**Conclusions:** In order to develop an FBCT intervention that is "adolescent-friendly" it is important to equip both adolescents and their primary caregivers with tools that help to initiate, sustain and encourage open communication that is supportive and caring.

## TUPEE572

### PREPARING FOR DREAMS: DEVELOPING AN INDEX TO ASSESS VULNERABILITY FOR HIV ACQUISITION AMONG ADOLESCENT GIRLS AND YOUNG WOMEN IN TANZANIA

H.R. Mahler[1], M. Bangser[1], C. Casimir[2], D. Boyee[1], M. Betron[3], C. Casalini[1], A. Akridge[4], A. Komba[1], S. Baral[5]
*[1]Jhpiego - an affiliate of Johns Hopkins University, Tanzania Country Office, Dar es Salaam, Tanzania, United Republic of, [2]Pact/Tanzania, Dar es Salaam, Tanzania, United Republic of, [3]Jhpiego, Baltimore, United States, [4]USAID Tanzania, Dar es Salaam, Tanzania, United Republic of, [5]Johns Hopkins University, Bloomberg School of Public Health, Baltimore, United States*
*Presenting author email: albert.komba@jhpiego.org*

**Background:** Adolescent girls and young women (AGYW) are known to have significant risks for HIV acquisition and evidence-based HIV prevention services are currently being scaled to address their needs through the PEPFAR-funded DREAMS Initiative. However, characterizing specific HIV acquisition risks for AGYW is critical to guide the implementation of targeted HIV prevention and treatment services for these young women. The Sauti program is implementing DREAMS in Tanzania and developed a risk index to effectively delineate a pathway of risks from primarily social vulnerabilities to acute HIV acquisition risks.
**Description:** A scoping review informed the development of the Sauti AGYW Risk Index (ARI) which includes Community and Individual Modules. The Community Module aims to identify communities which have high, medium and low proportions of risk for AGYW. The Individual Module is a screening questionnaire that explores key risk-related domains: sexual behavior, gender-based violence, impoverishment, social isolation, and schooling with indicators chosen based on established association with prevalent and incident HIV infections. The Individual Module was administered by peer educators and community health promoters at mobile HTC services and community outreach to 237 AGYW aged 15-24 across five regions in November 2105.
**Lessons learned:** Among 237 participants, the ARI scored risk as: 6% low, 37% medium, 54% high and 4% very high. Given the significant levels of acute HIV acquisition risks observed among these young women, the ARI validated the Sauti programmatic approaches of engaging AGYW in high transit and commercial areas of Tanzania. Statistical assessments of risk stratification conducted on indicators of the ARI demonstrated strong relationships between composite score for most measures except for perceptions of gender-based violence.
**Conclusions/Next steps:** The initial assessment of the ARI reinforces the ability to categorize AGYW into those who are acutely in need of HIV prevention programs compared to those who are earlier in the pathway of risks and represent candidates for social protection. The ARI will be scaled up for use throughout the Tanzania DREAMS Initiative and linked to programmatic health data allowing eventual evaluation of these programs through self-reported and biologic data including HIV and STI test results.

## TUPEE573

### ASSESSING THE UTILITY OF THE SAUTI ADOLESCENT GIRL AND YOUNG WOMEN RISK INDEX TO DISCRIMINATE HIV ACQUISITION RISKS IN TANZANIA

T. Lennemann[1], S. Ketende[2], M. Bangser[3], C. Casalini[1], C. Chipere[1], M. Yeronimo[1], H. Mahler[1], S. Baral[2]
*[1]Jhpiego, Sauti Program, Dar es Salaam, Tanzania, United Republic of, [2]Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, [3]Independent Consultant, Dar es Salaam, Tanzania, United Republic of*
*Presenting author email: tlennemann@hotmail.com*

**Background:** Adolescent girls and young women (AGYW) are known to have significant risks for HIV aquisition. Characterizing specific HIV acquisition risks is important to guide the implementation of specific HIV prevention and treatment services for these young women. Traditionally, indices of risk for AGYW have focused on social vulnerabilities, but to inform the implementation of the PEPFAR-funded Sauti Program in Tanzania, an index has been developed to categorize AGYW into low, medium, high and very high risk of HIV acquisition.
**Methods:** A scoping review informed the development of the Sauti AGYW Risk Index (ARI) which includes short modules with indicators examining sexual practices, gender-based violence, impoverishment, social isolation, and schooling. The ARI was piloted in Sauti Program sites in November 2015 with 237 AGYW. Analyses used STATA 14.0 and included pearson's chi-square test to compare observed proportion by age group with p-values reported.
**Results:** 55.3% (n=131/237) of the AGYW sampled were between 15-19 and 44.7% (n=106/237) were 20-24. Younger respondents had a significantly lower age at sexual debut ($p< 0.01$), and used condoms less frequently with anal and vaginal sex ($p< 0.01$, $p< 0.01$ respectively). Overall younger respondents reported fewer pregnancies, though the age of first pregnancy was significantly lower ($p< 0.01$) than in the older age group. Older women were more likely to use FP methods ($p< 0.01$), be married ($p< 0.01$), less socially isolated ($p< 0.05$) and more educated ($p< 0.01$). There was a statistically significant relationship between individual indicators and ultimate risk score except for indicators related to perceptions of violence. Overall, 63% of 15-19 and 49% in 20-24 were considered high/very high risk ($p< 0.05$).
**Conclusions:** For the initial assessment, it appeared that younger women (15-19) sampled were at higher risk than those 20-24, though overall, there is a tremendous amount of HIV acquisition risk measured among all of these women. The ARI did effectively discriminate risk between those who were at high/very high risk of HIV acquisition compared to those at low/medium risk suggesting the utility of this tool in identifying those most at risk and evaluating the utility of interventions in changing these risks throughout implementation of Sauti.

## TUPEE574

### "WHERE ARE THEY NOW?" MORTALITY, LOSS TO FOLLOW-UP AND VIRAL SUPPRESSION IN PERINATALLY HIV-INFECTED (PHIV) POST-TRANSITION YOUNG ADULT ANTIRETROVIRAL THERAPY (ART) PATIENTS IN THE DOMINICAN REPUBLIC (DR): 2004-2015

R. Abreu-Perez[1], L. Lerebours-Nadal[2], C. Beck-Sague[3], M. Halpern[2], S. Nicholas[2,4], J. Devieux[3]
*[1]Robert Reid Cabral Children's Hospital, Teofilo Gautier Comprehensive Care Center, Santo Domingo, Dominican Republic, [2]Clinica de Familia La Romana, Dept. of Research, La Romana, Dominican Republic, [3]Florida International University, Robert Stempel College of Public Health and Social Work, Miami, United States, [4]Columbia University, IFAP Global Health Program, College of Physicians & Surgeons, New York City, United States*
*Presenting author email: leonel.lereboursnadal@gmail.com*

**Background:** The DR has among the most successful pediatric ART scale-ups in low- and middle-income countries; almost 80% of known HIV-infected youth receive ART. But little is known of the outcomes of these pediatric ART patients post-transition to adult care.
**Methods:** In 2016, we analyzed de-identified data abstracted from medical records of children who started ART in 2004-2015 at the two leading DR centers providing ART to children to describe pre- and post-transition mortality and response to ART, and characteristics at transition associated with post-transition death and loss to follow-up.
**Results:** From 2004-2015, 876 children (>95% PHIV), started ART in these two centers; 92 (10.5%) died pre-transition. To date, 81 (9.2%) have transitioned to adult care. Age at transition ranged from 13-26 (median=18) years. In 2016, post-transitioned patients' ages ranged from 15-29 (median=21) years. Post-transition, 8 (9.9%) were lost to follow-up; 5 (6.2%) died. Time since transition ranged from 0-9 (median=2) years, and tended to be longer in the 13 who had died or been lost to follow-up (median=3 years) than in those still receiving ART in adult care (median=2 years; *P*=.02). Most recent viral loads of patients in adult care ranged from < 40-165,479 (median=1,759) copies/ml; 60% had viral loads >1,000 copies/ml. Risk of death or loss to follow-up did not vary significantly by ART regimen, or median CD4 count or viral load at transition, although those who died tended to be more likely to have been receiving protease inhibitor-containing "second line" regimens (80%) and had higher viral loads at transition (median=12,523 copies/ml) than those who survived (46.1%; Odds Ratio=4.7, *P*=.14; median=575 copies/ml; *P*=.25, respectively). All patients who died post-transition had caregivers who were their mothers or grandmothers (5/5 [100%]) vs. 34/69 (49.3%) of survivors [*P*=.036]).
**Conclusions:** Post-transition death and loss to follow-up were considerable, with increased risk with more time post-transition. Viral response to ART was sub-optimal in survivors in care. It is unclear why youth whose caregivers were their mothers or grandmothers had greater mortality risk; in other DR studies, those caregivers tended to be poorer and more food insecure and depressed. Measures to improve post-transition outcomes are needed.

## TUPEE575

### HIV VULNERABILITY REDUCTION THROUGH ECONOMIC EMPOWERMENT AMONG THE YOUTH IN MALAWI: THE CASE OF MZUZU YOUTH ASSOCIATION

P. Makondesa[1], M. Licata[2], S. Mabhele[3], R. Ameur[4]
*[1]International Labour Organization, Lilongwe, Malawi, [2]International Labour Organization, Geneva, Switzerland, [3]ILO, Pretoria, South Africa, [4]International Labour Organisation, Pretoria, South Africa*

**Background:** The Malawi National HIV and AIDS strategic framework (2011-2016) acknowledges that progress has been made in delivering services to youth. However, key gaps remain, including inadequate support provided to those young people who are most in need. In Malawi, 65% of the population lives in absolute poverty, two-thirds of the population is under 25, and out-of-school youth lack the skills to secure decent work and have little access to health and social services,
Since 2011, the ILO has engaged with national and local partners in Malawi to reach young people with a combination of health and economic services, increasing their resilience to HIV and AIDS.
**Description:** The ILO program supported over 15,000 beneficiaries located in 12 hotspots along the transport corridors in Malawi, with interventions aimed at reducing HIV vulnerabilities through economic empowerment initiatives. Poverty, as one of the key drivers of the epidemic, leads most youth to engage in high HIV-risk behaviors, including sex work. Interventions thus largely targeted vulnerable youth through the transport corridor hotspots where most transactional sex occurs. The ILO targeted youth initiatives in four hotspots, training 7000 youths on HIV. 1500 youth benefited from training on group formation, entrepreneurship skills, and business mentorship. 30% of youth trained accessed loans through a partnership with microfinance institutions and 82% started their own businesses.
**Lessons learned:** The programme proved that empowering youth reduces the HIV risk for them and their communities. 75% of girls engaged in sex work and are now engaged in various economic activities, resulting in increased average incomes ($57 at baseline to $111) resulting in increased savings (35%-77), increased spending on education ($26 - $56) and health care ($48-56). Moreover, project beneficiaries increased use of risk reduction strategies (33-72%) including use of condoms (85%), reduced number of partners (26%) and reduced alcohol intake (15%).
**Conclusions/Next steps:** Economic empowerment provides youth with necessary skills and opportunities and reduces their HIV vulnerabilities. The economic empowerment model can be replicated in other areas of Malawi sub-Saharan Africa where economic inequalities are one of the key drivers of the epidemic, and where youths are most at risk.

## TUPEE576

### COMBINED INTERVENTIONS TO INCREASE HIV DIAGNOSIS AND LINKAGE TO HIV TREATMENT AMONG MEN WHO HAVE SEX WITH MEN (MSM) IN CURITIBA, BRAZIL

M. Cruz[1], B. Grinsztejn[2], R. de Boni[2], V. Veloso[2], R. Girade[3], R. de Jesus[4], A. Barbosa[5], N. Lentini[5], R. Miranda[5], T. Bingham[6]
*[1]ENSP/Fiocruz, Rio de Janeiro, Brazil, [2]INI/Fiocruz, Rio de Janeiro, Brazil, [3]Ministry of Health, Brasilia, Brazil, [4]HTS Mobile Testing Intervention, A Hora e Agora Project, São Paulo, Brazil, [5]CDC/CGH/DGHT, Brasília, Brazil, [6]CDC/CGH/DGHT, Atlanta, United States*
*Presenting author email: marlycruz12@gmail.com*

**Background:** A multi-disciplinary team launched a community-wide intervention to reduce HIV transmission among men who have sex with men (MSM), the group most affected by HIV, in Curitiba, Brazil. The implementation science project, *A Hora é Agora (AHA),* evaluates the acceptability, uptake and cost- effectiveness of multiple HIV testing services (HTS) combined with linkage to services to improve HIV cascade outcomes for MSM.
**Description:** The project aims to increase the proportion of MSM who have accessed HTS and to link 90% of HIV positives to treatment. To expand HTS options for MSM, it's offered a web-based HIV self-testing platform; and rapid HTS in mobile vans, community organization, and public health facility. Individuals with reactive tests are referred for confirmatory tests. Peer navigators facilitate enrolment in treatment. Tailored communication strategies boost program uptake through virtual and mobile media, coupled with peer workers' face-to-face interactions at MSM social gathering venues.
**Lessons learned:** Communication strategies became the core of the intervention. Innovative, tailored and interchangeable messaging is key to high uptake of HTS and linkage. Communications also prioritize user-friendly technological tools, to better engage young MSM. Client cost-sharing and other strategies to reduce operating expenses ($16/rapid self-test; $5/test delivery) will be required for intervention scale-up and adoption by local governments.
**Conclusions/Next steps:** *The AHA* combined approach has substantially expanded MSM access to HTS in less than one year of implementation (February-December 2015) the number of MSM users accessing HTS (42% first time HIV testers; 70% 18-29 years): a) Mobile and Fixed HTS Outlets: 954/2,726 (35%) are MSM, 8,6% HIV+ MSM and 67% HIV+ accepted linkage-to-care navigators; b) Web-Based HIV testing: >3,000 test kits delivered to users, with >2,000 kits requested by self-reported MSM, >400 MSM self-reported test results returned to AHA web platform and 19/400 results HIV+, >90% of HIV+ accepted linkage services. The target of testing 1,750 MSM who have never accessed HTS is likely to be exceeded. In year 2, improved follow-up of MSM testing via the web platform, analysis of the communications strategy as well as cost-effectiveness, feasibility and service quality evaluations will inform program improvements for Curitiba and will facilitate expansion to additional Brazilian cities.

## TUPEE577

### GENDER NORMS, SEXUALITY AND SPORTS FOR DEVELOPMENT: CHALLENGES ADOLESCENT GIRLS IN KHAYELITHSA, SOUTH AFRICA, FACE WHEN PARTICIPATING IN A SOCCER-BASED HIV PREVENTION PROGRAMME

R.L. Banciu[1], C. Barkley[2], S. Ben[3]
*[1]Grassroot Soccer, Research, Monitoring and Evaluation, Cape Town, South Africa, [2]Grassroot Soccer, Development and Strategy, Cape Town, South Africa, [3]Grassroot Soccer, Cape Town, South Africa*
*Presenting author email: bsanders@grassrootsoccer.org*

**Background:** Gender norms and community beliefs around sexuality influence girls' participation in soccer, considered a "male sport" in the community of interest for this research. The objective of our study is to explore access and participation to, as well as ways to improve a sports-based HIV prevention programme for teenage girls.

**Methods:** Preliminary findings of the qualitative study are based on data collected November 28th - December 11th 2015, in Khayelitsha. We conducted interviews with teachers from four of the five implementing schools and two focus-groups with a total of 14 participants. Additional data comes from field notes and observations. Participants in the focus-groups were girls aged 10-14. We will conduct additional focus-groups and interviews with coaches, parents and peer-learners and collect secondary data on participants' school results.
**Results:** Preliminary results reveal relevant information related to the challenges teenage girls who enroll in the soccer-based HIV prevention programme face. Initially, teachers indicated that girls who want to play soccer face no barriers in doing so. Prompted, they would indicate lack of resources, sporting facilities and lack of opportunities for girls among the main barriers. Although they support the programmes, they also indicated their concerns that participants might turn into "tomboys" (lesbians), since girls playing soccer are expected to behave like boys. Most teachers seemed not to be aware that this belief in itself might constitute an important barrier for girls.
Participants indicated feelings of shame for not playing well, beliefs that they would turn into "tomboys" and beliefs that girls cannot play soccer as reasons for which other girls dropped out or reasons for them to feel demotivated. Results indicate imposed and auto-imposed gender stereotypes.
Among ways to improve the program, teachers mentioned involving parents and other teachers, addressing the issue of participants' sexual identity, and organizing soccer leagues for girls.
**Conclusions:** Although the target group are adolescent girls, other community members (parents, teachers and peer-learners) need to be addressed in soccer-based HIV prevention programmes so that traditional gender norms, gender stereotypes and community values which maintain a disadvantage for a population which is already at a higher risk, are challenged.

## TUPEE578

### FEASIBILITY AND EFFECTIVENESS OF A POSITIVE PARENTING INTERVENTION IN REDUCING HIV INCIDENCE AMONG ADOLESCENT GIRLS AND YOUNG WOMAN FROM GRANDPARENT-HEADED HOUSEHOLDS

P. Muwoni
*World Education, Boston, United States*
*Presenting author email: pmuwoni@zw.worlded.org*

**Background:** To ensure children, particularly adolescent girls from highly vulnerable families, are empowered with knowledge to stay HIV negative and have better life outcomes, the Bantwana Initiative of World Education piloted the *Families Matter!* Parenting program, adapted from the Center for Disease Control's *Parents Matter!* program. In order to close the generation gap and open up communication between children and caregivers, the program targets grandparent-headed households receiving government cash transfers in Bulawayo, Zimbabwe and empowers these caregivers to be the primary source of sex information to the children in their care. The caregivers participate in a positive parenting module on adolescent sexual reproductive health, which covers the sexual pressure and choices faced by adolescents, and provides caregivers with appropriate HIV prevention, family planning and sexual abuse prevention and responses. The program was piloted to assess the intervention's feasibility and effectiveness.
**Description:** 42 elderly caregivers, aged 50 and older, met once weekly for a three-hour long session for seven weeks. Subsequently, they completed practical discussion exercises with their children at home. Routine data collection and interviews for qualitative feedback were conducted.
**Lessons learned:** Evidence from the pilot shows caregivers' knowledge on sex and sexuality issues increased. The weekly exercises that caregivers practiced at home made them more comfortable to openly discuss sex related issues with their children. As a result, both children and their caregivers indicated that the generational gap had reduced and their relationships grew stronger. Children noted that the caregivers were now their primary source of sexuality information and they felt empowered to change their behavior and make better sex choices.
**Conclusions/Next steps:** *Families Matter* is an effective family centered approach which increases caregivers' and adolescents' knowledge of sex, sexuality and HIV issues. The approach opens up communication and deepens mutual understanding between children and their caregivers. Children are better supported and they enjoy protective parental surveillance. The pilot proved successful, strengthening relationships and understanding of HIV prevention, family planning and sexual abuse prevention, detection and appropriate responses. WEI/Bantwana will scale up the pilot to 9,300 caregivers in three districts over two years and track its effectiveness in reducing HIV incidence.

# IMPACT OF DONOR AGENCIES AND POLICIES ON NATIONAL RESPONSES

## TUPEE579

### CASE STUDIES ON INTEGRATION OF HIV AND AIDS RESPONSE (FOCUSING ON NEEDLE AND SYRINGE EXCHANGE PROGRAM) WITHIN THE JAKARTA HEALTH SYSTEMS

L.V. Wongso, L. Nevendorf, A. Gabriella, I. Praptoraharjo
*AIDS Research Center Atma Jaya University, Research, Jakarta, Indonesia*
*Presenting author email: praptoraharjo@gmail.com*

**Background:** The HIV and AIDS response in Indonesia is connected to global health initiatives (GHI) through various programs and funding schemes. The role of GHI in developing countries, including Indonesia, has resulted in both positive and negative consequences. Despite the fact that GHI can increase the response to HIV and AIDS transmission reduction strategies, they operate alongside, yet separately, from the Indonesian health care system. This dual system could, in fact, be detrimental to the overall operation of the health system, as each has different mechanisms of service delivery, planning, financing, and monitoring-evaluation. This study aims provide better information surrounding the current scope of HIV and AIDS responses and they ways in which they have been integrated into health care system, specifically in Jakarta.
**Methods:** A qualitative study conducted in Jakarta. Data was collected by interviewing 42 respondents, including stakeholders that implement HIV and AIDS programs and also key population. The framework approach will be used in this analysis.
**Results:** There are several aspects that have been fully integrated with the Indonesian health system, such as budgeting, proportion, distribution, and expense, Financing of human resources, Availability of services, Coordination & referral.
We found that partial integration with the health system had occurred for the realms of Regulation, Policy formulation, Management of financing sources, Financing mechanisms, Compensation, Provision & storage regulations, Resources, Synchronization of information system, Dissemination & utilization, and Quality of services guarantees.
In the realms of Accountability, Policy and Human Resources Management, and Community Participation we did not find evidence for any integration within the health system.
**Conclusions:** Less involvement of key populations in planning, developing, and evaluating HIV and NSP programs acted as an indicator for a lack of integration of Community Participation and Accountability in the health system. There were no specific regulations about human resources in NSP, therefore no formal competencies were used for recruitment.
The government needs to continuously develop several aspects of GHIs that are yet to become fully integrated with the health system, to ensure the continuity of HIV and AIDS response, pressingly so as there are no current donors supporting these programs.

## TUPEE580

### EFFECT OF PEPFAR FUNDING POLICY CHANGE ON HIV SERVICE DELIVERY IN A LARGE HIV CARE AND TREATMENT NETWORK IN NIGERIA

B. Banigbe[1], O. Arije[2], K.A. Freedberg[3,4,5], P. Okonkwo[1], A.A. Ahonkhai[3,4,5]
*[1]AIDS Prevention Initiative in Nigeria, Abuja, Nigeria, [2]Obafemi Awolowo University Teaching Hospital, Community Medicine, Ile- Ife, Nigeria, [3]Medical Practice Evaluation Center, Massachusetts General Hospital, Boston, United States, [4]Division of Infectious Disease,Massachusetts General Hospital, Boston, United States, [5]Harvard Medical School, Boston, United States*
*Presenting author email: bbanigbe@gmail.com*

**Background:** PEPFAR has streamlined support for HIV services in Nigeria and other recipient countries. The objective of this study was to measure and describe the impact of the PEPFAR policy change (PPC) instituted in October 2014 on HIV care delivery in APIN, a large network of HIV clinics in Nigeria.
**Methods:** We distributed questionnaires to clinic managers at APIN's 30 comprehensive HIV treatment sites. The survey assessed services supported pre-PPC (October 2013-September 2014) and post-PPC (October 2014-September 2015), impact of the PPC on service delivery areas, and responses instituted for the PPC. We compared differences in support for staffing, laboratory services, and clinical operations pre and post-PPC using proportion tests. Responses to open-ended questions in the questionnaire were analyzed qualitatively using ATLAS.ti version 7 and data categorization was done inductively.
**Results:** Eight-three percent (n=25) of sites completed the survey. The majority were public (60%, n=15) and secondary (68%, n=17) facilities. Clinics had a median of 989 patients in care (IQR: 543-3326). All clinics continued to receive support for 1st line antiretrovirals and CD4 testing after the PPC, while no clinics received support for other routine drug monitoring labs. We found statistically significant reductions in support before and after the policy change in viral load testing capacity,

staff employment, defaulter tracking, and prevention services (92% vs. 64%, p=0.02; 80% vs. 20%, 100% vs. 44%, 84% vs. 16%, p< 0.0001 for all). Almost all sites (96%) introduced patient fees to cover the cost of lab monitoring tests (96%), hospital registration (32%), or clinical consultation (20%); yearly median fees were $40USD (IQR:21-69$USD). Qualitative analysis revealed that private facilities more frequently adopted strategies to cushion the user fee impact on patients. Clinic directors reported limitations in comprehensive care delivery, hampered clinical decision making, and decrease in new patient enrolment after the PPC. These challenges were more common in tertiary facilities.
**Conclusions:** Clinics in Nigeria are experiencing major challenges in providing routine HIV services as a result of the recent PEPFAR policy change. User fees are the most common coping response. The consequences include reduced laboratory monitoring, poor clinic attendance, and decreased new patient enrollment.

## SUSTAINABILITY OF FINANCING AND PROGRAMMES OF NATIONAL AIDS PROGRAMMES AND RESPONSES

### TUPEE581

### UNDERSTANDING PROSPECTS FOR MOBILIZING DOMESTIC RESOURCES FOR HIV IN UGANDA

V. Menon[1], S. Koseki[1], D. Nelson[2], T. Fagan[1]
*[1]Palladium, Washington, United States, [2]Uganda AIDS Commission, Kampala, Uganda*
*Presenting author email: thomas.fagan@thepalladiumgroup.com*

**Background:** With more than 1.7 million PLHIV in Uganda, the country's HIV epidemic remains among the largest in sub-Saharan Africa. As with other countries, Uganda's health sector relies heavily on donor funding. According to the most recent NHA, in FY 2011/12, donor resources accounted for 46 percent (US$860 million) of total health expenditure. For Uganda to achieve 90-90-90 targets by 2020, it will need to mobilize sustainable domestic resources to ensure the country stays on track.
**Methods:** The USAID- and PEPFAR-funded Health Policy Project used a set of indicators to assess the potential for domestic resource mobilization in Uganda. The team assessed the gap in projected HIV funding and the contribution from various sources: government HIV budget allocation, private sector, and donor funds.
**Results:** High levels of donor funding have been the primary support for significant scale-up of HIV services in Uganda over the past decade. PEPFAR funding increased rapidly from US$96 million to US$284 million between 2004 and 2008. While Uganda's domestic contribution increased between FY 2011/12 and 2014/15 (US$66 million to US$70 million), an annual inflation rate of around 7.9 percent wiped out those gains and domestic contribution actually decreased in real terms. The private sector contributed approximately US$3.8 million to HIV services. Household expenditure on HIV, in the form of out-of-pocket payments to providers, was valued at US$49.7 million. HPP estimates the total resources needed to achieve 90-90-90 targets will amount to around US$3.9 billion and the funding gap will be around US$1.09 billion over five years (2016-2020).
**Conclusions:** For Uganda to achieve its ambitious scale-up targets for ART coverage, significant mobilization of domestic, public-sector resources is essential. In the short term, realistic targets should be set for scale-up to establish quantifiable and achievable targets for the mobilization of domestic resources. Given the expected growth in the patient pool, increasing budgetary space through improved tax collection and creating secured streams of funding through innovative funding mechanisms will be critical to achieving Uganda's targets.

### TUPEE582

### ANALYZING CURRENT FUNDING FOR HIV AND TB IN SOUTH AFRICA TO IMPROVE THE ALLOCATIVE EFFICIENCY OF THE RESPONSE

T. Guthrie[1], T. Ryckman[2], G. Meyer-Rath[3], E. Kiwango[4], Y. Pillay[5], F. Abdullah[6], S. Soe-Lin[2], S. Heung[2], R. Hecht[2]
*[1]Independent Consultant, Cape Town, South Africa, [2]Results for Development Institute, Washington, D.C., United States, [3]HE2RO, Johannesburg, South Africa, [4]UNAIDS, Pretoria, South Africa, [5]National Department of Health, Pretoria, South Africa, [6]South African National AIDS Council, Pretoria, South Africa*
*Presenting author email: guthriehealthfinancingconsult@gmail.com*

**Background:** The South African government's increasing allocation of resources for HIV requires substantial financial planning with development partners. To assess past allocative efficiency and enable more evidence-based joint planning, the government of South Africa and UNAIDS undertook an Investment Case to jointly assess past spending and determine the most impactful future allocations across ten interventions.
**Description:** As part of the Investment Case, we conducted an analysis of HIV and TB spending in South Africa by the government, PEPFAR, and the Global Fund. This analysis built on earlier exercises to map and analyze PEPFAR financing. We undertook the analysis using publicly available financial data to ensure replicability and compatibility going forward. Findings were compared against the Investment Case's proposed optimal mix of cost-effective interventions.
**Lessons learned:** The tracking provides an innovative approach to consolidating data from domestic and international funders into a database compatible with public finance data, potentially enabling routinizable and real-time analysis for use by the government and partners.
Total HIV and TB spending in South Africa steadily increased from R17.4 billion in 2011/12 to R22.1 billion in 2013/14. The government accounted for the largest share (80%), followed by PEPFAR (17%) and the Global Fund (3%). The government's expenditures steadily increased even as the South African economy declined and other public expenditures dropped. PEPFAR's contribution decreased over time, while the Global Fund contribution increased.
A comparison of expenditures against the Investment Case's proposed optimal mix found that South Africa's HIV response was allocatively efficient. Only 14% of expenditures were for interventions not found to be cost-effective in the evidence review, but these could be considered important programme or social enablers.
**Conclusions/Next steps:** This exercise represents a first attempt at routinizing joint expenditure analysis for HIV and TB in South Africa. It provides a model that can be used going forward in South Africa and tailored for use in other countries. The findings of the Investment Case were used to improve the efficiency of allocations in the government's 2015/16 budget. We are now working to institutionalize this approach within the government's systems in conjunction with the System of Health Accounts, to enable improved evidence-based joint planning.

### TUPEE583

### ARE HIV-AFFECTED POPULATIONS WILLING AND ABLE TO PAY FOR HIV PREVENTION GOODS AND SERVICES? RESULTS FROM A CROSS-SECTIONAL STUDY IN VIETNAM

B. Vu[1], K. Green[1], M. Tran[2], H. Vu[2], T. Le[3], C. Reddy[3]
*[1]PATH, Mekong Region, Hanoi, Vietnam, [2]CCIHP, Hanoi, Vietnam, [3]TNS, Hanoi, Vietnam*
*Presenting author email: bvu@path.org*

**Background:** Middle-income countries such as Vietnam are facing steep declines in donor assistance for HIV prevention interventions. This raises concerns regarding key population (KP) access to condoms, needles and syringes (N&S), and HIV testing and counseling (HTC) services. USAID/PATH Healthy Markets conducted a consumer survey to measure KP willingness to pay (WTP) for commercial condoms, low dead space syringes (LDSS) and HTC services.
**Methods:** A cross-sectional survey recruited a total of 1,296 people who inject drugs (PWID), 1,248 female sex workers (FSW), and 1,528 men who have sex with men (MSM), using respondent-driven sampling in six focus provinces of Vietnam (Hanoi, Hai Phong, Dien Bien, Nghe An, Ho Chi Minh City and Can Tho) during 2015.
**Results:** KP reported high WTP for condoms. WTP the minimum price of 2,000VND ($0.1) per condom ranged from 83.6% among PWID, 90.5% among FSW, to 99.5% among MSM. A significant percentage of MSM were WTP the maximum price of 12,000VND ($0.6) (42%), while a significant less percentage of FSW and PWID reported (10.5 and 6.3% respectively). Only one of four PWID reported using LDSS 1ml. Regardless, PWID WTP for LDSS ranged from 47% at the minimum price of 2,000 VND ($0.1) per LDSS to 30.5% at maximum price of 5,000VND ($0.25). The survey confirmed annual HIV testing uptake to be low (33.2% PWID, 46.8% FSW and 52.6% MSM). WTP the minimum price of 50,000VND ($2.5) for an HIV test was high, ranging from 71.8% among PWID, 80.3% among FSW, to 90.4% among MSM. WTP at a maximum price of 150,000 VND ($7.5) was still relatively high at 44.8% among MSM, although low among PWID (13.9%) and FSW (19.9%). In multiple regression models, WTP rates were higher among high income KP, but lower among those interacting with peer educators (potentially due to subsidy access).
**Conclusions:** There is an opportunity to implement the Total Market Approach (TMA) in Vietnam by targeting subsidized commodities and services to the poorest KP, and establishing a viable commercial market for those able and willing to pay. This will ensure equitable and sustainable access, while reducing the public sector financial burden.

## TUPEE584

### SUSTAINING HIV/AIDS SERVICES IN THE FACE OF FALLING GOVERNMENT REVENUE: THE ZAMFARA STATE EXPERIENCE

S. Akande[1], E. Atuma[1], M. Salami[1], D. Akila[2], A. Sarki[3], S. Ibrahim[4], O. Omitayo[1]
*[1]Management Sciences for Health, Health Systems Strengthening Unit, Abuja, Nigeria, [2]Management Sciences for Health, Community Capacity Building, Abuja, Nigeria, [3]Management Sciences for Health, State Team Lead, Gusau, Nigeria, [4]Management Sciences for Health, State Team Lead, Sokoto, Nigeria*
*Presenting author email: sylvester.akande@gmail.com*

**Background:** Nigeria is the biggest economy in Africa but up to 77% of the country's funding for its HIV and AIDS response is provided by international development partners, including the USG PEPFAR[1]. In recent times, PEPFAR Nigeria has been engaged in activities that focus more on increasing country ownership through the gradual transitioning of certain HIV/AIDS services to the host Government.
However, recent economic challenges threaten the ability of the country and states to allocate adequate resources for the effective takeover of HIV/AIDS services at the health facility level - a situation exacerbated by the shrinking fiscal space for health resulting from falling Government revenue caused by dwindling oil prices.
[1] NASA 2013: National AIDS Spending Assessment 2013.
**Description:** To complement Government spending on HIV/AIDS, the USAID funded Management Sciences for Health ProACT project supported Zamfara State to develop resource mobilization implementation plans in two pilot health facilities to increase funding for HIV/AIDS.
This plan which responds to and is aligned with the State Strategic Health Development Plan was developed on-site over a five day period and represents the aspiration of the facility management team.
It focuses on identifying the activities and resources needed to sustain transitioned HIV/AIDS services, mapping the sources of resources, systematically mobilizing resources from identified philanthropists and private sector, as well as managing resources efficiently.
**Lessons learned:** The State Ministry of Health was involved in the plan's conceptualization and development. This participatory approach enabled capacity transfer to the State actors. The innovation also stimulates the full participation of communities - a key element of country ownership.
As a result, across the two facilities; 11,750 USD was mobilized within three months to close the financial gap and these funds have since been used to procure laboratory reagents to serve as seed stock for the laboratory revolving fund.
**Conclusions/Next steps:** Countrywide, Government is mobilizing more resources to support the HIV/AIDS response. As States pursue this path, they are trying out innovative mechanisms. The concept of the facility resource mobilization plan should be backed by Government policy and scaled up to other health facilities as it has the potential to realize a sustainable HIV/AIDS program.

## TUPEE585

### IMPLEMENTING A CONCEPTUAL FRAMEWORK FOR STIMULATING DOMESTIC FINANCING FOR HIV/AIDS RESPONSE: A MULTI-SECTORIAL FINANCING SOLUTION

G. Alawode[1], E. Baruwa[2]
*[1]Abt Associates/Health Finance and Governance, International Health Division, Abuja, Nigeria, [2]Abt Associates/Health Finance and Governance, International Health Division, Bethesda, United States*
*Presenting author email: galawode@yahoo.com*

**Background:** Nigeria has the second largest burden of HIV/AIDS in the world (approximately 3.4 million infected) and external financing accounts for over 75% of its HIV/AIDS resources. In order to close the resource gap, USAID's Health Finance and Governance (HFG) project supports selected states (Lagos, Akwa Ibom, Rivers and Cross River) in Nigeria to implement a set of HIV/AIDS financing interventions.
**Description:** The HIV/AIDS domestic resource mobilization initiative is based on a framework of five related and concurrent interventions:
1) resource planning (how much do we need and why?);
2) resource mobilization (how do we raise the money and from where?);
3) resource allocation (how do we program to achieve technical and allocative efficiency?);
4) resource tracking (how do we demonstrate accountability); and
5) resource utilization (how do we demonstrate value for money?).
Interventions implemented so far include HIV/AIDS financial and gap analysis, high level advocacy for budget allocation and disbursement, HIV/AIDS resource mobilization strategy development and HIV/AIDS resource tracking. Such interventions are commonly implemented individually but HFG is employing a holistic, multi-sectoral approach engaging a range of stakeholders and building skills from advocacy through to demonstrating value for money such that each year's program can effectively be used as advocate for budget increases in the next year.
**Lessons learned:** Following the HFG interventions, supported states significantly increased allocation to HIV/AIDS response. In the last year, Lagos and Cross River states increased their HIV/AIDS allocations by 39.5% and 24.1% respectively, overcoming the widely held notion that HIV/AIDS funding is the exclusive domain of development partners. Governments of the intervention states are committed to the HIV/AIDS response but continued advocacy, coordination, planning, financial management and evaluation are needed.
**Conclusions/Next steps:** Implementing the HIV/AIDS domestic financing framework demonstrates potential for stimulating domestic financing to narrow the HIV/AIDS resource gap and achieve long term sustainability. If applied to the entire health sector, this model could stimulate improved financing for the sector which in turn would produce further increases in HIV/AIDS financing.

## TUPEE586

### THE GLOBAL HEALTH INITIATIVE INFLUENCE OVER THE EXISTENCE AND ROLE OF CIVIL SOCIETY ORGANIZATION IN HIV CONTROL IN INDONESIA

G.V. Simanullang[1], A. Sutrisna[1], K. Apriyana[1], A. Gabriella[1], I. Praptoraharjo[1,2]
*[1]AIDS Research Center Atma Jaya Catholic University of Indonesia, Research Center, Jakarta, Indonesia, [2]Center of Health Policy and Medicine Gajah Mada University, AIDS Research, Yogyakarta, Indonesia*
*Presenting author email: praptoraharjo@gmail.com*

**Background:** Foreign grants for HIV-AIDS programs in Indonesia have been part of the Global Health Initiatives (GHI). Results from previous researches related to the GHI showed that the GHI not only brings positive impact but also negative ones towards the healthcare system in grant-receiving countries. The role of CSO in AIDS programs in Indonesia in the future becomes important considering the diminishing funds from the GHI will surely threaten the continuity of existing programs. Therefore the objective of this research is to understand the influence the GHI has over the existence and role of CSO in HIV-AIDS response in Indonesia.
**Methods:** A qualitative approach was developed using interview guides and self-assessment matrixes that are specifically used to answer the research objectives. The information gathered are about the existence and role of CSO in HIV-AIDS programs in Indonesia both in their partnership with the GHI, policy development, providing healthcare services and references along with advocacy activities. Twenty three CSOs, ten regional institutions and five GHI where interviewed in six Indonesian cities with CSOs working in the field of HIV and AIDS.
**Results:** The GHI has played an important part in providing insights and benchmarks for the government and CSO so that HIV-AIDS programs especially those related to healthcare services and prevention had developed swiftly and had been accepted by the general public for the past year. The dependency of HIV-AIDS programs to the donors affected the work orientation of CSO so that they are trapped in short-term projects. Only a few CSO are preserving the organizational value and culture as the core spirit of their every movement and organization program. The lack of knowledge management and learning from the works done made the CSOs seem to make fewer contributions to theories of change in human development especially for their assisted groups.
**Conclusions:** Findings from this research indicates that aside from the highly important role that the GHI holds for HIV-AIDS response efforts in Indonesia, the influence GHI holds towards the existence and role of CSO is extraordinarily strong, it can even affect the foundation, vision, mission, and objective of the CSO.

## TUPEE587

### MERCOSUR JOINT PRICE NEGOTIATIONS: A TOOL TO INCREASE ACCESS AND SUSTAINABILITY OF AIDS PROGRAMMES

J. Vieira Borges Vallini[1], J.M. do Nascimento Junior[1], F. Viegas Neves da Silva[2], J. Dell'Agnolo[1]
*[1]Ministry of Health of Brazil, Brasília, Brazil, [2]Ministry of Health of Brazil, International Affairs Office, Brasília, Brazil*
*Presenting author email: francisco.viegas@saude.gov.br*

**Background:** In June 2015, in Brasilia, the Ministers of Health from MERCOSUR (Argentina, Brazil, Uruguay, Paraguay and Venezuela) and Associated States (Bolívia, Chile, Colombia, Ecuador, Peru and Suriname) issued a Declaration concerned about the soaring costs of medicines. One issue was the price disparity in Latin America and its impact on access, in particular medicines for HIV/AIDS and hepatitis. In the Declaration they mandated a working group (WG), comprised of representatives from MOH from MERCOSUR, to identify alternatives and opportunities to address this issue, especially joint negotiation schemes.
**Description:** In September 2015, the Ministers of Health signed an agreement to established an *Ad Hoc* Committee for Joint Price Negotiation for Medicines. It established that:

Tuesday 19 July Poster Exhibition
Wednesday 20 July
Thursday 21 July
Friday 22 July
Late Breaker Posters
Author Index

1) the countries would jointly negotiate the prices of selected medicines by pooling their demands;
2) the pharmaceutical companies should provide the same price for all countries;
3) the ceiling price would be the lowest price applied to any country in Latin America;
4) the purchase and distribution of the selected medicines would be made through the Pan-American Health Organization (PAHO) Strategic Fund.

**Lessons learned:** The first round of negotiations took place in Paraguay in November 2015. It focused in Darunavir and Sofosbuvir, Simeprevir and Daclatasvir. In relation to DRV the price reduction was of more than 83% for some countries, amounting for a total estimated saving of US$ 20 million. Regarding Sofosbuvir, Simeprevir and Daclastavir, medicines for Hepatitis C, the negotiation is still on-going, since the pharmaceutical companies' didn't provide adequate prices. The expectation is to have another round of negotiations. It was proven that the mechanism shown results for single-source medicines that usually are less likely to obtain price reductions.

**Conclusions/Next steps:** This 1st Round of Joint Negotiation highlighted the medicines price disparity in Latin America, but also demonstrated that pooling demands and standing together can result in significant price reductions. It also contributes to increase access and to the sustainability of the national health system. Additionally, it has reaffirmed the importance of PAHO's Strategic Fund as a cooperative mechanism that can enable countries to get fairer and more homogeneous prices for the countries in the Region.

## TUPEE588

### SHOULD SOUTH AFRICA INTEGRATE HIV FINANCING INTO NATIONAL HEALTH INSURANCE, AND HOW? A FRAMEWORK-DRIVEN APPROACH TO FACILITATING POLICY DIALOGUE

M. Chaitkin[1], T. Guthrie[2], A. Ishtiaq[1], A. Kamath[1], N. Blanchet[1], R. Hecht[1], E. Morah[3], E. Kiwango[3], N. Tavanxhi[4], J.-A. Izazola[4], collaborating with Y. Pillay and A. Pillay, Nat'l Dept. of Health, and M. Blecher and A. Kollipara, Nat'l Treasury
*[1]Results for Development Institute, Washington, United States, [2]Independent Consultant, Cape Town, South Africa, [3]UNAIDS, Pretoria, South Africa, [4]UNAIDS, Geneva, Switzerland*
*Presenting author email: mchaitkin@r4d.org*

**Background:** As South Africa prepares to implement National Health Insurance (NHI), the National Treasury and the National Department of Health are exploring how to incorporate funding for the country's HIV program—which accounts for nearly 30 percent of government spending on primary health care (PHC)—into a future NHI Fund. To help policymakers consider various approaches to financially sustaining the country's HIV response, we conducted a feasibility study of integrating HIV and other health financing.

**Methods:** First, we characterized South Africa's health financing system, including the extent of integration across the financing functions of revenue collection, pooling, and purchasing. Second, we constructed five integration scenarios ranging from the devolution of health funds to the creation of a national PHC fund. Each scenario contained a distinct configuration of health financing pools and governance arrangements. Third we evaluated the scenarios' likely impact—their effect on the HIV response, PHC services, and health system efficiency—and legal, political, and technical feasibility. For these three steps we reviewed relevant literature and government documents and data, as well as interviewed senior officials responsible for HIV and PHC services, NHI policy design, and social sector spending. Finally, we convened policymakers to discuss findings and identify options for further study and possible implementation.

**Results:** The exercise illustrated a useful analytical and consultative process to scoping policy options by combining a theory-driven approach to understanding financing integration with a practical application to ongoing policy debates in South Africa. We charted different pathways available to policymakers for integrating HIV and other health financing, as well as highlighted potential drawbacks of altering the status quo. The scenarios captured considerable variation in both their feasibility and impact on health system performance. Without recommending any one scenario, we provided a useful foundation for debate and planning among senior officials.

**Conclusions:** We demonstrated that a consultative process to develop financing integration options tailored to country context can advance policy dialogue at the most senior levels of government. We will next apply lessons from South Africa to adapt the consultative process and assessment framework to Kenya and other countries working to sustain their HIV programs.

## TUPEE589

### AN INNOVATIVE OPPORTUNITY TO TAP: USE OF DOMESTIC RESOURCES FOR HIV RESPONSE HEALTH CARE FINANCING IN TANZANIA

K. Madege[1], P. Malunde[1], B. Kilama[1], D.Z. Chaula[2], P. Swai[3], J. Eshun[1], M. Njelekela[1]
*[1]Deloitte Consulting Limited, Project Management-TUNAJALI, Dar es Salaam, Tanzania, United Republic of, [2]President's Office Regional Administration and Local Government, Dodoma Regional Hospital, Dodoma Municipal Council, Tanzania, United Republic of, [3]USAID Tanzania, Dar es Salaam, Tanzania, United Republic of*
*Presenting author email: casmadege2013@hotmail.com*

**Background:** In low- and middle-income countries, national health systems face financial sustainability challenges as donor funding declines. Donor dependence is particularly high for HIV programs including Tanzania. In Tanzania combined donor assistance to HIV programs amounted to average of 95% of total HIV funding every year. The NHIF and CHF together cover 5,867,140 beneficiaries, which is approximately 13.6% of the total population in the mainland (MOHSW 2012).This shows that direct support from the government is at 5% excluding in-kind or indirect costs such as infrastructure, human resources, transport as well as health system.
Management of HIV has long-term implications for treatment costs as it requires medical attention in patients' lifetime. Also, as an infectious disease, it requires sustained financial resources for prevention. To address potential non-donor funding resources for national HIV responses in Tanzania, Deloitte Tanzania TUNAJALI (USAID/PEPFAR Project) introduced resource mobilization interventions using domestic sources in Dodoma Regional Hospital as a pilot site by collecting funds from HIV clients using National Health Insurance Fund and Community Health Fund. This intervention was initiated as alternative source of revenues needed to complement government efforts.

**Description:** The alternative source of fund was collected and measured using service statistics data collected during client's visits in their HIV Care Service point (CTC). The revenues collected was utilized for medical supplies and other related services.

**Lessons learned:** The NHIF and CHF fund for 2015 was collected through 3,711clients' visits amounting to USD 64, 285.17. About 13% of the total fund used for care and treatment service at Dodoma Regional Hospital is now obtained from own source. The table below narrates two year activities.

| Period | Visits | Visits with NHIF/CHF | Revenue collected (USD $) |
|---|---|---|---|
| Jan-Dec 2014 | 14279 | 784 | 3,570.12 |
| Jan-Dec 2015 | 20386 | 3711 | 64,285.17 |
| Total | 34665 | 4495 | 67,855.29 |

*[Number of CTC clients visits and revenue collected Jan 2014 - December 2015]*

**Conclusions/Next steps:** Stepping the pace for domestic resources is vital for continued health related HIV outcomes. Health Facilities may use funds from NHIF and CHF for health service provision and improve retention of the PLHIV.

## TUPEE590

### IS PEPFAR FUNDING MOVING FROM INTERNATIONAL TO LOCAL? ANALYSIS OF FUNDING FOR IMPLEMENTING PARTNERS IN PEPFAR COUNTRIES/REGIONS, 2007-2015

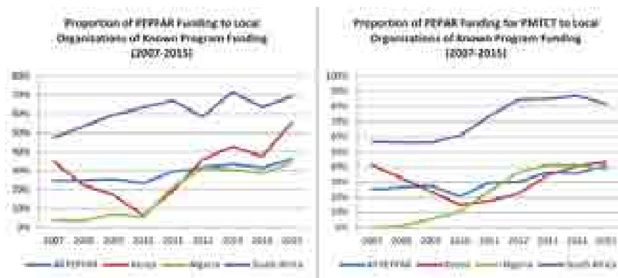
J. Kates[1], B. Honermann[2], G. Millett[2], J. Sherwood[2], C. Chandra[2], L. Lazar[2], J. MacAllister[2], K. Lindsey[2]
*[1]Kaiser Family Foundation, Washington, United States, [2]amfAR, Public Policy Office, Washington, United States*
*Presenting author email: jenniferk@kff.org*

**Background:** Critical to PEPFAR's ability to achieve long term gains in controlling the HIV epidemic is creating sustainable local responses and increasing country ownership. This analysis looks at PEPFAR funding between 2007-2015, stratified by international or local implementing partner.

**Methods:** Utilizing amfAR's Country Operational Plan (COP) Database, we categorized all implementing partners who have received at least $1 of funding in any year between 2007 and 2015 as "International", "Local", "US government (USG)", or "unknown (NA)". Data were broken out by country, year, organizational type, funding agency, program area, and budget code.

**Results:** Over the 2007-2015 period, the proportion of total COP funding directed to local organizations increased from 21% to 29%. Of funded local organizations, 50.65% were NGOs followed by Host Country Governments (29.36%). Funding for international organizations proportionately decreased from 64% in 2007 to 50% in 2015, largely driven by a subset of countries that receive the majority of PEPFAR funding, including South Africa, Kenya, and Nigeria. This shift also occurred in some service areas, including prevention of mother to child transmission. Nevertheless,

in only a handful of countries (n=5) was the plurality of 2015 funds provided to local organizations, and in only 6 did local organizations receive greater funding than international organizations.



[Figure 1]

**Conclusions:** The extent to which PEPFAR, and other international HIV donors, increase country-level capacity is essential for achieving sustained control of local HIV epidemics. Our analysis provides firm evidence that PEPFAR has begun to shift funding from international to local organizations. However, most funding overall remain channeled to international organizations. Continued tracking of such shifts will be important for assessing future prospects for sustainability of the local HIV response.

## TUPEE591

### SUSTAINABILITY OF THE PROGRAMS IN FIGHTING AIDS IN SERBIA WHICH WERE CONDUCTED WITHIN ROUND 1, ROUND 6 AND ROUND 8 AFTER ENDING OF PROJECTS FUNDED BY THE GLOBAL FUND

N. Maksimovic[1], D. Lazarevic[2]
*[1]Yugoslav Youth Association Against AIDS, Belgrade, Serbia, [2]Youth of JAZAS Novi Sad, Novi Sad, Serbia*
*Presenting author email: nebojsa.maksimovic@jazas.rs*

**Background:** Global Fund approved for Serbia financing of the following HIV projects:
2002, Round 1 - 3.575.210.00 USD
2006, Round 6 - 9.557.094 EUR
2009, Round 8 - 12.406.231 EUR
All projects were five-year projects and were closed down in 2014. Through funds from Global Fund overall national response to the HIV epidemics had been financed, including the creation of two five-year national strategies. The only remaining activity that the government continuously financed itself was the procurement of medicines for ART.
During the year following the withdrawal of GF from Serbia, the majority of activities realized through project funds ended.
**Description:** Activities in fight against HIV which the GF financed during its 12 - year presence in Serbia were expected to continue within the framework of National AIDS Response.
In 2014, a closeout period was carried out aimed to finalize the ongoing projects and to create the exit strategy through which the implementation of activities would be transferred to the stakeholders in the country. However, after close out period, nearly all the ongoing activities discontinued.
By the end of 2015, not a single NGO (out of more then 30 organisations that were carrying out activities of the project in Serbia) continued its work previously performed in the GF project. (Except few organizations which were granted small programs by the local community).
**Lessons learned:** Regretfully, the GF financed projects in Serbia did not include sound sustainability plans and proper exit strategies.
**Conclusions/Next steps:** When creating programs, Global Fund should consider long term trends of the national response that applying countries show in fight against HIV, to make sure that the funded activities are better fit into existing national response to the epidemics of HIV and that from the very beginning of the project implementation sustainability is incorporated as the most important aspect of the program in all the countries in which it finances programs in order to make sure that the national response will continue to exist even after the GF ends financing of these countries. Obviously this would require repositioning of the approach that the Global Fund currently has when evaluating national applications.

# NATIONAL FINANCING INITIATIVES

## TUPEE592

### PATIENT THANKSGIVING INITIATIVE AS A FUNDRAISING STRATEGY FOR MEETING PATIENTS' OTHER NEEDS: TASO RUKUNGIRI EXPERIENCE

N. Nuwamanya Ruta[1], A. Kateeba[2]
*[1]The AIDS Support Organisation (TASO) Uganda Limited, Pyscosocial, Kampala, Uganda, [2]The AIDS Support Organisation (TASO) Uganda Limited, Advocacy, Kampala, Uganda*
*Presenting author email: nuwamanyan@tasouganda.org*

**Background:** The AIDS Support Organization (TASO) Uganda Limited has supported over 100,000 active HIV positive people to access Services Since 1987. TASO Rukungiri one of the centers started in 2005 and is supporting 15,617 active HIV positive persons. Over years there has been success in raising funds to support client's needs but the gap between centre demand and available resources remains high. TASO Centers were tasked by senior management to come up with initiatives aimed at increasing resource envelope to run other non donor funded activities.
**Description:** We identified different avenues from which thanksgiving to keep critical services running would be held namely; Center Annual General Meetings (AGM), candle light Memorial Day, World AIDS day, staff briefs and general staff meetings to mention but a few. Focal person was identified to request consent of clients to participate voluntarily in the initiative and also to keep track of collections from thanksgiving. Clients were also encouraged to give personal testimonies related to Living with HIV and to appreciate that there's no greater joy than seeing someone invest in something they deeply care about. Reports presented to the stakeholders for accountability and ways to utilize the funds are suggested by staff and clients. 35 thanksgiving events were held since January 2015 to January 2016.
**Lessons learned:** In one year (4th January 2015 to 31st January 2016), 1,170,950Ugandan shillings has been raised.
We have also noted increased willingness to give/donate at all TASO events.
The funds collected have enabled TASO Rukungiri to link 70 needy clients' households to community health insurance scheme and recruitment of more needy households continues.
The initiative has boosted the resource envelope for the centre to also give financial support to non-medically insured needy clients who fail to meet medical bills in case of admission.
**Conclusions/Next steps:** Strategies aimed at addressing financial constraints like patient thanks giving increase the resource envelope to meet clients' 'other' needs in resource limited settings.

## TUPEE593

### IMPACT OF DECENTRALIZED AND REDUCED GOVERNMENT FUNDING ON HIV/AIDS PROGRAM FOR MSM AND TG POPULATION IN INDIA

R. Salvi[1], V. Anand[2], H. Mhaprolkar[1]
*[1]The Humsafar Trust, Mumbai, India, [2]The Humsafar Trust, CEO, Mumbai, India*
*Presenting author email: richasalvi.hst@gmail.com*

**Background:** According to 2011 HIV Sentinel Survey, the national mean HIV prevalence among transgender people (8.8%) and men who have sex with men (4.4%) was about 10-20 times greater than that among the general population. However a shift from centralized to decentralized government funding mechanism has posed challenges in implementation of HIV prevention programs for MSM and TG.
**Description:** Until July 2014 all targeted interventions (TIs) received funds from State AIDS Control Societies (SACS) through National AIDS Control Organization (NACO). After NACO merged with health ministry in August 2014, funds were diverted to state treasuries instead of SACS. In Feb 2015, total budget for HIV/AIDS control was reduced by 22%.This resulted into reduced and delayed fund disbursements thus affecting delivery of services to the communities.
The Humsafar trust through GFATM R-9 MSA grant provides technical support to MSM and TG - projects in 10 states and 1 union territory. In 2015, it was observed that 11 projects in Assam, 4 in Nagaland, 2 in Jammu and Kashmir, 4 in Arunachal Pradesh, 3 in Himachal Pradesh and 8 in Uttaranchal had not received grants for more than 6 months. 7 TIs in Chhattisgarh, 3 in Chandigarh, 2 in Mizoram and 1 in Tripura received consolidated grants for 6 months in September 2015 covering only staff salaries.14 out of 16 projects in Haryana have been closed.
**Lessons learned:** MSM and TG interventions are managed by small NGOs and during fund crunches these NGOs continued working by taking loans from their board members and small corpus to sustain human resources and operational costs with lesser allocation towards service delivery.
**Conclusions/Next steps:** The states under consideration have hidden MSM and TG population who are hard to reach. TIs had successfully reached out to this population through outreach strategies. High turnover of staff especially peer educators

and outreach workers has affected outreach program and has increased risk of HIV transmission among MSM and TG population due to unavailability of prevention services. Timely and adequate disbursement of funds by states is need of the hour to implement HIV/AIDS prevention program for MSM and TG population.

## Transitional financing

### TUPEE594

#### Guiding principles for transitional financing: examining key features of donor-country agreements for sustainable financing of the HIV & AIDS response

T. Ryckman[1], N. Oomman[2], A. Kamath[1]
*[1]Results for Development Institute, Washington, United States, [2]Independent Consultant, Washington, United States*
*Presenting author email: akamath@r4d.org*

**Background:** As donor assistance for HIV plateaus and even decreases, low- and middle-income countries must start planning for a transition away from donor financing. One promising tool to promote financial sustainability and uninterrupted service delivery is a well-developed, explicit agreement between countries and donors outlining programmatic and financial responsibilities and specifying mechanisms for accountability. Such an agreement can be an important means of clarifying roles and ensuring that all actors deliver on commitments. The objective of our study is to establish key guiding principles for designing transition agreements to improve government and donor policies on agreements and ensure smooth and sustainable transitions.
**Methods:** The study utilizes grounded theory to analyze qualitative data gathered from 21 donor-country agreements and key informant interviews with stakeholders from PEPFAR, the Global Fund, the World Bank, and the MCC. We identified key features relating to the roles of donors and government, inputs for planning and budgeting, and mechanisms for accountability, to identify guidelines and processes that are salient to the HIV financing transition. For each feature, we analyzed current donor practice, identified a standard to follow, and developed a guiding principle.
**Results:** The broad guiding principles identified are:
1. Duration of agreement: set a standardized time period for all agreements
2. Actors involved: select a key financing or high-level political authority as the country signee
3. Financing targets: specify domestic and external commitments for the duration of the agreement
4. Inputs for target setting: ground financing commitments in country strategies, quantitative approaches, and country dialogue
5. Monitoring and evaluation: identify expenditure tracking tools and processes to monitor financing commitments
6. Potential consequences: specify mutual consequences for not meeting commitments
**Conclusions:** The guiding principles provide a clear course for the development of donor-country agreements for sustainable financing for HIV. To strengthen the guidance, we are undertaking an analysis—complete in May 2016—of the HIV transition in Namibia, to identify successes, challenges, and lessons learned that can be extrapolated to other transition settings and used to ground the guidance in country experience. Our findings will help enable more smooth and sustainable HIV transitions moving forward.

## International assistance, frameworks and funding mechanisms

### TUPEE595

#### Diagnostics at a discount? An analysis of tiered pricing for HIV diagnostics

E. Schaffer
*University of North Carolina, Health Policy & Management, Chapel Hill, United States*
*Presenting author email: emschaff@live.unc.edu*

**Background:** Most people living with HIV do not reside in the same countries where technologies for combatting HIV/AIDS are produced. In order to account for the differential ability of consumers across the globe to pay for important health products, firms might employ strategies of tiered pricing. In this analysis, I sought to determine whether national income is associated with the price at which diagnostics to detect HIV are purchased.
**Methods:** Transactional data were obtained from the Global Fund to Fight HIV/AIDS, Tuberculosis, and Malaria for purchases of HIV tests by recipient countries from 2005-2015. Examining the distribution of prices for HIV tests, I constructed three tiers to reflect purchases made at low, middle, and high prices. I employed an ordered logit model to determine whether gross national income per capita is associated with purchasing diagnostics at each price tier. As covariates, I included national HIV prevalence, purchase volume, whether diagnostics were procured directly from the manufacturer, whether freight costs were embedded in the price, and the year of purchase.
**Results:** Prices for diagnostics to detect HIV varied considerably. On average, HIV tests purchased at a low price tier cost 0.48 USD per test ($SD$=0.26). At a middle price tier, HIV tests cost 1.00 USD per test ($SD$=0.18) and at a high price tier, HIV tests cost 4.19 USD per test ($SD$= 9.30). As national income increases, recipients of Global Fund assistance are more likely to purchase HIV tests at low prices (p< .05) and are less likely to purchase HIV tests at high prices (p< .05).
**Conclusions:** Contrary to expectation, I did not find evidence that HIV tests are differentially priced to account for the varying ability of consumers to pay for these products. Rather, it appears that low-income countries are less likely to purchase HIV tests at low prices and that as income increases, countries are more likely to purchase HIV tests at low prices. Despite arguments that strategies of tiered pricing could enhance access to important health products while preserving profits, these findings suggest that such strategies do not dominate global pricing for HIV tests.

### TUPEE596

#### Most impacted least served: meaningful engagement of transgender people in Global Fund processes

A. Sarkar[1,2], J. Keatley[2,3]
*[1]India HIV/AIDS Alliance, Programme, New Delhi, India, [2]IRGT: A Global Network of Transgender Women and HIV, Oakland, United States, [3]The Center of Excellence for Transgender Health, San Francisco, United States*
*Presenting author email: amitava_kolkata@yahoo.co.in*

**Background:** Globally transgender people are vigorously affected by HIV/AIDS. Social stigma, punitive laws, lack of community friendly services and resources, less or no opportunity for being in the decision making process made them unserved regarding HIV response. A global study, undertaken by IRGT, A Global Network of Transgender Women and HIV, has helped to identify the extensive barriers to address transgender specific needs in HIV epidemic and what has been the mechanism undertaken for engaging transgender people by key donors such as Global Fund.
**Methods:** Apart from study and literature review, semi-structured interviews were conducted with transgender community activists from different parts of the globe, data were collected from civil society organization (CSO) representatives, and officials from the Global Fund and other major HIV donors. The study has unfolded the different needs and challenges faced by the transgender community throughout the globe, the current scenario of the HIV epidemic among the transgender population and also the strategies adopted by the key donor agencies.
**Results:** Five key findings revealed in interviews around the meaningful engagement of transgender people in Global Fund processes,
1) Data collection with and among trans people;
2) Tokenistic engagement of trans people in Global Fund processes;
3) Capacity-building, organizational development, and social support;
4) Global Fund withdrawal from middle income countries; and
5) Critical role of global and regional networks of trans advocates.
**Conclusions:** In recent years, Global Fund initiated activities to increase the meaningful engagement of transgender people in their programme implementing process. Five recommendations listed to ensure more meaningful engagement of transgender people are -
1) Support trans-specific data collection and engagement
2) Recognize and reinforce the engagement of trans activists and organizations as technical and community experts contributing to Global Fund processes
3) Ensure that Global Fund withdrawal from middle income countries does not undermine trans programming and engagement
4) Reinforce capacity and development of trans activists and organizations and
5) Finance and work with global and regional trans networks to increase the meaningful
engagement of trans people, improve gender sensitivity, and advance policy change

## Effect of health insurance schemes and other support models on access, adherence, and outcomes

### TUPEE597

### Public and private sectors collaboration for increased access to treatment

F. Dube, A. Manenji, T. Magure, M. Dube, A. Mpofu
*National AIDS Council, Harare, Zimbabwe*
*Presenting author email: fdube@nac.org.zw*

**Background:** The National AIDS Council utilises 50% of its AIDS Levy income on treatment and care, which include procurement of ARVs. These ARVs have been available for free, even to workers whose medical aid covers ARVs. Unfortunately, due to self stigma and lack of time to present at public facilities, workers would be forced to rely on medical aid, and in this process have to pay additional costs after busting medical aid limits due to high prices in the private sector.
**Description:** Noting these challenges, the National AIDS Council and its partners initiated a partnership called ***Increased Access to Treatment***, wherein NAC procures comparatively cheaper ARVs in bulk. The ARVs are stored at the National Pharmaceuticals Company, and accessed by private pharmacies and doctors. There is a small mark up percentage charged along the chain, taking the price from US$10 at importation to below US$17 retail.
Effectively, this arrangement has reduced the price of ARVs on the private scheme from at least US$70.00 per person per month to not more than US$17.00 for the TLE combination. The National AIDS Council invested US$1,5 million at the start of the partnership and has now recovered USD1 million, which is the past was considered spent money. The recovered amount has been re-invested into procurement of new drugs. Over 100 pharmacies across the country are currently participating, with opportunities for growth as new pharmacies join in.
**Lessons learned:** Patients on medical aid are unlikely to exhaust their annual drug limit. The productive capacity of the patients is improved as they no longer wait long hours queuing for treatment in public facilities, while decongesting public facilities. At the same time national resources are saved as funders reduce expenditure on ART prescription. Additionally, the initiative addresses stigma and discrimination as clients on medical aids access services in confidential circumstances. As a domestic and sustainable funding system, the initiative has enabled the underfunded NATPHARM to raise over USD150, 000 in administration fees.
**Conclusions/Next steps:** Public and private sectors collaboration has increased domestic funding contribution to treatment and created an opportunity for funding other essential drugs for cancer and TB.

## Effects of financial crises

### TUPEE598

### Effects of the introduction of cost-sharing in HIV treatment due to donor funding reduction on the people living with HIV (PLHIV) utilizing antiretroviral clinics in Ibadan, Nigeria

E. Walker, M. Salawu, M. Adebanjo
*Initiative for Integrated Community Welfare in Nigeria, Research and Development, Ibadan, Nigeria*
*Presenting author email: iicwin2005@yahoo.com*

**Background:** The donor agencies are largely responsible for the costs of antiretroviral treatment (ART) - laboratory investigations and medicines - in Nigeria and other developing countries. This resulted from advocacy by global civil societies including the community of PLHIV. The downturn in global economy and changing policies in the western countries led to the scaling down of support for free treatment. This resulted in the introduction of cost-sharing for laboratory investigations while ART medicines remain free in Ibadan ART centres. This study explored the effects of cost-sharing for HIV/AIDS treatment on PLHIV utilizing such ART services.
**Methods:** This qualitative study was conducted among PLHIV in 5 ART Centres (3 paying and 2 non-paying) in Ibadan. Using a developed Guide, 2 Focus Group Discussions (FGD), 1 male and 1 female, were conducted per centre. The discussions explored the effects of cost-sharing on PLHIV in facilities that introduced payment for investigations. Data were analysed using the thematic approach.
**Results:** The mean age of participants was 40 years. Three ART Centres introduced cost-sharing 4-10 months before this study. PLHIV part-paid for biochemical and hematologic investigations and purchased opportunistic infections medicines. The ART medicines and virologic/ immunologic investigations remained free. The policy was 'no cost-sharing for laboratory investigations, no free antiretroviral medicine'. The costs paid was 2000 - 12000 Naira ($7- $45) in anual, biannual or monthly installments. Children paid 500 Naira ($2.5) monthly in one centre. Following cost-sharing introduction, PLHIV reported widespread payment difficuties resulting in drastic changes in treatment quality; strained caregiver/PLHIV relationships; hopelessness and depression; increased loss to follow-up; irregular clinic attendance; delayed treatment initiation among new PLHIV; worsening clinical conditions and increasing deaths. Difficulties with paying resulted from poverty, unpreparedness for the change, non-disclosure to potential supporters, and spousal refusal to assist. There seems to be no gender differences in their experiences. PLHIV requested the government to sustain free services, or provide realistic economic empowerment.
**Conclusions:** The introduction of cost-sharing due to dwindling donor funding is causing disruptions in ART services and impacting adversely on the PLHIV. The governments need to intervene promptly with alternative funding mechanisms to curb the emerging public health crisis.

## Economic evaluation of prevention, treatment, and/or care programmes

### TUPEE599

### Patient costs of antiretroviral treatment for men who have sex with men (MSM) in Jiangsu province, China

H. Yan[1], D. Ji[2], M. Yang[3], L. Ye[4], W. McFarland[5], J. Li[1], X. Huan[1], H. Yang[6]
*[1]Jiangsu Provincial Center for Diseases Control and Prevention, Institute of HIV/AIDS/STI Prevention and Control, Nanjing, China, [2]Southeast University, Department of Public Health, Nanjing, China, [3]Nanjing Medical University, Nanjing, China, [4]Zhenjiang Municipal Center for Diseases Control and Prevention, Zhenjiang, China, [5]University of California San Francisco, Department of Epidemiology and Biostatistics, San Francisco, United States, [6]Jiangsu Institute of Parasitic Diseases, Wuxi, China*
*Presenting author email: yanhongjing@hotmail.com*

**Background:** China's National Free Antiretroviral Therapy program has treated about 420,000 people living with HIV/AIDS since 2002, reducing mortality from 10.7% in 2010 to 5.6% in 2015. The cost-effectiveness of ART encouraged the Chinese government to scale up free ART. However, little data on costs of ART beyond free first and second-line medicine for patients exist, especially among MSM who account for a growing proportion of the epidemic in China.
**Methods:** A cross-sectional survey on costs of ART was conducted in 2015 in three cities of Jiangsu province, China. MSM registered in the national ART management system and had taken ART for at least 1 year (initiated on or before December 31, 2013) were enrolled. ART clinic physicians contacted MSM and conducted a structured interview at the time of picking up medicine or at a scheduled appointment to collect information on patients' direct and indirect costs incurred in obtaining ART in 2014. Information of the direct costs included direct medical expenditure such as routine examination, medical care and costs of treating side-effects of drugs and AIDS-caused opportunistic infections (OI), and direct non-medical costs such as transportation costs. Indirect costs included patients'/family members' lost wages and lost jobs. Differences in costs between groups were compared using the Wilcoxon rank sum test. In a generalized linear regression model, total costs were log-transformed.
**Results:** Of 1,003 eligible MSM identified, 845 were interviewed. Median age was 36 years, median monthly income was between 313-781 USD. 83.5% had insurance. Viral load was < 1000 copies/uL for 94.2% in 2014. The overall annual median cost of ART for MSM was 146 USD (IQR: 84-340).Main expenditures were from direct medical costs (88USD, IQR 57-200), followed were direct non-medical costs (13 USD, IQR 3-38). No indirect costs were paid by patients and their family members. Generalized linear regression found total patient cost of ART significantly higher early in treatment (F=48.52, P<0.0001) and in those with OI (F=39.63, P<0.0001).
**Conclusions:** Most MSM paid less than 150 USD per year to obtain ART in Jiangsu province, China. Our findings suggest that expansion of earlier HIV treatment among Chinese MSM is financially feasible to the patient.

### POTENTIAL COST SAVINGS IN REDUCING ANTIRETROVIRAL REFILL SCHEDULES FOR STABLE PATIENTS ON ANTIRETROVIRAL THERAPY AT TASO, UGANDA

G. Karukoma[1], S. Okoboi[2]
*[1]The AIDS Support Organization, Finance and Administration, Kampala, Uganda,*
*[2]The AIDS Support Organization, Research and Evaluation, Kampala, Uganda*
*Presenting author email: okoboi25@gmail.com*

**Background:** TASO runs antiretrovirals (ARV) refill appointment for stable clients after monthly, bi-monthly and quarterly periods. This was implemented after noting an increase in patients who would attend at random for refills. These routine refill appointments were aimed to reduce the frequency of client attendance for drug refills and clinical checkups for stable patients on ART. TASO examined the potential cost savings during two, three month and 6 month refill schedules to refill patients' ARVs.
**Methods:** We identified the drivers of treatment costs per patients in TASO, which included staff wages, operational costs, medications, laboratory and training costs. A baseline cost was computed per patient using an average cost per visit based on 2012 cost analysis of $38.86USD per visit. The average patient visited TASO for ARV refill 6 times per year. This cost was used to estimate an annual cost of treatment based on the three frequencies of ARV refill. A stable patients is one who has disclosed serostatus, reports excellent adherence level and an CD4 above 350 cells/ml.
**Results:** For 2 month refill period based on six visits per patient per year will cost USD$233, three (3) months refill assuming reducing visit per patients from six to four per year with 33% savings in staff and operational costs based on the drivers of treatment costs identified above will cost USD $189, six (6) months refill assumes reducing visits per patients from four to two with 50% saving in staff and operational costs based on the cost drivers identified will cost US $146.
**Conclusions:** Increasing the duration between ARV drug refill appointments for stable patients has the potential of reducing cost for caring of HIV infected patients throughout TASO Uganda centers and in sub-Saharan Africa. Reducing appointment frequency from 2 to 6 months should be investigated for long-term stable patients that are virally suppressed and report good adherence levels. Future research should be conducted to explore possible extrapolation of these findings to other sub-Saharan African countries.

## TUPEE601

### CLINICAL OUTCOMES AND COST-EFFECTIVENESS OF ART MONITORING IN MOZAMBIQUE: CLINICAL, LABORATORY CD4, POINT-OF-CARE CD4 AND VIRAL LOAD STRATEGIES

E. Hyle[1], I. Jani[2], K. Rosettie[1], R. Wood[3], S. Resch[4], T. Peter[5], K. Freedberg[1], R. Parker[1], R. Walensky[1]
*[1]Massachusetts General Hospital, Boston, United States, [2]Instituto Nacional de Saúde, Maputo, Mozambique, [3]Desmond Tutu HIV Centre, Cape Town, South Africa, [4]Harvard T. H. Chan School of Public Health, Boston, United States, [5]Clinton Health Access Initiative, Gaborone, Botswana*

**Background:** Point-of-care CD4 tests (POC-CD4) expedite clinical decision-making but can be less accurate/precise and more expensive than laboratory CD4 (LAB-CD4). We examined the clinical and economic impact of POC-CD4 in Mozambique to monitor for ART failure, since HIV RNA is not widely available.
**Methods:** We used a validated model to simulate a cohort of HIV+ adults at ART initiation. Patients were monitored clinically (CLIN), with annual CD4 tests (LAB-CD4 or POC-CD4), or HIV RNA (VL). We examined 2 settings: without laboratories (POC-CD4 vs CLIN) and with laboratories (VL vs POC-CD4 vs LAB-CD4). The cohort was 63% female, mean age 30y (SD 10y), and median CD4 166/µl (IQR 78-226/µl). Table (left side) provides strategy-specific parameters. Model outcomes included life expectancy (LE), lifetime medical costs (both discounted, 3%/yr), and incremental cost-effectiveness ratios (ICER, $/year of life saved(YLS)). We varied POC-CD4 costs, test characteristics, time to adherence intervention or regimen-switch in sensitivity analyses. We considered ICERs < $600/YLS (2013 Mozambique *per capita* GDP) to be cost-effective.
**Results:** Without laboratories, projected LE increased from 11.68y (CLIN) to 12.96y (POC-CD4); lifetime costs increased from $3,860 (CLIN) to $4,580 (POC-CD4); the ICER was $560/YLS (Table, right side). Even at higher POC-CD4 costs or with delayed time lag, POC-CD4 remained near the cost-effectiveness threshold and improved outcomes compared to CLIN. With laboratories available, LE was 12.83y (LAB-CD4), 12.96y (POC-CD4), and 13.34y (VL); lifetime costs were $4,400 (LAB-CD4), $4,580 (POC-CD4), and $5,170 (VL), resulting in similar ICERs of $1,440/YLS and $1,550/YLS. At higher POC-CD4 costs, poorer POC-CD4 test characteristics, or longer POC-CD4 time-lags, POC-CD4 was dominated (reduced LE, higher costs); the ICER of VL vs LAB-CD4 decreased ($1,520/YLS).
**Conclusions:** POC-CD4 monitoring for ART failure improved clinical outcomes and was cost-effective in settings without laboratories. With laboratories available, ICERs of POC-CD4 and VL were similar (vs LAB-CD4); investments in VL should be prioritized.

| | Strategy | Model Input Parameters | | | | Model Output | | |
|---|---|---|---|---|---|---|---|---|
| | | Bias (%) | Precision (%) | Test cost ($) | Time lag* (months) | Life Expectancy (years) | Cost ($) | ICER ($/YLS) |
| No lab | CLIN** | N/A | N/A | N/A | 0/0 | 11.68 | 3,860 | - |
| | POC-CD4† | -4 | 19 | 13 | 1/11 | 12.96 | 4,580 | 560 |
| | SA: POC 2x cost | | | 26 | | 12.96 | 4,770 | 710 |
| | SA: POC +3m time lag | | | | 4/14 | 12.83 | 4,500 | 580 |
| Lab | LAB-CD4† | 0 | 15 | 10 | 4/14 | 12.83 | 4,400 | - |
| | POC-CD4† | -4 | 19 | 13 | 1/11 | 12.96 | 4,580 | 1,400 |
| | VL†† | 0 | 0 | 31 | 4/14 | 13.34 | 5,170 | 1,550 |
| | SA: POC 2x cost | | | 26 | | 12.96 | 4,770 | DOM |
| | SA: POC test characteristics | +20 | +25 | | | 12.90 | 4,600 | DOM |
| | SA: POC +3m time lag | | | | 4/14 | 12.83 | 4,500 | DOM |

Abbreviations: ICER, incremental cost-effectiveness ratio; YLS, year of life saved; CLIN, clinical strategy; POC-CD4, point-of-care CD4 strategy; LAB-CD4, laboratory CD4 strategy; VL, HIV RNA; N/A, not applicable; SA, sensitivity analysis; m, months; DOM, dominated (lower life expectancy, more costly).

* Time lag to adherence intervention / time lag to regimen switch.
** ART failure defined by a WHO Stage IV opportunistic infection occurring >12 months after ART initiation.
† ART failure defined by clinical criteria or if annual CD4 is <nadir, <100/µl or <50% of peak CD4 >12 months on ART; a 2nd confirmatory CD4 test was performed the following month if the 1st CD4 detected ART failure.
†† ART failure defined by clinical criteria or if annual HIV RNA is >setpoint, or >1,000 copies/µl.

*[Table 1. Projected clinical outcomes and cost-effectiveness of different monitoring strategies (white areas represent base case inputs and results; shaded areas are sensitivity analyses)]*

## TUPEE602

### HOW DOES THE COST OF PATIENT CARE CHANGE WITH THE INTRODUCTION OF ROUTINE VIRAL LOAD MONITORING? A MICRO-COSTING STUDY FROM KENYA

M. Bii[1,2], R. Langat[1,2], I. Kiptoo[1], F. Sawe[1,3,4], J. Maswai[1,2], D. Shaffer[1], B.A. Larson[5]
*[1]Kenya Medical Research Institute/Walter Reed Project, Kericho, Kenya, [2]HJF Medical Research International, Inc, Kericho, Kenya, [3]U.S. Military HIV Research Program, Walter Reed Army Institute of Research, Silver Spring, United States, [4]Henry M. Jackson Foundation for the Advancement of Military Medicine, Rockville, United States, [5]Boston University School of Public Health, Department of Global Health, Boston, United States*
*Presenting author email: margaret.bii@usamru-k.org*

**Background:** This paper evaluates the impact of introducing routine viral load monitoring (RVLM) at 6, 12, and 18 months on the cost of care for patients receiving antiretroviral therapy. Patient-level data come from a clinical trial of RVLM in Kenya (CLADE study).
**Methods:** A micro-costing approach, based on detailed patient medical records, was used to evaluate the costs of care (2012 $US) for each patient in each study arm through their first 18 months on ART (the per-protocol groups; Arm A: no RVLM, n = 336; Arm B: RVLM, n=321). Resources included in costs were ARV and non-ARV drugs, diagnostic tests, staff, and clinic fixed costs. The year 2012 is used for the costing analysis because the majority of patient follow up was during 2012. The unit cost of a viral load test in 2012 was $52.94, and the cost of a CD4 test was $9.41.
**Results:** Table 1 reports the average quantity of key resources used for patients in each study arm. Table 2 reports average costs of care for patients in each study arm.

| | Arm A (no RVLM) | Arm B (RVLM) | Difference (Arm B - Arm A) |
|---|---|---|---|
| Number of CD4 tests | 3.3 | 3.1 | -0.2 |
| Number of viral load tests | 0.08 | 3.9 | 3.82 |
| Number of visits patient seen by Doctor | 2.2 | 2.2 | 0.0 |
| Number of visits patient seen by Clinical Officer | 11.6 | 12.2 | 0.6 |
| Total months of first-line ARV regimens (3 most common below) | 19.7 | 19.3 | -0.4 |
| (#1: Fixed dose combination: D4T 30mg/3TC 150mg/NVP 200mg) | 6.0 | 5.3 | -0.7 |
| (#2: Fixed dose combination: AZT 300mg/3TC 150mg /NVP 200mg) | 5.4 | 6.1 | 0.7 |
| (#3: 2 pill combination: AZT 300mg/3TC 150mg + EFV) | 3.9 | 3.9 | 0.0 |
| Total months of second-line regimens | 0.1 | 0.6 | 0.5 |

*[Average quantity of resources by study arm (full list of all resources included in the analysis is available from the authors)]*

| | Arm A | Arm B | Mean Difference | 95% Confidence Interval |
|---|---|---|---|---|
| Average cost per patient | 432 | 641 | 209 | 191, 228 |
| Of which: | | | | |
| ARV drugs | 147 | 150 | 3 | -8, 14 |
| OI drugs (Septrin/Dapson) | 10.6 | 10.6 | 0 | -0.19, 0.14 |
| CD4 tests | 31 | 29 | -2 | -3.2, -1.3 |
| Viral load tests | 4 | 209 | 205 | 195, 214 |
| Other diagnostics | 36 | 35 | -1 | -3.5, 0.2 |
| Total staff | 130 | 136 | 6 | -0.64, 12.7 |
| Fixed costs | 73 | 73 | 0 | Not relevant |

*[Average costs per patient (2012 USD) by study arm]*

**Conclusions:** Over the first 18 months on ART, RVLM increased the cost of care (basically the unit cost of the test times the number of tests). As the costs of viral load testing continues to decline and RVLM largely replaces CD4 monitoring, the additional cost of RVLM on the costs of patient care will decline substantially. Future research is needed to address cost and health outcomes over a longer period of time.

