided thinking of the violence, focusing instead on their children and work. Some resorted to alcohol use or suicide attempts. At the interpersonal level, acceptance, resistance, and minimization of violence emerged as key strategies for coping with violent emotional partners. Most women normalize their partners' violent behaviors. To avoid recurrent IPV, some women reported agreeing to unprotected sex. Others reported no problem negotiating condom use with their emotional partner. At the family/community level, about half of the women reported seeking help for IPV, typically from a sibling, friend, or church member. Most women avoided reporting IPV to the police, because they felt that police were ineffective or untrustworthy.
**Conclusions:** These HIV-positive Kenyan FSWs have developed coping strategies for IPV. Some, such as alcohol use and unprotected sex, may have negative consequences for women's health, and may pose a risk for secondary HIV transmission.

## THPED371

### COUNTY KEY POPULATIONS SUPPORT SYSTEMS AS MEANS TO REDUCE VIOLENCE AND VULNERABILITY TO HIV INFECTION AMONG SEX WORKERS: A CASE STUDY OF NAKURU COUNTY, KENYA

J.M. Wambua[1], J. Anthony[2], B. Ogwang[1], S. Kaosa[1], H. Musyoki[3], G. Ngángá[4]
*[1]Partner for Health and Development in Africa, Technical Support Unit, Nairobi, Kenya, [2]University of Manitoba, Technical Support Unit, Nairobi, Kenya, [3]National AIDS and STIs Control Program, Nairobi, Kenya, [4]Hope World Wide Kenya, Nairobi, Kenya*
*Presenting author email: jtanuh@yahoo.com*

**Background:** Violence cases in Nakuru County among female Sex Workers (FSWs) are of great concern. The 2014 Polling Booth Survey conducted by NASCOP revealed that 11% of FSWs reported to have been ever beaten or physically forced to have sex in 2014 and this later rose to 15% in 2015 (NASCOP 2015). In the same survey, FSWs that had been beaten or arrested by the law enforcers rose from 44% (2014) to 61% (2015). Between October 2015 and January 2016 six cases of FSW deaths perpetrated by their male clients was also reported.
Violence has direct and indirect impact on increasing FSWs vulnerability to HIV infection and therefore the role of County Key Population (KP) support system in reducing violence and vulnerability of FSWs to HIV becomes important.
**Description:** In order to launch a response and mitigate violence faced by FSWs, a County Health Management Team (CHMT) was established under the leadership of County health staff. Different stakeholders that included FSWs representatives, HIV program implementing partners, police, lawyers and higher county leadership were made members of CHMT. This CHMT also acted as a county Technical Working Group (TWG) to provide program directions and creating an environment that helped reduce violence against FSWs.Through the TWG, several sensitization's for police, KP, bar and lodge owners and Civil Society Organizations were conducted.
**Lessons learned:** Violence cases reported by KP programs were at 44 inMarch-2014and this dropped to 13 by September 2015. Number of incidents of violence reported and addressed during the same periods increased from 55% to 71%. The County TWG managed to conduct five sensitization forums for different stakeholders who included; KPs, Law enforcers, Bar and Lodges managers and civil society organizations. The KPs also formed a Whats App group as a platform for reporting cases of violence and getting swift response and support from the Members.
**Conclusions/Next steps:** By involving all key stakeholders in the County, a more responsive support system to manage violence faced by KPs was put in place. The platform has been used for experience, knowledge sharing and empowering sex workers to advocate for their rights.

## THPED372

### RISK FACTORS ASSOCIATED WITH VIOLENCE TOWARDS SEX WORKERS IN BOTSWANA, NAMIBIA, SOUTH AFRICA AND ZIMBABWE

S. Hendriks[1,2], I. Nagel[2], Hands Off! programme team, VU University, African Sex Workers Alliance (trough members)
*[1]AIDS Fonds, Sex Work Programme, Amsterdam, Netherlands, [2]VU University, Sociology, Amsterdam, Netherlands*
*Presenting author email: shendriks@aidsfonds.nl*

**Background:** Violence is one of the most important factors affecting the vulnerability of sex workers to HIV/AIDS. Violence stops sex workers accessing necessary information, support and services that help to protect them from HIV/AIDS. It also puts them in situations that make them more vulnerable to HIV/AIDS. Modelling estimates show that a reduction of almost 25% in HIV infections among sex workers may be achieved when physical or sexual violence is reduced. Psychical and sexual violence increase HIV infection and decrease condom use. This study looks at the risk factors associated with violence against sex workers.
**Methods:** Trough a participatory mixed methods design 2086 sex workers were reached in Botswana, Namibia, South Africa and Zimbabwe (Survey, N=1762, in-depth interviews/life stories, N=171, and FGDs, N=153). The standardized survey was established with sex worker- led groups and distributed through peers. The survey focussed on violence, perpetrators, social capital, health determinants and risk and mitigation factors.
**Results:** Overall violence experienced was high (Physical Violence 79%, Economic violence 72%, Sexual violence 77%, Emotional Violence, 89%). Logistic regression analysis showed that street-based sex workers and sex workers that work through internet are more at risk for violence then their venue-based peers (P< .001), as are sex worker that disclose their profession (P< .01 ), that are being arrested (P< .001) and use drugs and alcohol during work (P< .01). (In)consistent condom use and being HIV positive , showed mixed results in the different countries. In most countries being HIV positive increased the risk of violence.
**Conclusions:** Criminalizing laws and policies make sex workers more vulnerable for HIV and violence, trough arrest, stigma & discrimination and incomprehensive support packages. Condom distribution is an essential part of HIV prevention for sex workers. But without inclusion of training on safe negations skills, violence can be provoked and therefore increase the risk of HIV infection.

## THPED373

### MEDIA ADVOCATE ON TRANSGENDER SEX WORKERS IN CHINA THROUGH DOCUMENTARY AND PHOTO EXHIBITION

T. Ma
*Consultation Center of AIDS Aid and Health Service, Shenyang, China*
*Presenting author email: sytom160@gmail.com*

**Background:** Transgender sex workers are originally outputted from Shenyang, a northeastern city in China during the past 25 years to southern part of China. Due to the severe social discrimination from mainstream media and the social public, these transgender women sex workers had to migrate to distant cities or even countries,

say, Thailand, Singapore and Malaysia to make a fortune. In order to increase their social visibility and acceptance, it is crucial to document this specific population and generate non-discrimination publications to the society.
**Methods:** With regard to increasing the visibility of transgender sex workers, we have spent 3 and a half years to shoot documentaries and take photos to document this specific population in China. During the past 3 years, we have organized 11 times of photo exhibitions and 8 times of documentary screening in different cities of China, such as Beijing, Shenyang, Guangzhou, Hong Kong and Bangkok. There were two ways of collecting photo and video materials:
1) we recruited a transgender photographer to live with these transgender people and document their daily scenes;
2) we organized a series of media empowerment trainings to enable them to document their own life.
**Results:** By far we have composed two individual documentaries and more than 2,000 well-polished photos. Through organizing photo exhibitions and documentary screening, we have propagate the key results directly to some 1,200 people from the society. With the help of our propagation, we have help establish more than 12 local non-government organizations and student unions that serve transgender people as well as people living with HIV. Another positive impact is that through organizing photo exhibitions and documentaries screening, we successfully attracted the attention of mainstream media. So far, our events have been reported by more than 20 different mainstream media companies.
**Conclusions:** Although in China the visibility and social acceptance to transgender people and sex workers has been improved in many first-tier cities, it is still unsatisfying, for in a lot of second-tier cities transgender sex workers are still stigmatized and discriminated. Media advocate as well as policy-based advocate should be more combined to make the situation much better.