## TUPEE603

### A better deal for mothers and children: modeling the cost-effectiveness of civil society organizations for delivering PMTCT services

J. Cali[1], A. Cico[1], A. Yemaneberhan[2,3], S. Musau[1], C. Avila[1], S. Faye[4]
*[1]Abt Associates Inc, International Health Division, Bethesda, United States, [2]John Snow Inc, Arlington, United States, [3]Elizabeth Glaser Paediatric AIDS Foundation, Washington, United States, [4]Abt Associates Inc, International Health, Bethesda, United States*
*Presenting author email: sophie_faye@abtassoc.com*

**Background:** Governments are considering contracting civil society organizations (CSOs), including faith-based organizations, to expand prevention of mother to child transmission (PMTCT) services. These organizations have well established working relationships with communities and marginalized populations, and have reported higher retention in care. However, there are few studies assessing CSOs' provision of health services in terms of value-for-money. This economic evaluation assessed the cost-effectiveness of CSOs and public facilities in Kenya in the provision of PMTCT services.
**Methods:** We use an activity-based costing approach, dividing PMTCT into six components: HIV counselling and testing (HCT), antiretroviral treatment (ART) for the mother, early infant diagnosis (EID), NVP and CTX prophylaxis for the infant and ART for the child. We developed probability trees of PMTCT services provided by CSOs and public facilities and modeled the progression from when a pregnant woman enters the health system through to the infant's HIV status after one year. We used actual costs for HCT and ART from Kenya and filled data gaps for some components using assumptions based on comparable reports of costs and effectiveness from various health interventions delivered by public facilities and CSOs.
**Results:** We estimated that PMTCT services per mother-child pair in Kenya cost US$ 433 in CSO facilities as compared to US$ 511 in public facilities. Overall, most PMTCT components were more costly in public facilities except for HCT. HCT cost US$ 19.05 per woman in CSOs and US$ 17.64 in public facilities. ART for mothers cost US$ 330.00 in CSOs and US$ 349.35 in the public sector. Preliminary calculations suggest that the incremental cost-effectiveness ratio (ICER) of CSO-PMTCT services compared to public PMTCT facilities is US$ 823.40 per life year saved.
**Conclusions:** The ICER of CSO-PMTCT services is below the per capita GDP of US$ 1,246, suggesting that contracting CSOs in Kenya is a highly cost-effective strategy for expanding coverage of PMTCT services. CSOs could have an important role to play in preventing mother-to-child transmission of HIV and achieving an AIDS-free generation.

## TUPEE604

### Costs and constraints in meeting ambitious scale up targets for pediatric and adolescent antiretroviral treatment in Kenya

A. Dutta, S. Bowsky, C. Barker
*Palladium, Washington DC, United States*
*Presenting author email: catherine.barker@thepalladiumgroup.com*

**Background:** The PEPFAR and Children's Investment Fund Foundation-supported Accelerating Children's Treatment (ACT) Initiative aims to double numbers of children and adolescents on ART in nine countries including Kenya. The Government of Kenya (GOK) aims to increase ART coverage in these two age groups from 25% and 36%, respectively, to 90% by 2019. The USAID- and PEPFAR-funded Health Policy Project analyzed the ART cascade from identification to retention in Kenya and estimated the resources needed to meet GOK/ACT targets.
**Methods:** Constraints and related responses along the cascade were addressed through qualitative data collected from 18 implementing partners (IPs). Outputs and financial data on ART service delivery and health systems strengthening activities were collected from seven IPs. Commodities costs for identification (including EID), laboratory monitoring, and antiretrovirals were based on recent prices under local Global Fund grants.
Authors estimated weighted average unit costs by age, cascade stage, and cost category. Disaggregated future targets by cascade stage and age group were projected using Spectrum and program data.
**Results:** IPs cited weak case identification and stigma as the greatest overarching barriersto ART scale-up and expressed concern that adolescents are falling through the cracks. The unit costs for essential treatment cascade activities funded by development partners are US$148, $90, and $81 per person for ages 0-23 months, 2-14 years, and 15-19 years, respectively. About 73-84% of costs are for treatment, 3-22% for linkage, and the remaining for identification. Linkage and identification costs were higher among children 0-23 months than other ages. Costs of antiretroviral regimens increase with age, from $104 per patient-year in patients ages 0-23 months to $140 for those 15-19 years. The total resource needs for essential cascade activities and commodities considered is estimated at US$74.8 million for calendar years 2016 and 2017.
**Conclusions:** Though ACT contributes significant supplemental funding above regular PEPFAR support, the costs of increasing identification and linkage to care are significant to meet expanded ART targets in children and adolescents. These costs outstrip forecasted resources in future years after the ACT initiative ends. Kenya must address implementation bottlenecks along the ART cascade and raise significant additional resources.

## TUPEE605

### Optimizing the response of HIV prevention and treatment: assessing efficiency of HIV interventions in Nigeria

I. Ezirim[1], K. Ogungbemi[1], F. Agbo[2], O. Amanze[2], G. Ashefor[2], J. Aneni[2], S. Bautista-Arredondo[3]
*[1]National Agency for the Control of AIDS, Strategic Knowledge Management Department, Abuja, Nigeria, [2]National Agency for the Control of AIDS, Strategic Knowledge Management Department, FCT, Nigeria, [3]National Institute of Public Health, Mexico City, Mexico*
*Presenting author email: send2teyin@yahoo.com*

**Background:** As Nigeria faces dwindling resources for HIV, there is a need to optimize the use of resources in order to ensure scale up of HIV services as well as achieve national objectives and target. Unit cost estimates are essential for the better use of resources and information on the heterogeneity in the unit among interventions and across health facilities is critical to addressing inefficiencies. The aim of the Optimizing the Response of Prevention Treatment and HIV Efficiency in Nigeria (ORPTHEN) study is to measure costs and identify determinants of higher efficiency of HIV prevention and treatment programs.
**Methods:** The study was a retrospective, cross sectional, observational assessment in 200 sites across 17 states in Nigeria in 2015. The goal was to assess the total cost, average cost and determinants of efficiency for three HIV interventions: HIV counseling and testing (HCT), Prevention of Mother to Child Transmission (PMTCT) and Antiretroviral Therapy. Data was collected from primary, secondary and tertiary facilities in seventeen Nigerian states on inputs to HIV prevention services and their cost, outputs produced in 2013 fiscal year, the environment and constraints in which production decisions are made.
**Results:** The weighted average cost per HCT client tested was estimated at US$12.4, Cost per PMTCT client tested was US$19.3 and Cost per ART client was US$157. *The* major cost component for prevention interventions is staff while ARVs is the major cost component for ART. The study also revealed that characteristics such as scale of service provided and type of facility contributes to heterogeneity of costs.

**Conclusions:** The result of the ORPTHEN study will be used by decision makers to improve efficiency of HCT, PMTCT and ART services in Nigeria. Nigeria is now conducting the OPRTHEN study for HIV Prevention interventions among Female Sex Workers to achieve higher efficiency in the delivery of HIV interventions to FSWs.

## TUPEE606

### THE COST OF VOLUNTARY MEDICAL MALE CIRCUMCISION IN SOUTH AFRICA

M. Tchuenche[1], E. Palmer[2], V. Hate[2], A. Thambinayagam[3], D. Loykissoonlal[4], P. Segman[5], M. Schnure[6], E. Njeuhmeli[7], S. Forsythe[8]
*[1]Health Policy Project, Project SOAR (Supporting Operational AIDS Research), Avenir Health, Washington DC, United States, [2]Health Policy Project, Washington DC, United States, [3]USAID, Pretoria, South Africa, [4]National Department of Health, Pretoria, South Africa, [5]Project SOAR (Supporting Operational AIDS Research), Avenir Health, Washington DC, United States, [6]Palladium Group, Washington DC, United States, [7]USAID, Washington DC, United States, [8]Health Policy Project, Project SOAR (Supporting Operational AIDS Research), Avenir Health, Phoenix, United States*
*Presenting author email: melissa.schnure@thepalladiumgroup.com*

**Background:** South Africa has a low prevalence of male circumcision. On the basis of compelling and overwhelming evidence that voluntary medical male circumcision (VMMC) reduces men's risk of becoming HIV infected through heterosexual intercourse, South Africa in 2010 embarked on scaling up its VMMC program. To project the resources needed for continued scale-up of VMMC services and ensure program sustainability, it is crucial to:
1. Estimate the unit cost to provide VMMC,
2. Assess cost drivers and cost variances across the provinces and different VMMC service delivery modes, and;
3. Evaluate the costs associated with mobilizing and motivating men and boys to access VMMC services.
**Methods:** Cost data were systematically collected and analyzed from 33 government and PEPFAR-supported (U.S. President's Emergency Plan for AIDS Relief) urban, rural, and peri-urban VMMC facilities from eight of South Africa's nine provinces. Unit costs were calculated from a bottom-up approach. All costs are reported in U.S. dollars.
**Results:** The cost per circumcision performed in South Africa in 2014 was $132, with the largest cost drivers being direct labor (43%), consumables (24%) and quality assurance/quality improvement (13%). The unit cost was higher when performed in public hospitals ($158), compared to health centers and clinics ($121). Direct labor costs could be reduced by 17% if South Africa were to encourage task shifting from doctors to professional nurses, which could have resulted in saving as much as $15 million in 2015, during which the country had set a target of performing 1.6 million circumcisions. About $14.2 million was spent on VMMC demand creation in 2014. Most of these costs were attributable to personnel, including community mobilizers (36%) and small and mass media (35%).
**Conclusions:** The VMMC unit cost ($132) in 2014 was generally consistent with other studies that analyzed VMMC unit costs in South Africa. VMMC demand creation requires further investigation to assess if the level of spending and the allocation of spending are appropriate for South Africa's VMMC program. The results of this study are expected to inform strategic planning for continued scale-up of VMMC and to identify the resources required to sustain the VMMC intervention.

## TUPEE607

### ESTIMATING OUT OF POCKET EXPENDITURES INCURRED BY CLIENTS OF VOLUNTARY MEDICAL MALE CIRCUMCISION IN SOUTH AFRICA

M. Tchuenche[1], M. Hate[2], D. Mcpherson[3], E. Palmer[3], A. Thambinayagam[4], D. Loykissoonlal[5], E. Njeuhmeli[6], S. Forsythe[7]
*[1]Health Policy Project, Project SOAR (Supporting Operational AIDS Research), Avenir Health, Washington DC, United States, [2]Project SOAR (Supporting Operational AIDS Research), George Washington University, Washington, DC, United States, [3]Health Policy Project, Washington DC, United States, [4]USAID, Pretoria, South Africa, [5]National Department of Health, Pretoria, South Africa, [6]USAID, Washington DC, United States, [7]Avenir Health, Fountain Hills, United States*
*Presenting author email: eurica7@gmail.com*

**Background:** In 2010, South Africa embarked on scaling-up its voluntary medical male circumcision (VMMC) program based on compelling evidence that circumcision reduces men's risk of acquiring HIV infection through heterosexual intercourse. While VMMC is offered free-of-charge, there is concern that clients seeking VMMC services might be incurring some indirect out-of-pocket expenditures such as transportation cost or foregone income. Since these costs might pose challenges to increasing uptake of VMMC services within the target population, this study assessed costs from a client perspective in order to inform policies aimed at demand creation.
**Methods:** Cost and demographic data were systematically collected through 190 interviews conducted in 2015 with VMMC clients or their caregivers (in the case of minor clients) at 25 Government and PEPFAR-supported VMMC facilities in 8 of the 9 provinces in South Africa. All information on costs was gathered through in-person interviews. Average costs in U.S. dollars were calculated using a bottom-up approach.
**Results:** The main VMMC clients' out-of-pocket expenditure reported was transportation cost, with an average of US$ 9.20 (R 100), ranging from US$ 7.75 (R84) in Northern Cape to approximately US$ 14 (R152) in Mpumalanga. Lost days of work were reported by only 8 clients (4%). Other sources of indirect expenditures included costs of childcare or expenditures on miscellaneous items such as food or medicine, reported respectively by 1 and 20 clients.
While the average age of VMMC clients is 22 years, about 42% are < 18 years with the largest proportion of minor clients between 10-15 years of age (29%). Nearly 92% of VMMC clients are < 35 years.
**Conclusions:** The largest VMMC client out-of-pocket expenditure is transportation costs although there is considerable variation in costs between provinces. In 2011, poor and non-poor households in South Africa were able to spend respectively US$ 0.7 (R7) and US$ 5.8 (R63) daily on transportation.
Consequently, spending R100 on transport to access VMMC services could represent a significant burden to the expansion of VMMC demand creation. Child care expenses and lost income were not significant items identified by respondents, which was not surprising given the relatively young age of the VMMC clients.

## TUPEE608

### DOES INTRODUCTION OF PREPEX™ INTO AN EXISTING SURGICAL VMMC PROGRAM SAVE MONEY?

V. Hate[1,2], G. Dean[3], S. Frade[3], D. Rech[3], D. Taljaard[3], P. Stegman[1], K. Kripke[1]
*[1]Health Policy Project, Avenir Health, Washington, United States, [2]The George Washington University, Global Health Department, Washington, United States, [3]The Center for HIV/AIDS and Prevention Studies (CHAPS), Johannesburg, South Africa*
*Presenting author email: vhate@gwmail.gwu.edu*

**Background:** Researchers in South Africa participated in a demonstration study assessing the feasibility and acceptability of introducing the PrePex™ device for non-surgical voluntary medical male circumcision (VMMC). Devices, such as PrePex™, are intended to make the circumcision procedure quicker, simpler, and more cost-effective. This study aimed to derive the incremental costs of introducing PrePex™ into facilities where a surgical circumcision programme was already established and fully functioning.
**Methods:** Cost data were systematically collected through facility surveys and information provided by CHAPS. The contributions of the following cost categories to the unit costs were assessed: direct clinical labour, support staff, medicine and consumables, continuous quality improvement (CQI), overhead, training, equipment and vehicles. Per unit costs were calculated using a costing model employing a top-down approach. All costs were converted into US dollars at the 2014 exchange rate (R 10.83 = US $1).
**Results:** The overall unit cost was US$121.92 (R1320.41) prior to the introduction PrePex™ and US$117.46 (R1272.04) after the introduction of PrePex™. The cost per circumcision performed was lower after the introduction of the PrePex™ device because the total number of clients increased considerably, while the total expenditure incurred remained fairly constant.
The only increase in total expenditure was seen among medicines and consumables - total expenditure on medicines and consumables increased from US$ 238,565 (approximately R2.5 million) to US$ 255,491 (approximately R2.7 million), thereby resulting in a 7.1 percent increase in expenditure on medicines and consumables after the introduction of PrePex™. All other expenditures on equipment, overhead, CQI, and vehicles remained the same.
**Conclusions:** The introduction of PrePex™ into an existing surgical program did not increase the cost per VMMC. Results indicate that the introduction of PrePex™ in clinical settings where surgical VMMC is already taking place may not result in increased costs per unit since no additional equipment is required for the PrePex™ procedure and the additional costs of medicines and consumables is not expected to be significant. While additional clinical labour might be needed as the total number of VMMC procedures increase, since non-physicians can perform circumcisions using PrePex™, it is possible that these additional costs may also not be significant.

## TUPEE609

### THE IMPACT OF INTEGERATED PRODUCTION ON THE EFFICIENCY OF HIV PREVENTION SERVICES: ECONOMETRIC ESTIMATES FROM THE ORPHEA FOUR-COUNTRY SAMPLE

S.G. Sosa-Rubí[1], D. Contreras-Loya[1], M. Over[2], S. Bautista-Arredondo[1]
*[1]Instituto Nacional de Salud Publica, Health Economics, Cuernavaca, Mexico, [2]Center for Global Development, Washington, DC, United States*
*Presenting author email: mover@cgdev.org*

**Background:** The widely shared ambition to greatly expand the provision of HIV prevention services in severely affected countries will be more affordable if national programs can achieve "economies of scale", so that total prevention costs expand less than proportionately with the expansion of prevention services. Another potential source of economies is the integration of multiple HIV services within a single facility in the expectation that the facility can achieve "economies of scope".
In a facility producing multiple services with shared personnel, these two sources of cost-savings are closely related, since the economies of scale of expanding any one service will typically depend on its synergy with other services and thus on the rates at which those other services are simultaneously expanded.
**Methods:** In order to identify, differentiate and empirically estimate the potential contribution of each of these two sources of cost savings, this study develops and applies a method for estimating a joint cost function for producing two HIV prevention interventions; HIV testing and counseling (HTC) and prevention of mother-to-child transmission (PMTCT) in Kenya, Rwanda, South Africa and Zambia. Using the data collected for 2011-2012 by the ORPHEA project from 194 facilities producing both services and controlling for service quality, we compare the fit of several different model specifications to characterize the effects of scale, scope and input prices on total facility costs of HTC and PMTCT.
**Results:** For HTC, holding PMTCT constant at its mean, we estimated the economies of scale ($1-\partial C/\partial q$) to be statistically indistinguishable from zero. For PMTCT, holding HTC constant at its mean, we estimated substantial economies of scale: doubling the number of pregnant women tested increases total facility cost by only 33% in all countries (p-val< 0.01), and at most by only 65% for Zambia (p-val< 0.01). Economies of scale are also significant if we increase both outputs maintaining a low ratio of HTC to PMTCT.
**Conclusions:** Our results suggest that policy makers will be misled by cost projections that assume a constant "unit cost" of either HTC or PMTCT or assume that the impact of scale on the cost of either is independent of the other.

## TUPEE610

### OPTIMIZING THE RESPONSE OF PREVENTION AND TREATMENT: ESTIMATION OF ANTIRETROVIRAL COSTS OF HIV/AIDS TREATMENT IN NIGERIA

M.A. Colchero[1], S. Bautista-Arredondo[1], G. La Hera[1], O. Silverman[1], O. Amanze[2], K. Ogungbemi[2], G. Ashefor[2], J. Anenih[2], A. Adeyemi[2]
*[1]National Institute of Public Health, Mexico, Mexico, [2]National Agency for the Control of AIDS, Abuja, Nigeria*

**Background:** Nigeria has committed to provide comprehensive HIV services to all in need. Yet as in most countries in the region, critical HIV financing shortfalls will likely arise and persist as eligibility for and demand for access to services continue to increase. Greater efficiency and effectiveness throughout HIV programming are therefore essential priorities.
The objective of this study was to estimate the average annual cost per HIV patient treated and factors associated with their variation.
**Methods:** We analyzed data from a cross-sectional study carried out in 200 health facilities providing integrated HIV services located in seventeen States with the highest HIV prevalence in Nigeria, between December 2014 and May 2015. We estimated the annual antiretroviral (ARV) cost per patient. An index of the antiretroviral and TB drugs dispensed in each facility during the costing year, weighted by the frequency of use of each specific drug was estimated. Annual ARV treatment cost per patient was estimated by adding annual costs of staff, utilities, capital, training, laboratory tests (CD4), ARV drugs and TB treatment divided by the average number of patients reported for 2014.
**Results:** The national average weighted cost/patient was $156.6, while the average annual cost/patient across facilities was $231.4 and the median was $159.1. Average unweighted costs were $257.2 in secondary level facilities and $158.7 in tertiary level facilities. Staff, ARVs and laboratory tests were the most important components of the ART costs/patient (38%, 40.4% and 16.5% respectively). Additionally, the cost per patient per facility decreases as the size of facility increases. Although secondary level facilities -that attend fewer patients- have higher costs compared to tertiary facilities, findings reveal that a larger number of patients is associated with higher costs in tertiary level facilities.
**Conclusions:** The study showed a wide variability in the average annual ART costs/patient. The differences are associated with the number of patients attended. Staff, ARVs, followed by laboratory costs are the main components of the cost/patient of ART services in the overall sample. Results from the study will help design intervention to improve efficiency in the delivery of comprehensive HIV services in Nigeria.

## TUPEE611

### IMPACT AND ECONOMIC EVALUATION OF THE KENYA MENTOR MOTHER PROGRAM (KMMP)

M.S. Wafula[1], R.N. Wafula[1], J. Wanyungu[1], D. Mwai[2], I. Yonga[3], L. Kiige[4], N. Otwoma[5], P. Muange[1], M. Simba[6], N. Fulton[6], S. Chapman[7]
*[1]Ministry of Health, National AIDS & STI Control Programme, Nairobi, Kenya, [2]Futures Group, Nairobi, Kenya, [3]USAID Kenya, Nairobi, Kenya, [4]UNICEF Kenya, Nairobi, Kenya, [5]National Empowerment Network of People living with HIV/AIDS in Kenya, Nairobi, Kenya, [6]mothers2mothers, Department of Programmes and Technical Services, Nairobi, Kenya, [7]mothers2mothers, Department of Programmes and Technical Services, Cape Town, South Africa*
*Presenting author email: sirengomartins@gmail.com*

**Background:** Eliminating mother-to-child transmission of HIV is possible through ensuring pregnant mothers know their HIV status, early ART initiation for the HIV-positive, adherence to treatment and retention in care of mother-baby pairs. Peer support is critical for these interventions. Kenya's Ministry of Health launched *National guidelines for peer education and psychosocial support in PMTCT (The Kenya Mentor Mother Program -KMMP)* in 2012. An external economic evaluation was done in 2014.
**Methods:** Quasi-experimental design was used. Eight KMMP intervention facilities were compared to eight implementing non-KMMP model matched on geography, HIV epidemiology and facility type. 2,997 mothers (1,541 in KMMP and 1,456 in non-KMMP facilities) with children aged 18 to 24 months were recruited. Facility ART, ANC and HIV-exposed Infant (HEI) registers, HEI cards, and HIV care patient card were reviewed. Using standardized questionnaire patients' psychosocial well-being was assessed. Cost data were collected from stakeholders, patient and facility interviews, and a review of facility fiscal records.
**Results:** 18 months MTCT rate was 5.7% in KMMP sites and 8.7% in non-KMMP facilities (AOR = 0.51, 95% CI 0.32-0.81; p < 0.012). Maternal and infant ARV uptake was 1.42 and 1.89 times higher in KMMP facilities compared to non-KMMP facilities. The risk of poor psychosocial adjustment to HIV among mothers in KMMP sites was 60% lower than that of mothers in non-KMMP sites
(AOR = 0.4, 95% CI 0.2-0.8).
The annual cost incurred per client by the facility to provide KMMP intervention was estimated at KES 13,759.17 (USD 146.37) compared to KES 11,033.85 (USD 117.38) in non-KMMP facilities. The Incremental cost per Disability Adjusted Life Year (DALY) averted using KMMP care compared to non-KMMP care was KES 20,327.74 (USD 216.25). The observed cost-benefit ratio for KMMP was 7, thus a net savings in treatment costs of HIV positive children over their lifetime are 7 times more than the intervention costs, when compared to non-KMMP PMTCT care.
**Conclusions:** PMTCT care using KMMP guidelines results in greater reduction in 18-month MTCT rate, positive health outcomes, improved maternal psychosocial wellbeing compared to non-KMMP care. It is also more cost-effective and cost beneficial compared to PMTCT care provided in non-KMMP facilities.

## TUPEE612

### WHAT ALLOCATIVE EFFICIENCY GAINS ARE POSSIBLE FOR THE WORLD WITH AVAILABLE HIV RESOURCES?

S.L. Kelly[1], C.C. Kerr[1], R.M. Stuart[1], A.J. Shattock[2], K.L. Grantham[1], A. Hussain[1], X.F. Yap[2], R. Martin-Hughes[2], I. Reporter[1], J. Petravic[1], L. Grobicki[3], J. Skordis-Worrall[3], H. Haghparast-Bidgoli[3], Z. Baranczuk[4], O. Keiser[4], J. Estill[4], R.T. Gray[2], D.P. Wilson[1]
*[1]Burnet Institute, Infectious Disease Modelling, Melbourne, Australia, [2]UNSW, Surveillance Evaluation and Research Program, Sydney, Australia, [3]University College London, London, United Kingdom, [4]University of Bern, Bern, Switzerland*
*Presenting author email: sherrie.kelly@burnet.edu.au*

**Background:** International funding for HIV is no longer increasing, yet there are large gaps in prevention needs and treatment scale-up to reach the UNAIDS 90-90-90 targets. Therefore, it is imperative that HIV resources are allocated as efficiently as possible. We estimated the additional impact of averting new HIV infections by optimizing allocation of HIV resources at regional and global levels.
**Methods:** We applied the Optima HIV epidemic and resource optimization model at the national and sub-national level in 42 low- and middle-income countries, representing over 80% of the global HIV burden. We modelled the HIV epidemic in each country by calibrating to demographic, epidemiological, and behavioral data from 2000 to 2014 and used data on HIV program costs, potential program coverage levels, and key outcomes. We then used an optimization algorithm, incorporating

constraints for treatment, to generate the optimal allocation of available resources to minimize new HIV infections from 2015 to 2030 for each country, aggregating at the regional and global levels.

**Results:** Our analyses suggest that cumulative new HIV infections globally can be reduced by around 10-20% (almost 6 million new infections averted) by 2030 by reallocating the current annual US$21 billion of global HIV resources. While regional priorities differ, optimization led to significant reductions in infections in all areas. Scaling up ART is the most cost-effective strategy and priority for all regions, in combination with prevention programs for key populations subject to the cost of their implementation and country-specific epidemic profile. Unless additional resources become available, our analyses suggest that countries will need to deprioritize programs with relatively high implementation costs and/or programs that do not directly reach or influence outcomes among people at greatest risk, including behavior-based programs targeting the general population.

**Conclusions:** Optimization of existing HIV resources at the regional and global levels, with a main priority to scale-up ART nuanced by country epidemic setting and prevention priorities, would significantly reduce HIV incidence.

## TUPEE613

### COST-EFFECTIVENESS OF THREE PI-BASED SECOND-LINE ANTIRETROVIRAL TREATMENT COMBINATIONS IN HIV-INFECTED PATIENTS IN SUB-SAHARAN AFRICA (ANRS 12169 -2LADY)

M.L. Nishimwe[1,2,3], L. Sagaon-Teyssier[1,2,3], L. March[4], S. Koulla-Shiro[5], A. Ambani[1,2,3], L. Ciaffi[4], E. Delaporte[4,6], A. Sawadogo[7], B. Spire[1,2,3], N.F. Ngom Gueye[8], S. Boyer[1,2,3], 2-Lady Study Group

*[1]INSERM, UMR_S912, SESSTIM, Marseille, France, [2]Aix Marseille Université, UMR_S 912, IRD, Marseille, France, [3]ORS PACA, Observatoire Régional de la Santé Provence-Alpes-Côte d'Azur, Marseille, France, [4]UMI 233 Institut de Recherche pour le Développement (IRD), INSERM U 1175, Université de Montpellier, Montpellier, France, [5]Faculté de Médecine et des Sciences Biomédicales, Université de Yaoundé 1, Yaoundé, Cameroon, [6]Service de Maladies Infectieuses, Centre Hospitalier Universitaire de Montpellier, Montpellier, France, [7]Hôpital de Jour, Centre Hospitalier Universitaire de Souro Sanou, Bobo-Dioulasso, Burkina Faso, [8]Hôpital de Jour, Centre Hospitalier Universitaire de Fann, Dakar, Senegal*

*Presenting author email: luis.sagaon-teyssier@inserm.fr*

**Background:** High cost of second-line antiretroviral treatment (ART) together with a decrease in funding for HIV/AIDS programs in sub-Saharan Africa strongly limit access to second-line ART in those countries. Identifying the best treatment strategies, both in terms of health benefits and costs is essential to optimize available resources. A cost-effectiveness analysis was conducted to assess three second-line combinations in Cameroon, Burkina-Faso and Senegal.

**Methods:** We used data from the randomized, non-inferiority, 48-weeks ANRS-12169 2-Lady trial. Between 2010-2012, 454 HIV-infected patients failing a first-line ART were randomly assigned to: tenofovir/emtricitabine+lopinavir/ritonavir (arm A; one of WHO recommended-regimens); abacavir/didanosine+lopinavir/ritonavir (arm B); tenofovir/emtricitabine+darunavir/ritonavir (arm C). After week 48, the follow-up was pursued until the last patient enrolled had the W48-visit. The analysis was conducted from a modified societal perspective including the following costs: comorbidities and antiretroviral drugs, laboratory tests, consultations and inpatient costs. We assessed health benefits as the number of Life Year Saved (LYS). Costs and health benefits of each strategy were estimated over a four-year period using a patient-level Markov model. Uncertainty was handled using the cost-effectiveness acceptability curves method.

**Results:** 451 patients were included in the analysis with a median follow-up [interquartile range] of 3.0 [2.5;4.0] years. The estimated cost per patient-year was €702 (arm A), €1010 (arm B) and €1184 (arm C). Arm A was significantly cheaper than arms B and C with a significant cost difference [95% Confidence Interval (CI)] of €-1063 [-1188;-935] and €-1862 [-1990;-1719], respectively. Arm A presents similar health benefits as the two others, with a non significant difference in LYS [CI 95%] (A *versus* B= 0.03 [-0.07;0.16] and A *versus* C= 0.06 [-0.05;0.18]). Cost-effectiveness acceptability curves show that in each study country, arm A had a 100% probability to be cost-effective when compared to B and C. Furthermore, the combination C would be cost-effective if the monthly price of Darunavir reduced by 75% (from €65 to €16).

**Conclusions:** Our findings suggest that the combination A provides the best economic value at current ART prices compared with the two other alternatives. Substantial price reduction of Darunavir would also make combination C cost-effective in the study countries.

## TUPEE614

### EXAMINING THE RELATIONSHIP BETWEEN QUALITY AND EFFICIENCY OF HTC AND PMTCT SERVICES SUPPLY IN KENYA AND ZAMBIA USING DATA ENVELOPMENT ANALYSIS (DEA)

S.G. Sosa-Rubí[1], C. Chivardi[1], D. Contreras-Loya[1], M. Opuni[2], S. Bautista-Arredondo[1]

*[1]Instituto Nacional de Salud Publica, Health Economics, Cuernavaca, Mexico, [2]UNAIDS, Geneva, Switzerland*

*Presenting author email: dcloya@gmail.com*

**Background:** Several efficiency studies have highlighted the importance to achieving lower costs of operation without compromising the quality of the HIV services, however little empirical evidence exists on the trade-off between economic efficiency and quality-gains. Furthermore, quality has been traditionally ignored in efficiency analyses of HIV health services. We analyzed the relationship of efficiency and quality of two HIV prevention interventions; HIV testing and counseling (HTC) and prevention of mother-to-child transmission (PMTCT) in Kenya and Zambia.

**Methods:** Using data collected in 2012-2015 by the ORPHEA project, we applied data envelopment Analysis (DEA) in 129 facilities to assess the efficiency of the synergy in the supply of HTC and PMTCT services. DEA scores were derived using an output-orientation with multi-inputs and multi-outputs. We also estimated a process-quality index using clinical vignettes to assess levels of competence of health staff. We identified quadrants where facilities fall into, according to their efficiency and quality scores.

**Results:** The quality score varied between 20% and 70%, and 40% and 80% for PMTCT and HTC services, respectively. The efficiency score ranged from 10% to 95%, and from 1% to 98% for PMTCT and HTC services, respectively. For PMTCT services, 13% of the facilities showed high-efficiency and high-quality, 31% low-efficiency and low-quality, 3% low-efficiency and high-quality and 53% high-efficiency and low-quality. Regarding HTC services, 19% of the facilities display high-efficiency and high-quality, 21% low-efficiency and low-quality, 14% low-efficiency and high-quality and 45% high-efficiency and low-quality.

**Conclusions:** There are facilities with high efficiency and quality offering HTC and PMTCT services. However an important challenge remains for improving quality and efficiency among facilities with low levels of efficiency and quality. Remarkably, the proportion of facilities located in the quadrant of high-efficiency and low-quality for HTC and PMTCT services is the highest among the four quadrants - highlighting the crucial trade-off between these elements of services provision. Additional exploration of facilities that underperform in one of the two measures is needed, particularly those with high efficiency and low quality, in order to identify the mechanisms that can improve facility performance without compromising these two competing outcomes.

## TUPEE615

### COST-ANALYSIS OF THE PREVENTION OF MOTHER TO CHILD TRANSMISSION OF HIV/AIDS SERVICE IN ETHIOPIA: URBAN-RURAL HEALTH FACILITIES SETTING

E.A. Zegeye[1], J. Mbonigaba[2], S. Kayes[3], B. John[4]

*[1]University of KwaZulu Natal (UKZN), Economics, Durban, South Africa, [2]University of KwaZulu Natal, Durban, South Africa, [3]Durban University of Technology, Economics, Durban, South Africa, [4]Abt Associates Inc, Bethesda, United States*

*Presenting author email: eliasasfawe@gmail.com*

**Background:** Local context costing evidence continues to be scarce in Ethiopia while it is relevant for health care planning, budgeting and cost-effectiveness analysis. This study aimed to identify, measure and value the cost of providing prevention of mother-to-child transmission of HIV/AIDS (PMTCT) service across heterogeneous prevalence (high, low) and socio-economic status (urban, rural) contexts.

**Methods:** A total of twelve health facilities from six regions (Amhara, South Nations and Nationality Peoples (SNNP), Harrar, Dire Dawa, Oromia and Addis Ababa) are purposively selected from the latest 2012 ANC Sentinel HIV prevalence report (EPHI, 2014). Six health facilities with the highest HIV prevalence (8.1% to 17.3%) among pregnant women were chosen in urban setting and six health facilities with the lowest prevalence rate (0.0% to 0.1%) were selected from the rural setting. We applied an ingredient based costing approach to identify, measure and value the resource used for the provision of comprehensive PMTCT service at the lowest health service unit. The analysis was conducted across different PMTCT service packages and major resource ingredients. We applied a 3 % discount rate, and adjusted inflation to the base year (2014).

**Results:** The unit cost per pregnant women and infant pair per year (PPY) range from 6,280.39 ETB (319.28 USD) to 21,620.19 ETB (1,099.12 USD) in the urban highly HIV prevalent health facilities. In rural low HIV prevalent health facilities, the cost ranges from 4,322.62 ETB (219.75 USD) to 7,538.46 ETB (383.24 USD). PMTCT service provision in the urban health facilities costs more than twice the cost in rural health facilities. Consumables (including antiretroviral treatment drugs) and infrastructure are the major cost drivers in the urban and rural health facilities.

Anti-retroviral treatment option B+ follow-up and counseling service accounted for the highest proportion of costs, which ranges from 58% to 72 %, across the PMTCT service continuum.
**Conclusions:** The analysis suggests that resource used for PMTCT service packages varied across health facilities and HIV prevalence settings. Providing PMTCT service in the high HIV prevalent urban health facility settings cost more than the rural. Context specific costing are vital to provide local relevant evidences for health service management and priority setting.

## TUPEE616

### HIV resource allocation and budgetary policies under conditions of uncertainty

B. Woods[1], C. Rothery[1], S.-J. Anderson[2], J.W. Eaton[2], T.B. Hallett[2], K. Claxton[1]
*[1]University of York, Centre for Health Economics, York, United Kingdom, [2]Department of Infectious Disease Epidemiology, Imperial College London, London, United Kingdom*

**Background:** Decision modelling now plays a key role in determining which HIV interventions are prioritised for funding, and in which populations and geographical regions. This process is based on the costs and health outcomes expected to be generated by different programmes. However, these costs are uncertain, and where costs are unexpectedly high this may result in planned programmes becoming unaffordable. This can happen for a range of reasons, including unanticipated epidemiological conditions. This work examines how decision makers react to unexpected cost variances, how this impacts on the health generated by HIV funding and what might be done to avoid costly responses to uncertainty.
**Methods:** We use a transmission model to predict the costs and quality adjusted life years (QALYs) associated with investing a fixed HIV budget across six regions for 15 years. The model reflects a sub-Saharan African setting with a generalised HIV epidemic in which regions differ in terms of the proportion of people living with HIV. HIV budgets of $0-30 per capita are considered. Health care decision makers can choose to invest in one or more interventions (late ART, male voluntary circumcision or early ART) in each region at a range of coverage levels. Uncertainty in key parameters (HIV prevalence, intervention costs and intervention effects) is propagated through the model using Monte Carlo simulation.
**Results:** If we assume that decision makers are required to remain within their regional planned budgets, the QALYs generated by the HIV budget are 15% lower than expected when the HIV budget is $10 per capita and 19% lower when it is $20 per capita. This reduces to 4% and 9% if we assume decision makers can re-allocate funds across regions in response to uncertainty. Research that reduced uncertainty could increase health to the level originally expected.
**Conclusions:** Current predictions of the health generated by HIV budgets do not take into account that decision makers may need to alter planned programmes in order to remain within programme budgets. This reality may substantially reduce the health generated by HIV spending. Efforts to re-design budgetary policies or reduce uncertainty via research can increase health.

## TUPEE617

### Economic analysis of effectiveness of investments in HIV prevention services among key population groups in Ukraine

T. Saliuk[1], O. Doroshenko[2], G. Naduta[3], Y. Sazonova[1], Y. Novak[1], P. Skala[4]
*[1]Alliance for Public Health, Monitoring & Evaluation, Kyiv, Ukraine, [2]World Bank Ukraine Country Office, Kyiv, Ukraine, [3]Independent Consultant, Kyiv, Ukraine, [4]Alliance for Public Health, Policy and Communication, Kyiv, Ukraine*
*Presenting author email: tetyanas@gmail.com*

**Background:** Economic instability in the country and limited availability of resources for HIV/AIDS programs in the subsequent years may significantly limit availability of HIV prevention services for key populations (KPs). Understanding returns of investment into HIV prevention is especially important given the fact that in 2017 the funding from the Global Fund to Fight AIDS, Tuberculosis and Malaria (GFATM) for Ukraine will cease, and the country will need to undertake responsibility for the funding of such programs.
**Methods:** Cost Benefit Analysis (CBA) was used to project costs and benefits of investment in HIV prevention activities among people who inject drugs (PWID), sex workers (SWs), and men having sex with men. The prevention and treatment costs for two different scenarios of budget allocations were assessed: the availability of funding for HIV prevention versus termination of HIV prevention programs for KPs beginning in 2017-2018 with phasing out of the GFATM funding. AIDS Epidemic Model (AEM) was used to project epidemic trends for both scenarios in three different regions of Ukraine, as well as for the whole country.
**Results:** For the national level the benefit-to-cost ratio of providing prevention services to KPs is 2.17, which is more than twice higher than the feasibility threshold for economic effectiveness. Similar results were obtained for Odessa and Lvov regions (2.2 and 2.01 respectively) For Kherson region the benefit-to-cost ratio was 4.8.
**Conclusions:** These results show that each dollar invested in existing HIV prevention programs by 2030 can save $2.17 for the funding agencies due to savings on treatment and care for prevented HIV cases. The results of the analysis should serve as an additional argument for decision-making on support to HIV prevention programs at the regional level and nationwide, as well as securing their funding from state and local budgets. It should be also noted that prevention programs implemented in Ukraine" also cover prevention of hepatitis B and C, and STIs. The averted costs of treatment and other components of medical servicing related to these infections are not included in the analysis, thus, prevention programs implementation benefits might turn out even higher.

## TUPEE618

### Determinants of efficiency of the supply of PMTCT and HTC services in 4 countries in Africa: results of ORPHEA project

S. Bautista-Arredondo[1], S.G. Sosa-Rubí[1], D. Contreras-Loya[1], M. Opuni[2], A. Kwan[3], J. Condo[4], K. Dzekedzeke[5], O. Galárraga[6], N. Martinson[7], F. Masiye[8], S. Nsanzimana[9], R. Wamai[10], J. Wang'ombe[11]
*[1]Instituto Nacional de Salud Publica, Health Economics, Cuernavaca, Mexico, [2]UNAIDS, Geneva, Switzerland, [3]World Bank, San Francisco, United States, [4]National University of Rwanda, School of Public Health, Kigali, Rwanda, [5]Dzekedzeke Research & Consultancy, Lusaka, Zambia, [6]Brown University, Providence, United States, [7]University of the Witwatersrand, Perinatal HIV Research Unit, Johannesburg, South Africa, [8]University of Zambia, Division of Economics, Lusaka, Zambia, [9]Rwanda Biomedical Center, Kigali, Rwanda, [10]Northeastern University, Boston, United States, [11]University of Nairobi, School of Public Health, Nairobi, Kenya*
*Presenting author email: sbautista@insp.mx*

**Background:** Limited evidence on the efficiency and its determinants of HIV prevention-interventions is a barrier to creating effective policy. The ORPHEA project aimed to estimate average costs per service and to identify determinants of efficiency for two HIV-prevention interventions: prevention of mother-to-child transmission (PMTCT) and HIV testing and counseling (HTC) in Kenya, Zambia, Rwanda and South Africa.
**Methods:** Input costs and intervention output data were collected retrospectively by month for 2011/2012 as part of the ORPHEA project. The analytical sample comprised around 180 health facilities for each intervention. We assessed the impact of determinants such as scale and labor composition, and management characteristics at the facility level such as structure and governance, staff composition and dedication, accountability and supervision, incentives and sanctions, on the heterogeneity of PMTCT and HTC costs per service at the facility level.
**Results:** Aspects such as scale of production, supervision, labor dedication, funding based on inputs management, regular financial reporting, and staff price per hour, explained nearly 70% of the variation in costs of HTC services (cost per individual tested). Characteristics associated with lower HTC unit costs were scale of production and supervision of HIV units. For PMTCT services, the scale of production and management aspects such as staff price and levels of specialization, and funding based on management performance, explained around 40% of the variation in unit costs. The most important factor linked to lower PMTCT unit costs was scale of production.
**Conclusions:** There is a large potential to increase efficiency within current financial and structural constraints of health systems. Unit-cost variation is explained by other constraints different from scale. Besides de scale of production, modifiable characteristics at the health facility level related to management aspects such as supervision, staff price and specialization, labor dedication and funding based on management performance, seem to be policy variables to be addressed through interventions to improve efficiency.

## TUPEE619

### IMPROVING COST-EFFECTIVENESS BY MANAGING HIV AS A CHRONIC DISEASE IN UGANDA

E. Broughton[1], M. Murire[2], E. Karamagi[2], H. Kisamba[2], J. Byabagambi[3]
*[1]URC, R&E, Bethesda, United States, [2]URC, Kampala, Uganda, [3]University Research Co, .LLC, Kampala, Uganda*
*Presenting author email: jbyabagambi@urc-chs.com*

**Background:** The chronic care model (CCM) is an integrated, population-based approach to providing health care for those with chronic diseases that involves patient self-management, delivery system design and decision-support for clinicians and patients to ensure evidence-based care. Its effectiveness and efficiency in managing people with HIV is unknown in low resource settings. We sought to determine this in Uganda.
**Description:** Orientation was conducted by the “team” (improvement experts from USAID’s ASSIST Project, with clinicians involved in pilot implementation of CCM and district Ministry of Health staff) and 25 staff from participating facilities. Material covered ranged from identifying service delivery problems and implementing changes to address them to empowering patients to actively manage their condition.
Following orientation the team conducted eight monthly visits to each participating clinic. Team members provided feedback to clinic staff on successful practices, performance gaps and ideas on addressing them. A staff member from each facility visited another participating site to learn about changes implemented there, and subsequently shared best practices. The team also conducted a learning session with 29 participating facility workers.
Changes implemented include provision of visual reminders of recommended HIV patient care practices, written appointment reminders for patients, fastidious tracking of patient CD4s and acting on their findings, and early identification and treatment for tuberculosis co-infection, among others.
**Lessons learned:** This controlled, pre/post-intervention evaluation used difference-in-differences analysis controlling for confounders in three facilities in one intervention and one control district in central Uganda.
Results showed the odds of increased CD4 in the intervention group was 3.2 times higher than the control group (p=0.022). Clinician-reported ART adherence to ART was 60% (p = 0.001) more likely to be higher in the intervention group. The intervention cost $11,740 for 7,016 patients enrolled for ART care ($1.67/patient). Incremental cost-effectiveness ratios were $6.90 per additional patient with improved CD4 and $3.40 per additional ART patient with the same or better adherence.
**Conclusions/Next steps:** Findings suggest that for modest expenditure, it is possible to improve process and outcome indicators of quality of care. We recommended implementing the CCM in Uganda and it may be suitable for application in similar settings.

## TUPEE620

### ECONOMIC AND EPIDEMIOLOGICAL IMPACT OF A PUBLIC-PRIVATE PARTNERSHIP: THE CASE OF THE AFRICAN COMPREHENSIVE HIV/AIDS PARTNERSHIP (ACHAP)

L. Busang[1], P. Stegman[2], F. Mwangemi[3], J. Mafeni[4]
*[1]African Comprehensive HIV/AIDS Partnership, Research, Monitoring and Evaluation, Gaborone, Botswana, [2]Institution, Gaborone, Botswana, [3]African Comprehensive HIV/AIDS Partnership, Programmes, Gaborone, Botswana, [4]African Comprehensive HIV/AIDS Partnership, Gaborone, Botswana*
*Presenting author email: lesego@achap.org*

**Background:** Botswana reached the height of AIDS epidemic in year 2001 with the adult HIV prevalence (15-49 years) estimated 27%, then one of the highest country prevalence figure in the world. This situation led to a novel public health initiative: a public-private partnership, ACHAP, between The Merck Foundation (TMF), Bill and Melinda Gates Foundation (BMGF) and the Government of Botswana. Questions remains over the value of such models if it is to be adopted elsewhere. This abstracts present an analysis of the economic and epidemiological impact of this model.
**Methods:** This analysis uses Spectrum modelling system called Goals model for analysing impact of ART and circumcision interventions supported by ACHAP. Model has been set up for Botswana using all available data sources on Botswana.
**Results:** By 2014, SMC program averted an estimated 7,470 infections. About 42,000 infections to be averted by 2030, which is One (1) infection averted for every 2 male circumcisions performed. Infections averted will also lead to future deaths averted. ART cumulatively averted 110,000 new infections during the period 2000-2014. Combined ART/SMC new infections averted with ACHAP support is 114,000 new infections from 2001 to 2014.
ART program averted an estimated 165,000 deaths from 2001 to 2014 or 48%, or one (1) death averted for 9 persons put on treatment.
Economic benefits of circumcision are 30 times greater its costs. Estimated infections averted $351.5 million future costs to Botswana compared to $11.6 million as cost of 101,680 SMC’s. Costed ART support was $168.4 million and ART saved $814 million hence economic benefits exceed costs 5 fold.
ART and SMC cost was $180 million, but ART and SMC Combined saved $843.6 million. The cost ratio is $4.7/$1.0 cost. Benefits may be significantly higher if other benefits are considered.
**Conclusions:** ACHAP as a Public Private Partnership has valuably contributed economically, epidemiologically and socially to Botswana.

## TUPEE621

### ESTIMATING THE ECONOMIC COSTS OF CLIENTS ACCESSING INTEGRATED SEXUAL AND REPRODUCTIVE HEALTH AND HIV SERVICES IN ZIMBABWE

C. Mangenah[1], E. Sibanda[1], K. Hatzold[2], G. Maringwa[1], M. Owen[3], F.M. Cowan[1,4], H. Thirumurthy[5]
*[1]Centre for Sexual Health and HIV/AIDS Research (CeSHHAR), Harare, Zimbabwe, [2]Population Services International Zimbabwe, Harare, Zimbabwe, [3]Ministry of Health and Child Care (MoHCC), Harare, Zimbabwe, [4]University College London, London, United Kingdom, [5]University of North Carolina at Chapel Hill, Chapel Hill, NC, United States*
*Presenting author email: cmangenah1@gmail.com*

**Background:** Integration has been widely reported as a good model for improving access to sexual and reproductive health (SRH) and HIV services and may prove cost-effective, reducing frequent health facility visits and patient costs. As limited data exists on costs of accessing integrated SRH and HIV services from the client’s perspective we evaluated burden and impact of costs on clients seeking integrated SRH and HIV services (HTC, TB screening, STI screening and treatment, Family Planning, and Cervical Cancer screening).
**Methods:** Exit interviews were held (February-April 2015) with clients (n=856) at three purposively selected integrated SRH and HIV clinics in Zimbabwe (Harare, Chitungwiza, and Bulawayo). Data included employment status, monthly earnings, travel time to, accessing services and from facility, service payments, transport expenditures, and other incidentals. Costs were analysed using StataCorp 2013. All costs were analysed in 2014 constant US dollars.
**Results:** Most clients were either unemployed (37%), unskilled or semi-skilled (30%), and the rest professionals (9%), students (4%) and other (20%). Clients incurred zero expenses for services as they were fully borne by the provider. In principle availability of integrated services free of charge (at point of use) ought to encourage take-up of services. However, clients incurred costs of transport ($1.67), other incidental expenses ($1.16), and costs of time seeking services ($4.86). Time spent seeking services had the highest proportional contribution (63%) to client cost per visit in comparison to transport (22%), and other incidental expenses (15%). Waiting time at the facility (averaging 3 hours and 4 minutes) contributed more to cost of time (63%) in comparison to travel time to (18%) and from clinics (18%). Mean client cost per visit was $7.69 accounting for more than 3 times the daily family income ($2.13).
**Conclusions:** Despite incurring zero service expenses, clients nonetheless incurred other significant expenses. Elsewhere, client costs impose considerable financial burdens on households and clients, and reduce health seeking especially among the poorest. Providers of integrated SRH and HIV services need to minimize impact of client costs by situating services closer to communities, offering incentives or subsidies, and reducing waiting times at integrated facilities.

## TUPEE622

### EVALUATING THE RELATIVE ECONOMIC COSTS OF INTEGRATING SEXUAL AND REPRODUCTIVE HEALTH, AND HIV SERVICES IN FOUR OPERATIONAL SERVICE DELIVERY MODALITIES IN ZIMBABWE

C. Mangenah[1], E. Sibanda[1], K. Hatzold[2], O. Mugurungi[3], F.M. Cowan[1,4], H. Thirumurthy[5]
*[1]Centre for Sexual Health and HIV/AIDS Research (CeSHHAR), Harare, Zimbabwe, [2]Population Services International Zimbabwe, Harare, Zimbabwe, [3]Ministry of Health and Child Care (MoHCC), Harare, Zimbabwe, [4]University College London, London, United Kingdom, [5]University of North Carolina at Chapel Hill (UNC-CH), Chapel Hill, NC, United States*
*Presenting author email: cmangenah1@gmail.com*

**Background:** Women in sub-Saharan Africa face huge socio-economic inequities despite advances in sexual and reproductive health (SRH) service delivery. Integrating SRH and HIV services may help fulfill the Millenium Development Goals, and may also prove to be cost-effective as it reduces need for frequent health facility visits. We evaluated relative unit costs of five integrated SRH and HIV services within four PSI Zimbabwe run integration models.

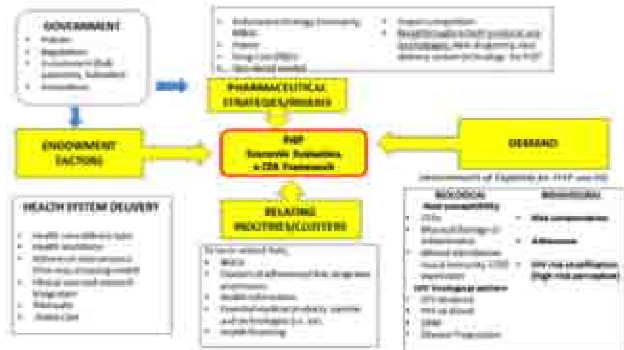
**Methods:** Taking a provider perspective we conducted retrospective facility based costing at four purposively selected clinics integrating SRH and HIV services [PSI/Z directly-managed, PSI/Z partner-managed, Public Private Partnership (PPP), and PSI/Z directly-managed outreach]. We collected economic and financial costs for 2014 and estimated cost per visit of five integrated services (HTC, TB screening, STI screening and treatment, Family Planning, and Cervical Cancer screening). We combined bottom up (quantifying each ingredient or resource component) and step down costing (step wise allocation of costs to all overhead departments and then to final cost centres) and analysed costs in 2014 constant US dollars.
**Results:** Unit costs for the five integrated services were lowest at the PPP clinic (Chitungwiza Profam) and highest at the PSI partner managed site (Mutare). Costs per visit for the five integrated SRH and HIV services ranged from US$6.22 (TB screening) at the directly-managed clinic to US$193 (Cervical-Cancer screening) at the partner-managed clinic. Costs per visit varied across the four integrated models with highest variability for STI screening and treatment (US$9.36 for PPP and US$148 for outreach). HTC showed least variability from US$32 for outreach to US$41 at Chitungwiza NSC. Main cost drivers were personnel, management and administration costs, and to a lesser extent supplies.
**Conclusions:** Unit cost variability, and percentage distribution of cost components suggests potential for cost reductions. Interventions that can increase demand for integrated SRH and HIV services can help achieve lower recurrent costs particularly with respect to personnel, and management and administration costs, thereby reducing unit costs. Where possible, integrated SRH and HIV service providers in Zimbabwe should negotiate lower drugs, diagnostics and supplies prices as these were an important contributor to unit costs of services.

## TUPEE623

### ARE HIV PREP COST-EFFECTIVE ANALYSES COMPREHENSIVE? THE DEVELOPMENT OF A COMPREHENSIVE CLINICAL ECONOMIC ANALYSIS FRAMEWORK

L. Peralta[1], V. Guardigni[2], R. Conti[3], E. Berndt[4]
*[1]Massachusetts Institute of Technology, Center for Biomedical Innovation, Cambridge, United States, [2]S. Orsola-Malpighi Hospital, Infectious Diseases, Bologna, Italy, [3]University of Chicago, Chicago, United States, [4]Massachusetts Institute of Technology, Cambridge, United States*
*Presenting author email: ligiaperalta@gmail.com*

**Background:** Globally, the public health emphasis centers on reducing new HIV infections through the use of new prophylactic tools. However, these efforts are dampened by the cost of PrEP drugs and its implementation, which represents a barrier to the response to avert HIV infections in individuals at risk. The purpose of this study was to review PrEP cost-effectiveness analysis (CEA) studies and identify methodology gaps. The objective was to develop a comprehensive model for CEA of HIV pre-exposure prophylaxis that would accurately inform program policy and planning.
**Description:** We researched PrEP cost-effectiveness studies from 2007-2015. They were catalogued by CEA from (1) demonstration projects and open-label trials, and (2) mathematical modeling studies based on clinical trials results, proxies and assumptions. We categorized the gaps in four areas using the Porter's diamond: demand, endowment factors and pharmaceutical strategies/rivalry, and relating industries.
**Lessons learned:** We analyzed five PrEP demonstration projects and open label trials, and eighteen modeling studies. We found no studies of PrEP implementation in real clinical practice settings. The methodology gaps were included in the four fields as depicted in figure 1.



*[Figure 1. HIV PrEP Comprehensive CEA Framework]*

Examples of major gaps included the lack of: (1) behavioral and biological risk stratification, (2) the estimated impact on health care delivery systems (i.e. PrEP adherence interventions) and (3) policy and regulatory considerations such as drug patent regulations including generic drugs and substitutes.

Based on these gaps and using Porter's diamond, we elaborated a framework for a comprehensive PrEP behavioral- biomedical-economic analysis model.
**Conclusions/Next steps:** Cost-effectiveness studies suffer from important methodology gaps including the lack of inclusion of key biological, behavioral and economic conditions. Our framework will guide cost effectiveness analysis that yield reliable results to assist governments in planning to scale up PrEP implementation, expand drug access for at-risk populations and ultimately bend the curve of new infections.

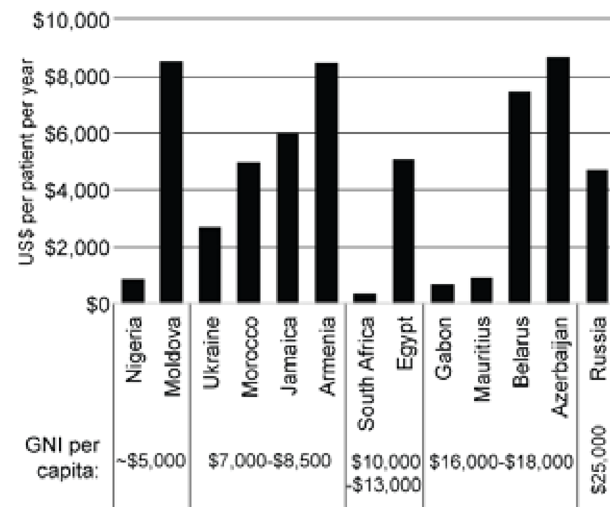
### DIFFERENCES IN ANTIRETROVIRAL DRUG PRICES BETWEEN COUNTRIES WITHIN AND OUTSIDE SUB-SAHARAN AFRICA

D. Gotham[1], R.S. Alex[2], A. Hill[3], B. Simmons[1], A. Pozniak[3]
*[1]Imperial College London, Faculty of Medicine, London, United Kingdom, [2]MetaVirology Ltd, London, United Kingdom, [3]Chelsea and Westminster Hospital, St Stephens AIDS Trust, London, United Kingdom*
*Presenting author email: dg1911@ic.ac.uk*

**Background:** Antiretroviral (ARV) prices have fallen substantially in low-income countries, but low prices may not be consistently available in middle-income countries with large HIV epidemics. Several key antiretrovirals are still on patent in middle-income countries.
**Methods:** Prices and transactions for 8 ARVs used in national treatment programmes (2013-2015) were extracted from the WHO Global Price Reporting Mechanism database for >100 countries, and a Russian government database. Prices were compared between countries, using World Bank data on per-capita gross national income (GNI, US$ PPP).
**Results:** Prices of generic ARVs in sub-Saharan Africa were not significantly different to prices outside sub-Saharan Africa. However, two originator drugs had significantly higher prices when sold outside sub-Saharan Africa: LPV/r $360 (nonSSA) vs $232 (SSA), DRV $5760 (nonSSA) vs $657 (SSA). There were large differences in darunavir prices between countries with similar GNI (Figure). Prices of generic drugs also differed significantly between countries in Africa with similar GNI. For example TDF/FTC cost $124 in Senegal versus $55 in Kenya; ABC cost $216 in Mauritius versus $113 in Botswana. In Russia, which was reclassified as high-income in 2013, but has a large untreated HIV-positive population, ARV prices were significantly higher than in sub-Saharan Africa: ATV/r was 647% higher, LPV/r 581% higher, DRV/r 592% higher, TDF/FTC 3600% higher (Table).
**Conclusions:** There are still significant differences in HIV drug prices between countries with similar Gross National Income. Patent restrictions in countries with large epidemics (e.g Russia) lead to very high prices. Mechanisms to ensure fair pricing across middle-income countries need to be improved to ensure the sustainable treatment access.



*[Price differences for darunavir between countries with similar Gross National Income per capita]*

### COST-EFFECTIVENESS OF E/C/F/TAF IN THE UNITED KINGDOM: ASSESSMENT THROUGH A NOVEL INDIVIDUAL PATIENT SIMULATION

L. Wild[1], C. Kiff[2], E. Fenwick[2], C. Parker[2], R. Perard[1], N. Hawkins[3]
*[1]Gilead Sciences Europe, Uxbridge, United Kingdom, [2]ICON Health Economics, Abingdon, United Kingdom, [3]London School of Hygeine and Tropical Medicine, London, United Kingdom*
*Presenting author email: christopher.parker@iconplc.com*

**Background:** E/C/F/TAF (elvitegravir/cobicistat/emtricitabine/tenofovir alafenamide) is a novel antiretroviral therapy for HIV. E/C/F/TAF has been investigated in an extensive clinical trial programme including treatment naïve, virologically suppressed, mild to moderate renal impairment and adolescent patients. In addition to high rates of efficacy in adult HIV patients (≥92% suppressed HIV-1 RNA < 50 copies/mL at Week 48), E/C/F/TAF is also associated with a favourable safety profile, including fewer bone and renal off target effects versus regimens containing tenofovir disoproxil fumarate (TDF). The objective of this study was to evaluate the cost-effectiveness of E/C/F/TAF versus relevant comparators in the UK healthcare setting.
**Methods:** An individual patient simulation model was developed to calculate the cost and QALY impact of treatment-related adverse events and non-AIDS related comorbidities (NARCs), in conjunction with CD4 count and viral load historically. These are not typically considered by HIV cost-effectiveness models. The analysis also considered the impact of adherence, resistance and tolerability on virologic failure and treatment choice as patients moved through the modelled treatment pathway. Literature reviews and input validation were conducted to populate the model. Relative efficacy of treatment regimens was established through a systematic literature review and network-meta analysis. Comorbid events associated to hypertension, fracture, cardiovascular, renal, and diabetes were predicted using a set of integrated regression models, derived from the literature and the Data Collection on Adverse events of Anti-HIV Drugs (D:A:D) cohort.
**Results:** The comparators for E/C/F/TAF were the most commonly used integrase inhibitor regimens in the UK: E/C/F/TDF, F/TDF + raltegravir (RAL) and dolutegravir/abacavir/lamivudine (DTG/ABC/3TC). E/C/F/TAF accrued 11.27 QALYs, more than comparators: E/C/F/TDF (11.16), F/TDF+RAL (11.21), and DTG/ABC/3TC (11.22). E/C/F/TAF is associated with lower overall costs against these comparators (-£59,438 vs. E/C/F/TDF, -£54,232 vs. F/TDF+RAL, -£52,027 vs. DTG/ABC/3TC) over a 20 year time horizon. Therefore, E/C/F/TAF dominates E/C/F/TDF, F/TDF+RAL and DTG/ABC/3TC. These results were robust in deterministic and probabilistic sensitivity analyses.
**Conclusions:** This study demonstrates that E/C/F/TAF is cost-effective versus E/C/F/TDF, F/TDF+RAL and DTG/ABC/3TC in the UK setting. By considering a wide range of factors influencing costs and health outcomes, including adverse events and NARCs, this result is likely to reflect the benefits of E/C/F/TAF beyond virological suppression.

## TUPEE626

### ACCOUNTING FOR NON-AIDS RELATED COMORBIDITIES (NARCS) IN AN INDIVIDUAL PATIENT SIMULATION MODEL FOR HUMAN IMMUNODEFICIENCY VIRUS (HIV): IMPACT ON COSTS AND QUALITY-ADJUSTED LIFE-YEARS

C. Kiff[1], E. Fenwick[1], C. Parker[1], R. Perard[2], N. Hawkins[3]
*[1]ICON Health Economics, Abingdon, United Kingdom, [2]Gilead Sciences Europe, Uxbridge, United Kingdom, [3]London School of Hygeine and Tropical Medicine, London, United Kingdom*
*Presenting author email: chris.kiff@iconplc.com*

**Background:** HIV affects approximately 1.2 million people across Western and Central Europe. People living with HIV (PLHIV) can remain virologically suppressed providing they adhere to their antiretroviral treatment (ART). However, PLHIV are more likely to develop NARCs such as diabetes, chronic kidney disease (CKD) and cardiovascular disease (CVD) than the general population. Our objective was to estimate the impact of NARCs associated with different ART regimens on lifetime costs and Quality-Adjusted Life-Years (QALYs).
**Methods:** We developed an individual patient simulation model to predict clinical and economic outcomes of ART in treatment naïve patients. Patients progress through a clinically validated treatment pathway based on their previous treatments and standard of care. CD4 count, patient's characteristics and current ART were used to predict the NARCs (hypertension, bone fracture, diabetes, CKD and CVD) using published HIV specific risk equations mainly from the Data Collection on Adverse events of Anti-HIV Drugs (D:A:D) cohort. We utilised the model to estimate lifetime costs and QALYs for four ART regimens and their subsequent treatment pathways; E/C/F/TAF, E/C/F/TDF, DTG/ABC/3TC and R/F/TDF.
**Results:** Our model predicts that the mean lifetime costs associated with NARCs ranges from £6,420 for PLHIV starting on E/C/F/TAF to £9,207 for PLHIV starting on E/C/F/TDF. Mean lifetime QALY decrement associated with NARCs ranges from 0.52 for PLHIV starting on E/C/F/TDF to 0.63 for PLHIV starting on R/F/TDF. The mean costs for PLHIV who develop diabetes, CKD and CVD were £1,841, £13,952 and £973 respectively. The mean QALY decrements for the same NARCs were 0.24, 0.09 and 0.78 respectively.
**Conclusions:** To our knowledge, this is the first HIV model to incorporate NARCs in estimates of costs and QALYs for specific ART regimens. The additional cost and QALY loss of NARCs in PLHIV accounts for more than 15% of non-ART costs and needs to be taken into consideration when assessing ART regimens impact on patients and healthcare systems.

## TUPEE627

### ACCOUNTING FOR NON-AIDS RELATED COMORBIDITIES (NARCS) IN AN INDIVIDUAL PATIENT SIMULATION MODEL FOR HUMAN IMMUNODEFICIENCY VIRUS (HIV): IMPLEMENTATION AND PREDICTION

C. Kiff[1], E. Fenwick[1], C. Parker[1], R. Perard[2], N. Hawkins[3]
*[1]ICON Health Economics, Abingdon, United Kingdom, [2]Gilead Sciences Europe, Uxbridge, United Kingdom, [3]London School of Hygeine and Tropical Medicine, London, United Kingdom*
*Presenting author email: chris.kiff@iconplc.com*

**Background:** HIV affects approximately 1.2 million people across Western and Central Europe. People living with HIV (PLHIV) can remain virologically suppressed providing they adhere to their antiretroviral treatment (ART). However, PLHIV have been shown to be more likely to develop NARCs such as diabetes, chronic kidney disease (CKD) and cardiovascular disease (CVD) than the general population. Very few studies specifically assess the association of NARCs with specific ART regimens. Therefore, our objective was to estimate the proportion of PLHIV developing NARCs associated with different ART regimens.
**Methods:** We developed an individual patient simulation model to predict clinical and economic outcomes of ART in treatment naïve patients. Patients progress through a clinically validated treatment pathway based on their previous treatments and standard of care. CD4 count, patient's characteristics and current ART were used to predict the NARCs (hypertension, bone fracture, diabetes, CKD and CVD) using published HIV-specific risk equations mainly from the Data Collection on Adverse events of Anti-HIV Drugs (D:A:D) cohort. We utilised the model to estimate the proportion of PLHIV developing NARCs over a lifetime for four ART regimens and subsequent treatment pathways; E/C/F/TAF, E/C/F/TDF, DTG/ABC/3TC and R/F/TDF.
**Results:** Our model predicts that the proportion of PLHIV developing a NARC ranged from 58.7% for PLHIV starting on E/C/F/TAF to 61.4% for PLHIV starting on DTG/ABC/3TC. The proportion developing NARCs across treatment strategies ranged between 17.2% and 33.8%; 18.1% and 32.3%; 23.1% and 37.7% for diabetes, CKD and CVD respectively. In addition, between 15.9% and 17.7% of PLHIV developed multiple NARCs depending on their initial treatment. PLHIV starting on E/C/F/TAF developed statistically significantly fewer occurrences of CKD than PLHIV starting on either E/C/F/TDF or R/F/TDF (p< 0.01).

**Conclusions:** To our knowledge, this is the first model to predict the proportion of PLHIV developing NARCs for specific ART regimens. Based on the high estimated proportions of NARCs as presented, with some statistically significant differences seen across treatment strategies, the impact of NARCs should be incorporated when considering the long term health and economic outcomes of ART.

## TUPEE628

### COST-CONSEQUENCES AND HEALTH OUTCOMES OF COFORMULATED RILPIVIRINE, EMTRICITABINE AND TENOFOVIR ALAFENAMIDE (R/F/TAF), A NOVEL ORAL SINGLE-TABLET REGIMEN IN HIV PATIENTS IN THE UNITED STATES

F. Altice[1], E. DeJesus[2]
*[1]Yale University, School of Medicine, New Haven, United States, [2]Orlando Immunology Center, Orlando, United States*

**Background:** Highly effective antiretroviral (ARV) therapies have transformed treatment of HIV from acute to long-term chronic-care. HIV patients are living longer and treated earlier. With increasing age, comorbidities such as chronic kidney disease (CKD) and cardiovascular disease (CVD) are increasing. R/F/TAF, a novel ARV, has demonstrated bioequivalence to the components of coformulated riplivirine, emtricitabine, and tenofovir alafenamide, with potentially improved renal, CVD, and bone safety profiles.
Objective is to estimate health outcomes associated with R/F/TAF in treatment-naïve (TN) and virally suppressed treatment-experienced (TE) HIV patients compared to selected TDF and abacavir (ABC) containing regimens.
**Methods:** A cost-consequence analyses (CCA) was developed using an event simulation framework; the framework considers patients' conditions and events impacting these conditions. Inputs were drawn from published randomized controlled trials, the peer-reviewed literature, and real-world database analyses. Model structure, assumptions, and inputs were validated by a panel of experts in HIV, nephrology, CVD, endocrinology and skeletal abnormalities. The analysis compared R/F/TAF to R/F/TDF, F/TDF+dolutegravir (DTG), and efavirenz/F/TDF (CKD outcomes) and to DTG/ABC/3TC (CVD outcomes). The model assessed time horizons of 1-5 years.
**Results:** Table 1 summarizes the 5-year events predicted for a simulated cohort of 1000 US insured patients.
Compared to regimens with TDF backbones, R/F/TAF significantly reduced the number of patients predicted to progress to CKD-III. Additionally, patients treated with R/F/TAF are predicted to experience signifincantly reduced CVD events compared to those treated with DTG/ABC/3TC.
As a result, the proportion switching from first line was reduced, and time to first switch increased for patients treated with R/F/TAF compared to all comparators. This resulted in less total treatment failure that was observed in later lines of therapy.
Results were similar in TN and TE patients and were robust under various sensitivity analyses.

| Event | Treatment Naive Patients | | | | Treatment Experienced Patients | | | |
|---|---|---|---|---|---|---|---|---|
| | R/F/ TAF | R/F/ TDF | EFV/F/ TDF | DTG/ ABC/3TC | R/F/ TAF | R/F/ TDF | EFV/F/ TDF | DTG/ ABC/3TC |
| CKD III, n (NNT) | 43 | 67 (41) | 62 (53) | 43 (NA) | 55 | 84 (34) | 79 (42) | 54 (NA) |
| CVD, n (NNT) | 33 | 32 (NA) | 29 (NA) | 43 (100) | 65 | 62 (NA) | 58 (NA) | 82 (59) |
| Treatment Failure, n | 886 | 949 | 1,303 | 1,073 | 857 | 930 | 1,185 | 1,124 |
| 5 Year Persistence, Line 1 | 54% | 46% | 30% | 41% | 56% | 47% | 35% | 36% |
| Time to First Switch (months) | 45 | 42 | 35 | 40 | 45 | 42 | 37 | 37 |

*[Table 1: Health Outcomes Results]*

**Conclusions:** R/F/TAF is estimated to reduce comorbid events, increase first line persistence, reduce switching to second line and salvage therapies, and improve patient health outcomes.

# MANAGING HIV SUPPLY CHAIN CHALLENGES WITH LIMITED RESOURCES

## TUPEE629

### PUBLIC-HEALTH PATENT LICENCES: A SHIELD FROM ESCALATING COST BURDEN OF UNIVERSAL ACCESS TO ARVS IN RESOURCE LIMITED SETTINGS?

S. Juneja, A. Gupta
*Medicines Patent Pool Foundation, Business Development, Geneva, Switzerland*
*Presenting author email: sjuneja@medicinespatentpool.org*

**Background:** Intellectual property licenses played an important role in speeding access to patented Antiretroviral medicines (ARVs) in certain low- and middle-income countries (LMIC) in early 2000s. With the formation of United Nations-backed Medicines Patent Pool (MPP) in late 2010, ARV licensing gained momentum during the period 2011-2015, ensuring availability of latest ARVs in over 100 countries that may have otherwise not received access to those medicines. While access importance of such licenses is known, this paper uses financial approaches to analyse return on investment for public-health oriented patent licences.
**Methods:** MPP is a not-for-profit, funded by UNITAID through grants till 2020: this is MPP's total cost in obtaining licenses from originators and ensuring sufficient generic players compete to distribute low-cost ARVs in LMICs.
Savings resulting from low-cost medicines are computed for each drug by multiplying the differential between originator pharmaceutical company's tiered price and projected average generic price, multiplied with forecasted use of that drug during the period 2016-2025; WHO-MPP's forecasts (presented at IAS-2015) for ARVs is used for this calculation. Applicable generic price is computed using historical generic price evolution in similar competitive pharmaceutical markets. Savings are counted only in incremental countries where generics are distributed as result of MPP agreements due to "unblocking" of patents, and only until expiry of those patents. Projected savings and expected costs are discounted with UK treasury rate. A series of financial analyses were carried out on costs and savings.
**Results:** Savings till date through MPP agreements are estimated at $160 million, representing a cost-to-benefit ratio of 1:7, which means for every dollar spent, MPP's public-health oriented licenses saved $7. Savings would increase as newer ARVs such as dolutegravir are used in LMICs. By 2028, total direct savings generated by the MPP are estimated at $1.16 billion, representing a benefit ratio of 1:22, translating into a saving of $58 per patient year. Internal rate of rerurn, or IRR of 235% and proforma annualized return on investment is 108%.
**Conclusions:** The MPP model shows that investments in public-health oriented patent licenses deliver significant financial returns, which will increase substantially, providing shield from escalating cost burden of universal access.

# KEY POPULATIONS IN HUMANITARIAN SETTINGS AND FRAGILE CONTEXTS

## TUPEE630

### COMBINATION PREVENTION: WHAT WORKS IN HUMANITARIAN SETTINGS - A NEEDS ASSESSMENT FOR CHILDREN AND ADOLESCENTS IN KAKUMA REFUGEE CAMP IN KENYA

E. Gitau[1], M. Chizororo[1], U. Gilbert[1], G. Luttah[2], P. Izulla[3], F. Mutua[3], J. Burton[4]
*[1]UNICEF, Nairobi, Kenya, [2]International Rescue Committee, Nairobi, Kenya, [3]Consultant, Nairobi, Kenya, [4]UNHCR, Nairobi, Kenya*
*Presenting author email: maqceryx@gmail.com*

**Background:** This paper highlights the needs of children and adolescents living with HIV/AIDS in Kakuma refugee camp in Turkana County, Kenya, which for hosts 188, 453 refugees, majority being < 18 years old. The camp's location, interaction of refugees and host community, low literacy levels and poverty pose a great risk to its population, particularly adolescents to HIV/AIDS. Turkana County has one of the highest prevalence of HIV at 7.6%.
**Methods:** This is a qualitative study, conducted from four health facilities, exploring key components of quality of health care for children and adolescents from the perspectives of health providers and guardians: prevention of mother to child transmission, quality of pediatric care, adolescent health literacy, community support, appropriate package of service, provider competencies, facility characteristics, equity and non-discrimination, data and quality improvement, and adolescent participation. 14 key informants were interviewed. 6 focus group discussions were held at Kakuma refugee camp and host community. Direct observations were conducted at health facilities. Purposive sampling was employed.
**Results:** Referral chain for pregnant mothers throughout the period of their pregnancy existed. Community health workers acted as linkages between peer mother networks and pregnant mothers, including those living with HIV. This ensured that

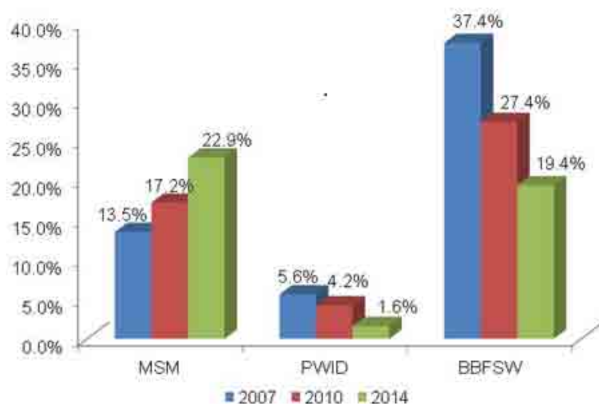
the child's progress up to their transition to adolescence was adequately monitored. The structures of the health facilities were dilapidated, compromising confidentiality and privacy of patients. There was lack of active channels of information provision. Condoms were distributed on a need basis or at designated areas without requisite training on correct and consistent use. Service providers were not sufficiently trained to cater specifically for children and adolescents' sexual and reproductive health needs. There was little evidence of adolescent participation in programming.
**Conclusions:** Combination prevention in humanitarian situations needs to be contextual. In Kakuma, the underlying issues are poverty and low literacy levels. A peer approach which is successful for the case of mothers can be applied to adolescents throughout the implementation of evidence-based behavioral interventions to circumvent the low literacy levels. In addition, community health workers and incentive workers can be trained to supplement the health workers in the facility and carry out outreach programmes.

## TUPEE631

### IMPLICATION OF SAME SEX MARRIAGE ACT 2013 ON HIV EPIDEMIC AMONG MEN WHO HAVE SEX WITH MEN IN NIGERIA

O. Oyedeji[1], G. Omoregie[2]
*[1]Society for Family Health, Global Fund HIV Directorate, Abuja, Nigeria, [2]Society for Family Health, Abuja, Nigeria, Nigeria*
*Presenting author email: segunoyedeji@gmail.com*

**Background:** The same-sex-marriage-(prohibition)-Act 2013 of Nigeria stipulates a jail term of 14-years-imprisonment for same-sex-marriage-contract and 10-years-imprisonment for operating-a-gay-club, societies and organization or supporting and sustaining such organizations. The implication of this on the health-and well-being of Men-who-have-sex-with-men (MSM) had not been-documented. Society-for-Family-Health, a foremost-Non-Governmental-Organization implementing a Global-Fund-and-United States-Government-funded programme for key-populations (KPs) in Nigeria constituted a team to determine the effect of the Act on programming for MSM and the critical HIV-indicators like HIV-Testing-Services-uptake, HIV-Prevalence, Condom-use and STI-treatment among MSMs.
**Description:** A desk-review of available-national-data was carried out using the Integrated-Biological-and-Behavioral-Surveillance-Survey-(IBBSS) 2007, 2010 and 2014 and programme-reports. The survey-data covered the whole country for all KPs and the programme reports were for selected-States with-emphasis-on-the-MSMs.
**Lessons learned:** The programme-report showed that peer-education-sessions-with-MSM were held in small-cohorts at high-cost because of the fear of harassment-by-the-security-forces. The review of the survey revealed that there had been a-consistent-decline in the prevalence-of-HIV-among the brothel-based Female-Sex-Workers (BBFSW), People-who-inject-drugs-(PWID) from 2007 to 2014. In stark contrast, HIV-prevalence among-MSM has steadily-risen from 13.5% in 2007 to 22.9% in 2014 as shown in figure 1.



*[Figure 1. HIV Prevalence of Key Populations in Nigeria. IBBSS 2014]*

The-misconception about HIV-transmission was highest-among-the-MSM compared to other-members of the-KPs. Unusual-genital-discharge was experienced by 13.0% of MSM compared to 9.0% among PWIDs. Condom-use with commercial-partners was lowest among MSM. Radio was the main-source-of-information-on-HIV-and-AIDS among the MSM.
**Conclusions/Next steps:** The prevalence-of-HIV among-the-KPs especially-MSM was higher-than-the-national-average of 3.4% reported in the-National-and-Reproductive-Health-Survey Plus 2012. The National-Agency-for-the-Control-of-AIDS needs to come out with a policy-statement that will address the health-needs of MSM particularly on HIV-transmission as some of them have female-partners who serve as bridge to the general-population without contravening the Act. There is need to continue to intensify-effective-intervention-programmes for the prevention of HIV among the KPs particularly the MSM through constructive-engagement of law-enforcement-agents on the public-health-significance-of HIV for the good-of-all-people.

# LESSONS LEARNED FOR HIV IN THE CONTEXT OF THE MILLENNIUM DEVELOPMENT GOALS (MDGS)

## TUPEE632

### EDCTP AS A MODEL FOR EUROPE-AFRICA PARTNERSHIP ON HIV/AIDS RESEARCH: ACHIEVEMENTS AND FUTURE DIRECTIONS

L. Pandya, P. Mohammed, C. Comeaux, J.G. Breugelmans, P. Beattie, M. Blázquez Domingo, M. Rijks-Surette, J.M. Habarugira, O. Olesen
*European & Developing Countries Clinical Trial Partnership (EDCTP), The Hague, Netherlands*

**Background:** The goals of the European & Developing Countries Clinical Trials Partnership (EDCTP) are to support collaborative research that accelerates the clinical development of new or improved interventions (drugs, vaccines, diagnostics) to prevent or treat HIV/AIDS, tuberculosis (TB), malaria and other poverty-related and neglected infectious diseases (PRDs) and to promote capacity building and networking in sub-Saharan Africa (SSA).
**Description:** EDCTP was established to pool resources and provide a research cooperation platform for HIV, malaria and TB between European/SSA countries. Under EDCTP1 (2003-2015) 254 grants (208 M€) were awarded; 68 on HIV and HIV/TB (68.5 M€; 32.9%), including 30 HIV trials (17 drug, 3 microbicide, 8 vaccine, and 2 on e-devices) and 9 HIV/TB co-infection trials. The 68 grants involved collaboration between 67 institutions from 13 European countries and 88 institutions from 24 African countries.
**Lessons learned:** EDCTP trials influenced national/international policies through adult/paediatric/adolescent and HIV/TB co-infection treatment trials, including initiation studies and pharmacogenomics. The CHAPAS-1 trial supported FDA approval and registration of a paediatric ARV formulation (Pedimune) in SSA. The PROMISE PrEP study recommended prophylaxis is administered to children breastfeeding from untreated HIV-positive mothers to minimise transmission risk.
**Conclusions/Next steps:** EDCTP-funded trials have contributed to the progress towards the Millennium Development Goals, HIV global health policy and strengthened clinical research capacity in Africa. EDCTP will continue supporting trials, clinical capacity building and networking, in collaboration with global health initiatives and funders. EDCTP2 (2014-2024) will receive ≤€ 683 million from the European Union and matching funding from European Participating States. The ~ €1.3bn budget will support phase I-IV clinical trials in SSA and contribute towards achieving the Sustainable Development Goals. EDCTP2 also aims to: promote greater alignment and coordination of national research programmes on PRDs; increase financial contributions from developing countries; and leverage cofunding from public/private sources. African nations can now become EDCTP members, providing a strong and equal European-African partnership. EDCTP2 calls for proposals are broad, aiming to address research areas of importance to SSA not already funded. To date, calls have covered diagnostics, treatment and research capacity development, with future calls expected to address gaps in treatment/ prevention of HIV/AIDS and other PRDs in SSA.

## TUPEE633

### LESSONS LEARNED FROM IMPLEMENTATION OF OPTION B+ IN LESOTHO WILL INFORM ROLL-OUT OF TEST AND TREAT

A.E.J. Tumbare, A. Tiam, A. Isavwa
*Elizabeth Glaser Pediatric AIDS Foundation Lesotho, Technical, Maseru, Lesotho*
*Presenting author email: etumbare@pedaids.org*

**Background:** At 23%, Lesotho has the second highest adult HIV prevalence in the world and 57% of HIV-infected adults are women. Coverage of adult and pediatric antiretroviral treatment (ART) remains low at 35% and 30%, respectively. The country adopted World Health Organization Option B+ guidelines in April 2013, and countrywide coverage was complete by Q1 of 2014. Lesotho is set to adopt new test and treat guidelines early in 2016. Implementation of Option B+ will inform implementation of these new guidelines.
**Description:** The Elizabeth Glaser Pediatrics AIDS Foundation (EGPAF) is a leading clinical partner supporting the Ministry of Health in Lesotho and supported roll out of Option B+ guidelines countrywide. Routine programmatic data were collected

from all antenatal facilities to inform progress. After one year of Option B+ implementation, a cross-sectional review of routine prevention of mother-to-child HIV transmission program data from 17 high volume sites was done to analyze the proportion of women remaining alive and on ART at three, six, and 12-months after Option B+/ART initiation and to assess rates of early mother-to-child HIV transmission (MTCT) at six weeks, 14 weeks, and 9-12 months postpartum.
**Lessons learned:** Rapid adaptation resulted in successful, rapid countrywide scale-up of Option B+ and increased enrollment of pregnant women on ART from 11% in Q1 of 2013 to 94% in Q1 of 2014. Retention rates for women initiating Option B+ for their health were higher at 12 months compared those initiating Option B+ for prevention (81% versus 76%, respectively). Overall MTCT rates were low (2.5%) at nine months, but lower for women enrolled in Option B+ for their own health compared to women enrolled in Option B+ for prevention of transmission (1% versus 2.9%).
**Conclusions/Next steps:** Lesotho demonstrated capability for rapid (<1 year) scale up of Option B+ and high acceptability of lifelong treatment initiation among pregnant and breastfeeding women regardless of their disease status. This enrollment success provides the impetus for the national rollout of test and treat. However, improved adherence and retention are needed and will require development of enhanced messaging for both healthcare providers and for patients regarding the rationale and benefits of universal ART.

## Challenges and opportunities for HIV in the context of the Sustainable Development Goals (SDGs)

### TUPEE634

### Patents, public health and the SDGs: are least developed countries (LDCs) making full use of public health safeguards under WTO's TRIPS agreement to ensure sustainable access to affordable generic medicines?

K. Bhardwaj
*Independent Lawyer (HIV, Health and Human Rights), New Delhi, India*

**Background:** For ensuring health lives, SDG 3 specifically calls for use of the Doha Declaration. Developing country experience shows TRIPS flexibilities must be incorporated &used to the fullest to ensure access to affordable medicines through import/local production. For the world's poorest countries, two recent hard won victories at the WTO have given them till 2021 for TRIPS compliance & till 2033 to enforce/grant pharmaceutical patents putting them in an ideal position to heed the calling of the SDGs.
**Methods:** To determine whether LDCs are in fact making use of the transition period and TRIPS flexibilities, the study:
(a) compiled &analysed LDC patent laws to determine coherence with public health objectives;
(b) identified potential impact on access to medicines due to early TRIPS compliance/non-inclusion of TRIPS flexibilities;
(c) proposed recommendations for law/policy makers.
**Results:** Despite the 2021 transition period, most LDCs appear to have complied with TRIPS including African LDCs who are members of OAPI. Afghanistan, Bangladesh, DRC, Madagascar, Myanmar & Nepal are considering Bills for early TRIPS compliance. Importantly, Cambodia,Burundi,Madagascar, Uganda, Rwanda & Zanzibar are making use of the pharmaceuticals transition period. The incorporation of TRIPS flexibilities in LDC laws is varied. For instance:
(a) only Zanzibar, Samoa, Burundi, Rwanda have safeguards against patent evergreening;
(b) for parallel imports, 11 LDCs have national & 13 have regional exhaustion limiting their ability to import lower-cost patented medicines;
(c) OAPI, Yemen, Mozambique, Cambodia, Angola, CapeVerde, Madagascar, Lesotho, SouthSudan, Rwanda & SierraLeone criminalise patent infringement that has a chilling effect on generic production/import. LDCs in WTO accession or FTA negotiations face TRIPS-plus demands. Positive attempts at including TRIPS flexibilities were observed in the East African Community LDC members.
**Conclusions:** LDCs have already used Doha Declaration/TRIPS flexibilities for access to generic ARVs. Facing disproportionate impact of NCDs (cancer incidence: 82% in 2030), such measures will be increasingly important as the TRIPS transition period ends, countries graduate LDC status &financial aid decreases. For local/regional pharmaceutical production, LDC transition period is crucial. Global Commission on HIV&law recommends suspending TRIPS for medicines &the recent Ebola crisis in Western African LDCs has raised serious questions on whether patents incentivise research for diseases affecting LDCs. Till a new paradigm emerges, access, equity, rights &the SDG health commitments require that LDCs make full use of the TRIPS transition period &amend their laws to include all TRIPS flexibilities.

## Scale up of paediatric diagnosis

### TUPEE635

### Six years of early infant diagnosis in Haiti, consolidating the program to support elimination of mother to child transmission efforts (2009-2014)

N. Segaren[1], T. Lewis[1], S. Boisson[1], O. Desinor[2], E. Carras-Terzian[1], T. Jean-Pierre[1], M. Skaer[1], P. Madan[1], J. Buteau[1], K. Francois[3], A. Smith[4]
*[1]Caris Foundation, Port au Prince, Haiti, [2]USAID, Port au Prince, Haiti, [3]MOH, Port au Prince, Haiti, [4]University of Oxford, Public Health, Oxford, United Kingdom*

**Background:** Dried blood spot HIV DNA PCR is a key component of PMTCT strategy. The Haitian National EID program started in September 2009. The rate of transmission has fallen from 26.3% in 2009 to 5.1% in 2014. The number of sites with EID capacity has grown from 25 in 2009 to 120 in 2014. This covers the majority of the Haitian population.
**Description:** The EID program is a partnership between the Haitian Ministry of Health, PEPFAR, The National Laboratory, Gheskio and other NGOs. The Caris Foundation is responsible for the training, specimen collection, result delivery and follow up of HIV positive infants identified.
From 1st September 2009 - 31st December 2194, 9886 infants were tested. This represents 85% of HIV positive pregnant women who were identified nationally for the same period. The median age of 1st PCR test has fallen from 12 weeks in 2009 to 8 weeks in 2014. The median turnaround time, from blood draw to return of PCR result to health provider was 21.0 days. Median time for laboratory testing was 7.3 days and median delivery of PCR result from the lab to health providers was 1.0 day due to an automated electronic system. 100% of results were returned to health providers.
Of the 736 identified as HIV positive, 733 (99.6%) were enrolled into clinical care (defined as returning for at least 1 clinical appointment after testing) and 558 (75.8%) were stared on ARV treatment.
**Lessons learned:** Scaling up the EID program has been successful and led to national coverage over 6 years. The testing processes have been merged with clinical follow up of children identified as positive. This has led to the possibility of reporting on clinical outcomes and improved the number of children started on ARVs. Electronic automation of result delivery and specimen processing has led to decreases in turnaround.
**Conclusions/Next steps:** The EID program needs to drive the elimination campaign in terms of targeting mother-child pairs to receive optimal PMTCT interventions. Further integration between PCR testing and follow up of HIV positive infants will improve the number of children initiated on ARVS and could reduce mortality.

## Scale-up of HIV self-testing

### TUPEE636

### Can 'late-read' of self-test devices be used as a quality assurance measure? Results of a pilot HIV self-test project in Zimbabwe

Y. Mavengere[1], E. Sibanda[1], K. Hatzold[2], F.M. Cowan[1,3], O. Mugurungi[4], S.N. Mavedzenge[5]
*[1]Centre for Sexual Health and HIV/AIDS Research, Harare, Zimbabwe, [2]Population Services International, Harare, Zimbabwe, [3]University College London, Research Department of Infection and Population Health, London, United Kingdom, [4]Ministry of Health and Child Care, Harare, Zimbabwe, [5]RTI International, Women's Global Health Imperative, San Francisco, United States*
*Presenting author email: yvonne@ceshhar.co.zw*

**Background:** HIV self-testing (HIVST) may increase testing uptake. Critical to success is HIVST accuracy and quality assurance (QA). We evaluated the potential for 'late-read' of self-test devices as a QA measure.
**Methods:** We conducted supervised self-testing of Oraquick rapid tests, where participants self-tested, and recorded their result, followed by confirmatory testing. Self-test devices were immediately read by study staff. Between 2-6 months after testing, we late read test devices and compared with real-time results to assess late-read validity. We subsequently conducted a HIVST observational study. 695 participants opting to self-test were asked to anonymously return their used test device along with a self-administered questionnaire (SAQ) reporting their test result to a drop-box in their community, and participated in a post-test telephone survey. Test devices were collected weekly, late read, and compared to self-reported results.
**Results:** 201 supervised self-tests were included in the late-read validation study. 9 (4%) tests had faded test lines at the time of late-read. Results are in Table 1.

| | N | Sensitivity | Specificity | Agreement | Kappa statistic |
|---|---|---|---|---|---|
| **All results** | 201 | 100% (80.5%, 100%) | 96.6% (92.7%, 98.7%) | 93.5% | 73.9% (61.2%, 86.6%) |
| **Faint positive dropped** | 192 | 100% (78.2%, 100%) | 99.4% (96.8%, 100) | 96.9% | 84.7% (73.0%, 96.3%) |

*[Table 1: Real time versus late read of supervised self-test results]*

In our observational study 541 (78%) self-testers returned their used test devices, 73% returned the SAQ with test result indicated, and 622 (89%) participated in the telephone survey. Late-read HIV prevalence was 13% versus reported HIV prevalence of 8%. 92% of HIV-ve per late-read were reported HIV-ve by SAQ. Accurate reporting of HIV+ve results were less good, with 71% agreement on SAQ, however, telephone survey results were significantly more likely to be HIV+ve than SAQ results (P< 0.01, data not shown).
**Conclusions:** Supervised self-testing results demonstrated excellent agreement between real-time and late-read, suggesting late-read is a valid QA measure. Observational study participants were largely willing to return used test devices and report their results, necessary steps for QA of HIVST accuracy. Significant differences in reporting HIV+ve results between telephone survey and SAQ plus qualitative data (not presented here) indicating reluctance to disclose HIV status, supports reporting bias. Late-read is a potential strategy for QA of HIVST accuracy, however, measures to address potential reporting bias of results should be considered.

## ADHERENCE TO ANTIRETROVIRAL THERAPY, INCLUDING WHEN USED AS PREVENTION OR FOR CHEMOPROPHYLAXIS

## TUPED637

### BARRIERS TO ANTIRETROVIRAL TREATMENT ADHERENCE IN HIV-INFECTED LONG-TERM TREATED ADOLESCENTS AND ADULTS IN UGANDA

S. Chekata Inzaule[1], R. Hamers[1], C. Kityo[2], T.F. Rinke de Wit[1], M. Roura[3]
*[1]Academic Medical Center of the University of Amsterdam, and Amsterdam Institute for Global Health and Development, Department of Global Health, Amsterdam, Netherlands, [2]Joint Clinical Research Centre, Kampala, Uganda, [3]Centre for International Health Research (CRESIB) Hospital Clínic, Universitat de Barcelona, Barcelona, Spain*
*Presenting author email: maserya@gmail.com*

**Background:** Long-term success of antiretroviral therapy for HIV requires near-perfect adherence, maintained throughout one's lifetime. However perception and patterns of adherence may change during the life course. We assessed challenges to long-term adherence in adolescents and adults in three HIV treatment regional centers in Uganda.
**Methods:** We conducted 24 in-depth interviews and 2 focus group discussions with a total of 33 health-care providers and expert clients. Interview topics included experiences with patients on long-term treatment with either declining or persistent non-adherence. Transcribed texts were coded and analyzed based on the social-ecological framework.
**Results:** Common themes to adults and adolescents were challenges with disclosure in intimate relationships, side effects upon treatment switch, erratic supply of drugs and change of brands with unfavorable taste. In adolescents main themes included lack of family and clinical support including facilitating caretakers for early and progressive disclosure of HIV status prior to adolescence, transitioning to adult-based care and declining peer-to-peer support groups. In addition there was also experimentation with treatment holidays, perceived discrimination and experienced stigma in boarding schools. In adults, temporary economic migrants had poor appointment keeping citing lack of transport, premise for being healthy hence prioritizing business to drug refills, political conflicts hindering their travel and reluctance to transfer out to nearby facilities.
**Conclusions:** Adherence counseling and support should be adaptive to different life stages and to the emerging life course challenges in long-term treated patients, and should be supported by sufficient well-trained counselors and appropriate supportive guidelines. Moreover, programs should also address constraints experienced by temporary economic migrants to ensure continuity of treatment within the host country.

## EXPERIENCES AND IMPACTS OF HIV-RELATED STIGMA

## TUPED638

### PSYCHOSOCIAL MANAGEMENT OF INTERNALISED HIV STIGMA, IN THE LOW PREVALENCE CONTEXT OF TURKEY

P. Oktem[1,2]
*[1]Positive Living Association, Istanbul, Turkey, [2]Independent Researcher and Consultant, Ankara, Turkey*
*Presenting author email: pinar.oktem@pozitifyasam.org*

**Background:** The paper explores how people living with HIV (PLHIV) experience and manage internalised stigma in Turkey, a low prevalence, conservative setting with very little and sporadic interventions on HIV/AIDS. Previous data show that internalised (or felt) stigma is higher and more powerful than enacted stigma in Turkey. Yet, being one of the most important obstacles in front of PLHIV's empowerment and participation, internalised stigma remains relatively under-researched in the overall stigma literature, as well as in the specific context of low prevalence settings.
**Methods:** Data were generated through narrative interviews with 28 PLHIV including key populations, interviews with 32 key informants and participant observation in a civil society programme offering direct support to PLHIV. Theoretical sampling, based on an intersectional approach was used. Social constructionist perspective to stigma and health psychology guided data analysis, in which thematic and narrative techniques were used.
**Results:** Main drivers of internalised stigma were identified as perceived 'failure' to fulfill family-related social roles and discrimination from healthcare providers. The paper focuses more on the effects of internalized stigma and on the active management strategies employed by PLHIV. Internalised stigma manifested itself in perceived responsibility, perceived shift in one's 'ideal' social identity, and feelings of shame and fear. Apart from preventing PLHIV from seeking treatment and professional psychological support, it also hindered participation in peer/support groups, made PLHIV 'keep a low profile' in healthcare settings and workplaces. Due to the internalised stigma, many reported cases of discrimination were perceived as 'justifiable differential treatment' and PLHIV were reluctant to take legal action. A number of psychosocial strategies for maintaining or enhancing a positive self-concept were identified, including passive acceptance versus 'resistance thinking', positive reappraisal and spiritual beliefs/practices.
**Conclusions:** Experiences differing in terms of gender, sexual orientation, and participants' involvement in activism, pointed out the intersectional character of internalised stigma and suggested that stigma management strategies should be conceptualised in non-linear and non-dichotomised terms. The roles of perceived risk and responsibility and the positive effect of peer support are demonstrated as particularly important in a low prevalence setting and suggested the urgent need for awareness-raising and stigma-reduction interventions in Turkey.

Wednesday 20 July

# ORAL ABSTRACT SESSIONS

## WEAA01 ACUTE HIV INFECTION: THE BATTLE BEGINS

### WEAA0101

### TH17 CELLS ARE PREFERENTIALLY INFECTED IN THE FIRST 48 HOURS AFTER VAGINAL TRANSMISSION OF SIVMAC239 IN MACAQUES

D.J. Stieh[1], E. Matias[1], A.J. Fought[2], P.A. Marx[3], R.S. Veazey[4], T.J. Hope[5]
*[1]Northwestern University, Cell and Molecular Biology, Chicago, United States, [2]Northwestern University, Preventative Medicine, Chicago, United States, [3]Tulane University, Tropical Medicine, New Orleans, United States, [4]Tulane National Primate Research Center, Pathology, Covington, United States, [5]Northwestern University, Cell and Molecular Biology, OB/GYN, Biomedical Engineering, Chicago, United States*
*Presenting author email: thope@northwestern.edu*

**Background:** Macaque vaginal challenge with SIV is utilized to reproduce the circumstances of male-to-female HIV transmission. This model has provided insights into HIV vaginal transmission, but the critical window of the earliest events taking place after mucosal exposure remains undefined.
**Methods:** We have recently developed a SIV-based dual reporter expression vector that facilitates the efficient identification of transmission susceptible sites in the rhesus macaque FRT after vaginal exposure. This system demonstrated that initial infection events can be widespread throughout the female reproductive tract (FRT), highly variable in their localization, and that T cells are the primary target in initial infection. Because this system efficiently identifies regions of susceptibility to infection in the FRT, we have determined that we can identify small foci of SIVmac239 infection 48 hours after vaginal challenge with a mixture of wildtype SIVmac239 and the LICh dual reporter. Utilizing this novel approach to SIV challenge, we routinely identify SIVmac239 infected cells revealing their localization and fates in the FRT 48 hours after vaginal challenge.
**Results:** Foci of infection with SIVmac239 are found throughout the female reproductive tract, from labia to ovary. We find that T cells are the major targets, and there is a strong bias for those with a Th17 phenotype. Infection of immature dendritic cells and macrophages is also observed representing approximately 25% of infected cells. 48 hours post inoculation, we find host responses to infection, evidenced by apoptosis, cell lysis, and phagocytosis of infected cells. RNA-Seq profiling of gene expression in tissues where SIV infection was established indicate that inflammatory responses and epithelial repair processes are occurring.
**Conclusions:** Defining the location and phenotype of SIV infected cell foci and early host responses informs the development of interventions designed to decrease HIV acquisition. Preferential infection of Th17 cells could explain the known conditions that increase HIV acquisition, including sexually transmitted infections and bacterial vaginosis. How these conditions precisely influence mucosal barrier function or the density of target cells remains to be determined. However, the system presented here provides essential sampling of these foci, facilitating characterization of the earliest host responses to SIV/HIV infection.

### EFFECT OF INJECTABLE HORMONAL CONTRACEPTIVES ON VAGINAL EPITHELIUM THICKNESS AND GENITAL HIV TARGET CELL DENSITY IN WOMEN RECENTLY INFECTED WITH HIV

S. Ngcapu[1], A.M. Carias[2], L.J. Liebenberg[1], L. Werner[1], G.C. Cianci[2], M. McRaven[2], S. Sibeko[3], N.J. Garrett[1], J.-M. Kriek[4], L.R. McKinnon[1], S. Abdool Karim[1,5], Q. Abdool Karim[1,5], J.-A.S. Passmore[1,4,6], T.J. Hope[2]
*[1]Centre for the AIDS Programme of Research in South Africa (CAPRISA), Durban, South Africa, [2]Northwestern University, Chicago, United States, [3]Oxford University, London, United States, [4]Institute of Infectious Diseases and Molecular Medicine, University of Cape Town Medical School, Cape Town, South Africa, [5]Columbia University, Department of Epidemiology, Mailman School of Public Health, New York, United States, [6]National Health Laboratory Service, Cape Town, South Africa*
*Presenting author email: ngcapu@ukzn.ac.za*

**Background:** Vaginal epithelial thinning and/or increased density of mucosal HIV-1 target cells are possible mechanisms by which injectable hormonal contraceptives (HCs) may increase risk for HIV-1 infection in HIV-1 negative women and the risk of her transmitting to her partner if infected. Here, the influence of injectable HCs on genital epithelial thickness, mucosal HIV-1 target cell density and depth in women with acute HIV infection was investigated.
**Methods:** CD4+ T cell and CD68+ macrophage density, both target cells for HIV infection, was measured by immunofluorescent staining in vaginal tissue biopsies from acutely-infected women who were either using injectable HCs or not using contraception. Concentrations of 48 cytokines measured in cervico-vaginal lavage (CVL). Blood CD4 counts and plasma viral loads were performed during acute infection and 12 months post-infection.
**Results:** Vaginal epithelial thickness was similar in women using injectable HCs compared to non-injectable HC users. The frequency of CD4+ T cells in the vaginal squamous epithelium of injectable HC users was significantly higher than non-injectable HC users (p=0.028). CD68+ macrophage cell density did not differ between women using injectable HCs and those not using injectable HCs, although macrophages were closer to the vaginal luminal surface in injectable HC users than those not using HCs (p=0.021). Furthermore, the frequency of mucosal CD68+ macrophages during the acute infection were positively associated with the concentration of the RANTES (beta coefficient (β)=0.779, p=0.024), MCP-1 (β=0.453, p=0.041), IP-10 (β=0.568, p=0.042), IL-7 (β=1.332, *p*=0.018), IL-9 (β=0.336, p=0.015), and IL-17 (β=1.058, p=0.007) in CVL, after adjusting for multiple comparisons.
**Conclusions:** Women using injectable HC users had increased frequencies of CD4+ T cells in their vaginal stratified epithelium than those not using injectable HCs. CD68+ macrophages correlated with a broad panel of mucosal cytokines. This study provides valuable insight into possible underlying mechanisms by which genital inflammation may increase HIV-1 risk and subsequent clinical phenotypes during HIV-1 disease course, such as viral set point.

*Presenting author email: kdr26@pitt.edu*

**Background:** African Green Monkeys (AGMs) do not normally progress to AIDS. Instead, they maintain a lifelong infection in spite of high viral replication. We investigated the impact of early virus replication and dissemination on the outcome of SIVsab infection in AGMs.
**Methods:** 29 adult male AGMs were intrarectally inoculated with SIVsab and serially sacrificed at 1-12 and 42+ days postinfection (dpi). Virus spread was monitored by PCR. vRNA and vDNA were quantified in 38 different tissues from each animal, including the site of inoculation**.** Plasma viral loads were quantified by standard RT-PCR and single copy assay (SCA). The PCR results were confirmed by extensive *in situ* hybridizations. Single genome amplification was performed to assess the bottleneck of SIV transmission.
**Results:** Plasma viremia was detectable as early as 2 dpi by SCA and 6 dpi by conventional PCR. vRNA and vDNA were detectable at the site of entry and draining LN as early as 1-3 dpi, in PBMCs at 3-4 dpi, in peripheral gut and lymphatics at 4-6 dpi and all other tissues 6 dpi. The highest levels of both vDNA and vRNA were found at the site of entry, LNs, peripheral gut and spleen. Multiple transmitted/founder viral variants were detected in all animals.
**Conclusions:** Early virus enrichment occurred at the site of entry, where the virus became detectable by 1-3 dpi. Plasma virus also became detectable very early, which indicates that the initial viral expansion and dissemination were nearly simultaneous. Furthermore, virus was detected early in the distal LNs, indicating rapid viral dissemination through the lymphatic system, in addition to the bloodstream. Multiple transmitted/founder viruses were identified in all animals, demonstrating that there is little bottleneck of virus transmission. These results are similar to the early viral dynamics of rectal transmission in adult male rhesus macaques, indicating that following rectal transmission there is little opportunity to prevent virus spread.

## WEAA0104

### EARLY TREATMENT OF HYPERACUTE HIV INFECTION IMPACTS PHENOTYPE AND CLONAL REPERTOIRE OF HIV-SPECIFIC CD8+ T CELLS

Z. Ndhlovu[1], T. Nkosi[2], N. Mewalal[2], N. Ismail[2], A. Moodley[2], K. Dong[1], T. Ndun'gu[2], B.D. Walker[1]
*[1]Harvard University, Ragon Institute of MGH, MIT and Harvard, Cambridge, United States, [2]University of KwaZulu Natal, Nelson Mandela School of Medicine, HIV Pathogenesis Programme, Durban, South Africa*
*Presenting author email: ndhlovuz@ukzn.ac.za*

**Background:** Although natural immunity in some cases can lead to prolonged HIV suppression, it does not completely eliminate the virus. Consequently most of what we know regarding the nature of HIV-specific responses is based on inadequate responses generated in the setting of high levels of persistent plasma viremia and marked CD4 cell decline in acute infection. We investigated the impact of antigen withdrawal through very early treatment of hyperacute infection on the functional qualities of HIV-specific CD8+ T cell responses.
**Methods:** 10 subjects who initiated ART in Fiebig stage 1 and 12 subjects with untreated hyperacute HIV infection (UTx) were studied. We conducted a comparative longitudinal analysis of the clonality, phenotype and functional profile of HIV-specific CD8+ T cell responses generated during treated and untreated hyperacute infection. HIV-specific CD8+ T cells were measured using MHC class I tetramers. T cell receptors (TCR) were sequenced from tetramer sorted CD8+ T cells.
**Results:** In spite of rapid plasma virus suppression and blunted peak viremia, HIV-specific CD8+ T cell responses were detected in 7 of 10 (70%) ETx subjects studied, compared to 90% detection rate in UTx. Phenotypic analysis of tetramer+ cells showed that responses in ETx subjects expressed higher levels of interleukin-7 receptor alpha (CD127+), a marker associated with the development of long term memory, compared to untreated subjects (*=0.0001*). ETx responses were more fully differentiated with terminally differentiated effector cells account for the 90% of the responses (*p=0.0001*) whereas untreated responses were less differentiated, with effector cells account for 90% of the response (*p=0.0001*). Combined tetramer ICS staining of 2 ETx had >70% tetramer+ cells secreting IFN-g compared to < 20% in UTx. Furthermore, longitudinal TCR analysis of tetramer sorted cells obtained from ETx revealed striking clonal stability over time whereas UTx responses were characterized by successive waves of clonal loss and emergency of new clonotypes over time.
**Conclusions:** We show that very early ART is associated with measurable CD8+T cell responses that are phenotypically and functionally superior to untreated hyperacute HIV infection. Our data suggest that prompt curtailment of HIV replication result in more functionally competent immune responses with potential for long-term survival.

*Presenting author email: genevieve.martin@ndm.ox.ac.uk*

**Background:** The rate at which HIV-1 infected individuals progress to AIDS is highly variable and impacted by T cell immunity. CD8 T cell inhibitory molecules are up-regulated in HIV-1 infection and associate with T cell dysfunction. Here we aimed to determine whether CD8 T cell immune checkpoint markers PD-1, Lag-3 and Tim-3 are associated with immune activation and disease progression.
**Methods:** We evaluated participants (n=122) with primary HIV infection (PHI) randomised to receive short-course ART, or no therapy, in the SPARTAC trial. Expression of PD-1, Tim-3, Lag-3 and CD38 on CD8 T cells from the closest pre-therapy time-point to seroconversion was measured by flow cytometry, and correlated with surrogate markers of HIV disease (HIV-1 plasma viral load (pVL) and CD4 T cell count) and the trial endpoint (time to CD4 count < 350 cells/µl or initiation of long-term antiretroviral therapy). To explore the functional significance of these markers, co-expression of Eomes, T-bet and CD39 was assessed.
**Results:** Expression of PD-1 on bulk and CD38 CD8 T cells correlated with pVL and CD4 count, and predicted the trial endpoint. Lag-3 expression was associated with pVL but not CD4 count. For all exhaustion markers, expression on CD38 CD8 T cells increased the strength of the associations. In Cox models, progression to the trial endpoint was most marked for PD-1/CD38 co-expressing cells, with evidence for a stronger effect within 12 weeks from seroconversion. The effect of PD-1 and Lag-3 expression on CD8 T cells retained statistical significance in Cox proportional hazards models including antiretroviral therapy and CD4 count, but not pVL as co-variants (HR 1.76; p=0.047 and HR 1.46; p=0.024 respectively). In a cohort of similar individuals with untreated PHI we demonstrated strong associations of PD-1 and Lag-3 with the T-bet$^{dim}$/Eomes$^{hi}$ CD8 population and CD39 expression, suggesting the expression of these markers during PHI represents functional exhaustion.
**Conclusions:** Expression of 'exhaustion' or 'immune checkpoint' markers in early HIV infection is associated with clinical progression, and may be impacted by immune activation and timing of therapy. New markers to identify exhausted T cells and novel interventions to reverse exhaustion may inform the development of new immunotherapeutic approaches.

## WEAA0106LB

### HIV CURE RESEARCH IN A NOVEL POPULATION OF SOUTH AFRICAN HYPER-ACUTE HIV INFECTIONS DETECTED IN THE BLOOD DONATION SETTING: THE MONITORING AND ACUTE TREATMENT OF HIV STUDY (MATHS)

K. van den Berg[1], M. Vermeulen[2], T. Xulu[3], C. McClure[4], C. Ingram[1], G. Beck[2], M. Stone[5], M.P. Busch[5], B. Custer[5], E.L. Murphy[5,6], NHLBI Recipient Epidemiology and Donor Evaluation Study-III (REDS-III)
*[1]South African National Blood Service, Medical Division, Johannesburg, South Africa, [2]South African National Blood Service, Johannesburg, South Africa, [3]Right To Care Health Services, Johannesburg, South Africa, [4]RTI International, Rockville, United States, [5]Blood Systems Research Institute, San Francisco, United States, [6]University of California San Francisco, San Francisco, United States*
*Presenting author email: karin.vandenberg@sanbs.org.za*

**Background:** All blood donations in South Africa are tested in parallel for HIV antibody and for RNA using highly sensitive individual-donation nucleic acid testing (ID-NAT). About 60 South African donors per year are detected to have RNA but not antibody (Fiebig stages I and II). We reasoned that with rapid initiation of antiretroviral therapy (ART), this population could be important for studying elimination of the HIV reservoir and HIV Cure.
**Methods:** We plan to enrol 50-75 Fiebig stage I and II HIV infected persons detected at the time of blood donation. HIV antibody (Abbott Prism HIV O Plus) and HIV RNA ID-NAT (Griffols, Emeryville, CA) were measured on samples taken at donation and enrolment. In collaboration with Right to Care Health Services, ART with Raltegravir/FTC/TDF is initiated at enrolment and switched to EFV/FTC/TDF at 6 months. HIV reservoir will be measured prospectively on leukocytes obtained from peripheral blood and plasma/leukapheresis. Finally, 25 Elite controllers, defined as antibody positive but HIV RNA negative on ID-NAT, are followed for HIV virology and immunology without treatment.
**Results:** Since October 2015, we have enrolled 14 donors with hyperacute HIV infection, median age 26 years, 10 female, 12 Black, 1 Asian and 1 White, mean HIV RNA 506,000 copies and mean CD4 547 cells/mm$^3$. Enrolment occurred a median of 13 days after donation and ART was initiated a median of 2 days after enrolment. Participants were Fiebig stages I (n=9) and II (n=5) at donation and Fiebig stages I (n=1), II (n=6) and III (n=7) at enrolment. In 9 evaluable participants, viral suppression (< 20 copies/mL on a sensitive viral load assay) occurred after a median of 35 days on ART. To date, 7 Elite controllers have been enrolled.
**Conclusions:** This study provides proof of principle that a partnership between the national blood service and a treatment NGO can be used to detect and rapidly treat persons with hyperacute HIV infection in South Africa. Initial results suggest that half of enrolees were still in Fiebig stage I/II at enrolment and that rapid viral suppression can be achieved once they are started on ART.

# WEAB01 SUPPORTING THREE GENERATIONS OF HEALTHY MOTHERS AND HEALTHY BABIES

## WEAB0101

### ACCEPTABILITY OF EARLY HIV TREATMENT AMONG SOUTH AFRICAN WOMEN

N. Garrett[1], E. Norman[2], V. Asari[1], N. Naicker[1], N. Majola[1], K. Leask[1], Q. Abdool Karim[1,2], S. Abdool Karim[1,2]
*[1]Centre for the AIDS Programme of Research in South Africa (CAPRISA), Durban, South Africa, [2]Columbia University, New York City, United States*
*Presenting author email: nigel.garrett@caprisa.org*

**Background:** WHO guidelines recommend immediate initiation of antiretroviral therapy (ART) for all individuals at HIV diagnosis regardless of CD4 count. There is a concern among some health care providers that there will be low uptake and/or poor adherence for ART in patients who are well and have high CD4 counts, but there is little data on uptake of earlier ART in resource-poor settings. This study assessed the acceptability of earlier treatment among HIV-positive South African women in a 10-year prospective cohort study (CAPRISA 002).

**Methods:** CD4 count and HIV viral load were measured 3-monthly from acute infection until five years post-ART initiation for CAPRISA 002 participants. Acceptability of earlier ART initiation was assessed by
(i) describing temporal trends of CD4 count at initiation in relation to WHO guidance,
(ii) virological suppression rates post-ART initiation at different CD4 count thresholds, and
(iii) administration of a standardized questionnaire.

**Results:** A total of 170/232 (73.3%) CAPRISA002 participants had initiated ART between January 2006 and December 2015. Mean CD4 count at initiation was 216 cells/µl [standard deviation (SD) 73.0; range 135-372] before 2010, and substantially increased to 531 cells/µl (SD 183; range 272-1095) by 2015 (p< 0.001). Median viral load simultaneously decreased from 5.3 [interquartile range (IQR) 4.6-5.8] to 4.1 (IQR 3.4-4.6) log copies/ml (p=0.004). Virological suppression rates at 3, 6, 12 and 18 months were consistently above 85% with no statistically significant differences for participants starting ART at higher versus lower CD4 count thresholds (Table). An early ART questionnaire revealed that 40/51 (78.4%) participants were willing to start ART at CD4 500 cells/µl or above, while 11/51 (21.6%) were unwilling. Within six months of questionnaire administration 28/40 (70.0%) and 6/11(54.5%) participants had initiated treatment (p=0.472).

| CD4 Count at Initiation (cells/µl) | 3 months | 6 months | 12 months | 18 months |
|---|---|---|---|---|
| <350 (n=77) | 87.9% (51/58) | 85.9% (67/78) | 87.8% (65/74) | 92.8% (65/70) |
| ≥350 (n=80) | 95.3% (61/64) | 92.7% (51/55) | 92.1% (35/38) | 100% (26/26) |
| P-value | 0.190 | 0.273 | 0.544 | 0.319 |
| <500 (n=132) | 92.2% (94/102) | 88.5% (100/113) | 88.0% (88/100) | 94.4% (85/90) |
| ≥500 (n=35) | 90.0% (18/20) | 90.0% (18/20) | 100% (12/12) | 100% (6/6) |
| P-value | 1.000 | 1.000 | 0.357 | 1.000 |

*[Virological suppression after ART initiation at different CD4 count thresholds]*

**Conclusions:** Temporal increases in CD4 counts, high virological suppression rates, and positive patient perceptions confirm high acceptability of ART irrespective of CD4 treatment threshold for the majority of patients in this population.

## WEAB0102

### TIMING OF PREGNANCY AMONG HIV-POSITIVE WOMEN, POSTPARTUM RETENTION AND RISK OF VIROLOGIC FAILURE

D. Onoya[1], T. Sineke[1], A. Brennan[2], M.P. Fox[2]
*[1]University of the Witwatersrand, Health Economics and Epidemiology Research Office, Johhannesburg, South Africa, [2]Boston University, School of Public Health, Boston, United States*
*Presenting author email: donoys@heroza.org*

**Background:** The wide implementation of the PMTCT Option B+ approach in South Africa warrants a closer examination of postpartum antiretroviral therapy (ART) outcomes. In this study we examine the association between timing of the first pregnancy with the risk and predictors of postpartum ART failure and disengagement from HIV care in South Africa.

**Methods:** This is a retrospective cohort study of 5780 HIV positive women 15 to 49 years of age, initiated on ART between 2004 and September 2014 in Johannesburg, South Africa. The incidence and predictors of ART failure (two consecutive viral load>1000 copies/ml) and loss to follow up (LTFU, >3 months late for a scheduled visit) during 24 months post-delivery/equivalent time were assessed using Cox proportional hazards modelling.

**Results:** Compared to non-pregnant women (Rate 5.6 per 100PY), women were more likely to be LTFU after a prevalent (Rate 13.7 per 100PY; HR 8.2, 95%CI: 6.3-10.6) or an incident pregnancy (Rate 10.1 per 100PY; HR 5.0, 95%CI: 4.0-6.2). The risks of ART failure following an incident pregnancy (Rate 5.9 per 100PY; HR 2.2, 95% CI: 1.6 - 2.9) and in the risk in the non-pregnant group (Rate 7.6 per 100PY; HR 1.9, 95% CI: 1.4 - 2.6) were higher than the risk after a prevalent pregnancy (Rate 4.9 per 100PY). Predictors of postpartum ART failure were being anaemic at delivery (HR 1.25, 95% CI: 1.01 - 1.54), having a low CD4 (< 350 cells) (HR 1.9, 95% CI: 1.6 - 2.4) and meeting the definition for LTFU (HR 1.4, 95%CI: 1.1-1.9). When stratified by CD4 count, among women with low CD4 (< 350) at delivery, the hazard of failure in the incident pregnancy group remained higher than in the prevalent pregnancy group (HR 2.5, 95% CI: 1.8-3.5). There was no difference in the high CD4 strata.

**Conclusions:** The risk of HIV treatment failure remains high among postpartum women, particularly those who conceive while on ART. The results highlight the importance of strengthening retention and monitoring efforts for postpartum women to sustain the benefits of the PMTCT program.

## WEAB0103

### ADVERSE OBSTETRICAL OUTCOMES AMONG HIV-POSITIVE AND HIV-NEGATIVE MOTHER-INFANT PAIRS IN NIGERIA AND SOUTH AFRICA: FINDINGS FROM THE INFANT STUDY

P. Datong[1], H. Jaspan[2,3], S. Osawe[4], J. Gatei[3], J.-A. Coombs[3], K.A. Muldoon[5,6], R. Mallick[5], C. Gray[3,7], K. Rosenthal[8], D.W. Cameron[5,6,9], A. Abimiku[4,10]
*[1]Plateau State Specialist Hospital, Jos, Nigeria, [2]Seattle Children's Research Institute, Seattle, United States, [3]University of Cape Town, Institute of Infectious Disease and Molecular Medicine, Faculty of Health Sciences, Cape Town, South Africa, [4]Plateau State Human Virology Research Centre, Institute of Human Virology, Jos, Nigeria, [5]Ottawa Hospital Research Institute, Clinical Epidemiology Program, Ottawa, Canada, [6]University of Ottawa, School of Epidemiology, Public Health and Preventative Medicine, Ottawa, Canada, [7]University of Cape Town, Institute of Infectious Disease and Molecular Medicine, Clinical Laboratory Sciences, Cape Town, South Africa, [8]McMaster University, Department of Pathology and Molecular Medicine, Hamilton, Canada, [9]The Ottawa Hospital and University of Ottawa, Department of Medicine, Ottawa, Canada, [10]University of Maryland, School of Medicine, Institute of Human Virology, Baltimore, United States*

**Background:** Sub-Saharan Africa has disproportionately high rates of infant morbidity and mortality. Healthy obstetrical outcomes are critical for establishing strong developmental trajectories, especially among infants exposed to HIV perinatally. This analysis was designed to identify the prevalence and correlates of adverse neonatal outcomes among HIV+ and HIV- mothers and their infants.

**Methods:** The INFANT study is a longitudinal cohort of healthy HIV+ and HIV- mother-infant pairs recruited from B Clinic in Khayelitsha, South Africa and Plateau State Specialist Hospital in Jos, Nigeria (April 2013 to March 2015). Adverse obstetrical outcomes included low birth weight
(< 2500g), small for gestational age (< 10 percentile), pre-term birth (< 37 weeks) and a composite outcome for any adverse outcome. Using odds ratios (OR) and 95% confidence intervals (CI), bivariable and multivariable logistic regressions determined association between HIV and adverse obstetrical outcomes.

**Results:** A total of 680 mother-infant pairs were recruited into the study - 490 pairs with HIV+ mothers and 190 with HIV- mothers. The mother's median age was 29 years (IQR: 25-33), 147 (21.65%) had less than elementary school education, 503 (74.19%) were married, and 477 (70.25%) lived without running water. A total of 170 (25.00%) births had an adverse obstetrical outcome - 30 (4.41%) with low birth weight, 92 (13.53%) were small for gestational age, and 71 (10.44%) were pre-term. Adverse outcomes were higher among mothers with HIV (OR:1.52, 95% CI:1.08-2.13), those with less than elementary school (OR:1.49, 95% CI:1.12-1.97) and those without running water (OR:1.48, 95%CI:1.06-2.05). Married mothers (OR:0.55, 95%CI:0.98-0.81) and mothers from the Khayelitsha site (OR:0.35, 95% CI: 0.24-0.50) had lower odds of adverse outcomes. After adjusting for education, running water, marital status and study site, mothers living with HIV had significantly higher odds of adverse obstetrical outcomes (AOR: 1.45, 95% CI:1.03-2.04).

**Conclusions:** Although this study was designed to include healthy births, 25% of mother-infant pairs had an adverse obstetrical outcome, and 45% higher odds were documented among mothers with HIV. Comprehensive antenatal care for all women, including those living with HIV, is needed to optimize maternal and child health.

## WEAB0104

### HIGH PROPORTION OF DEATHS ATTRIBUTABLE TO HIV AMONG POST-PARTUM WOMEN IN BOTSWANA DESPITE WIDESPREAD UPTAKE OF ART

R. Zash[1,2,3], S. Souda[4], J. Leidner[5], K. Binda[3], C. Hick[3], K. Powis[2,3,6], J. Makhema[2,3], M. Mmalane[3], M. Essex[2,3], S. Lockman[2,3,7], R. Shapiro[2,3]
*[1]Beth Israel Deaconess Medical Center, Division of Infectious Diseases, Boston, United States, [2]Harvard School of Public Health, Boston, United States, [3]Botswana Harvard AIDS Institute Partnership, Gaborone, Botswana, [4]University of Botswana, Faculty of Health Sciences, Gaborone, Botswana, [5]Goodtables Data Consulting, Norman, United States, [6]Massachusetts General Hospital, Boston, United States, [7]Brigham and Women's Hospital, Boston, United States*
*Presenting author email: rzash@bidmc.harvard.edu*

**Background:** Mortality in the post-partum period may be impacted by antiretroviral treatment (ART) received in pregnancy, and whether ART is continued in the post-partum period.
**Methods:** HIV-infected and HIV-uninfected mothers were enrolled within 48 hours of delivery at 5 public hospital maternity wards throughout Botswana. Follow up visits were conducted by cellphone at 1 and 3 months, then every 3 months until 24 months post-partum. Maternal deaths were reported by one of the approved contacts given by the mother at enrollment. Risk factors for maternal survival were assessed using Cox proportional hazard models.
**Results:** Between February 2012 and March 2013, 3000 mothers (1499 HIV-infected and 1501 HIV-uninfected) were enrolled. There were 26 total maternal deaths in 24 months post-partum
(411 per 100,000 person-years), 22 among HIV-infected women (769 per 100,000 person-years) and 4 among HIV-uninfected women (134 per 100,000 person-years). Maternal age, availability of indoor toilet, formal housing, Rh factor, preterm delivery and higher parity were associated with mortality in univariate, but not adjusted analyses. Maternal HIV-infection (aHR 5.0, 95% CI 1.6, 15.2) and infant birth injury (aHR 3.8, 95% CI 1.3, 11.4) were independent risk factors for maternal death in the post partum period. Among HIV-infected women, when compared with the 924 women who received continuous 3-drug ART in pregnancy and post-partum, there was no significant increase in mortality among 281 women who discontinued ART after pregnancy (aHR 2.1, 95% CI 0.6, 7.5); among 241 women who initiated or re-started ART in the post-partum period (aHR 1.1, 95% CI 0.2, 5.1); or among 70 women who received no ART at any time (aHR 2.8, 0.3, 28.2). CD4 cell count in pregnancy was not associated with mortality (p=0.20) and longer ART duration prior to delivery (> 2 years) did not decrease mortality (aHR 0.6, 95% CI 0.1, 3.4).
**Conclusions:** Despite high uptake of 3-drug ART in pregnancy and post-partum, HIV infected women were 5 times more likely than HIV-uninfected women to die within 24 months after delivery, independent of CD4 cell count. Further research is needed to understand the increased risk of mortality among HIV-infected post-partum women.

## WEAB0105

### BIRTH WEIGHT AND PRETERM DELIVERY OUTCOMES OF PERINATALLY VS. NON-PERINATALLY HIV-INFECTED PREGNANT WOMEN IN THE U.S.: RESULTS FROM THE PHACS SMARTT STUDY AND IMPAACT P1025 PROTOCOL

*Presenting author email: jennifer.jao@mssm.edu*

**Background:** The success of antiretroviral therapy (ART) has resulted in many perinatally HIV-infected (PHIV) youth reaching reproductive age. Pregnancy outcomes of PHIV women compared to women acquiring HIV non-perinatally (nPHIV) are poorly defined.
**Methods:** We compared birth weight (BW) and preterm delivery (PTD) outcomes of PHIV versus nPHIV pregnant women enrolled in the PHACS Surveillance Monitoring for ART Toxicities Study (SMARTT) or IMPAACT P1025 protocol. Women were 13-30 years old. Infants were HIV-uninfected singleton liveborns. Maternal PHIV status was identified by self-report, medical record review, or HIV infection documented within 5 years of birth. BW *z*-scores (BWZ) and small-for-gestational-age (SGA) were calculated using U.S. standards. Mixed effects models were applied to assess the association of maternal PHIV status with infant BWZ; log binomial models using generalized estimating equations were fit for PTD (delivery at < 37 weeks) and SGA outcomes.
**Results:** From 1998-2013, 2,270 HIV-infected pregnant women delivered 2,692 newborns (270 born to PHIV and 2,422 to nPHIV women). Compared to nPHIV women, PHIV women were younger (mean age 21 vs. 25 years, $p< 0.01$) and less often Black (55% vs. 67%, $p< 0.01$). PHIV women were more likely to have a CD4 count < 200 cells/mm³ during pregnancy (19% vs. 11%, $p=0.01$), delivery HIV RNA level ≥400 copies/mL (28% vs. 23%, $p< 0.01$), receipt of ≥3-class ART during pregnancy (23% vs. 2%,
$p< 0.01$), and pre-pregnancy body mass index (BMI) < 18.5 kg/m² (6% vs. 3%, $p< 0.01$). PHIV were less likely to report tobacco (14% vs. 20%, $p=0.01$) and substance use (1.7% vs. 3.3%, $p< 0.01$) during pregnancy. After adjustment, BWZ was 0.13 lower in infants of PHIV vs. nPHIV women (adjusted mean: -0.46 vs. -0.33, $p=0.03$). Black race, tobacco and substance use in pregnancy, and maternal pre-pregnancy BMI < 18.5 kg/m² were also significantly associated with lower infant BWZ. No associations between maternal PHIV status and PTD or SGA were observed.
**Conclusions:** Infants of PHIV versus nPHIV women may be at greater risk for lower BW, although the absolute difference was small. Future studies are warranted to understand mechanisms by which the intrauterine environment of PHIV women may affect fetal growth.

## WEAB02 TAKING TB FROM TESTING TO TREATMENT

### WEAB0201

#### DAILY IS BETTER THAN THRICE-WEEKLY ANTI-TUBERCULOSIS THERAPY IN HIV PATIENTS WITH CULTURE CONFIRMED PULMONARY TB: A RANDOMISED CONTROLLED CLINICAL TRIAL FROM SOUTH INDIA

G. Narendran[1], S. Ramesh Kumar[1], C. Padmapriyadarsini[1], N.S. Gomathi[1], P.A. Menon[1], L. Sekar[1], S. Devarajulu Reddy[1], S. Chandra[1], A.K. Hemanth Kumar[1], S. Kumar[2], S. Sekar[3], N. *[1]National Institute for Research in Tuberculosis, Clinical Research, Chennai, India, [2]Government Hospital of Thoracic Medicine, TB Sanatorium, Chennai, India, [3]Madras Medical College, ART Centre, Chennai, India, [4]District TB Office, Government of TamilNadu, Chennai, India, [5]Government Stanley Hospital, Pulmonology, Chennai, India, [6]State TB Officer, Governemnt of Tamilnadu, Chennai, India, [7]Institute for Thoracic Medicine, Pulmonology, Chennai, India, [8]DG, Indian Council of Medical Research, DHR, New Delhi, India*

*Presenting author email: nareng@nirt.res.in*

**Background:** Benefit of daily over thrice-weekly anti-tuberculosis therapy (ATT) in pulmonary TB (PTB) patients with HIV on anti-retroviral therapy (ART) is unclear.

**Methods:** Efficacy comparison (first head to head) of three ATT regimens of 6 months administered daily

(**A**: $2EHRZ_7/4HR_7$), part daily

(**B**: $2EHRZ_7/4HR_3$) or thrice weekly throughout

(**C**: $2EHRZ_3/HR_3$) in HIV-PTB.

An open label randomised clinical trial at the National Institute for Research in Tuberculosis, India, enrolled HIV infected treatment-naive confirmed PTB patients (sputum smear or Xpert-MTB Positive). Clinical evaluation, two sputa smear for Acid Fast Bacillus and culture including drug susceptibility testing (Lowenstein Jensen medium) was done at baseline and monthly for 18 months. CD4 cell count, HIV viral load, liver and renal function tests, and Chest X-ray were performed at 0, 2, 6, 12 and 18 months. Block randomisation, stratified by baseline sputum smear grading (0 & 1+) or (2+&3+) and CD4 cell count (< 150 or >150), was performed and patients allocated to fully supervised ATT regimens **A**, **B** and **C .** ART initiation was within 8 weeks of starting ATT. Pre-treatment rifampicin- sensitive cases were analysed. Primary outcomes were failures and acquired rifampicin resistance (ARR).Secondary outcomes were death, default, and toxicity. Intent to treat and efficacy analyses were performed. Outcomes compared using Chi-square test. [NCT00933790].

**Results:** Till date, 324 patients were allocated to regimens A (110), B (109) and C (105) respectively. Baseline characteristics were comparable.

| | Daily regimen A (n=110) | Part Daily regimen B (n=109) | intermittent regimen C (n=105) |
|---|---|---|---|
| Mean Age in years ±SD | 38±8 | 39±9 | 39±9 |
| Mean weight in kilograms ±SD | 42.6±8.1 | 42.0±7.5 | 44.4±7.5 |
| Mean HB gms% ±SD | 9.7±2.2 | 9.6±2.0 | 10.0±2 |
| Mean HCT% ±SD | 28.7±6.6 | 27.8±5.3 | 29.8±7.1 |
| Mean HIV viral load(log10){copies/ml}±SD | 4.8±1.2 | 4.9±1.0 | 4.9±1.2 |
| Median CD4 cell count (IQR)cells/mm3 | 130 (65-220) | 145 (79-262) | 135(65-252) |
| Median ATT-ART interval (IQR), in days | 17 (3-36) | 17 (5-45) | 15 (2-34) |
| Mycobacterium TB sensitive to all drugs % | 77 | 71 | 68 |

*[Baseline Characteristics of HIV patients with newly diagnosed PTB randomized to three ATT regimens]*

Favourable responses (ITT) in **A** and **C** were 90% (83/92) vs.77% (65/85) {p=0.013, crossing OB'rein Fleming boundaries at second interim analysis}.B had 79% (70/89) efficacy. Failures were three in B and eight ( four with ARR) in C. Adverse drug reactions were 24%, 19% and 10% in A, B, C regimens respectively.

**Conclusions:** Daily ATT resulted in higher cure, lower failure, no emergence of ARR but higher toxicity ( mostly manageable) compared to thrice-weekly ATT.

### WEAB0202

#### INTENSIFIED TUBERCULOSIS CASE-FINDING AMONG PEOPLE LIVING WITH HIV: DIAGNOSTIC YIELD OF XPERT MTB/RIF, URINE LIPOARABINOMANNAN AND LIQUID CULTURE

E. Atuhumuza[1], C. Yoon[2], J. Katende[3], L. Asege[1], S. Mwebe[1], A. Andama[4], D. Armstrong[5], D. Dowdy[6], M. Kamya[1,4], F.C. Semitala[3,4], A. Cattamanchi[2]

*[1]Infectious Diseases Research Collaboration, Kampala, Uganda, [2]University of California, Department of Medicine, San Francisco, United States, [3]Makerere University Joint AIDS Program, Kampala, Uganda, [4]Makerere University, College of Health Sciences, Department of Medicine, Kampala, Uganda, [5]Johns Hopkins University, Department of Medicine, Baltimore, United States, [6]Johns Hopkins University, Epidemiology, Baltimore, United States*

*Presenting author email: semitala@gmail.com*

**Background:** To reduce the burden of tuberculosis (**TB**) among **PLHIV**, the WHO recommends symptom-based screening at every clinic visit, followed by Xpert MTB/RIF (Xpert) testing for all individuals who screen-positive (*intensified* case finding [**ICF**]). However the utility of this ICF strategy is unknown. It is also not clear how other TB diagnostics can increase sensitivity and/or reduce the time to diagnosis.

**Methods:** We administered the WHO TB symptom screen to consecutive HIV-infected adults with CD4+ count ≤350 cells/uL initiating antiretroviral therapy (ART) in Uganda from July 2013-December 2015. We collected 2 spot sputum specimens from all patients and urine if CD4 was ≤200 cells/uL. We compared the proportion of culture-confirmed TB cases detected by individual tests (sputum Xpert, urine Determine TB LAM [Grade II cut-point], a single sputum mycobacterial growth indicator tube [MGIT] culture) and test combinations (Xpert+LAM, Xpert+MGIT, LAM+MGIT, Xpert+LAM+MGIT). We also calculated the time to TB detection as the time from enrollment to first positive result.

**Results:** Symptom screening was positive in 1,012 of 1128 (90%) patients (median CD4 156 cells/uL, IQR 69-265), including 152 of 159 patients with TB. TB prevalence among symptomatic PLHIV was 15%. Of the 152 symptomatic and culture-confirmed TB cases, 49% (95% CI: 41-57) were identified with Xpert, 33% (95% CI: 20-48) with LAM, and 77% (95% CI: 69-83) with a single MGIT culture. Compared to Xpert alone, the diagnostic yield increased to 68% (difference 19%, 95% CI: 2-35) with Xpert+LAM, 85% (difference 36%, 95% CI: 26-46) with Xpert+MGIT, 80% (difference 30%, 95% CI: 19-42) with LAM+MGIT, and 86% (difference 37%, 95% CI: 26-47) with Xpert+LAM+MGIT. The false-positive rate was < 3% for all strategies. Over 75% of patients were diagnosed on the same day for ICF strategies that used Xpert, LAM, or Xpert+LAM.

**Conclusions:** TB prevalence was high among symptomatic PLHIV initiating ART. The currently-recommended ICF strategy (Xpert alone) missed nearly half of all TB cases. The inclusion of urine LAM increased diagnostic yield and same-day diagnosis, but without culture, any ICF strategy is likely to miss at least one-third of all patients with active TB in this setting.

### WEAB0203

#### CYTOMEGALOVIRUS VIRAEMIA AND 12-WEEK MORTALITY AMONG HOSPITALISED ADULTS WITH HIV-ASSOCIATED TUBERCULOSIS IN KHAYELITSHA HOSPITAL, SOUTH AFRICA: A PROSPECTIVE COHORT STUDY

A. Ward[1], D. Barr[2], C. Schutz[1], R. Burton[3], A. Boulle[1], G. Maartens[1], R.J. Wilkinson[1], G. Meintjes[1]

*[1]University of Cape Town, Cape Town, South Africa, [2]University of Liverpool, The Wellcome Trust Liverpool Glasgow Centre for Global Health Research, Liverpool, United Kingdom, [3]Khayelitsha Hospital, Cape Town, South Africa*

**Background:** Mortality in hospitalised patients with HIV-associated tuberculosis remains high. Cytomegalovirus (CMV) organ disease is one of the co-infections found in autopsies of such patients. We investigated the association of CMV viraemia with mortality in this setting.

**Methods:** HIV-infected inpatients in Khayelitsha Hospital with CD4< 350cells/mL and new diagnosis of tuberculosis were enrolled from January 2014-June 2015. Plasma CMV qPCR was performed and categorized as detectable (CMV+) or undetectable (CMV-). Endpoint was 12-week mortality.

**Results:** We included 256 patients with median age 36 years (IQR 31-44 years), 49% male, 35% on ART, median CD4=64 cells/mL(IQR 24-117) and 79(30.9%) CMV+. By 12 weeks, 26/77(38.0%) of CMV+ and 31/174(17.8%) of CMV- patients died (p=0.008); 5 were lost to follow-up. In CMV+ patients with < 1000 copies/ml mortality was 12/36(33.3%) compared to 14/41(34.1%) in those with higher viral load (p=1.0).

Mortality was higher in older patients (≥36 years): 32.8% vs. 14.1%(p< 0.001). Older patients were more likely to be CMV+ (38.0% vs. 23.6%, p=0.015) and a larger proportion of older patients had CD4 count< 50 cells/mL (48.5% vs. 37.9%, p=0.106). In Kaplan-Meier analysis, CMV+ was associated with mortality in older, not younger patients.

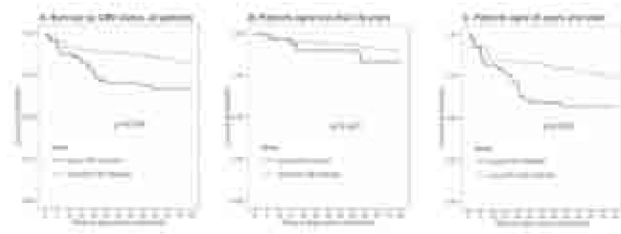
In multivariate Cox proportional-hazards regression, age (aHR=1.70, 95%CI=1.34-2.15 per 10years increase) was associated with mortality; CMV status was not.



*[Figure: Survival by CMV status: whole cohort and stratified by age]*

| | Univariate | | | | Multivariate: n=232 with complete observations | | | |
|---|---|---|---|---|---|---|---|---|
| | HR | lower 95%CI | upper 95%CI | p.value | aHR | lower 95%CI | upper 95%CI | p.value |
| Age, per 10 years | 1,75 | 1,41 | 2,19 | **<0.001** | 1,70 | 1,34 | 2,15 | **<0.001** |
| Male sex | 0,84 | 0,50 | 1,41 | 0,505 | 0,69 | 0,41 | 1,19 | 0,185 |
| CD4, per 50 cellsx10^6/L | 0,78 | 0,64 | 0,96 | **0,017** | 0,80 | 0,64 | 1,00 | 0,052 |
| HIV viral load, Log10 copies/mL | 0,90 | 0,80 | 1,03 | 0,117 | 0,94 | 0,82 | 1,07 | 0,316 |
| Mycobacteraemia | 1,48 | 0,88 | 2,49 | 0,138 | 1,00 | 0,56 | 1,76 | 0,990 |
| Albumin, per 5 g/L | 0,73 | 0,58 | 0,92 | **0,006** | 0,84 | 0,66 | 1,08 | 0,177 |
| CMV viraemia | 2,09 | 1,24 | 3,53 | 0,004 | 1,67 | 0,95 | 2,93 | 0,077 |
| Likelihood ratio test= 37.2 on 7 d.f., p<0.0001 | | | | | | | | |

*[Table: Cox proportional hazards regression analysis of factors associated with 12-week mortality]*

**Conclusions:** CMV viraemia was associated with higher mortality, but not after adjusting for potential confounders. Older patients had higher mortality and were more likely to have CMV viraemia. CMV viraemia is likely a marker of more severe immunodeficiency rather than a direct contributor to mortality.

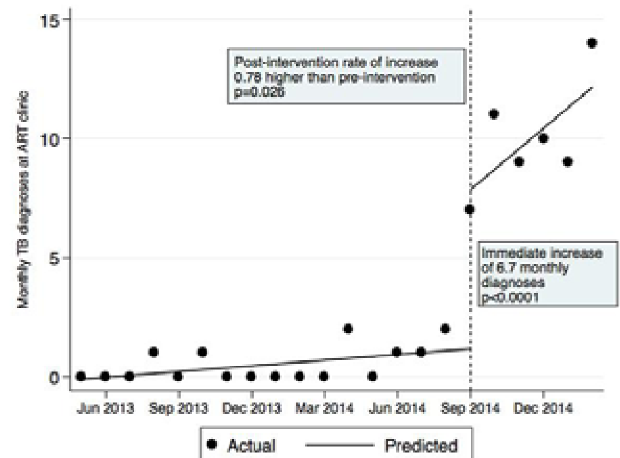
## WEAB0204

### YIELD OF COMMUNITY HEALTH WORKER-DRIVEN INTENSIFIED CASE FINDING FOR TUBERCULOSIS AMONG HIV-POSITIVE PATIENTS IN RURAL MALAWI

R. Flick[1,2,3], K. Simon[2,4], A. Munthali[2], A. Dimba[5], M. Kim[2,4], P. Kazembe[2,4], M. Hosseinipour[1,6], S. Ahmed[2,4]

*[1]University of North Carolina Project Malawi, Lilongwe, Malawi, [2]Baylor College of Medicine Children's Foundation Malawi, Lilongwe, Malawi, [3]University of Colorado School of Medicine, Denver, United States, [4]Baylor International Pediatric AIDS Initiative at Texas Children's Hospital, Baylor College of Medicine, Houston, United States, [5]Malawi Ministry of Health National Tuberculosis Control Programme, Lilongwe, Malawi, [6]University of North Carolina at Chapel Hill, Chapel Hill, United States*
*Presenting author email: simon.katier@gmail.com*

**Background:** Tuberculosis (TB) is the most common cause of death in HIV-positive patients. Early detection and anti-TB treatment initiation improves outcomes and minimizes ongoing transmission. Intensified case finding (TB-ICF) among HIV-positive patients is recommended by the WHO, however evidence from routine implementation at high-volume antiretroviral therapy (ART) clinics in resource-constrained settings is scarce. Here, we describe the yield of TB-ICF conducted by community health workers (CHWs) among HIV-positive patients accessing ART in rural Malawi.
**Methods:** Thirteen CHWs employed by the Baylor Tingathe outreach program were trained to conduct TB-ICF using a standardized symptom screening tool at a large rural district hospital. Patients were screened while awaiting routine services at ART clinic. Patients screening positive were triaged for assessment by a clinician and sputum analysis by smear microscopy and GeneXpert. Patients were followed up until final diagnosis and traced if necessary. Sixteen months of pre- and six months of post-intervention data was abstracted from registers and tools used by CHWs. Single-group interrupted time series analysis was used to assess impact of the intervention.
**Results:** The mean number of monthly TB diagnoses made at ART clinic increased by a factor of 20 post-intervention(0.5 vs 10.0 monthly diagnoses, p< 0.0001). In the first month of the intervention an immediate increase of 6.7 monthly diagnoses occurred (p< 0.0001, Figure 1). There was a statistically significant increase in the monthly trend of TB diagnoses relative to the pre-intervention trend of 0.78 per month(p=0.026). The yield of screening in the post-intervention period was 10.0%(46/459). Diagnoses were only made in children post-intervention(9/46, 19.6%).



*[Figure 1. Actual and model-fitted monthly TB diagnoses at ART clinic before and after CHW TB-ICF]*

**Conclusions:** Implementation of TB-ICF with CHWs was associated with significant increases in the number and trend of monthly TB diagnoses. Screening resulted in favorable yields, and helped link children to care. Future work is needed to ascertain the durability of this effect and the impact on treatment outcomes.

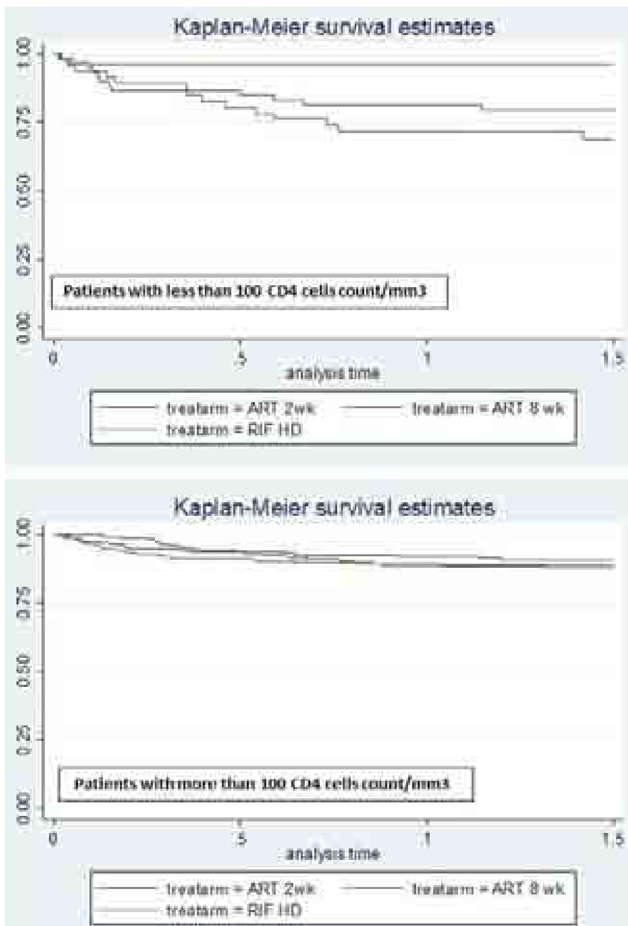
## WEAB0205LB

### HIGH-DOSE RIFAMPICIN TUBERCULOSIS TREATMENT REGIMEN TO REDUCE 12-MONTH MORTALITY OF TB/HIV CO-INFECTED PATIENTS: THE RAFA TRIAL RESULTS

C.S. Merle[1,2], S. Floyd[2], A. Ndiaye[3], T. Galperine[4], A. Furco[5], B.C. De Jong[6], H. McIlleron[7], J. Glynn[2], M. Sarr[3], O. Bah-sow[8], D. Affolabi[9], on behalf of the RAFA Team

*[1]WHO, TDR, Geneva, Switzerland, [2]London School of Hygiene & Tropical Medicine, IDEU, London, United Kingdom, [3]National Tuberculosis programme, Dakar, Senegal, [4]Tenon Hospital, Paris, France, [5]University College London, London, United Kingdom, [6]Institute of Tropical Medicine, Antwerp, Belgium, [7]Cape Town University, Clinical Pharmacology Laboratory, Cape Town, South Africa, [8]Hospital Ignace Deen, Service de Pneumophtisiologie, Conakry, Guinea, [9]National TB programme, Cotonou, Benin*
*Presenting author email: merlec@who.int*

**Background:** Approximately 30% of TB/HIV patients die within 12 months of starting TB treatment. Current treatment strategies to reduce TB/HIV mortality rely largely on the optimal management of HIV disease. But, as supported by autopsy studies, the problem might also be seen from the TB perspective: more intensive TB treatment might also reduce mortality.
**Methods:** We conducted an open label, 3 parallel arms, randomised controlled trial, among TB/HIV co-infected patients who were ARV-naive and with a CD4 cell-count ≥50 cells/mm3 at enrolment, in Benin, Guinea and Senegal.
The trial arms were: Arm A - ARV initiation at 2 weeks combined with standard TB treatment; Arm B (control arm) - ARV initiation at 8 weeks combined with standard TB treatment; Arm C - ARV initiation at 8 weeks with high-dose rifampicin (15mg/kg) during the first 2 months of TB treatment. The primary outcome was 12-month mortality.
**Results:** In total, 778 TB/HIV patients were randomised (n=262, 258 and 258 for arms A, B and C respectively). All TB cases were bacteriologically confirmed. CD4 cell-counts ranged from 50-949 (median 183), balanced across arms.
By January 2016, all patients completed 12 months of follow-up post-randomisation. The overall 12-month mortality rates were: 11.8, 15.5 and 10.9 per 100 person-years in arms A, B and C respectively. Using Cox regression, there was no evidence that overall mortality rates differed by treatment arm (p=0.40).
Restricting the analysis to patients with a baseline CD4 cell-count < 100 cells/mm3, mortality was substantially reduced (p=0.006) in Arm C, with high-dose rifampicin, compared with Arm B, but not in Arm A (p=0.24) (Fig 1). There was no evidence of an increased risk of hepatotoxicity in Arm C.



*[Fig 1: Time to mortality, from randomisation date in patients with less 100 CD4 count and more than 100 CD4 count- Kaplan-Meier analyses]*

**Conclusions:** More aggressive TB treatment using high dose of rifampicin, in addition to ARV treatment, could reduce TB/HIV mortality among severely immunosuppressed co-infected TB/HIV patients.

### SOFOSBUVIR/VELPATASVIR FIXED DOSE COMBINATION FOR 12 WEEKS IN PATIENTS CO-INFECTED WITH HCV AND HIV-1: THE PHASE 3 ASTRAL-5 STUDY

N. Bräu[1], D. Wyles[2], S. Kottilil[3], E. Darr[4], K. Workowski[5], A. Luetkemeyer[6], O. Adeyemi[7], P. Ruane[8], B. Doehle[9], K.C. Huang[9], A. Osinusi[9], J. McNally[9], M. Natha[9], M. Guion[9], T. McLean[9], D.M. Brainard[9], J.G. McHutchison[9], S. Naggie[10], M. Sulkowski[11]

*[1]Mount Sinai School of Medicine, New York, United States, [2]University of California, San Diego, United States, [3]University of Maryland, Baltimore, United States, [4]David Geffen School of Medicine, Torrance, United States, [5]Emory University, Atlanta, United States, [6]University of California, San Francisco, United States, [7]Rush Medical College, Chicago, United States, [8]Ruane Medical and Liver Health Institute, Los Angeles, United States, [9]Gilead Sciences, Inc, Foster City, United States, [10]Duke Clinical Research Institute, Durham, United Kingdom, [11]Johns Hopkins University School of Medicine, Baltimore, United States*

*Presenting author email: norbert.brau@va.gov*

**Background:** The once-daily fixed-dose combination (FDC) tablet of sofosbuvir/velpatasvir (SOF/VEL) administered for 12 weeks, has demonstrated high efficacy in genotypes 1-6 HCV-infected patients. A prospective clinical trial was performed to evaluate the safety and efficacy of SOF/VEL in patients co-infected with HCV and HIV-1.

**Methods:** This single arm, open label study enrolled treatment naïve- and -experienced HCV/HIV co-infected patients of all HCV genotypes with or without cirrhosis. Patients on stable antiretroviral (ARV) regimens with fully suppressed HIV RNA received SOF/VEL (400 mg/100 mg daily) for 12 weeks. ARV regimens included emtricitabine/tenofovir disoproxil fumarate or abacavir/lamivudine with raltegravir, cobicistat/elvitegravir, rilpivirine, ritonavir-boosted atazanavir, darunavir or lopinavir. Safety evaluations included adverse event (AE) and standard laboratory parameter monitoring including renal function monitoring, CD4 count, and HIV-1 RNA levels. The primary endpoint was sustained virologic response 12 weeks after treatment (SVR12).

**Results:** 106 patients were enrolled and treated with SOF/VEL for 12 weeks. 86% were male, 45% were black, 77% had IL28B non CC genotypes, 29% had prior treatment failure (primarily PegIFN/RBV), and 16% had compensated cirrhosis. The genotype distribution was 62% GT1a, 11% GT1b, 10% GT2, 11% GT3, and 5% GT4. Median baseline CD4 count was 548 cells/uL (range: 183-1513 cells/uL) with a median estimated glomerular filtration rate of 97 mL/min (range 57- 198 mL/min). Boosted protease inhibitor (PI) regimens were the most commonly used regimen (Table 1). In this interim analysis with 95% of patients beyond treatment week 4 time point, the most common AEs were fatigue (19%), headache (14%), and nausea (7%). One patient experienced a serious adverse event (toe infection), considered unrelated to study drugs. No patient experienced confirmed HIV virologic rebound (HIV-1 RNA ≥400 copies/mL). No significant changes in lab abnormalities including renal function were observed. Efficacy and safety outcomes including complete SVR12, HIV parameters, and the impact of HCV resistance variants on outcomes will be presented.

**Conclusions:** The single tablet regimen of SOF/VEL administered for 12 weeks was well tolerated in HCV/HIV co-infected patients with GT 1-4, regardless of past treatment experience or presence of cirrhosis.

| ARV regimen at enrollment | PI + NRTI | Integrase + NRTI | NNRTI + NRTI | *Combination (at least 2 of the following classes: PI, NNRTI or integrase)* |
|---|---|---|---|---|

*Presenting author email: annie.luetkemeyer@ucsf.edu*

**Background:** A once-daily fixed-dose combination tablet composed of sofosbuvir (SOF; nucleotide analog NS5B inhibitor) and velpatasvir (VEL; pangenotypic NS5A inhibitor) is under regulatory review for the treatment of chronic HCV infection. Phase 1 studies were conducted in healthy volunteers to evaluate potential drug-drug interactions (DDIs) between SOF/VEL and HIV antiretroviral (ARV) regimens to support coadministration in HIV/HCV co-infected patients.

**Methods:** These were multiple-dose, randomized, cross-over DDI studies. Subjects received SOF/VEL and ARVs EFV/FTC/TDF, RPV/FTC/TDF, DTG, RAL+FTC/TDF, EVG/COBI/FTC/TDF, DRV/r + FTC/TDF, ATV/r + FTC/TDF, LPV/r + FTC/TDF, or EVG/COBI/FTC/TAF alone and in combination. Steady-state plasma concentrations of SOF, its predominant circulating nucleoside metabolite GS-331007, VEL, and ARVs were analyzed on the last day of dosing for each treatment. PK parameters were calculated and geometric least-squares means ratios and 90% confidence intervals (combination vs. alone) for SOF, GS-331007, VEL, and ARV $AUC_{tau}$, $C_{max}$ and $C_{tau}$ were estimated and compared against lack of PK alteration boundaries of 70-143% for all analytes. Safety assessments were conducted throughout the study.

**Results:** 230 of 237 enrolled subjects completed the studies; 5 subjects withdrew consent, 1 discontinued due to Grade 1 urticaria and 1 discontinued due to pregnancy. The majority of adverse events (AEs) were Grade 1 and there were no serious AEs. Table 1 reports the effect of coadministration on HIV ARVs and SOF/VEL. No clinically significant changes in the PK of HIV ARVs, except TDF, were observed when administered with SOF/VEL. Increased TFV exposure (~40%) was observed with SOF/VEL when administered as TDF.