## THPED374

### DISCLOSURE OF VIOLENCE AMONG FEMALE SEX WORKERS IN INDIA: EVIDENCE FROM AVAHAN PHASE-III EVALUATION

B. Madhusudana, S. Kishor Patel, A. Rajatshuvra
*Population Council, HIV/AIDS, New Delhi, India*

**Background:** Disclosure of violence is one of the key indicators in violence prevention and reduction programmes among high risk group population, especially among female sex workers (FSWs) in India. Physical and sexual violence experienced by FSWs, perpetrators of violence, disclosure and non-disclosure of violence, association with membership in Community Organizations (COs) are examined in this study.
**Methods:** Data were drawn from Avahan phase-III baseline evaluation survey conducted among 4098 FSWs across five states in India in 2015. The data were collected on experience of physical and sexual violence, STI symptoms, condom use, social protection, financial security. The analytical samples include FSWs who experienced either physical or sexual violence in past six months. Descriptive statistics, frequency, bivariate and multivariate logistic regression techniques were used for analysis.
**Results:** About 10% of FSWs experienced either physical or sexual violence. The major perpetrators of violence are intimate partners (45%), stranger/client (31%) police (6%), and others (18%). Among the FSWs who experienced violence, 48% disclosed about the last incident to the community organization while 52% did not disclose. Reporting last incident of violence perpetrated by strangers/clients were 1.8 times more likely higher than the violence perpetrated by intimate partners (55 % vs. 41 %, AOR: 1.882, 95% CI: 1.186- 2.620. FSWs not registered in CO were less to report last incident of violence to CO (9353 vs 25%, AOR 0.251, 95%CI, 0.127-0.496). Similarly FSWs who were not involved in collective action in past six months were less likely to report the last incident to CO (54% vs. 40%, AOR 0.592, 95% CI: 0.388-0.904).
**Conclusions:** Not disclosing experience of violence by FSWs is quite high which could be a major barrier in addressing of violence reduction. Immediate efforts are required to understand the reasons for non-disclosure based on which interventions can be developed. Community collectivisation, strengthening of community based organizations and designing gender-based interventions with the involvement of intimate partners should be prioritised in the prevention programs.

## THPED375

### ANTICIPATED AND EXPERIENCED VIOLENCE AMONG MALE AND FEMALE SEX WORKERS IN KENYA AND THEIR RELATIONSHIP TO UTILIZATION OF GENERAL AND HIV-SPECIFIC HEALTH SERVICES

L. Nyblade[1], D.K. Mbote[2], C. Barker[3], M. Stockton[1], D. Mwai[2], T. Oneko[2], A. Dutta[3], J. Kimani[4], J. Morla[1], H. Musyoki[5], S. Njugana[6], M. Sirengo[5], C. Kemunto[7], J. Mathenge[8], P. Mwangi[9], T.O. Abol[10]
*[1]RTI International, Global Health, Washington, United States, [2]The Palladium Group, Nairobi, Kenya, [3]The Palladium Group, Washington, United States, [4]University of Nairobi, Nairobi, Kenya, [5]National AIDS and STI Control Programme (NASCOP), Nairobi, Kenya, [6]KEMRI, Nairobi, Kenya, [7]Survivors, Kisumu, Kenya, [8]Health Options for Young Men on HIV, AIDS and STIs (HOYMAS), Nairobi, Kenya, [9]The Bar Hostess Empowerment and Support Programme, Nairobi, Kenya, [10]Keeping Alive Societies Hope, Kisumu, Kenya*
*Presenting author email: lnyblade@rti.org*

**Background:** High levels of violence faced by sex workers is a human rights issue in urgent need of response. Data on the levels and sources of this violence, and its effect on health, is needed for advocacy and targeted intervention. As part of a study on stigma with male (MSW) and female sex workers (FSW) in Kenya, the USAID-and-PEPFAR-funded Health Policy Project, four civil society organizations, National-AIDS-Control-Programme (NASCOP), Kenya-Medical-Research-Institute (KEMRI) and the University of Nairobi collected data on violence and its relationship to utilization of health services in four sites in 2015.
**Methods:** Quantitative cross-sectional survey using a modified RDS process resulted in a snowball sample of FSW (497) and MSW (232). Key measures included: anticipated and experienced physical and sexual violence; avoidance or delay in seeking needed health service; type of service avoided/delayed. Multivariate analysis examined the relationship between physical or sexual violence in the past 12 months and delay/avoidance/delay of general or HIV-specific health services, controlling for key background variables, including self-reported HIV status.
**Results:** MSW and FSW reported high rates of violence (table 1), and anticipation or experience of violence led to higher odds of avoiding or delaying general and HIV-specific health services (table 2). For example, MSW who experienced sexual violence were significantly more likely to avoid/delay HIV services than MSW who had not (OR: 3.1, p=0.01). FSW who anticipated sexual violence were 2.5 times (p=0.00) more likely to report avoiding HIV services.

| Table 1:Source or Type of Violence | Anticipated (FSW, n=497) | Experience (FSW, n=497) | Anticipated (MSW, n=232) | Experienced (MSW, n=232) |
|---|---|---|---|---|
| Family | 48% | 31% | 56% | 12% |
| Community | 39% | 41% | 54% | 21% |
| Police | 55% | 45% | 53% | 22% |
| Physical Violence | 67% | 63% | 74% | 33% |
| Sexual Violence | 62% | 49% | 57% | 26% |

*[Table 1]*

| Table 2 | Avoided or delayed HIV services Odds Ratio (P-value) | | Delayed all health services Odds Ratio (P-value) | | Avoided all health services Odds Ratio (P-value) | |
|---|---|---|---|---|---|---|
| | FSWs | MSWs | FSWs | MSWs | FSWs | MSWs |
| Anticipated physical violence | 1.46 (.22) | 2.23 (.07) | 1.93 (.01) | 2.19 (.08) | 2.06 (.00) | 2.00 (.09) |
| Anticipated sexual violence (rape) | 2.49 (.00) | 2.38 (.02) | 1.56 (.06) | 1.05 (.91) | 2.14 (.00) | 2.60 (.01) |
| Experienced physical violence | 1.86 (.04) | 2.11 (.05) | 1.68 (.02) | 1.15 (.75) | 1.33 (.21) | 1.73 (.13) |
| Experienced sexual violence (rape) | 1.39 (.20) | 3.1 (.01) | 1.51 (.05) | 1.14 (.78) | 1.56 (.03) | 1.09 (.82) |

*[Table 2]*

**Conclusions:** Anticipated and experienced violence are prevalent and negatively associated with general and HIV-specific healthcare seeking. Programming and policies to prevent and mitigate violence towards sex workers should also aim to improve links and access to essential health services; improving the wellbeing of sex workers, as well as the communities they live and work in.

### DOCUMENT HUMAN RIGHTS VIOLATION AMONG TRANSGENDER SEX WORKERS AND ADVOCATE FOR EQUAL HUMAN RIGHTS BY SCREENING DOCUMENTARIES IN DIFFERENT COUNTRIES

Y. Liu[1,2]
*[1]Youth Voices Count, Bangkok, Thailand, [2]Consultation Center of AIDS Aid and Health Service, Shenyang, China*
*Presenting author email: michael0228jy@gmail.com*

**Background:** In China there are hundreds of transgender s sex workers living in Shenyang, Shanghai, Guangzhou, and Beijing. Due to the severe discrimination towards this population, transgender women find it extremely difficult to apply for a regular job in the society. In our previous research carried out in 2014, 94 percent of those transgender women are now working as sex workers, which serves as a crucial factor for aggravated discrimination by the public. The discrimination and ignorance from the society and legislation leads more human rights violation cases among transgender sex workers.
**Description:** In the past two years, we have interviewed and documented more than 60 transgender sex workers from different parts of China. So far we have composed 2 different short documentaries, which reveal the real life of transgender sex workers in China. In order to protect the privacy of this vulnerable population, we have not uploaded these documentaries onto mainstream media. Instead we screened the documentaries in different workshops, trainings and college classes. In 2015, one of the documentaries named *Magic* was selected to screen by Sex Worker Film & Arts Festival in San Francisco, Boston LGBT Film Festival, and Bangalore Queer Film Festival in India.
**Lessons learned:** After the documentaries been screened in 8 different universities and more than 20 times screening in different film festivals and workshops worldwide, we have found out that most of the audience were shocked by the human rights violation cases on transgender sex workers, such as the violation from local policemen, clients and other sex workers. Also, the higher HIV infection rate (about 40%) aroused public attention, too. The third focus was on the use of crystal meth among transgender sex workers.
**Conclusions/Next steps:** The human rights violation among transgender sex workers could not be ignored, since this is the key factor that affects their vocational discrimination and medical discrimination as a consequence. In the near future, we are going to hire a number of lawyers to pursue several judicial proceedings to achieve legal transform, and these documentaries would serve as evidences to increase the possibility.