**Conclusions:** Study treatments were generally well tolerated. Results from these studies demonstrate that SOF/VEL may be administered safely with RPV, RAL, DTG, EVG, COBI, DRV/r, ATV/r, and LPV/r (but not EFV) with a backbone of FTC/TDF or FTC/TAF. The safety and efficacy of SOF/VEL and ARVs are being evaluated in clinical studies of HIV/HCV coinfected subjects.

| ARV with SOF/VEL | Effect on SOF/VEL AUC | Effect on ARV AUC |
|---|---|---|
| EFV/FTC/TDF | SOF: ↔ GS-331007: ↔ VEL: ↓53% | EFV: ↔ FTC: ↔ TFV: ↑81% |

### HIGHER MORTALITY IN HIV-HBV CO-INFECTED PERSONS WITH ELEVATED HBV REPLICATION IN THE TEMPRANO TRIAL

M.G. Kouamé[1], R. Moh[1,2], A. Boyd[3], A. Badjé[1,4], D. Gabillard[5], J.B. N'takpé[1], S. Maylin[6], S.P. Eholié[1,2], X. Anglaret[1,4], C. Danel[1,4], ANRS12136 Temprano Trial Group
*[1]National Agency for AIDS Research (ANRS), Programme PAC-CI, Abidjan, Cote D'Ivoire, [2]Service des Maladies Infectieuses et Tropicale, CHU de Treichville, Infectious Diseases, Abidjan, Cote D'Ivoire, [3]INSERM, UMR S 1136, Institut Pierre Louis d'Epidémiologie et de Santé Publique, Public Health, Epidemiology, Paris, France, [4]INSERM U 897, Université de Bordeaux, Public Health, Bordeaux, France, [5]INSERM U 897, Université de Bordeaux, Statistics, Bordeaux, France, [6]Laboratoire de Virologie, Hôpital Saint-Louis, AP-HP, Virology, Paris, France*
*Presenting author email: k.menangerard@yahoo.fr*

**Background:** In West Africa, 10% of HIV-infected adults are co-infected with hepatitis B virus (HBV). The impact of HBV co-infection on mortality is unknown. We analyzed the association between HBV replication and mortality during long-term follow-up in the Temprano trial.
**Methods:** Between March 2008 and July 2012, HIV-1 infected adults with CD4< 800/mm³ and no criteria for starting ART according to most recent WHO guidelines were randomized to deferred ART or early ART , and to receive or not Isoniazid Preventive Therapy. At inclusion, hepatitis B surface antigen (HBsAg) was tested for all those included and plasma HBV DNA was quantified for HBsAg-positive samples using an in-house PCR technique (detection limit=2 copies/ml). All first-line ART regimens contained Tenofovir/Emtricitabine. 30-month mortality and severe morbidity were previously described in the paper reporting the final results of the trial. After their 30-month visits, all participants continued to be followed up until the last participants reached 30 months. Here we present mortality during and after the trial in all participants in Temprano. We used Cox regression to assess the risk of mortality in patients with high levels of HBV DNA at baseline, compared to other patients, adjusting for early/deferred ART and IPT.
**Results:** Of the 2056 participants in Temprano (78% women, median age 35 years, median CD4 count 465/mm3), 193 (9%) were HBsAg-positive. Of the 173 co-infected participants with available plasma HBV DNA, 119 (69%) had detectable HBV DNA (median 3880 copies/ml, IQR 660-2120000), including 73 (42%) with HBV DNA >2000 copies/ml. Median follow-up time was 58 months (IQR 40-69), totaling 9322 person-years (PY). During follow-up, 1814 (89%) patients started ART, 85 (4%) died, and 187 (9%) were lost to follow-up. The incidence of mortality was 0.9 /100 PY overall, 2.1/100 PY in HBsAg-positive patients with baseline HBV DNA >2000 copies/ml and 0.9/100 PY in other patients ($p$=0.02). In multivariate analysis, the risk of mortality was independently higher in patients with HBV DNA >2000 copies/ml (adjusted Hazard Ratio 2.23, 95%CI 1.02-4.85, $p$=0.04).
**Conclusions:** In these West African HIV-infected adults with high baseline CD4 count, mortality was 2.2 times higher in patients with high levels of HBV replication.

## WEAB0304LB

### TURQUOISE-I PART 2: SAFETY AND EFFICACY OF OMBITASVIR + PARITAPREVIR/R ± DASABUVIR WITH OR WITHOUT RBV IN PATIENTS WITH HIV-1 AND HCV GT1 OR GT4 CO-INFECTION

J.K. Rockstroh[1], C. Orkin[2], R.M. Viani[3], D. Wyles[4], A. Luetkemeyer[5], A. Lazzarin[6], R. Soto-Malave[7], M. Nelson[8], S.R. Bhagani[9], H.H.F. Klinker[10], G. Rizzardini[11], P.-M. Girard[12], N.S. Shulman[3], Y.B. Hu[3], L.M. Fredrick[3], R. Trinh[3], E. Gane[13]

*Presenting author email: juergen.rockstroh@ukb.uni-bonn.de*

**Background:** Ombitasvir, paritaprevir co-administered with ritonavir, and dasabuvir (OBV/PTV/r+DSV) comprise the 3 direct-acting antiviral (DAA; 3D) regimen ± ribavirin (RBV) approved for HCV genotype (GT) 1 infection. Here we investigate the safety and efficacy of 3D±RBV for GT1, and the 2 DAA (2D) regimen of OBV+PTV/r approved for GT4, in HIV-1 co-infected patients with or without compensated cirrhosis.
**Methods:** TURQUOISE-I, Part 2 is a phase 3 multicenter study. Eligible patients were HCV treatment-naïve or RBV/interferon-experienced, on an HIV-1 antiretroviral regimen containing atazanavir, raltegravir, dolutegravir, or darunavir (for GT4 only), and had plasma HIV-1 RNA < 40 copies/mL at screening. Patients received OBV/PTV/r (25/150/100 mg) ± DSV (250mg) ± weight-based RBV for 12 or 24 weeks per label guidelines. Interim safety and efficacy data are presented.
**Results:** Table 1 presents baseline demographics on 227 treated patients as of 4/21/2016. Of the 194 GT1- and 26 GT4-infected patients with available data, 98% and 100% achieved sustained virologic response at post-treatment week (PTW) 4 (SVR4), respectively. Three patients experienced virologic failure: one GT1a patient relapsed at PTW4, a second relapsed at PTW12, and one GT1b patient experienced breakthrough at week 10. No patients discontinued treatment due to adverse events (AEs). Most AEs were mild to moderate in severity, and key lab abnormalities were rare (Table 2).
**Conclusions:** The 2D and 3D regimens were well-tolerated and yielded high SVR4 rates in patients with HCV GT1 or GT4/HIV-1 co-infection. OBV+PTV/r±DSV±RBV is a potent HCV treatment option for patients with HIV-1 co-infection, regardless of treatment-experience or presence of compensated cirrhosis.

### HEPATITIS B VIRAL LOAD RESPONSE TO TWO ANTIVIRAL REGIMENS (TENOFOVIR/LAMIVUDINE VS LAMIVUDINE) IN HIV AND HBV CO-INFECTED PREGNANT WOMEN IN GUANGXI, CHINA: THE TENOFOVIR IN PREGNANCY (TIP) STUDY

A. Kourtis[1], L. Wang[2], J. Wiener[3], S. Liang[4], X. Wei[5], W. Liu[4], L. Chen[4], C. Shepard[6], A. Wang[7], F. Zhang[7], M. Bulterys[8], TIP study Group

*[1]U.S. Centers for Disease Control and Prevention, Atlanta, United States, [2]U.S. Center for Disease Control and Prevention, Beijing, China, [3]U.S. CDC, Atlanta, United States, [4]China CDC, Nanning, China, [5]U.S. CDC, Beijing, China, [6]US CDC, Beijing, China, [7]China CDC, Beijing, China, [8]US CDC, Atlanta, United States*

*Presenting author email: apk3@cdc.gov*

**Background:** There is limited information on the value of HBV antiviral therapy during pregnancy to prevent transmission of HBV to the infant, including agent choice and duration needed to achieve HBV viral load (VL) suppression by delivery.

**Methods:** The Tenofovir in Pregnancy (TiP) study is a randomized controlled trial of the safety of a regimen containing tenofovir (TDF), lamivudine (3TC), and lopinariv/ritonavir, compared with zidovudine, lamivudine, and lopinavir/ritonavir, starting as early as 14 weeks gestation, in HIV/HBV co-infected pregnant women and their infants in Guangxi, China, recruited from 2012-2015. HBV VL response during pregnancy was compared in the two study arms, and associations of pretreatment characteristics with such response were performed using Fisher's exact test and Poisson regression.

**Results:** Thirty one of 35 women enrolled have delivered. The baseline median HBV VL was 4.01 $\log_{10}$ copies/ml in the TDF/3TC arm and 3.64 $\log_{10}$ copies/ml in the 3TC arm; proportions of HBeAg+ women were 38% and 20%, and median duration of antiviral therapy was 20 and 19 weeks, respectively. At delivery, 50.0% of mothers in the TDF/3TC arm and 73.3% in the 3TC-only arm achieved undetectable HBV VL (p=0.27). The median decline of HBV DNA between enrollment and delivery was 2.60 $\log_{10}$ copies/ml in the TDF-3TC arm and 2.24 $\log_{10}$ copies/ml in the 3TC arm (p=0.41). All women achieved delivery HBV DNA levels < 6 $\log_{10}$ copies/ml. In multivariable analysis, maternal baseline HBV VL >200,000 IU/ml was the only factor significantly associated with not reaching undetectable HBV VL at delivery (Relative Risk=0.12, 95% CI, 0.02-0.78).

**Conclusions:** Initiation of HBV antiviral drugs from 14-28 weeks of gestation achieved HBV DNA suppression in 61% of pregnant women co-infected with HIV/HBV, with no difference in the proportion of women achieving undetectable HBV DNA at delivery in the TDF/3TC or 3TC arms. Initiation of either regimen in the second trimester of pregnancy led to all women achieving HBV DNA level < 6 $\log_{10}$ copies/ml at delivery, the threshold thought to predict breakthrough HBV transmission to the infant.

# WEAC01 MAKING PREP REAL FOR THOSE WHO NEED IT MOST: OPTIMIZATION STRATEGIES

## WEAC0102

### EFFICACY OF ON DEMAND PREP WITH TDF-FTC IN THE ANRS IPERGAY OPEN-LABEL EXTENSION STUDY

J.-M. Molina[1,2], I. Charreau[3], B. Spire[4], L. Cotte[5], J. Chas[6], C. Capitant[3], C. Tremblay[7], D. Rojas-Castro[8], E. Cua[9], A. Pasquet[10], C. Bernaud[11], W. Rozenbaum[2], C. Delaugerre[12], V. Doré[13], S. Le Mestre[13], M.-C. Simon[13], J.-F. Delfraissy[13], L. Meyer[3,14], ANRS IPERGAY Study Group

*[1]University of Paris Diderot, INSERM UMR 941, Paris, France, [2]Hospital Saint-Louis, APHP, Infectious Diseases Department, Paris, France, [3]INSERM, SC 10-US 19, Villejuif, France, [4]INSERM, UMR 912, Marseille, France, [5]Hospices Civils de Lyon, Infectious Diseases Department, Lyon, France, [6]Hospital Tenon, APHP, Infectious Diseases Department, Paris, France, [7]Centre de Recherche du Centre Hospitalier de l'Université de Montréal, Montréal, Canada, [8]AIDES, MIRE, Pantin, France, [9]Hospital de l'Archet, Infectious Diseases Department, Nice, France, [10]Hospital Gustave Dron, Infectious Diseases Department, Tourcoing, France, [11]CHU Hôtel Dieu, Infectious Diseases Department, Nantes, France, [12]Hospital Saint-Louis, Virology Department, Paris, France, [13]INSERM-ANRS, Paris, France, [14]INSERM, Paris 11 University, Kremlin Bicêtre, France*

*Presenting author email: jean-michel.molina@aphp.fr*

**Background:** In ANRS IPERGAY, on demand PrEP with TDF-FTC reduced by 86% the incidence of HIV-1 infection in high risk MSM (Table). However, the cumulative follow-up time on TDF-FTC was limited and the long term efficacy and safety of this strategy remains to be assessed.

**Methods:** From November 2014 to June 2016, participants who were followed or being screened in the ANRS IPERGAY trial were offered to continue follow-up every two months with open-label TDF-FTC. The primary study objectives of this open-label phase were to assess study retention, HIV incidence, safety and changes in sexual behaviour.

**Results:** Among the 400 pts initially enrolled in the study, 336 (84%) were eligible for the open-label phase, and all but 3 (99%) signed a new informed consent form. Twenty-nine additional pts were also enrolled. Overall, 362 pts were enrolled for a cumulative follow-up time of 334 person-years (py), until December 14, 2015 with a median follow-up of 11.7 months. Study retention was good with only 23 pts discontinuing follow-up (6.4%). Only a single individual who had discontinued PrEP acquired HIV-1 infection and the overall incidence of HIV-1 infection was 0.3 per 100 py (95% CI: 0.00-1.67) (Table). Pts used a mean of 18 pills/month and 39% acquired a new STI. There was no significant changes between the double-blinded phase and the open-label phase in the median number of sexual intercourses or sexual partners, but there was a significant decrease in condom use for receptive anal intercourse (p=0.0004). Safety was good with a low rate of serious adverse events (6% of pts) and a single participant discontinued TDF-FTC because of an increase in creatinine plasma level. Drug-related gastrointestinal adverse events (mainly nausea and diarrhea) were reported in 11% of pts.

| IPERGAY phase | Person-years of follow-up | Incidence of HIV Infection per 100 person-years [95% confidence interval] |
|---|---|---|
| IPERGAY double-blinded (Placebo Arm) | 212 | 6.60 [3.61-11.07] |
| IPERGAY double-blinded (TDF-FTC Arm) | 219 | 0.91 [0.11-3.30] |
| IPERGAY open-label extension (open-label TDF-FTC) | 334 | 0.30 [0.00-1.67] |

*[Incidence of HIV infection according to IPERGAY phase]*

**Conclusions:** Open-label on demand PrEP with oral TDF-FTC continued to be highly effective in high risk MSM to prevent HIV-infection and had a good safety profile.

## WEAC0103

### HPTN 073: SUCCESSFUL ENGAGEMENT OF BLACK MSM INTO A CULTURALLY RELEVANT CLINICAL TRIAL FOR PRE-EXPOSURE PROPHYLAXIS (PREP)

C. Hucks-Ortiz[1], J.P. Lucas[2], D.P. Wheeler[3], S.D. Fields[4], The HPTN Black Caucus

*[1]John Wesley Community Health Institute Inc. (JWCH), Division of HIV Services, Los Angeles, United States, [2]FHI 360, Science Facilitation Department, Durham, United States, [3]University at Albany State University of New York, Vice Provost for Public Engagement, Dean School of Social Welfare, Albany, United States, [4]Charles R Drew University of Medicine and Science, Mervyn M. Dymally School of Nursing, Los Angeles, United States*

**Background:** In the United States, Black men who have sex with men (BMSM) continue to be disproportionately impacted by high HIV incidence rates. Comprising less than 0.4% of the U.S. population, BMSM accounted for more than 20% of new HIV infections in 2013. Identifying innovative and effective methods to deliver culturally-tailored prevention methods to end this epidemic among BMSM is a public health priority. HPTN 073 is one of the first U.S. studies to evaluate pre-exposure prophylaxis (PrEP) in a BMSM cohort.

**Methods:** HIV-uninfected BMSM were enrolled in three U.S. cities (Washington, DC, Los Angeles, CA, and Chapel Hill, NC). Under the study motto "My Life, My Health, My Choice" all participants were offered once daily oral FTC/TDF combined with client-centered care coordination (C4). The C4 model provided counseling support to promote and support PrEP use, along with service referral, linkage, and follow-up strategies to assist participants in addressing unmet psychosocial needs. Each participant was followed for a total of 12 months.

**Results:** All of the staff at the three sites were asked to participate in cultural responsiveness training as a part of implementation activities, and then utilized a variety of culturally relevant recruitment and retention techniques such as webinars, street and online outreach, peer-to-peer engagement, and partnerships with community service organizations. 344 BMSM were screened and 226 were enrolled in HPTN 073. 209 (92%) participants completed 12 months of follow-up. 40% were age 25 or less, 27% unemployed/disabled, 31% did not have health insurance, 25% reported high school graduation or less. 178 men (79%) accepted PrEP over the course of the study.

**Conclusions:** HPTN 073 demonstrated that BMSM can be successfully recruited, engaged, enrolled and retained in PrEP biomedical clinical trials using theory-based culturally tailored techniques. HPTN 073 provides a model for how best to integrate culturally-specific recruitment approaches when targeting communities at risk for HIV acquisition. Utilizing theory-based culturally tailored programs for BMSM that are reflective of their reality is key to reaching this highly at risk population of MSM who can benefit from the new HIV prevention biomedical advances.

### CORRELATES FOR LEVELS OF SELF-REPORTED PREP ADHERENCE AMONG BLACK MEN WHO HAVE SEX WITH MEN IN 3 U.S. CITIES

D. Wheeler[1], S. Fields[2], L. Nelson[3], L. Hightow-Weidman[4], M. Magnus[5], S. Shoptaw[6], G. Beauchamp[7], L. Emel[8], E. Piwowar-Manning[9], Y. Chen[7], P. Watkins[10], K. Mayer[11,12], HPTN073 Study Team
*[1]State University of New York at Albany, Social Welfare, Albany, United States, [2]Charles Drew University, Nursing, Los Angeles, United States, [3]University of Rochester, Nursing, Rochester, United States, [4]University of North Carolina, Chapel Hill, United States, [5]George Washington University, Washington, United States, [6]University of California Los Angeles, Los Angeles, United States, [7]Statistical Center for HIV/AIDS Research & Prevention (SCHARP), Seattle, United States, [8]Fred Hutchinson Cancer Research Center, Seattle, United States, [9]Johns Hopkins University, Baltimore, United States, [10]FHI 360, Durham, United States, [11]The Fenway Institute, Boston, United States, [12]Harvard University, Cambridge, United States*
*Presenting author email: dwheeler@albany.edu*

**Background:** HPTN 073 Study assessed the initiation, acceptability, safety, and feasibility PrEP for Black men who have sex with men (BMSM) in three US cities. Upon the PrEP initiation, levels of PrEP use were monitored using self-reported adherence.
**Methods:** HPTN 073 Study enrolled 226 HIV-uninfected BMSM in three US cities( Los Angeles, CA, Washington DC, and Chapel Hill, NC, August 2013 and September 2014). All study participants were offered once daily oral FTC/TDF and client centered care coordination, and were followed for 12 months, with scheduled clinical visits every 13 weeks.
**Results:** Among the total 226 enrolled participants, 178 (79%) participants initiated PrEP. Proportions of self-reported high PrEP adherence (≥90%) ranged between 62% and 71%, while self-reported low PrEP adherence (< 50%) ranged between 13% and 19% during weeks 13 through 52. High adherence is associated with age ≥25, higher education, full time employment, no poly drug use and having a primary partner. Conversely, low adherence is associated with younger age, less education, non-fulltime employment, poly drug use, and no primary partner. Adjusted analysis shows that having a primary partner and no poly drug are highly associated with high adherence, whereas converse is true for low adherence.

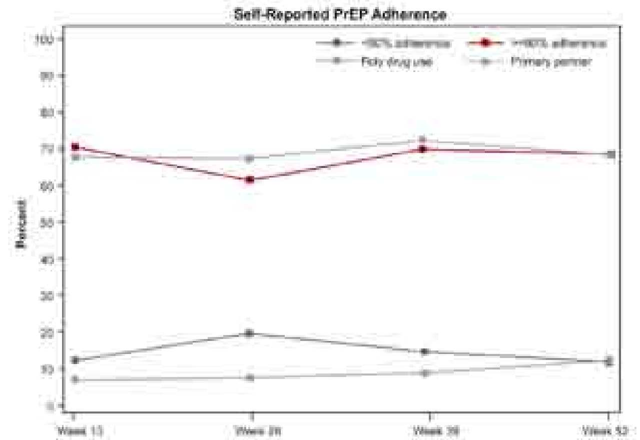
* The factors included in the adjusted models are the factors that are <0.05 significance level in the unadjusted model. Analysis was done using generalized estimating equation with exchangeable covariance structure. The behavioral questions were asked for the past three months at each visit. Abbreviation: AOR, adjusted odds ratio.

*[Table 1. Correlates of self-reported adherence]*



*[Figure 1: Self-Reported PrEP Adherence]*

**Conclusions:** Understanding the contextual factors that support and impede adherence (Figure 1) and targeting these in comprehensive intervention packages may maximize PrEP adherence and minimize lower adherence for BMSM. Our data support consideration of the need for addressing these factors as core elements for BMSM.

## WEAC0105

### INTEGRATED DELIVERY OF PREP AND ART RESULTS IN SUSTAINED NEAR ELIMINATION OF HIV TRANSMISSION IN AFRICAN HIV SERODISCORDANT COUPLES: FINAL RESULTS FROM THE PARTNERS DEMONSTRATION PROJECT

J. Baeten[1], R. Heffron[1], L. Kidoguchi[1], N. Mugo[2], E. Katabira[3], E. Bukusi[2], S. Asiimwe[4], J. Morton[1], K. Ngure[5], N. Bulya[3], J. Odoyo[2], E. Tindimwemba[4], J. Haberer[6], M. Marzinke[7], D. Donnell[8], C. Celum[1]
*[1]University of Washington, Seattle, United States, [2]Kenya Medical Research Institute, Nairobi, Kenya, [3]Makerere University, Kampala, Uganda, [4]Kabwohe Clinical Research Centre, Kabwohe, Uganda, [5]Jomo Kenyatta University of Agriculture and Technology, Nairobi, Kenya, [6]Massachusetts General Hospital, Boston, United States, [7]Johns Hopkins University, Baltimore, United States, [8]Fred Hutchinson Cancer Research Center, Seattle, United States*
*Presenting author email: jbaeten@uw.edu*

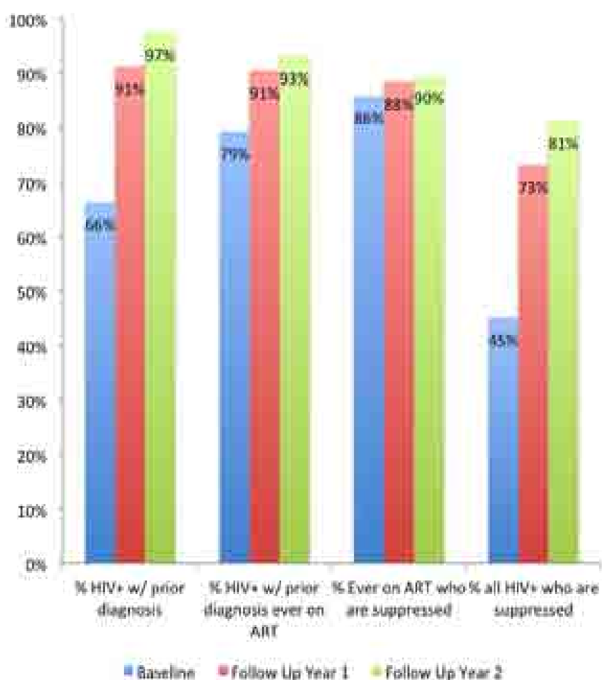
**Background:** Antiretroviral therapy (ART) used by HIV infected individuals and pre-exposure prophylaxis (PrEP) by HIV uninfected individuals are highly efficacious HIV prevention tools. Assessing the effectiveness of these interventions and integrated delivery strategies in implementation settings is a priority.
**Methods:** The Partners Demonstration Project, an open-label PrEP and ART delivery study, began in 2012, and enrolled antiretroviral-naïve, high-risk, heterosexual HIV serodiscordant couples from Kenya and Uganda. Couples were followed for 2 years. ART was recommended following national ART guidelines - initially CD4 < 350 cells/µL but soon thereafter all HIV serodiscordant couples regardless of CD4 count. PrEP was offered as a 'bridge' to ART in the partnership - i.e., until ART initiation by the HIV infected partner and for the first 6 months after ART initiation. We compared observed HIV incidence to a counterfactual simulation model, using bootstrapping methods and constructed with data from a prior prospective study of HIV serodiscordant couples (the Partners PrEP Study, placebo arm). In a previously reported interim analysis, with ~40% of total expected follow-up time accrued, we found that HIV incidence was substantially reduced (2 incident infections compared to 40 expected infections); updated findings are presented here.
**Results:** Of 1,013 couples enrolled, 67% had an HIV positive female partner and the median age was 29. Among a randomly-selected sample of HIV negative partners receiving PrEP, tenofovir was detected in 82% of plasma samples (483/587 visits). ART was initiated by 92% of HIV positive partners by 24 months and viral suppression (< 400 copies/mL) was achieved in 90%. As of January 2016, counterfactual simulations predicted that 63 incident HIV infections would be expected (incidence rate 5.1 per 100 person years, 95% CI 3.9-6.4). However, only 5 incident infections have been observed (incidence rate 0.3, 95% CI 0.1-0.7), for sustained HIV relative risk reduction of 94% (95% CI 85-98, p< 0.001).
**Conclusions:** An integrated PrEP and ART strategy is highly effective for preventing HIV transmission within HIV serodiscordant couples, showing near elimination in a high risk cohort. The Partners Demonstration Project will complete follow-up and analysis in June 2016 with final results available in July 2016.

## WEAC0106LB

### SEARCH TEST AND TREAT STUDY IN UGANDA AND KENYA EXCEEDS THE UNAIDS 90-90-90 CASCADE TARGET BY ACHIEVING 81% POPULATION-LEVEL VIRAL SUPPRESSION AFTER 2 YEARS

M. Petersen[1], L. Balzer[2,3], D. Kwarsiima[4], N. Sang[5], G. Chamie[2], J. Ayieko[5], J. Kabami[4], A. Owaraganise[4], T. Liegler[2], F. Mwangwa[4], K. Kadede[5], V. Jain[2], A. Plenty[2], G. Lavoy[4], D. Black[2], E. Bukusi[5], C. Cohen[2], T. Clark[2], E. Charlebois[2], M. Kamya[6], D. Havlir[2], SEARCH Study Team
*[1]University of California, Berkeley School of Public Health, Berkeley, United States, [2]University of California, San Francisco, San Francisco, United States, [3]Harvard T H Chan School of Public Health, Boston, United States, [4]Infectious Diseases Research Collaboration (IDRC), Kampala, Uganda, [5]Kenya Medical Research Institute (KEMRI), Nairobi, Kenya, [6]Makerere University, Kampala, Uganda*
*Presenting author email: mayaliv@berkeley.edu*

**Background:** The SEARCH Study (NCT01864683; first phase endpoint 2017) is a cluster randomized trial evaluating a "test and treat" HIV and multi-disease prevention strategy in rural Uganda and Kenya. We evaluated interim population-level HIV cascade coverage achieved over two years in the 16 SEARCH intervention communities.
**Methods:** We enumerated residents via baseline household census. HIV serostatus and plasma RNA were measured annually at multi-disease health campaigns followed by home-based testing for non-attendees. Streamlined ART (EFV/TDF/+FTC or 3TC), including patient-centered care and viral load counseling, was universally offered. At baseline, and after one and two years follow-up, we estimated (1) proportion of baseline HIV+ adult (≥15 years) stable (>6mo/past year) residents previously diagnosed; (2) of these, proportion ever on ART; (3) of these, proportion with viral suppression (RNA< 500 copies/ml). We estimated population viral suppression as a cascade product and via direct HIV RNA measurement, using inverse weights to adjust for missing measures.
**Results:** Of 77,773 baseline adult stable residents, 55% were women, 53% farmers, and 20% < 20 years. Baseline HIV prevalence was 9.9% (West Uganda: 6.3%; East Uganda: 3.3%; Kenya: 19.5%). We achieved high cascade coverage by follow up year 2 (Figure): (1) 97.4% (95%CI:97.3%,97.5%) were previously diagnosed; (2) 93.2% had received ART (95%CI:92.6%,93.9%); (3) 89.5% were suppressed (95%CI:88.6%,90.4%). Population viral suppression at year 2 was 81.3% (95%CI:80.3%,82.3%) based on the cascade product and 82.8% (95%CI:80.2%,85.3%) by adjusted direct measure. Coverage was high among men and mobile populations: 97.5% (95%CI:97.4%;97.7%;) of men and 97.1% (95%CI:96.8%,97.5%) of mobile populations tested at least once; among baseline HIV+, 80.3% (95%CI:78.4%,82.2%) of men and 81.7% (95%CI:78.3%,85.1%) of mobile populations had at least one suppressed RNA level.
**Conclusions:** Using a multi-disease community-based approach and patient-centered streamlined care**,** we increased population viral suppression from 45% to 81%, exceeding the UNAIDS 90-90-90 cascade target within 2 years in SEARCH intervention communities.



*[Cascade coverage and population-level viral suppression among baseline HIV+ adult stable residents of SEARCH Study intervention communities]*

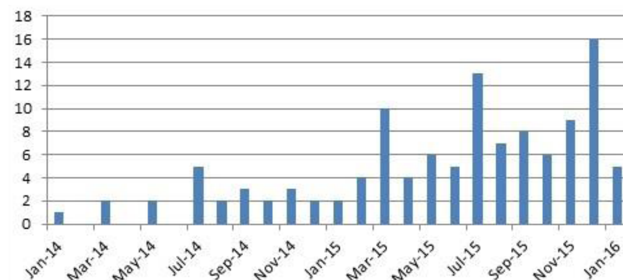
## WEAC02 TRANS-FORMING HIV PREVENTION AND CARE TALK

## WEAC0202

### TRANSGENDER PATIENTS AT RISK: ENSURING ACCESS TO PREP IN A NYC COMMUNITY HEALTH CENTRE

A. Radix[1,2], P. Carneiro[1], S. Stephanos[1], S. Mosher[1], P. Meacher[1], U. Belkind[1], I. Evans-Frantz[1], F. Brigham[1], A. Fortenberry[1], L. Comstock[1], R. Vail[1], S. Weiss[1], S. Pena[1], S. Golub[3]
*[1]Callen-Lorde Community Health Center, New York, United States, [2]Columbia University, Mailman School of Public Health, Epidemiology, New York, United States, [3]Hunter College, City University of New York, New York, United States*

**Background:** Transgender women (TGW) are known to be disproportionately affected by HIV. Although less is known about transgender men (TGM) recent studies have highlighted elevated risk in this population, especially among those who identify as MSM. PrEP is an effective biomedical intervention to prevent incident HIV infections, but adherence is reported to be lower among TGW. In 1/2014 Callen-Lorde Community Health Center, an LGBT-focused clinic in NYC that predominantly cares for HIV-infected and at-risk clients, implemented PrEP services. One of the goals was to create a program that was trans-inclusive.
**Description:** Almost 1500 clients have accessed PrEP since implementation of the program. Careful tracking of PrEP uptake revealed low involvement by transgender clients, with only 5 receiving PrEP in the first 6 months. Challenges included community-level lack of knowledge, provider and client under-estimation of HIV risk, especially among TGM, and lower rates of HIV-testing, resulting in fewer opportunities to discuss PrEP. The clinic responded by offering HIV screening during all new transgender intake appointments, distributing trans-inclusive education materials, PrEP education videos that included transgender/genderqueer actors. The clinic has intentionally become a more diverse work place with transgender counselors, testers, patient navigators and nurses.
**Lessons learned:** The interventions were successful. 118 transgender clients have accessed PrEP over 3 years, 8.4% of total prescriptions written. The majority 71.2% (84) have been TGW, 10.2% (12) genderqueer, and 18.6% (22) TGM. The populations differed by insurance and race with public "safety net" coverage being predominantly used by genderqueer and TGW (67% & 60.7%) whereas TGM predominantly used commercial insurance (64%). TGW were mostly nonwhite (70%) whereas TGM and genderqueer people were predominantly white (81% , 78%).
**Conclusions/Next steps:** As scale-up of PrEP continues, clinics considering implementation of PrEP need to ensure that they track utilization to monitor disparities among users. Addressing PrEP uptake among transgender clients requires a multi-faceted approach.



*[Uptake of PrEP by Transgender Clients at The Callen-Lorde Community Health Center]*

## WEAC0203

### LIFESKILLS: RESULTS FROM A FULL-SCALE, RANDOMIZED CONTROLLED TRIAL EXAMINING THE EFFICACY OF A GROUP-BASED BEHAVIOURAL INTERVENTION FOR HIV PREVENTION AMONG YOUNG TRANSGENDER WOMEN

R. Garofalo[1,2], L. Kuhns[1,2], S. Reisner[3,4,5], K. Biello[5,6], M. Mimiaga[5,6]
*[1]Northwestern University, Feinberg School of Medicine, Chicago, United States, [2]Ann and Robert H. Lurie Children's Hospital of Chicago, Chicago, United States, [3]Boston Children's Hosptial, Pediatrics, Boston, United States, [4]Harvard Medical School, Pediatrics, Boston, United States, [5]Fenway Health, The Fenway Institute, Boston, United States, [6]Brown University, Epidemiology & Behavioral and Social Sciences, Providence, United States*
*Presenting author email: rgarofalo@luriechildrens.org*

**Background:** HIV prevalence is high among transgender women. A global meta-analysis of HIV burden among transgender women found a 19% HIV prevalence and 49-fold increased odds of HIV infection compared with all adults of reproductive age. A U.S.-based meta-analysis found an overall 28% laboratory-confirmed HIV prevalence. No evidence-based HIV prevention interventions (EBIs) for transgender women exist in the Centers for Disease Control and Prevention (CDC) compendium of EBIs. We addressed this gap by testing a culturally-specific, behavioral intervention for HIV prevention ("LifeSkills") among young transgender women (YTW) in a randomized controlled efficacy trial. LifeSkills is theoretically-driven and grounded in the social realities of YTW, with content developed using a community-based participatory approach with guidance from a multidisciplinary research team.
**Methods:** We recruited 300 YTW, ages 16-29, in two US cities (Boston and Chicago), who were randomly assigned 2:2:1 in a 3-arm (LifeSkills, standard-of-care, and time-matched attention control) trial examining the efficacy of a multi-session, group-based intervention for HIV prevention. Participants were followed for one year, with visits at 4, 8 and 12-months post-randomization. Enrollment was completed between 2012-2015, with follow-up visits through September 2016. Generalized linear models (GLM) examined differences in condomless sex (CS) acts between intervention and control arms.
**Results:** Participants were racially/ethnically diverse; 49% Black, 12% Latina, 25% White, and 14% other. At enrollment, 22% of participants were HIV-infected (3% previously undiagnosed). Interim analysis with >90% of visits completed indicates feasibility and efficacy of the intervention to reduce CS acts compared to the standard-of-care control arm. We found a >20% difference in reduction in CS acts (vaginal and anal) from baseline with a significant 12-month arm x time interaction ($F(3,447) = 12.29$, $p<0.0001$). Intervention participants reported high satisfaction with the curriculum: 98% indicated they would refer a friend and 99% said the intervention met their expectations.
**Conclusions:** Using the CDC "Guide to the Continuum of Evidence for Efficacy" as a framework, LifeSkills may be the first well-supported, evidence-based behavioral intervention (EBI) for HIV prevention among YTW. Additional research is needed to demonstrate independent replication of findings and guide implementation and dissemination of LifeSkills in other U.S communities and regions of the world.

## WEAC0204

### DIFFERENCES BETWEEN UNKNOWN HIV-POSITIVE AND HIV-NEGATIVE BLACK TRANSGENDER WOMEN IN THE UNITED STATES: RESULTS FROM PROMOTING OUR WORTH, EQUALITY, AND RESILIENCE (POWER)

L. Bukowski, S. Meanley, J. Egan, D. Matthews, R. Stall, The Power Study Team
*University of Pittsburgh, Graduate School of Public Health, Pittsburgh, United States*
*Presenting author email: lab108@pitt.edu*

**Background:** HIV disproportionately burdens Black transgender women (BTW) in the United States. Improving HIV testing uptake to identify unknown HIV-positive individuals is critical to attenuating the HIV epidemic in this population. Understanding demographic and psychosocial differences between HIV-positive BTW who are unaware of their status and HIV-negative BTW may help elucidate means by which to increase HIV testing uptake in this population. Therefore, this analysis explores possible differences between unknown HIV-positive BTW and HIV-negative BTW.
**Methods:** Cross-sectional data for our analysis came from the first two years of the ongoing study, POWER. In 2014 and 2015, POWER employed time-location sampling (TLS) to recruit a community-based sample of Black men who have sex with men and BTW (n=3,426) who attended Black Pride events in six U.S. cities. Participants completed a behavioral health survey and were offered onsite HIV-testing. Unknown HIV-positive BTW were identified for analysis if they reported a *negative* HIV-status within the survey but provided a *positive* HIV antibody screening test result through on-site testing. Self-report HIV-negative status was confirmed with on-site testing. Differences in HIV-status (unknown versus negative) were evaluated using TLS weighted independent logistic regression models adjusted for age, education, and city.
**Results:** A total of 253 BTW provided complete data for our analysis. We observed an HIV prevalence of 37.9%. Of the 96 HIV-positive BTW, 50.0% were unaware of their HIV-status. Compared to HIV-negative BTW, unknown HIV-positive BTW reported significantly higher prevalence of past-year physical assault (40.4% vs. 58.3%, respectively) and past two-year incarceration (31.9% vs. 52.1%, respectively). In independent multivariable models, physical assault (AOR=2.1.0; 95% CI: 1.0, 4.2) and incarceration (AOR=2.3; 95% CI: 1.1, 4.7) were associated with greater likelihood of unknown positive status.
**Conclusions:** Developing and implementing interventions that address experiences of physical assault and a history of incarceration may assist in informing the HIV disparity among BTW in the U.S. More research is needed to identify and understand the structural, community, and individual-level barriers and facilitators that shape BTW's engagement with HIV-testing and HIV-care.

## WEAC0205

### FACTORS AFFECTING HIV TESTING AMONG TRANSGENDER PEOPLE IN ONTARIO, CANADA: RESULTS FROM A RESPONDENT-DRIVEN SAMPLING SURVEY

G.R. Bauer[1], M. Shokoohi[1,2], R. Hammond[3], A.I. Scheim[1]
*[1]The University of Western Ontario, Schulich School of Medicine & Dentistry, Department of Epidemiology & Biostatistics, London, Canada, [2]Regional Knowledge Hub, and WHO Collaborating Centre for HIV Surveillance, Institute for Futures Studies in Health, Kerman University of Medical Sciences, Kerman, Iran, Islamic Republic of, [3]Sherbourne Health Centre, Toronto, Canada*
*Presenting author email: shokoohi.mostafa2@gmail.com*

**Background:** In Ontario, a high proportion of trans (transgender, transsexual or transitioned) people have never been tested for HIV. Whether this can be explained by actual level of HIV risk or by other factors requires exploration. To date, no prior study has identified predictors of HIV testing among trans people.
**Methods:** The Trans PULSE Project conducted a respondent-driven sampling survey to recruit trans Ontarians age ≥16 (n=433). Descriptive statistics were weighted by the probability of recruitment to estimate population frequencies. Regression models predicting both lifetime testing and past-year testing were weighted, and variances adjusted for clustering within recruitment networks.
**Results:** Of Ontario trans people, 55.7% (95% CI: 47.9, 63.6) had ever been self-reportedly tested for HIV, and 22.1% (95% CI: 15.9, 28.3) were tested within the past 12 months. Common reasons for not being tested for HIV were perceptions of low risk (36.2%) and not having sex recently (23.1%). However, being aware of their status (39.4%) and routine check-up (38.8%) were the most frequent reasons for being tested for HIV. Lifetime testing was highest in Aboriginal people (92.6%) and lowest among non-Aboriginal racialized people (39.9%). Lifetime testing was predicted by ethno-racial group. For both testing timeframes, a history of transphobic experiences and higher lifetime number of sex partners predicted increased odds of testing. Past-year sex partner number had no detectable effect on past-year testing.
**Conclusions:** While a lower testing prevalence was observed than in estimates from U.S. studies, this may in part reflect the lower overall risk of this province-wide sample. That higher lifetime number of sex partners was associated with testing indicates a logical decision-making component. Multiple possibilities exist - ranging from resiliency, to confounding by social participation, to health cynicism - for the observation that a history of transphobic experiences was strongly associated with increased odds of testing. A range of possibilities for each of our findings and directions for additional research will be presented.

### THE EPIDEMIOLOGY OF PERINATALLY HIV-INFECTED ADOLESCENTS: A CIPHER COHORT COLLABORATION GLOBAL ANALYSIS

A. Slogrove[1], A. Judd[2], V. Leroy[3,4], Collaborative Initiative for Paediatric HIV Education and Research (CIPHER) Global Cohort Collaboration
*[1]University of Cape Town, Center for Infectious Disease Epidemiology and Research, Cape Town, South Africa, [2]University College London, London, United Kingdom, [3]INSERM, U 897, Bordeaux, France, [4]University Bordeaux, Institut de Sante Publique, d'Epidemiologie et de Developpement, Bordeaux, France*
*Presenting author email: slogrove@gmail.com*

**Background:** The population of perinatally HIV-infected adolescents (PHA) continues to expand globally. This study aims to describe the geographic and temporal characteristics and outcomes of PHA.
**Methods:** Through the Collaborative Initiative for Paediatric HIV Education and Research (CIPHER), individual retrospective data from 12 cohort networks were pooled. Included PHA entered care before age 10 years with no known non-vertical route of HIV infection, and were followed beyond age 10 years. This initial analysis describes characteristics at first visit, start of antiretroviral therapy (ART), start of adolescence (age 10 years) and surviving patients at last follow-up.
**Results:** Of 37,614 PHA included, 49.4% (18,591) were male and 79% were from sub-Saharan Africa (Table 1). Median (interquartile range [IQR]) follow-up during adolescence was 2.36 (1.00-4.35) years, ranging from 2.04 (0.87-3.77, sub-Saharan Africa) to 6.38 (3.51-8.01, Europe & Central Asia) years.

| Region | Countries included | N (%) | Observation period | Duration of follow-up during adolescence - median (IQR) years | Cumulative Mortality % (95% CI) |
|---|---|---|---|---|---|
| South & Southeast Asia | Cambodia, India, Indonesia, Malaysia, Myanmar, Thailand, Vietnam | 2,902 (7.7) | 1994-2014 | 2.53 (1.17; 4.37) | 2.98 (2.08; 4.25) |
| Europe & Central Asia | Belgium, France, Ireland, Italy, Netherlands, Poland, Portugal, Romania, Russian Federation, Spain, Sweden, Switzerland, Ukraine, United Kingdom | 3,058 (8.1) | 1982-2015 | 6.36 (3.51; 8.01) | 0.78 (0.50; 1.21) |
| South America & Caribbean | Argentina, Brazil, Haiti, Honduras | 903 (2.4) | 1990-2015 | 4.92 (2.68; 7.37) | 4.72 (3.33; 6.65) |
| North America | United States of America | 1,048 (2.8) | 1991-2014 | 3.73 (2.01; 5.43) | 1.09 (0.52; 2,24) |
| Sub-Saharan Africa | Benin, Botswana, Burkina Faso, Burundi, Cameroon, Central African Republic, Democratic Republic of Congo, Côte d'Ivoire, Ethiopia, Ghana, Guinea, Kenya, Lesotho, Malawi, Mozambique, Rwanda, Senegal, South Africa, Swaziland, Tanzania, Togo, Uganda, Zambia, Zimbabwe | 29,703 (79.0) | 1996-2015 | 2.04 (0.87; 3.77) | 3.59 (3.26; 3.96) |

*[Table 1: Countries, periods of observation, duration of follow-up and cumulative mortality between 10 and 15 years of age by region]*

90.7% (34,132) of PHA received ART; 9.9% (3,385) started after age 10 years. Age, CD4 count, CD4 percent and HIV viral load at first visit and ART start varied markedly across regions (Table 2). Although laboratory markers improved by age 10 years, median weight-for-age (WAZ), height-for-age (HAZ) and body mass index-for-age (BMIZ) WHO Z-scores changed little. Median HAZ at age 10 years and last visit remained well below zero in all regions, although BMIZ was less impaired.

| | First visit | | ART start | | Age 10 years (+/- 6 months) | | Last visit | |
|---|---|---|---|---|---|---|---|---|

| BMIZ (>= age 5 years) | -0.60 (-1.54;0.22) N=19892 | -1.44; 0.16 | -0.56 (-1.46;0.25) N=19,697 | -1.46; 0.20 | -0.54 (-1.26;0.13) N=26,530 | -1.00; 0.38 | -0.68 (-1.46;0.09) N=32,295 | -1.02; 0.50 |

*[Table 2: Age, laboratory and anthropometric characteristics of perinatally HIV-infected adolescents (N=37,614) and ranges of medians across regions]*

Reported mortality between age 10 and 15 years was 3.08% (95%CI 2.83-3.36) ranging from 0.78% in Europe & Central Asia to 4.72% in South America & Caribbean (Table 1).
**Conclusions:** Reported mortality during adolescence was < 5% in all regions represented in this global analysis of HIV-infected children surviving to age 10 years. Under-ascertainment of mortality and impaired growth are concerns.

## WEAC0302

### PREVALENCE AND PREDICTORS OF FORCED-SEX AMONG SOUTH AFRICAN HIGH SCHOOL STUDENTS

S. Naidoo[1], B. Sartorius[2], H. de Vries[3], M. Taylor[1]
*[1]University of KwaZulu-Natal, Discipline of Public Health Medicine, Durban, South Africa, [2]University of KwaZulu-Natal, Discipline of Public Health, Durban, South Africa, [3]Maastricht University, Department of Health Organisation, Policy and Economics Management, Maastricht, Netherlands*
*Presenting author email: naidoos71@ukzn.ac.za*

**Background:** Gender violence in South Africa is a public health problem, including among adolescents.[1,2] Prevalence of sexual violence in adolescents ranges from 10% - 17%.[1,2] Forced sex, given the South African HIV epidemic, is a risk factor for HIV transmission. Understanding the predictors of forced sex among adolescents is important in developing preventative strategies.
**Methods:** This study aimed to identify the prevalence and predictors of forced sex in high school students in 16 randomly selected schools in Ugu and eThekwini districts of KwaZulu-Natal, South Africa. All students in a single randomly selected grade ten class at each school were invited to participate. Parents/guardians gave informed written consent and students consented to participate in the study. The study had ethical approval from the Biomedical Research ethics Committee of the University of KwaZulu-Natal and the Provincial Department of Basic Education. The I-Change Theoretical model was used as a conceptual framework for development of a self-administered questionnaire which included questions on socio-economic status. Survey weights were utilised given the study's complex multi-stage random sampling strategy. Point estimates and associated 95% confidence intervals were calculated. Factor analysis was employed to identify underlying factors associated with the construct variables related to forced sex. Survey weighted multivariable regression was performed to assess factors associated with forced sex status. Population attributable fractions for risk factors associated with forced sex were estimated.
**Results:** Overall 54 out of 434 subjects reported forced sex (survey weighted prevalence: 14.2%, 95%CI: 9.1 21.5%). The prevalence of reported forced sex was higher amongst females at 15.0% (95% CI: 10.8-20.4) compared to 13.6% (95%CI: 6.5-26.5) amongst males (p-value=0.781).There was a higher prevalence of forced sex amongst students in the low SES category (24.8%; 95%CI: 11.6-45.4) compared to the combined medium-high SES categories (12.9%; 95%CI: 8.8-18.5) (p-value=0.036). After multivariable adjustment, urban location (39%), low SES (15%)

and discordant mother/father vital status (20%) (specifically mother alive and father deceased) remained high impact risk factors for forced sex.
**Conclusions:** Public health and socio-economic interventions addressing household economics and family structure in urban communities are required to reduce the risk of forced sex among adolescents in South Africa.

## WEAC0303

### THE IMPACT OF A CASH TRANSFER ON YOUNG SOUTH AFRICAN WOMEN'S ON MENTAL HEALTH: HPTN 068

A. Pettifor[1], J. Wang[2], A. Selin[3], J. Hughes[2], X. Gómez-Olivé[4], R. Wagner[4], C. MacPhail[5], K. Kahn[4], HPTN 068 Study Team
*[1]University of North Carolina at Chapel Hill, Epidemiology, Chapel Hill, NC, United States, [2]SCHARP, Seattle, United States, [3]University of North Carolina at Chapel Hill, Carolina Population Center, Chapel Hill, United States, [4]University of the Witwatersrand, MRC/Wits Rural Public Health and Health Transitions Unit, Johannesburg, South Africa, [5]University of New England, School of Health, Armindale, Australia*
*Presenting author email: apettif@email.unc.edu*

**Background:** Cash Transfers have been found to improve the mental health of recipients. Possible mechanisms for the improvement in mental health include a reduction in financial stress and a hope for a better future due to an improved financial situation.
**Methods:** HPTN 068 was a 3-year randomized controlled trial to assess the impact of a cash transfer, conditioned on school attendance, on HIV incidence among young rural South African women. 2328 young women were HIV negative at baseline and had at least one follow up visit. Young women completed a survey using Audio Computer Assisted Self-Interview at baseline and at 12, 24, and 36 months. We assessed depression and anxiety using: the Short Form Children's Depression Index (CDI), The Center for Epidemiologic Studies Depression Score (CES-D), and the Revised Children's Manifest Anxiety Scale. Hope was measured with the Abler Hope Scale. CDI (>=7) and CES-D (>=16) were analyzed using log-binomial regression and robust variance to account for repeated measures. CMAS (summed score) and Hope (summed score) were analyzed using generalized estimating equations (GEE) with identity link, normal distribution and robust variance to account for repeated measures.
**Results:** Overall we saw no association between receipt of the conditional cash transfer and reduced depression or anxiety among young women (Table 1). In addition, there was no association between receipt of the cash transfer and increased hope for the future (Table 1).

| Outcomes Range, cronbach's alpha | CCT n=1,214 | Control n=1,114 | RR | 95%CI | p-value |
|---|---|---|---|---|---|
| CDI Index (>=7)**, alpha=0.70 | 25.8% | 25.9% | 0.99 | 0.85-1.16 | 0.93 |
| CES-D (>=16)**, alpha=0.84 | 28.4% | 29.9% | 0.96 | 0.86-1.06 | 0.39 |
| CMAS Anxiety (0-14), alpha=0.89 | 2.51 | 2.72 | -0.21* | -0.53-0.11 | 0.19 |
| Abler Hope (0-39), alpha=0.97 | 31.9 | 32.0 | -0.14* | -0.75-0.48 | 0.66 |
| *: Risk Difference | ** >=7 for CDI and >=16 for CES-D indicates depressive symptoms | | | | |

*[Association between cash transfer program and mental health outcomes in young South African women, HPTN 068]*

**Conclusions:** In this randomized control trial of a cash transfer, conditional on school attendance, we saw no impact of receiving the cash on depression, anxiety or hope for the future. High levels of school attendance and social protection coverage were observed in the cohort and thus it is possible that the addition of the cash transfer did not meaningfully reduce anxiety about poverty or improve future outlook above the baseline levels.

## WEAC0304

### WHY THE DISPARITIES? THE FIRST NATIONAL LOOK AT HIV-RELATED RISK BEHAVIOURS AMONG GAY AND BISEXUAL MALE HIGH SCHOOL STUDENTS, UNITED STATES 2015

L. Kann, E. Olsen, T. McManus, S. Zaza
*Centers for Disease Control and Prevention, Division of Adolescent and School Health, Atlanta, United States*
*Presenting author email: lkk1@cdc.gov*

**Background:** An estimated 22% of all new diagnoses of HIV in the United States in 2014 occurred among 13-24 year-olds and most of these diagnoses occurred among males who have sex with males. The 2015 national Youth Risk Behavior Survey (YRBS) is the first national survey in the United States to provide national estimates of the size of the sexual minority population in high schools and document the disparities in HIV-related risk behaviors between gay/bisexual and heterosexual male high school students.
**Methods:** The 2015 national YRBS employed a three-stage national probability sample of 15,624 students in grades 9-12 (ages 14-17). Black and Hispanic students were oversampled. T-tests were used to determine significant pairwise differences between gay/bisexual and heterosexual male high school students.
**Results:** Nationwide, 2.0% of male high school students identified as gay and 2.4% identified as bisexual. Gay/bisexual male students were at least twice as likely as heterosexual male students to report being electronically bullied; bullied on school property; not going to school because of safety concerns; being physically forced to have sexual intercourse; experiencing physical and sexual dating violence; ever using cocaine, heroin, and methamphetamines; and ever injecting drugs. However, no significant differences were identified between gay/bisexual male students and heterosexual male students in ever drinking alcohol, ever using marijuana, ever having sexual intercourse, having sexual intercourse with four or more persons, being currently sexually active, using a condom at last sexual intercourse, and drinking alcohol or using drugs before last sexual intercourse.
**Conclusions:** Though males who have sex with males are disproportionally affected by HIV, behaviors that directly contribute to HIV infection (ex. not using a condom) do not appear to be driving the disparities at least among male high school students nationwide. Nonetheless, the results clearly demonstrate significant disparities in many other health-risk behaviors that could present barriers and decrease access to HIV prevention and treatment technologies among gay/bisexual male students. The results also suggest the importance of addressing broader social determinants of health associated with increased risk for HIV infection including stigma, discrimination, lower educational attainment, unemployment, and incarceration.

## WEAC0305LB

### CHANGES IN BONE MASS AFTER DISCONTINUATION OF PREP WITH TENOFOVIR DISOPROXIL FUMARATE/EMTRICITABINE (TDF/FTC) IN YOUNG MEN WHO HAVE SEX WITH MEN (YMSM): EXTENSION PHASE RESULTS OF ADOLESCENT TRIALS NETWORK (ATN)110

K. Mulligan[1], S. Hosek[2], B.G. Kapogiannis[3], R.J. Landovitz[4], N. Liu[5], S.S. Cofield[6], S.E. Perumean-Chaney[6], P.L. Havens[7], B. Rutledge[5], C.M. Wilson[6], Adolescent Trials Network (ATN) for HIV/AIDS Interventions Protocol 110 Team
*[1]University of California, San Francsico, San Francisco, United States, [2]John Stroger Hospital of Cook County, Chicago, United States, [3]National Institute of Child Health and Human Development, National Institutes of Health, Bethesda, United States, [4]University of California, Los Angeles, Los Angeles, United States, [5]Westat, Rockville, United States, [6]University of Alabama, Birmingham, Birmingham, United States, [7]Medical College of Wisconsin, Milwaukee, United States*
*Presenting author email: cwilson@uab.edu*

**Background:** PrEP with TDF/FTC is associated with modest bone loss in HIV-seronegative adults and adolescents. There is particular concern about bone loss during adolescence/early adulthood, a period of continuing bone growth. The aim of this study was to determine whether bone loss reversed with discontinuation of PrEP in HIV-seronegative YMSM ages 18-22.
**Methods:** ATN110 is a 48-week open-label demonstration and safety study of TDF/FTC PrEP in 200 YMSM. As part of safety monitoring, bone mineral density (BMD) was measured by dual-energy X-ray absorptiometry (DXA). Participants who lost or failed to accrue bone after 48 weeks on TDF/FTC PrEP immediately entered an extension phase (EPH) in which DXA scanning was performed 24 and 48 weeks after discontinuation of PrEP. Results are mean±SD.
**Results:** Of 135 participants who had DXA scans at the end of the 48-week TDF/FTC treatment phase, 105 (78%) were eligible for EPH. After exclusion of seroconverters (N=6) and those who received PrEP through their regular providers (N=16), EPH data are available for 74 participants. Among this group, average BMD changes from baseline to week 48 of the treatment phase were: spine -0.2±2.7% (P=0.53); hip -1.4±3.6% (P=0.002); whole body (WB) -0.6±2.5% (P=0.03). Forty-eight weeks after discontinuation of TDF/FTC, BMD increased (spine +1.1±3.0% [P=0.003]; hip

+1.0±3.8% [P=0.04]; WB +0.6±2.0% [P=0.01]). Net BMD changes from baseline to the end of EPH (48 weeks on TDF/FTC followed by 48 weeks off TDF/FTC) were not statistically significant (spine +0.6±4.1% [P=0.24]; hip -0.5±4.2% [P=0.34]; WB -0.2±2.6% [P=0.52]). Despite gains in BMD during EPH, there were small but statistically significant net decreases from baseline in Z-scores (SDs based on population norms for BMD) in the spine (-0.18±0.38 [P< 0.001]) and WB (-0.08±0.31 [P=0.03]), with no significant change in the hip (-0.05±0.30 [P=0.22]).
**Conclusions:** On average, HIV-seronegative YMSM who lost BMD during TDF/FTC PrEP experienced partial or full recovery of BMD during the 48 weeks following discontinuation of PrEP, but some Z-scores declined slightly from baseline. While the risk of slight BMD loss is counterbalanced by protection from HIV acquisition, these results highlight the continuing need for strategies to mitigate bone loss in at-risk YMSM.

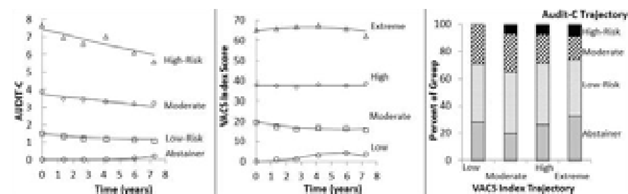
### WEAC0401

### Long-term alcohol use patterns and HIV disease severity typologies in U.S. veterans: a joint trajectory analysis

B. Marshall[1], J. Tate[2,3], K. McGinnis[4], D. Fiellin[2,3], K. Bryant[5], A. Justice[2,3]
*[1]Brown University, Department of Epidemiology, Providence, United States, [2]Yale University, Department of Internal Medicine, New Haven, United States, [3]West Haven VA Healthcare System, Veterans Aging Cohort Study Coordinating Center, West Haven, United States, [4]VA Pittsburgh Healthcare System, Pittsburgh, United States, [5]National Institute on Alcohol Abuse and Alcoholism, Bethesda, United States*
*Presenting author email: brandon_marshall@brown.edu*

**Background:** Although unhealthy alcohol use is common in HIV-infected populations, the effect of alcohol consumption on HIV disease progression is unclear. We examined the relationship between long-term alcohol use patterns and HIV disease severity among participants enrolled in the Veterans Aging Cohort Study (VACS).
**Methods:** HIV-infected participants in care at eight US Veterans Health Administration sites were eligible. Between 2002 and 2010, we assessed alcohol consumption annually using the 3-item Alcohol Use Disorders Identification Test-Consumption (AUDIT-C). Overall disease severity was ascertained using the VACS index, a validated measure of morbidity and mortality. We identified trajectories of alcohol use and disease severity with group-based finite mixture modelling. We examined associations between membership in distinct alcohol use and VACS index trajectories using multinomial regression.
**Results:** Of 3,539 eligible participants, median age was 49 (IQR: 44-55), 98% were male, and 70% were African American. Group-based modelling identified four alcohol consumption patterns: abstainers (24%), low-risk drinkers (44%), moderate-risk drinkers (24%), and high-risk drinkers (8%) [left panel]. We also found four VACS index trajectories: low (2% of sample), moderate (46%), high (36%) and extreme (16%) [center panel]. Membership in higher VACS index trajectories was associated with older age, African American race, HCV co-infection, history of injection drug use, and lack of viral suppression (all *p*< 0.001). Membership in VACS index and alcohol consumption trajectories was strongly correlated [right panel]. No high-risk drinkers were in the low VACS Index group, whereas high-risk drinkers were most common in the extreme group. Abstainers were most common in the low and extreme VACS Index groups.



*[Joint alcohol use and VACS index trajectories among study participants]*

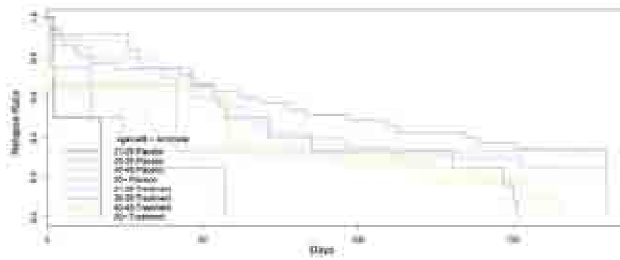
**Conclusions:** Alcohol use patterns implying long-term hazardous drinking were associated with greater disease severity among HIV-infected veterans receiving care. Joint trajectory analyses revealed two distinct groups of abstainers ("sick quitters" and "healthy abstainers"). Further research is needed to identify mediators of long-term alcohol consumption patterns and HIV disease severity.

### WEAC0402

### Extended-release naltrexone lengthens time to heavy drinking among HIV+ released prisoners with alcohol use disorders

S. Springer[1], M. Azar[1], R. Barbour[2], A. Krishnan[3], F. Altice[1], A. DiPaola[1]
*[1]Yale School of Medicine, Section of Infectious Disease, Yale AIDS Program, New Haven, United States, [2]Yale University School of Medicine, Center for Interdisciplinary Research on AIDS, New Haven, United States, [3]State University of New York at Albany, Department of Communication, Albany, United States*
*Presenting author email: sandra.springer@yale.edu*

**Background:** Alcohol use disorders (AUDs) negatively impact every step in the HIV continuum of care. For HIV+ prisoners in particular, relapse to heavy alcohol use upon release is associated with poor retention in care and loss of HIV viral suppression. Extended-release naltrexone (XR-NTX) is an approved and effective monthly injectable medication to prevent relapse to alcohol use but has not been studied among HIV+ persons or among prisoners.
**Methods:** We conducted a NIAAA-funded double blinded placebo-controlled trial of XR-NTX (randomized 2:1, XR-NTX: placebo) among HIV+ prisoners with AUDs who were released to the community in Connecticut, U.S.A. Primary outcome of interest was time to first heavy drinking day (TFHDD). Due to elevated data missingness, a Little's MCAR test was first performed and confirmed the data were missing at random. This missingness structure allowed multiple imputation and subsequent multivariate analysis via Bayesian modeling. A heavy drinking day was defined as ≥5 drinks for males, ≥4 drinks for females. Intervention time was 6 months and total follow-up period was 12 months.
**Results:** 107 HIV+ prisoners were enrolled during the study period from 2010-2015. The first study drug injection occurred one week prior to release during incarceration, and five subsequent injections occurred monthly after release to the community. TFHDD was significantly longer in those that received XR-NTX vs placebo (80.4 vs 73.5 days; p< 0.001). In addition to the overall treatment effect of XR-NTX; age < 30 years, lower Alcohol Use Disorder Identification Test (AUDIT) scores, and abstinence from opioids and/or cocaine during the intervention period were significantly associated with longer TFHDD (p< 0.001).



*[Figure 1. Kaplan Meier Plot of Time to First Heavy Drinking Day by Age & Study Arm]*

**Conclusions:** XR-NTX significantly lengthened the time to heavy drinking after release for HIV+ released prisoners, particularly among younger persons. Interventions aimed at preventing relapse to alcohol among HIV+ prisoners transitioning to the community should include XR-NTX.

### WEAC0403

### Preliminary experience with medically assisted therapy for people who inject drugs in Mombasa County, Kenya

A.A. Baghazal[1], L. Tariko[2], K. Shikely[1], S. Patta[1], B. Omar[1], H. Musyoki[3], S. Bertrand[4], S. Abdallah[4]
*[1]County Government of Mombasa, Health, Mombasa, Kenya, [2]Coast General Hospital, Health Records, Mombasa, Kenya, [3]Ministry of Health, National AIDS and STI Control Programme, Nairobi, Kenya, [4]United Nations Office on Drugs and Crime, Nairobi, Kenya*
*Presenting author email: docbaghazal@gmail.com*

**Background:** Kenya modes of transmission study attributed 4% of all new HIV infections to injecting drug use. AFYA-PWID, a 4-year program, funded through PEPFAR grant aims to reduce HIV morbidity and mortality among people who use drugs in Kenya.
**Methods:** This program is implemented via a four pronged approach: improving policies, strategies, guidelines and coordination; increasing access to comprehensive HIV prevention, care and support package for PWID; strengthening policy makers & community support; and enhancing M&E Capacity. This program's key focus is introduction and scale up of high impact, evidence-based interventions, specifically Medically Assisted Therapy (MAT) - alias opioid substitution therapy.

Author Index

Program achievements in Mombasa County since project start in mid-2014 include: functioning multi-sectorial technical working group, county-specific standard operating procedures for MAT in place, two MAT clinics established at public health facilities; and over 60 health workers and over 30 CSO staff trained, 20 policy makers, 80 law enforcement, 10 judiciary, 50 religious leaders and 10 media personnel sensitized.
**Results:** From September to December 2015, a total 167 individuals had initiated MAT. All males who inject heroin, all heroin-dependent females regardless of injecting status and sexual partners of enrolled clients were eligible. 26% MAT clients were females, 11% aged ≤ 25 years, 24% were HIV-infected (18% males versus 42% of females), 28% HCV infected (33% males versus 16% females). Overall HBV prevalence 2%. 100% tested opiates positive at baseline urine toxicology: 30% dependent on heroin alone, two-thirds concurrently used cannabis and heroin, while 5% dependent on heroin, cannabis and benzodiazepine.
Daily methadone maintenance doses ranged 36 to 140 mgs. After 3 months, random urine screening reported 50% opiates positivity. By end of 2015, 6% clients were lost to follow up and 2.3% died.
**Conclusions:** This program represents a major milestone for Mombasa County! Within less than 4 months of initiation, 167 highly marginalized and stigmatized clients were accessing long overdue MAT services. Despite limited psychosocial support and other intervention there is high treatment retention rate - possibly due to optimal methadone dosing. However, there is urgent need for integrated service delivery and livelihood assistance for recovering MAT clients.

## WEAC0404

### Incarceration and people who inject drugs in Ukraine: modelling its role in HIV transmission and the impact of introducing OST in prisons

J. Stone[1], E. Brooks-Pollock[1], F.L. Altice[2], L. Azbel[3], P. Smyrnov[4], N.K. Martin[1,5], P. Vickerman[1]
*[1]University of Bristol, School of Social and Community Medicine, Bristol, United Kingdom, [2]Yale University School of Medicine, Section of Infectious Diseases, New Haven, United States, [3]London School of Hygiene & Tropical Medicine, London, United Kingdom, [4]International HIV/AIDS Alliance, Kyiv, Ukraine, [5]University of California San Diego, Division of Global Public Health, San Diego, United States*
*Presenting author email: jack.stone@bristol.ac.uk*

**Background:** People who inject drugs (PWID) experience high incarceration rates, and current or previous history of incarceration is associated with increased HIV and Hepatitis C transmission and heightened injecting risks. We assess the contribution of incarceration to HIV transmission amongst PWID in Ukraine, and the impact of introducing opiate substitution therapy (OST) in prison.
**Methods:** We developed a dynamic model of incarceration and HIV transmission amongst PWID, which was fit using a Bayesian framework to data from Ukraine. The model was calibrated to data on HIV prevalence amongst never and previously incarcerated PWID in 2013 (12.8 and 28.2%, respectively), and currently incarcerated PWID in 2011 (28.5%). Based on data on the frequency of syringe sharing, baseline projections assumed increased injecting risk amongst previously incarcerated PWID compared to never incarcerated community PWID (1.9-3.3 times greater in first 12 months after release and 1.4-2.0 times greater thereafter), but made no assumption about the level of risk amongst incarcerated PWID because of insufficient data. Sensitivity analyses considered less informative priors. We projected the 15-year: contribution of incarceration to cumulative HIV incidence among PWID and impact of introducing prison OST from 2015.
**Results:** Despite uncertainty in the HIV transmission risk among currently incarcerated PWID, the model projected that 55% (95% credibility interval: 40-68%) of new HIV infections could be averted amongst PWID in Ukraine over the next 15 years if incarceration had no effect on HIV transmission from 2015. This result was robust to less informative priors on the level of risk in previously and currently incarcerated PWID. Conversely, if prison OST was initiated in Ukraine, with 50% coverage of incarcerated PWID and OST maintained for one year after incarceration, the model suggests 20% (95% credibility interval: 15-25%) of HIV infections could be averted from 2015 to 2030.
**Conclusions:** Incarceration and the increased transmission risk associated with previous incarceration are likely to be important contributors to HIV transmission amongst PWID in Ukraine. Interventions need to focus on reducing these risks, with OST in prison possibly being an important strategy to reach this aim.

## WEAC0405

### Modelling the potential impact of the incarceration on HIV incidence among people who inject drugs in Tijuana, Mexico

A. Borquez[1], D. Abramovitz[1], L. Beletsky[1], P. Vickerman[2], P. Gonzales-Zuñiga[1], G. Rangel[3], M. Hickman[2], S.A. Strathdee[1], N. Martin[1]
*[1]University of California San Diego, Global Public Health, San Diego, United States, [2]University of Bristol, Bristol, United Kingdom, [3]Comisión de Salud Fronteriza, Mexican Ministry of Health, Tijuana, Mexico*
*Presenting author email: aborquez@ucsd.edu*

**Background:** Incarceration rates are high among people who inject drugs (PWID) in Tijuana, Mexico with a higher HIV prevalence among those ever compared to never incarcerated. Using dynamic mathematical modeling we estimate the contribution of incarceration to the HIV epidemic among PWID in Tijuana and the potential impact of reducing incarceration rates.
**Methods:** Data on HIV prevalence and incidence by incarceration exposure were obtained from an ongoing cohort of PWID in Tijuana (“El Cuete IV” 2006-2015). HIV prevalence was 3.4% and 6.7% among male and female PWID respectively. 85% and 53% of male and female PWID, respectively reported previous incarceration. Relative risk of HIV infection among ever versus never incarcerated male and female PWID was 1.10 (95%CI: 0.26-4.73) and 3.24 (95%CI: 0.70-15.00) respectively. A deterministic mathematical model of HIV transmission among PWID was developed reproducing the differential HIV risk and incarceration patterns among PWID by sex. The model was embedded in a Bayesian statistical framework using a Markov Chain Monte Carlo (MCMC) algorithm to estimate uncertainty in the outputs. Epidemic fits were resampled from the posterior distribution and the proportion of new infections attributable to incarceration was calculated over different time periods (1980-2016, 2016-2021 and 2016-2026).
**Results:** The model estimated that from the start of the epidemic to date, 43.5% [95%CrI: 25.9%-60.3%] of new infections were attributable to incarceration and without incarceration HIV prevalence could have been a relative 2.1 folds [95%CrI: 1.4-3.1] lower in 2016 (1.7% instead of 3.4%). In the absence of incarceration between 2016-2021 and 2016-2026, 7.7% [95%CrI: -8.8%-22.8%] and 10.6% [95%CrI: -6.4%-26.6%] of new infections would be averted.
**Conclusions:** Preliminary modeling suggests incarceration has contributed substantially to HIV incidence among PWID in Tijuana, and a reduction in incarceration could avert up to 10% of new infections in the next 10 years. In 2009, Mexico decriminalized the possession of certain drugs for personal consumption in an effort to reduce incarceration rates among users, however the reform has not been enforced in Tijuana. Further delaying its enforcement undermines the efforts to control the epidemic among this population.

### Sustained effect of couples’ HIV counselling and testing on reducing unprotected sex among HIV serodiscordant couples

K. Wall[1], W. Kilembe[2], B. Vwalika[2], L. Haddad[3], N. Htee Khu[3], I. Brill[3], C. Vwalika[2], E. Chomba[2], A. Tichacek[3], S. Allen[3]
*[1]Emory University, Epidemiology, Atlanta, United States, [2]Emory University Rwanda Zambia HIV Research Group, Lusaka, Zambia, [3]Emory University Rwanda Zambia HIV Research Group, Atlanta, United States*
*Presenting author email: kristin.wall@gmail.com*

**Background:** Couples’ voluntary HIV counseling and testing (CVCT) has been shown to significantly reduce HIV/STI incidence in HIV discordant couples by increasing condom use. The long-term impact of CVCT on sustained behavior change has not been published.
**Methods:** From 1994-2012, heterosexual HIV discordant couples (M+F- and M-F+) were recruited in Lusaka, Zambia into long-term follow-up. Baseline and time-varying covariates were measured every three months. The outcome was a time-varying composite measure of: self-reported unprotected sex, sperm presence on a vaginal swab wet prep, incident pregnancy, and incident HIV seroconversion. Multivariable repeated outcomes survival analysis (Anderson-Gill) explored factors predictive of unprotected sex.
**Results:** Among 3,049 couples followed an average of two years/couple, incidence of unprotected sex indicators decreased significantly after the first CVCT visit ($p < 0.001$), and this decrease was sustained over follow-up (p-trend $< 0.05$). Predictors of unprotected sex are shown in Table 1. Model findings were similar when also controlling for fertility intentions.

| | M+F- couples (N = 1393) | | | | M-F+ couples (N = 1656) | | | |
|---|---|---|---|---|---|---|---|---|
| **Contraceptive method (versus condoms alone)*** | HR^ | 95%CI | | p-value | HR+ | 95%CI | | p-value |

| **Circumcised male partner (yes versus no)** | 1.23 | 1.04 | 1.47 | 0.019 | | | | |

OCP: oral contraceptive pill; IUD: copper intrauterine device; HR: adjusted hazard ratio; CI: confidence interval; yr: year; *time-varying variables; p-values are two-tailed; ^controlling for controlling for age, self-reported protected sex with the study partner, self-reported outside sex, and follow-up time since enrollment; +controlling for age, self-reported protected sex with the study partner, and follow-up time since enrollment

*[Table 1. Multivariable models of predictors of unprotected sex among HIV discordant couples]*

**Conclusions:** In HIV discordant couples, reductions in unprotected sex after CVCT are significant and sustained over long-term follow-up. We recommend broad CVCT scale-up per WHO guidelines. Reinforced condom counseling may be needed in M+F- couples (especially oral and injectable users, female alcohol users, and during pregnancy) and M-F+ couples (especially during pregnancy). The finding that oral and injectable method use was predictive of unprotected sex in M+F- couples potentially explains published associations between hormonal contraception and HIV seroconversion (uncontrolled confounding by unprotected sex). The finding that male circumcision in M+F- couples was associated unprotected sex warrants further investigation.

## WEAD0102

### POSITIVE IMPACT OF A RANDOMIZED CONTROLLED TRIAL OF THE UTHANDO LWETHU ("OUR LOVE") INTERVENTION ON RATES OF COUPLES HIV TESTING IN RURAL SOUTH AFRICA

L. Darbes[1,2], N.M. McGrath[3,4], M.O. Johnson[2], V. Hosegood[4,5], K. Fritz[6], T. Ngubane[7], H. van Rooyen[7]
*[1]University of Michigan, School of Nursing, Ann Arbor, United States, [2]University of California, Center for AIDS Prevention Studies, San Francisco, United States, [3]University of Southampton, Faculty of Medicine, Southampton, United Kingdom, [4]Africa Centre for Population Health, Mtubatuba, South Africa, [5]University of Southampton, Social Sciences, Southampton, United Kingdom, [6]International Center for Research on Women, Washington DC, United States, [7]Human Sciences Research Council, Sweetwaters, South Africa*
*Presenting author email: lynae.darbes@ucsf.edu*

**Background:** Couples-based HIV testing and counseling (CHTC) is an effective strategy for reducing sexual transmission between partners. However, uptake of the service has been low. We tested the efficacy of a couples-based intervention to increase participation in CHTC in a high HIV-prevalence setting.
**Methods:** We randomized 332 couples (664 individuals) from a rural community in KwaZulu-Natal South Africa for an RCT of a couples-based behavioral intervention comprising six sessions (two group sessions/four couple counseling sessions) (n= 168 couples) or one group session (n = 164 couples). The intervention explored barriers to HIV testing and promoted improved communication skills and positive relationship dynamics. The primary outcomes were participation in CHTC and number of reported unprotected sex acts in the last 90 days with primary partner. Couples were ineligible if they had mutually disclosed their HIV status or previously participated in CHTC.
**Results:** 22 couples (6%) were lost-to-follow-up before 9 months, with no difference by group, p=0.36. Using intent-to-treat analysis, at final 9-month follow-up, a higher proportion of intervention couples had participated in CHTC than control couples (42% and 12% respectively; p ≤ 0.001), with a shorter time to CHTC than control group couples who participated in CHTC (Logrank p ≤ 0.0001). For sexual behavior, there was a significant reduction in proportion of unprotected sex acts for intervention couples at 3-month follow-up (IRR = 0.74, p ≤ 0.022), but a negative binomial regression model accounting for couple clustering found no significant group-by-time interaction (p=0.08).
**Conclusions:** To our knowledge, this is the first intervention that targeted increasing participation in CHTC. Results suggest that addressing relationship factors among African heterosexual couples can significantely improve rates of CHTC. The intervention had an impact on proportion of unprotected sex acts at first follow-up but this was not sustained over time. Our intervention reached a high number of couples that were unaware of their joint HIV status at baseline. Further, results show that it is possible to promote engagement in CHTC-- which is an effective strategy that accomplishes HIV testing, mutual disclosure and can facilitate entrée into treatment for HIV-positive individuals in high prevalence settings.

## WEAD0103

### ASSESSMENT OF COUPLE RELATIONSHIP QUALITY AND LINKS TO HIV PREVENTION, TREATMENT AND CARE IN RURAL MALAWI

A. Ruark[1,2], D. Brewster-Lee[2], J. Hembling[2], V. Rhoe Davis[2]
*[1]Brown University, Medicine, Providence, United States, [2]Catholic Relief Services, Baltimore, United States*
*Presenting author email: ahruark@gmail.com*

**Background:** Couple relationship quality may impact partner-level behaviors related to HIV risk, including couples' HIV testing, serostatus disclosure and care outcomes. The Couple Functionality Assessment Tool (CFAT) was developed to allow programs to assess couple relationship quality in low-resource settings.
**Methods:** The CFAT was pilot tested among 203 women and 198 men (married and cohabiting) in rural Malawi in August 2015. Factor analysis reduced the CFAT to thirty-one questions addressing five domains of relationship quality (intimacy, partner support, sexual satisfaction, decision-making, communication and conflict management), plus questions on intimate partner violence and partner support for seeking HIV care. Regression analysis examined the relationship of the refined CFAT to key HIV-related behaviors.
**Results:** Most participants reported that they and their partners had been tested for HIV and mutually disclosed their status (90% of women, 85% of men). Women with the highest relationship quality scores were significantly more likely than women with the lowest scores to report that they and their partners had been tested for HIV and mutually disclosed results (94% vs. 72%, p < .01) and also to report other behaviors critical to HIV care and treatment adherence, such as deciding with partner how to manage household budget (p< .001) and having a joint financial plan (p< .001). Women with low relationship quality were also significantly more likely to report intimate partner violence and abuse. Men reported that they would be more supportive of women seeking PMTCT and of children's HIV testing than women perceived them to be (differences between men's and women's perceptions significant at p < .001 and p = .002, respectively).
**Conclusions:** The CFAT showed validity in this population, and findings suggest that strengthening couple relationship quality and giving couples tools to build good communication may support behaviors critical to HIV outcomes. Women may be underestimating men's support for PMTCT services and pediatric testing, which could create barriers to care. The greater violence and abuse experienced by women in low-quality relationships may also create HIV risk and impede care. The CFAT will enable projects aiming to improve HIV outcomes by enhancing couple functionality to measure relationship quality validly and reliably.

## WEAD0104

### PARTNER COMMUNICATION AND SUPPORT AROUND HIV AND HOW THIS RELATES TO HEALTH-SEEKING BEHAVIOUR: A QUALITATIVE STUDY AMONGST HIV-POSITIVE INDIVIDUALS AND COUPLES IN KARONGA, MALAWI

J. Renju[1], A. Wringe[1], A.C. Crampin[1,2], O. Koole[1], C. Nyirenda[2], H. Namadingo[2], E. McLean[1,2], ALPHA Network
*[1]London School of Hygiene & Tropical Medicine, London, United Kingdom, [2]Malawi Epidemiology and Intervention Research Unit, Karonga, Malawi*
*Presenting author email: jenny.renju@lshtm.ac.uk*

**Background:** HIV policies and practices in Malawi and elsewhere in sub-Saharan Africa have strongly focused on couple testing, counselling and partner disclosure to improve treatment adherence and outcomes. Little is known about how HIV-positive concordant couples respond to these initiatives, and the consequences for their relationships and HIV care-seeking behaviours. In the context of a larger qualitative study on the experiences of care-seeking among HIV-infected adults, communication around HIV and its influence on care-seeking behaviours was explored.
**Methods:** In-depth interviews were carried out with 24 women and 17 men diagnosed with HIV, including 8 mutually disclosed couples, purposefully sampled from ART clinics or households using the Karonga health and demographic surveillance system database. Participants were encouraged to explain their journey with HIV;

topic guides explored communication with partners and other support networks, and experiences with HIV services. A framework analysis approach was used. Individual narratives from eight couples were compared to map communication within relationships and understand potential implications on health-seeking behaviours.
**Results:** Communication about HIV testing, care and treatment in a relationship was primarily driven by a perceived need for support: some people disclosed their status in anticipation of specific support mechanisms, while others did not disclose for fear of being abandoned and losing any kind of support. Communication about HIV testing and treatment was often initiated by women, and was often influenced by child-bearing and care.
Despite knowing each others' HIV status, most partners were unable to accurately articulate their partner's HIV-related experiences suggesting communication was restricted to particular areas and implying an individual focus. Those that reported support generally defined it in practical rather than psychological terms (e.g. reminders to take drugs).
**Conclusions:** Most participants reported that disclosing to their spouse was important, but following disclosure communications did not consistently extend to a meaningful understanding of the other's experience of living with HIV. Despite purportedly couple-friendly services, partners rarely attended the health facility together, suggesting HIV remains a solo journey. As policy moves towards universal ART, further consideration is required around how to engage partners in culturally appropriate ways to support improved communication and health-seeking behaviours.

## WEAD0105

### INTERVENTION OUTCOMES ON MENTAL HEALTH OF PLH, FAMILY MEMBERS AND CHILDREN: A RANDOMIZED CONTROLLED TRIAL IN RURAL CHINA

L. Li[1], L.-J. Liang[1], C.Q. Lin[1], Y. Xiao[2], G.P. Ji[2]
*[1]University of California, Semel Institute, Los Angeles, United States, [2]Anhui Provincial CDC, Hefei, China*
*Presenting author email: lililili@ucla.edu*

**Background:** HIV impacts families. This study examines the efficacy of an intervention that targets people living with HIV (PLH), their family members and children in rural China. The intervention outcomes on mental health were evaluated for all the three populations.
**Methods:** The intervention trial utilized a two-arm design with 475 families impacted by HIV in rural Anhui, China, including 522 PLH, 475 sero-negative family members, and 536 children aged 6-18. Previously piloted TEA (Together for Empowerment Activities) intervention was delivered at three levels: 1) TEA Gathering (small group for PLH and family members); 2) TEA Time (home-based family activities with children); and 3) TEA Garden (community events). Intervention effect was evaluated at baseline, 6-, 12-, 18-, and 24-month follow-ups. Mixed-effects regression models were used to assess the improvement on the mental health measures -- for PLH on depressive symptoms and coping with illness, for family members on depressive symptoms and caregiver burden, and for children on self-esteem and daily stress. Estimated difference and standard error (SE) in changes from baseline between intervention and control from the regressions are shown.
**Results:** For PLH, we found significant intervention effects on improved levels of coping with illness at the 6-month (4.45±0.84; P< 0.0001), 12-month (3.19±0.85; P=0.0002), 18-month (3.09±0.85; P=0.0003), and 24-month follow-up (2.55±0.87; P=0.0034). Similarly, significant effect on reduction of depressive symptoms was observed at each of the follow-ups for PLH. For family members, significant intervention effects at the follow-ups were found on improved depressive symptoms, but not on caregiver burden. For children, although intervention effects on the improved self-esteem were not significant between intervention and control, significant intervention effects on levels of daily stress were found at the 6-month (1.49±0.72; P=0.0386) and 12-month (1.68±0.74; P=0.0241) follow-ups.
**Conclusions:** This is our first longitudinal outcome report based on the large-scale, randomized trial. Study findings support the feasibility in implementation and efficacy of the multilevel TEA intervention not only for PLH also for family members and children. Intervention activities that connect various members in a family could be the key to link to the intervention outcomes.

## WEAD0201

### MEETING THE REPRODUCTIVE INTENTIONS OF PLHIV IN MALAWI

L. Irani[1], E. McGinn[2], M. Mellish[3], O. Mtema[4], P. Dindi[4]
*[1]UNICEF, Gender Section, New York, United States, [2]Palladium, Washington, United States, [3]Palladium, Health Policy Plus Project, Washington, United States, [4]Palladium, Health Policy Plus Project, Lilongwe, Malawi*
*Presenting author email: pierre.dindi@thepalladiumgroup.com*

**Background:** Malawi's HIV clinical management guidelines recommend provider-initiated family planning (PIFP) counselling and provision of condoms and injectables within ART settings. The USAID- and PEPFAR-funded Health Policy Project's 2015 study assessed how the reproductive rights of PLHIV are being addressed through the integration of FP into ART services.
**Methods:** Data were collected from a purposive sample of 41 public and private facilities across nine districts of Malawi. Facilities ranged from large high-volume hospitals to small health posts. Data collectors conducted 41 facility audits, 41 interviews with facility in-charges, 122 interviews with providers, 425 client exit interviews, 58 mystery client interviews, and three focus group discussions with PLHIV (n=33).
**Results:** Over half (52%) of female clients (n=315) reported not wanting another child. The majority of female clients (60%) were using contraception; half relied on condoms, one-third were using injectables. Almost one-half (47%) reported not being told about side effects with their current method; 26% reported they were not told about other FP methods. Only 14% of clients reported receiving PIFP at that day's visit. Few clients (18%) reported receiving multiple services that day; however 97% said they would prefer to receive fully integrated services. Clients identified fewer trips to the facility (78%) and reduced transportation costs (43%) as clear benefits of integrated services. Mystery client visits revealed extremely low levels of PIFP implementation (2), and also documented cases of harsh treatment (11), and instances where clients were denied services (ART=5, FP =11) because they were not registered at that facility. Fewer than half of mystery clients reported a satisfactory experience. Some FGD participants recounted experiences of mistreatment from service providers.
**Conclusions:** ART clients in Malawi have a high demand and need for effective FP services, and express a preference for integrated services. Yet despite national guidelines on PIFP, few providers are initiating discussions on reproductive intentions with ART clients. Many HIV clients are relying on condoms to meet their reproductive intentions, and a large number are not receiving quality counseling on a range of methods. An unanticipated finding was the degree to which providers may be mistreating clients, which warrants further study.

## WEAD0202

### SEXUAL AND REPRODUCTIVE HEALTH (SRH) NEEDS AND EXPERIENCES OF YOUTH LIVING WITH HIV

R. Imakit[1], S. Ajok[2], D. Talima[2], A. Namakula[2]
*[1]Straight Talk Foundation, Research and Evaluation, Kampala, Uganda, [2]Straight Talk Foundation, Kampala, Uganda*
*Presenting author email: rmakit@gmail.com*

**Background:** The 1994 International Conference on Population and Development marked the start of the rights-based approach to SRH, with focus towards individuals and their needs, aspirations and rights. SRH needs of youth living with HIV (YLHIV) are often overlooked, meeting them is fundamental to SRH rights of YLHIV and to addressing the global HIV pandemic. Despite its significance, SRH of YLHIV is an often neglected area of research and programming and represents a priority on 2015 post-MDG agenda. Straight Talk Foundation aimed to investigate the dynamics underpinning sexual and reproductive health for YLHIV in Uganda.
**Methods:** A cross sectional and qualitative study design was adopted. The study was carried out among YLHIV who lived in either an urban setting (Kampala) or a rural or post war (Gulu) district. A sequential exploratory approach was used in data collection. Participants were systematically picked from a sample frame determined within their peer network. 39 Semi-Structured interviews with YLHIV and 7 key informants with counselors and medical staffs were carried out. Voice recorders were used to capture data thus data was transcribed and exported to Nvivo version 10 for data analysis. Consent was sought from the young people.
**Results:** YLHIV were sexually active, or in relationships with intentions of sexual activity, and with sero-discordant partners. Health facilities where YLHIV accessed ARVs from had no SRH services integrated. The sexual encounters of YLHIV were typically unplanned making negotiation of safe sex, such as disclosure and use of contraceptives challenging and inconsistent. YLHIV reported experiencing a lot of public HIV-related stigma and discrimination leading to social isolation, which re-

duces social support networks and led to poor self-esteem consequently poorer motivation for self-protection during sex. Many of the YLHIV lacked SRH information for decision making thus fuelling myths and misconceptions which YLHIV commonly act upon; faced cultural taboos and the association of sexuality with immorality inhibiting discussion of sex, relationships and contraception between YLHIV and their parents.

**Conclusions:** Social vulnerability of YLHIV to SRH threats is complex and multifaceted. In order to improve SRH for YLHIV, a holistic approach which addresses the broader social environment is required.

## WEAD0203

### "I ALWAYS WANTED A BIG FAMILY BECAUSE I LOST MINE": A QUALITATIVE ANALYSIS OF PARENTING PERSPECTIVES AMONG YOUNG PARENTS WITH PERINATALLY-ACQUIRED HIV

H. Allen[1], C. Fair[2], C. Trexler[3], L. D'Angelo[4]
*[1]Elon University, Elon, United States, [2]Elon University, Human Service Studies and Public Health Studies, Elon, United States, [3]Children's National Medical Center, Adolescent Clinical Research, Washington, United States, [4]Children's National Medical Center, Division of Adolescent and Young Adult Medicine, Washington, United States*
*Presenting author email: hallen6@elon.edu*

**Background:** Globally, children with perinatally-acquired HIV (PHIV) are now living into young adulthood and having children of their own. Little is known about the parenting perspectives of youth who may have experienced family disruption due to loss/illness of biological parents. This research explores the perceptions of adolescents and young adults (AYA) living with PHIV as they transition into parenthood.

**Methods:** We conducted hour-long, semi-structured, audio recorded interviews with a purposive sample of 16 AYA parents with PHIV who were current or former patients at two U.S. pediatric/adolescent infectious diseases clinics. Participants were asked about their childhood family structure, rewards/challenges of parenting, and anticipated future fertility desires/intentions. Analysis of the transcribed interviews was guided by grounded theory identifying key common themes across the interviews.

**Results:** Mean age of participants was 22 years. The majority were black (7) or Hispanic (4) and female (14). Four AYA were raised by biological mothers, five by foster/adoptive parents and the others by relatives. Participants had a range of 1-3 children (mean=1.4), one of whom was HIV-positive. Participants expressed many normative parenting rewards and challenges such as the joy of their child's smile and financial concerns. Unique themes associated with HIV infection included a concern about not "being there" for their child due to sickness and worries that their child may experience HIV-related discrimination. Among those parents who intended to have another child, many were motivated by a strong desire to create a family of their own as a way to deal with HIV-related losses experienced in childhood. Finally, participants also noted the positive role played by pediatric and adolescent medical providers, even if they had transitioned to adult care. Participants reported the importance of emotional support offered by providers as well as concrete social services available in that care setting.

**Conclusions:** AYA with PHIV who have children experience many of the same issues as other young parents. However, they also have HIV-specific experiences that influence their parenting such as illness, discrimination, and childhood parental loss that may intensify their fertility desires. The positive impact providers have throughout a youth's childhood must be recognized and capitalized upon.

## WEAD0204

### BIOGRAPHIES OF HIV AND CERVICAL CANCER: UNDERSTANDING TREATMENT-SEEKING FOR CERVICAL CANCER AMONGST HIV-POSITIVE WOMEN IN INNER CITY JOHANNESBURG

J. Stadler[1], A. Chikandiwa[1], P. Mayaud[1,2], H. Rees[1,2], J. Imrie[1], S. Delany-Moretlwe[1]
*[1]University of the Witwatersrand, Reproductive Health and HIV Institute, Johannesburg, South Africa, [2]London School of Hygiene and Tropical Medicine, London, United Kingdom*
*Presenting author email: jstadler@wrhi.ac.za*

**Background:** Cervical cancer is preventable, yet in South Africa it is the leading cause of cancer mortality, particularly amongst women living with HIV/AIDS (WLHA). Low screening rates and poor uptake of treatment for CIN2 are contributing factors. We explored the challenges facing WLHA diagnosed with CIN2 in the 'HPV for Africa Research Partnership' (HARP) study that screened, counselled and referred WLHA. We investigate why over a quarter of women in the study who needed surgical treatment did not access it.

**Methods:** A purposive sub-sample (n=30) was selected for in depth interviews (IDI), of which 15 had received surgical treatment for CIN2 and 15 had not. Of these, five of each were invited to a second interview. The McGill Illness Narrative Interview tool (www.mcgill.ca) was used to elicit:

(1) a chronology of symptoms and illness experiences;
(2) popular representations of illness; and
(3) explanatory models of illness and treatment.

Recorded IDI at the study clinic, conducted in local languages, were transcribed and translated and coded in Nvivo 10 according to emergent themes.

**Results:** Twenty study participants (16 treated and 4 untreated, including 12 taking ART) attended one IDI and nine participated in a second IDI. Participant's illness narratives reflected shared experiences of intimate partner violence (IPV), domestic instability, and material deprivation. These experiences shaped a collective perception of cancer as untreatable and hopeless that threatens productive and reproductive futures. In contrast, HIV was well understood and manageable. Cash availability and supportive household relationships facilitated women's treatment seeking for HIV and CIN2. However, all women in the study experienced challenges in accessing treatment.

**Conclusions:** The biographies of WLHA diagnosed with CIN2 reveal structural and interpersonal violence that shaped individual experiences and perceptions of illness, helping us to understand their fatalistic outlooks and the delays and failures in seeking treatment. Health services need to address women's perceptions of cancer, but also remove barriers to immediate treatment. Screen and treat options may be an important intervention for this population and a HPV vaccine for WLHA is a promising option to prevent cervical cancer.

## WEAD0205

### FINDINGS FROM THE SEXUAL HEALTH AND AGING PROGRAM (SHAPE) FOR OLDER WOMEN WITH HIV PILOT STUDY AND FUTURE DIRECTIONS

T. Taylor
*SUNY Downstate Medical Center, Medicine/Infectious Disease, Brooklyn, United States*
*Presenting author email: tonyataylor27@gmail.com*

**Background:** There are few sexual risk reduction interventions that prioritize the unique needs of older women living with HIV (OWLH). The lack of proven interventions is particularly problematic in light of documented risk behaviors in this population, including condomless sex (CS), often with serodiscordant partners. To address the dearth of work on HIV prevention for OWLH, we conducted research to develop the Sexual Health and Aging Program (SHAPE).

**Description:** SHAPE is a theoretically derived, gender- and generationally-tailored, peer-delivered, small-group, skills-based intervention designed to reduce participants' stress related to HIV disclosure and maintaining safer sexual behaviors and promote successful aging with HIV which incorporates HIV transmission prevention methods for OWLH (Treatment as Prevention) and their partners (PrEP). We pilot tested SHAPE with 58 OWLH, aged 45 years and older who reported CS in the prior 3 months to assess the feasibility, safety, and acceptability of study procedures and evaluation process. We conducted 58 baseline ACASI surveys, 49 (84%) and 48 (83%) 3- and 6-month follow-up assessments respectively, and we conducted 7, 2-day SHAPE programs with 33 women and 7 booster sessions; 25 women also received a standard of care program.

**Lessons learned:** Participants found SHAPE to be highly acceptable and comfortable. Due to ceiling effects and the small size, the intervention had no effect on reducing CS, or improving coping, HIV disclosure and safer sex self-efficacy compared to standard of care. Almost 80% of the participants were virally suppressed and had extremely high baseline coping self-efficacy (mean scores: 199-203).

**Conclusions/Next steps:** We believe that SHAPE's impact would be greatest if it was targeted to the most vulnerable OWLH - those with inconsistent viral suppression, concomitant psychosocial factors and partner-related barriers. We propose to further refine and develop SHAPE as an adaptive intervention strategy to improve its ability to impact viral suppression and self-care management needed to foster *Healthy HIV Aging* and strengthen its's impact on transmission risk by developing new adaptive partner disclosure and couples-support intervention components for those OWLH who report condomless sex with serodiscordant partners.

## WEAD03 Pulling the levers: Policy, advocacy approaches to influence

### WEAD0301

### Measuring the impact of advocacy: civil society's influence over Global Fund concept notes in eight African countries

G. Oberth[1], O. Mumba[2], L. Bhayani[3]
*[1]University of Cape Town, Centre for Social Science Research, Cape Town, South Africa, [2]Eastern Africa National Networks of AIDS Service Organizations (EANNASO), Arusha, Tanzania, United Republic of, [3]International HIV/AIDS Alliance, Lusaka, Zambia*
*Presenting author email: gemma.oberth@gmail.com*

**Background:** One fifth of Global Fund grants are implemented by civil society organizations. However, the degree to which non-state actors are able to shape the content of those grants through the initial concept note is uncertain and hard to measure. As a result, it is not always clear if the Global Fund is investing appropriately in communities.
**Methods:** Global Fund concept notes from Kenya, Malawi, Swaziland, Tanzania, Uganda, Zanzibar, Zambia and Zimbabwe were systematically measured to assess the inclusion of civil society priorities. National Civil Society Priorities Charters were used as indicators for civil society priorities. Each priority in the country's Charter was assessed for its inclusion in the Global Fund concept using a three-point scale (2=included, 1=partially included and 0=not included).
**Results:** The percentage of civil society priorities that were included in Global Fund concept notes were as follows: Malawi (87%), Kenya (76%), Tanzania (67%), Zanzibar (67%), Uganda (64%), Swaziland (50%), Zimbabwe (40%) and Zambia (38%). Across the eight countries, civil society priorities on key populations were the most likely to get included in the concept notes (68%), while priorities on voluntary medical male circumcision were the least likely to get included (15%). Several contextual factors help explain these results. Using Afrobarometer survey data, civil society had greater influence over Global Fund concept notes in countries where people often attend community meetings (CI 95%, P=0.041), often join others to raise an issue (CI 95%, P=0.017) and feel completely free to say what they think (CI 95%, P=0.030). Using World Bank Governance Indicators, civil society had greater influence over Global Fund concept notes in countries where there is a greater degree of freedom of association and freedom of expression (CI 90%, P=0.083). In countries where civil society was more effective at influencing Global Fund concept notes, HIV prevalence was lower (CI 95%, P=0.021).
**Conclusions:** This is some of the only statistical evidence to demonstrate that open and inclusive dialogue spaces are linked to a more effective civil society in the HIV response. An empowered civil society is vital, as the inclusion of their priorities is related to lower HIV prevalence.

### WEAD0302

### Global solidarity to win increased accountability and impact from PEPFAR country programs: an analysis of North-South collaborative advocacy strategies

A. Russell[1], F. Mwanza[2], M. Milanga[3]
*[1]Health Global Access Project (Health GAP), on behalf of the PEPFAR Watch Network, Kampala, Uganda, [2]Treatment Advocacy and Literacy Campaign, Lusaka, Zambia, [3]Health Global Access Project (Health GAP), Nairobi, Kenya*
*Presenting author email: asia@healthgap.org*

**Background:** The U.S.-funded President's Emergency Plan for AIDS Relief (PEPFAR) is the largest funder of the HIV response in the hardest hit countries in the world. Holding PEPFAR accountable through civil society advocacy is a pre requisite to ensure that PEPFAR resources deliver effective, high impact prevention and treatment services for communities. After civil society criticism, in 2013 PEPFAR announced a commitment to support civil society engagement in the annual development of PEPFAR's Country Operational Plans or COPs—the documents describing PEPFAR's budgets, targets and strategies for each country. However in most countries in 2014, civil society (and particularly key populations) engagement in shaping the PEPFAR COPs remained limited. The PEPFAR Watch Network emerged to increase community engagement in the COPs process, and comprises US-based organizations and civil society in PEPFAR-funded countries, advocating to shape PEPFAR funding and priorities based on the priority unmet need of people living with HIV and their communities.
**Description:** We examine the impact of a global advocacy network of allies in high burden countries and in the US in challenging PEPFAR to increase meaningful engagement of CSOs, transparency and accountability to communities from 2014 - 2016.
**Lessons learned:** Health GAP and other partners in the PEPFAR Watch Network learned that applying concerted and coordinated pressure both in Washington DC and in key recipient countries to amplify demands regarding PEPFAR service delivery is an effective strategy. The unique North-South partnership allowed advocates to successfully challenge decision makers in both Washington D.C, and within PEPFAR-funded countries.
**Conclusions/Next steps:** PEPFAR's stated commitment could have a substantial impact on the drive to end the AIDS epidemic, using civil society advocacy to bring PEFPAR's priorities into alignment with the demands and priorities of people with HIV. PEPFAR investments are an area of untapped potential, which can be made more effective in the global AIDS response through the involvement of community advocates and key populations groups. High-impact watchdogging, monitoring and accountability by a North-South coalition of civil society partners can leverage new opportunities to engage with the PEPAR COPs process to ensure that critical HIV prevention and treatment services are in line with community needs.

### WEAD0303

### Demanding a high impact HIV response: civil society advocacy and the President's Emergency Plan for AIDS Relief (PEPFAR) in Uganda

R. Nandelenga[1], D. Namutamba[2]
*[1]International Community of Women Living with HIV/AIDS (ICW), Kampla, Uganda, [2]International Community of Women Living with HIV/AIDS (ICW), Programmes, Kampala, Uganda*
*Presenting author email: dnamutamba@icwea.org*

**Background:** The PEPFAR programme provides treatment, prevention and care for people living with or affected by HIV/AIDS in high burden countries including Uganda where it is the largest donor. Engagement of civil society in the development and implementation of PEPFAR's plans is therefore critical to ensuring that PEPFAR's priorities reflect real lived experience and that the plans emphasize the priorities of communities most affected. Uganda's faltering response to HIV makes it crucial to ensure funding is invested in high impact interventions..
**Description:** In Uganda, the International Community of Women Living with HIV Eastern Africa (ICWEA) coordinates and convenes CSOs in a coalition focused on analysis and advocacy on PEPFAR and other major actors the AIDS response. This coalition has engaged in a series of high impact advocacy efforts, including development of civil society monitoring tools, training and empowerment of women living with HIV so that they are able to engage the implementing partners (IPs) and PEPFAR teams directly and demand programs that address the needs of the communities. Results of field assessments and other data are shared with the PEPFAR country teams to inform planning and programming and correct mistakes in real time. The coalition also links with advocates in the US regarding priority advocacy and policy matters.
**Lessons learned:** CSOs and the PEPFAR country team have an engagement roadmap in line with the COP planning cycle and written information and feedback is shared regularly. CSOs provide formal recommendations to the in-country COP development and implementation process and to PEPFAR headquarters and understand better PEPFAR COP programming. Quarterly field assessments have enabled CSOs to provide feedback informed by evidence to the PEPFAR country teams and push for relevant corrective measures. The process is empowering and creates a sense of ownership to people with HIV and their communities, especially women and young women living with HIV who gather this data.
**Conclusions/Next steps:** ICWEA with national and global partners has developed a PEPFAR COP engagement strategy, complementing Global Fund, to generate strong and effective advocacy in order to improve accountability of donors and address bottlenecks obstructing efforts to end AIDS in Uganda.

### WEAD0304

### PLHIV in the Caribbean: many islands, same issues. Lack of resources, fragmented health/care systems: an under-resourced community response

C. Albert-Hope[1], R. Gustav[2], Y. Simon[1], E. Castellanos[3], R. Irwin[4]
*[1]Caribbean Regional Network of People Living with HIV and AIDS (CRN+), Port of Spain, Trinidad and Tobago, [2]GNP+, Amsterdam, Netherlands, [3]CNET+, Belmopan, Belize, [4]GNP, Amsterdam, Netherlands*
*Presenting author email: cahope@crnplus.com*

**Background:** 2014 figures: 280 000 [210 000-340 000] PLHIV in the Caribbean, However treatment coverage is only 44% [33%-54%] of people 15 years or older, 36% [32%-42%] among children. Caribbean countries continue to face **economic and fiscal challenges**. Global economic crises and decline or withdrawal of donor resources impact adversely on the response; nowhere is this more acutely played out

than in funding available to community based PLHIV and allied organisations - who are the first point of call for people facing HIV **related stigma and discrimination** . This is still a major barrier for accessing HIV and other health services - especially considering the very small population of many islands and Caribbean territories. This is compounded by, punitive laws (e.g. the criminalisation of key populations), policies and practices that foster significant human rights violations, promote fear, and discourages many PLHIV from disclosing their status.

**Description:** In 2015 The Caribbean Regional Network of People Living with HIV and AIDS (CRN+) as part of the Positive Networks Consortium (led by GNP+) with the support of RCNF (Robert Carr Network Fund) conducted an advocacy strategy assessment amongst 10 countries (and one caribbean municipality of the Netherlands Seba). 225 people across the 11 sites (with over half PLHIV, and others community members from key populations , and community workers) ) were interviewed about the work they did in relation to HIV, how funded, and priorities for advocacy and the response.

**Lessons learned:** Whether from (St Lucia pop., 185K) to Haiti (pop.10.5 m) common themes ran through the results; included were the need for universal access to medications (ARV's) without stockouts, sub optimal regimes in place ,services not being delivered free from stigma and discrimination. The evidence illustrated that the input of community organisations to the response was not properly valued, and feelings they lacked the advocacy tools and strategies to change this.

**Conclusions/Next steps:** The results fed into strategic plan for CRN+ and partners In progress the PNC is building a advocacy plan for an enhanced community role in CCM's, other fora . Support for key populations to challenge punitive laws and practices being put in place.

## WEAD0305

### RAPID RESPONSE RESEARCH TO INFORM HIV POLICY DECISION-MAKING: LESSONS LEARNED FROM CALIFORNIA'S COLLABORATIVE HIV/AIDS POLICY RESEARCH CENTERS

I.W. Holloway[1], W.T. Steward[2], J. Mortimer[3], P. Curtis[4], D. Van Gorder[5], A. Leibowitz[1], S. Morin[2], C. Mulhern-Pearson[6], A. Donnelly[5], A.J. King[1], A. Fox[7], C. Pulsipher[4], D. Evans[5], G. Lemp[3]

**Background:** Responding to the HIV epidemic requires policy decisions that are well researched and informed by empirical evidence. The policy environment, however, is dynamic and fast-paced, and the opportunity to effect change may be limited to brief periods of time. To ensure research findings are ready within these "policy windows," researchers must be able to launch and complete projects quickly. Responding to these realities, the California HIV/AIDS Research Program (CHRP) has, since 2009, funded two collaborative HIV/AIDS Policy Research Centers. Each consists of university and community-based agency partners that work statewide with consumers, advocates, and policymakers to conduct "rapid response" short-term projects designed to address questions that emerge in the dynamic health policy environment.

**Description:** Policy research advisory committees meet annually in northern and southern California to prioritize HIV policy-related questions and concerns that would benefit from research. Following each meeting, policy center investigators formulate specific research questions and study designs based on policy research advisory committee priorities. Data for each rapid response project are then collected, analyzed, and disseminated back to policy stakeholders, ideally in six months or less.

**Lessons learned:** The HIV/AIDS Policy Research Centers have successfully addressed critical policy issues that emerged in California over the past seven years. These include analyses of: state budget cuts to HIV prevention; enhanced surveillance efforts on federal funding for California; mandating condom distribution in correctional facilities; the impact of the state's Affordable Care Act implementation on HIV providers and patients; the effects of healthcare reform efforts on the care of HIV-positive individuals who also have mental health diagnoses; the impact of limiting physician visits, capping prescriptions, and charging co-pays for HIV medications; and examining various HIV workforce issues, such as the aging and specialty mix of physicians who provide HIV treatment in California.

**Conclusions/Next steps:** The collaboration between academic and community partners through standing policy research centers has brought together synergistic skill-sets, knowledge bases, and professional relationships to successfully inform robust and timely analyses of HIV-relevant policy issues. Expansion of this funding model would help to ensure that research is able to respond to the rapid changes in policy environments.

### THE UPTAKE OF POPULATION SIZE ESTIMATION STUDIES FOR KEY POPULATIONS IN GUIDING HIV RESPONSES ACROSS SUB-SAHARAN AFRICA: A SYSTEMATIC REVIEW

S. Baral[1], C. Lyons[1], E. Sullivan[1], S. Kurani[1], J. Sherwood[2], G. Millett[2], J. MacAllister[3]

*[1]Johns Hopkins Bloomberg School of Public Health, Epidemiology, Baltimore, United States, [2]The Foundation for AIDS Research, Washington, United States, [3]The Foundation for AIDS Research (amfAR), Washington, United States*

*Presenting author email: jwmacallister@gmail.com*

**Background:** There has been an increase in the focus on data to better inform the HIV response. This has included data focused on both defining the content of HIV programs as well as the scale of these programs in response to evidence-based need. To this end, population size estimation(PSE) studies for key populations have become increasingly common to define the necessary scale of specific programs for these populations. This study aims to systematically assess the uptake of PSE in HIV policy and program documents across the continent of Africa including Sub Saharan and North Africa to assess the ultimate utility of these studies.

**Methods:** This study included two phases; Phase 1 included a systematic review of all PSE for key population, including men who have sex with men(MSM), female sex workers(FSW), and people who inject drugs(PWID) across SSA from Jan,2009-Feb,2016 using the Preferred Reporting Items for Systematic-Reviews and Meta-Analyses(PRISMA) guidelines. Phase 2 represented a review of 23 different types of documents used to inform HIV programming in countries with a focus on PEPFAR and the Global Fund(GF) investments.

| Year of estimation (if mentioned) | Population | Location | Stakeholders developed an Interpretation and Use Plan for PSE | PSE used to identify a problem | PSE used to develop a plan of action/ recommendation to address that problem | PSE used to change a Global Fund policy as documented in concept notes | PSE used to change a PEPFAR policy as documented in country operational plans | PSE used to change a national MOH policy as documented in NSPs | Study results published in a peer-reviewed academic journal | Results/data translated into non-academic resources (briefs/ pamphlets/ advocacy tools) |

*[Table 1: Research Utilization Indicators]*

**Results:** 71 PSE were identified; two of which were mentioned in GF Concept Notes,12 in PEPFAR Country Operational Plans, and seven in national Ministry of Health documents; and 15 included plans of action for the data (Table 1).

**Conclusions:** While there is an increasing trend in the completion of PSE studies for key populations in more generalized HIV epidemic settings involving significant investments of finances and human resources, there is limited evidence of effective uptake of these data to guide the HIV responses in these countries. While PSE are important to guide data-driven HIV responses, the data presented here suggest an opportunity to build capacity to ensure that available data appropriately guides responses and optimal decisions are made about data needs moving forward.

### WEAE0101

### Acceptability and preferences for HIV self-testing in Zambia: A population-based formative study using a discrete choice experiment

A. Zanolini[1], J. Chipungu[2], S. Bosomprah[2], M. Mafwenko[2], C. Holmes[2,3], H. Thirumurthy[4]
*[1]American Institutes of Research, Lusaka, Zambia, [2]Centre for Infectious Disease Research in Zambia, Lusaka, Zambia, [3]Johns Hopkins University, Lusaka, Zambia, [4]University of North Carolina at Chapel Hill, Chapel Hill, United States*
*Presenting author email: azanolini@air.org*

**Background:** Uptake of HIV testing in Zambia remains low and Zambia is considering the use of HIV self-testing (HIVST) to increase awareness. We assessed acceptability and preferences for HIVST among adults in Lusaka province, Zambia.
**Methods:** Households in Lusaka Province were randomly selected to participate in a household survey and one member aged ≥16 years randomly selected as a respondent. Respondents were asked about perceptions and preferences around HIVST after receiving information about the Oraquick oral fluid-based test. Preferences were assessed through a Discrete Choice Experiment (DCE). The DCE contained a full factorial design with cost (free, 10 Kwacha or 25 Kwacha), location to obtain the test (from voluntary counseling and testing departments in clinics, VCT; outpatients departments within clinics, and private chemists) and pre-counseling (provided or not) as attributes. Participants were asked to choose between two different HIVST models but also had an opt-out option to choose conventional modes of HIV testing or no testing. We used mixed logit regressions to analyze the DCE results.
**Results:** Among 1,617 participants, 47% had not tested in the past year. 74% reported feeling comfortable with HIVST and 76% of those who have not tested in the past year reported they would definitely test if given a self-test. Only 2% reported having concerns serious enough to not recommend HIVST in Zambia. In the DCE, 73% of those who had tested in the past year chose HIVST over conventional modes of testing, and 88% of those who had tested in the past year chose HIVST over not testing. The most predictive attribute for a choice was presence of counseling, followed by lower cost especially for regular testers. The lowest relative preference was for location. When considering only two types of HIVST and excluding the opt-out option, participants had a negative preference for obtaining the test at VCT, a location found to be highly stigmatized.
**Conclusions:** HIVST is highly acceptable among adults in Lusaka province, Zambia. There is a strong positive preference for the provision of some counseling accompanied with HIVST and for lower-cost self-tests, especially for those who were already regular testers.

### WEAE0102

### Benefits and adverse outcomes of HIV self-testing among high-risk MSM in China: an implementation perspective

Y. Qin[1,2], F. Liu[3], W. Tang[1], S. Tang[1], C. Liu[1], J. Mao[1], W. Zhang[1], A. Taege[2], A. Nowacki[2], C. Wei[4], J. Tucker[1]
*[1]UNC Project China, Guangzhou, China, [2]Cleveland Clinic Lerner College of Medicine of Case Western Reserve University, Cleveland, United States, [3]Guangdong Provincial Center for Skin Diseases and STI Control & Prevention, Guangzhou, China, [4]UCSF, San Francisco, United States*
*Presenting author email: ylqin458@gmail.com*

**Background:** HIV self-testing (HIVST) holds great promise for reaching high-risk key populations who do not access facility-based services, but it has not been examined in the 'real-world' implementation context. HIVST is a process by which a person performs and interprets a test in private. We sought to describe unsupervised HIVST use among men who have sex with men (MSM) in China.
**Methods:** We conducted a nationwide online survey of MSM in China recruited from MSM websites and social media. Eligible men reported being at least 16 years of age, having anal sex with a man at least once, and having condomless anal/vaginal sex in the past three months. We analyzed benefits (e.g., first-time testing, increased testing frequency, post-testing counseling) and adverse outcomes (e.g., coercion, violence, suicidality) among MSM using HIVST. We compared MSM whose first-time HIV test was a self-test (first-time HIVST) to those whose first-time was at a facility and assessed correlates using multivariable logistic regression.
**Results:** Among 1685 eligible men who clicked the banner, 1189 men completed the survey. 28.7% (341/1189) of men reported ever using HIVST. The most common place to obtain an HIVST kit was online (171/341, 50.1%). Among those who had used HIVST, 58.7% (200/341) reported their first-time HIV test using HIVST. Multivariable analysis found that first-time HIV testing using HIVST was correlated with younger age (adjusted OR = 1.05, 95% CI 1.02, 1.08) and men who had not disclosed MSM behaviors to anyone (adjusted OR=2.24, 95% CI 1.57, 3.22). The most common adverse outcome was coercion (31/341, 9.1%). 40/341 (11.7%) of those who underwent HIVST reported a positive HIV self-test. Among men with a positive self-test, 30/40 (75.0%) received post-test counseling and 31/40 (77.5%) received subsequent confirmatory HIV testing. Among men with a negative self test, 134/301 (44.5%) received post-test counseling and 118/301 (39.2%) confirmed their results.
**Conclusions:** HIVST is common among Chinese MSM. A substantial portion of them have never previously tested, particularly younger MSM that are not open about their orientation. However, coercion and lack of subsequent test confirmation have been reported. Further implementation research is needed to better understand HIVST outside of research programs.

### WEAE0103

### "Not without us...": views on the introduction of HIV self-testing among health care workers providing integrated HIV and sexual and reproductive health services

C. Madanhire[1], E. Sibanda[1], N. Ruhode[1], K. Hatzold[2], F.M. Cowan[1,3], S.N. Mavedzenge[4]
*[1]Centre for Sexual Health and HIV AIDS Research, Harare, Zimbabwe, [2]Population Service International Zimbabwe, Harare, Zimbabwe, [3]University College London, Department of infection and Population Health, London, United Kingdom, [4]RTI International, North Carolina, United States*
*Presenting author email: cmadanhire@gmail.com*

**Background:** HIV self-testing (HIVST) has potential to increase uptake of HIV testing. Its success depends on various stakeholders' support, including health care workers (HCW). In preparation for adoption and scale-up of HIVST in Zimbabwe we explored HCW views on HIVST.
**Methods:** Between December 2015 and January 2016, focus group discussions (FGDs) were held with HCWs providing integrated HIV and sexual & reproductive health services at two Population Services International (PSI) Clinics in Harare and Chitungwiza. Discussions were audio-recorded, transcribed, translated and analysed thematically.
**Results:** Four FGDs were held with 10-13 HCWs each, including 18 nurses, 15 Counsellors, 4 lab technicians, and 6 administrative staff (total=43). HCW had mixed feelings about HIVST. While they generally believed that HIVST can increase testing uptake among men, well-to-do clients and those living in hard-to-reach areas, a recurrent theme was that HIVST poses a threat to HCW jobs. All cadres believed that jobs of HCW who primarily provided counselling were most threatened. HCWs providing other clinical duties (family planning, cervical cancer screening and ART) were perceived to be safer. HCWs had mixed views on whether self-testing would lead to optimised linkage to post-test services. Additionally, it was perceived that while HIVST might be cheaper, this was likely further justification for job losses. The potential for social harms (domestic violence, suicide, and forced-testing) was widely discussed. HCW described fear that devices showing negative results could be 'traded' and used to deceive partners of HIV-positive individuals.A good HIVST program was viewed as one which worked with existing health delivery structures and centred on continued HCWs involvement, including counselling before and after testing, and storage of kits by HCWs - thought important due to fears that kits could find their way into uncontrolled informal markets. Educating the community about HIVST was highly recommended.
**Conclusions:** The potential for HIVST to increase testing uptake, and to be cost-effective, is appreciated by HCWs. There is need to educate HCWs on how HIVST can enhance rather than compete with their roles, with less testing of HIV-negatives HCWs can focus on care, support and retention of HIV-positives, leading to better targeting of resources.

## WEAE0104

### INDEX CLIENT TRAILING: A HOME-BASED HIV COUNSELLING AND TESTING STRATEGY TO IDENTIFY AND LINK PEOPLE LIVING WITH HIV TO TREATMENT

N. Manjezi, G. Fatti, E. Mothibi, N. Shaikh, O. Oyebanji, A. Grimwood
*Kheth'Impilo, Cape Town, South Africa*
*Presenting author email: eula.mothibi@khethimpilo.org*

**Background:** UNAIDS has set targets that 90% of people living with HIV should know their HIV status and that 90% of these should receive antiretroviral treatment by 2020. Implementing innovative programs to help achieve these ambitious targets in sub-Saharan Africa, the epicentre of the global AIDS epidemic, are essential. We report on results of an innovative program in which home-based HIV counselling and testing is offered to household members of known HIV positive clients in South Africa.
**Methods:** Consenting HIV positive clients (index clients) identified at primary health-care centres in three high HIV prevalence districts were visited at their homes by lay community-based healthcare workers. Consenting household members of index clients received HIV-related education and HIV counselling and testing. Household members testing HIV positive also received symptom screening for tuberculosis and were referred to HIV care and treatment facilities. The proportions of household members testing HIV positive and proportions linked to treatment facilities over a 14 month period during 2014-2015 were calculated.
**Results:** 14,779 index clients were visited in their homes. 66,766 household members received HIV-related education and counselling (4.5 household members per index client). Amongst these, 59,457 (89.1%) consented to HIV testing (91% and 81% of counselled females and males consented to HIV testing, respectively). Amongst those tested, 9219 (15.5%) were found to be HIV positive. Amongst people testing HIV positive, 8642 (93.7%) were successfully linked to HIV care and treatment facilities. 97.0% of those testing HIV positive received tuberculosis symptom screening, of whom 21.3% were symptom positive. Amongst 2837 children who received HIV testing, 70 (2.5%) were HIV positive and 100% were successfully linked to care and treatment.
**Conclusions:** Index client trailing utilizing home-based HIV testing by lay healthcare workers in a high HIV prevalence setting resulted in a high uptake of HIV testing, a high yield of people newly diagnosed with HIV, a high proportion with potential concomitant tuberculosis, and a high proportion of adults and children were successfully linked to treatment facilities. This is a strategy which can help sub-Saharan Africa achieve the UNAIDS targets for HIV testing and antiretroviral treatment initiation.

## WEAE0105

### RESULTS OF A CLUSTER-RANDOMISED TRIAL OF NON-FINANCIAL INCENTIVES TO INCREASE UPTAKE OF COUPLES COUNSELLING AND TESTING AMONG CLIENTS ATTENDING PSI MOBILE HIV SERVICES IN RURAL ZIMBABWE

E.L. Sibanda[1], M. Tumushime[1], J. Mufuka[1], S. Gudukeya[2], S. Napierala Mavedzenge[3], S. Bautista-Arredondo[4], H. Thirumurthy[5], S. McCoy[6], N. Padian[6], K. Hatzold[2], A. Copas[7], F.M. Cowan[7,8]
[1]*Centre for Sexual Health and HIV AIDS Research, Harare, Zimbabwe,* [2]*Population Services International Zimbabwe, Harare, Zimbabwe,* [3]*RTI International, San Francisco, United States,* [4]*Mexican National Institute of Public Health, Mexico, Mexico,* [5]*University of North Carolina Chapel Hill, Chapel Hill, United States,* [6]*University of California, Berkeley, Berkeley, United States,* [7]*University College London, Research Department of Infection & Population Health, London, United Kingdom,* [8]*Centre for Sexual Health and HIV/AIDS Research (CeSHHAR), Harare, Zimbabwe*
*Presenting author email: euphemiasibanda@yahoo.co.uk*

**Background:** Couples HIV testing (CHTS) is associated with greater uptake of HIV prevention/care and is more cost-effective than individual testing, but its uptake remains sub-optimal. Broaching CHTS often results in accusations of infidelity/distrust. Formative research suggests that incentives may mitigate this by changing focus of the pre-test discussion. We investigated the effectiveness of non-financial incentives to increase CHTS uptake among clients accessing PSI's outreach HTS in rural Zimbabwe.
**Methods:** Sixty-eight rural communities in four districts were randomized 1:1 to incentives or no incentives following formative research on nature of incentives that might stimulate CHTS. In intervention communities, information was promoted that anyone testing with a partner could select a grocery item worth US$1.50. Standard mobilization was done in control communities. Three months after CHTS, willing couple-testers from four communities per arm individually completed a telephone survey to determine whether there were social harms resulting from incentives or CHTS. The effect of incentives on CHTS was estimated using logistic regression with random effects for communities. Testing in the trial is now complete; we report interim data from May-August 2015 in 57 communities, but will present final data at the conference.
**Results:** Of 9,721 participants tested; 5652(58.1%) were in incentives communities. 49.5% and 10.6% in incentive and non-incentive arms respectively tested with partners, odds ratio 6.88(95%CI:4.86-9.72). HIV prevalence was 9.9%(95%CI 8.2-11.8%) and 6.9%(95%CI 6.1-7.8%) among couple-testers and individual-testers respectively; 8.5% of couple-testers had discordant results. 413/697 (59%) eligible participants (176 couples) completed the telephone survey. Motivators for CHTS included desire to know each's other's status, (93%), incentives (37%) and planning a pregnancy (30%); 22% in incentive arm said they would not have tested without the offer of incentives. Relationship unrest was reported by 8 individuals (1.9%) in the telephone survey, 6 in incentive arm although none attributed this to incentives. Nine individuals (2.2%) regretted testing with partner, of whom 4 tested because of incentives. 65.9% said testing programs should offer incentives.
**Conclusions:** Small incentives are a potentially scalable way to increase CHTS uptake. Although incentives were not reported to cause relationship disharmony, there is need to find better ways of supporting couples with positive/discordant HIV diagnosis.

## WEAE0106LB

### REACHING THE FIRST 90: IMPROVING COVERAGE OF INPATIENT PEDIATRIC PROVIDER-INITIATED HIV TESTING AND COUNSELING (PITC) USING A QUALITY IMPROVEMENT COLLABORATIVE STRATEGY AT 24 HEALTH FACILITIES IN TANZANIA

G. Dougherty[1], K. Clarke[2], R. Fayorsey[1], M. Kamonga[3], S. Kimambo[4], D. Lutkam[5], C. Madevu-Matson[1], H. Mtiro[6], S. Msuka[3], V. Mugisha[6], M. Panya[6], A. Ramadhani[7], J. Sipemba[5], P. Urasa[7], M. Rabkin[1]
[1]*International Center for AIDS Care and Treatment Programs (ICAP), Columbia University, New York, United States,* [2]*US Centers for Disease Control and Prevention, Atlanta, United States,* [3]*Christian Social Services Commission (CSSC), Dar es Salaam, Tanzania, United Republic of,* [4]*US CDC Tanzania, Dar es Salaam, Tanzania, United Republic of,* [5]*Ariel Glaser Pediatric AIDS Healthcare Initiative (AGPAHI), Dar es Salaam, Tanzania, United Republic of,* [6]*ICAP Tanzania, Dar es Salaam, Tanzania, United Republic of,* [7]*Tanzania National AIDS Control Program (NACP), MOHSW, Dar es Salaam, Tanzania, United Republic of*
*Presenting author email: gd2410@columbia.edu*

**Background:** Tanzania's pediatric HIV testing and treatment rates are suboptimal. Provider-initiated HIV testing and counseling (PITC) is necessary to identify and treat HIV-infected children, and expanding pediatric PITC services is a national priority. Despite rollout of guidelines and training, PITC has not been consistently implemented.
**Description:** ICAP at Columbia University designed a Quality Improvement Collaborative (QIC) to improve pediatric PITC coverage. Working with CDC, NACP, AGPAHI and CSSC, ICAP launched the QIC at 24 health facilities. Each aimed to improve inpatient PITC coverage to $\geq$ 80%, while reducing HIV test kit stock outs and maintaining high linkage rates to care for HIV-infected children. ICAP provided training on QI methods, while AGPAHI and CSSC provided facility-level supportive supervision. Each facility identified contextually appropriate interventions; conducted rapid tests of change using PDSA cycles; and analyzed progress using run charts. ICAP convened quarterly meetings where facility teams compared progress, and a final "harvest" meeting enabled synthesis of lessons learned.
**Lessons learned:** Change ideas included improvements in staff and client education, staffing, workflow, commodity management, documentation, and referrals. 16,569 of 25,282 children (66%) admitted during the intervention period received PITC services; 263 (1.6%) tested positive, and 255 (97%) were enrolled into care. All 24 facilities achieved the QIC target, and the overall inpatient PITC coverage rose from 25% to 70%. Despite increased testing volume, the average number of days with HIV test kit stock outs fell from 8.8 to 1.5/month.

*[% of children and adolescents admitted to inpatient wards who received HIV PITC and received results and % of rapid test kit (RTK) stock outs]*

Wednesday 20 July Oral Abstract Sessions

Thursday 21 July

Friday 22 July

Late Breaker Posters

Author Index

**Conclusions/Next steps:** Bridging the "know-do gap" is one of the greatest challenges facing HIV programs. QIC methodology improved coverage of PITC (*what we know works*) by helping facilities to generate local innovations to ensure PITC is consistently implemented (*what we do*). In addition to building QI capacity and improving targeted outcomes, the PITC QIC resulted in a "change package" of successful initiatives that will be disseminated within Tanzania.

# WEAE02 TARGET 90-90-90: THE UPS AND THE DOWNS

## WEAE0201

### CURRENT STATE OF THE GLOBAL HIV CARE CONTINUUM

R. Granich[1], S. Gupta[2], I. Hall[3], J. Aberle-Grasse[3], S. Hader[3], J. Mermin[3]
[1]*International Association of Physicians in AIDS Care (IAPAC), Washington, United States,* [2]*International Association of Physicians in AIDS Care (IAPAC), Delhi, India,* [3]*Centers for Disease Control and Prevention, Atlanta, United States*
*Presenting author email: rgranich@iapac.org*

**Background:** In 2014, UNAIDS issued the 90-90-90 HIV response targets: by 2020, 90% of individuals living with HIV will know their HIV status, 90% of people with diagnosed HIV infection will receive ART, and 90% of those taking ART will be virally suppressed. Consistent methodology and routine reporting in the public domain is necessary for tracking progress towards the 90-90-90 targets.
**Methods:** For 2011-2015, we searched PubMed, UNAIDS country progress reports, WHO/UNAIDS reports, national surveillance and program reports, and conference presentations and/or abstracts for the latest available national HIV care continuum and estimation methods. We ranked continuum with described estimation methods for indicators to derive high, medium and low quality continuum.
**Results:** We identified 48 national care continuum in the public domain representing 58% of the 2013 global estimate of people living with HIV available. Eleven continuum were excluded from further analysis for either not providing estimates of viral load or substantial problems with representativeness. Of the remaining 37, four (with < 1% of global burden) were high quality, using standard surveillance methods to derive an overall denominator and program data from national cohorts for estimating steps in the continuum. Of the 37 countries with adequate data, the average proportion of the aggregate of people living with HIV from all countries receiving ART was 37%, and virally suppressed was 29%. Care continuum from only six countries in sub-Saharan Africa were available.
**Conclusions:** Relatively few complete national continuum are available in the public domain and there is a wide variation in methodologies for describing progress towards treatment and viral suppression targets. Standardized continuum of care monitoring and evaluation based on a national program cohort of everyone living with diagnosed HIV would be a major step towards improving the use of scarce resources to achieve 90-90-90 through improved efficiency, transparency, accountability and impact.

## WEAE0202

### SAME-DAY HIV TESTING AND ANTIRETROVIRAL THERAPY INITIATION RESULTS IN HIGHER RATES OF TREATMENT INITIATION AND RETENTION IN CARE

S. Koenig[1,2], N. Dorvil[2], P. Severe[2], C. Riviere[2], M. Faustin[2], C. Perodin[2], C. Paul[2], A. Apollon[2], G. Saintil[2], L. Duverger[2], E. Dumont[2], B. Hedt-Gauthier[3], K. Hennessey[4], V. Rivera[5], J. Devieux[6], J.W. Pape[2,5]
[1]*Brigham and Women's Hospital, Division of Global Health Equity, Department of Internal Medicine, Boston, MA, United States,* [2]*GHESKIO, Port-au-Prince, Haiti,* [3]*Harvard Medical School, Boston, MA, United States,* [4]*Analysis Group, Boston, MA, United States,* [5]*Weill Cornell Medical College, Center for Global Health, New York, United States,* [6]*Florida International University, Miami, United States*
*Presenting author email: skoenig@partners.org*

**Background:** High rates of pre-ART attrition are widely reported. Retention may be improved if pre-ART services could be effectively provided in one day.
**Methods:** We conducted a randomized study comparing standard and same-day ART initiation for adult patients (age >17 years) who presented for HIV testing with WHO stage 1 or 2 disease and CD4 count ≤500 cells/mm³ at GHESKIO in Port-au-Prince, Haiti. All participants received same-day HIV and CD4 count testing, TB screening, and physician evaluation. The standard group initiated ART at the third follow-up visit (day 21); the same-day group initiated ART on the day of presentation. The only difference in services provided was the timing of ART initiation. Participants were followed for 12 months.
**Results:** Between August 2013 and October 2015, 762 participants were randomized to standard (n=384) or same-day ART (n=378) (see Table 1). Twenty-four participants in the standard and 18 in the same-day ART group transferred during the study period, and were removed from all analyses; this left 360 participants in each group. ART was initiated within 90 days in 329 (91%) of participants in the standard and 100% in the same-day ART group (p< 0.001). 577 participants (80%) have completed 12 months of potential follow-up time (290 in standard; 287 in same-day ART groups). In the standard group, 212 participants (73%) were retained, 17 (6%) died, 56 (19%) were lost to follow-up (LTFU), and 5 (2%) were late returners. In the same-day ART group, 230 participants (80%) were retained, 8 (3%) died, 46 (16%) were LTFU, and 3 (1%) were late returners. Twelve-month retention was higher in the same-day ART group (p=0.046).
**Conclusions:** Same-day ART is associated with higher rates of ART initiation and retention, compared with standard ART initiation. These findings suggest that immediate ART is feasible in PEPFAR "Test and Start" recommendations.

| | | Standard Group (n=360) | Same-Day Group (n=360) | p-value |
|---|---|---|---|---|
| Baseline Characteristics | Female sex - no. (%) | 183 (51%) | 169 (47%) | 0.296 |
| | Age - mean (SD) | 38 (10) | 38 (10) | 0.296 |
| | CD4 count - mean (SD) | 244 (129) | 241 (124) | 0.781 |
| Pre-ART Outcomes | Completed CD4 count - no. (%) | 360 (100%) | 360 (100%) | --- |
| | Initiated ART within 90 days after HIV testing - no. (%) | 329 (91%) | 360 (100%) | **<0.001** |
| Outcomes 12-Months Post-ART (among participants with 12 months of potential follow-up time) | Retained in care - no. (%) | 212 (73%) | 230 (80%) | **0.046** |
| | Late returners - no. (%) | 5 (2%) | 3 (1%) | 0.486 |
| | Lost to follow-up - no. (%) | 56 (19%) | 46 (16%) | 0.302 |
| | Died - no. (%) | 17 (6%) | 8 (3%) | 0.062 |

### TOWARDS THE LAST 90% OF THE 90-90-90 STRATEGY: A REVIEW OF VIRAL SUPPRESSION RATES IN A HIV PROGRAMME IN CENTRAL AND EASTERN KENYA

M. Kitheka[1], K. Curran[2], P. Gathii[3], M. Mudany[3], S. Bii[4]
*[1]Jhpiego Kenya, Jhpiego, Nairobi, Kenya, [2]Jhpiego, Baltimore, United States, [3]Jhpiego, Nairobi, Kenya, [4]USAID, Nairobi, Kenya*
*Presenting author email: moses.kitheka@jhpiego.org*

**Background:** 1.6 million Kenyans live with HIV with 101,560 infected annually. Kenya has adapted UNAIDS' 90-90-90 initiative under the Kenya AIDS Strategic Framework and the Acceleration plan for HIV Care and Treatment. To monitor the last 90%, Kenya introduced viral load (VL) monitoring, with VLs done for clients after 6 months and 12 months on ART then annually thereafter. Health facilities submit samples to two national laboratories, one doing the Dry Blood Spot (DBS) and the other frozen plasma. Viral suppression is defined as VL less than 1000 copies/ml.
**Description:** APHIAPLUS KAMILI, a PEPFAR/USAID funded project, is led by Jhpiego and supports care and treatment in 142 facilities in Eastern and Central Kenya. As of December 2015, the project supported 35,132 clients on ART, 9.5% (3,332) of whom were children under 15 years. To launch VL monitoring, APHIAPLUS KAMILI sensitized providers on specimen collection, patient follow-up and financed specimen transport to laboratories. Results are posted online and hard copies sent to facilities. This review analyzed VL results from January to December 2015 obtained from the National VL Laboratories database
**Lessons learned:** A total of 24,030 samples were sent to laboratories. In this review, we excluded results with any incomplete entry (age, sex, results) and all rejected samples. 15,253 samples had complete data for review. The crude viral suppression rate was 84% (12,750) with 16% (2,503) above 1000 copies/ml. 84% (8,864) of women and 82% (3,886) of men were suppressed (P-value 0.003). Viral suppression classified by age was 77% (2,656) for children age below 15 years and 85% (10,094) for clients aged above 15 years (P-value< 0.001). Viral suppression for client type ranged from 68% among pregnant women, 77% suspected clinical failure, 82% immunological failure and 84% for routine VL monitoring (P-value=0.006)
**Conclusions/Next steps:** The sites reviewed achieved fairly high levels of viral suppression among those clients who received VL testing, but are still below 90% for all populations. Viral suppression is higher among non-pregnant adults than among children, adolescents and pregnant women; these populations may need additional adherence support. The high suppression rates among clients with suspected treatment failure warrant additional investigation

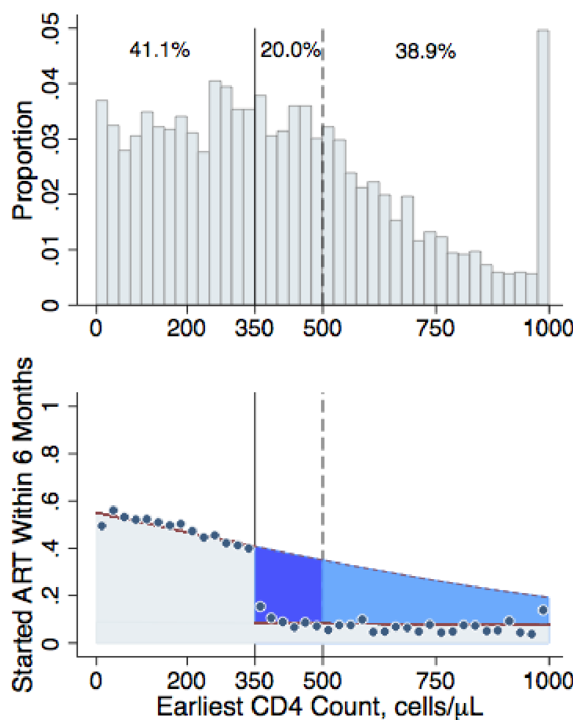
## WEAE0204

### ELIMINATING CD4 THRESHOLDS IN SOUTH AFRICA WILL NOT LEAD TO LARGE INCREASES IN PERSONS RECEIVING ART WITHOUT FURTHER INVESTMENT IN TESTING, LINKAGE AND INITIATION

J. Bor[1,2,3], S. Ahmed[1], M.P. Fox[3,4], S. Rosen[1,3], I. Katz[5,6,7], F. Tanser[2], D. Pillay[2,8], T. Bärnighausen[2,9]

H. Chan School of Public Health, Department of Global Health and Population, Boston, United States*
*Presenting author email: jbor@bu.edu*

**Background:** It is hoped that eliminating CD4 count thresholds for ART eligibility will increase the number of HIV-infected persons receiving therapy and reduce transmission of HIV. However, little is known about the impact of relaxing eligibility thresholds on uptake of ART.
**Methods:** Clinical records were analyzed for all patients presenting for HIV care in the Hlabisa sub-district public sector ART program. We estimated the distribution of first CD4 counts for patients presenting in 2013 (Figure, left). We then estimated the conditional probability of ART initiation within six months for each CD4 count under two counterfactual states of the world (Figure, right): *if CD4-eligible* and *if not CD4-eligible*. Multiplying the conditional probabilities by the distribution of CD4 counts, we estimated the probability that a person would initiate ART under expanded guidelines (CD4< 500, or elimination of CD4 criteria) and under older guidelines (CD4< 350). We forecast the number of new initiators expected if South Africa adopts new WHO recommendations.
**Results:** In 2013, 20.0% of patients presented at 350-500 cells and 38.9% >500 cells. 8.4% of patients 350-500 cells and 8.0% of patients >500 cells would have initiated ART under the old guidelines. 29.7% of patients 350-500 cells and 19.2% of patients >500 cells would initiate ART if CD4 criteria were eliminated. 62.1% of patients at 350-500 cells and 72.8% > 500 cells are not expected to initiate under expanded guidelines despite being eligible. If these numbers hold nationally, then South Africa can expect 130,000 additional initiators per year from raising the threshold to 500 and a further 164,000 initiators per year from eliminating CD4 criteria, representing a 5% increase in persons on ART.
**Conclusions:** Removing CD4 criteria alone, without improving HIV testing, linkage, and ART initiation procedures, will not achieve the country's 90-90-90 targets.



*[Figure. Distribution of first CD4 counts and probability of starting ART at different CD4 counts]*

*Presenting author email: dmackellar@cdc.gov*

**Background:** In an urban lake-zone district of 129,000 people, the Bukoba Tanzania Combination Prevention Evaluation (BCPE) aims to increase antiretroviral therapy (ART) coverage among eligible HIV-infected adult residents from an estimated 34% in 2013 to 80% after a two-year intervention. First-year objectives to achieve this aim include conducting 45,000 HIV tests among adults (18,000 among men), registering 1,360 persons for HIV care, and initiating ART on 90% of eligible patients (CD4 < 350). This abstract summarizes BCPE first-year intervention outcomes, October 2014-September 2015.
**Description:** BCPE interventions include provider-initiated (PITC) and community-based (CBHTC) HIV testing and counseling (HTC) and integrated linkage case management (LCM). Conducted in 11 outpatient-department clinics, PITC includes routine eligibility screening and referral for on-site HTC. CBHTC is offered at homes and at male-frequented venues throughout the district. Provided to consenting HIV-infected out-of-care clients for up to 90 days, LCM includes escort and expedited

first-visit care at 9 HIV clinics, and counseling on HIV care and disclosure. Outcomes of HTC and of LCM clients whose cases were closed through September 2015 were compiled and analyzed.

**Lessons learned:** Of 56,907 HIV tests conducted, 48,752 (86%) were among adults ≥15 years of age (18,648 tests among adult males). PITC accounted for 64% of tests and 79% of 2,292 HIV-infected out-of-care persons identified (86% newly HIV diagnosed). Of 1,519 (75%) clients of closed LCM cases (516 clients were still under management at compilation), 1,369 (90%) had registered for HIV care, of whom 50% were initiated on ART. Similar percentages of HIV-infected out-of-care women and men consented to LCM, registered for care, and were initiated on ART (Table).

| | HTC Outcomes | | | Linkage Case Management (LCM) Outcomes | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| BCPE Clients | Total Tests | PITC Tests | HIV+ Out-of-care | LCM Consent | Closed Cases | HIV-Care Registered | CD4 Recorded | CD4 Count <350 | ART (of registered) |
| | n | (%) | n (%) | (%) | n | n (%) | (%) | n (%) | n (%) |
| All | 56,907 | (64) | 2292 (4) | (86) | 1519 | 1369 (90) | (83) | 594 (47) | 689 (50) |
| Female | 34,207 | (71) | 1427 (4) | (85) | 932 | 830 (89) | (81) | 303 (40) | 408 (49) |
| Male | 22,700 | (53) | 865 (4) | (88) | 587 | 539 (92) | (86) | 291 (57) | 281 (52) |

*[Table]*

**Conclusions/Next steps:** BCPE HTC and linkage-to-care interventions met first-year objectives and are promising methods that might help similar programs achieve 90-90-90 targets. Next steps for BCPE include initiating ART at CD4 < 500 (approved December 2015), increasing LCM participation rates, and in 2017, conducting the endline evaluation to assess achievement of 80% ART coverage among eligible adult residents.

## WEAE0206LB

### LINK4HEALTH: A CLUSTER-RANDOMIZED CONTROLLED TRIAL EVALUATING THE EFFECTIVENESS OF A COMBINATION STRATEGY FOR LINKAGE TO AND RETENTION IN HIV CARE IN SWAZILAND

M. McNairy[1,2], M. Lamb[1], A. Gachuhi[1], H. Nuwagaba-Biribonwoha[3], S. Burke[3], S. Mazibuko[4], V. Okello[4], P. Ehrenkranz[5], R. Sahabo[3], W. El-Sadr[1], Link4Health Study Group

*[1]ICAP Columbia University, New York, United States, [2]Weill Cornell Medicine, Medicine, New York, United States, [3]ICAP Columbia University, Mbabane, Swaziland, [4]Ministry of Health, Kingdom of Swaziland, Mbabane, Swaziland, [5]Gates Foundation, Seattle, United States*

*Presenting author email: mollymcnairy@gmail.com*

**Background:** Gaps in the HIV care continuum contribute to suboptimal individual health outcomes and increased HIV transmission. Practical interventions targeting known barriers to care are needed.

**Methods:** Link4Health, a cluster-randomized controlled trial, evaluated the effectiveness of a combination intervention strategy (CIS) versus standard of care (SOC) on the combined outcome of linkage to care within 1 month and retention in care at 12 months after HIV diagnosis. CIS included: point-of-care CD4 at the time of HIV+ test, accelerated antiretroviral treatment for adults with CD4< 350 cells/uL, mobile phone appointment reminders, health educational packages, and non-cash financial incentives. Ten study clusters in Swaziland, each consisting of a network of affiliated HIV clinics, were randomized to CIS versus SOC. Adults ≥18 years newly tested HIV+ and willing to receive HIV care at the study unit were enrolled from August 2013-November 2014 and followed for 12 months.

**Results:** A total of 2201 individuals were enrolled (1100 CIS arm; 1101 SOC arm). The majority were female (59%); median age was 32 years (IQR 26-40). In intention-to-treat analysis, 64% (705/1100) adults at CIS sites achieved the primary outcome versus 43% (477/1101) at SOC sites [relative risk (RR) 1.48, 95% CI 1.36-1.60, p< 0.0001], with similar result when adjusted for clustering. Participants in the CIS versus the SOC study arm had higher linkage to care within 1 month (92% versus 83%, RR 1.10, 95% CI 1.07-1.14, p< 0.0001); higher 12-month retention (65% versus 45%, RR 1.45, 95% CI 1.34-1.56, p< 0.0001); and lower death before ART initiation (1% versus 2%, RR 0.44, 95% CI 0.21-0.91, p=0.02). A higher proportion of those lost to follow-up at 12 months were pre-ART compared to ART patients. The effectiveness of the CIS intervention did not differ by age, sex, distance to clinic or clinic type.

**Conclusions:** A combination strategy of pragmatic evidenced-based interventions, aimed at gaps in the HIV care continuum, was associated with a 50% increase in prompt linkage to care and 12-month retention. This strategy offers promise for enhanced outcomes among HIV-infected patients and for decreased transmission to others.

# WEAE03 GOING VIRAL FOR VIRAL LOAD IMPLEMENTATION

## WEAE0301

### IMPLEMENTATION OF ROUTINE VIRAL LOAD MONITORING IN LESOTHO, MALAWI, MOZAMBIQUE AND ZIMBABWE: A CASCADE ANALYSIS

M. Dhodho[1], M. Frieden[1], A. Shroufi[2], E. Wanjiru[3], S. Daho[3], E. Simons[4], H. Bygrave[5]

*[1]Médecins Sans Frontières, MSF Zimbabwe, Harare, Zimbabwe, [2]Médecins Sans Frontières, MSF South Africa, Cape Town, South Africa, [3]Médecins Sans Frontières, MSF Malawi, Blantyre, Malawi, [4]Médecins Sans Frontières, MSF Mozambique, Maputo, Mozambique, [5]Médecins Sans Frontières, Southern Africa Medical Unit, Cape Town, South Africa*

*Presenting author email: helenbygrave@hotmail.com*

**Background:** Routine viral load (VL) to monitor the response to ART has been recommended by WHO since 2013. From 2012 routine VL testing to monitor ART was introduced in MSF projects in Lesotho, Malawi, Mozambique and Zimbabwe. All districts except Changara were rural settings where ART had been extensively decentralised. VL is performed annually in all sites except Malawi ( 2 yearly). To assess programmatic implementation of routine VL an analysis was carried to assess performance at each step of the VL algorithm.

**Methods:** Analyses were performed between January and November 2015 across six districts in four countries. Reviews of clinical and laboratory records of representative samples of patients were used to determine how each step of the routine VL algorithm (coverage of VL, uptake of enhanced adherence counselling, repeat VL testing (within 2-9 months), re-suppression, and appropriate switch to second-line ART) was implemented within a defined period according to local guidelines (18 months preceding date of analysis in Lesotho, Mozambique and Zimbabwe and 30 months in Malawi). Results were presented to programme staff and barriers for implementation identified.

**Results:**

| Site | Buhera, Zimbabwe | Gutu, Zimbabwe | Thyolo, Malawi | Nsanje, Malawi | Roma, Lesotho | Moz Changara (3000 copies/ml is threshold for action throughout algorithm) |
|---|---|---|---|---|---|---|
| Year routine VL testing started | 2012 | 2013 | 2012 | 2013 | 2014 | 2013 |
| Number of patients in the analysis | 4760 | 2978 | 7576 | 2785 | 3069 | 3095 |
| Coverage of routine VL testing (VL1) | 91% | 74% | 56% | 32% | 70% | 62% |
| VL > 1000 copies/ml | 14% | 15% | 9% | 20% | 10% | 40% |
| EAC documented for patients with VL >1000 copies/ml | 57% | 76% | 62% | 56% | 70% | 70% |
| Repeat VL test performed (VL2) | 68% | 67% | 55% | 40% | 42% | 23% |
| Resuppressed to <1000copies/ml | 43% | 39% | 46% | 32% | 8% | 22% |
| VL threshold for switch to second-line ART (copies/ml) | 1000 | 1000 | 5000 | 5000 | 1000 | 3000 |
| Eligible patients switched to second-line ART | 37% | 35% | 15% | 38% | 37% | 10% |

*[Outcomes of VL cascade analysis]*

In those sites with low coverage of VL1 and VL2 challenges included lack of human resources to draw blood, dedicated staff to perform enhanced adherence counselling and lack of effective appointment and tracing mechanisms. Across all sites reluctance to task shift and decentralise second line ART care was cited as a barrier to switching.

**Conclusions:** This analysis demonstrated limited compliance with a routine VL algorithm based on WHO recommendations. Scale up plans for VL monitoring must address human resource issues and make implementation plans for provision of second-line in sites where ART care has been decentralised.

## WEAE0302

### VIRAL LOAD CASCADE AND PROGRAMMATIC CHALLENGES AFTER 2 YEARS OF ROUTINE HIV VIRAL LOAD TESTING IN MAPUTO, MOZAMBIQUE

R. Giuliani[1], A. Torrens[1], L. Molfino[1], C. Silva[1], T. Ellman[2], A. Magaia[3]
*[1]Médecins Sans Frontières, Maputo, Mozambique, [2]Médecins Sans Frontières, SAMU - South Africa Medical Unit, Cape Town, South Africa, [3]Ministry of Health, Maputo, Mozambique*
*Presenting author email: msfocb-maputo-medco@brussels.msf.org*

**Background:** Médecins Sans Frontières (MSF) together with the Ministry of Health (MoH) introduced routine viral load (VL) monitoring in December 2013 for ART-enrolled patients in Maputo city, Mozambique. This analysis aims to describe, the VL cascade outcomes and the programmatic challenges of routine VL monitoring and counseling intervention after 2 years of implementation.
**Methods:** A retrospective cohort study design with routine program data was used. The study was conducted between July 2013 and March 2015 in six MSF supported health centres in Maputo city where routine VL monitoring with enhance adherence counselling (EAC) for patients with detectable VL (≥3000 cp/ml as per national guidelines) was implemented. All HIV patients more than 6 months on ART were included in the study. Data was analysed using Stata software version 14. Percentages (%) were calculated to report coverage detectability at first VL, coverage of EAC, VL re-suppression and switch to second line treatment.
**Results:** Among 45591 ART eligible patients, 14026 (30.8%) had at least one VL. Median age was 37.5 years (24-51), 91.4% were above 15 years and 76.3% were female . Detectability rate was 19.8% (2617) at VL≥3000 and 27.% (3569) at VL≥1000 cp/ml. 34.5% of patients < 15 years had a VL ≥3000 compared to 17.5% of adults ≥15 years. 702 (26.8%) high VL patients did at least one EAC session. 669 (36%) patients with high VL had a follow up VL at least 3 months after. 249 (37.3%) re-suppressed. Out of 420 patients with the second high VL, 197(47%) were referred and approved by the ART Committee to regime change and 59 (30%) have switched to second line so far.
**Conclusions:** Viral load coverage remains low after 2 years. The implementation of routine VL requires a multi-sectorial approach and a well-established VL flow. Outcomes reveal high failure rate and the importance of implementing early adherence interventions to prevent developing of treatment failure, specifically for children and adolescents. Access to 2nd line ART for patients in failure is still limited. Ensuring access to 2nd line should be a priority alongside ensuring patients with low VL are fast tracked into a differentiated model of care.

## WEAE0303

### ROLL OUT OF TARGETED VIRAL LOAD TESTING IN TWO RURAL DISTRICTS WITHIN MASVINGO PROVINCE, ZIMBABWE

J. van Dijk[1], K. Kamenova[1], A. Shamu[2], K. Pfeiffer[3], M. Hobbins[3], J. Ehmer[3], J. Murungu[4]
*[1]SolidarMed, Masvingo, Zimbabwe, [2]Ministry of Health and Child Care, Provincial Medical Directorate, Masvingo, Zimbabwe, [3]SolidarMed, Lucerne, Switzerland, [4]Ministry of Health and Child Care, AIDS & TB Programmes, Harare, Zimbabwe*
*Presenting author email: j.vandijk@solidarmed.ch*

**Background:** Following the World Health Organization's recommendation of viral load (VL) testing as the preferred approach for monitoring anti-retroviral therapy treatment outcomes, the Zimbabwe Ministry of Health and Child Care (MoHCC), with support of the medical relief organization SolidarMed, committed to improve access to targeted VL (TVL) testing, thus offering VL testing to patients with suspected treatment failure.
**Description:** After training of Healthcare Workers (HCWs), TVL testing, as defined in the national guidelines, was newly introduced to all 48 health facilities (HF) in two districts in Masvingo Province in 2013. With limited access to VL measurements nationally, specimens were collected as Dried Blood Spots and processed at an accredited laboratory in South Africa (SA) using bioMerieux-Platform. Samples were collected at four hospitals within the districts, transported via existing sample transportation networks, and sent to SA by courier. Results were communicated back within two weeks via secured web-link to the central hub in Masvingo, and distributed to the sites. Bi-monthly clinical mentoring visits to HF took place.
**Lessons learned:** High sample success rate (99%), short turnaround time (TAT) of test-results, and moderate costs (USD25/sample, all-inclusive) were major advantages of this approach. Low proportion of patients identified for TVL based on routine clinical and immunological screening by HCWs, and low percentage of repeat VLs done, remain concerning.

| | 2013 | 2014 | 2015 |
|---|---|---|---|
| Number of patients on ART by year end | 16'506 | 17'892 | 21'788 |
| Patients on ART with 1st VL (N/%) | 150 / 0.9% | 315 / 1.8% | 368 / 1.7% |
| VL test results available (N/%) | 149 / 99.3% | 313 / 99.4% | 360 / 97.8% |
| VL undetectable (<20 copies/ml) (N/%) | 44 / 29.5% | 88 / 28.1% | 119 / 33.1% |
| VL detectable at >3000 copies/ml (N/%) | 76 / 51.0% | 172 / 55.0% | 167 / 46.4% |
| Patients with detectable VL who had a repeat VL done (N/%) | 38 / 50.0% | 71 / 41.3% | 52 / 31.1% |
| Patients with confirmed virological failure on repeat VL (N/%) | 37 / 97.4% | 55 / 77.5% | 43 / 82.7% |

*[TVL in two districts in Masvingo Province, Zimbabwe, during 2013-2015]*

**Conclusions/Next steps:** Zimbabwe MoHCC's VL scale-up strategy 2015-2018, plans to role out VL testing to district and Rural Health Center level in 2016. With current insufficient national laboratory capacity, outsourcing of sample processing to SA can allow for testing targets to be reached. However, the low number of TVL done so far in the two districts suggest that the overall success of roll-out heavily depends on the skills and awareness of HCWs to identify eligible patients, as well as on system strengthening to improve patient follow-up and timely switch to 2nd line treatment in case of confirmed treatment failure.

## WEAE0304

### DRIED BLOOD SPOTS PROVIDE ACCURATE ENUMERATION OF HIV-1 VIRAL LOAD IN EAST AFRICA

R. Barnabas[1], R. Coombs[2], M. Chang[2], T. Schaafsma[1], S. Asiimwe[3], K. Thomas[1], J. Baeten[1], C. Celum[1]
*[1]University of Washington, Global Health, Seattle, United States, [2]University of Washington, Seattle, United States, [3]Integrated Community Based Initiatives, Kabwohe, Uganda*
*Presenting author email: rbarnaba@uw.edu*

**Background:** HIV-1 viral load monitoring of antiretroviral therapy (ART) confirms treatment efficacy and facilitates timely switching to second line regimens. However, collection of plasma for ART monitoring requires phlebotomy, controlled transport conditions and is costly, thereby limiting its use in community-based settings. The use of dried blood spot (DBS) cards to collect finger-prick blood, and transport specimens at ambient temperature to a central laboratory for viral load testing would simplify monitoring but requires validation against the gold standard method of plasma testing.
**Methods:** In a randomized study of pre-exposure prophylaxis (PrEP) among HIV serodiscordant couples in Kenya and Uganda (the Partners PrEP Study), HIV-infected participants provided EDTA plasma and DBS specimens at the same visit. The Abbott RealTime HIV-1 assay was used to measure viral load in plasma (limit of quantification (LOQ): 80 copies/mL) and a modified assay was used for DBS whole blood specimens (LOQ: 520 copies/mL); all testing was done on samples transported to the University of Washington. We selected 165 HIV-positive participants including 34 men and women on ART, and 131 not on ART across a range of CD4 count categories. The plasma and DBS viral load results were compared using Bland-Altman plots and two by two tables.
**Results:** The median viral load was 3.49 and 3.10-$\log_{10}$ copies/mL for plasma and DBS, respectively. The mean difference between plasma and DBS specimens was 0.17-$\log_{10}$ copies/mL (CI: 0.08 to 0.26-$\log_{10}$ copies/mL). The correlation between plasma and DBS results was 0.85 (p< 0.0001). At the WHO viral suppression threshold of < 1000 copies/mL in plasma and < 624 copies/mL with DBS, the sensitivity and specificity of DBS was 87% and 86%, respectively, with positive and negative predictive values of 46% and 98%, respectively, for detecting treatment failures in a population with 13% virological failures. There were no significant differences by gender, CD4 count, or ART use.
**Conclusions:** DBS specimens provide a highly comparable result to plasma viral load and thus might be used for population-based ART monitoring. DBS and plasma specimens should be compared in the field to determine the appropriate threshold and optimal predictive values for identifying treatment failures in decentralized settings.

*Presenting author email: sikhulilemoyo@gmail.com*

**Background:** Increasing scale-up of ART necessitates routine HIV-1 viral load (VL) testing for monitoring treatment failure and adherence. In rural settings, laboratory-based VL testing remains challenging (insufficient access to laboratory facilities, cold chain, sample transportation), and delays in result reporting may negatively impact the HIV treatment cascade. Point-of-care (POC) VL testing has the potential to alleviate these challenges, particularly in rural communities.
**Methods:** We compared the performance of the Cepheid Xpert® HIV-1 VL (POC assay) against the Abbott m2000sp/m2000rt (Abbott assay). ART-naïve individuals (n=168) in 12 rural communities participating in the Botswana Combination Prevention Project provided EDTA blood specimens during household surveys. POC assay testing was completed in mobile community-based facilities, while the Abbott assay was performed in the reference laboratory. Bland-Altman and Passing-Bablok regression were used to test for systematic and proportional differences. Correlation analysis was performed using the Spearman rank test.
**Results:** We found very high correlation between the POC and Abbott assay results ($r_s$=0.89). The POC assay results were 0.46 $log_{10}$ (95%CI: -0.38-1.31; Figure 1A) higher than the Abbott on average, but this difference was not significant. In contrast, Passing-Bablok regression, no proportional bias was observed (slope=0.97; 95%CI: 0.91-1.03; Figure 1B), but a test for systematic bias was significant (intercept=0.58; 95%CI: 0.34-0.82). Agreement of 96%, 93% and 88% was found at the 40, 400 and 1000 copies/mL thresholds, respectively. Seven samples with VL between 50-115 copies/mL on the POC assay were below the limit of detection with the Abbott assay. One sample with undetectable VL on the POC assay had VL of 66 copies/mL with the Abbott assay.
**Conclusions:** The Xpert HIV-1 VL assay showed high agreement and high accuracy compared to the standard laboratory-based method of VL testing. This POC assay is a promising tool for monitoring ART scale-up in rural communities.

## WEAE0306LB

### USING EPIDEMIOLOGY AND COLLABORATIVE FUNDING TO ENABLE INNOVATION IN OPPORTUNISTIC SCREENING TO REDUCE THE LATE DIAGNOSIS OF HIV: INTERIM RESULTS FROM A TARGETED PRIMARY CARE PROJECT IN ENGLAND (UK)

O. Brigstock-Barron[1], L. Logan[1], H. Sowerbutts[2], V. Womack[3], M. Osman[4], J. Anderson[5], A. Nardone[1]
*[1]Public Health England, Health & Wellbeing, London, United Kingdom, [2]Leeds City Council, Leeds, United Kingdom, [3]NHS Leeds North Clinical Commissioning Group, Leeds, United Kingdom, [4]Elton John AIDS Foundation, London, United Kingdom, [5]Homerton University Hospital Trust, Centre for the Study of Sexual Health and HIV, London, United Kingdom*
*Presenting author email: owen.brigstock-barron@phe.gov.uk*

**Background:** The estimated percentage of diagnosed HIV in England remains below the UNAIDS target and rates of late HIV diagnosis remain high. In 2015 Public Health England (PHE) and the Elton John AIDS Foundation (EJAF) collaborated to co-fund a project aimed at increasing HIV testing in geographical areas with high incidence of HIV and high rates of late HIV diagnosis. PHE undertook an epidemiological analysis of large urban areas in England to select potential areas to run the intervention. This approach ensured investment was targeted to achieve the greatest impact.
**Methods:** The selected intervention targets new patients registering with primary care services in high HIV prevalence districts of a large city in the north of England, offering them routine Blood Borne Virus (BBV) testing. The project has developed innovative promotional resources in languages targeting those most at risk (Czech, Tigrigna and Arabic) and targeted training to enable staff to deliver the intervention. Local primary care teams have also developed a new digital prompt protocol aimed at increasing HIV testing in patients presenting with associated clinical indicator illnesses.
**Results:** During the first five months of implementation 31 primary care practices were enrolled in which 8,401 eligible new patients between the ages of 16-65 were registered. So far 19% (1,616) of patients have been offered tests for HIV, HBV and HCV, of those, 87% (1,405) were tested. Of those tested there were five, nine and four positive results for HIV, HBV and HCV respectively representing positivity rates of 0.36%, 0.64% and 0.28%.
**Conclusions:** Using collaborative funding approaches targeted at the areas of high burden of infection/late diagnosis shows high impact. Interim findings demonstrate positivity rates higher than the background diagnosed prevalence's for those areas and high test uptake rates demonstrate good patient acceptability. Feedback so far has indicated that the scheme and associated training has increased healthcare workers' awareness and confidence in offering BBV screening. Development of an effective digital prompt tool will allow clinical staff to identify individuals at risk more easily. Resources developed are of national and international relevance and show that specific targeting of limited funding in high prevalence areas is effective.