## THPED377

### PROVISION OF INTEGRATED SEXUAL AND REPRODUCTIVE HEALTH AND HIV PREVENTION SERVICES FOR FEMALE SEX WORKERS

Z. Phiri[1], M. Silukena[2]
*[1]Young Happy Health and Safe, Chipata, Zambia, [2]Southern African AIDS Trust (SAT), Lusaka, Zambia*
*Presenting author email: zikphiri@gmail.com*

**Background:** Sex workers in Zambia report that they are frequently exposed to HIV and STIs, and have multiple risks for infection, including multiple sexual partners, and barriers to the negotiation of consistent condom use. Sex workers are often in no position to control these risk factors in Zambia, because of the legal, political and social environment, and the context they live and work in - making them vulnerable to HIV and other STIs. Young Happy Healthy and Safe (YHHS) has increased the provision and uptake of integrated health services for sex workers aged 18-24, increased their access to SRH services and HIV prevention and thus improved their health and that of the wider population. An average of 120 sex workers access information and health services monthly.
**Methods:** To increase access to non discriminatory HIV and sexual and reproductive health and rights services to sex workers, YHHS worked with stakeholders from the health sector, police, Human Rights and NGOs. Through partner support, YHHS provided effective interventions for the prevention and referral of HIV, cervical cancer and STIs among sex workers and their clients. Through partnerships, a non discriminatory friendly environment for easy access to integrated health services by sex workers was created. The project also worked with the taskforce which included all the key partners such as the Zambia police for gender based violence.
**Results:** From January 2015 to December 2015: 198 sex workers accessed HIV counseling and testing, 115,000 male and female condoms were distributed, 56 sex workers accessed Maternal and child health services and a total of 425 were reached with SRHR , HIV prevention messages and 17 reported gender based violence to the police.
**Conclusions:** Working with different stakeholders using a project taskforce, peer educators, and access to information hubs, health services were made available, accessible, and acceptable without stigma and discrimination. As part of future project scale-up and planning, the feedback documented from monitoring and evaluation informed YHHS the changes that occurred before and after intervention such as increased female sex worker access to services.

## SOCIAL NETWORKS AND ASSOCIATIONS OF SEX WORKERS

## THPED378

### PERFORMING *PUTA* POLITICS AND ITS ROLE IN THE RESPONSE TO AIDS IN BRAZIL

L. Murray[1], M.B. Mello dos Santos[2]
*[1]Institute of Social Medicine / State University of Rio de Janeiro, Department of Health Policy, Planning and Administration, Rio de Janeiro, Brazil, [2]Associação Mulheres Guerreiras (Association of Warrior Women), Campinas, Brazil*
*Presenting author email: laurinhamurray@gmail.com*

**Background:** The sex worker movement in Brazil has been a reference on the international landscape for its protagonist role in constructing a rights-based response to AIDS. This ethnographic and historical research documents their activism and how they navigated political setbacks and broad shifts in the country's approach to HIV.
**Methods:** Research was conducted over a 36-month period from November 2011 through October 2014 and included archival research, participant observation with sex worker rights organizations, oral histories with 21 sex worker rights activists and 44 interviews with AIDS activists and government health, rights and security administrators in three Brazilian cities.
**Results:** Facing institutional and political challenges, sex worker activists used cultural forms to draw attention to injustices, challenge gender and sexuality norms and reduce the stigma that continues to surround prostitution by making visible that which is commonly seen as immoral and/or transgressive. For example, a social media protest campaign declared happiness with their profession after a similar HIV prevention campaign was censored by the Ministry of Health and a *Daspu* fashion show and soccer game demanded the right to work in response to violent World Cup police crackdowns. Archival research uncovered the historical roots of this form of politics that purposefully breaks with protocol and refuses victimization. Gabriela Leite's statement in a 1989 article about the first national meeting on AIDS and prostitution is illustrative: "I felt that people were distant from everything and that the doctors were, of course, involved in a debate with themselves. So the next morning, I came back in a low cut black dress, high heels, exaggerated make-up and I talked about my life".
**Conclusions:** The concept of *puta politics* is proposed to refer to this form activism that breaks down hierarchies and barriers between institutional structures and the street by strategically drawing on the flexibility and multiplicity inherent in the *puta* [whore] subjectivity to advance the goals of the sex worker movement. By confronting stigma as the primary driver of the AIDS epidemic among sex workers, the performance of *puta politics* advances a human-rights-affirming approach to the epidemic that places sex workers at the forefront.

## THPED379

### SEX WORKERS OUTREACH PROJECT INC.: MULTICULTURAL PROJECT

N.M. Cheung[1], C. Cox[2]
*[1]Sex Workers Outreach Project Inc, Multicultural Project, Sydney, Australia, [2]Sex Workers Outreach Project Inc, CEO, Sydney, Australia*
*Presenting author email: namonc@swop.org.au*

**Background:** As a migrant sex worker in Australia I have experience working in a variety of legal regulation systems in different countries and have been a migrant sex worker peer educator at SWOP NSW for five years. the government and media use the idea of "sex slavery" to create moral panic and makes efforts to address the labor exploitation of migrant sex workers and legal pathways for sex work and migration more difficult. Furthermore, it creates stigma and barriers for migrant sex workers to access HIV/AID prevention, medical services and support.
**Description:** The Sex Workers Outreach Project, NSW (SWOP) is Australia's longest established community based peer education sex worker organisation focused on HIV, STI and Hepatitis C prevention and health promotion for sex workers. Many of our service users are from culturally and Linguistically Diverse (CALD) communities. The SWOP Multicultural Project is staffed by Chinese, Thai and Korean speaking sex workers who provide non-judgmental and culturally specific support needed for truly peer to peer services. Peer translated resources, peer interpreting support, workplace outreach, and sex industry specific health and safety training workshops are provided in workers' first languages. We assist migrant sex workers to access non-discriminatory medical services and HIV/AIDS related social support. Advocating for

decriminalisation is also a key in our work to decrease stigma and discrimination.
**Lessons learned:** Political factors and Media create the use of force, fraud or coercion to transport an unwilling victim into sexual exploitation image of migrant sex workers that provoked real public anxiety and moral panic . The project have empower migrant workers to positive image and provide services to worker become determinate and autonomy towards their own sexual health and occupation.
**Conclusions/Next steps:** Culturally and linguistically diverse peer educators are most effective in providing peer support to migrant sex workers. It is essential for migrant sex workers to feel safe and not judged for them to engage with services. Through providing translated resources and workplace health and safety training workshop in workers first language the Multicultural Project at SWOP has successfully increased migrant sex workers access to HIV prevention education and support.

## Specific practices, impacts and responses for distinct substances and modes of administration (including alcohol use, injecting drug use and non-injecting drug use)

### THPED380

#### Impacts and responses for substance use among Canadian women living with HIV: a latent class analysis

A. Carter[1,2], E. Ding[1], E. Roth[3], M.-J. Milloy[1,4], M. Kestler[4], S. Jabbari[1], K. Webster[2], M. Desbiens[5], D. Dubuc[6], R.S. Hogg[1,2], A. de Pokomandy[6], M.R. Loutfy[5], A. Kaida[2], CHIWOS Research Team
*[1]BC Centre for Excellence in HIV/AIDS, Vancouver, Canada, [2]Simon Fraser University, Burnaby, Canada, [3]University of Victoria, Victoria, Canada, [4]University of British Columbia, Division of AIDS, Department of Medicine, Vancouver, Canada, [5]Women's College Research Institute, Toronto, Canada, [6]McGill University Health Centre, Montreal, Canada*
*Presenting author email: allison_carter@sfu.ca*

**Background:** Substance use can increase the risk of multiple negative health effects for women living with HIV (WLWH), in particular jeopardizing adherence to antiretroviral therapy (ART) and lowering the likelihood of optimal treatment outcomes. We analyzed substance use patterns among a national cohort of WLWH in Canada to determine associations between substance use, social determinants of health, and ART adherence.
**Methods:** Latent class analysis was used to model patterns of substance use among WLWH in the Canadian HIV Women's Sexual and Reproductive Health Cohort Study (CHIWOS), a multi-site community-based research study. Seven indicators were included: alcohol, tobacco, cannabis, recreational drugs (Cocaine/Ecstasy/MDMA/Acid/Mushrooms), misused prescription drugs (Benzodiazepines/Diluadid/Oxycotin/Oxycodone/Talwin and Ritalin/T3s and T4s), stimulants (Mathamphetamine/Crack/Speed), and opiates (Heroin/Speedballs/Morphine/Methadone). Fit statistics indicated best class solution. Multinomial logistic regression with class membership as the dependent variable identified independent covariates.
**Results:** Of 1,363 WLWH: median age was 43 (IQR: 35-50); 41% identified as Caucasian, 30% African, Caribbean, or Black-Canadian, and 22% Indigenous; 87% were heterosexual, and 6% were currently engaged in sex work. Among those on ART, 73.4% reported ≥95% adherence. We uncovered 6 latent classes of substance users: Abstainers (26.3%); Tobacco Users (8.8%); Alcohol Users (31.9%); Tobacco, Alcohol, and Cannabis Users (13.9%); Users of Non-Illicit and *Some* Illicit Drugs (recreational, stimulants) (9.8%); Users of Non-Illicit and *All* Illicit Drugs (9.3%). Bivariable analyses revealed increasing proportions of Indigenous women and sexual minorities, and decreasing incomes, resiliency scores and adherence with each subsequent class. Results were mirrored in multivariable analyses. Women identifying as Indigenous v. Caucasian (AOR: 1.71 (95% CI: 0.88, 3.32)) and LGBTQ v. heterosexual (2.24 (1.09, 4.6)), and those with resiliency scores < median (2.41 (1.37, 4.22)), incomes < $20,000 (3.6 (1.78, 7.28)), and **adherence < 95% (2.41 (1.37, 4.22))** were more likely to be 'Users of Non-Illicit and *All* Illicit Drugs' than Abstainers.
**Conclusions:** There is considerable heterogeneity in substance use patterns among WLWH in Canada. Latent classes with increasing types of substances used were associated with lower ART adherence and increased societal marginalization. Addressing substance use and improving ART adherence requires responses that meaningfully involve WLWH in transforming the socio-structural barriers that threaten their health.

### THPED381

#### Rewired: treatment and peer support for men who have sex with men who use methamphetamine

K. Burgess[1], R. Keane[2], M. Stoovè[3,4], J. Wiggins[1], S. Ruth[1,5]
*[1]Victorian AIDS Council, Services, South Yarra, Australia, [2]Living Positive Victoria, Board of Directors, Melbourne, Australia, [3]Burnet Institute, Centre for Population Health, Melbourne, Australia, [4]Monash University, School of Population Health and Preventive Medicine, Melbourne, Australia, [5]Australian Federation of AIDS Organisations, Board, Sydney, Australia*
*Presenting author email: kent.burgess@vac.org.au*

**Background:** Methamphetamine use is a significant contributor to HIV transmission risk in men who have sex with men (MSM). Approximately 11% of the MSM in Australia use methamphetamine, with use even higher (up to 35%) among MSM living with HIV (LHIV). This compares to 2% of the general population.
*Rewired* is a model developed to reduce harm associated with methamphetamine use in MSM, inclusive of MSM LHIV. This specialist program combines an evidence-based, harm reduction treatment group with a peer support group led by MSM LHIV. The model adapts best practice substance use interventions, and tailors these for MSM using methamphetamine.
*Rewired* assists MSM to manage, reduce or cease methamphetamine use and reduce, drug-related and sexual risk. *Rewired* overtly addresses the interplay between methamphetamine use, sex and HIV.
**Description:** The centre-piece of *Rewired* is a free, six-week group treatment program for MSM that equips MSM with skills and strategies to better manage their methamphetamine use and general health and wellbeing. The group focuses on topics including relapse prevention, methamphetamine and the brain, sleep and nutrition, HIV, sex,pleasure, mental health, and mindfulness. Participants are also provided the opportunity to join a post-treatment program peer support group run by MSM LHIV trained and under clinical supervision.
**Lessons learned:** *Rewired* evaluation demonstrated treatment group efficacy, with significant reductions in methamphetamine use and psychological distress and increases in personal wellbeing measured through validated pre- to post-program psychometric scales; these positive outcomes were maintained at 3,6 or 12 months post treatment. Qualitative data also revealed the importance of peer support and a specialist program for this population. It was demonstrated that the integration in treatment of MSM regardless of HIV status provided an effective intervention model.
**Conclusions/Next steps:** The *Rewired* program for MSM who use methamphetamine demonstrates the potential for a specialist approach to reduce harm and HIV transmission risk in this vulnerable population and would be readily translatable to similar developed-country settings.

### THPED382

#### On point: recommendations for prison-based needle and syringe programs in Canada

E. van der Meulen[1], S. Claivaz-Loranger[2], S. Clarke[3], A. Ollner[3], T.M. Watson[4], S.K.H. Chu[2], R. Elliott[2], C. Kazatchkine[2]
*[1]Ryerson University, Criminology, Toronto, Canada, [2]Canadian HIV/AIDS Legal Network, Toronto, Canada, [3]PASAN, Toronto, Canada, [4]University of Toronto, Toronto, Canada*
*Presenting author email: ckazatchkine@aidslaw.ca*

**Background:** Canada's prison population is comprised of a disproportionate number of Indigenous and Black prisoners, as well as individuals from low-income backgrounds with little formal education who use drugs and have mental health care needs. Against this backdrop, rates of HIV and HCV are respectively 10 and 30 times higher in prison than in the general population, and even higher among women and Indigenous prisoners. Although the HIV and HCV epidemics behind bars are principally fueled by the sharing of drug injection equipment, prison-based needle and syringe programs (PNSPs) are prohibited.
**Description:** To support PNSP implementation, a research study was conceptualized to determine a "best practice" framework for PNSPs in Canadian prisons. The study consisted of: (1) a stakeholder meeting that brought together former prisoners, researchers, health care providers and representatives from HIV, Indigenous, women's health, harm reduction, and prisoners' rights organizations; (2) travel to observe PNSPs at three prisons in Switzerland employing different modalities of distribution; and (3) a data collection phase involving consultation with 30 former prisoners (9 women and 21 men) and 10 community and medical professionals from across the country.
**Lessons learned:** Research participants shared a high level of support for PNSPs and agreed about potential health benefits, including PNSP capacity to reduce HIV and HCV transmission behind bars. The study led to six recommendations for the effective establishment of PNSPs in Canada, emphasizing the importance of: program ac-

cess and confidentiality; education regarding safer drug injection; a hybrid approach to injection equipment distribution; consultation with relevant stakeholders; the active role of prisoners in determining how PNSPs work; and the need to address drug use as a social and health issue.
**Conclusions/Next steps:** The report has been shared with relevant government entities, including the Ministers of Public Safety, Health and Justice. It will also be employed as a resource to complement other initiatives for PNSP implementation, including an ongoing lawsuit to compel the Canadian government to introduce PNSPs in federal prisons.