### NOVEL MODE OF RECOGNITION OF THE GLYCAN-V1V2 REGION OF HIV-1 ENVELOPE BY A NEW LINEAGE OF BROADLY NEUTRALIZING ANTIBODIES

E. Cale[1], J. Gorman[1], N. Radakovich[1], G. Ozorowski[2], E. Crooks[3], K. Osawa[3], M. Asokan[1], N. Doria-Rose[1], A. Ward[2], P. Kwong[1], J. Binley[3], J. Mascola[1]
*[1]National Institutes of Health, Vaccine Research Center, NIAID, Bethesda, United States, [2]The Scripps Research Institute, La Jolla, United States, [3]San Diego Biomedical Research Institute, San Diego, United States*
*Presenting author email: caleem@mail.nih.gov*

**Background:** Studies of naturally occurring broadly neutralizing antibodies (bnAbs) have yielded valuable clues for HIV-1 vaccine design. To date, bnAbs targeting the glycan-V1V2 region of HIV-1 Env have been cloned from only 4 individuals. These bnAbs have an unusually long heavy chain complementarity-determining region 3 (CDRH3) that penetrates the glycan shield to access the underlying epitope. We isolated of a new lineage of glycan-V1V2 bnAbs, N90-VRC38, that has more conventional immunogenetic qualities, and we determined how this lineage is able to target the glycan-V1V2 epitope with a shorter CDRH3 loop.
**Methods:** HIV-specific B cells from the clade B virus-infected NIAID Donor N90 were sorted by flow cytometry using Env-bearing virus-like particles or soluble trimers as HIV-specific probes. Antibody heavy and light chains were recovered by RT-PCR, expressed and purified, and evaluated for multiclade neutralization activity using the TZM-bl neutralization assay. Two structures of mAb N90-VRC38.01, one complexed with BG505 SOSIP trimer and another complexed with a WITO.33 V1V2 scaffold, were solved by negative-stain electron microscopy (EM) and by X-ray crystallography, respectively. Binding stoichiometry of the antibody was determined by native PAGE and by biolayer interferometry (BLI) under saturating conditions.
**Results:** The broadest of the 11-member N90-VRC38 clonal lineage, N90-VRC38.01, neutralized 29% of 208 Env-pseudotyped viruses. This antibody has a neutral, short 18 amino acid (AA) CDRH3; in contrast, other glycan-V1V2 bnAbs exhibit long (>26 AA), negatively charged CDRH3s. N90-VRC38.01 uses both its CDRH3 and CDRL1 to make hydrogen bonds with side chains of strands A, B, and C of the V1V2 region. This is unlike other glycan-V1V2 bnAbs, which make main-chain protein-protein contacts with strand C of the epitope.
**Conclusions:** The N90-VRC38 lineage represents a new type of glycan-V1V2-binding bnAb that that binds via a CDRH3 loop that is far shorter than those of other V1V2-directed bnAbs. This raises the possibility that eliciting V1V2-specific bnAbs by vaccination may be more readily achievable than previously thought, as antibodies with such shorter CDRH3 loops are common in the human IgG repertoire.

### NON-CLASSICAL CD8+ T CELLS RESTRICTED BY HLA CLASS II EMERGE IN HIV INFECTION AND SHOW ANTIVIRAL EFFICACY

S. Ranasinghe[1], P. Lamothe-Molina[1], D. Soghoian[1], S. Kaizer[1], M. Cole[2], A. Shalek[1], N. Yosef[2], B. Jones[1], M. Carrington[3], H. Streeck[4], D. Kaufmann[5], L. Picker[6], J. Kappler[7,8], B.D. Walker[1,8]
*[1]Ragon Institute of MGH, MIT and Harvard, Cambridge, United States, [2]University of California, Berkeley, Berkeley, United States, [3]Cancer and Inflammation Program, NCI, Frederick, Maryland, United States, [4]Institute for Medical Biology, Essen, Germany, [5]Centre de Recherche du Centre hospitalier de l'Université de Montréal, Montreal, Canada, [6]Oregon Health Sciences University, Portland, United States, [7]National Jewish Health, Denver, United States, [8]Howard Hughes Medical Institute, Chevy Chase, United States*
*Presenting author email: sranasinghe@mgh.harvard.edu*

**Background:** CD8+ T cells typically recognize infected cells through viral peptides presented on HLA class I. However, CD8+ T cell responses restricted by HLA class II have also been reported in CD4 knockout mice and in a macaque AIDS vaccine model where Gag-specific CD8+ T cells restricted by class II were elicited by CMV vector immunization. This raises a critical question: do class II-restricted CD8+ T cell responses exist in natural HIV-infection?
**Methods:** We detected class II-restricted CD8+ T cell populations in 3 of 101 treatment-naive HIV-infected individuals screened using a novel 'CD8 HLA-DR' IFNy ELISpot assay. CD8+ T cells targeted HIV Gag37 or Gag41 peptides presented by LCL stably expressing recombinant DR01 and DR11. Antibody blocking of class I and II, and flow cytometric staining with class II tetramers confirmed the restriction. TCR sequencing was conducted from class II tetramer-sorted cells.
**Results:** Our detailed analysis demonstrates the existence of Gag-specific CD8+ T cell responses restricted by HLA-DR, which exhibit potent cytolytic functions that are comparable to class I-restricted cytotoxic T lymphocytes. The HLA-DR-restricted CD8+ T cells were Perforin+GranzymeB+ and efficiently lysed HIV-infected autologous CD4+ T cells and macrophages (p< 0.01). Although these responses are rare, detected in only 3% of HIV controllers screened, in one individual it was the most immunodominant CD8+ response encompassing 12% of total CD8+ T cells directly *ex vivo* (in the absence of T cell expansion). Moreover, these HLA-DR-restricted CD8+ T cells showed atypical patterns of TCR usage that were characterized by two different co-expressed TCR alpha chains, and intriguingly, a single TCR beta clonotype that was shared with CD4+ T cells targeting the same peptide-HLA class II complex. Indeed, TCR beta clonotype TRBV2 was shared between 100% of CD8+ and 73.9% of CD4+ targeting the DR11-Gag41 complex, with 2/27 sequences identical in VDJ and CDR3 motifs.
**Conclusions:** These data not only reveal the presence of atypical CD8+ T cells governed by unusual TCR cross-reactivity in HIV infection, but may also have relevance for future CMV vector-based HIV vaccines as they move into Phase 1 trials in humans, where their ability to induce unconventional CD8 T cells remains unknown.

### WEPDA0103

### PRESENCE OF HIV-1C BROADLY NEUTRALIZING ANTIBODIES IN PREGNANCY AND AT DELIVERY

T. Mduluza[1,2], S. Dzoro[3,4], K. Bedi[3,4], W.S. Mpoloka[3]
*[1]University of Zimbabwe, Biochemistry, Harare, Zimbabwe, [2]University of KwaZulu-Natal, School of Laboratory Medicine and Medical Sciences, Durban, South Africa, [3]University of Botswana, Biological Sciences, Gaborone, Botswana, [4]Botswana Aids Institute Partnership, Research Laboratory, Gaborone, Botswana*
*Presenting author email: mduluza@medic.uz.ac.zw*

**Background:** HIV neutralizing antibody assays are now being widely employed in different laboratories in search for correlates of protective immunity. There are strong arguments in favor of a beneficial role of some broadly neutralizing antibodies in prevention of HIV infection if these antibodies exist prior to exposure. The neutralizing antibodies could be useful in immunotherapy.
**Methods:** Archived plasma samples collected from 54 mothers at recruitment, before and after delivery from a PMTCT study were assayed for presence of neutralizing antibodies using TZM-bl cells. The participating mothers were divided into HIV transmitters and non-transmitter, indicated at delivery. The virus panel comprised of reference strains (92TH021 and MBA2'- clade AE; 92BR020- clade B; and 93IN905, ZA012, ZM651- clade C, and results were expressed as the plasma inhibition dilution causing 50% or 90% reduction in viral replication.
**Results:** Plasma samples were from 21 non-transmitters and 33 transmitters. Non-transmitters compared to the transmitting mothers had 332 CD4+ cells/µl and 103 024 HIV RNA copies/ml compared to 321 CD4+ cells/µl and 158 164 HIV RNA copies/ml, respectively. Broadly neutralizing antibodies were present in baseline plasma from both HIV-1 transmitters and non-transmitters. When a more stringent cut off value for the neutralizing activity was applied, a decline in the potency and breadth of neutralization was observed in only 2 plasmas showing high 90% infection inhibition of 3 out of 7 strains. Potent neutralizing antibodies to the South African strain (ZA012) were more frequently detected among the non-transmitting mothers. Neutralization titers were significantly higher in non-transmitters for 50% inhibition of the subtype C strains, 93IN905 (p< 0.001) and ZM651 (p=0.014), and for 90% inhibition of 92TH021, MBA2', 92BR020 and 93IN905 (p< 0.001), ZM651 (p=0.006).
**Conclusions:** Despite an overall reduced potency at 90% infection inhibition, non-transmitting mothers had significantly higher potency and breadth (cross-clade neutralization) for 90% viral inhibition at delivery compared to the transmitting mothers. These results provide evidence of the presence of HIV-1 broadly cross-neutralizing antibodies during pregnancy and at delivery that directly could be utilized in the management of HIV infection hence contribute to reduced mother to child transmission.

## WEPDA0104

### PML/TRIM19-DEPENDENT INHIBITION OF RETROVIRAL REVERSE-TRANSCRIPTION BY DAXX

J. Dutrieux[1], G. Maarifi[1], D. Portilho[2], N. Arhel[2], M. Chelbi-Alix[1], S. Nisole[1]
*[1]Institut National de la Santé et de la Recherche Médicale (INSERM), UMR-S 1124, Paris, France, [2]Institut National de la Santé et de la Recherche Médicale (INSERM), U941, University Institute of Hematology, Saint-Louis Hospital, Paris, France*
*Presenting author email: jacques.dutrieux@inserm.fr*

**Background:** PML (Promyelocytic Leukemia protein), also known as TRIM19, belongs to the family of tripartite motif (TRIM) proteins. PML is mainly expressed in the nucleus, where it forms dynamic structures known as PML nuclear bodies that recruit many other proteins, such as Sp100 and Daxx. While the role of PML/TRIM19 in antiviral defense is well documented, its effect on HIV-1 infection remains unclear.
**Methods:** HeLa or MEF cells derived from wt or PML KO mice were transduced with GFP-encoding vectors derived from HIV-1, SIV, EIAV and MLV. Human T lymphocytes were infected with HIV-1. PML knockdown was performed using siRNA, shRNA or by inducing its degradation by arsenic. Retroviral transductions were quantified by flow cytometry and qPCR whereas HIV-1 propagation in T-cells was followed by ELISA. Localization of PML, Daxx and HIV-1 capsid protein was determined by immunofluorescence and *in situ* proximity ligation assay. Retro-transposition events were estimated by the number of G418R foci after transfection of HeLa cells (over-expressing Daxx or not) with neo-marked retrotransposons.
**Results:** Infection by HIV-1 and other retroviruses triggers the formation of PML cytoplasmic bodies, as early as 30 minutes post-infection. Quantification of PML cytoplasmic bodies revealed that they last approximately 8h, with a peak at 2h post-infection. PML re-localization is blocked by reverse-transcription inhibitors and is not observed following infection with unrelated viruses, suggesting it is specifically triggered by retroviral reverse-transcription. Furthermore, PML knockdown dramatically increases reverse-transcription efficiency. However, although it is required for retroviral restriction, PML does not inhibit directly retroviral infection but acts through the stabilization of one of its well-characterized partners, Daxx. In the presence of PML, cytoplasmic Daxx is found in the vicinity of incoming HIV-1 capsids and inhibits reverse-transcription whereas in the absence of PML, Daxx is degraded. Interestingly, Daxx not only interferes with exogenous retroviral infections but can also inhibit retro-transposition of endogenous retroviruses.
**Conclusions:** We show for the first time that PML and Daxx cooperatively interfere with an early step of retroviral infection by targeting the reverse-transcription step. Our findings unravel a novel antiviral function for PML and its nuclear body-associated protein Daxx as a broad cellular inhibitor of reverse-transcription.

## WEPDA0105

### HUMAN SPD1-BASED HIV-1 GAG-FUSION DNA VACCINE INDUCES HIGH FREQUENCY OF BROADLY REACTIVE T CELL RESPONSES IN MICE AND RHESUS MACAQUES

S. Chen, J. Tang, Z. Chen
*University of Hong Kong, Microbiology, Hong Kong, Hong Kong*
*Presenting author email: samueamu813@hotmail.com*

**Background:** Ongoing AIDS epidemic commonly involves diverse HIV-1 subtypes even in a single geographical location (e.g. Hong Kong). Therefore, vaccine-induced host immunity should be broadly reactive for protection. We have previously reported a vaccine strategy that can induce potent cellular immunity by fusing murine soluble programmed death-1 (sPD1) with HIV-1 Gag-p24. Using this strategy, we further investigated a novel human sPD1-based HIV-1 Gag-fusion DNA vaccine in mice and rhesus macaques.
**Methods:** The mosaic-like immunogen design was based on hundreds of Gag sequences covering three major circulating HIV-1 subtypes B/B', C/CB' and 01_AE in China. The novel DNA vaccine contained human sPD1 fused together with two Gag, thus achieving the epitope coverage about 97% of all three subtypes according to the HIV database analysis. This vaccine was evaluated through *in vivo* electroporation in mice and rhesus macaques. The immunogenicity profiles were determined using ELISA, ELISpot, ICS and Tetramer assays. The vaccine-induced protection was also investigated in immunized mice challenged with a replicating-competent Eco-HIV.
**Results:** *In vitro* analysis confirmed the design and expression of the fusion immunogen, which was also able to interact with both human and murine PD-L1/L2. *In vivo* experiments indicated that the novel vaccine not only induced potent T cell immune responses similar to murine sPD1-p24$_{fc}$ as we previously published but also had an enhanced breadth across three subtypes. Moreover, vaccine-induced Gag-specific CD8$^+$ T cells conferred significant protection against EcoHIV infection in mice. Notably, in rhesus macaques vaccine-induced T cell responses were broadly reactive and comparable to that elicited by a heterologous vaccinia prime and ad5 boost regimen.
**Conclusions:** We found that the human sPD1-based HIV-1 Gag-fusion DNA vaccines are highly immunogenic in two animal species, and confers substantial protection against EcoHIV-1 infection in mice. The immunogenicity of our vaccine in rhesus macaques is promising and may warrant future development for human use.

### DEFERRED ANTIRETROVIRAL THERAPY IS ASSOCIATED WITH LOWER ESTIMATED GLOMERULAR FILTRATION RATE IN HIV-POSITIVE INDIVIDUALS WITH HIGH CD4 COUNTS

A. Mocroft[1], A.C. Achra[2], M. Ross[3], L. Ryom[4], A. Avihingsanon[5], E. Bakowska[6], W. Belloso[7], A. Clarke[8], H. Furrer[9], G. Lucas[10], M. Ristola[11], M.S. Rassool[12], J. Ross[13], C. Somboonwit[14], C. Wyatt[3], On behalf of the INSIGHT and START Study Group
*[1]University College London, London, United Kingdom, [2]University of New South Wales, Sydney, Australia, [3]Icahn School of Medicine at Mount Sinai, New York, United States, [4]University of Copenhagen, Copenhagen, Denmark, [5]Chulalongkorn University, Bangkok, Thailand, [6]Wojewodzki Szpital Zakazny, Warsaw, Poland, [7]Hospital Italiano de Buenos Aires, Buenos Aires, Argentina, [8]Royal Sussex County Hospital, Brighton, United Kingdom, [9]Bern University Hospital and University of Bern, Bern, Switzerland, [10]Johns Hopkins University of Medicine, Baltimore, United States, [11]Helsinki University Central Hospital, Helsinki, Finland, [12]University of Witwatersrand, Johannesburg, South Africa, [13]University Hospitals Birmingham NHS Foundation Trust, Birmingham, United Kingdom, [14]University of South Florida, Tampa, United States*
*Presenting author email: a.mocroft@ucl.ac.uk*

**Background:** The impact of antiretroviral therapy (ART) on renal function in HIV-positive persons with high CD4 is largely unknown. We evaluated changes in estimated glomerular filtration rate (eGFR) among participants randomised to immediate or deferred ART within the INSIGHT START trial.
**Methods:** eGFR was calculated from locally measured creatinine using MDRD and CKD-EPI at months 4, 8, 12 and annually. Participants with baseline and $\geq$1 follow-up eGFR were included. We analysed change in eGFR at each visit from baseline using random effects models.
**Results:** 4629 of 4685 START participants (99%) were included; characteristics were balanced between the immediate (n=2294) and deferred ART arms (n=2335). In both arms, median baseline CD4 was 651/mm$^3$ and eGFR (CKD-EPI) 111 ml/min/1.73m$^2$ . Mean follow-up was 2.6 years. ART was initiated in 2271 participants (99.0%) in the immediate and 1126 (48.2%) in the deferred arm, accounting for 94% and 28% of follow-up time, respectively. 89% of initial regimens in both arms included TDF. In the primary randomized comparison those in the deferred arm had a lower eGFR over follow-up (Table) with no evidence that the eGFR slope was different comparing the immediate and deferred arms (p>0.2). The lower mean eGFR in the deferred arm remained significant in secondary analyses (Table). In a model adjusted for time and baseline eGFR, the mean change in eGFR (CKD-EPI) in the deferred versus immediate arm in those of non-black and black race was 0.23 (95%CI: -0.42, 0.87) and -2.43 (95% CI: -3.42, -1.43; p< 0.0001 test for interaction) respectively.

| Outcome | Model 1* Deferred arm (vs. immediate arm) (95% CI), P | Adjusted Model 2** Deferred arm (vs. immediate arm) (95% CI), P | Adjusted Model 3*** Deferred arm (vs. immediate arm) (95% CI), P |
|---|---|---|---|
| eGFR-CKD-EPI | -0.56 (-1.11 to -0.003), 0.049 | -1.85 (-2.50 to -1.21) <0.001 | -1.72 (-2.34 to -1.11) <0.001 |
| eGFR-MDRD | -1.26 (-2.14 to -0.38), 0.005 | -3.43 (-4.51 to -2.35), <0.001 | -3.21 (-4.25 to -2.17), <0.001 |

*Model 1: adjusted for baseline eGFR and years since randomization
**Model 2: additionally adjusted for current receipt of TDF and boosted PI
***Model 3: Model 2 + additionally adjusted for age, gender, race, region of enrolment, time since HIV diagnosis, use of injecting drugs, CD4, viral load, proteinuria, body mass index, hepatitis B/C, diabetes, hypertension, dyslipidemia, cardiovascular disease, smoking status, ACE inhibitors or NSAIDS, all measured at randomisation.

*[Table. Mean change in eGFR by randomisation arm in INSIGHT START trial]*

**Conclusions:** Deferring ART initiation in patients with high CD4 led to a small but significantly lower eGFR compared to those starting immediately, and was most pronounced in those of black race. These results suggest asymptomatic HIV infection may promote kidney disease despite preserved immune function.

## WEPDB0102

### THE EFFECT OF HIV INFECTION ON THE AGE AT PRESENTATION OF HBV-DRIVEN HEPATOCELLULAR CARCINOMA IN SOUTH AFRICA

T. Maponga[1], H. Vermeulen[2], B. Robertson[3], S. Burmeister[4], W. Preiser[1], M. Kew[5], M. Andersson[1]
*[1]University of Stellenbosch, Division of Medical Virology, Cape Town, South Africa, [2]Tygerberg Hospital, Radiation Oncology, Cape Town, South Africa, [3]University of Cape Town, Department of Radiation Medicine, Cape Town, South Africa, [4]University of Cape Town, Department of Surgery, Cape Town, South Africa, [5]Groote Schuur Hospital & University of Cape Town, Department of Medicine, Cape Town, South Africa*
*Presenting author email: tongai@sun.ac.za*

**Background:** Hepatocellular carcinoma (HCC) is the third most common cause of cancer mortality worldwide. Over 60% of HCC cases arise from chronic infection with HBV and/or HCV. Although HIV is known to impact on the natural progression of HBV infection, its impact on the epidemiology of HCC is not completely understood. This study investigated the occurrence of HIV among a cohort of patients incidentally diagnosed with HCC at four hospitals in South Africa.
**Methods:** A total of 107 patients diagnosed with HCC were recruited at Tygerberg and Groote Schuur hospitals in the Western Cape and at Chris Hani Baragwanath and Charlotte Maxeke hospitals in Gauteng, South Africa following informed consent. Study subjects were recruited between December 2012 and October 2015. Demographic, laboratory and clinical data together with blood specimens were collected. When unknown at the time of diagnosis, patients were tested for HBsAg, HBeAg and HIV on the Abbott Architect.
**Results:** Of 107 recruited HCC cases, 68/106 (64.1%) were positive for HBsAg. HIV seropositivity was seen in 22/100 (22%) of all HCC cases. HBeAg was seen in 10/17 (59%) of HIV-infected compared to 9/46 (20%) among HBV-monoinfected cases, p=0.005. Among HBsAg-positive HCC cases, 19/66 (29%) were HIV-infected compared to only 3/34 (9%) among those that were HBsAg-negative, p=0.04. The proportion of females among the HBV/HIV co-infected HCC cases of 6/18 (33%) was significantly higher it was among those that were HBV-monoinfected 6/47 (13%), p=0.005. HIV/HBV co-infected females presented younger, at median age 37.0 years (range: 30-44) compared to 50 years (range: 24-83) in HBV-monoinfected women, p=0.08.
**Conclusions:** There is a high prevalence of HIV and HBV co-infection among HCC patients in South Africa. There is a trend towards younger age at diagnosis of HCC among HIV-positive women compared to those who are HIV-negative. Larger multi-centred studies are needed to more accurately evaluate the impact of HIV infection on the epidemiology of HCC among sub-Saharan populations where HIV is highly prevalent and HBV-driven HCC is common.

### ANTIRETROVIRAL TREATMENT ADHERENCE, VIREMIA, AND PSYCHIATRIC DIAGNOSIS THROUGHOUT ADOLESCENCE AMONG PERINATALLY HIV-INFECTED YOUTH

A. Bucek[1], C.-S. Leu[1], S. Benson[1], P. Warne[1], E. Abrams[2], K.S. Elkington[1], C. Dolezal[1], A. Wiznia[3], C.A. Mellins[1]
*[1]Columbia University, HIV Center for Clinical and Behavioral Studies, New York, United States, [2]ICAP, Columbia University, Mailman School of Public Health, New York, United States, [3]Jacobi Medical Center, Albert Einstein College of Medicine, Bronx, United States*
*Presenting author email: cam14@cumc.columbia.edu*

**Background:** Adolescence is associated with suboptimal medication adherence and is a time of increased risk for mental health and substance use disorders (SUD) that strongly predict antiretroviral treatment (ART) non-adherence in adults. Few studies of perinatally HIV-infected (PHIV+) youth have examined the relationships of psychiatric disorders to adherence and viral load (VL), longitudinally. This study utilized a diagnostic measure of psychiatric disorders including SUD to investigate the association of disorder with ART adherence and viremia as PHIV+ youth age.
**Methods:** We analyzed data from three follow-up interviews (FU2-4, N=179) spanning 2.7 years of a longitudinal study of PHIV+ youth (13-24 years at FU2; 51% female; 67% African-American/Black) in New York City. At FU2 and FU4, six categories of psychiatric disorder (anxiety, behavior, mood, SUD, any disorder, any disorder excluding SUD) were assessed with the Diagnostic Interview Schedule for Children. At each interview, participants reported on missed doses within the past week and 3 VL results +/-90 days from the interview were abstracted from medical charts.
Multiple logistic regression analyzed cross-sectional associations, at FU2 and FU4, between psychiatric disorders and two outcomes: 1)missed doses and 2)most recent VL>1000. Multiple linear regression analyzed the relationship between FU2 psychiatric disorder and proportion of VL tests >1000 across FU2-4. Analyses adjusted for age and sex.
**Results:** At FU2, 53% of youth had *any disorder*, 35% missed doses in the past week, and 47% had a VL>1000.
Cross-sectionally, at FU2, *behavioral disorder* was associated with missed dose (p=.009) and VL>1000 (p=.019) and *mood disorder* was associated with missed dose (p=.041). At FU4, *behavioral disorder* was associated with missed dose (p=.009). *Behavioral disorder* (p=.041), *SUD* (p=.016), and *any disorder* (p=.008) at FU2 were significantly associated with higher proportion of VLs >1000 across FU2-4. Other associations were not significant (p>.05).
**Conclusions:** This is the first study to identify that adolescent psychiatric diagnoses were concurrently associated with poor adherence and prospectively associated with viremia over time. Psychiatric disorders in adolescence may predict viremia over the next 2-3 years. Assessment and treatment of psychiatric and substance abuse problems may be critical to improving adherence and preventing poor health outcomes during this vulnerable stage.

### HIV ASSOCIATED NEUROCOGNITIVE DISORDER IN A PERI-URBAN HIV CLINIC IN KWAZULU-NATAL, SOUTH AFRICA

J.C. Mogambery[1,2], H. Dawood[1,3], D. Wilson[4], A. Moodley[5,6]
*[1]Grey's Hospital, Internal Medicine, Infectious Diseases, Pietermaritzburg, South Africa, [2]University of KwaZulu Natal, Internal Medicine, Pietermaritzburg, South Africa, [3]University of KwaZulu-Natal, CAPRISA, Durban, South Africa, [4]Edendale Hospital, Internal Medicine, Pietermaritzburg, South Africa, [5]Grey's Hospital, Neurology, Pietermaritzburg, South Africa, [6]University of KwaZulu-Natal (UKZN), Neurology, Pietermaritzburg, South Africa*
*Presenting author email: jadecaris@gmail.com*

**Background:** The prevalence of HIV associated neurocognitive disorder (HAND) in KwaZulu-Natal has not been established. This prospective, cross-sectional study determined the prevalence of HAND in ART naïve patients attending a peri-urban HIV clinic. The impact of HAND on functional capacity and factors associated with HAND were examined. Alternate neurocognitive tools were tested against the international HIV dementia scale (IHDS) score. An association between HAND and non-adherence to ART was explored.
**Methods:** Between May 2014 and May 2015, 146 ART naïve outpatients were assessed prior to commencing ART electively. HAND was diagnosed using an IHDS score ≤ 10. Functional capacity was assessed using the eastern cooperative oncology group (ECOG) score. The get-up-and-go test and center for epidemiological studies depression scale - revised (CESD-R) were performed at the same consultation and correlation between these two tests and IHDS was determined. A HIV viral load done 6 months after initiating ART was used as a surrogate marker for adherence to ART.
**Results:** The prevalence of HAND determined by the IHDS was 78/146 (53%). ECOG score was 0 in 99.9% of patients with HAND. CD4 count ≤ 200 cells/mm³ (p=0.17) and alcohol consumption (p=0.17) were not associated with HAND. There was no correlation between the get-up-and-go test, CESD-R and the IHDS score. Of the 129/146 patients with 6 month viral loads assays a detectable viral load was found in 24/69(35%) with HAND and 12/60(20%) without HAND. There was no significant association between HAND and a detectable viral load after 6 months of ART use (p=0.06).
**Conclusions:** Whilst the prevalence of HAND was high, it was not associated with impaired functional capacity. This finding suggests that early asymptomatic disease was prevalent in this population. A low CD4 count was not associated with HAND. The get-up-and-go-test and CESD-R were not useful in the diagnosis of HAND. A further study is needed to determine whether a relationship between HAND and non-adherence to ART exists.

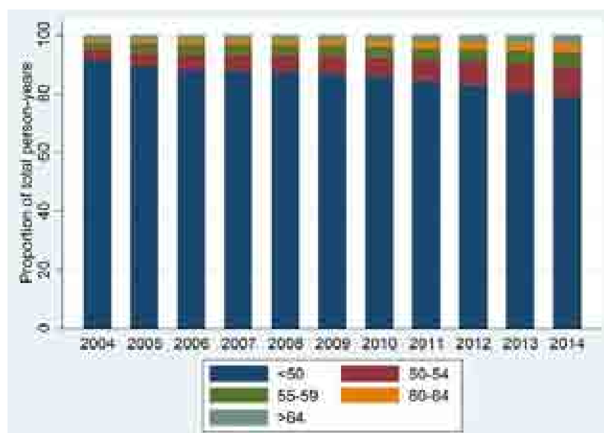
sons in the Cohort of the Spanish AIDS Research Network (CoRIS).

**Methods:** We calculated the age distribution in CoRIS, from 2004 to 2014, as the proportion of total person-years(py) in each age group (< 50;50-55;56-60;61-65;>65). We calculated incidence rates (per 1000py) for each comorbidity and the distribution of the number of comorbidities in persons >=50 compared with persons < 50 years. Age was modelled as a time-dependent variable.

**Results:** Overall, 9,569 (34385py of follow-up) persons were included, 83.5% were men, median age at entry was 35 years (Interquartile Range(IR): 29-43)and median CD4 count 384 (IR:203-582). Figure 1 shows changes in current age distribution by year; the proportion of total py aged >=50 years increased from 8.8% to 21.2%, from 2004 to 2014. Among those aged >=50 years, 17% of the total py presented one co-morbidity and 4% two or more, compared to 8% and 1%, respectively, among those aged < 50 years. Table 1 presents incidence rates for each comorbidity by age group. The most common comorbidities were psychiatric and Non-AIDS-Defining Malignancies (NADM).Comorbidity rates for cardiovascular, kidney-associated, bone fractures, metabolic and NADM were significantly higher for persons aged >=50years.

| | | Rate (95% CI) per 1000 person-years, by age group | | | |
|---|---|---|---|---|---|
| **Comorbidity** | **n** | **All** | **<50 years** | **>=50 years** | **P-value** |
| **Cardiovascular** | 85 | 2.49 (2.01;3.08) | 1.38 (1.01;1.88) | 8.75 (6.53;11.72) | <0.001 |
| **kidney-associated event** | 89 | 2.61 (2.12;3.21) | 2.07 (1.61;2.67) | 5.60 (3.89;8.06) | <0.001 |
| **Liver-associated event** | 94 | 2.76 (2.25;3.37) | 2.63 (2.10;3.29) | 3.46 (2.18;5.48) | 0.299 |
| **Bone** | 122 | 3.58 (3.00;4.28) | 3.19 (2.60;3.91) | 5.81 (4.06;8.31) | 0.004 |
| **Psychiatric** | 212 | 6.30 (5.50;7.20) | 6.30 (5.44;7.29) | 6.28 (4.44;8.88) | 0.987 |
| **Metabolic** | 87 | 2.55 (2.07;3.15) | 1.69 (1.28;2.24) | 7.40 (5.38;10.17) | <0.001 |
| **Other Non-AIDS infections** | 11 | 0.32 (0.18;0.58) | 0.27 (0.14;0.55) | 0.57 (0.18;1.77) | 0.281 |
| **Non-AIDS malignancies (more than one event per person is considered)** | 181 | 5.32 (4.60;6.16) | 5.16 (4.40;6.06) | 13.61 (10.77;17.20) | <0.001 |

*[Incidence rates (95% CI) per 1000 person-years for each comorbidity by age group]*



*[Age distribution in CoRIS since 2004 to 2014]*

**Conclusions:** Non-AIDS events have emerged as an important cause of comorbidity and multi-morbidity, especially among those with older age, and pose a new challenge for HIV treatment and care.

## WEPDB0106

### LOW RATES OF CHOLESTEROL SCREENING DESPITE CARDIOVASCULAR RISK IN PROTEASE INHIBITOR-TREATED HIV PATIENTS IN BOTSWANA

M. Mosepele[1,2,3], L. Mokgatlhe[4], P.F. Hudson[5], V. Letsatsi[6], R. Gross[7,8]
*[1]University of Botswana, Faculty of Medicine, Gaborone, Botswana, [2]Botswana Harvard Partnership, Gaborone, Botswana, [3]Harvard T.H. Chan School of Public Health, Immunology and Infectious Diseases, Boston, United States, [4]University of Botswana, Biostatistics, Gaborone, Botswana, [5]University of North Carolina, Infectious Disease, Chapel Hill, United States, [6]Princess Marina Hospital Infectious Disease Care Clinic, Gaborone, Botswana, [7]University of Pennsylvania Perelman School of Medicine, Philadelphia, United States, [8]Botswana-UPenn Partnership, Gaborone, Botswana*
*Presenting author email: mosepelemosepele@gmail.com*

**Background:** Treatment of human immunodeficiency virus (HIV) with protease inhibitors (PIs) is associated with increases in serum cholesterol levels. This association is strongest among those on 1st generation ritonavir boosted PIs. However, little is known about routine cholesterol screening and statin use to reduce risk of cardiovascular disease (CVD) among HIV-infected patients on PIs in sub-Saharan Africa (SSA) and how to increase appropriate screening.

**Methods:** Cholesterol screening and statin use was retrospectively assessed among HIV-infected patients on ritonavir boosted PI-containing antiretroviral (ART) between 2008 and 2012 at a large public urban HIV clinic in Botswana. Non-fasting lipid profile blood testing was prospectively recommended to the patient by the study team at time of enrolment for those without a lipid profile in the prior 12 months. Proportion of patients screened per year was calculated, and statin recommendation ascertained for each participant using atherosclerosis risk score (ASCVD) and Framingham risk score (FRS) as of 2012

**Results:** A total of 375 patients, median age 40 years, on ritonavir boosted PIs were enrolled. Sixty-four percent were female. Proportion of patients screened for hypercholesterolemia ranged between 19% and 30% per year during four years of observation, with 3% having hypercholesterolemia (>5.0mmol/L) and 1% using statins. After enrolment, the proportion of patients screened increased to 80%, and 31% had hypercholesterolemia. ASCVD guidelines recommended statin therapy for 14.3% of participants versus 9.4% by FRS.

**Conclusions:** Cholesterol screening during routine care among high risk HIV patients was low in a clinical setting in Botswana. The high rate of hypercholesterolemia and indication of statin therapy for nearly 15% of patients highlights a huge gap in addressing CVD risk reduction among PI-treated patients. The fact that patients obtained testing when directed to do so by study staff suggests that patient behaviour is not the barrier to testing. Future work should explore innovative ways to increase and sustain cholesterol screening and statin use to reduce CVD risk among HIV-infected patients in Botswana.

## WEPDC01 CIRCUMCISION: WHERE TO, HOW TO, WHO TO?

## WEPDC0102

### EVALUATION OF THE ACCUCIRC DEVICE FOR EARLY INFANT MALE CIRCUMCISION IN KISUMU, KENYA: UPTAKE AND SAFETY

I. Nyaboke[1], V. Pengo[1], S. Ojuok[1], M. Athiambo[1], E. Okello[1], F. Otieno[1], R. Plank[2], R.C. Bailey[3]
*[1]Nyanza Reproductive Health Society, Kisumu, Kenya, [2]Brigham and Womens Hospital, Div of Infectious Diseases, Boston, United States, [3]University of Illinois at Chicago, School of Public Health, Chicago, United States*
*Presenting author email: inyaboke@nrhskenya.org*

**Background:** As countries in sub-Saharan Africa scale up medical male circumcision (MMC), they are considering long term sustainable strategies, including early infant male circumcision (EIMC). AccuCirc is a single use, disposable device that comes in a sterile pre-packaged kit and may have advantages over the Mogen clamp, which is the currently approved device for EIMC in Kenya. This study assesses the safety and acceptability of the AccuCirc device for EIMC in 600 male infants in Kisumu, Kenya.

**Methods:** Infant boys are recruited through informational talks and materials at antenatal and maternal child health clinics, maternity wards and during post-natal visits. Mothers ≥18 years and their healthy infants aged ≤60 days with no genital abnormalities nor history of bleeding disorder and meeting weight-for-age criteria are enrolled. They are given a dorsal penile block, and circumcised using the AccuCirc. During the one-hour post-op observation period, questionnaires are administered to mothers to assess knowledge about EIMC and levels of satisfaction. Three days after circumcision the wound is assessed and mothers are asked additional questions. Data are entered into RedCap and analyzed using STATA version 13.1.

**Results:** Among 541 mothers and babies screened, 359 (66%) were eligible. Of these 110 (31%) opted for a Mogen clamp procedure; 249 (69%) were enrolled and circumcised using AccuCirc. The median age of mothers was 26 years (IQR=22,30); 20% were unmarried and 62% had greater than a primary education. The median age of infants circumcised was 16 days (IQR=7,32); 27% were ≤7 days and 73% were ≤30 days. There were no severe adverse events (AEs); there were 17 (6.8%) moderate AEs, all due to bleeding that occurred immediately after device removal. All were resolved in less than one hour. There were also 9 (3.6%) incomplete cuts, which required completion using surgical scissors or the Mogen clamp. Bleeding and incomplete cuts were more frequent in older/heavier babies. No infections or injuries to the glans were observed.
**Conclusions:** The AccuCirc device may be an efficient and safe alternative for EIMC. Restricting procedures to babies ≤30 days may reduce AEs. These results contribute evidence needed as countries transition from adult toward infant circumcision.

## WEPDC0103

### THE INTERACTION OF LOW MALE CIRCUMCISION AND HIGH PARTNER CONCURRENCY ON HIV RISK IN AFRICA: EVIDENCE FROM DEMOGRAPHIC AND HEALTH SURVEYS

M. Little[1], A. Fox[2]
*[1]Rutgers University, Institute for Health, Healthcare Policy & Aging Research, New Brunswick, United States, [2]University at Albany, Public Administration, Albany, United States*
*Presenting author email: madison.tyler.little@gmail.com*

**Background:** HIV rates vary widely across Sub-Saharan Africa. High rates of multiple concurrent sexual partners (MCP) and low rates of male circumcision (MC) have each separately been identified as underlying drivers of HIV in Sub-Saharan Africa. However, their joint contribution to HIV risk has not been examined empirically.
**Methods:** Using Demographic and Health Survey data on couples with linked serostatus, the joint impact of MC and MCP on HIV risk for men and women was examined through multilevel models that accounted for the prevalence of both indicators at the regional-level. "High-risk individuals" were categorized as those whose partner had other sexual partners and where the male was uncircumcised and "high-risk regions" as those where >5% of the population had multiple partners and < 80% of the population was circumcised. A varying-intercept model was run to identify the intercepts for MC prevalence and MCP prevalence and their interaction on individual risk for HIV infection, adjusting for individual demographic and behavioral covariates. The models were run on nearly 30,000 observations across 96 regions within 11 Sub-Saharan countries.
**Results:** Assessing the joint impact of MC and MCP at the individual-level, higher-risk individuals had up to a 15% higher likelihood of contracting HIV (p< 0.05). Assessing the joint impact at the regional level, living in a high-risk region was associated with up to a 3.2 times higher likelihood of being HIV-positive for men and up to nearly two times higher likelihood for women (p< 0.001). The lowest-risk regions had a mean HIV prevalence of 1.4% and highest-risk regions had a prevalence of 21.6%. With nearly a three-times higher relative risk, the regional-level interaction risk factor was more predictive of the HIV status for both sexes than the individual-level interaction factor (p< 0.001).
**Conclusions:** MC and MCP should not be addressed as separate interventions. While much emphasis has been placed on scaling up male circumcision, in the absence of concerted efforts to reduce sexual concurrency, increased circumcision may have a less-than-anticipated impact. Adopting an integrated approach to addressing male circumcision and sexual concurrency is critical to achieving the Sustainable Development Goal target 3.3: Ending the AIDS epidemic by 2030.

## WEPDC0104

### BARRIERS TO AND FACILITATORS OF VMMC UPTAKE AMONG OLDER MEN AGED 25-39 YEARS IN NYANZA REGION, WESTERN KENYA: THE TASCO STUDY

K. Agot[1], J. Grund[2], E. Mboya[1], P. Musingila[3], E. Omanga[1], D. Emusu[3], E. Odoyo-June[3], S. Ohaga[1], B. Otieno-Nyunya[3]
*[1]Impact Research and Development Organization, Research, Kisumu, Kenya, [2]Centers for Disease Control and Prevention, Division of Global HIV & TB (DGHT), Atlanta, United States, [3]Centers for Disease Control and Prevention, Kisumu, Kenya*
*Presenting author email: jgrund@cdc.gov*

**Background:** Kenya began rolling out voluntary medical male circumcision (VMMC) in 2008, with a goal of reaching 80% of approximately 1 million uncircumcised males aged 15-49 years by 2013. While over 700,000 males were circumcised by 2013, client demand for VMMC was primarily among younger clients, and uptake was lowest among men aged ≥25 years. We present reasons reported by men ≥25 years for going or not going for VMMC.
**Methods:** Between May 2014 and December 2015, we conducted a cluster randomized controlled study to assess the impact of two interventions (enhanced interpersonal communication and dedicated clinics for men aged ≥25 years) on the uptake of VMMC. We administered a questionnaire to men aged 25-39 years who were already circumcised at enrollment and those who received VMMC during the study on their reasons for going for VMMC. We also interviewed men who were uncircumcised at enrollment and those who remained uncircumcised at the end of the study, on their reasons for not going for circumcision.
**Results:** We interviewed 3,200 circumcised men and 2,781 uncircumcised men. For men who were circumcised before the study (n=2,848), reduction in HIV risk (43.7%) *(95% CI, 41.9, 45.6)* and culture/religion (18.4%) *(95% CI, 17.1, 19.9)* were the two most important reasons for getting circumcised, while for men circumcised during the study (n=352), reduction in HIV risk (50.9%) *(95% CI, 45.6, 55.6)* and improved genital hygiene (16.2%) *(95% CI, 12.5, 20.2)* were the top reasons for getting circumcised. For those uncircumcised at enrollment (n=2,781), lost wages was the main barrier (34.2%) *(95% CI, 32.6, 36.0)* followed by pain (27.8%) *(95% CI, 26.1, 29.4)* while among those who remained uncircumcised when the study closed and were interviewed at exit (n=1,265), top barriers were inconvenient time/venue *(43.2%) (95% CI, 40.4, 46.0)* and lost wages *(26.0%) (95% CI, 23.7, 28.5)*.
**Conclusions:** Reduction in HIV risk remains the primary reason why men aged 25-39 pursue circumcision while losing wages is the primary reason others remain uncircumcised. Demand creation efforts for older men must amplify key client-level facilitators while overcoming primary barriers.

## WEPDC0105

### SAFETY OF THE NO-FLIP TECHNIQUE AND SPONTANEOUS DETACHMENT FOR SHANGRING CIRCUMCISION IN BOYS AND MEN: RESULTS FROM A RANDOMISED CONTROLLED TRIAL

Q.D. Awori[1], R. Lee[2], P. Li[2], D. Ouma[1], N. Obura[1], M. Oundo[1], D. Mwamkita[1], B. Chirchir[3], M. Barasa[3], M. Kirui[3], P. Macharia[4], J. Oketch[5], P. Otiende[5], N. Nyangweso[5], M. Maina[6], N. Kiswi[6], M. Goldstein[2], J. Nyanchoka[1], M.A. Barone[7]
*[1]Engender Health, ShangRing Research Project, Nairobi, Kenya, [2]Weill Cornell Medical College, Urology, New York, United States, [3]Bon Sante Consuting, Nairobi, Kenya, [4]NASCOP, Ministry of Health, Nairobi, Kenya, [5]Homa Bay County Referal Hospital, VMMC, Homa Bay, Kenya, [6]Vipingo Health Centre, VMMC, Kilifi, Kenya, [7]Engender Health, ShangRing Research Project, New York, United States*
*Presenting author email: qawori@engenderhealth.org*

**Background:** Use of medical devices for voluntary medical male circumcision (VMMC) can offer several advantages. The ShangRing, a disposable single-use circumcision device, is simple to use, safe, and well-accepted in males 13 years old and above. We evaluated the safety, effectiveness, and acceptability of circumcision in males 10 years and above using a modified "no-flip" ShangRing technique, in addition to allowing spontaneous detachment of the device (as opposed to ring removal seven days after circumcision).
**Methods:** We enrolled men and boys seeking VMMC at two sites in Kenya. Participants were randomised to standard ShangRing removal seven days after circumcision vs. spontaneous device detachment. Weekly follow-up visits included evaluation of the degree of detachment if the ring was still in place, occurrence of adverse effects (AEs), and status of wound healing. Participants in the spontaneous detachment group could request device removal at any point during follow-up.
**Results:** 230 men and boys underwent ShangRing circumcision using the no-flip technique; 114 and 116 were randomised to the seven-day and spontaneous detachment groups, respectively. Mean ages in the two groups were 17.4 and 19.0 years, respectively. Mean circumcision times between the groups were similar (7.3±2.5 vs 7.0±2.6; p=0.4). All circumcisions were successfully completed using the ShangRing. Six (5.2%) and two (1.7%) moderate AEs were reported in the seven-day and spontaneous detachment groups, respectively, and were similar (p=0.17); there were no severe AEs. 84(72.4%) participants in the spontaneous detachment group wore the ring until it fell off; the remainder requested earlier removal. The probability of complete spontaneous detachment on seven, 14, and 28 days post-circumcision was 0.11, 0.63, and 1.00, respectively. Satisfaction with cosmetic results was high and similar in both groups—98.9% and 96.0% (p=0.3).
**Conclusions:** These results demonstrate the safety, acceptability, and effectiveness of the "no-flip" technique in males 10 years old and above, with 100% eligibility for all screened participants. Spontaneous detachment of the ring was safe and effective and was acceptable to a majority of men and boys. Use of the ShangRing as a single visit may significantly reduce the burden of service provision at health facilities.

### ADOLESCENT GIRLS' SUPPORT OF MALE PEERS AND SEXUAL PARTNERS RECEIVING VOLUNTARY MEDICAL MALE CIRCUMCISION SERVICES: IMPLICATIONS FOR DEMAND CREATION

M. Kaufman[1], K. Dam[2], K. Hatzold[3], L. Van Lith[2], G. Ncube[4], G. Lija[5], C. Bonnecwe[6], W. Mavhu[3], C. Kahabuka[7], K. Seifert-Ahanda[8], A. Marcell[9], L. Mahlasela[10], M.E. Figueroa[2], E. Njeuhmeli[8], A. Tobian[9], Adolescent VMMC Technical Advisory Group

*[1]Johns Hopkins Bloomberg, School of Public Health, Department of Health, Behavior & Society, Baltimore, United States, [2]Johns Hopkins University, Center for Communication Programs, Baltimore, United States, [3]Population Services International, Harare, Zimbabwe, [4]Ministry of Health and Child Welfare, Harare, Zimbabwe, [5]Ministry of Health and Social Welfare, Dar es Salaam, Tanzania, United Republic of, [6]National Department of Health, Pretoria, South Africa, [7]CSK Research Solutions, Dar es Salaam, Tanzania, United Republic of, [8]United States Agency for International Development (USAID) Washington/Global Health Bureau/Office of HIV/AIDS, Washington, DC, United States, [9]Johns Hopkins University, School of Medicine, Baltimore, United States, [10]Centre for Communication Impact, Pretoria, South Africa*

*Presenting author email: kdam@jhu.edu*

**Background:** Voluntary medical male circumcision (VMMC) in sub-Saharan Africa has reached a large number of adolescent males (ages 10-19). While some research has evaluated what attracts these boys to services, little is known as to female adolescents' involvement, if any, in the decision-making process and support of males being circumcised. This study explored adolescent girls' support of their male peers and sexual partners undergoing the procedure.

**Methods:** Twelve focus group discussions (FGDs) were conducted with female adolescents (ages 16-19) in South Africa, Tanzania, and Zimbabwe. These FGDs focused on the girls' opinions and perceptions of VMMC, including their perceived influence on VMMC uptake. In addition, 92 interviews were conducted with male adolescent VMMC clients 6-8 weeks post-procedure, which asked about their experiences in sharing their VMMC status or experience with girls. Audio recordings were transcribed, translated into English, and coded by two independent coders using qualitative coding software. Coders discussed discrepancies until at least 85% agreement was reached. Coded text was then assessed for themes.

**Results:** Overall, girls are supportive of VMMC. Girls discussed preferring circumcised male sexual partners over uncircumcised ones, citing the former's sexual appeal, hygiene, better sexual performance, and reduced chances of passing on infections (including HIV). Additionally, girls discussed being supportive of boys' decision to be circumcised and both overtly and covertly influencing their peers/partners to undergo VMMC. This was corroborated by some older boys who described how girls made them feel that if they got circumcised, then such girls would be more interested in them. In some instances, older boys reported girls using VMMC as criteria for selecting male partners. Girls discussed not necessarily offering tangible support during the healing process, but rather emotional support in making the decision to get circumcised. Younger boys (< 15 years) reported not interacting with girls much at all regarding VMMC.

**Conclusions:** Findings show that adolescent girls are involved in the VMMC decision-making process, especially with older adolescent boys. Given the apparent role of female peers/partners as support in influencing VMMC uptake, demand creation initiatives should continue to engage females in promoting VMMC to their male counterparts.

## WEPDC0107

### SAFETY OF A FACILITY-BASED VERSUS COMMUNITY-BASED MODEL OF EARLY INFANT MALE CIRCUMCISION USING THE MOGEN CLAMP IN WESTERN KENYA: MTOTO MSAFI MBILI STUDY

F. Adera[1], M. Young[2], T. Adipo[1], F. Otieno[1], S. Nordstrom[3], S. Mehta[4], R.C. Bailey[4]

*[1]Nyanza Reproductive Health Society, Kisumu, Kenya, [2]Emory University, Obstetrics and Gynecology, Atlanta, United States, [3]University of Illinois at Chicago, Obstetrics and Gynecology, Chicago, United States, [4]University of Illinois at Chicago, Epidemiology, Chicago, United States*

*Presenting author email: fadera@nrhskenya.org*

**Background:** As countries in sub-Saharan Africa (sSA) scale up male circumcision, they are considering long term sustainable strategies, including early infant male circumcision (EIMC). An important aspect of introducing EIMC in sSA settings is safety. We present AE rates associated infant circumcisions achieved during the Mtoto Msafi Study.

**Methods:** A standard delivery package (SDP) included training health providers in four facilities to deliver safe EIMC and all health facility staff to educate, promote and mobilize mothers in antenatal, maternal neonatal child health (MNCH) and immunization clinics and surrounding communities. A SDP-PLUS model included all SDP activities in four facilities plus provision of EIMC services in the community by trained domiciliary midwives (DM). Infant boys were recruited through informational talks at MNCH and maternity wards, during post-natal visits and in the community by the DMs. Mothers ≥16 years and their healthy infants aged ≤60 days with no genital abnormalities nor history of bleeding disorder and meeting weight-for-age criteria were eligible. They were circumcised using the Mogen clamp after a dorsal penile block. Follow-up to assess the wound occurred three days after circumcision or as needed.

**Results:** Among 1681 babies screened, 1598 (95%) were eligible and circumcised: 561 in the SDP and 1037 in the SDP-PLUS community. Reasons for ineligibility were: under weight-for-age (34%), rashes or infections (18%), fever (15%) genital abnormalities (12%), jaundice (8%) and other (13%). Median age of mothers was 24 years (IQR=20,28); median age of infants was 8 days (IQR=1,36) and median weight was 3.6kg (IQR=3.1,4.4). Follow-up occurred in 72% of babies. There were 6 moderate (0.3%) and 5 severe (0.3%) adverse events (AEs). Among SAEs, 3 were in the context of training. Three were deaths, two of which were unrelated to EIMC, one possibly related. One was intra-operative bleeding requiring suturing, and one was a post-operative hematoma. No AEs were associated with procedures done in the community by DMs.

**Conclusions:** EIMC can be provided in a sSA community setting safely with low occurrence of AEs. SAEs possibly related or unrelated to the procedure may occur, requiring emergency response. These results contribute evidence needed as countries transition from adult toward infant circumcision.

# WEPDC02 PREVENTION FOR WOMEN: THE NEED FOR MULTIDISCIPLINARY APPROACHES

## WEPDC0201

### VAGINAL BACTERIA ASSOCIATED WITH INCREASED RISK OF HIV ACQUISITION IN AFRICAN WOMEN

R.S. McClelland[1], J.R. Lingappa[1], G. John-Stewart[1], J. Kinuthia[2], K. Yuhas[1], W. Jaoko[3], S. Srinivasan[4], K.N. Mandaliya[1], T.L. Fiedler[4], M.M. Munch[4], B.A. Richardson[1], J. Overbaugh[4], D.N. Fredricks[4]

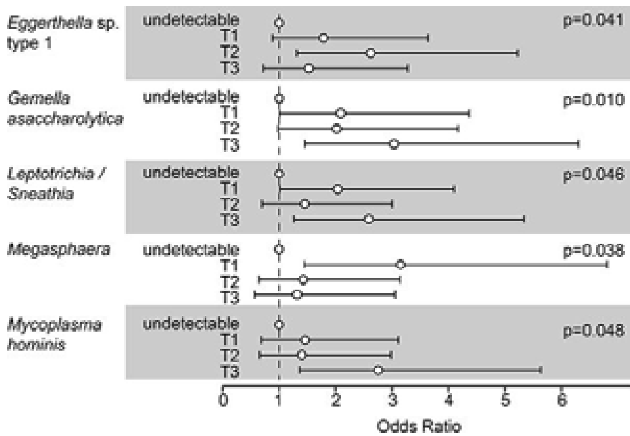
*[1]University of Washington, Seattle, United States, [2]Kenyatta National Hospital, Nairobi, Kenya, [3]University of Nairobi, Nairobi, Kenya, [4]Fred Hutchinson Cancer Research Center, Seattle, United States*

*Presenting author email: mcclell@uw.edu*

**Background:** Disruptions of the vaginal microbiota have been associated with increased HIV-1 risk. This study utilized molecular characterization of vaginal microbiota to test the hypothesis that specific vaginal bacteria are associated with increased risk of HIV-1 acquisition.

**Methods:** A nested case-control study was conducted in cohorts of women in Kenya, Uganda, Tanzania, Zambia, Botswana, and South Africa. Vaginal microbiota was compared at the pre-seroconversion sample in women who acquired HIV-1 (cases) versus women in the same cohort who remained seronegative (controls). Characterization of vaginal microbiota included deep sequence analysis of broad-range 16S rRNA gene polymerase chain reaction (PCR) products, and bacterium-specific quantitative PCR (qPCR) assays for selected bacteria.

**Results:** Among 349 women (87 cases and 262 controls), 40 were from a female sex worker cohort, 112 were from a cohort of pregnant and post-partum women, and 197 were HIV-seronegative women in discordant couples cohorts. Their median age was 28 years (interquartile range 22-35) and 77 (22.1%) were pregnant. Vaginal bacterial community diversity was higher in women who acquired HIV-1 compared to seronegative controls (mean Shannon Diversity Index 1.3 (standard deviation (SD) 1.0) versus 0.9 (SD 0.9), p=0.02. Based on comparison of relative abundance in cases versus controls, 15 taxa were selected for qPCR testing. Of these, *Eggerthella* species type-1, *Gemella asaccharolytica*, *Leptotrichia/Sneathia*, *Megasphaera*, and *Mycoplasma hominis* each showed a significant association with HIV-1 acquisition when undetectable levels were compared to tertiles representing increasing bacterial concentrations. High correlation between species precluded including multiple species together in a single multivariable model. These results remained significant after adjustment for age, pregnancy, contraceptive type, number of sex partners, frequency of sex, and recent unprotected intercourse (Figure 1).



*[Figure 1: Association between vaginal bacterial concentration and odds of HIV acquisition]*

**Conclusions:** Women's HIV-1 susceptibility may be influenced by the presence and quantity of key vaginal bacteria, including a number of fastidious bacteria recently linked to bacterial vaginosis.

## WEPDC0202

### A brief, trauma-informed intervention is feasible and acceptable, increases safety behaviour, and reduces HIV risk among drug-involved women who trade sex

M. Decker[1], C. Tomko[1], E. Wingo[1], S. Peitzmeier[1], A. Sawyer[2], N. Glass[3], S. Sherman[1]
*[1]Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, [2]Baltimore City Health Department, Baltimore, United States, [3]Johns Hopkins School of Nursing, Baltimore, United States*
*Presenting author email: mdecker@jhu.edu*

**Background:** The HIV epidemic among female sex workers (FSWs) is shaped by structural, social network, and behavioral factors. Violence is pervasive and associated with risk behavior and infection, yet interventions to respond to violence are limited.
**Methods:** Our intervention was developed in partnership with practitioners and clients from community-based organizations, who prioritized violence-related support, connection to services and responding to the myth that sex workers cannot be raped. The brief (3-5 minute), trauma-informed intervention (INSPIRE) was implemented with drug-involved FSWs in Baltimore, MD and evaluated for feasibility, acceptability and effect via a quasi-experimental, single group pretest-posttest study; baseline n=60; n=39 (65%) at follow-up; non-differential by baseline measures.
**Results:** At follow-up, participants had improved condom negotiation confidence (p=0.04), and reduced frequency of sex trade under the influence of drugs/alcohol (p=0.04). Endorsement of sex work-related rape myths decreased (p=0.04), and safety behavior scores increased (p< .001). Participants improved knowledge and use of support services for sexual violence and intimate partner violence. At follow-up, 68% knew at least one place to obtain assistance reporting violence to police, and 29% had approached such a program. Participants emphasized the value of a safe and supportive space to discuss violence; their feedback and that of community partners indicated high feasibility and acceptability of this brief, low-dose intervention.
**Conclusions:** Findings indicate the feasibility and acceptability of brief, trauma-informed discussion of safety and resources in the context of HIV risk reduction for FSWs, and suggest the potential for impact. This approach appears to prompt engagement in safety strategies, decrease the extent of sex trade under the influence, and bolster confidence in condom negotiation. INSPIRE influenced endpoints identified as valuable by community partners, specifically connection to support services and countering structural forces that falsely blame sex workers for violence. Future implementation research can advance limitations of our pilot study, including the short follow-up duration and attrition. These early results can inform scalable interventions that address the impact of trauma on HIV acquisition and care trajectories for FSWs, and in doing so address the dual epidemics of violence and HIV to support health and human rights.

## WEPDC0203

### HIV pre-exposure prophylaxis (PrEP) formulation preference among women participating in the qualitative component of the ASPIRE (MTN-020) study

A. van der Straten[1,2], M.K. Shapley-Quinn[1], K. Reddy[3], H. Cheng[1], J. Etima[4], K. Woeber[5], P. Musara[6], T. Palanee-Phillips[3], J. Baeten[7], E.T. Montgomery[1], MTN-020/ASPIRE Study Team
*[1]RTI International, WGHI/ Center for Global Health, San Francisco, United States, [2]University of California San Francisco, Center for AIDS Prevention Studies (CAPS), San Francisco, United States, [3]Wits Reproductive Health and HIV Institute, Johannesburg, South Africa, [4]Makerere University - Johns Hopkins University Research Collaboration, Kampala, Uganda, [5]Medical Research Council, Durban, South Africa, [6]UZ-UCSF Collaborative Research Programme, Harare, Zimbabwe, [7]University of Washington, Seattle, United States*
*Presenting author email: ariane@rti.org*

**Background:** During MTN-020/ASPIRE, a phase III trial of the Dapivirine vaginal ring in Africa, preferences for various PrEP delivery forms (including the ring) were explored in a subsample of participants receiving exit in-depth interviews (IDIs).
**Methods:** Participants were presented with pictures and descriptions of 9 possible PrEP formulations (vaginal gel, ring, suppositories, and films; oral tablets, injections, implants, male and female condoms) and asked to discuss these, first in relation to the ring and second to select the formulations they would be most/least interested in for future use. IDIs were summarized in reports for rapid review of key findings; levels of interest in products were tabulated and themes related to product preference were extracted.
**Results:** In the qualitative subsample (N=71; Malawi n=12; South Africa n=34, Uganda n=13, Zimbabwe n=12), baseline median age was 26 (range 18-45 years), all had a primary sex partner; 41% reported using a male condom at last sex; the most common current contraceptives were injections (52%) and implants (24%). Participants expressed most interest for future PrEP formulated as rings (94%), implants (39%) and injections (34%). Positive attributes of these methods included being long-acting, discreet, familiar and easy-to-use. The ring was also liked for reliability, lack of side effects and comfort. Opinions were divided for implants and injections (28% and 32% uninterested in future use, respectively) due to needle-phobia, pain upon administration, low reversibility and fear of side effects based on previous contraceptive experience. Formulations participants had least interest in included: oral tablets (61%), vaginal gel (55%) and film (41%). Attributes of tablets that were disliked included the daily regimen, difficulty in swallowing and stigma related to taking HIV medicines. The gel, films and other vaginal formulations were disliked because of the act of vaginal insertion, coital use, effect on sex and lack of familiarity.
**Conclusions:** Diverse PrEP formulations elicited interest in this subsample, with long-acting methods being favored. Despite high interest in the vaginal ring, other vaginal products did not generate much interest. Familiarity, reliability, absence of side effects and low burden in terms of administration and use were determined as important attributes to consider for new PrEP formulations.

## WEPDC0204

### Sexual behaviour of men and women within age-disparate partnerships in South Africa: implications for young women's HIV risk

B. Maughan-Brown[1], M. Evans[2,3], G. George[4]
*[1]University of Cape Town, Southern Africa Labour and Development Research Unit (SALDRU), Cape Town, South Africa, [2]Institute for Humanities in Africa (HUMA), University of Cape Town, Cape Town, South Africa, [3]University of Cape Town, Department of Sociology, Cape Town, South Africa, [4]Health Economics and HIV and AIDS Research Division (HEARD), University of KwaZulu Natal, Durban, South Africa*
*Presenting author email: brendan.maughanbrown@gmail.com*

**Background:** Age-disparate partnerships are hypothesized to increase HIV-risk for young women. However, the evidence base remains mixed. Most studies have focused only on unprotected sex among women in the partnership. Consequently, little is known about other risky behaviours, such as transactional sex, alcohol use, and concurrency, as well as the behaviours of the men who partner with young women. We therefore examined various sexual behaviours of both young women and of men in partnerships with young women in order to investigate whether age-disparate partnerships involve riskier sexual behaviour.
**Methods:** We used nationally representative data from South Africa (2012) on partnerships reported by 16-24 year old women (n=818) and by men in partnerships with 16-24 year old women (n=985). We compared sexual behaviours in age-disparate partnerships and age-similar partnerships, using multivariate logistic regression to control for potential confounders and to assess rural/urban differences.
**Results:** Young women in age-disparate partnerships were more likely to report unprotected sex than in similar-aged partnerships (aOR:1.51; p< 0.05). Men in partnerships with young women were more likely to report unprotected sex (aOR:1.92; p< 0.01), transactional sex (aOR:2.73; p< 0.01), drinking alcohol before sex (aOR:1.60;

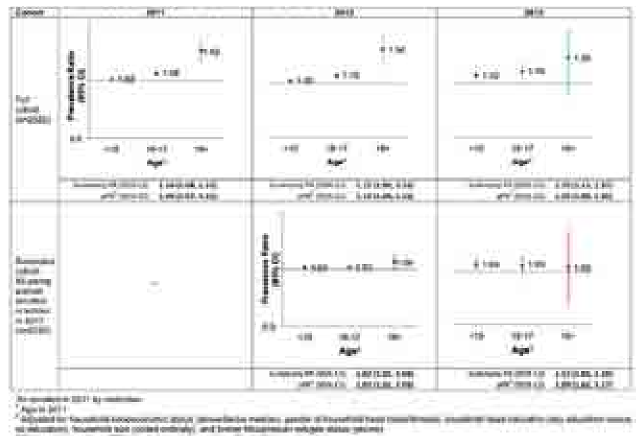
p< 0.1), and concurrency (aOR:1.39; p< 0.1) when their partners were five or more years younger. Significant associations between age-disparate partnerships and transactional sex (aOR:4.14; p< 0.01) and alcohol use (aOR:2.24; p< 0.05) were only found in urban areas.
**Conclusions:** Results provide evidence that young women's age-disparate partnerships involve greater sexual risk, particularly through the risky behaviours of their male partners, with the risk amplified for young women in urban areas.

## WEPDC0205

### EVIDENCE FOR SELECTION EFFECT AND HAWTHORNE EFFECT IN BEHAVIOURAL HIV PREVENTION TRIAL AMONG YOUNG WOMEN IN RURAL SOUTH AFRICA

M. Rosenberg[1], A. Pettifor[2], R. Twine[3], J. Hughes[4], F.X. Gomez-Olive[1], R.G. Wagner[3], A. Selin[5], C. MacPhail[6], K. Kahn[3]
*[1]Harvard University, School of Public Health, Center for Population and Development Studies, Cambridge, United States, [2]University of North Carolina - Chapel Hill, Epidemiology, Chapel Hill, United States, [3]University of the Witwatersrand, MRC/Wits Rural Public Health and Health Transitions Research Unit (Agincourt), Johannesburg, South Africa, [4]University of Washington, Biostatistics, Seattle, United States, [5]University of North Carolina - Chapel Hill, Carolina Population Center, Chapel Hill, United States, [6]University of New England, School of Health, Armidale, Australia*
*Presenting author email: mrosenb@hsph.harvard.edu*

**Background:** HPTN 068 was a randomized controlled trial to examine whether cash transfers conditional on school attendance reduce the risk of HIV acquisition in young South African women. Findings indicated no difference in HIV acquisition between study arms, with low HIV incidence and high levels of school enrollment in both treatment and control groups. We examine whether school enrollment trajectories of the study participants differed from the underlying study population, and whether differences could be attributed to existing differences in school enrollment at baseline (selection effect) or differences that arose during study participation (Hawthorne effect).
**Methods:** Using census data from the Agincourt Health and Socio-Demographic Surveillance System within which the HPTN 068 trial was nested, we constructed a cohort of 2525 young women between the ages 13-20 in 2011. Using log-binomial regression models, we compared 2011 and 2012 school enrollment between those who did (n=1145) and did not (n=1380) enroll in HPTN 068 in 2011. To isolate the Hawthorne effect we restricted the cohort to those enrolled in school at time of study enrollment. We adjusted for key sociodemographic characteristics and stratified by age.
**Results:** Nearly all HPTN 068 participants (97%) were still enrolled in school in 2012 compared to 86% of non-participants. The magnitude of association between study enrollment and school enrollment was strongest among those who were older at baseline. Small but statistically significant effects remained in the restricted cohort. Similar preliminary findings were observed in 2013.
**Conclusions:** HPTN 068 participants, regardless of study arm, were more likely to be enrolled in school than non-participants. Our findings suggest that both selection and Hawthorne effects may have diminished the differences in school enrollment between study arms and is one plausible explanation for the null study effect. The Hawthorne-specific findings generate hypotheses for how to structure school retention interventions to prevent HIV.



*[Figure 1. The association between enrollment in the HIV prevention trial in 2011 and school enrollment in 2011, 2012 and 2013, stratified by age, in both the full cohort and a restricted cohort of those enrolled in school in 2011]*

## WEPDC0206

### ADHERENCE TO TOPICAL PREP: QUALITATIVE FINDINGS FROM THE FACTS 001 TRIAL

J. Stadler[1], S. Delany-Moretlwe[1], D. Baron[1], S. Ju[2], G. Gray[3], H. Rees[1], FACTS 001 Study Group
*[1]University of the Witwatersrand, Reproductive Health and HIV Institute, Johannesburg, South Africa, [2]CONRAD, Arlington, United States, [3]SAMRC, Cape Town, South Africa*
*Presenting author email: jstadler@wrhi.ac.za*

**Background:** In the FACTS 001 phase III trial, a peri-coital (before and after sex) vaginal application of tenofovir 1% gel did not prevent HIV-1 infection amongst young South African women. Given that sub-optimal adherence can dilute estimations of efficacy, understanding what shaped gel use in FACTS 001 is critical to comprehend these outcomes.
**Methods:** A random sample of 145 participants was selected from the trial population, weighted to reflect enrolment distribution at the nine trial sites. Participants were invited to an in depth interview (IDI) at their product discontinuation visit. IDIs were conducted in a language of the participant's choice and were recorded, transcribed and translated. Nvivo 10 was used to code interview text that reflected the key research objectives and themes arising from the literature on other HIV prevention trials: risk of HIV; perceived efficacy and acceptability of the gel; comprehension of the peri-coital dosing regimen; and relationship dynamics.
**Results:** A total of 136 participants were interviewed. Interviewees broadly represented the main trial population: a cohort of predominantly young (average 22 years), single (87%) and unemployed women (78%), who mostly resided with their parents (62%). Recognising their risk of HIV infection, they expressed hopefulness that the trial gel would provide protection. Women liked the gel because it enhanced their sexual experiences, and they believed it improved their health. However, the required dosing regimen, especially the post-sex dose, was not always feasible under certain circumstances, particularly when living apart from partners, and when attempting to conceal gel use from partners.
**Conclusions:** Despite their perceived vulnerability to HIV, the hope for an effective product, and favourable experiences of using the gel, many FACTS 001 participants were unable to integrate the gel into their lives and use it consistently enough to provide protection against HIV. Social contextual factors such as residential and intimate partner dynamics can be critical in limiting women's agency to use HIV prevention products. This has implications for the PrEP field and indicates the need for programs to support adherence that considers women's everyday lives.

# WEPDD01 TRANSLATING TRADITION IN THE AIDS RESPONSE

## WEPDD0101

### PROMISE OR PERIL? THE NATURE OF MEDICAL PLURALISM ALONG THE CASCADE OF CARE FOR HIV/AIDS IN EASTERN AND SOUTHERN AFRICA

M. Moshabela[1], D. Bukenya[2], G. Darong[3], J. Wamoyi[4], T. Zuma[3], J. Renju[5,6], C. Nyamukapa[7,8], W. Ddaaki[9], O. Bonnington[6], J. Seeley[6], V. Hoosegood[10,11], A. Wringe[6]
*[1]University of KwaZulu Natal, Africa Centre for Population Health, Durban, South Africa, [2]Medical Research Council, Uganda Virus Research Institute Programme on AIDS, Entebbe, Uganda, [3]University of KwaZulu Natal, Africa Centre for Population Health, Mtubatuba, South Africa, [4]Tanzanian National Institute of Medical Research, Mwanza, Tanzania, United Republic of, [5]Kilimanjaro Christian Medical Centre, Moshi, Tanzania, United Republic of, [6]London School of Hygiene and Tropical Medicine, London, United Kingdom, [7]Biomedical Research and Training Institute, Harare, Zimbabwe, [8]Imperial College, London, United Kingdom, [9]Rakai Health Sciences Program, Rakai, Uganda, [10]Southampton University, Southampton, United Kingdom, [11]Africa Centre for Population Health, Mtubatuba, South Africa*
*Presenting author email: moshabela@ukzn.ac.za*

**Background:** There are concerns that medical pluralism may delay patients' progression through the HIV cascade and contribute to poor treatment outcomes. However there is a dearth of evidence regarding pluralistic practices among PLHIV in different African settings in the context of widespread ART use. We aimed to address this gap by documenting patients' experiences with HIV care across medical systems, identify dominant patterns of medical pluralism, and explore their implications for health outcomes.
**Methods:** We purposively selected 180 participants from each stage of the cascade in six demographic surveillance sites in five east and southern African countries: Uganda, Kenya, Tanzania, Malawi, Zimbabwe, and South Africa. In-depth interviews were conducted using shared tools across sites. We used pathways to care analysis to code and map the health care-seeking journeys of participants, which were com-

pared with their illness experiences using a constant comparison method.
**Results:** Identified patterns of medical pluralism included use of dominant public sector clinics and hospitals with use of
1) private sector practitioners and chemists,
2) indigenous sector traditional healers and herbalists, and
3) religious sector faith healers and prophets.
These patterns differed depending on the cascade stage, available sources of health care, and other contextual factors in each country. Sequential medical pluralism, adopted for alternative care purposes, appeared more common prior to ART, largely around HIV testing and linkage to care, both associated with delays. Concurrent medical pluralism, used for complementary purposes, appeared more common among ART patients. Patients engaged in medical pluralism predominantly to compensate for aspects of HIV care needed but not received from their main public sector providers, rather than to seek substitute services.
**Conclusions:** Sequential medical pluralism may act as a bottleneck towards ART initiation. Concurrent medical pluralism suggests a tendency towards complementary forms of health care utilization among ART users, which may be deemed necessary by individual patients in order to complete their desired or required package of health care. Complementary approaches may serve a purpose of resolving tensions and minimize competition between sources of health care, but carry the risk of drug-drug interactions.

## WEPDD0102

### CLAIMS OF A CURE: USE OF CD4 CELL COUNT RESULTS TO GUIDE TRADITIONAL TREATMENT IN BUSHBUCKRIDGE, SOUTH AFRICA

C. Audet[1], S. Ngobeni[2], R. Wagner[2]
*[1]Vanderbilt University, Medical Center, Health Policy & Global Health, Nashville, United States, [2]University of the Witwatersrand, Johannesburg, South Africa*
*Presenting author email: carolynaudet@gmail.com*

**Background:** Traditional healers play an important role in providing health care in much of sub-Saharan Africa, due to both their greater accessibility and acceptability. In rural northeastern South Africa (SA), studies have documented HIV patients using both traditional and allopathic healers, often 'ping-ponging' back and forth between the two systems. The initial use of traditional healers can cause delays in initiation of life-saving medicine for serious conditions such as HIV.
**Methods:** We conducted 27 in-depth interviews and 133 surveys with a random sample of traditional healers living in Bushbuckridge, SA to document illnesses treated, methods for diagnosis, self-reported effectiveness of treatments, and the monetary fees they charged for a variety of ailments, including HIV.
**Results:** Healers in the rural Bushbuckridge were mostly female (77%), older (median = 58 [IQR: 50-67 years]), with low levels of education (median = 3.7 [IQR: 3.2-4.2]) years). Our qualitative interviews revealed that healers treating probable HIV-infected patients first referred them to the clinic for testing and confirmation. Subsequently if the patient preferred traditional treatment, they differentiated between two categories of known HIV-infected patients: (1) those with CD4 < 350 cells/mm$^3$ and (2) those with > 350 cells/mm$^3$. Only patients with "low" CD4 cell counts were routinely referred back to health facilities for antiretroviral therapy. Among those surveyed, 39 (30%) reported successfully treating adult HIV-infected patients with CD4 cell >350 cells/mm$^3$. Healers who reported treating HIV-infected patients treated more patients (median 8.7 vs. 4.8 per month; p=0.03), had been practicing for less time (median 16.9 vs. 22.8 years; p=0.03), and had lower levels of education (2.8 vs 4.1 years; p=0.017). Both groups experienced similar number of blood exposures during their treatments (median 1.5 vs 1.0; p=0.24). Healers charged a median of 1500 Rand (~92 USD) to treat patients (with high CD4) for HIV.
**Conclusions:** Traditional healers in rural SA do refer suspected HIV-infected patients to biomedical care, yet continue to treat patients once confirmed, particularly when patients have a CD4 cell count >350 cells/mm$^3$. Given that patients with higher CD4 cell counts have fewer physical symptoms of HIV-infection, a greater emphasis on patient education and healer engagement are warranted.

## WEPDD0103

### MOONLIGHT METHADONE FOR MUSLIMS ON MEDICALLY ASSISTED THERAPY CURBING DRUG RELAPSE IN MALINDI, KENYA

S. Abdallah[1], F. Ibrahim[2], M. Kirimo[3], A. Mongi[3], J. Baya[3], M. Shossi[4], A. Omar[2]
*[1]UNODC, Mombasa, Kenya, [2]Kilifi County, Kilifi, Kenya, [3]Malindi Sub-County Hospital, Malindi, Kenya, [4]The Omari Project, Malindi, Kenya*

**Background:** It is widely acknowledged that heroin dependence results in homelessness, family disruption, social instability and marginalization. Anecdotal reports indicate many members of society regard people who use drugs as sinners. Although 2011 UNODC Study Kenya revealed 55% of all PWID are Christian, 42% Muslim. Nairobi PWID comprise 16% versus 72% at Coast. Evidence regarding spiritual support for PWID is limited.
**Description:** Following initiation of Medically Assisted (MAT) Program in Malindi, enrolled Muslim MAT clients expressed a desire to fast during Ramadhan 2015. From May 2015 they requested MAT clinic team to to dispense methadone after sunset for Muslim clients or wean them off methadone 6 weeks before Ramadhan. Unfortunately national guidelines for MAT don't recommend take home doses, dispensing by non-pharmacists or beyond operational hours. International MAT experts restricted detox for incarcerated MAT clients and advised against shifting MAT Clinic operational hours to assure structured way of life for clients. Religious leaders recommended MAT clients adopt Islam's waiver from fasting for sick, pregnant or nursing women. Malindi hospital unwilling to dispense methadone at 24-hour main pharmacy due to security concerns. Mathari MAT Clinic in Nairobi rejected a similar plea as its Muslim MAT Clients were few (< 10).
**Lessons learned:** On 1st day of Ramadhan 2015, almost 40 clients missed daily methadone dose. By third day, severe withdrawal drove a few Muslim clients to MAT pharmacy for daily dose. Clients who showed up on subsequent days required re-induction. However, by 7th Ramadhan, 29 clients still kept away. Rumours that some fasting clients were taking heroin after sunset and at pre-dawn to manage their withdrawal prompted Malindi MAT Clinic team to unanimously approve evening dispensing for fasting Muslim clients. Eligibility for evening doses for MAT defaulters: 3-days re-induction at daytime. 3 fasting clients refused to comply. On 12th Ramadhan, 26 fasting clients accessed evening services. All routinely reported immediately after prayers; within 40 minutes, all doses dispensed. This service was halted on Eid day.
**Conclusions/Next steps:** Moonlight dispensing enabled Muslim clients to fast after years of drug use while improving client-provider relations. As Kenya scales up MAT program, prioritize spiritual recovery for MAT Clients.

## WEPDD0104

### TAKING ON FAITH: A NARRATIVE ANALYSIS OF DISCUSSIONS ABOUT HIV USED BY PARTICIPANTS PLATFORMS FOR CONTESTING FAITH IN 9 HIGH HIV-BURDEN COMMUNITIES IN THE WESTERN CAPE, SOUTH AFRICA

S. Nomsenge[1], A. Thomas[1], G. Hoddinott[1], G. Carolus[1], V. Bond[2,3],
On behalf of HPTN 071 (PopART) Study Team
*[1]Stellenbosch University, Desmond Tutu TB Centre, Department of Paediatrics and Child Health, Cape Town, South Africa, [2]Zambart, Lusaka, Zambia, [3]LSHTM, Department of Global Health and Development, London, United Kingdom*
*Presenting author email: snomsenge@gmail.com*

**Background:** The history of HIV in southern Africa is interwoven with faith. Faith-based institutions and prominent faith leaders were often key in championing HIV rights. Community-based care networks were often underpinned by faith-based principles of altruism and care. Conversely, faith institutions may also be associated with harmful moralising and sexual conservatism linked to stigma and with a focus on abstinence and partner fidelity. With increasing ART availability, faith is sometimes now equated with 'alternative health beliefs' that hinder uptake and adherence.
**Methods:** Between December 2012 and May 2013 we conducted research to describe the HIV landscape in 9 study communities in the Western Cape, South Africa. In each study community, we spent approximately 10 days conducting semi-structured observations, group discussions (48, participants = 232) and interviews (32) with residents and health service stakeholders (some also faith leaders). We present a narrative analysis of how HIV is used in community discussions in relation to interpreting 'faith'.
**Results:** Over the course of data collection participants often used this HIV research as an opportunity to talk about faith. A core faith-based dilemma underpins the narratives which we interpret as 'charity *versus* justice'. On the one hand, HIV requires people to act charitably - holding empathetic attitudes, showing community solidarity, and acting selflessly. When describing this response, participants often also drew on wider post-colonial, post-*Apartheid* narratives of returning to cherished cultural values of inclusivity. On the other hand, HIV is also often aligned with stigmatised (or otherwise morally marginalised) social groups. In this positioning, faith-based values of chastity, being held accountable to moral choices, and penance for sin are called upon to justify marginalising people living with HIV. Several faith-based leaders circumvented this dilemma by drawing a distinction between matters of the body (like HIV) and soul. This distinction enabled discussion of experiences of living with HIV and sexual morality on separate registers (empathy *and* justice).
**Conclusions:** Faith is a double-edged sword for HIV interventions, both preaching charity and being used to justify alienating individuals who are deemed responsible for acquiring HIV. Attempts to re-interpret this narrative (to facilitate faith-based participation in health messaging) should be further investigated.