## Interplay between drug use and sexual transmission

### THPED383

### Methamphetamine use increases the likelihood of condomless anal sex (CAI) among Vietnamese men who have sex with men (MSM) who have low sexual sensation-seeking scores

N.T.T. Vu[1,2], M. Holt[2], H.T. Phan[3], L.T. La[4], G.M. Tran[5], T.T. Doan[5], N.N.T. Nguyen[6], J. de Wit[2]
*[1]Hanoi Medical University, Institute of Preventive Medicine and Public Health, Ha Noi, Vietnam, [2]University of New South Wales Australia, Center for Social Research in Health, Sydney, Australia, [3]Vietnam Administration for HIV/AIDS Prevention and Control, Ha Noi, Vietnam, [4]Ha Noi Center of HIV/AIDS Prevention and Control, Ha Noi, Vietnam, [5]Center for Community Health Promotion, Ha Noi, Vietnam, [6]Center for Promotion of Quality of Life, Ho Chi Minh City, Vietnam*
*Presenting author email: nga.vuthithu@gmail.com*

**Background:** Methamphetamine use and CAI have been identified as HIV risky behaviors. However, evidence of an association of methamphetamine use with CAI among MSM has been found inconsistently. Particularly, evidence from middle and low income countries are lacking. The aim of this study was to describe HIV-related sexual behaviors among MSM in Vietnam and explore the relationship between sex-related methamphetamine use and CAI.
**Methods:** From September through December 2014, 622 MSM were recruited in Hanoi and Ho Chi Minh City, Vietnam. We collected information on demographic characteristics, sexual behaviors, use of amphetamine-type stimulants (ATS) and other recreational drugs, sexual sensation seeking, depressive mood, homosexuality-related stigma and belief in the efficacy of different HIV prevention strategies. We calculated descriptive statistics for demographic and sexual behaviors. We assessed the potential modification of the effect of sex-related methamphetamine use on CAI by sexual sensation seeking. The association of sex-related methamphetamine use with CAI was assessed by generalized linear modelling using modified Poisson regression and robust error variances.
**Results:** Majority of the 622 participants (74.0 %) exclusively had sex with other men. In the last three months, 75.7% reported any CAI, 23.2% reported engaging in sex work and 14.3% had used methamphetamine during sex. In the last twelve months, 21.1% reported group sex (of which 44.3% reported any CAI. Reporting any CAI was associated with living in Ho Chi Minh City vs. Hanoi, being versatile during anal sex, a greater degree of sexual sensation-seeking, and more strongly agreeing that withdrawal before ejaculation is effective in preventing HIV. Effect-modification analysis showed that sex-related methamphetamine use was related to higher probabilities of engaging in CAI among men who had low sexual sensation seeking scores of 2.6 or lower but not for men with higher scores.
**Conclusions:** We found a high rate of CAI reported by MSM participants. The effect of sex-related methamphetamine use on CAI was modified by levels of sexual sensation seeking, suggesting that methamphetamine use may facilitate men who otherwise do not seek riskier sex to engage in CAI. HIV and harm reduction interventions should consider targeting MSM who use methamphetamine for sex and sexually-adventurous men.

### THPED384

### Touchbase: online harm reduction for MSM PLHIV who use drugs

K. Burgess[1], R. Keane[2], M. Stoovè[3,4], J. Wiggins[1], S. Slavin[5], I. Combden[6], S. Ruth[1,7]
*[1]Victorian AIDS Council, Services, South Yarra, Australia, [2]Living Positive Victoria, Board of Directors, Melbourne, Australia, [3]Burnet Institute, Centre for Population Health, Melbourne, Australia, [4]Monash University, School of Population Health and Preventive Medicine, Melbourne, Australia, [5]Australian Federation of AIDS Organisations, Health Promotion, Sydney, Australia, [6]Australian Drug Foundation, Melbourne, Australia, [7]Australian Federation of AIDS Organisations, Board, Sydney, Australia*
*Presenting author email: kent.burgess@vac.org.au*

**Background:** Substance use in men who have sex with men (MSM) living with HIV (LHIV) contributes to poorer health outcomes, treatment adherence and onward transmission. In Australia, MSM LHIV experience rates of illicit drug use far greater than the general population, including a prevalence of methamphetamine use of up to 35%.
Despite these figures, there is a lack of culturally appropriate harm reduction resources targeting MSM living HIV.
*Touchbase*, the first of its type, is an online health promotion intervention that provides harm reduction for MSM LHIV who use drugs integrated within an alcohol and drug information resource for the broader gay, lesbian, transgender and intersex (LGBTI) community.
**Description:** This resource provides accurate, non judgemental information to users, family and peers of the most common drugs used by LGBTI Australians. Each substance included addresses issues and risks specifically for PLHIV, including maintaining treatment adherence, minimising drug interactions and reducing drug-related and sexual risk.
**Lessons learned:** Critical to the success of this digital intervention has been engagement of MSM LHIV in both the pre-implementation formative work and the post implementation evaluation to develop and maintain relevance. These experiences show:
· The language and visuals of online resources need to be accessible, accurate and tailored to the subculture;
· Information needs to be provided in engaging ways that are non judgemental and avoids authoritarian language;
· High appeal and useability among MSM LHIV;
· Harm reduction information specific to MSM LHIV can be successfully integrated within a broader harm reduction resource for LGBTI and within a platform that also addresses stigma and marginalisation of MSM LHIV.
**Conclusions/Next steps:** The development and evaluation of *Touchbase* provides a model for an accessible, culturally relevant, non stigmatising digital intervention to reduce harms associated with drug use for MSM PLHIV.
Digital platforms using accurate, culturally appropriate and engaging information have the potential to be an effective tool in HIV prevention and support for the issue of illicit drug use among MSM LHIV.

### THPED385

### Sexual risks of non-medical prescription opioid users in New York City

S.R. Friedman[1], P. Mateu-Gelabert[1], H. Guarino[1], L. Jessell[2], The Young Opioid Users Study Team
*[1]National Development and Research Institutes, Infectious Disease Research, New York, United States, [2]New York University, Silver School of Social Work, New York, United States*
*Presenting author email: friedman@ndri.org*

**Background:** Non-prescribed use of prescription opioids (POs) has become widespread in the USA and elsewhere. The southern Indiana HIV/HCV outbreak is one result. We address two relatively little-studied questions: The extent of sexual risk behavior by PO users and of their having sex in settings that might function as bridges to other populations.
**Methods:** 455 youth aged 18 - 29 who reported using POs non-medically and/or heroin in past 30 days were recruited using Respondent-Driven Sampling to recruit a diverse sample by reimbursing participants who recruited PO-user peers. Recruitment began with 20 seeds. Eligibility was assessed by self-report, visual PO (pill) identification quiz, urine drug screening, and, for those reporting recent drug injection, visual assessment for injection marks. Eligible participants completed a computer-assisted, interviewer-administered questionnaire including sociodemographics, drug use, and sexual behaviors.
**Results:** Participants were 33% female and 66% white non-Hispanic (i.e., not racially subordinated). Only 25% reported consistent condom use with opposite-sex partners. The table describes sex partnerships over last 90 days. Although only 7% of men and 6% of women reported having sex in a group setting in the last 90 days, this was not associated with their age at time of interview, and lifetime group sex

was common: among men, only 145 (48%) reported never having had group sex; 18% reported sex at one group sex event, 10% at two, and 5% at 10 - 300 group sex events. Among women, only 58 (43%) reported never having had group sex; 13% reported sex at one group sex event, 9% at two events, and 5% at 10 - 20 events.

| Sex partnerships in the last 90 days | # of partners of the given type in the last 90 days | | | |
|---|---|---|---|---|
| | 0 | 1 | 2 - 4 | 5+ |
| Total sex partners | 12% | 45% | 31% | 11% |
| Female sex partners (Male respondents only) | 4% | 47% | 34% | 15% |
| Male sex partners (Female respondents only) | 5% | 58% | 32% | 6% |
| Male sex partners (Male respondents) | 96% | 1% | 2% | 0% |
| Female sex partners (Female respondents) | 89% | 8% | 2% | 1% |
| Sex partners who inject drugs | 56% | 31% | 10% | 2% |
| Sex partners they had sex with in a group setting | 93% | 1% | 5% | 1% |

*[Table]*

**Conclusions:** PO users' unprotected sex multiple partners and group sex attendance puts them and others at high HIV risk. Interventions should be developed and evaluated to increase condom use and (depending on context) PREP use by PO users both in dyadic events and at group sex events.

## THPED386

### GENDER DIFFERENCES IN SEXUAL BEHAVIORS AND CONDOM USE WITH TEMPORARY PARTNERS AMONG AMPHETAMINE-TYPE STIMULANT USERS IN CHINA

Q. Zhao[1], Y. Mao[2], X. Li[2]
[1]*Nanjing University of Information Science and Technology, Nanjing, China,*
[2]*University of South Carolina, Columbia, United States*
*Presenting author email: zhaoqunnju@hotmail.com*

**Background:** Previous studies have suggested the significant association of amphetamine-type stimulant (ATS) use with HIV infection among various at-risk populations. The present study aimed to explore gender differences in sexual behavior and condom use with temporary partners among ATS users in China.
**Methods:** The cross-sectional data were collected from 901 ATS users (504 males vs 397 females) at two compulsory detoxification institutes in China in 2014, who were recruited and investigated using a self-administered questionnaire. We assessed the status of sexual behavior and condom use among the respondents. Bivariate comparison and multiple regression analysis were performed to assess the association of condom use with different dimensions of sexual behavior.
**Results:** Bivariate chi-square analyses indicated that males were less likely to use condom for sex with temporary partners ($\chi^2$=20.1, $p < 0.001$), or think other ATS users can get HIV/AIDS ($\chi^2$=11.5, $p < 0.001$), and more likely to have sex after taking drugs ($\chi^2$=170.4, $p < 0.001$), or have contracted STDs ($\chi^2$=44.1, $p < 0.001$). Multiple regression analysis indicated that age (β=-.03, p < 0.01 for males, β=-.07, p < 0.01 for females) and ATS use (β=-.17, p < 0.05 for males, β=-.31, p < 0.05 for females) were significantly negatively related to condom use regardless of gender. The male respondents who had contracted STDs (β=-.30, p < 0.05), or were from higher-income families (β=-.29, p < 0.05) were less likely to use condom for sex with temporary partners. The females respondents who tended to have sex after taking drugs (β=-.25, p < 0.05) were less likely to use condom, while those who had higher perceived level of STD knowledge (β=.47, p < 0.01) and who had higher-level perception of others' risk of getting HIV/AIDS (β=.47, p < 0.001) were more likely to use condom.
**Conclusions:** The findings indicate that ATS use is significantly associated with increasing frequency of engaging in unprotected sex, especially among female users. Therefore, interventions such as sexual health and HIV prevention education for ATS users should differentiate between males and females, especially among older population.

# SOCIAL NETWORKS AND ASSOCIATIONS OF DRUG USERS

## THPED387

### THE INFLUENCE OF SOCIAL NETWORK ON DRUG USE AND HIV RISK BEHAVIORS AMONG METH USERS IN THREE CITIES OF INDONESIA

I. Praptoraharjo[1], L. Nevendorff[2], H. Eksen[3], M. Busz[3]
[1]*AIDS Research Center Atma Jaya University, Jakarta Selatan, Indonesia,* [2]*AIDS Research Center, Jakarta Selatan, Indonesia,* [3]*Mainline, Amsterdam, Netherlands*
*Presenting author email: gambitevara@gmail.com*

**Background:** Crystal-meth use has become an emerging issue in Indonesia which covers about 1.2 million users across the archipelago. Research suggests that social networks have significant influence on drug use and also on HIV risk behaviors. This study aims to provide better knowledge on the mechanism by which social network influences on drug use and HIV risk behaviors among crystal-meth users in three big cities of Indonesia.
**Methods:** A qualitative research design was developed to produce a deeper understanding of the influence of social network of meth users on patterns of meth use and its implication to HIV risk. Thirty eight meth users in Jakarta, Medan and Makassar were interviewed using semi-structured interview guide. Analysis on social network's properties was performed to describe the mechanism by which social network' influence on drug use and HIV risk behaviors.
**Results:** Thirty eight informants named 116 friends as regular partners of using meth in the last 30 days. Most of them are their friends who live in the same neighborhood or work place, the others are sexual partners. Drug use initiation is mainly encouraged by their peers in the neighborhood or schools at early episode of life (< 15 years old of age). The network provides knowledge on the drug, the effect of the drug and the network of drug selling. In the later life, the social network's role is to provide significant help in borrowing money, pawning things, pooling money, or providing drugs. The temporary cessation or relapse in using meth is also influenced by the network. The network usually have a script in using meth in which seeking sexual pleasure is part of their use due to perception that meth is associated with sexual desire. Most informants report that they have multiple sexual partners and condom use are not common when they have sex.
**Conclusions:** The study finds that meth use is influenced by engagement in the social network which situated within experience of the informant across their lives. An HIV intervention focusing on sexual transmission should address this population, which is currently overlooked by the existing intervention.

# INTERSECTING STIGMAS AND MARGINALIZED IDENTITIES

## THPED388

### DESTABILISING HETEREONORMATIVITY, DESTIGMATISATION OF SEXUAL AND GENDER DIVERSITY IN AFRICA

L. van den Heever
*AIDS Accountability International, Cape Town, South Africa*

**Background:** Sexual orientation and gender identity remain one of the largest barriers to access to rights, including healthcare, in Africa today. In almost every country across the continent there is institutionalised stigma and discrimination against sexually and gender diverse people. Stigma and discrimination is a known driver which prevents people who are lesbian, gay, bisexual and transgender from accessing HIV information and prevention. As threats have intensified, LGBT activists have been calling on governments and NGOs to respond to this crisis.
**Description:** AIDS Accountability International initiated the Destabilising Heteronormativity project. The first of its kind on the African continent, a multi-country, multi-partnered project which tackles hetereonormativity, the underlying norms which drive stigma and discrimination towards sexually and gender diverse people. If people who are LGBT mostly suffer discrimination at the hands of a society which is driven by hetereonormativity then we have to tackle the norms underlying it. The uniqueness and strength of this project lies in its lens, where a multi-pronged approach is used with a diverse range of partners. Building regional partnerships have been key to the project. This regional collaboration allows for people to build a movement of allies together with sexually and gender diverse partners.
**Lessons learned:** To destabilise hetereonormativity and tackle stigma and discrimination we have to work at multi-levels which engages a diverse range of partners at local and regional level. This project has been a timely and much needed intervention at a time where stigma and discrimination has been intensifying across the continent. The hostile context towards LGBT people requires collective effort at addressing sexual and gender diversity. It requires addressing harmful norms and

attitudes which prevents sexually and gender diverse people from accessing their basic human rights. Allies are key in this intervention, particularly religious leaders, political leaders, researchers and health care workers.