### CAPACITY BUILDING OF TRADITIONAL HEALTH PRACTITIONERS TO MAINSTREAM HIV AND AIDS PREVENTION IN ZIMBABWE

F. Dube, M. Dube, A. Mpofu, T. Magure, I. Taramusi
*National AIDS Council, Harare, Zimbabwe*
*Presenting author email: fdube@nac.org.zw*

**Background:** The purpose of this project was to strengthen the capacity of Traditional Health Practitioners (THPs) in HIV and AIDS prevention and treatment. The National AIDS Council spearheaded the local implementation of the project, which was simultaneously implemented in South Africa and Botswana, funded by the SADC. Specifically, the project sought to train 360 THPs in HIV prevention and treatment in Zimbabwe in two years.

**Description:** A three member project steering committee, comprising NAC, Ministry of Health and Child Care and a representative of the THPS was established. After this, an all inclusive stakeholders consultative meeting to sensitise them on the objectives of the project and obtain their buy-in was held. A manual was then developed and translated into Ndebele and Shona. Six people, including three THPS were trained as facilitators.

A total of 296 THPs were trained in five provinces. At the end of the SADC funded project, the National AIDS Council adopted the project and has trained an additional 180 THPs. During the training most THPs confirmed claims that condoms contain HIV causing worms and that the THPs could treat AIDS. These claims and others were demystified during training. 40% of the trained THPs underwent HIV counselling and testing, provided during training. In addition condoms were provided to the THPs to dispense to their clients at home. 100 healers have been followed up 12 months after training and 90% of them found to be practising what they learnt, in particular referring clients for HIV counselling and testing, record keeping and art adherence counselling.

**Lessons learned:**

- Most THPs have serious misconceptions about causes of HIV and that they treat AIDS
- The misconceptions are due to lack of knowledge on the causes of HIV and its management
- THPs are willing to collaborate with mainstream health care as long as this does not lead to loss of income
- Engaging THPs should not discredit their work but amplify it
- THPS can become good partners in responding to HIV and AIDS

**Conclusions/Next steps:** NAC continues to fund this intervention to ensure all provinces are covered and also monitor post course behaviour.

## WEPDD0106

### DEVELOPING AN ETHICAL INDIGENOUS RESEARCH PROTOCOL: SOWING SEEDS FOR THE INCLUSION OF INDIGENOUS PEOPLES WITH HIV

C.D.P. Montalvo Pacahuala[1], T. Stratton[2], R. Masching[3], A. King[3,4], C. Aspin[5]
*[1]International Indigenous Working Group on HIV & AIDS (IIWGHA), Investigación, Lima, Peru, [2]International Indigenous Working Group on HIV & AIDS (IIWGHA), Coordination, Vancouver, Canada, [3]Canadian Aboriginal AIDS Network, Research, Halifax, Canada, [4]Simon Fraser University, Faculty of Health Sciences, Burnaby, Canada, [5]Royal University of Phnom Penh, Dentistry Departament, Phnom Penh, Cambodia*
*Presenting author email: pmontalvop@gmail.com*

**Background:** Indigenous responses to HIV/AIDS have been underway for over two decades. The International Indigenous Working Group on HIV and AIDS (IIWGHA) includes seventeen Indigenous leaders from five continents, thirteen countries and multiple Indigenous communities. IIWGHA is an international voice that links Indigenous Peoples with their leadership, governments, AIDS service organizations, cooperatives, and others in collective action to reduce these health inequities. Robust responses to HIV/AIDS must be grounded in country and population-specific evidence generated through high-quality research. The distinct histories of research exploitation within our communities have led to distrust; therefore it is imperative that research becomes Indigenous-led.

We are generating a meaningful engagement protocol for use within IIWGHA to ensure that research is conducted in a culturally respectful way, responsive to the diverse needs of IIWGHA members.

**Description:** Our initiative responds to the dearth of Indigenous HIV-focused research. Our goal is to sow seeds for community-led research benefitting Indigenous populations affected by HIV. This protocol will strategically support Indigenous researchers implementing research meeting the highest standards of scientific excellence, and respectful and ethical community engagement, contributing to knowledge building and strengthening partnerships, which underpin and inform strategic action

**Lessons learned:** We ground ourselves in Indigenous knowledges and paradigms that inform our understandings of the world. We will also incorporate knowledge generated through the academy and apply Two-Eyed Seeing and community-based research frameworks. Mutually respectful, ethical partnerships address socioeconomic and structural health determinants. Decolonizing methodologies and processes are central themes in this protocol development and modalities of research partnerships. Key principles include: 1. Inclusion of Indigenous Peoples throughout the research process; 2. Research in good faith, with free, prior and informed consent; 3. Evidence of vulnerability and risks; 4.Grounding research in the strengths, cultures and ancestral practices of Indigenous Peoples; 5. Honoring both Indigenous and Western Ways of Knowing.

**Conclusions/Next steps:** This work brings together Indigenous HIV research networks from IIWGHA member countries for a constructive and critical look at Indigenous HIV research. Next steps will include finalizing a research protocol for use nationally and internationally by members of IIWGHA and its collaborators and funders.

## WEPDE01 FILLING THE GAPS IN PMTCT/B+ PROGRAMMES

## WEPDE0101

### SCALING UP PARTNER TESTING IN MATERNAL & CHILD HEALTH CLINIC (MCH) SETTINGS: A CASE STUDY OF GUCHA SUB-COUNTY HOSPITAL, WESTERN KENYA

J. Nyakerario Omare, A. Kituku
*Care International, Health Sector, Kisii, Kenya*
*Presenting author email: judynyakerario@gmail.com*

**Background:** Male partner involvement is generally low in MCH settings due to a myriad of factors including lack of policy guidance and socio-cultural factors. The objective of this study was to assess male involvement in PMTCT services, including partner counseling and testing in the MCH and to gather recommendations for improvement and strengthening of these services.

**Description:** Two mentor mothers were trained in mid-2013 and placed at Gucha Sub-county hospital, Western Kenya to support PMTCT interventions at the facility, including encouraging partner testing among women receiving PMTCT services. All women attending 1st ANC services were counseled on the importance of partner involvement and testing, provided with an invitation card for the partner to accompany them to the clinic for their next ANC visit. Couples who attended clinic were provided with a variety of services including HIV counseling and testing. Community mobilization and sensitizations were done around the facility catchment on importance of partner involvement and testing. Routinely collected data for partner counseling and testing uptake from MCH registers was compared before (2012) and after placement of the mentor mothers (2014)

**Lessons learned:** A total of 1690 and 1619 pregnant women attended the facility for ANC services for the first time in 2012 and 2014 respectively. Forty three percent (741/1690) and (97%) 1582/1619 were counseled and tested for HIV. Among these, 17/741(3%) partners were counseled and tested for HIV in 2012 as compared to 953/1582 (60%) in 2014. Among the partners tested, 0/17 (0%) were HIV discordant in 2012 while 14/953 (1.4%) were discordant in 2014. A total of 12 community sensitization meetings were held in 2014.

**Conclusions/Next steps:** Scaling up partner testing is feasible but requires both facility and community level coordination. With good mobilization and community education, partner testing can be institutionalized. With improved partner testing, uptake of PMTCT interventions can be improved. There is need for County governments to put in place guidance of male involvement in RMNCH services.

## WEPDE0102

### COUNSELLED TO COMPLIANCE: EXPERIENCES OF OPTION B+ FOR THE PREVENTION OF MOTHER TO CHILD TRANSMISSION IN FOUR HEALTH AND DEMOGRAPHIC SURVEILLANCE SITES IN SUB-SAHARAN AFRICA

E. McLean[1,2], J. Renju[1], J. Wamoyi[3], D. Bukenya[4], W. Ddaaki[5], K. Church[1], A. Wringe[1], ALPHA Network
*[1]London School of Hygiene & Tropical Medicine, London, United Kingdom, [2]Malawi Epidemiology and Intervention Research Unit, Karonga, Malawi, [3]National Institute for Medical Research, Mwanza, Tanzania, United Republic of, [4]MRC/UVRI Uganda Research Unit on AIDS, Entebbe, Uganda, [5]Rakai Health Sciences Program, Kalisizo, Uganda*
*Presenting author email: estelle.mclean@lshtm.ac.uk*

**Background:** Option B+ for the prevention of mother-to-child transmission (PMTCT) was intended to improve PMTCT coverage and retention in HIV care for mothers and virtually eliminate perinatal infections. Although Option B+, and wider test and treat policies, are to be rolled-out in many countries, little is known about how pregnant women and health workers perceive Option B+ and its influence on HIV care-seeking behaviours. This qualitative study explored these experiences in four African settings.
**Methods:** Thirty in-depth interviews (IDIs) were conducted with HIV-positive women, purposefully sampled from ART clinics or health and demographic surveillance datasets in Karonga, (Malawi), Kisesa (Tanzania), Kyambuliwa and Rakai (Uganda). 20 IDIs were conducted with health-care providers. IDIs explored health worker and patients' understanding and experiences of Option B +. A framework analysis using a thematic approach was conducted, and findings compared across sites.
**Results:** Health providers and women generally considered the main benefit of Option B+ as being to protect the unborn baby with few references to potential or expected health benefits of early ART for the mothers. Across all sites, health workers reported a desire to maximise opportunities to initiate HIV positive women onto ART through Option B+ programmes. Both providers and women reported instances of repeated counselling sessions until consent to initiate ART was obtained, particularly in women for whom the positive test result was new or unexpected. Some pregnant women responded to a perceived lack of autonomy over Option B+ participation by covertly refusing to adhere to ART, while others avoided antenatal clinics completely.
**Conclusions:** Most women willingly initiated ART through Option B+, however there was an occasional disconnect between health worker actions, and the 'readiness' of women to start lifelong treatment resulting in practices that could be perceived as coercive. This could be further exacerbated by the perceived requirements among some health workers to meet Option B+ programme targets. ART initiation following an HIV diagnosis should be accompanied by greater efforts to ensure preparedness for life-long ART. These findings may also be relevant to guiding the implementation of universal test and treat policies.

## WEPDE0103

### MOMCONNECT: MHEALTH STRENGTHENING OF DEMAND AND SUPPLY SIDES OF THE SOUTH AFRICAN HEALTH SYSTEM TO IMPROVE PMTCT

P. Barron[1], Y. Pillay[2], J. Sebidi[2], A. Fernandes[2]
*[1]University of the Witwatersrand, School of Public Health, Johannesburg, South Africa, [2]National Department of Health, Pretoria, South Africa*
*Presenting author email: pbarron@iafrica.com*

**Background:** MomConnect is a South African National Department of Health initiative that aims to use the ubiquity of cell phones. It sends pregnant women messages appropriate to their stage of pregnancy to strengthen the **demand** for health services and empower women. It enables these women to interact with the health system, obtain further health information and to provide feedback on the quality of care that they receive to improve supply of services.
**Description:** Since its launch in August 2014 MomConnect has registered 583 929 pregnant women. More than 95% (34887) of all facilities dealing with pregnant women have recorded MomConnect registrations, indicative of its universal roll out.
**Lessons learned:** Women interact free of charge with a help desk. Over 200,000 questions have been asked. Examples related to HIV include:
*"Why are health care workers initiating ARV treatment without CD4 Count";*
*"What is the safest method of delivery if you are HIV positive";*
*"What are the chances of the baby getting infected with the virus when one has cracked nipples should breastfeeding continue*?"
Each question is answered on a daily basis and if serious women are directed to a health facility.
Women also have the ability to compliment the service. To date 4173 compliments received more than six times the complaints (690) received. Examples of complaints impacting on PMTCT include:
*"Lack of confidentiality for HIV Patients, as files were labelled, consulting rooms designated only for HIV patients, treatment room labelled ARV room".*
The resultant action was that the district focal person visited facility and met the manager. They looked at areas that patient complained and removed all the signs related to HIV.
*"Complained that she went to the clinic to collect HIV treatment and she was sent off without medication."* Client advised to return to facility, where she received the necessary ARVs after managers of facility were briefed.
**Conclusions/Next steps:** MomConnect has empowered pregnant women and improved the demand for better quality as well as improving supply and the quality of health services. The help desk is being upgraded to be more responsive to feedback from pregnant women. MomConnect data is being integrated with national data system.

## WEPDE0104

### VIRAL LOAD SAMPLE LOGISTICS FOR HIV-POSITIVE WOMEN IN RURAL SETTINGS: EXPERIENCE FROM THE INSPIRE MOMENT NIGERIA PMTCT STUDY

O. Adeyemi[1], S. Erekaha[1], E. Ogum[1], F. Yunusa[1], H. Swomen[2], A. Barde[1], C. Chime[3], I. Ebagua[3], N.A. Sam-Agudu[1,4]
*[1]Institute of Human Virology Nigeria, Clinical Department, Abuja, Nigeria, [2]London School of Hygiene and Tropical Medicine, London, United Kingdom, [3]Institute of Human Virology Nigeria, Molecular Laboratory, Abuja, Nigeria, [4]Institute of Human Virology, University of Maryland Baltimore, Department of Epidemiology and Prevention, Baltimore, United States*
*Presenting author email: nsamagudu@ihvnigeria.org*

**Background:** Due to its earlier detection of treatment failure, Viral Load (VL) is preferred over CD4 count in treatment monitoring. In Nigeria, VL is not routinely available to rural patients at Primary Healthcare Centers (PHCs). Whole blood samples require transport on ice and processing within 6 to 8 hrs. Routine sample transport is difficult in rural areas due to distance and terrain. We present our experience in the establishment of a rural VL transport logistics system in North-Central Nigeria.
**Description:** The MoMent study evaluates PMTCT service uptake, ARV adherence, and retention among mother-infant pairs in rural areas. VL is a study proxy for maternal ART adherence, and in order to measure this outcome, a VL sample transport system had to be developed *de novo*. Field Research staff were trained with a VL sample collection and transport SOP alongside clinical PHC staff. Study sites were mapped to the Central Lab; sites too distant were linked to a hub facility for sample centrifugation and storage before delivery to the central processing lab. Sample collection and transport materials were provided to each study site. Where official vehicles were not available, commercial transport was costed and utilized.
**Lessons learned:** In total, 28 staff received one-day training on VL sample collection and transport. In 13 months, 201 maternal VL samples were collected and transported from 20 PHCs to the Central Lab; 28/201 (13.9%) were transited through the hub. Overall, 4/201 (1.9%) samples were rejected, comparable to rejection rates from secondary and tertiary clinics; major reason being sample lysis. Average collection, transport and processing cost per VL sample was 55.50 USD; rejected samples cost 57.50 USD to repeat. High turnover rate of trained PHC staff (7/17, 41.2%) was also observed.
**Conclusions/Next steps:** Routine VL in rural Nigeria is feasible if resources can be directed at training, staff retention, and quality assurance. Additionally, we recommend mapping of facilities and strategic placement of molecular labs or point-of-care testing to reduce transport cost and logistic challenges. However, processing cost remains high, especially for rejected samples. Innovative financing and technology is needed to provide equitable access to VL monitoring for HIV-positive women in hard-to-reach areas.

## WEPDE0105

### EARLY RETENTION IN ANTENATAL CARE AMONG HIV-POSITIVE WOMEN ENROLLED IN THE OPTION B+ PROGRAM IN KINSHASA, DRC

J. Ditekemena Dinanga[1], M.M. Gill[2], A. Loando[1], C. Nyombe[3], J. Bakwalufu[1], N. Mbonze[1], F. Fwamba[4], V. Ilunga[1], R. Machekano[2]
*[1]Elizabeth Glaser Pediatric AIDS Foundation (EGPAF), MSA, Kinshasa, Congo, Democratic Republic of the, [2]Elizabeth Glaser Pediatric AIDS Foundation - Global, Washington, United States, [3]Kinshasa University School of Public Health, Kinshasa, Congo, Democratic Republic of the, [4]Programme National de Lutte Contre le Sida, Kinshasa, Congo, Democratic Republic of the*
*Presenting author email: jditekemena@hotmail.fr*

**Background:** Effective retention in prevention of mother-to-child HIV prevention (PMTCT) programs implementing universal, lifelong treatment (“Option B+”) is critical to achieving pediatric HIV elimination. Innovative strategies are needed to strengthen retention in PMTCT/antenatal care (ANC). The Elizabeth Glaser Pediatric AIDS Foundation (EGPAF) assessed early loss to follow-up of HIV-positive pregnant women in ANC following introduction of a standard operating procedure (SOP) in select facilities in Kinshasa, Democratic Republic of the Congo. The SOP included guidance to health providers and mentor mothers (HIV-positive expert patients) on 1) linking newly and known HIV-positive women to these mothers, 2) counseling at first ANC, 3) tracking those who miss antenatal appointments through phone calls and home visits, and 4) documenting appointments and follow-up activities.
**Methods:** A quasi-experimental study was conducted from May to November 2015 in 16 EGPAF-supported health facilities, purposively selected for high volume and high HIV prevalence. Facilities were randomized to receive the SOP enhancement or no intervention. All records of HIV-positive women who attended their first ANC visit were abstracted during the data collection period. Multiple logistic regressions were used to identify determinants of second ANC visit attendance by HIV-positive pregnant women enrolled in the PMTCT Option B+ program.
**Results:** One-hundred-and-seventy-four women were included in the analysis: 43.7% (n=76) in the intervention and 56.3% (n=96) in the comparison group. Women’s average age was 31 years (SD: 6.4). Approximately 86.2% of participants were assessed as WHO Clinical Stage I. Overall attrition at the second ANC visit was 25.8% (n=45). After multivariable logistic regression, being in the comparison group remained independently associated with early attrition (AOR=3.49, CI 95%: 1.58-7.71, p=0.002). Women attending facilities without SOP implementation were 3.5 times more likely to miss the second ANC visit (n=35, 35.7%) compared to the women from the intervention group (n=10, 13.2%).
**Conclusions:** Study findings demonstrated a positive effect of the SOP intervention on second ANC visit attendance. This SOP should be expanded to include the full range of ANC visits and delivery. This tool should be promoted and scaled up to contribute to the improvement of the retention in care for PMTCT clients.

## WEPDE0106LB

### SELF-REPORTED ANTENATAL ADHERENCE TO PREDICT POSTNATAL VIRAL REBOUND AMONG WOMEN INITIATING ART DURING PREGNANCY IN CAPE TOWN, SOUTH AFRICA: A PROSPECTIVE STUDY

T. Phillips[1], K. Brittain[1], E.J. Abrams[2,3], A. Zerbe[2], A. Ronan[1], C.A. Mellins[4,5], R.H. Remien[4,5]
*[1]University of Cape Town, Division of Epidemiology and Biostatistics, Cape Town, South Africa, [2]Columbia University, ICAP, Mailman School of Public Health, New York, United States, [3]Columbia University, College of Physicians & Surgeons, New York, United States, [4]Columbia University, HIV Center for Clinical and Behavioral Studies, New York, United States, [5]New York State Psychiatric Institute, New York, United States*
*Presenting author email: tk.phillips@uct.ac.za*

**Background:** Maintaining postnatal viral suppression is critical to minimize risk of breastfeeding mother-to-child transmission and ensure ongoing maternal health. Determining simple ways to identify women at risk of postnatal viraemia will have benefits for both mother and child.
**Methods:** HIV+ women initiating ART during pregnancy at a large primary care clinic were recruited and followed in the MCH-ART study in Cape Town, South Africa. Consenting women completed up to eight study visits from ART initiation through 12 months postpartum, including viral load (VL) measurement, demographics and self-report of missed ART doses in the previous 30 days. We investigated time to VL >1000 copies/mL and associations between antenatal adherence and viral rebound among women suppressed at delivery.
**Results:** Overall, 339 women with VL ≤50 copies/mL at delivery were included in this analysis (median age 28 years, median 18 weeks on ART). From ART initiation through delivery, 28% of women reported any missed ART doses; 16% reported one or more missed doses/month on average. Using product limit methods 79% of women maintained VL ≤1000 copies/mL at 12 months postpartum. In a proportional hazards model adjusted for age, duration of antenatal ART and ART history, reporting one or more missed doses per 30 days on average during pregnancy was associated with a more than twofold increase in the hazard of postnatal viral rebound (adjusted hazard ratio [aHR] 2.64, p< 0.001). Previous ART use increased the hazard of viral rebound; increasing age and weeks on ART were protective. When stratified by age, the association between missed doses and viral rebound was stronger among women ≥25 years compared to younger women (aHR 3.88 and 2.20, respectively).
**Conclusions:** In this cohort of women who initiated ART in pregnancy and were suppressed at delivery, report of antenatal missed ART doses was predictive of postnatal viraemia. Self-reported antenatal missed doses, together with other routinely collected antenatal risk factors like age, could be used to flag women at high risk of postnatal viral rebound. There is need for further research to explore how reported antenatal adherence could be used in low-resource settings to target interventions to recently postpartum women most at risk.

# WEPDE02 IT TAKES A COMMUNITY: LEADERSHIP, ENGAGEMENT AND INNOVATION

## WEPDE0201

### COMMUNITY LEADER ENGAGEMENT AND PEER GROUP ATTENDANCE IMPROVES SELECTED MCH AND PMTCT SERVICES UPTAKE AND RETENTION: PRELIMINARY FINDINGS FROM PROJECT ACCLAIM

G. Woelk[1], M.P. Kieffer[2], D. Mpofu[3], R. Cathcart[1], ACCLAIM Study Group
*[1]Elizabeth Glaser Paediatric AIDS Foundation, Washington DC, United States, [2]Elizabeth Glaser Paediatric AIDS Foundation, Lilongwe, Malawi, [3]Elizabeth Glaser Paediatric AIDS Foundation, Mbabane, Swaziland*
*Presenting author email: gwoelk@pedaids.org*

**Background:** Project Advancing Community Level Action for Improving maternal and child health (MCH)/prevention of mother-to-child HIV transmission (PMTCT) (Project ACCLAIM), a three-arm randomized trial with 45 PMTCT-implementing health facilities and their catchment areas across Swaziland, Uganda and Zimbabwe, aimed to improve access, uptake and retention in MCH and PMTCT services.
The study evaluates three interventions:
Arm 1) Community leader (CL) engagement (training in MCH/PMTCT, community action mentoring including dialogues;
Arm 2) CL plus community days (CDs), a community event with structured dialogues on MCH/PMTCT and provision of health services;
Arm 3) CL plus CDs and male and female MCH classes: four structured peer-led sessions. We report preliminary results on outcomes of increased proportions of HIV exposed infants (HEI) receiving HIV testing at 6-8 weeks, health facility deliveries, male partners tested.
**Methods:** Routine health facility data were collected prior to implementation (July 2013, Swaziland and Zimbabwe, January 2014, Uganda) and for each quarter through June 2015. We compared changes in proportions pre-implementation and the last quarter after implementation in the three arms using chi square tests for linear proportions.
**Results:** The interventions’ effects differed in the three countries. In Uganda, the proportion of HEI tested increased from 31% (56/182) to 48% (56/116), p< 0.001 in Arm 1, and in Arm 3 from 19% (20/106) to 43% (22/51), p< 0.001; male partners tested increased from 11% (224/2,067) to 22% (533/2,475) p< 0.001 in Arm 1 and 10% (71/728) to 15% (119/797) in Arm 3, p< 0.001. The proportion of women delivering in health facilities increased from 60% (1,252/2,083) to 94% (1,694/1,797) p< 0.001, Arm 1. In Swaziland the proportions of women delivering in a health facility increased in both Arm 1 and Arm 3-49% (160/325) to 81% (26 4/324) p< 0.001, and 50% (100/199) to 78% (153/195) respectively, p< 0.001. In Zimbabwe, the proportions of male partners tested increased in Arm 1 from 42% (66/159) to 73% (130/178), p< 0.001.
**Conclusions:** The CL and peer group interventions appeared to increase MCH/PMTCT services update and retention, with Uganda registering the most improvements. The CL plus CD intervention, Arm 2, appeared to have no effect on the outcomes.

## WEPDE0202

### THE IMPORTANCE OF INVOLVING YOUNG WOMEN LIVING WITH HIV IN SEXUAL REPRODUCTIVE HEALTH RESEARCH: INTERNATIONAL COMMUNITY OF WOMEN LIVING WITH HIV EASTERN AFRICA (ICWEA) EXPERIENCE

B. Azizuyo
*International Community of Women Living with HIV (ICW), Sexual Reproductive and Health Rights, Kampala, Uganda*
*Presenting author email: brendafacyazizuyo@gmail.com*

**Background:** Almost 60% of new HIV infection among young people aged 15-24 occur among adolescent girls and young women (2013). Globally, 15% of the women living with HIV are aged 15-24, of whom 80% live in sub-Saharan Africa. Although young women living with HIV can have a role in ensuring that research in Sexual and Reproductive Health and Rights (SRHR) is relevant to their needs, they have historically not been targeted as research assistants and the benefits and opportunities of involving them are not well documented.
**Description:** The young women were engaged in multi stakeholder dialogue on SRHR violations. Experiences and lessons learnt involving women living with HIV as research assistants have been documented in a toolkit to inform future research. In April 2014 ICWEA involved young women living with HIV (15-30years) in a research "Violation of Sexual Reproductive Health Rights of women living with HIV in clinical and community settings in Uganda." ICWEA called for application for research assistants on list- servers and HIV civil society including youth focused organizations in 9 research focus districts. Thirty five young women living with HIV, were selected and underwent training in research methods, data collection and understanding SRHR.They participated in identifying research respondents, pre-tested research tools, collected and transcribed data, participated in report writing, validation and dissemination of findings. They were represented on the Advisory Board to the research.
**Lessons learned:** The process enhanced the capacity of the young women to engage in research and dialogue on SRHR violations. The process built confidence in the respondents, because research assistants were also women living with HIV and some spoke out for the first-time on sensitive issues such as forced and coerced sterilization. The young women got in-depth understanding of SRHR information and services to inform their own advocacy.
**Conclusions/Next steps:** Involving young women living with HIV as research assistants is beneficial for respondents of SRHR research and empowering to them. Population specific recruitment and capacity building strategies with greater gender consideration for young women living with HIV are important to ensure their involvement in research processes. Their experiences should be documented and shared to inform future researchers.

## WEPDE0203

### "WHEN YOU DON'T HAVE MONEY, HE CONTROLS YOU": FINANCIAL SECURITY, COMMUNITY SAVINGS GROUPS, AND HIV RISK AMONG FEMALE SEX WORKERS IN IRINGA, TANZANIA

A. Mantsios[1], C. Shembilu[2], J. Mbwambo[2], S. Likindikoki[2], S. Beckham[1], A. Mwampashi[2], A. Leddy[1], N. Galai[3], W. Davis[3], D. Kerrigan[1]
*[1]Johns Hopkins Bloomberg School of Public Health, Health, Behavior and Society, Baltimore, United States, [2]Muhimbili University of Health and Aliied Sciences, Psychiatry and Mental Health, Dar es Salaam, Tanzania, United Republic of, [3]Johns Hopkins Bloomberg School of Public Health, Epidemiology, Baltimore, United States*
*Presenting author email: amantsios@jhu.edu*

**Background:** There is a growing literature indicating the importance of financial insecurity as a structural driver of HIV risk behaviors such as unprotected sex including among female sex workers (FSW), who are at heightened risk for HIV infection across geographic settings.
**Methods:** A Phase II randomized controlled trial of a community-empowerment based combination HIV prevention intervention is being conducted in Iringa, Tanzania. Using baseline survey data from 254 FSW of an ongoing cohort, bivariate and multivariate logistic regression was conducted to examine the statistical association between community savings group participation and HIV protective behaviors. Iterative, semi-structured in-depth interviews were also conducted with 15 FSWs participating in community savings groups. Interviews were audiotaped, transcribed, translated from Swahili into English, coded and analyzed through thematic content analysis.
**Results:** Participants qualitatively described that immediate financial need inhibited their ability to refuse high-risk sexual behaviors such as sex without a condom and anal sex with clients. With insufficient capital to participate in formal banking, community savings groups were described as a mechanism through which FSW can securely save their money, and create a safety net they can utilize when they have immediate financial need, safeguarding against HIV risks. Quantitative analysis confirmed the women's qualitative narratives. Approximately 25% of the cohort participates in community savings groups. In multivariate analysis controlling for age, education, marital status, number of children, and length of time in sex work, participating in a community savings group was significantly associated with always using a condom with new clients (AOR 2.06 [95% CI 0.98-4.32]) and refusal of unsafe sex (AOR: 2.94 [95%CI: 1.33-6.49]), including when a client was unwilling to use a condom, requested anal sex, or was unwilling to pay the requested price. Savings group participation was also significantly associated with a lower odds of having reported an STI in the last 6 months (AOR 0.37 [95% CI 0.16-0.84]).
**Conclusions:** Findings demonstrate the promising role of community savings groups as a structural intervention to promote financial security and reduce HIV risk among FSW.

## WEPDE0204

### CHASING THE POSSIBLE: ARE WE THERE YET? INNOVATIONS IN TESTING TO END THE HIV EPIDEMIC IN NSW, AUSTRALIA

T. Duck[1], C. Selvey[2], B. Telfer[2], H.M.A. Schmidt[1], K. Price[3], P. Keen[4], M.E. Cecilio[1], J. Holden[5]
*[1]New South Wales Ministry of Health, North Sydney, Australia, [2]Health Protection NSW, North Sydney, Australia, [3]ACON, Surry Hills, Australia, [4]Kirby Institute, UNSW, Kensington, Australia, [5]New South Wales Ministry of Health, Centre for Population Health, North Sydney, Australia*
*Presenting author email: jhold@doh.health.nsw.gov.au*

**Background:** To achieve the ambitious targets for reducing HIV transmission set in the *NSW HIV Strategy 2012-2015*, NSW implemented a suite of innovations to facilitate increased HIV testing and better detect undiagnosed HIV infections among priority populations.
**Description:** In 2013-2015, NSW:
- Integrated rapid HIV testing (RHT) into the mix of testing options for gay men at public clinics across NSW.
- Delivered RHT at community sites and mobile locations through peer educators to increase accessibility.
- Facilitated service redesign in public clinics to increase targeted testing delivery.
- Realigned purchasing arrangements with non-government organisations to support Strategy targets.
- Established a 'real-time' monitoring and reporting framework to drive performance among key stakeholders.
- Delivered targeted marketing and communications activities, including the award-winning *Ending HIV* campaign.

**Lessons learned:** From January-September 2015, HIV testing in laboratories increased by 7%, 11% and 18% compared with January-September 2014, 2013 and 2012. From July-September 2015, there was a 68% increase in HIV testing at sexual health services among gay men compared with the same period in 2014. Self-reported HIV testing rates among gay men were the highest on record since 1996, with 76% surveyed in 2014 and 75% surveyed in 2015 reporting an HIV test within the last 12 months. From January-September 2015, there were 247 new HIV diagnoses in NSW; 7% less than the 2009-2014 average during the same period. Of these, 41% had evidence of early stage infection; less than the January-September 2009-2014 average of 46%.
**Conclusions/Next steps:** The combination of increases in HIV testing, a decrease in new diagnoses count and evidence for reductions in early stage diagnosis suggest a reduction in HIV transmission. The diversity and range of program efforts have contributed towards *NSW HIV Strategy* targets. However, further innovations are needed to meet the Strategy's goal of virtual elimination of HIV transmission by 2020, including the introduction of self-sampling testing to reach high-risk populations testing infrequently for HIV.

## WEPDE0205

### A COHORT STUDY OF COMMUNITY-BASED TEST AND TREAT FOR MEN WHO HAVE SEX WITH MEN AND TRANSGENDER WOMEN: PRELIMINARY FINDINGS FROM THAILAND

R. Vannakit[1], J. Jantarapakde[2], S. Pengnonyang[2], S. Jitjang[2], R. Janamnuaysook[2], T. Pankam[2], D. Trachunthong[2], K. Pussadee[2], R. Reankhomfu[3], D. Lingjongrat[4], S. Janyam[5], T. Nakpor[6], P. Leenasirimakul[7], T. Jadwattanakul[8], S. Noriega[9], S. Charoenying[10], T. Sattayapanich[10], A. Arunmanakul[10], P. Phanuphak[2], M. Cassell[1], N. Phanuphak[2]

*[1]United States Agency for International Development, Office of Public Health, Bangkok, Thailand, [2]The Thai Red Cross AIDS Research Centre, Bangkok, Thailand, [3]Caremat Organisation, Chiang Mai, Thailand, [4]Rainbow Sky Association of Thailand, Bangkok, Thailand, [5]Service Workers In Group Foundation, Bangkok, Thailand, [6]Sisters Foundation, Chonburi, Thailand, [7]Nakornping Hospital, Chiang Mai, Thailand, [8]Queen Savang Vadhana Memorial Hospital, Chonburi, Thailand, [9]RTI International, Bangkok, Thailand, [10]FHI 360, Bangkok, Thailand*

**Background:** HIV prevalence is high among men who have sex with men (MSM) and transgender women (TG) in Thailand. We explored the feasibility of the community-based Test and Treat strategy conducted by community-based organization (CBO) staff, to provide early case identification and immediate antiretroviral therapy (ART), for MSM and TG.

**Methods:** MSM and TG were recruited into an operational research cohort through 5 CBOs in Bangkok, Pattaya and Chiang Mai. Trained CBO staff provided same-day result HIV testing and sexually transmitted infection (STI) screening at baseline. At diagnosis, HIV-positive individuals had point-of-care CD4 count measurements and ART immediately offered. Data on demographic, risk behavior, knowledge and attitudes towards HIV and ART were collected using self-administered questionnaires.

**Results:** From May to November 2015, 1,029 participants were enrolled (71% MSM and 29% TG). HIV prevalence was 17% (20% in MSM: 8% in TG). HIV-positive participants were more likely to

i) have never had HIV testing (72% vs. 42%, p< 0.001);

ii) have been screened positive for STIs (58% vs. 29%, p< 0.001);

iii) perceive themselves to be moderate to high risk for HIV (62% vs. 48%, p=0.001);

iv) had unprotected sex in the past 6 months (87% vs. 78%, p=0.01);

v) have used amphetamine-type stimulants in the past 6 months (12% vs. 7%, p=0.02); and

vi) have low knowledge on HIV transmission routes (p=0.007).

Overall, 39% knew that ART could reduce HIV risk for their partners. Among 172 HIV-positive, 141 (82%) accepted immediate ART while 31 declined or did not start ART after more than 2 weeks of diagnosis. Binary logistic regression identified being sex workers or unemployed (OR 0.40, 95%CI 0.16-0.98, p=0.046) and having used illicit drugs in the past 6 months (OR 0.26, 95%CI 0.11-0.63, p=0.003) to be factors associated with unsuccessful ART initiation.

**Conclusions:** Implementing the community-based Test and Treat strategy by trained CBO staff is feasible in Thailand. Overall acceptance and success of immediate ART initiation were high. Additional efforts are needed to more effectively target HIV-positive MSM and TG who are unemployed, sex workers or using drugs in order to strengthen linkages to care and treatment.

### GENETIC VARIABILITY OF HIV-1 IN THE NORTH-WEST OF BENIN, AFRICA: THE RISE OF COMPLEX CIRCULATING RECOMBINANT FORM 30_0206 (CRF30_0206)

C. Ceriani[1], S. Cavallari[1], T. Cerulli[1], D. Cagnin[1], M. De Paschale[1], K. Diombo[2], J. Ndayake[2], G. Priuli[2], P. Viganò[3], P. Clerici[1]
*[1]Hospital of Legnano, Microbiology Unit, Legnano, Italy, [2]Fatebenefratelli Saint Jean de Dieu Hospital, Tanguiéta, Benin, [3]Hospital of Legnano, Infectious Disease Department, Legnano, Italy*
*Presenting author email: cristina.ceriani87@gmail.com*

**Background:** West and Central Africa is characterized by the birth of the greatest number of circulating and unique recombinant forms (CRF and URF). Recent reports shows the rise of CRF30_0206, a more complex recombinant strain, identified for the first in parts of West Africa (Burkina Faso and Niger). Benin is a West African country with a relatively low seroprevalence and failing reports about the HIV subtypes and CRF circulating. The aim of this study is the evaluation of HIV subtypes and CRFs circulating in a rural area of the north-West of Benin, on the commercial route with Burkina Faso and the other neighboring country.
**Methods:** Plasma samples were collected from 57 HIV-positive patients associated with the Fatebenefratelli Saint Jean de Dieu Hospital in Tanguiéta, located in the north-West of Benin. A portion of HIV-1 reverse transcriptase (RT, codons 38-247) and protease (PR, codons 4-99) genes were sequenced. For phylogenetic analysis, a neighbor-joining tree was built with Tamura-Nei substitution model and 1000 replicates (Bootstrap value ≥ 70% was considered significant). Unknown sequences were examined using SimPlot (Similarity Plotting) and/or aligned with Basic Local Alignment Search Tool (BLAST) search engine.
**Results:** Phylogenetic analysis showed that CRF02_AG was predominant, followed by CRF06-cpx, subtype A and subtype G (Figure 1a). Finally, 6 (11%) sequences were included in CRF30_0206-like groups because they showed a different pattern of recombination in PR and/or in RT region or a suspected recombinant event in the region not sequenced (Figure 1b).
**Conclusions:** The study shows, for the first time, presence of a new circulating recombinant form (CRF30_0206) in Benin, probably linked to the contact of this area with the neighboring country.

*Presenting author email: nkinloch@sfu.ca*

**Background:** HIV-1 mutational escape from cellular immunity is predictable based on host HLA. However, the extent to which viral genetic context influences HIV-1 escape pathways remains incompletely understood. We investigate this by studying HIV-1 sequences paired to host HLA genotypes from Uganda, where multiple HIV-1 subtypes and CRFs co-circulate in a single host population. We focused on the two predominant HIV-1 subtypes in Uganda, A and D.
**Methods:** We performed high-resolution HLA class I typing and HIV-1 Gag, Pol and Nef plasma RNA genotyping for 513 antiretroviral-naïve individuals from Kampala and Mbarara, Uganda. After exclusion of recombinant and non-subtypeA/D sequences, datasets of approximately N=200 (subtype A) and N=135 (subtype D) remained for analysis. First, HLA-associated polymorphisms were identified in each HIV-1 subtype via statistical association with phylogenetic correction. We then took the union of all HLA-associated polymorphisms identified and compared their strength of selection in subtypes A vs. D using a phylogenetically-corrected logistic regression approach to identify instances of differential selection between subtypes. Multiple tests were addressed using q-values.
**Results:** Of the 103 unique HLA alleles observed in study participants, none differed in frequency between subtype A and D datasets, consistent with co-circulation of multiple HIV-1 subtypes in a single population. Overall, 83 Gag, 198 Pol and 105 Nef HLA-associated polymorphisms were identified in subtype A and/or D at $q< 0.2$ (all $p< 9x10^{-4}$). Of these, 34%, 39% and 27% in Gag, Pol and Nef, respectively, exhibited significant differential selection *between* the two subtypes ($p< 0.05$; $q< 0.1$). For example, HLA-B*57:03 was strongly associated with selection of Gag-T242N in subtype D (Odds Ratio [OR]=250; $p=2x10^{-10}$), but not in subtype A (OR=1.8; p=0.8), a difference that was highly significant (inter-subtype comparison $p=8x10^{-6}$; q=0.001). This raises the hypothesis that the subtype A consensus proline at adjacent Gag codon 243, which differs from the consensus leucine observed in most other subtypes including D, is incompatible with T242N.
**Conclusions:** Our results support HIV-1 subtype-specific genetic constraints on immune escape and identify a large number of candidate cases for functional verification. Characterization of subtype-constrained HIV-1 escape pathways may help identify subtype-specific mutationally-constrained viral regions for vaccine design strategies.

### WEPEA004

### ANALYSIS OF INTRA-PATIENT, FULL LENGTH HIV *GAG* SEQUENCES IDENTIFIES REGIONS OF VARIABILITY

E. Anderson[1], M. Gouzoulis[1], A. Ganesan[2], C. Rehm[3], S. Jones[4], F. Maldarelli[1]
*[1]National Cancer Institute, HIV Dynamics and Replication Program, Frederick, United States, [2]Walter Reed National Military Medical Center, Division of Infectious Diseases, Bethesda, United States, [3]National Institute of Allergy and Infectious Diseases, Laboratory of Immunoregulation, Bethesda, United States, [4]Leidos Biomedical Research, Inc, Bethesda, United States*
*Presenting author email: elizabeth.anderson@nih.gov*

**Background:** HIV Gag polyprotein is central to assembly, budding, and maturation of HIV virions, and there is substantial interest in Gag as a therapeutic target. Previously, maturation inhibitors have been limited by natural polymorphisms in *gag*. A more comprehensive analysis of intra-patient *gag* genetic variation, including linkage analysis is essential to inform novel approaches to therapeutics. As a first step, we developed a new single genome sequencing (SGS) assay to analyze full length HIV *gag* to investigate intra-patient genetic variation, localize regions of variability, and determine linkage patterns.
**Methods:** Antiretroviral naïve individuals with detectable HIV RNA were recruited at NIH and Walter Reed National Military Medical Center and underwent phlebotomy. Plasma derived HIV RNA was subjected to cDNA synthesis and PCR primers were designed to amplify the entire 1.5kb fragment from upstream p17 through p6. SGS (9-21 sequences per patient) were aligned (CLUSTAL W), and subjected to phyloge-

netic (MEGA) and population genetics (DNASP) analyses.
**Results:** Patients (N=22, median age 30 years, 37% non-white, median baseline CD4 =568 cells/µl, median HIV RNA =3.9 log10 copies/ml) were enrolled, and 181 sequences from 13 patients have been analyzed thus far (average: 14 sequences/ patient). Full length *gag* sequences were genetically diverse (average pairwise difference range 0.4% to 1.59%, one acute patient excluded). Although diversity was present throughout *gag*, most of the variation was attributed to p6. On the protein level, translated p6 sequences had significantly higher average pairwise difference (APD) compared to translated full length *gag* (1.7-fold p=0.041, Students t-test). Indels were common in p6, including PTAP duplications and contribute additional variability. Polymorphisms were common, (mean 45 segregating sites/patient dataset) but no significant linkage between *gag* polymorphisms was detected (Fisher's exact =NS, Bonferroni corrected ).
**Conclusions:** Intra-patient *gag* genetic diversity is substantial but overall variability is largely limited to p6. No significant linkage between polymorphic positions was detected, indicating that populations were in linkage equilibrium. Next generation sequencing approaches focusing on specific regions in *gag* will be useful in characterizing intra-patient diversity.

## VIRAL DYNAMICS AND FITNESS

### WEPEA005

### NATURAL VARIATION AND CO-VARIATION OF THE HIV-1 INTEGRASE IN DRUG-NAÏVE NEWLY DIAGNOSED HIV-1 INFECTIONS IN GERMANY

K. Meixenberger[1], K.P. Yousef[2], S. Somogyi[1], S. Fiedler[3], B. Bartmeyer[4], M. von Kleist[2], C. Kuecherer[1]

*Presenting author email: kuechererc@rki.de*

**Background:** The objective of our study was to analyse the natural evolution of the HIV-1 integrase. For the first time integrase sequences of HIV-1 infections newly diagnosed between 1986 and 2006 in Germany were analysed to determine time trends of natural variation and co-variation of amino acid substitutions in the viral enzyme prior to the approval of integrase inhibitors (INI) in 2007.
**Methods:** The population sequences of HIV-1 integrase (amino acids 1-278) were determined from 386 archived EDTA-plasma samples of newly diagnosed individuals (1986-2006). Analyses of amino acid substitution were restricted to subtype B strains (n=337). Resistance-associated mutations were identified according to the IAS 2014 list and the Stanford HIVdb genotype resistance interpretation. Time trends of variation were identified by linear regression examined by bootstrap distributions and corrected for multiple testing. Co-variation was assessed by mutual information values in combination with Jaccard index.
**Results:** Some established minor INI resistance mutations (T124A, V151I, K156N, T206S, S230N) and potential resistance mutations to new INI (T124N, V165I, V201I) were identified at overall frequencies >5%. The most prevalent polymorphisms (overall frequencies >10%) were E10D, E11D, S17N, V31I, M50I, I72V, L101I, S119P, T122I, T125A, M154I, G193E, D256E, and A265V. Time trends were identified for eleven amino acid substitutions, including four potentially resistance-associated mutations (L101I, T122I, V165I, V201I). Thirty-nine pairs of amino acid substitutions showed co-variation, of which eleven pairs included the (potential) INI resistance mutations E157Q, G193E, T122I, V165I, V201I, or N222K. Finally, 19 co-varying pairs contained amino acid substitutions that exhibited a time trend, including the potentially resistance-associated mutations T122I, V165I, and V201I as well as some of the most prevalent polymorphisms (E11D, I72V, M154V, A265V).
**Conclusions:** Detailed knowledge of the evolutionary potential of the polymorphic sites and resistance-associated positions of the HIV-1 integrase is important to understand the development of resistance in the presence of INI. An INI-independent epistatic association of resistance-related sites with secondary sites might increase the likelihood of INI-selection of resistance mutations. Taking into account the observed natural variation and co-variation in the HIV-1 integrase will contribute to improve resistance prediction algorithms and the preclinical development of new INI.

### WEPEA006

### IMPACT OF GAG-PROTEASE MUTATIONS ON VIRAL FITNESS AND DRUG SUSCEPTIBILITY IN HIV-1 SUBTYPE C INFECTED PATIENTS FAILING A PROTEASE INHIBITOR INCLUSIVE TREATMENT REGIMEN FROM DURBAN, SOUTH AFRICA

U. Singh[1], K. Pillay[2], T. Ndung'u[1,3,4], M.L. Gordon[3]
[1]*KwaZulu-Natal Research Institute for TB and HIV, Durban, South Africa,* [2]*University of KwaZulu-Natal, Nelson R Mandela School of Medicine, Durban, South Africa,* [3]*University of KwaZulu-Natal, HIV Pathogenesis Programme, Durban, South Africa,* [4]*Ragon Institute of Massachusetts General Hospital, Massachusetts Institute of Technology and Harvard University, Boston, United States*
*Presenting author email: urisha.singh@gmail.com*

**Background:** Virologic failure due to protease inhibitor (PI) resistance is increasing, even in the absence of mutations in protease (PR). Studies on HIV-1 subtype B attribute this to mutations in Gag, however information is limited for HIV-1 subtype C, the most prevalent subtype globally. We aimed to investigate mutations in HIV-1 subtype C full-length Gag-Protease and their impact on viral fitness and drug susceptibility.
**Methods:** Gag-Protease amplicons of 80 patients failing a PI inclusive treatment regimen were sequenced and co-transfected with pNL43Δgag-protease to produce chimeric viruses which were subject to: a replication capacity (RC) assay using a green fluorescent protein GXR reporter cell line and a phenotypic drug susceptibility luciferase-based assay. Associations of Gag-Protease mutations with RC and drug susceptibility were confirmed by site-directed mutagenesis (SDM).
**Results:** Eight known Gag RAMs (i.e. R76K, Y79F, V128I, A431V, K436R, L449F, R452K and P453L) and four novel Gag mutations, possibly associated with PI failure, (i.e. Q69K, S111C/I, T239A/S and I256V) were identified. Samples with PR RAMs (M46I, I54V, V82A and/or L76V) had a significantly lower RC than samples without PR RAMs (P< 0.0001). Samples with Gag RAMs showed no difference in RC compared to samples without Gag RAMs (P< 0.01). Samples with both PR RAMs and Gag mutations had significantly lower RC than samples with/without Gag mutations (p< 0.01). The A431V mutation was the only Gag mutation significantly associated with reduced RC. Interestingly, the Q69K novel gag mutation rescued viral replication and increased viral cleavage of samples harboring the A431V Gag RAM, without altering susceptibility to Lopinavir (LPV) or Darunavir (DRV). This was confirmed by SDM. All samples with PR RAMs showed reduced susceptibility to LPV and DRV whilst only certain combinations of Gag mutations, in the absence of PR RAMs, displayed reduced susceptibility to LPV and DRV.
**Conclusions:** Overall we identified novel mutations in Gag associated with PI failure. We showed that certain Gag mutations can rescue RC of viruses harboring Gag and PR RAMs and that viruses with certain Gag mutations can confer reduced susceptibility to PI's in the absence of PR RAMs. This data advocates for the inclusion of gag in PI resistance algorithms.

## HIV-1 SUPER-INFECTION/INTER/INTRA SUBTYPE CO-INFECTION

### WEPEA007

### HIV-1 GROUPS M+O DUAL INFECTIONS AND HIV-1/MO RECOMBINANT FORMS CIRCULATING IN CAMEROON

P.A. Tagnouokam Ngoupo[1,2], F. De Oliveira[2], S.A. Sadeuh-Mba[1], L. Ngono[1], E. Ngo Malabo[1], E. Akongnwi[1], P. Tchendjou[3], V. Ngono[4], R. Njouom[1], J.-C. Plantier[2], A. Kfutwah[1]
[1]*Centre Pasteur of Cameroon, Virology, Yaounde, Cameroon,* [2]*Rouen University Hospital, Virology, Rouen, France,* [3]*Centre Pasteur of Cameroon, Epidemiology and Public Health, Yaounde, Cameroon,* [4]*Yaounde Central Hospital, Yaounde, Cameroon*
*Presenting author email: ngoupopa@gmail.com*

**Background:** Cameroon is considered as the epicenter of HIV-1 group O. Therefore, the simultaneous presence of HIV-1 groups M and O in the country provides an ideal environment for HIV-1 groups M+O dual infections to occur and the emergence of HIV-1/MO recombinant forms. To date, no data on the prevalence of these forms are available. In this work, we determined the proportions of M+O dual infections and M/O recombinants forms in Cameroon and characterized genetic profile of the recombinants.
**Methods:** From March 2013 to June 2015, 275 HIV infected patients were included in the study based on an "In-house" serotyping test. Specific RT-PCR targeting the Prot, RT, Int and Gp41 regions of HIV-1/M and O were further performed. In the likelihood M+O dual infections and/or presence of M/O recombinant, a recombination point in the *vpr* gene was investigated. Genetic profile of recombinants was characterized by full length genome sequencing and genetic link with previous recombinants was investigated by phylogenetic and recombination analyses.

**Results:** Among the 275 patients, 47 were HIV-1/O mono-reactive, 199 HIV-1/M mono-reactive and 29 were M+O dual reactive. Mono-infections with HIV-1/O were confirmed by RT-PCR in 48 patients (17%) and HIV-1/M in 217 (79%). For 3 patients (1%) all RT-PCR were negative. M+O dual infections were identified in 4 patients (1.4%) and the presence of recombinants forms were confirmed in 3 patients (1%). The first recombinant form was associated with 'parental' strain HIV-1/M and two breakpoints were indentified (*vpu* and *LTR*). Two breakpoints were also present (*vpr* and *LTR*) in the two other recombinants but no parental strain was found. These two recombinants were identified in couple and the great similarity between the two viruses showed that both spouses were infected with a unique recombinant virus. The recombination patterns [M-O-M] were identical for the three recombinants described here but no link with previous recombinants was found.
**Conclusions:** Our results confirmed the co-ciculation of HIV-1/M+O dual infections and HIV-1/MO recombinants in Cameroon. Their distinct recombination profiles demonstrate the complexity of these recombinants. The transmissibility of an HIV-1/MO recombinant form described here point out the diffusion potential of such forms and emergence of CRF_MO.

## INTRINSIC CELLULAR DEFENCES AND RESTRICTION FACTORS

### WEPEA008

#### INTERFERON-INDUCED STERILE ALPHA MOTIF AND HISTIDINE/ASPARTIC ACID DOMAIN-CONTAINING PROTEIN 1 (SAMHD1) EXPRESSION IS MEDIATED BY MIR-181A

C. Jin, T. Xie, N. Wu
*Zhejiang University, Hangzhou, China*
*Presenting author email: flwnp2013@163.com*

**Background:** Human immunodeficiency virus associated neurocognitive disorders (HAND) is highly prevalent in the aging patient population. The pathogenesis of HAND is related to excessive secretion of interferon. Sterile alpha motif and histidine/aspartic acid domain-containing protein 1 (SAMHD1), a newly discovered human immunodeficiency virus-1 host restriction factor, has been found to be expressed in astrocytes and microglia, and to be regulated by microRNA-181a (miR-181a). As a negative regulator of interferon response, SAMHD1 is induced by interferon-γ and may be an important factor in HAND. However, the mechanism of interferon induction of SAMHD1 expression is unclear. We hypothesized that interferon induces SAMHD1 expression through JAK-STAT signaling pathways, which are mediated by miR-181a.
**Methods:** We examined the effect of interferon-α and interferon-γ on SAMHD1 expression and miR-181a levels in astrocytes and microglia,and then explored the mediation of miR-181a on SAMHD1 expression by over expression and inhibition of miR-181a. We also studied the role of JAK-STAT signaling pathway in SAMHD1 expression using specific inhibitor.
**Results:** We found that both isoforms of interferon increased SAMHD1 mRNA and protein expression. Interferon-α and interferon-γ also reduced levels of miR-181a, particularly in microglia. To determine whether interferon-induced SAMHD1 expression was mediated by miR-181a, we overexpressed or inhibited miR-181a in these cells and exposed them to interferon. We found that overexpression of miR-181a counteracted induction of SAMHD1 expression by interferon, and inhibition of miR-181a mimicked interferon treatment. Inhibition of JAK-STAT signaling pathways resulted in increased miR-181a levels and decreased SAMHD1 mRNA expression.
**Conclusions:** Our results suggest that both interferon-α and interferon-γ can induce SAMHD1 expression; this induction mechanism is mediated by miR-181a. MiR-181a is a key regulator of SAMHD1 and may become a new drug target for the treatment of HAND.

### WEPEA009

#### ENDOGENOUS TRIM5A FUNCTION IS REGULATED BY SUMOYLATION AND NUCLEAR SEQUESTRATION FOR EFFICIENT INNATE SENSING IN DENDRITIC CELLS

D. Portilho[1], J. Fernandez[1], M. Ringeard[2], A. Machado[1], A. Boulay[1], M. Mayer[3], M. Muller-Trutwin[4], A.-S. Beignon[5], F. Kirchhoff[3], S. Nisole[6], N. Arhel[1]
[1]*University Institute of Hematology, Viral Genetics and Pathogenesis Laboratory, INSERM U 941, Saint-Louis Hospital, Paris, France,* [2]*URA 3015, Institut Pasteur, Paris, France,* [3]*Institute of Molecular Virology, Ulm University Medical Center, Ulm, Germany,* [4]*Institut Pasteur, Unité HIV, Inflammation et Persistance, Paris, France,* [5]*CEA-iMETI/Division of Immuno-Virology, Université Paris Sud, INSERM U 1184, Fontenay-aux-Roses, France,* [6]*INSERM UMR-S 1124, Université Paris Descartes, Paris, France*
*Presenting author email: dmportilho@gmail.com*

**Background:** During retroviral infection, viral capsids are subject to restriction in the cytoplam by the cellular factor TRIM5a. For instance, rhesus macaque (RM) TRIM5a restricts HIV-1, SIVagm, and N-MLV, but not SIVmac, whereas human TRIM5a can block N-MLV and EIAV, but is less effective against HIV-1 (Bieniasz, 2004). However, while RM T lymphocytes efficiently block HIV-1 infection, we have previously shown that RM dendritic cells (DCs) lack TRIM5a-mediated restriction and are permissive to HIV-1 infection (Arhel et al., 2008). Recent work proposed that TRIM5a is a SUMO substrate and its restriction may be modulated by the SUMO machinery (Arriagada et al., 2011; Dutrieux et al., 2015). The aim of this study is to characterize whether TRIM5a SUMOylation participates in the permissiveness of DCs to HIV-1 infection.
**Methods:** To assess endogenous TRIM5a localization in PBLs and DCs from human and RM donors cells were co-labeled with the TRIM5a and GM-130, PML and Coilin antibodies. TRIM5a SUMOylation was investigated by gingkolic acid (GA) treatment, a SUMOylation inhibitor. The interferon (IFN) a and b, IL-6 and cGAS levels in DCs were assessed by qPCR after HIV-1, N-MLV and EIAV infection. The function of E3 SUMO ligases was investigated using stable RNA interference.
**Results:** In DCs, endogenous TRIM5a accumulates in nuclear bodies that partly co-localize with Cajal bodies in a SUMOylation-dependent manner. Nuclear sequestration of TRIM5a allowed potent induction of type I IFN responses during infection, mediated by sensing of reverse transcribed DNA by cGAS. Overexpression of TRIM5a or treatment with the GA resulted in enforced cytoplasmic TRIM5a expression and restored efficient viral restriction but abrogated type I IFN production following infection.
**Conclusions:** Our results demonstrate that DCs TRIM5a is sequestered in the nucleus in a SUMOylation-dependent manner, favoring innate sensing of retroviruses in the cytoplasm by cGAS and thus an antiviral response. This work adds to our understanding of how retrovirus restriction factors are regulated.

*Presenting author email: wasf1234@kmu.edu.tw*

**Background:** HIV-1 circulating recombinant form 07_BC (CRF07_BC) has been reported to cause serious HIV-1 epidemics among injecting drug users (IDUs) in Asia. 7-13 amino-acid deletion in the $p6^{Gag}$ was illustrated . The deletion contains Alix binding domain. Alix is known to coordinate with ESCRT complex to promote HIV-1 budding through interacting to the HIV-1 $p6^{Gag}$. Limited information is available regarding the viral characteristics and impacts of HIV-1 CRF07_BC on disease progression and virus replication.
**Methods:** A cohort study was conducted to compare viral loads and changes of CD4+ cells
between patients infected with subtype B and CRF07_BC. Viral replication kinetics and virus release efficacy were performed to compare the differences between subtype B and CRF07_BC. Site direct mutagenesis was used to construct the 7 amino acid deleted infectious clone. Co-immunoprecipitation and total internal reflec-

tion fluorescence(TIRF) microscope were used to evaluate the co-localization and interaction between Alix and truncated p6[Gag]. Immunoblotting and transmission electromicroscope(TEM) were used to observe the level of gp120 expressing level on virus envelope.

**Results:** Clinical results revealed that patients infected with CRF07_BC had significantly lower viral loads than patients with subtype B infection ($p< 0.01$). Replication kinetics between CRF07_BC and subtype B isolates indicate that CRF07_BC displayed significantly lower replicative capacity than subtype B. Results from virus release efficacy showed that CRF07_BC had lower virus releasing capabilities compared with subtype B strain($p< 0.05$). The NL4-3 mutant virus containing 7 amino-acid deletion(7d mutant) in p6[Gag] showed that this virus had significantly lower replication capacity, poorer protease-mediated processing and viral proteins production. Co-IP and TIRF microscope analyses showed that significantly lower co-localization and interaction occurred in NL4-3 7d mutant($p< 0.05$). TEM and immunoblotting showed that CRF_07 BC or NL4-3 7d mutant expressing higher level of gp120 on the envelope compared with subtype B and NL4-3 wild type viruses, respectively.

**Conclusions:** We conclude that patients infected with CRF07_BC dispayed significantly lower viral loads and higher CD4+ cells were due to 7 amino acid deletion on p6[Gag.] This study offers valuable information of virological characteristics of HIV-1 CRF_07 BC and dissects the possible mechanism of slow disease progression observed in clinical.

## Transcriptional and gene expression regulation (including regulatory genes)

#### Changes in Rev in HIV isolates from different clades have a significant impact on Rev/RRE functional activity

P. Jackson[1], D. Tebit[2], D. Rekosh[2], M.-L. Hammarskjold[2]

*[1]University of Virginia, Infectious Diseases, Charlottesville, United States, [2]University of Virginia, Microbiology, Immunology, and Cancer Biology, Charlottesville, United States*

*Presenting author email: pej9j@hscmail.mcc.virginia.edu*

**Background:** HIV-1 replication requires the nucleocytoplasmic export of intron-containing mRNAs which is ordinarily restricted. HIV accomplishes this by means of interaction of the viral Rev protein and an RNA secondary structure called the Rev Response Element (RRE). Recent work in subtype B from our group and others has demonstrated that the Rev/RRE regulatory axis functions as a rheostat to modulate viral protein production and replication. For this reason, we examined Rev/RRE functional activity in non-subtype B isolates.

**Methods:** Rev/RRE function was assayed using an HIV vector system. The vector transduces target cells to become resistant to hygromycin, and vector titer correlates with Rev/RRE function. Rev/RRE cognate pairs from two subtype A, two G, four CRF02_AG, and three B viruses were compared to determine the degree of activity variation. Artificial Rev/RRE pairs were also created to permit assay of Rev and RRE contributions to activity individually. Steady state levels of Rev protein were determined by Western blotting.

**Results:** The Rev/RRE functional activity of cognate pairs varied 24-fold from the least to most active virus. Large intra-subtype activity variation was observed for subtype G. An analysis was performed of the variation in activity of the individual RREs and Revs. There was no correlation between variation in RRE activity and that of the corresponding cognate pair. Rev activity did correlate closely with cognate pair activity ($R^2$=0.7248). Some artificial Rev/RRE combinations displayed greater functional activity than the original cognate pairs. There was no correlation between Rev expression and cognate pair activity ($R^2$=0.1174).

**Conclusions:** There is significant variation in Rev/RRE functional activity between non-subtype B HIV isolates. This variation tracks with Rev sequence but not with the RRE. Variation in Rev activity cannot be explained by differences in protein expression. Differences in Rev amino acid sequence and/or Rev/RRE intracellular complexes may be responsible for modulating the activity of this regulatory axis. Further research using non-subtype B viruses may further clarify the structural determinants of Rev/RRE activity and lead to greater understanding of the role of Rev/RRE in pathogenesis.

#### HIV-1 RNAs of the 1 kb class, splicing near the 3' end of the viral genome, lack coding capacity and enhance viral replication in peripheral blood mononuclear cells

E. Delgado[1], Y. Vega[1], E. García-Bodas[1], C. Carrera[1], C. Arcones[1], A. Mariño[2], A. Ocampo[3], S. Pérez-Castro[3], C. Miralles[3], I. López-Miragaya[3], H. Álvarez[2], M.M. Thomson[1]

*[1]Instituto de Salud Carlos III, Centro Nacional de Microbiología, Majadahonda, Spain, [2]Hospital Arquitecto Marcide, Ferrol, Spain, [3]Complejo Hospitalario Universitario de Vigo, Vigo, Spain*

*Presenting author email: mthomson@isciii.es*

**Background:** HIV-1 RNAs have been usually classified in three major categories: unspliced (~9 kb); singly spliced (~4 kb); and doubly spliced (~2 kb). We recently described a fourth RNA class, of ~1 kb, using 3' splice sites near the 3' end of the viral genome, within Nef coding sequence, which was subsequently confirmed by other authors. Most of these RNAs potentially code for a 33-34 amino acid peptide in the Nef C-terminus. Here we examine whether the predicted peptide is expressed from 1 kb RNAs and whether they have an effect on viral replication.

**Methods:** Peripheral blood mononuclear cells (PBMCs) from 24 HIV-1-infected individuals were subjected to immunomagnetic separation to obtain $CD4^+CD25^+$ lymphocytes. HIV-1 1 kb RNAs were amplified from total RNA by RT-nested PCR using primers recognizing sequences near both viral genome ends. RT-PCR products were cloned and sequenced. Six clones from 1 kb RNAs were subcloned into a mammalian expression vector. Coding capacity was examined through transfection into 293T cells and Western blot with a monoclonal antibody targeted to the C-terminus of Nef. Effect on HIV-1 replication was examined by nucleofection of endotoxin-free plasmids with HIV-1 infectious molecular clone p89.6, with p24 antigen measurement in supernatant at 48 h.

**Results:** Clones from HIV-1 1 kb RNAs were detected in 9 (37.5%) of 24 individuals, in 7 of which they were more abundant than clones derived from doubly spliced RNAs. In 7 samples, sequences predicted coding for a 33-34 C-Nef peptide. However, in Western blot assays the predicted peptide failed to be detected in all tested clones. In nucleofection assays in activated PBMCs, three cloned 1 kb cDNAs enhanced HIV-1 production by factors of 2.7-7.1 compared to the control plasmid lacking 1 kb cDNA sequences.

**Conclusions:** HIV-1 1 kb RNAs splicing near the 3' end of the viral genome are frequently detected in vivo. Although most potentially code for a 33-34 C-Nef peptide, it failed to be detected in transfection assays, probably due to short upstream open reading frames. In nucleofection assays in PBMCs, they enhance HIV-1 replication. A mechanism by sequestering cellular miRNAs targeted to the 3'UTR of HIV mRNAs is proposed.

## Viral replication (including necessary cellular elements)

#### Metabolic dependency of HIV-1 replication: glucose and glutamine metabolism in HIV-infected primary CD4+ T cells

H. Huthoff, A. Hegedus, M. Kavanagh Williamson

*King's College London, Infectious Diseases, London, United Kingdom*

*Presenting author email: hendrik.huthoff@kcl.ac.uk*

**Background:** All viral replication cycles are dependent on the host cell for provision of biosynthetic and bioenergetic resources to support virion biogenesis. We investigated ways in which HIV-1 is dependent on, and modulates the activity of, host metabolic pathways. Activated CD4+ T cells are the primary target for HIV-1 infection and replication, and are characterised by high rates of glycolysis and glutaminolysis. Thus, we have investigated the role of glucose and glutamine in *in vitro* HIV-1 infection studies.

**Methods:** Metabolite profiling, heavy-isotope tracing and starvation/supplementation studies to investigate the metabolic activity of HIV-1 infected cells. Virus replication as well as cell proliferation and survival were assessed by a combination of ELISA, western blotting and flow cytometry.

**Results:** We observed elevated glycolysis in HIV-1 infected primary CD4+ T cells. By providing cells with the alternative carbohydrate galactose that cannot support glycolysis, we demonstrated that glycolysis is required for HIV-1 virion biogenesis and also predisposes infected cells to apoptosis. We furthermore investigated the role of glutamine in HIV-1 infection. We detected elevated levels of glutamine in HIV-1 infected compared with uninfected primary CD4+ T cells, but found no evidence that entry of glutamine into the citric acid cycle is significantly altered upon infection with HIV-1. Instead, we have preliminary data from NMR studies with C13-

labeled glutamine that the secretion of glutamine-derived metabolites is altered in HIV-1 infected cells.
**Conclusions:** We have demonstrated dependency of HIV-1 replication on glycolysis and glutamine metabolism as well as significant upregulation of glycolysis by HIV-1. Our data support the notion that HIV-1 infected primary CD4+ T cells operate at their maximum glycolytic capacity, which is also associated with elevated apoptosis. Our studies have the potential to reveal metabolic factors that might serve as novel drug targets for antiretroviral therapy. Furthermore, HIV-1 carriers that receive ART are at risk for developing metabolic syndrome, which will cause many of these individuals to receive additional therapy to relieve those symptoms in addition to their HIV infection. It will be important to gain an understanding how such metabolic interventions may impact on virus replication and reservoir establishment in the face of ART.

## WEPEA014

### DEPENDENCY OF HIV-1 REPLICATION ON AND VIRAL MANIPULATION OF THE GLYCOLYTIC METABOLISM OF ACTIVATED PRIMARY CD4+ T CELLS

M. Kavanagh Williamson, A. Hegedus, H. Huthoff
*King's College Hospital, Infectious Diseases, London, United Kingdom*
*Presenting author email: maia.kavanagh_williamson@kcl.ac.uk*

**Background:** HIV-1, like all viruses, relies entirely on the host cell to provide biosynthetic resources to complete its life cycle. Glycolysis converts glucose to pyruvate and lactate, generating biosynthetic components and a small amount of ATP. Our laboratory recently reported that HIV-1 infection increased flux through this pathway in primary CD4+ cells. This research is investigating the mechanisms of increased glycolytic metabolism in HIV-1 infection in primary CD4+ T cells.
**Methods:** To investigate the interplay between HIV-1 infection and cellular metabolism, primary CD4+ T cells were cultured in galactose or glucose, with galactose preventing glycolysis but maintaining cell viability and proliferation. Glucose uptake inhibitors were used to investigate the roles of glucose transporters in increased glycolysis and HIV-1 infection. Glycolytic flux were analysed in real-time with the Seahorse XF24 extracellular flux analyser. To determine the impact of alterations in the cells metabolic state upon HIV-1 virion production, p24Gag ELISA and TZM-bl assays were performed.
**Results:** Using galactose or glucose to manipulate the metabolic state of primary CD4+ cells, we demonstrate that HIV-1 replication is dependent on the ability of the host cell to engage glycolysis. In order to investigate if glycolysis is also required to support the integrity of assembling virions, we compared the infectivity of HIV-1 virions from cultures containing galactose or glucose. Virions harvested from cultures containing galactose were far less infectious than virions from cultures containing glucose, when normalised for equal amounts of the p24Gag protein. We furthermore investigated the increase in glycolytic flux that persists in HIV-1 infected primary cells compared with uninfected cells. By monitoring the activity of glycolytic enzymes in cell lysates, we observed that the activity of Hexokinase, which commits glucose to glycolysis, is increased in HIV-1 infected cells.
**Conclusions:** This work demonstrates the important interaction between HIV-1 and cellular glycolytic metabolism, in particular the reduced infectivity of virions in the absence of glycolysis. As we continue to characterise this and the mechanisms by which HIV-1 manipulates cellular metabolism, there is the potential to identify novel therapeutic targets.

### EXPLORING THE ROLE OF PHOSPHORYLATION AS REGULATORY MECHANISM INDUCED BY HIV-1 TO FAVOR VIRUS REPLICATION

E. Pilotti[1], M. Galeazzi[2], A. Manfredi[2], L. Elviri[2], M. Castagnola[3], C.F. Perno[4,5], M.R. Larsen[6], S. Sidoli[6,7], O.N. Jensen[6], C. Casoli[1,8]
*[1]GEMIB SRL, Parma, Italy, [2]University of Parma, Parma, Italy, [3]Università Cattolica del Sacro Cuore, Rome, Italy, [4]National Institute for Infectious Diseases 'L. Spallanzani', Rome, Italy, [5]University of Rome 'Tor Vergata', Rome, Italy, [6]University of Southern Denmark, Odense, Denmark, [7]University of Pennsylvania, Philadelphia, United States, [8]University of Milan, Milan, Italy*
*Presenting author email: elisabetta.pilotti@gmail.com*

**Background:** It is known that HIV-1 regulates post-translation modifications to reprogram cellular signaling mechanisms. In particular, it has been demonstrated that HIV-1 modulates host cell phosphorylation pathways in order to favor its own replication (Wojcechowskyi JA et al, Cell Host & Microbe 2013). Here, we aimed to identify new host factors regulated by HIV-1 through phosphorylation, performing a global analysis of phosphoproteoma of both CD4+T cells from viremic naïve patients and healthy CD4+T cells exposed *in vitro* to viral antigens.
**Methods:** CD4+ T-cells were purified from PBMCs of 22 patients and 21 donors by negative immunomagnetic separation. Aliquots of healthy CD4+ T-cells were separately exposed to Tat, gp41/gp120, and Nef for a short time. After triptic digestion, we employed $TiO_2$ approach for enrichment of phosphopeptides. Quantitative proteomic analyses were performed using LC-MS/MS. Bioinformatics tools were employed for the determination of functional protein annotations and kinase/phosphatase/substrate associations.
**Results:** We identified 77 differentially modified proteins in patients compared to donors. In detail, 21 were newly phosphorylated, 35 dephosphorylated, while 19 showed modifications at different sites. Other two proteins showed differences in terms of localization and of total number of phosphosites. GO annotation established that platelet activation, poly(A)RNA binding, and extracellular exosomes were the most significant terms ($p< 0.05$). Interestingly, we observed an HIV-dependent phosphorylation of LMNB1, CETN2, LYN, VIM, FYN, and LFNA, known as potential substrates for phosphatases. As observed in patients, we revealed that Tat, and to lesser extent, Nef mainly stimulated a *de*-phosphorylation of target proteins. On the contrary, after gp41/gp120 exposure the majority of modified proteins showed an increase of phosphosites. Of particular importance, we found that Nef modulated PPP1CB phosphatase activity, essential for cell division, as well as activity of both SRRM1 and SRRM2, which are involved in numerous pre-mRNA processing events.
**Conclusions:** These findings highlighted the complexity of regulatory mechanisms induced by HIV-1, that, in particular, seems to preferentially trigger a dephosphorylation of target proteins to modify host microenvironment. This study also provided strong evidence for potential targets of new therapeutic approaches.

# VIRAL MECHANISMS OF HIV/SIV PERSISTENCE AND LATENCY

## WEPEA016

### HUMAN CYTOMEGALOVIRUS LATENT INFECTION MODULATES HIV RESTRICTION FACTORS IN CD34$^+$ HEMATOPOIETIC STEM CELLS

A. Cheung
*University of Hong Kong, AIDS Institute, Hong Kong, Hong Kong*
*Presenting author email: allen@hku.hk*

**Background:** Individuals pre-exposed to human cytomegalovirus (HCMV) are more prone to HIV/AIDS disease progression but the reasons remain elusive. HCMV is a ubiquitous DNA virus that establishes natural lifelong latent infection in CD34$^+$ progenitor cells, where latency-specific viral genes modulate the host cell environment. Myeloid-lineage cells are known to resist replicative HIV-1 infection but recent studies provided evidence that latent reservoir may be established in CD34$^+$ myeloid progenitors. Therefore, an intricate relationship between HCMV and HIV-1 may occur in these cells.
**Methods:** CD34$^+$ cells isolated from healthy PBMCs were cultured in specialized media for ~30 days to allow expansion. Phenotype of CD34-subsets were assessed by flow cytometry before infection by HCMV. Establishment of HCMV latency and modulation of cellular responses were assessed using real-time PCR and plaque assay. X4/R5-HIV-1 was used to infect CD34$^+$ cells harboring latent HCMV and successful HIV-1 infection was examined for proviral DNA by digital PCR.
**Results:** Peripheral blood-derived (PB-)CD34$^+$ cells expanded up to 50-fold after 30 days in culture and retained early progenitor phenotype. The success of the establishment of HCMV latency was assessed by the detection of latency-specific transcripts UL111.5A, LUNA and UL138, lack of infectious virions, and the ability to reactivate upon co-culture with permissive cells. Importantly, latent HCMV infection downregulated the HIV-1 restriction factors SAMHD1, APOBEC3A/G, tetherin and Mx2 in PB-CD34$^+$ cells, which led to higher HIV-1 transcriptional activity and proviral DNA. Interestingly, these cells retained HCMV-induced downmodulation of MHC class II molecules and did not show differentiation tendency. Furthermore, we demonstrated that the expression of CXCR4 and CCR5 on CD34$^+$ cells were not altered by HCMV latent infection, but HIV-1 infection can be inhibited by antiretrovirals. Lastly, using a dual-reporter pseudovirus, infection of latent HCMV PB-CD34$^+$ cells resulted in increased active infection compared to mock cells.
**Conclusions:** This study describes an *in vitro* CD34$^+$ cell expansion culture model to study the establishment of HCMV and HIV-1 infections. Furthermore, we demonstrated that interplay exists between latent HCMV and HIV-1 infection in CD34$^+$ progenitor cells. These findings provide insights into the importance of pre-existing latent HCMV that affects HIV-1 infection outcome.

## CELLULAR AND TISSUE RESERVOIRS OF HIV/SIV

### MEMORY CD4+ T CELLS EXPRESSING HLA-DR CONTRIBUTE TO HIV PERSISTENCE DURING PROLONGED ART

E. Lee[1,2], B. Hiener[1,2], P. Bacchetti[3], W. Shao[4], E. Boritz[5], D. Douek[5], R. Fromentin[6], T. Liegler[7], S.G. Deeks[7], F.M. Hecht[7], J. Milush[7], N. Chomont[6], S. Palmer[1,2]
*[1]The Westmead Institute for Medical Research, Centre for Virus Research, Westmead, Australia, [2]University of Sydney, Sydney Medical School, Sydney, Australia, [3]University of California, Department of Epidemiology and Biostatistics, San Francisco, United States, [4]Leidos Biomedical Research, Inc, Frederick National Laboratory for Cancer Research, Frederick, United States, [5]National Institutes of Allergy and Infectious Diseases, National Institutes of Health, Human Immunology Section, Vaccine Research Center, New York, United States, [6]Université de Montréal, Department of Microbiology, Infection and Immunology, Montreal, Canada, [7]University of California, Department of Medicine, San Francisco, United States*
*Presenting author email: eunok.lee@sydney.edu.au*

**Background:** Most measurements of HIV reservoirs are performed using "resting" CD4+ T cells depleted for cells expressing HLA-DR, which is considered an activation marker. However, little is known about the possible role of these cells in HIV persistence during ART. Here, we examine the contribution of memory CD4+ T cells expressing HLA-DR to HIV persistence after prolonged ART
(≥15 yrs).
**Methods:** Using LTR-specific qPCR, HIV RNA and DNA were quantified in memory CD4+ T cells expressing HLA-DR or not from 6 participants (P1-P6) on ART (≥15 yrs). Using single-genome/proviral sequencing, we characterized HIV-RNA/DNA (p6-RT) sequences from HLA-DR+ and HLA-DR- memory T cells, central (CM), transitional (TM) and effector (EM) memory T cells. Clonal expansions were defined as ≥2 identical sequences in phylogenetic trees.
**Results:** CD4+ HLA-DR+ and HLA-DR- memory cells contained a median of 3400 and 1000 HIV-RNA copies/million cells; and 36 and 60 HIV-DNA copies/million cells respectively, indicating the HIV transcriptional activity of HLA-DR+ cells is 6-fold higher than HLA-DR-. In participants treated during chronic infection, proportions of HIV-DNA clonal expansions were similar between HLA-DR+ and HLA-DR- memory T cells but HIV-DNA sequences from EM were more often identical to HIV-DNA sequences from HLA-DR+ memory cells (43% P1, 88% P2) than CM and TM (8-18% P1; 8-44% P2;
p< 0.0001-0.03). For one participant treated during acute infection, approximately 50% of the sequenced HIV-DNA from HLA-DR- memory T cells, CM, TM, and EM was defective (hypermutated and/or containing stop codons) and 26% of HIV-RNA from HLA-DR- memory T cells was defective. However, the amount of defective HIV-DNA and RNA from HLA-DR+ memory T cells was much lower (21% and 0% respectively).
**Conclusions:** These findings demonstrate that memory CD4+ T cells expressing HLA-DR contain persistent HIV-DNA and measurable HIV-RNA. Furthermore, these cells appear to contain more intact virus in the region sequenced than other cellular subsets. Therefore, measurements of the HIV reservoir during ART should include memory cells expressing activation markers, including HLA-DR. HLA-DR+ and EM cells had clonal expansions of genetically identical HIV-DNA, suggesting these cell subsets replenish the HIV reservoir through proliferation during prolonged ART.