**Conclusions/Next steps:** The first phase of the project is complete and in 2016 AAI is embarking on Phase 2. The importance of this project lies in the fact that it is African project run by Africans on sexual orientation and gender identity. This is also a knowledge producing project for Africans by Africans.

## THPED389

### HIV STIGMA AND GENDER INEQUITY AMONG CISGENDER AND TRANSGENDER WOMEN LIVING WITH HIV IN HYDERABAD, INDIA

S. Azhar
*University of Chicago, School of Social Service Administration, Chicago, United States*
*Presenting author email: svazhar@gmail.com*

**Background:** HIV stigma in India has been recognized as a barrier to early detection of HIV, disclosure of HIV status to partners, and accessing healthcare services. The goal of this study was to explore how stigma differentially affects cisgender women and *hijras/*transgender women living with HIV in Hyderabad, India, particularly in terms of experiencing depression and utilizing medical care.

**Methods:** The study's theoretical framework integrated gender role theory with Goffman's conceptualization of stigma. A mixed methods design was used in two interrelated phases. In Phase 1, 150 individuals living with HIV (50 heterosexual cisgender men, 50 heterosexual cisgender women and 50 *hijras*/transgender women) were recruited to complete a structured survey, conducted in either Hindi/Urdu or Telugu. HIV stigma scale scores were used to predict depression and medical care utilization, controlling for demographic variables. Stepwise multiple linear regression models were run on the statistical program *STATA 13*. In Phase 2, thirty individuals (15 cisgender heterosexual women and 15 *hijras*/transgender women), were recruited to complete in-depth interviews on their experiences with HIV, gender roles and nonconformity, poverty, caste and religion. Interviews were intended to understand the gendered experience of HIV stigma and to contextualize the answers from the survey. Interviews were translated, transcribed and thematically analyzed by two independent coders, using *NVivo 10.* Consensus was reached on all coding decisions.

**Results:** Interactions between gender and stigma had a statistically significant impact on health outcomes for cisgender and transgender women, namely in increasing risk for depression and decreasing utilization of medical care. Qualitative data revealed that for cisgender women in India, HIV stigma is impacted by restrictive gender roles, a limited ability to refuse or delay sex or marriage, and the prioritization of male partners' health over females. For *hijras*/transgender women in India, sex work and gender nonconformity were important factors in impacting HIV stigma.

**Conclusions:** Interventions to improve the health of people living with HIV in India need to take into account the specific needs of both cisgender women and *hijras*/ transgender women. Interventions that decrease the gendered experience of stigma will likely also improve women's health care utilization and ameliorate women's mental health.

## THPED390

### ASSOCIATIONS BETWEEN MULTIPLE TYPES OF STIGMA AND DISCRIMINATION AND SEXUAL RISK BEHAVIOR AMONG YOUNG BLACK MEN WHO HAVE SEX WITH MEN AND TRANSGENDER WOMEN IN THE UNITED STATES

S. Legrand[1], K. Muessig[2], S.K. Choi[2], K. Soni[3], H. Kirschke-Schwartz[3], L. Hightow-Weidman[3]
*[1]Duke University, Duke Global Health Institute; Center for Health Policy and Inequalities Research, Durham, United States, [2]University of North Carolina at Chapel Hill, Department of Health Behavior, Chapel Hill, United States, [3]University of North Carolina at Chapel Hill, Department of Medicine, Chapel Hill, United States*
*Presenting author email: sara.legrand@duke.edu*

**Background:** In the United States, young, black men who have sex with men and transgender women (YBMSM/TW) are the only populations with increasing HIV incidence. Stigma and discrimination related to sexuality, race, and HIV contribute to this health disparity by influencing risk factors for primary and secondary HIV transmission and hindering prevention, testing, and treatment.

**Methods:** healthMpowerment.org (HMP) is a mobile-phone-optimized, Internet-based intervention designed to reduce sexual risk behaviors among HIV-positive and HIV-negative YBMSM/TW. Baseline data from 474 HMP randomized controlled trial participants were analyzed to determine bivariate and multivariate associations between stigma and discrimination related to sexuality, race and HIV and one or more episodes of unprotected anal intercourse (UAI) in the last 3 months.

**Results:** Participants' mean age was 24.3. Most identified as gay (65.4%) or bisexual (18.1%). Others identified as queer (1.5%), transgender (1.9%), questioning (2.1%), straight (1.7%), and other (9.3%). The majority reported negative or unknown HIV status (60.5%) vs. positive HIV status (39.5%). Overall, 66.1% reported at least one episode of UAI in the last 3 months. UAI did not vary significantly by HIV status. In bivariate analyses of those who reported HIV-negative/unknown status, higher levels of perceived HIV stigma and perceived homophobia were marginally associated with UAI (p=0.07 and p=0.09, respectively). The relationship between experienced racial discrimination and UAI was significant (p=< 0.01). In multivariate analysis, racial discrimination was associated with a greater likelihood of UAI (OR 1.18; CI 1.03-1.34) after controlling for age, education and income. For HIV-positive participants, higher levels of experienced HIV discrimination (p=0.02), perceived HIV discrimination (p=< 0.01), perceived HIV stigma (p=0.02) and racial discrimination (p=0.02) were associated with UAI in bivariate analyses. Experienced sexual minority stigma was marginally associated with UAI (p=0.06). In multivariate analysis controlling for age, education and income, greater perceived HIV discrimination was associated with increased likelihood of UAI although the relationship was only marginally significant (OR 1.07; CI 0.99-1.14).

**Conclusions:** YBMSM/TW experienced multiple, intersecting types of stigma and discrimination. Examining the unique effects of these factors on UAI can identify priority areas for structural and individual-level interventions to help reduce risk of HIV transmission among this population.

## THPED391

### THE PRODUCTION OF HIV STIGMA AND CONSTRUCTION OF RACE AND GENDER STEREOTYPES IN PREVENTION AND CARE MATERIALS IN SOUTH AFRICA: A FOCUS GROUP STUDY

T.J. Nicholson[1], M. Quayle[2], O. Muldoon[2]
*[1]University of KwaZulu-Natal, Psychology, Pietermaritzburg, South Africa, [2]University of Limerick, Limerick, Ireland*
*Presenting author email: tamarynnicholson@gmail.com*

**Background:** What kind of stereotypes about people living with HIV (PLWH) do HIV campaigns produce? In our efforts to motivate people to avoid contracting HIV do we unintentionally create stigma? This paper reports on a study investigating the production of HIV stigma in HIV prevention and care campaign materials in South Africa, particularly exploring how HIV stigma intersects with stereotypes around race, class and gender.

**Methods:** Focus group discussions with South African tertiary education students used carefully sampled prevention and care HIV campaign materials to generate discussion around HIV and PLWH. A social constructionist method of analysis was used to identify how HIV and people living with HIV were constructed in these discussions sparked by campaign materials. Data collection is ongoing and the expected sample size is between 100-120 tertiary education students.

**Results:** Preliminary results indicate that participants orient to race, gender and class as salient categories for responding to the materials and that constructions of HIV and PLWH intersect with these categories. Stereotypes about race, gender and class categories are implicitly assigned to PLWH by association. Individual accountability and responsibility are key themes identified by participants both with respect to the materials and HIV risk in general. Participants frame PLWH and those at risk for HIV as sexually irresponsible and accountable for their HIV statuses, positioning them as individually 'blameworthy' via a failure to engage in protective practices. Tensions in the construction of HIV between prevention and care oriented campaign materials are evident, with participants constructing an HIV positive status as both fatal and manageable.

**Conclusions:** The findings indicate that HIV campaign materials are responded to by targets as stigma-inducing; that HIV prevention campaigns often produce the very stigma that HIV care campaigns attempt to dismantle; and that even care campaigns subtly introduce stigma by implication through intersectional identification with race, gender and class.

## THPED392

### THE SOCIOECONOMIC DIMENSIONS OF HIV STIGMA: EXPLORING STATUS AND RESOURCE EXPLANATIONS

M. Arnold[1], A. Benton[2], S. Skipper[2], J. Loveluck[2], B. Minalga[2], L. Sprague[3,4,5]

**Background:** HIV-related stigma and discrimination can negatively impact the health and well-being of persons living with HIV (PLWHIV) and hinder prevention goals. As others have emphasized, HIV stigma-reduction efforts require a multifaceted approach rooted in an understanding of how power differences perpetuate stigmas. We seek to better understand the role of economic power on HIV stigma. Our *status* hypothesis asserts that informational, attitudinal, and cultural factors within economically disadvantaged ingroups and more advantaged outgroups heighten conditions for stigmas directed at status-disadvantaged PLWHIV. Our *resource* hypothesis contends that resource access challenges expose economically disadvantaged PLWHIV to systems and interactions with a higher propensity for HIV stigma. We assess the extent to which these status and resource hypotheses may be supported among an exploratory sample of PLWHIV.
**Methods:** The *People Living with HIV Stigma Index* was piloted in the US in 2014 among 70 PLWHIV residing primarily in Southeast Michigan. The questionnaire measured 12-month stigma/discrimination experienced by PLWHIV. Logistic regression models estimated the effects of status and resource disadvantage on the likelihood of experiencing social or institutional stigma, and of defending (self/others) against HIV stigma. *Status disadvantage* measures included sex work history and unemployment. *Resource disadvantage* measures included homelessness and food insufficiency. We further assessed whether social support offset disadvantage effects.
**Results:** After controlling for significant demographic traits, both homelessness and food insufficiency were associated with a 5-times greater likelihood of experiencing *social stigma*. After also accounting for social support, PLWHIV with a history for homelessness were 4-times more likely than others to experience social stigma, but food insufficiency lost significance. Food insufficiency was associated with a 3- to 4-times greater likelihood of experiencing *institutional stigma* compared to others, with or without (respectively) adjustment for social support. Measures of status disadvantage were not associated with social or institutional stigma. Over 60% reported *challenging stigma* in the prior years, with no differences associated with disadvantage.
**Conclusions:** Resource, not status, disadvantage was associated with increased exposure to social and institutional stigma. There were no resource or status differences in challenging HIV stigma. We discuss implications of our findings for future research and stigma-reduction efforts.

**Background:** Psychological resilience is a measure of the ability to properly adapt to stress and adversity, with low resilience being linked to clinical depression and anxiety. Questions from the validated Connor-Davidson Resilience Scale (CD-RISC 10) were included in the STIGMASurveyUK2015; we investigate how resilience can impact upon the level of stigma felt by people living with HIV (PLHIV).
**Methods:** The STIGMASurveyUK2015 was co-designed by PLHIV, clinicians and researchers. People were recruited through >120 cross-sector community organisations and 47 HIV clinics to complete an anonymous online survey about their experience of living with HIV. A resilience score was calculated for participants who had answered >7/10 questions about resilience, the mean of all completed responses was taken to impute the score for missing responses.
**Results:** The mean resilience score of the 1,568 participants who completed the survey was 26.5 (SD 8.2), this is comparable with similar studies among PLHIV. Through cluster analysis, 429 (27%) were classified as having low, 611 (39%) medium, and 528 (34%) high resilience. Resilience scores were correlated with time since HIV diagnosis, with those diagnosed prior to 2005 likely to have lower resilience than those diagnosed in more recent years (53% vs 39%, p< 0.001). Those with low resilience were more likely than those with high to have been diagnosed with depression (71% vs 22%) and to have experienced stigma through discrimination (verbal/physical abuse and exclusion) (46% vs 23%), anxiety (53% vs 24%) and/or avoiding social/sexual experiences (54% vs 32%)
(all p< 0.001), furthermore, avoidance was more likely to be attributed to their HIV (34% vs 19%, p=0.001). No significant link was observed between resilience score and age, gender, sexuality or ethnicity. Thematic analysis of participants' experiences of living with HIV identified that those with low resilience most commonly reported "social isolation" and "negative experiences", whereas those with high resilience focussed on "adopting healthier behaviour" and "empowering experiences".
**Conclusions:** The majority of PLHIV in the UK scored highly on resilient measures. Participants with low resilience were more likely to experience stigma and to report negative experiences of living with HIV. This tool could be useful as a screening tool in clinical settings.

### ECONOMIC HARDSHIP AND INTERNALIZED STIGMA: EARLY RESULTS FROM THE US PEOPLE LIVING WITH HIV STIGMA INDEX-DETROIT

S. Skipper[1], L. Sprague[2], M. Arnold[3], A. Benton[4], B. Minalga[4]

**Background:** In the US and worldwide, HIV-related stigma and discrimination are consistently identified as key barriers to HIV prevention, treatment, care, and support. The PLHIV Stigma Index project was designed to train and support people living with HIV (PLWH) to measure and address stigma and discrimination in their settings with culturally and locally appropriate responses. In the US the PLHIV Stigma Index was piloted in Metropolitan Detroit in 2014 and 2015. Because of the racial and economic disparities in the US, particular attention in the analysis was placed on exploring relationships between these disparities and internalized stigma.
**Methods:** PLHIV were trained as interviewers and used a structured questionnaire to interview 70 persons living with HIV: 69% Black, 17% White, 59% Cisgender male, 31% Cisgender female, 10% Transgender, and 30% ages 18-25. Three measurements of internalized stigma--internalized negativity, anticipated stigma and social avoidance due to HIV status--were analyzed by age, race, key population status, gender, and economic hardship. Economic hardship was measured by experiences of homelessness, food insecurity and unemployment.
**Results:** Nearly 80% of our respondents experienced self-blame and/or guilt in the previous twelve months, 89% feared negative reactions from others, and 90% engaged in at least one form of social avoidance. Over 56% of our respondents had at least one form of economic hardship. A history of homelessness was associated with 10-times greater likelihood of reporting higher-than-average internalized negativity. Race and gender were not associated with differences in internalized stigma.
**Conclusions:** Most of the people in our sample experienced internalized stigma and discrimination for multiple reasons that included and went beyond their HIV status. The experience of economic distress, however, stands out for its strong correlation to increased internalized stigma. By contrast, respondents who felt most able to address stigma were those who were connected with or knew about HIV support groups, or services. Current efforts to support economically distressed PLHIV in metro Detroit focus on supporting HIV positive leadership training for PLHIV and other community members by educating them about HIV stigma and building networks and support systems for self-empowerment.

### ACCESS TO CARE, STIGMA AND SYSTEMIC VIOLENCE AGAINST HIV-INFECTED WOMEN IN THE PACIFIC REGION OF COLOMBIA

E. Siegel[1], Y. Valencia[2], Y. Ariza-Araujo[3]
*[1]Columbia University, New York, United States, [2]Asociacion LILA Mujer, Cali, Colombia, [3]Icesi University, Cali, Colombia*
*Presenting author email: lilamujer@gmail.com*

**Background:** HIV-infected women in the Pacific region of Colombia often face regional violence, extreme poverty, and forced migration. These women are unacknowledged in the national health agenda and health services are not designed with rural patients in mind, resulting in reports of high morbidity and mortality, but no systematic regional data exists on this population that could be used to inform the development of more appropriate services.
**Methods:** An anonymous, non-representative semi-structured questionnaire of 70 HIV-infected women in two Pacific states assessed access to care, stigma, ethnic/racial discrimination, and quality of life; data was triangulated with qualitative information collected throughout interviews.