### WEPEA018

### IS THE LUNG A SITE OF PRODUCTIVE HIV INFECTION THAT PERSISTS THROUGH ART?

D. Russell[1], D. Gludish[1], K. Jambo[2], H. Mwandumba[2]
*[1]Cornell University, Ithaca, United States, [2]Malawi-Liverpool-Wellcome Research Program, Blantyre, Malawi*
*Presenting author email: dgr8@cornell.edu*

**Background:** HIV persistence is maintained by viral reservoir(s) discrete from the peripheral viral population. These viral reservoirs are particularly significant during the rebound of peripheral viremia following failure of anti-retroviral therapy (ART). Using Fluorescent *in situ* Hybridization (FISH)-based detection system we demonstrated previously that chronically HIV-infected, ART-naïve individuals have virus in their lungs that is present predominantly in alveolar macrophages (AM). AM are long-lived cells that could represent an under-appreciated reservoir for HIV.
**Methods:** HIV mRNA was detected by FISH. The ability of cells isolated by bronchoalveolar lavage (BAL) to generate infectious virus was probed using a novel reporter cell line (TZM-GFP) engineered to express GFP in a tat/rev-dependent manner. Further characterization of the co-receptor utilization of these viral populations is being conducted using the Affinofile cell line expressing differing levels of CD4 and CCR5.
**Results:** Here we show that AM from Malawian HIV-1-infected adults who had been on ART for extended periods (>4yrs) remain positive for HIV-1 *gag* mRNA. The majority of these individuals possess a plasma viral burden below the limit of detection. To probe for production of infectious virus, we used a reporter cell line that exhibited HIV tat/rev-dependent expression of GFP and was permissive to infection when co-incubated with HIV-1-positive human monocyte-derived macrophages (HMDM) in culture. When co-cultured with BAL cells from ART-naïve HIV-infected individuals we could readily detect infection of the fluorescent reporter cell line. Furthermore, we also demonstrated production of infectious virus in individuals on extended ART, who lacked peripheral viremia but had detectable HIV-1 *gag* mRNA in their AM. The further characterization of the cell-tropism and infectious characteristics of this viral population is currently under investigation using Affinofile cells under differing levels of induction of CD4 and CCR5.
**Conclusions:** AMs are extremely long-lived cells that are not killed by HIV-infection. This raises the possibility that HIV-1-infected AM could contribute to the maintenance of productive HIV infection that persists through long-term ART. Phenotypically, with respect to the evolution of viral diversity, drug suppression of transcriptionally-active, HIV-infected AMs by ART would be indistinguishable from the arrested genomic diversity observed as a result of latent infections.

## MEASUREMENT OF HIV/SIV RESERVOIRS

### QUANTIFICATION AND CORRELATES OF THE REPLICATION COMPETENT HIV-1 LATENT VIRAL RESERVOIR IN A VIRALLY SUPPRESSED UGANDAN POPULATION

J.L. Prodger[1], J.D. Siliciano[2], J. Lai[2], S.J. Reynolds[1], J. Kasule[3], T. Kityamuweesi[3], D. Serwadda[3], A.D. Redd[1], R.F. Siliciano[2,4], R.D. Moore[2], T.C. Quinn[1]
*[1]National Institute of Allergy and Infectious Diseases, Laboratory of Immunoregulation, Baltimore, United States, [2]Johns Hopkins University School of Medicine, Infectious Disease, Baltimore, United States, [3]Rakai Health Sciences Program, Kalisizo, Uganda, [4]Howard Hughes Medical Institute, Baltimore, United States*
*Presenting author email: jessica.prodger@utoronto.ca*

**Background:** HIV-1 persists in latently infected cells resting memory CD4+ T cells, which is the major barrier to curing infection. Previous studies have quantified this pool of latently infected cells in North Americans and Europeans; however, no study has quantitated the latent HIV-1 reservoir (LVR) in sub-Saharan Africans, who make up the largest population of HIV-infected individuals globally.
**Methods:** Peripheral blood was collected from 30 virally suppressed HIV-infected individuals from Rakai, Uganda, who initiated ART during chronic infection (nadir CD4 count 76-192 cells/μl) and had an undetectable viral load (≤40 copies/μl) for a minimum of 18 months before enrolment. Resting CD4+ T cells were isolated by negative selection. The quantitative viral outgrowth assay (Q-VOA) was used to determine the minimum frequency of latently infected cells with replication competent virus. Multivariate regression analysis was used to identify correlates of LVR size.
**Results:** The median LVR size in this Ugandan population was estimated to be 0.31 IUPM (Infectious Units per Million; range 0.037 - 8.15 IUPM). LVR size correlated positively with pre-ART viral load (p=0.003) and the number of times plasma viral load became transiently detectable (>400 copies/μl) after initial ART-suppression (p=0.031). The LVR correlated negatively with CD4:CD8 T cell ratio (p=0.032). LVR size did not correlate with age, gender, duration of viral suppression, nadir CD4 count or CD4 count at the time of Q-VOA. Analyses of viral subtype sequences isolated from the supernatants of p24+ wells of the Q-VOA are ongoing. Of note, the LVR size in this Ugandan population is over 3-fold smaller than that previously reported in Americans
(Margolis *et al.* JID 2015).
**Conclusions:** We report the first quantification of latently infected resting CD4+ T cells with replication competent virus in an ART treated, virally suppressed sub-Saharan African population. LVR size correlated positively with pre-ART viral load and transient viral detection, and correlated negatively with CD4:CD8 T cell ratio. LVR size was smaller than previously reported in an American population; further studies will determine if this is attributable to differences in sample handling or other covariates, such as viral subtypes.

*Presenting author email: sarah.watters.09@ucl.ac.uk*

**Background:** HIV persistence in long-lived infected cells represents a barrier to viral eradication. Immune modulatory agents (IMiDs), including pomalidomide, have marked effects on T cell function, including increased CD4/CD8 proliferation (Polizzotto et al 2014). However, the impact of IMiDs on the HIV reservoir is unknown. We evaluated the effect of pomalidomide on HIV reservoirs by characterizing the size, structure and dynamics of HIV populations in individuals undergoing pomalidomide treatment.
**Methods:** HIV-1 infected individuals (14 males, median age 49.5 y, median CD4=437 cells/µl), undergoing combination antiretroviral therapy with HIV RNA < 50 copies/ml, enrolled in an NCI trial (NCT01495598) of pomalidomide (5 mg/day for 21 days per 28 day cycle) for co-morbid Kaposi sarcoma were studied. PBMCs were obtained at study entry, following cycle 2, and at therapy completion (median 7 cycles). Levels of plasma RNA, peripheral blood mononuclear cell (PBMC) associated HIV DNA and RNA were determined (ddPCR, real time PCR), and HIV populations analyzed using single genome sequences obtained from the p6-RT region of PBMC-derived HIV DNA. Sequences were aligned (CLUSTALW), analyzed to characterize phylogenetic structure (MEGA), population shifts (geographic subdivision), and migration (Simmonds AI, Slatkin-Maddison in HyPhy).
**Results:** Participants tolerated pomalidomide without complications. Levels of plasma RNA, PBMC-associated HIV DNA (CAD) and RNA (CAR) at study entry (range < 0.5- 58, median 1.5 RNA copies/ml; range 102-2072, median 779 CAD copies/million PBMC; range 220-1600, median 470 CAR copies/million PBMC) did not undergo significant change (p=0.16 RNA, p=0.29 CAD, p=0.53 CAR) after two cycles of pomalidomide or at study completion (p=0.25 RNA, p=0.53 CAD, p=0.27 CAR). HIV populations were genetically diverse at baseline (average pairwise difference, range 0.5-2.4 %) and included identical sequences. No evidence of expansion, population shift, or migration of any viral population was detected during or following pomalidomide therapy; some identical sequences persisted throughout study period. Minor changes in populations were detectable by pairwise difference analysis.
**Conclusions:** Pomalidomide neither expanded nor reduced cell associated HIV populations. HIV clonal variants persisted during pomalidomide therapy, but clonal expansions were not detected. Our data suggests that the sole use of pomalidomide is not sufficient to alter the HIV reservoir and impact HIV persistence.

## WEPEA021

### Novel pathways of Tat expression identify new targets for reactivation of latent HIV-1

M. Lee[1], J. Jacobson[1], M. Olshansky[1], T. Mota[1], S. Lewin[2,3], G. Khoury[1], S. Sonza[1], D. Purcell[1]
*[1]University of Melbourne at the Peter Doherty Institute for Infection and Immunity, Department of Microbiology and Immunology, Melbourne, Australia, [2]University of Melbourne, Peter Doherty Institute for Infection and Immunity, Melbourne, Australia, [3]Alfred Hospital and Monash University, Department of Infectious Diseases, Melbourne, Australia*
*Presenting author email: miclee@student.unimelb.edu.au*

**Background:** HIV-1 remains incurable due to the persistence of cells that harbour replication-competent virus in a non-productive state of infection. In this study, we characterised the expression of the HIV-1 Tat protein through a novel internal ribosome entry site (IRES) and explored its significance for reactivation of latent HIV. We examined the structure of chimeric cellular:HIV products in latently infected primary cells and assessed the properties of Tat translation from an IRES element within chimeric cell:*tat* readthrough transcripts.
**Methods:** HIV-containing RNAs were enriched from the CCL19-chemokine induced primary cell model of HIV-1 latency, as well as latently infected patient cells. Chimeric cellular:HIV RNAs were identified by RNA-Seq using Ilumina Mi-Seq. The Tat coding potential of these was investigated using expression plasmids and derivative lentivectors that contain either the HIV-$1_{NL4.3}$ Tat-86 coding exons in a conventional cap-dependent mRNA translation context, or in an unfavorable chimeric human growth hormone:*tat* mRNA context where Tat exons were embedded in the hGH gene, requiring Tat to be translated from an IRES underlying *tat*-coding RNA. The ability of both native and chimeric Tat-encoding RNA to reactivate latent virus was assessed by lentivector transduction of the latently infected T cell line, J-Lat10.6.
**Results:** In the CCL19-induced model of HIV-1 latency, chimeric messages represented ~0.2% of the RNA-Seq reads that were HIV sequences, and within these, several species of cellular:*tat* mRNA were detected. We showed that these are capable of Tat translation through the IRES element but with 6-fold lower efficiency than cap-dependent translation of Tat. The relative efficiency of Tat expression from the IRES was significantly increased during oxidative stress. HIV was also modestly increased in J-Lat10.6 cells after transduction with hGH-Tat lentivectors.
**Conclusions:** Primary T-cells latently infected with HIV contain cell:*tat* chimeric RNA that can translate HIV-1 Tat protein at low efficiency using an IRES element underlying coding exon 1. Tat expression from these mRNAs may be sufficient to weakly reactivate HIV from latency. Pharmacological approaches that increase the production of chimeric mRNA or Tat translation through its IRES may foster specific reactivation of latent HIV-1.

### Combinatorial CRISPR/Cas9 approaches targeting different steps in the HIV life cycle can prevent the selection of resistance

M. Nijhuis, D. de Jong, F. Wolters, E. Wiertz, R.J. Lebbink
*University Medical Center Utrecht, Medical Microbiology, Virology, Utrecht, Netherlands*
*Presenting author email: m.nijhuis@umcutrecht.nl*

**Background:** HIV presents one of the highest mutation rates, which in combination with a fast replication rate and a large population size accelerates viral evolution. Combination antiretroviral therapy can overcome the plasticity of the virus population and profoundly control viral replication. However, conventional treatment lacks the ability to stop viral production and clear the latent reservoir, which remains the major obstacle towards cure. Novel strategies, such as CRISPR/Cas9 genome editing, are required to permanently disrupt the HIV genome in the latently infected cells. In this study we investigated the ability of HIV to escape the CRISPR/Cas9 endonucleases targeting different steps in the viral life cycle.
**Methods:** The CRISPR/Cas9 system is comprised of a Cas9 protein, which in combination with a guideRNA (gRNA), is able to cleave a complementary dsDNA sequence. gRNAs were designed to target HIV-LTR, protease, reverse transcriptase, integrase and matrix. The CRISPR/Cas9 system was cloned in a lentivirus vector and transduced in SupT1 cells and the J.Lat Full-Length Clone 15-4. In the latter cells, impact of CRISPR/Cas9 on HIV reactivation was investigated. Transduced SupT1 cells were infected with HIV and viral replication and escape was monitored. On- and off-targeting efficiency (three genes per gRNA) and viral escape was assessed by deep sequencing.
**Results:** The CRISPR/Cas9 endonuclease induced efficient HIV genome editing (75%-99%), while off-target efficiency was < 0.9%. Subsequent TNFα-induced HIV reactivation was significantly reduced (single gRNA (40%-95%); two gRNAs (>98%)). We also demonstrated a significant reduction of HIV replication after six days of culture in SupT1 cells (single gRNA (82%-97%); two gRNAs (93%-99%)). Reduction in viral replication could be directly correlated to the number of CRISPR/Cas9 induced changes in the target sites (mostly indels). Independent of the potency of the gRNAs, selection of resistance was observed for all single gRNAs. However, all combinations of two potent gRNAs resulted in the generation of such a large number of CRISPR/Cas9 induced mutations (mostly indels) that viral replication could not be rescued after months of in vitro selection.
**Conclusions:** This is the first study to demonstrate that combining potent gRNAs targeting different steps in the viral lifecycle can prevent the selection of viral resistance.

### ENHANCING HIV-1 VIRION TETHERING BY BST2/TETHERIN SENSITIZES PRODUCTIVELY AND LATENTLY INFECTED T CELLS TO ADCC MEDIATED BY BROADLY NEUTRALIZING ANTI-HIV ANTIBODIES

T.N.Q. Pham[1], S. Lukhele[1], É.A. Cohen[1,2]
*[1]Institut de Recherches Cliniques de Montréal, Montréal, Canada, [2]Université de Montréal, Microbiology, Infectiology and Immunology, Montreal, Canada*
*Presenting author email: eric.cohen@ircm.qc.ca*

**Background:** Increasing evidence supports a role of Antibody-Dependent Cell-mediated Cytotoxicity (ADCC) in controlling HIV transmission and disease progression. HIV has evolved several mechanisms to limit the recognition of ADCC-preferred Env epitopes on infected cells. We previously reported that HIV-1 uses Nef- and Vpu-mediated CD4 downregulation to efficiently reduce exposure of Env epitopes recognized by A32, a non-neutralizing, CD4-induced ADCC-competent antibody. Moreover, BST2 antagonism by Vpu limits A32 binding to gp120 on infected cells. BST2 is a type I interferon (IFN)-upregulated restriction factor that inhibits HIV-1 release by tethering nascent virions at the surface of infected cells. In this study, we hypothesized that broadly neutralizing anti-HIV antibodies (bNAbs) can also mount ADCC response and that in this context, physical tethering of virions by BST2 will promote ADCC.
**Methods:** Primary CD4+ T cells or T cells expressing only CD4, BST2, or both were infected with wild-type (WT) HIV or viruses deficient for Nef, Vpu or both proteins. Infected T cells were examined by flow cytometry for Env recognition by anti-HIV Env antibodies and susceptibility to ADCC.
**Results:** Using CD4+ T cells infected with CCR5-tropic laboratory-adapted or transmitted-founder HIV strains, we show that bNAbs efficiently induce ADCC, with those targeting the N332 glycan-V3 loop (*e.g.*, PGT121 or PGT126) or CD4-binding site (*e.g.*, 3BNC117) being most potent. For most bNAbs, BST2 counteraction effectively attenuates Env recognition and ADCC activity. Conversely, IFNα treatment enhances antibody binding to Env and potentiates ADCC in a BST2-dependent manner. Importantly, upon reactivation with HDAC inhibitors, latently infected T cells become potent targets of ADCC, with exogenous IFNα promoting further their elimination by bNAbs such as PGT121. Lastly, we find that modulating the levels of surface gp120 in a CD4-bound conformation, via Vpu and Nef, affects ADCC activity of only 17b, which binds the co-receptor binding site.
**Conclusions:** Overall, our study indicates that physical retention of HIV virions by BST2 at the cell surface sensitizes infected cells to ADCC by most classes of bNAbs. Strategies aimed at restoring the BST2 restriction represent a promising avenue to enhance clearance of latent viral reservoirs by ADCC in "Shock and Kill" cure approaches.

### SMALL MOLECULE INHIBITORS OF BAF: A NEW FAMILY OF COMPOUNDS IN HIV-1 LATENCY REVERSAL

E. De Crignis[1], M. Stoszko[1], C. Rokx[2], M.M. Khalid[1], C. Lungu[1], R.-J. Palstra[1], T.-W. Kan[1], C. Boucher[3], A. Verbon[2], E.C. Dykhuizen[4], T. Mahmoudi[1]
*[1]Erasmus MC, Department of Biochemistry, Rotterdam, Netherlands, [2]Erasmus MC, Department of Internal Medicine, Rotterdam, Netherlands, [3]Erasmus Mc, Department of Viroscience, Rotterdam, Netherlands, [4]Purdue University, Department of Medicinal Chemistry and Molecular Pharmacology, West Lafayette, United States*
*Presenting author email: elisa.decrignis@gmail.com*

**Background:** New pharmaceutical strategies aimed at HIV-1 eradication have focused on molecules able to induce HIV replication from latently infected cells in order to render them susceptible to immune clearance. We investigated the activity of a new class of latency reversal compounds targeting BAF chromatin remodeling complex, a key player required for establishment and maintenance of HIV-1 latency and thus a promising molecular target for HIV-1 latency reversal.
**Methods:** Activation of latent HIV-1 following treatment with BAF inhibitors (BAFi's) was determined in cell line models of latency. Active compounds were further characterized at the molecular level by Western Blot, chromatin immunoprecipitation and FAIRE assays. Furthermore, cells were treated with BAFi's in combination with Prostratin and SAHA to determine whether BAFi's synergistically interact with known latency reversal agents (LRAs). Finally BAFi's activity was confirmed in primary models of latency and in cells obtained from virally suppressed HIV-1 infected patients.
**Results:** Latency reversal was strongly induced by 2 of the BAFi's included in the initial screening: Caffeic Acid Phenethyl Ester (CAPE) and Pyrimethamine (PYR). BAFi's reversed HIV-1 latency in cell line based latency models, in two ex vivo infected primary cell models of latency as well as in HIV-1 infected patient's CD4+ T cells, without inducing T cell proliferation or activation. Consistent with the observed latency reversal activity, treatment with BAFi's resulted in displacement of BAF complex from HIV-1 LTR as well as nucleosome remodeling in HIV-1 promotor region. Moreover, BAFi-induced HIV-1 latency reversal was synergistically enhanced upon treatment with the PKC pathway activator Prostratin and the HDAC inhibitor SAHA.
**Conclusions:** Molecules targeting the BAF complex reverse HIV-1 latency. For their activity in primary CD4+T cells and the synergistic interaction with known LRAs, BAFi's represent a promising family of molecules for inclusion in HIV-1 latency reversal regimens.

### NOVEL ACTIVATORS AND SUPPRESSORS OF LATENT HIV-1 FROM NATURAL PRODUCTS

I. Tietjen[1], K. Andrae-Marobela[2], X.T. Kuang[1], G.W. Fotso[3], D. Williams[4], A. Pagliuzza[5], B.M. Abegaz[6], R.J. Andersen[4], A. Cochrane[7], N. Chomont[5], Z.L. Brumme[1,8], M.A. Brockman[1,8,9]
*[1]Simon Fraser University, Faculty of Health Sciences, Burnaby, Canada, [2]University of Botswana, Department of Biological Sciences, Gaborone, Botswana, [3]University of Yaoundé I, Organic Chemistry, Yaoundé, Cameroon, [4]University of British Columbia, Earth, Ocean and Atmospheric Sciences, Vancouver, Canada, [5]Centre du Centre Hospitalier de l'Université de Montréal (CRCHUM), Montréal, Canada, [6]African Academy of Sciences, Nairobi, Kenya, [7]University of Toronto, Molecular Genetics, Toronto, Canada, [8]British Columbia Centre for Excellence in HIV/AIDS, Vancouver, Canada, [9]Simon Fraser University, Department of Molecular Biology and Biochemistry, Burnaby, Canada*
*Presenting author email: iantietjen@gmail.com*

**Background:** Combination antiretroviral therapy (cART) durably suppresses HIV replication, but virus persists in cellular reservoirs. Latency reversal agents (LRAs) capable of reactivating HIV-infected cells may promote their elimination through host or viral cytopathic effects; an approach termed "shock-and-kill". However, current LRAs have shown limited clinical success, and no single LRA reactivates all latent cells. Conversely, "deep-latency" agents (DLAs) that promote long-term suppression of viral transcription that is refractory to subsequent reactivation are few in number and not yet assessed *in vivo*. Thus additional LRAs and DLAs are needed.
**Methods:** We examined 433 pure compounds from marine natural products and medicinal plants using J-Lat 8.4 GFP-reporter T cells containing an NL4.3Δenv/nef genome. Compounds that induced GFP in >5% of cells while retaining >30% cell viability at 5µg/mL were assessed for synergism with established LRAs. Compounds that blocked >50% GFP expression induced by 50ng/mL TNFα were assessed for antagonism of LRAs and ability to block a doxycycline-induced, Tat/TAR-deficient provirus. Select compounds were also tested in infected, primary resting CD4 T-cells using the Tat/Rev-Induced Limiting Dilution Assay (TILDA).
**Results:** We identified 8 new LRAs and 2 DLAs. Two novel phorbol esters induced GFP in 6.0 ± 0.6 and 6.9 ± 0.4% of cells at 0.03µg/mL, respectively, having ~10-fold less activity than PMA but ~100-fold greater than prostratin. Interestingly, these compounds originate from a plant used by African traditional healers to treat AIDS symptoms. Anthrone "p61" reactivated 9.9 ± 0.9% of cells at 5µg/mL and synergized with panobinostat (HDAC inhibitor), prostratin (PKC activator), and TNFα, suggesting a distinct mechanism of action. p61-containing plants are traditionally used to treat malaria, and p61 does not synergize with the anti-malarial artemisinin, suggesting related modes of targeting latent HIV. Two novel flavonoids at 5µg/mL suppressed >85% of GFP induction by TNFα, control LRAs, and production of Tat/TAR-deficient provirus, suggesting mechanism(s) distinct from previously-reported DLAs. Finally, both phorbol esters induced multiply-spliced vRNA expression in resting CD4 T-cells, while one flavonoid suppressed >80% of PMA/ionomycin-induced vRNA.
**Conclusions:** We identified potential new LRAs and DLAs of natural origin, including some supported by traditional medicine, that display synergy with established LRAs and/or distinct mechanisms of action.

### HETERODIMERIC IL-15 INDUCES EFFECTOR CELL ACTIVATION AND TRAFFICKING TO THE GERMINAL CENTERS OF SIV INFECTED MACAQUES

G.N. Pavlakis[1], A. Valentin[1], D.C. Watson[1], E. Moysi[2], C. Petrovos[2], X. Hu[1], C. Bergamaschi[1], B.K. Felber[1]
*[1]National Cancer Institute at Frederick, Center for Cancer Research, Vaccine Branch, Frederick, United States, [2]National Institute of Allergies and Infectious Diseases, Vaccine Research Center, Bethesda, United States*
*Presenting author email: george.pavlakis@nih.gov*

**Background:** IL-15 stimulates the growth and activation of NK cells and cytotoxic lymphocytes. We have produced heterodimeric IL-15 (hetIL-15), the authentic form of IL-15 found in the circulation, and demonstrated that administration of hetIL-15 in macaques shows improved pharmacokinetics and pharmacodynamics compared to previous preparations of IL-15 without significant side effects. We have previ-

ously reported that therapeutic DNA vaccination together with pDNA encoding hetIL-15 in ART-treated macaques induces T cell responses able to control viremia after ART release.
**Methods:** Heterodimeric IL-15 (hetIL-15) was purified and tested in macaques upon subcutaneous (SC) administration. Phenotype and functional changes in lymphocyte subsets were monitored by flow cytometry and multiplexed confocal imaging (MCI).
**Results:** Treatment with hetIL-15 resulted in a significant increase of CD8+ effector T cells and NK cells with activated cytotoxic phenotype (Granzyme+). This expanded T lymphocyte population was distributed in the tissues and was also present in secondary lymphoid organs where an increased frequency of Ag-specific effector and total effector CD8 T cells could be observed by both flow cytometry and MCI. A subset of CD8 T cells present in lymph nodes expresses CXCR5, indicating ability to migrate into germinal centers where chronically infected CD4+Tfh cells reside. MCI confirmed the presence of effector CD8 in germinal centers and showed that these cells are cytotoxic (GrzmB+) and actively proliferating (Ki67+) in response to hetIL-15.
**Conclusions:** We are exploring the potential of hetIL-15 as a viral reservoir reducing agent in ART-treated SIV infected macaques therapeutically vaccinated with DNA. Effective levels of hetIL-15 can be delivered without side effects. hetIL-15 treatment in combination with DNA vaccination enhances access to virus sanctuary areas (germinal centers) and is a promising HIV eradication strategy.

## NOVEL ASSAYS OF HIV INFECTION

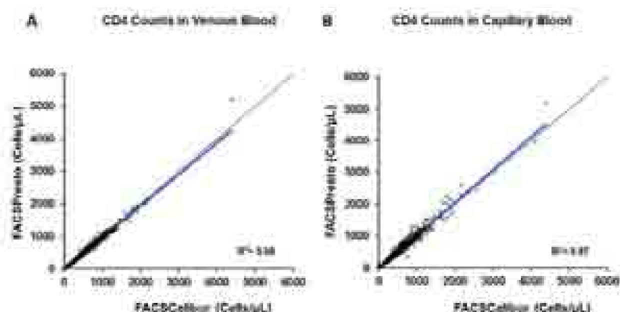
*[1]National AIDS Research Institute, Serology and Immunology Department, Pune, India, [2]Kenya Medical Research Institute/ US CDC Research and Public Health Collaboration, Kisumu, Kenya, [3]Faculty of Medicine Siriraj Hospital, Mahidol University, Bangkok, Thailand, [4]San Francisco General Hospital & Trauma Center, Laboratory Medicine, Clinical Chemistry Laboratory, San Francisco, United States, [5]Children's Hospital Los Angeles, and The Keck School of Medicine, University of Southern California, Laboratory Medicine, Los Angeles, United States, [6]Ditan Hospital, Beijing, China, [7]Peking University First Hospital, Beijing, China, [8]Blood Center of Wisconsin, Milwaukee, United States, [9]BD Biosciences, Biostatistics, San Jose, United States, [10]BD Biosciences, Medical Affairs, San Jose, United States, [11]US Centers for Disease Control and Prevention (CDC-Kenya), Kisumu, Kenya*
*Presenting author email: imelda_omana-zapata@bd.com*

**Background:** The BD FACSPresto™ CD4 Counter is designed for resource-limited settings to improve HIV/AIDS patient care. The portable system features include on-board quality control and single-use disposable cartridges. It reports absolute CD4, %CD4, and hemoglobin (Hb) results from 2-3 drops of blood (capillary or venous) within 22 minutes with 10-sample/hour throughput. We conducted an evaluation at eight clinical sites in five countries: Kenya, India, Thailand, China, and USA, to evaluate performance for establishing claims.
**Methods:** Method comparison was conducted using capillary and venous samples from HIV-infected patients and uninfected individuals with and without concomitant medical conditions. For comparison, venous samples were tested using the BD FACSCalibur™ system with BD Tritest™ CD3/4/45 reagent, BD Trucount™ tubes, and BD Multiset™ software for CD4 and %CD4, and the Sysmex® KX-21N for Hb concentration. Controls were used for multisite reproducibility testing.
**Results:** Enrollment included venous (N=795) and capillary (N=691) specimens (1.27 male/ female ratio), including 57 from subjects 2-11 years old, 68 between 12-21, and 592 subjects 22 years and older. The data was pooled for analysis. Venous and capillary samples were analyzed independently. CD4 (N=716) Deming regression results in venous and capillary samples are shown. Deming regression gave slopes within 1.00-1.05 with $R^2 \geq 0.96$ for %CD4 (N=716), and within 0.99-1.06 with $R^2 \geq 0.89$ for Hb (N=720). The overall agreement at 200 CD4 cells/μL clinical cutoff in venous blood (N=85) was ≥98.5%, and ≥97.7% in capillary blood (n=67). Multisite reproducibility had total precision (%CV/%SD) for CD4 < 5.32, %CD4 < 0.59,
and Hb < 2.83.
**Conclusions:** The BD FACSPresto provides accurate clinical results for CD4, %CD4, and Hb from capillary or venous samples, and ease of use for monitoring of CD4 and enabling treatment access. This product was CE Marked (IVD Directive 98/79/EC) and WHO prequalified (2014), and received FDA clearance (2015).



*[CD4 Counts in Venous and Capillary Blood]*

## WEPEA028

### PILOT ASSESSMENT OF THE DIAGNOSTIC ACCURACY OF CEPHEID GENEXPERT HIV-1 QUAL FOR EARLY INFANT DIAGNOSIS

J. Bitilinyu-Bangoh[1], R. Khunga[2], R. Ortuño[2], C. Metcalf[3], A. Shigayeva[2], M. Rumaney[3], H. Bygrave[3], Z. Ndlovu[3], J.P. Mangion[2]
*[1]Queen Elizabeth Hospital, Blantyre, Malawi, [2]MSF Operational Centre Brussels (OCB) Malawi Mission, Blantyre, Malawi, [3]Southern Africa Medical Unit (SAMU), MSF, Cape Town, South Africa*
*Presenting author email: msfocb-blantyre-opr@brussels.msf.org*

**Background:** Implementation of early infant diagnosis (EID) of HIV infection requires availability of diagnostic tests that are affordable, simple to use and improve diagnostic and treatment outcomes by enabling earlier initiation of infected infants on antiretroviral therapy (ART). The Xpert HIV-1 Qual assay (Cepheid, CA, USA) is a novel platform licensed for diagnosis of HIV among children. There are limited reports on its accuracy in the field settings.
MSF-Belgium and Malawi Ministry of Health collaborate on implementation of EID in Nsanje district, southern Malawi. In preparation for a larger feasibility study on Xpert HIV-1 Qual implementation, we implemented a pilot assessment of accuracy of Xpert HIV-1 Qual for diagnosis of HIV infection among infants and children.
**Methods:** Pilot study included samples from HIV-exposed infants and children aged 6 weeks to 18 months having HIV-PCR testing for diagnosis or confirmation of HIV infection. Samples were diagnostic samples from Nsanje district that were tested using the Abbott RealTime HIV-1 Qualitative at Queen Elizabeth Hospital Laboratory located in Blantyre, Malawi.
Samples were selected retrospectively, and included consecutive tests performed between 4 December 2015 and 6 January 2016, and were limited to availability of the Xpert test cartridges (n=400). Laboratory tests were performed as per manufacturer instructions. Testing was done on heel-prick dried blood spots. Samples that were taken more than 2 months before the start of the study, and those not meeting quality criteria were excluded.
STATA version 10 was used to estimate sensitivity, specificity, positive predictive value (PPV), and negative predictive value (NPV) of Xpert HIV-1 Qual.
**Results:** 378 samples were selected. 17/378 (4.5%) were HIV positive. Xpert HIV-1 Qual detected 16 out 17 HIV positive, and 358 out 361 HIV negative cases. The sensitivity of Xpert HIV-1 Qual was 94.1% (95% CI; 71.3-99.9%); and specificity 99.2% (92% CI; 97.6-99.8%), whereas PPV was 84.2% (63.2-94.3%)and NPV was 99.7% (98.2-100%).
**Conclusions:** Pilot assessment demonstrates high accuracy of Xpert HIV-1 Qual in diagnosing HIV among children less than 18 months. Further research is warranted to evaluate feasibility and effectiveness of decentralized Xpert HIV-1 Qual implementation at district level.

# SEX-BASED DIFFERENCES IN HIV

## WEPEB029

### GENDER-BASED DIFFERENCES IN ART OUTCOMES

R. Hassan-Moosa, K. Naidoo, N. Yende-Zuma, D. Govender, N. Padayatchi, R. Nicola Adams, A. Govender, S. Chinappa, S. Abdool Karim
*CAPRISA/UKZN, Treatment, Durban, South Africa*
*Presenting author email: razia.hassan-moosa@caprisa.org*

**Background:** Studies examining gender differences in antiretroviral therapy (ART) outcomes have produced varying results. We investigated gender differences in HIV clinical outcomes over a decade among urban and rural men and women in a HIV treatment program in KwaZulu-Natal, South Africa.
**Methods:** Patient characteristics and clinical/therapeutic outcomes, including mortality, were analysed prospectively among4043 patients (64% women) in the PEPfAR-funded CAPRISA AIDS Treatment Programme (CAT) from October 2004 to August 2013. The log-rank test was used to assess differences between men and women.
**Results:** At baseline, women had higher median CD4+ count (131 vs 113 cells/mm$^3$; p<0.001), higher median body mass index (BMI) (24.2 vs. 21.0 kg/m$^2$; p<0.001) and lower mean log viral loads (4.9 vs 5.0 copies/ml; p<0.001). In contrast, men presented more often in advanced WHO Stage 4 disease (14.3 % vs 9.7 %; p< 0.001) and with a history of past TB (34.4 % vs 26.3%; p<0.001).
During follow-up on ART, women demonstrated a better immunological response than men as they had consistently higher mean CD4+ counts at each clinical assessment (p=0.042). Viral suppression on ART, retention rates, TB incidence and ART regimen change rates did not differ by gender.
Overall all-cause mortality was 31% higher in men after adjustment for multiple co-variates including baseline CD4+ counts. The crude mortality rates were 6.9 per 100 person-years (95% confidence interval (CI): 5.9-8.0) in men and 4.4 per 100 person-years (CI: 3.8-5.0) (Crude IRR: 1.57; Adjusted hazard ratio: 1.31; CI: 1.07-1.61; p=0.01).
**Conclusions:** Women presented for care with higher CD4+ counts and lower viral loads, had consistently higher CD4+ counts throughout ART follow-up. Treatment response was similar in men and women. Men had more advanced disease at baseline; at comparable CD4+ counts and suppressed viral loads and a 31% higher chance of dying while on ART. These gender differences in disease stage at presentation and mortality outcomes are concerning. Effort needs to be directed toward encouraging men to test early and frequently, with effective linkage to care for early ART initiation and vigilance for opportunistic diseases with the aim of reducing mortality in men.

# DIAGNOSTICS OF CO-INFECTIONS (INCLUDING SYPHILIS, TB, CRYPTOCOCCUS, HEPATITIS B, C AND OTHER)

## WEPEB030

### SCREENING HIV-INFECTED PATIENTS WITH LOW CD4 COUNTS FOR CRYPTOCOCCAL ANTIGENEMIA PRIOR TO INITIATION OF ANTIRETROVIRAL THERAPY: COST-EFFECTIVENESS OF ALTERNATIVE SCREENING STRATEGIES IN SOUTH AFRICA

B.A. Larson[1], P.C. Rockers[1], R. Bonawitz[1], C. Sriruttan[2], D.K. Glencross[3,4], N. Cassim[3,4], L. Coetzee[3,4], G.S. Greene[5], T.M. Chiller[5], L. Long[4,6], C. van Rensburg[4,6], N.P. Govender[2,4]
*[1]Boston University School of Public Health, Department of Global Health, Boston, United States, [2]National Institute for Communicable Diseases - Centre for Opportunistic, Tropical and Hospital Infections, Johannesburg, South Africa, [3]National Health Laboratory Service, Johannesburg, South Africa, [4]Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa, [5]Centers for Disease Control and Prevention, Mycotic Diseases Branch, Atlanta, United States, [6]Health Economics and Epidemiology Research Office, Wits Health Consortium, Johannesburg, South Africa*
*Presenting author email: blarson@bu.edu*

**Background:** The South African government established a national cryptococcal antigenemia (CrAg) screening policy targeted at HIV-infected patients with CD4 counts <100 cells/µl not yet on antiretroviral treatment (ART). Two screening strategies are currently utilised: a reflex policy (RP) in which a CrAg test is performed using remnant blood samples from CD4 testing; and a provider-initiated policy (PIP) in which providers order a test after a patient returns for CD4 results. This analysis compares the costs and effectiveness of these two screening strategies.
**Methods:** We developed a decision-analytic model for the two policies in terms of screening and treatment costs (2015 USD) and health outcomes (years of life saved). We evaluated a base case using CrAg prevalence (4.6%) with other parameters based in part on data collected during screening projects in Gauteng, Free State, and Western Cape provinces. Unit costs for screening and treatment were based on National Health Laboratory Service estimates and published government data.
**Results:** Table 1 presents key unit costs for the analysis**.** Table 2 presents key results. In sum, per 100,000 CD4 tests, RP compared to PIP has higher screening costs but lower treatment costs and saves more life years. The incremental cost per incremental life year saved for RP compared to PIP is $3.49. Further results from sensitivity analyses leads to similar conclusions.

| | Rand | USD | Year of analysis is 2015. Exchange rate = 15.14 ZAR/USD. |
|---|---|---|---|
| Unit cost of CrAg test (reflex) | 75.00 | 4.95 | Unit cost based on NHLS estimate. |
| Unit cost of CrAg test (provider-initiated) | 93.75 | 6.19 | 25% above reflexive. |
| Unit cost (200 mg fluconazole tablet) | 0.86 | 0.06 | 2015 NDOH Master Procurement list. |
| Preemptive fluconazole treatment (outpatient) | 455.72 | 30.09 | Based on recommended regimen. |
| Hospitalization and treatment for cryptococcal meningitis | 29,535.00 | 1,950.10 | 15 days hospital; national average hospital costs per day from District Health Barometer report. |
| Post-hospital maintenance fluconazole treatment (outpatient) | 405.84 | 26.80 | Based on recommended regimen. |
| Other | | | |
| Life expectancy at death (death at age 35-39) | 32.6 years | | WHO Global Health Observatory. |
| Years of life saved per death avoided | 21.6 life years saved | | Calculated by authors using a 3% discount rate. |

*[Table 1. Unit costs and key model assumptions]*

| | Reflexive Policy (RP) | Provider-Initiated Policy (PIP) | Difference (RP - PIP) |
|---|---|---|---|
| Total number of patients missed (and incident CrAg-positive) | 98.4 | 145.8 | -47.4 |
| Total number of patients correctly identified for preemptive treatment | 64.8 | 17.5 | 47.3 |
| Total number of patients identified for preemptive treatment but CrAg-negative | 44.7 | 12.0 | 32.7 |
| Total number of patients screened | 9,500 | 1,536 | 7,964 |
| Total cost of screening (2015 USD) | $47,044 | $9,508 | $37,536 |
| Total cost of treatment (2015 USD) | $161,052 | $194,868 | -$33,815 |
| Total cost of screening + treatment (2015 USD) | $208,096 | $204,375 | $3,721 |
| Total lives saved from screening and treatment | 134 | 84 | 49 |
| Total years of life saved from screening and treatment | 2,891 | 1,824 | 1,067 |

*[Table 2. Summary results per 100,000 CD4 tests]*

**Conclusions:** A reflex screening strategy generally saves more lives than a provider-initiated policy, with a very low cost per additional life year saved and could potentially be cost neutral.

## WEPEB031

### SOUND COLLABORATION BETWEEN HEALTH CENTRES AS STEPS TOWARD DECENTRALIZING ARV DISPENSATION: IMPACT FOR EASIER ACCESS TO ARV FOR MSM IN CAMEROON. THE CASE OF ACCESS CENTER, DOUALA

Z. Makong, J. Ntetmen Mbetbo, H.C.D. Ngo Ndaptie
*Alternatives Cameroon, Psychosocial Unit, Douala, Cameroon*
*Presenting author email: makongzacharie@yahoo.fr*

**Background:** Since its creation in 2008, the Access Centre cares for MSM living with HIV. However those MSM depend on an Authorized Treatment Centres (CTA) for ARVs. In Cameroon in fact, ARVs are only available in such Centers. Therefore Access Center's beneficiaries had to go first to Access Center for the prescription and then to the CTA for the drugs. This double movement was causing several treatment in-

terruption and poor adherence among those MSM, because it took too much time and hassle, given the large number of people going to the CTA for ARVs. Beyond this, those MSM suffered from stigma at the level of CTA. These observations were made as the result of a systematic evaluation of adherence made by the management team of the Centre.

**Description:** To remedy this serious problem, we began negotiations with the CTA in order to increasingly facilitate the collection of ARVs. An agreement was reached so that we could go there to collect ARVs for all those who are in care at Access Centre. This took beneficiaries, a single trip to pick up their drugs at the Centre, instead of two. Thanks to an ongoing project, we are about to get permission to collect monthly all the ARVS we need for Access Center's beneficiaries.

Best of all, an agreement was reached to ensure that the annual physical identification at CTA for all those on ARVs, was done directly at Access Centre for its own beneficiaries. This was a great relief because each person had to wait for long hours or even two days before his annual identification is complete.

**Lessons learned:** Complaints about time consuming procedures are increasingly rare, and also the difficulties of drug adherence. We observed that the proportion of undetectable Viral loads rose from 56% to 80% before and after we started our collaboration with CTA about ARVs.

**Conclusions/Next steps:** We have in the near future to continue the process of becoming a fully autonomous center specialized forf MSM living with HIV.This will give MSM a unique opportunity to access global and stigma free care while keeping all chance to be retained under efficient care.

# OPPORTUNISTIC INFECTIONS (EXCLUDING TB)

## WEPEB032

### EVALUATION OF REFLEX LABORATORY CRYPTOCOCCAL DISEASE SCREENING, SOUTH AFRICA, 2012-2015

N.P. Govender[1], C. Sriruttan[1], G.S. Greene[2], P. Matlapeng[1], A. Adelekan[3], T. Maotoe[4], V. Chihota[5], V. Chetty[6], Y. Pillay[7], D.K. Glencross[8], T.M. Chiller[2], Cryptococcal Screening Initiative Group

*[1]National Institute for Communicable Diseases, Centre for Opportunistic, Tropical and Hospital Infections, Johannesburg, South Africa, [2]CDC, Atlanta, United States, [3]CDC, Pretoria, South Africa, [4]USAID, Pretoria, South Africa, [5]The Aurum Institute, Johannesburg, South Africa, [6]National Institute for Communicable Diseases - Centre for Opportunistic, Tropical and Hospital Infections, Johannesburg, South Africa, [7]National Department of Health, Pretoria, South Africa, [8]National Health Laboratory Service, Johannesburg, South Africa*

*Presenting author email: verushkac@nicd.ac.za*

**Background:** Screening for cryptococcal antigenemia is recommended to reduce mortality related to HIV-associated cryptococcal meningitis (CM). We evaluated a reflex laboratory-based cryptococcal antigen (CrAg) screening program that was implemented at 199 healthcare facilities in Gauteng and Free State provinces during September 2012 - August 2015.

**Methods:** Remnant plasma from any routinely-collected EDTA-blood sample for a CD4 count test, where the result was < 100 cells/µl, was tested with a CrAg lateral flow assay. Healthcare workers managed CrAg-positive patients using a standardized algorithm, including symptom screening and lumbar puncture (LP). At 114 enhanced surveillance (ES) sites, study nurses abstracted information on management of CrAg-positive patients from medical records. Screening data were merged with data from an established national CM surveillance program to determine patients with prior CM.

**Results:** Over 3 years, 50,324 of 50,327 specimens with a CD4 count < 100 cells/µl were tested for CrAg, including 7,658 specimens (15%) tested in duplicate. Of 42,666 unique patients, 667 (2%) had prior CM. Of the remaining 41,999, 1271 patients (3%) had new antigenemia. The number needed to screen to detect a case of new antigenemia was 33. Of 688 patients with new antigenemia at ES sites, 138 (20%) had no recorded follow-up visit. Of the remaining 550, symptom data were available for 539. Of these, 316 (59%) had headache and/or confusion; 223 (41%) were asymptomatic. LP was performed and results were available for 135 (25%) patients. Of these, CM was confirmed among 74% (68/92) and 26% (11/43) of symptomatic and asymptomatic patients respectively; 87% (69/79) received an amphotericin B-based regimen. Fluconazole was initiated among 88% (332/378) of all those with new antigenemia, where data were available (median time to fluconazole: 14 days [IQR, 5-27]).

**Conclusions:** In this reflex laboratory-based screening program, nearly all eligible patients were tested for CrAg. Redundant testing of the same patient was minimal. Screening enabled diagnosis of CM and detection of asymptomatic antigenemia. Of those with available data, the vast majority with CM received amphotericin B-based treatment, and asymptomatic patients received pre-emptive fluconazole. Improved linkage to care is needed to reduce the proportion of patients who did not return for CrAg results.

## WEPEB033

### OPPORTUNISTIC INFECTIONS AMONG HIV+ PEOPLE WITH CD4 COUNTS > 500/MM$^3$: A EUROSIDA STUDY

Á.H. Borges[1], J.D. Lundgren[1], A. d'Arminio Monforte[2], R.E. Schmidt[3], P. Domingo[4], D. Elbirt[5], S. de Wit[6], T. Benfield[7], M. Gottfredsson[8], S. Schmid[9], J. Begovac[10], A. Mocroft[11], EuroSIDA in EuroCoord

*[1]Centre for Health & Infectious Diseases Research (CHIP), Department of Infectious Diseases, Rigshospitalet, University of Copenhagen, Copenhagen, Denmark, [2]Ospedale San Paulo, Milano, Italy, [3]Mediziniche Hochschule Hannover, Hannover, Germany, [4]Hospital de la Santa Creu i Sant Pau, Barcelona, Spain, [5]Neve-Or AIDS Center, Rehovot, Israel, [6]CHU Saint-Pierre, Brussels, Belgium, [7]Hvidovre Universitets Hospital, Copenhagen, Denmark, [8]Landspitali University Hospital and University of Iceland, Reykjavik, Iceland, [9]Otto Wagner Spital, Vienna, Austria, [10]University Hospital of Infectious Diseases, Zagreb, Croatia, [11]Department of Infection and Population Health, University College London, London, United Kingdom*

*Presenting author email: alvaro.borges@regionh.dk*

**Background:** For reasons unknown, some HIV+ persons develop opportunistic infections (OIs) at high CD4 counts. We investigated determinants of OIs among persons with CD4 ≥ 500/mm$^3$ in a large international HIV cohort.

**Methods:** EuroSIDA participants were followed from the latest of 1/1/2001 or recruitment to last visit or death. Patient follow-up and events were censored when CD4 count was < 500/mm$^3$. Poisson regression determined factors associated with OIs. Three treatment categories were defined using time-updated cART and VL: off cART; on cART, VL < 400 (good response); or on cART, VL > 400 (intermediate response).

**Results:** Of 11,378 persons (median age 40y, median baseline CD4 589/mm$^3$, 73.3% male, 87.7% on cART and 77.1% VL < 400 at baseline), 336 persons developed 360 OIs during 64716 PYFU with CD4 ≥ 500/mm$^3$ (incidence 5.6/1000 PYFU [95% CI 5.0 - 6.1]). AIDS-cancers were the most common events, followed by fungal, bacterial, viral and protozoal OIs. After adjustment, those with any previous OI had an overall increased incidence of new OIs (aIRR: 1.96[1.54-2.50]), as did those with CD4 ≥ 500/mm$^3$ off cART (2.19[1.65-2.90] *vs* good response) and with intermediate response to cART (2.93[2.13-4.04] *vs* good response), anaemia (2.78 [2.21-3.49]), and current smokers (1.60[1.22-2.10]). After adjustment, a higher nadir CD4 was associated with a marginally significantly increased incidence of cancer and a lower incidence of viral OIs (Table). Other than viral or protozoal OIs, prior history of all types of OIs was associated with a new OI after immune recovery (Table).

| Opportunistic Infection (OI) (number of events) | % events occurring with nadir CD4 <200/ mm3 | Median (IQR) nadir CD4 (/ mm3) | Adjusted (a) Incidence Rate Ratios for new OI : Relationship with doubling nadir CD4 | | P-value | Adjusted (a) Incidence Rate Ratio for new OI : Relationship with prior diagnosis of different OIs | | P-value |
|---|---|---|---|---|---|---|---|---|
| AIDS-defining cancers (b) (n=80) | 41.3 | 242 (145 - 345) | 1.18 | 0.99 - 1.42 | 0.072 | 2.53 | 1.81 - 3.54 | <0.0001 |
| Viral (n=49) | 69.4 | 72 (49 - 230) | 0.88 | 0.77 - 1.01 | 0.062 | 1.45 | 0.93 - 2.26 | 0.10 |
| Bacterial (n=66) | 50.0 | 201 (135 - 300) | 0.99 | 0.85 - 1.17 | 0.94 | 1.93 | 1.36 - 2.73 | <0.0001 |
| Fungal (n=73) | 43.8 | 225 (120 - 328) | 1.15 | 0.96 - 1.37 | 0.13 | 1.38 | 1.00 - 1.90 | 0.049 |
| Protozoal (n=16) | 68.8 | 147 (56 - 240) | insufficient data | | | 1.11 | 0.60 - 2.02 | 0.75 |
| Other (n=10) | 60.0 | 100 (49 - 277) | insufficient data | | | 1.91 | 1.19 - 3.04 | 0.0068 |
| Fatal AIDS (c) (n=6) | 63.9 | 132 (52 - 266) | 1.02 | 0.89 - 1.18 | 0.74 | insufficient data | | |
| All (n=360) | 53.1 | 185 (74 - 137) | 1.02 | 0.94 - 1.10 | 0.63 | 1.96 | 1.54 - 2.50 | <0.0001 |

(a) Models adjusted for treatment category, current CD4 count, prior OI, prior non-AIDS event, anaemia and smoking status as time dependent variables. Anaemia was defined as a haemoglobin <14 mg/dl for males and <12 mg/dl for females. Treatment categories were defined as off cART; on cART, VL < 400 (good response); on cART, VL > 400 (intermediate response). (b) Kaposi sarcoma, non- Hodgkin lymphomas and cervical cancer. (c) Not included in any other category.

*[Relationship between nadir CD4, prior OIs and new OIs while CD4 > 500/mm3]*

**Conclusions:** A subset of HIV+ persons with CD4 ≥ 500/mm$^3$, particularly those with prior history of OIs and without good response to cART, remains at subsequent risk of OIs. Clinical scores to quantify individual risk of developing OIs after immune recovery are needed.

### PATHWAYS TO CARE AND OUTCOMES OF PATIENTS WITH CRYPTOCOCCOSIS, GAUTENG PROVINCE, SOUTH AFRICA, 2015

V. Chetty[1], S. Toro-Silva[2,3], C. Sriruttan[1,4], V. Chihota[2], V. Quan[1], A. Vassall[3], A. Grant[3], N.P. Govender[1,4]
[1]*National Institute for Communicable Diseases, Johannesburg, South Africa,* [2]*Aurum Institute for Health Research, Johannesburg, South Africa,* [3]*London School of Hygiene and Tropical Medicine, London, United Kingdom,* [4]*University of the Witwatersrand, Johannesburg, South Africa*
*Presenting author email: verushkac@nicd.ac.za*

**Background:** We aimed to evaluate pathways to care prior to hospital admission and outcomes among patients with HIV-associated cryptococcosis in routine care in Johannesburg, South Africa.
**Methods:** Patients were sampled consecutively at five public-sector hospitals and were eligible for enrolment if they were ≥18 years old and admitted for amphotericin B-based treatment of an episode of laboratory-confirmed cryptococcosis (positive cryptococcal antigen or India ink or culture from cerebrospinal fluid, blood or other specimen). Demographic, health-seeking behavior and clinical data were collected using structured questionnaires. Patients were followed up for 12 weeks post-admission.
**Results:** From May through October 2015, 184 patients were diagnosed with cryptococcosis; all were screened for eligibility and 105 (57%) were enrolled. Of 68 patients with questionnaires, 36 (53%) were male with a median age of 39 years (IQR: 34-45). Among 62 patients with recorded HIV infection status, 59 (95%) were HIV-infected; 43 (73%) were diagnosed HIV-seropositive prior to admission. Of 60% (26/43,) who were antiretroviral treatment (ART)-experienced, 24 patients (92%) were on ART at admission; median duration on ART was 215 days (IQR: 50-383). In the 6 weeks preceding admission, headache was the most common symptom (48/58; 83%) followed by neck stiffness (44/57; 77%), fever (28/56; 50%) and confusion (25/58; 43%). Of 52 patients with data, 23 (44%) had first sought help at a public clinic, 11 (21%) at a private doctor, 9 (17%) at a public-hospital casualty, 4 (8%) at a pharmacist and 1 at a traditional healer. For 57 patients with data, the median number of healthcare contacts prior to admission was 2 (IQR: 1-3). Of 66 patients who were followed up during admission, 21 (32%) died in hospital; 23 of 45 survivors had a known 12-week outcome, 8 of whom died.
**Conclusions:** In this urban hospital study, almost all patients eventually diagnosed with cryptococcosis had had an outpatient healthcare contact prior to admission; a large proportion was already diagnosed HIV-seropositive and ART-experienced. More than a quarter sought private care first. Screening for cryptococcal antigenaemia in these settings has potential to reduce the high in-hospital and 12-week mortality associated with meningitis.

## WEPEB035

### OUTCOMES OF HIV-INFECTED PATIENTS WITH CRYPTOCOCCAL MENINGITIS IN LATIN AMERICA AND ONE US SITE

B. Crabtree Ramírez[1], Y. Caro Vega[1], B.E. Shepherd[2], C. Le[3], P. Cahn[4], B. Grinsztejn[5], C. Cortes[6], D. Padgett[7], C. McGowan[3], A. Person[3]
[1]*Instituto Nacional de Ciencias Médicas y Nutrición Salvador Zubirán, Infectious Diseases, Mexico, Mexico,* [2]*Vanderbilt University, Biostatistics, Nashville, United States,* [3]*Vanderbilt University, Infectious Diseases, Nashville, United States,* [4]*Fundación Huésped, Investigaciones Clínicas, Buenos Aires, Argentina,* [5]*Instituto de Pesquisa Clinica Evandro Chagas, AIDS Research Unit, Rio de Janeiro, Brazil,* [6]*Universidad de Chile, Fundación Arriarán, Santiago, Chile,* [7]*Instituto Hondureño de Seguro Social y Hospital Escuela, Tegucigalpa, Honduras*
*Presenting author email: brendcrabtree@hotmail.com*

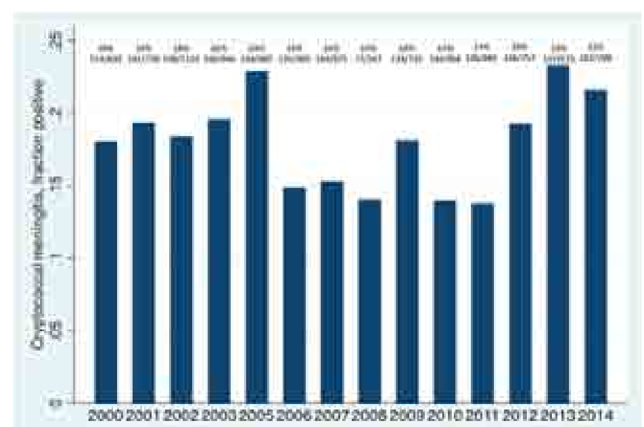
**Background:** Cryptococcal meningitis (CM) is associated with substantial mortality. Timing of antiretroviral therapy (ART) represents a clinical challenge. Studies suggest that patients who receive early ART have higher mortality, but studies of CM in Latin America are scarce. We investigated mortality and timing of ART among patients with CM at 5 sites in Latin America and one in the U.S.
**Methods:** All HIV-infected patients enrolled between 1985-2014 at the Vanderbilt Comprehensive Care Clinic (VCCC-Nashville, TN, USA) and participating sites in the Caribbean, Central and South America network (CCASAnet) who had CM at age ≥18 years were included. Survival probabilities were estimated using Kaplan-Meier techniques. The odds of death for initiating ART within the first 2 weeks after CM diagnosis versus initiating between 2-8 weeks were estimated using a dynamic marginal structural model adjusting for site, age, year of CM, CD4 at CM diagnosis (and subsequent measurements), and route of transmission.
**Results:** 340 patients were included (Argentina 58, Brazil 138, Chile 28, Honduras 27, Mexico 34, VCCC 55). 42% died during the observation period. 124 (36%) patients had CM before they started ART; they had lower rates of mortality than those with CM after ART initiation (p< 0.001). The probability of survival was not statistically different between those who started within 2 weeks of CM vs. those initiating between 2-8 weeks (p=0.45). However, using the dynamic marginal structural model, the odds of death for starting ART < 2 weeks after CM were 2.33 [95% confidence interval 1.06, 5.13] times higher than for starting between 2-8 weeks.
**Conclusions:** Patients with CM have high mortality rates regardless of site. Those with CM after ART had worse outcomes. Similar to previous clinical trial data, our results suggest that mortality is reduced by delaying ART initiation to 2-8 weeks after CM diagnosis.

## WEPEB036

### HIV-ASSOCIATED CRYPTOCCOCCAL MENINGITIS IN BOTSWANA: NATIONAL INCIDENCE AND TEMPORAL TRENDS FOLLOWING ART ROLLOUT

M. Tenforde[1], M. Mokomane[2], T. Leeme[3], R. Patel[3], N. Lekwape[3], C. Ramodimoosi[2], B. Dube[4], E. Williams[5], K. Mokobela[6], E. Tawanana[2], T. Pilatwe[6], H. Mitchell[3], D. Banda[3], D. Moalosi[6], H. Stone[7], M. Molefi[8], K. Mokgacha[6], H. Phillips[9], M. Mine[2], J. Jarvis[3,10,11]
[1]*University of Washington School of Medicine, Division of Allergy and Infectious DIseases, Seattle, United States,* [2]*Botswana National Health Laboratory, Gaborone, Botswana,* [3]*Botswana-UPenn Partnership, Gaborone, Botswana,* [4]*Nyangabwe Referral Hospital, Francistown, Botswana,* [5]*Royal London Hospital, London, United Kingdom,* [6]*Botswana Ministry of Health, Gaborone, Botswana,* [7]*University of Texas Southwestern Medical Center, Dallas, United States,* [8]*University of Botswana, Gaborone, Botswana,* [9]*UNAIDS, Gaborone, Botswana,* [10]*University of Pennsylvania Perelman School of Medicine, Division of Infectious Diseases, Department of Medicine, Philadelphia, United States,* [11]*London School of Hygiene and Tropical Medicine, Department of Clinical Research, Faculty of Infectious Diseases and Tropical Medicine, London, United Kingdom*
*Presenting author email: mark.tenforde@gmail.com*

**Background:** HIV-associated cryptococcal meningitis (CM) causes hundreds of thousands of deaths annually in sub-Saharan Africa. Incidence should decline with greater access to ART, but this relies on early HIV recognition and linkage-to-care. We performed a laboratory-based surveillance study to determine the incidence of CM in Botswana, a country with a well-established ART program and high ARV coverage.
**Methods:** Data from all laboratories in Botswana performing cerebrospinal fluid (CSF) analysis were obtained for 2014 (paper registers and electronic records). Diagnosis of CM was confirmed by CSF microscopy/India ink stain, cryptococcal antigen (CrAg), and/or positive fungal culture. UNAIDS country-estimates for 2014 were used to calculate incidence of CM, stratified by age, gender, HIV-status and CD4 count. At the largest referral center in Botswana, Princess Marina Hospital (PMH), we evaluated temporal trends in CM diagnosis over a 15-year period (2000-2014).
**Results:** In 2014, 319 cases of CM were diagnosed in Botswana. Overall annual incidence was 15/100,000 persons (95%CI: 13-16/100,000). Incidence was 78/100,000 (95%CI: 68-87/100,000) in HIV-infected persons, and 249/100,000 (95%CI: 222-279/100,000) in adults (≥15 years) with AIDS (CD4 count < 200 cells/µL). 38% (121) of patients were female and the median age was 37 years (IQR 32-44 years) with only 3% (10/319) of cases in children (< 15 years). At PMH, there were 2047 cases of CM over 15 years, comprising 17.8% of all CSF samples in adults, making cryptococcal meningitis the most common laboratory-confirmed cause of meningitis (Figure).



*[Figure. Percentage of cerebrospinal fluid samples in adults positive for cryptococcal meningitis at Princess Marina Hospital, 200-2014]*

**Conclusions:** A high burden of cryptoccoccal meningitis is still observed in Botswana, with no evidence of a reduction in case numbers over the past 6 years despite widespread ART access. Expanded HIV testing to prevent late presentation to care, CrAg

screening in individuals with low CD4 counts, and HIV-program strengthening to prevent default from ART are required for prevention of cryptoccoccal meningitis and other opportunistic infections.

## WEPEB037

### ANTIRETROVIRAL THERAPY AS PREVENTION... OF INVASIVE PNEUMOCOCCAL INFECTIONS?

A. Lesourd[1], J. Leporrier[1], V. Delbos[1], G. Unal[1], P. Honoré[2], M. Etienne[1], O. Bouchaud[2], F. Caron[1]
[1]*CHU Charles Nicolle, Infectious Disease, Rouen, France,* [2]*CHU Avicenne, Infectious Disease, Bobigny, France*
*Presenting author email: anais.lesourd@chu-rouen.fr*

**Background:** Despite antiretroviral (ARV) therapy, it is generally admitted that HIV patients remain at increased risk of pneumococcal infections (PI) and thus eligible to pneumococcal vaccination (PV). Most studies in this field, however, have been conducted before 2010, while the proportion of virologically controlled patients has dramatically increased these latter years, thanks to larger indications and more effective ARV regimens.
The aim was to reevaluate the current residual risk of PI and the PV coverage among HIV patients in France.
**Methods:** This retrospective study was conducted in two regional centers that overall reflect the current French HIV epidemiology. The total 1996-2014 cohort (30.371 patients) allowed to determine the incidence of PI. The 80 most recent cases of PI (2000-2014) were compared to 160 controls (patients without PI matched by date of HIV diagnosis) to analyze the residual risk factors of PI and the determinants of PV.
**Results:** From 1996-2014, 116 PI cases were observed among which 40 invasive infections (bacteremia or meningitis) with only 2 directly attributable deaths. The incidence of invasive PI among patients with comorbidities or uncontrolled HIV infection was 12 times higher than that of general French population (107 vs 9/100.000), while the incidence among virologically controlled patients without comorbidity was of only 7.6/100.000. The matched analysis showed that risk factors of PI among HIV patients were (a) detectable VL (p=0.003), and (b) other factors shared by the general population such as a BMI< 19 (p=0.005), addiction to alcohol (p=0.0004), tobacco (p=0.0003) or IV drugs (p=0.005), renal failure (p=0.01), or respiratory insufficiency (p=0.02). The PV coverage was low for controls (91/160, 57%) as well as for cases (44/80, 55%), with only 5 cases (6%) having been vaccinated before the first episode of PI. Determinants for PV coverage were regular follow-up (p< 0.001), acceptance of flu vaccine (p< 0.001) and higher count of CD4 T-cells (296, *vs* 152, p=0.03).
**Conclusions:** These data suggest that HIV infection is no longer *per se* a significant risk factor for invasive pneumococcal infections, raising the question to interrupt "systematic" pneumococcal vaccination (not well applied in real life) and prefer a strategy targeting the most at-risk patients.

# TUBERCULOSIS AND OTHER MYCOBACTERIA

## WEPEB038

### PLASMA INDOLEAMINE 2, 3 DIOXYGENASE ACTIVITY, A POTENTIAL BIOMARKER FOR TUBERCULOSIS

C. Adu-Gyamfi[1,2], T. Snyman[3], C. Hoffmann[4], N. Martinson[4], J. George[3], M. Suchard[1,2]
[1]*National Institute of Communicable Diseases, Centre for Vaccines and immunology, Johannesburg, South Africa,* [2]*University of the Witwatersrand, Department of Molecular Medicine and Haematology, Johannesburg, South Africa,* [3]*University of the Witwatersrand, Department of Chemical Pathology, Johannesburg, South Africa,* [4]*Chris Hanni Baragwanath Acadamic Hospital, Perinatal Health Research Unit, Johannesburg, South Africa*
*Presenting author email: clementgascua@yahoo.com*

**Background:** Tuberculosis (TB) is a global health challenge, especially in high HIV prevalence settings. To date, however, there is no validated biomarker for diagnosing TB in HIV infected patients. Indoleamine 2, 3 dioxygenase (IDO) is an immunoregulatory enzyme capable of modulating cell mediated immunity (CMI). IDO catalyses the breakdown of tryptophan (Trp) to its toxic metabolites collectively known as kynurenines (Kyn). Elevated IDO activity has been proposed as a prognostic biomarker for TB, however, there is no longitudinal data to assess the clinical significance of elevated IDO activity in HIV-TB co-infection. We investigated whether IDO activity, as measured by Kyn-to-Trp ratio, using UPLC-MS/MS can act as a biomarker for diagnosing TB in HIV infected patients who develop TB disease.
**Methods:** Kyn and Trp concentrations were measured simultaneously in plasma of 32 HIV infected patients who developed active TB during a longitudinal study and compared with 70 control subjects, age, sex and CD4 cell count matched, in the same HIV infected cohort who did not develop TB.
**Results:** IDO activity was significantly higher in TB patients than controls at the time of TB diagnosis
(P = 0.0001). At 6 months prior to TB diagnosis, IDO activity was significantly higher in those who developed TB than controls (P = 0.0001). Within 6 months of anti-TB treatment, IDO activity in TB patients declined to almost same levels as that of the controls. To evaluate diagnostic significance of IDO activity using a receiver operating characteristic (ROC) curve, we selected 0.70 as the optimal cut-off. At time of TB diagnosis using both laboratory confirmed and clinical TB as gold standard, IDO activity gave a diagnostic sensitivity of 100% and a specificity of 98.5% with Positive and Negative predictive values of 96.9% and 100% for detecting active TB cases.
**Conclusions:** Our results, demonstrate the plausibility of increased IDO activity as a biomarker of active TB in HIV positive patients. Further, IDO activity may be a useful biomarker for predicting progress to active TB disease within 6 months or monitoring response to TB treatment. Strengths of the study include inclusion of an HIV infected control group and a longitudinal study design.

### ASSESSMENT OF THE IMPLEMENTATION OF TB INTENSIFIED CASE FINDING (ICF) AMONG PEOPLE LIVING WITH HIV IN HIV CARE AND TREATMENT SETTINGS, NIGERIA

B. Odume[1], K. Dokubo[2], D. Onotu[1], A. Date[2], S. Pals[2], J. Ibrahim[1], S. Odafe[1], I. Dalhatu[1], J. Okpala[3], I. Abutu[3], B. Oyeledu[3], E. Asadu[4], N. Chukwurah[5], H. Tomlinson[1]
[1]*U.S. Centers for Disease Control and Prevention CDC, Division of Global HIV/AIDS and TB, Abuja, Nigeria,* [2]*U.S. Centers for Disease Control and Prevention, Division of Global HIV/AIDS and TB, Atlanta, United States,* [3]*Center for Integrated Health Programs CIHP, Abuja, Nigeria,* [4]*National HIV/AID and STI Control Program, NASCP, Public Health Department, Federal Ministry of Health, Abuja, Nigeria,* [5]*National Tuberculosis and Leprosy Control Program, NTBLCP, Public Health Department, Federal Ministry of Health, Abuja, Nigeria*
*Presenting author email: vic8@cdc.gov*

**Background:** Tuberculosis (TB) is one of the most common causes of morbidity and mortality in people living with HIV (PLHIV). TB Intensified Case Finding (ICF) is a critical intervention for reducing TB mortality and ongoing TB transmission among PLHIV. We conducted an evaluation to characterize the implementation of various steps of the ICF cascade that consists of TB symptom screening, identification of PLHIV with presumptive TB, diagnostic evaluation for TB disease, diagnosis of TB disease, initiation of TB treatment and monitoring of each step of the cascade.
**Methods:** A probability-proportional-to-size sampling technique was used in the selection of 2,833 PLHIV ≥15yrs of age, not diagnosed with TB and retained in care as at end of September 2012 from 15 PEPFAR-supported HIV care and treatment facilities in Benue State, Nigeria. Patient charts and registers were retrospectively reviewed and data was abstracted on TB ICF cascade steps.
**Results:** Among the patients seen at the selected facilities during the study period, 2604 (91.9%), [95% CI: 86.5-98.5] were screened for TB at their last clinic visit. Of these, 60 (2.3%), [95% CI: 1.5-3.3.1] had a positive symptom screen and were classified as presumptive TB. 2540 (97.5%), [95% CI: 96.9-98.5] had a negative TB symptom screen, and the outcome of TB screening was not documented for 4 (0.15%) patients. Of the 60 presumptive TB cases, 26 (43.3%), [95% CI: 20.4-83.7] were evaluated for TB, 24 (40.0%), [95% CI: 16.4-79.7] were not evaluated, and data on10 (16.7%) patients were missing. Among patients evaluated for TB, 20 (76.9%), [95% CI: 58.6-100] were diagnosed with TB, 15 (75.0%), [95% CI: 72.4-100] were initiated on TB treatment, 2 (10.0%),
[95% CI: 0.0-27.6] were not, and data on 3 (15.0%) were missing.
**Conclusions:** Although TB screening was consistently conducted, the evaluation highlighted significant drop-offs in the ICF cascade in the evaluation of PLHIVs with presumptive TB and initiation of TB treatment for those with TB disease. Interventions that would strengthen referral, linkage and tracking of PLHIVs with presumptive TB should be implemented to ensure that greater number of PLHIVs with presumptive TB are evaluated for TB disease and all diagnosed cases initiated on treatment.

### PREVALENCE OF TUBERCULOSIS AND HIV/AIDS CO-INFECTION AMONG HIV CLIENTS AT GLOBAL FUND SUPPORTED COMPREHENSIVE FACILITIES IN NIGERIA

A. Kenneth[1], R.M. Weaver[2], O.M. Kayode[1], A. Greg[1], A. James[1], A. Adeyemi[1], A. Matthias[1], A. Ada[1], U. Samuel[1]

*[1]National Agency for the Control of AIDS (NACA), Strategic Knowledge Management, Abuja, Nigeria, [2]University of Washington, Department of Global Health, Washington, United States*

*Presenting author email: kennethalau@yahoo.com*

**Background:** Tuberculosis (TB) and HIV constitute major public health problems in Nigeria. The country has one of the largest burdens of both HIV and TB in the world. The prevalence of HIV among TB patients in Nigeria has been established to be 22% but the prevalence of TB among HIV clients in Nigeria has not been determined. This study was designed to determine the prevalence of TB among HIV clients in Nigeria.

**Methods:** Secondary analysis of data collected from the HIV/TB program in 241 Global Fund (GF) supported comprehensive facilities in Nigeria was done. From January 2013 to June 2015, 57,516 HIV clients were enrolled into care/treatment at the GF supported sites. Clients were screened symptomatically during clinic visit. Any clients that answered "yes" to at least one TB symptomatic questions was referred to the laboratory for TB test either by microscopy or genexpert. The TB co-infection among the HIV clients was the ratio of HIV clients with reactive tests to clients enrolled into treatment/care.

**Results:** In 2013, 1,622 out of the 19,527 HIV clients were diagnosed with TB and the co-infection rate was 8.31%. In 2014, 1,595 out of the 23,906 HIV clients were diagnosed with TB and the co-infection rate was 6.67%. In 2015, 1,075 out of 14,083 clients were diagnosed with TB and the co-infection rate was 7.6%. The overall co-infection rate 7.5% while the TB co-infection among HIV clients by the 6 geopolitical zones was North-West (5.1%), South-East (5.7%), North-East (5.9%), North-Central (6.8%), South-West (8.3%) and South-South (10.3).

**Conclusions:** The overall co-infection rate of TB among HIV clients was 7.5%. Screening of TB among HIV clients is of public health priority toward mitigating the spread of TB. There is the need to improve TB infection control at HIV setting to reduce TB co-infection.

## WEPEB041

### THE CHILDHOOD TUBERCULOSIS CARE CASCADE IN HIV-INFECTED AND UNINFECTED CHILDREN LIVING IN RURAL UGANDA AND KENYA

C. Marquez[1], E. Ssemmondo[2], F. Mwangwa[2], D. Kwariisima[3], A. Owaraganise[2], J. Ayieko[4], G. Chamie[1], A. Plenty[5], T.D. Ruel[6], M.L. Petersen[7], E.D. Charlebois[5], T.D. Clark[1], C.R. Cohen[8], E.A. Bukusi[4], M.R. Kamya[2,9], D.V. Havlir[1], SEARCH Collaboration

*[1]University of California, Division of HIV, ID, and Global Medicine, San Francisco, United States, [2]Infectious Diseases Research Collaboration, Kampala, Uganda, [3]Makerere University Joint AIDS Program, Kampala, Uganda, [4]Kenya Medical Research Institute, Nairobi, Kenya, [5]Center for AIDS Prevention (CAPS), University of California, San Francisco, United States, [6]University of California, Department of Pediatrics, San Francisco, United States, [7]University of California, Divisions of Biostatistics and Epidemiology, School of Public Health, Berkeley, United States, [8]Bixby Center for Global Reproductive Health, Department of Obstetrics, Gynecology and Reproductive Sciences, University of California, San Francisco, United States, [9]Makerere University, Department of Medicine, Kampala, Uganda*

*Presenting author email: carina.marquez@ucsf.edu*

**Background:** One of the first steps in achieving the World Health Organization's goal of Zero Childhood TB Deaths is to "know one's epidemic". Data on childhood TB in rural communities with generalized HIV epidemics are sparse. We sought to describe the incidence, case characteristics, and gaps in the childhood TB care cascade in rural Uganda and Kenya.

**Methods:** We retrospectively collected TB diagnosis and demographic data on children (age $\leq$15 years) and adults from the 2013 and 2014 TB treatment registries in 32 rural communities in Uganda and Kenya (N=334,512), that were participating in the SEARCH study (NCT:01864603). The SEARCH census data were used to calculate childhood TB incidence.

**Results:** In our study population the incidence of reported cases of childhood TB in Kenya was 20.9 and 10.5 per 100,000 in 2013 and 2014 respectively. In Uganda the incidence was 4.8 per 100,000 in 2013. 0 cases were reported in Uganda in 2014. From 2013 to 2014, children accounted for 13% (18/136) of all TB diagnoses in Kenya and 4% (5/121) of all TB diagnoses in Uganda. The proportion of overall TB burden found in children in Uganda is below the estimated proportion of 14-20% (Dodd et al. Lancet Global Health 2014). Childhood TB case characteristics in Uganda and Kenya were notable for 52% HIV infected, 43% under the age of five, 30% smear positive, and 47% with extra pulmonary TB. In Kenya, of the 18 reported childhood TB cases, 100% (18/18) were started on TB treatment, and 39% (7/18) had documentation of treatment completion. Age, gender, HIV status, and TB type did not predict odds of treatment completion. In Uganda, of the 5 reported childhood TB cases, 100% (5/5) were started on TB treatment, 80% (4/5) had documentation of treatment completion.

**Conclusions:** Over half of reported childhood TB cases are HIV infected. TB diagnosis in Uganda, treatment completion in Kenya, and reporting in both are weak links in the childhood TB care cascade in HIV infected and uninfected children. Analysis of programmatic TB surveillance data can identify local gaps in the TB care cascade and aid in targeting local interventions.

## WEPEB042

### ARE SMEAR-NEGATIVE, HIV-INFECTED, TB PATIENTS APPROPRIATE PARTICIPANTS FOR CLINICAL TRIALS OF NOVEL TB REGIMENS?

N. Martinson[1,2], B. Gordhan[3], S. Friederich[4], K. Otwombe[1], M. Letutu[1], L. Lebina[1], Z. Waja[1], R. Msandiwa[1], R.E. Chaisson[5], B. Kana[6], A. Diacon[7,8]

*[1]University of the Witwatersrand, Perinaatal HIV Research Unit (PHRU), Soweto, South Africa, [2]Johns Hopkins University School of Medicine, Center for TB Research, Batlimore, United States, [3]University of the Witwatersrand, DST/NRF Center for Biomedical TB Research, Johannesburg, South Africa, [4]University of Stellenbosch, MRC Centre for Tuberculosis Research, DST/NRF Centre of Excellence for Biomedical Tuberculosis Research, Faculty of Medicine and Health Sciences, Cape Town, South Africa, [5]Johns Hopkins University, Center for TB Research, Baltimore, United States, [6]University of the Witwatersrand, Department of Science and Technology/ National Research Foundation Centre of Excellence for Biomedical TB Research, Johannesburg, South Africa, [7]Stellenbosch University, MRC Centre for Tuberculosis Research, DST/NRF Centre of Excellence for Biomedical Tuberculosis Research, Faculty of Medicine and Health Sciences, Cape Town, South Africa, [8]TASK Applied Science, Cape Town, South Africa*

**Background:** Clinical trials of novel anti-TB regimens assess treatment efficacy by measuring sputum culture conversion from positive to negative. Baseline positive sputum smears are used as a proxy for culture positivity and most trials of novel TB agents exclude smear negative patients. An unintended consequence of this is the exclusion of many HIV-infected patients from participation in such studies. Considering the high prevalence of HIV-TB co-infection in South Africa, we attempted to validate this practice by investigating the rates of baseline culture positivity and reduction in sputum bacillary load in HIV-infected, smear-positive or smear-negative adults with Xpert MTB/Rif-positive TB.

**Methods:** We prospectively recruited treatment-naive, smear-positive or smear-negative HIV-TB infected adults at two sites: Soweto and Cape Town. We assessed sputum bacillary load at baseline, and its decline on treatment, using: time to positive (TTP) in liquid culture (MGIT), colony forming units (CFU) on solid agar, and cycle threshold (Ct) on Xpert MTB/Rif. Sputum samples were collected to at least 56 days after initiation of TB treatment.

**Results:** We recruited 37 smear-positive and 40 smear-negative subjects with a median age of 35.8 years with no significant differences in age, CD4 count and gender ratio. A greater proportion of smear-positive than smear-negative individuals (61.1% v 38.9%) had cavities on chest x-rays. No smear-positive but 10/40 smear-negative patients were MGIT negative at baseline; the latter's median baseline Ct was 29.3 (IQR:26.8-31.1). At baseline, median TTP, log CFU, and Ct in smear-positive and smear-negative subjects, respectively were: 6 (IQR:45-8.0) v 13 days (IQR:10-14); 3.64 (IQR:1.53-4.88) v 2.48 (IQR:1.85-3.11); 18.0 (IQR:15.7-20.1) v 26.8 (IQR:25.3-29.1). By 14 days on TB treatment there were no differences between groups on these measures.

**Conclusions:** One quarter of smear-negative HIV-infected TB had baseline negative TB cultures on MGIT. However, after two weeks of TB treatment, all displayed similar trajectories of bacillary load decline. Our data support the case for including in clinical trials, HIV-infected TB patients, but to minimize early withdrawals of culture negative patients, we suggest including those whose Xpert MTB/Rif Ct is below 28.

## WEPEB043

### RAPID DIAGNOSIS, LINKAGE AND TREATMENT INITIATION OF PATIENTS WITH DRUG-RESISTANT TUBERCULOSIS IN SOUTH AFRICA: THE MILINC SOLUTION TO IMPROVE ACCESS TO CARE

J.E. Farley[1,2], S. Seiguer[3], M. Naicker[4], J. McKenzie-White[5], C. Greg[3], M. Elmi[3], W. Stevens[6], L. Stewart-Isherwood[6]
*[1]Johns Hopkins University School of Nursing, Baltimore, United States, [2]University of KwaZulu Natal, Durban, South Africa, [3]Emocha Mobile Health, Inc, Baltimore, United States, [4]JPS-Africa, Pretoria, South Africa, [5]Center for Clinical Global Health Education, School of Medicine, Baltimore, United States, [6]National Health Laboratory Services, National Priority Programmes (NPP), Johannesburg, South Africa*
*Presenting author email: jfarley1@jhu.edu*

**Background:** Tuberculosis (TB) remains the leading cause of death in South Africa. Rapid diagnostic testing for TB with identification of rifampicin resistance is now standard of care. Despite this, linkage to care and subsequent treatment initiation lags and late presentation to care is noted as a prevailing reason for poor programmatic outcomes. We investigate a health system strengthening solution combining rapid diagnosis, laboratory interfaced m-Health smartphone application and linkage officer to shorten time from diagnosis to treatment initiation for drug resistant TB patients, 70% of which are co-infected with HIV.
**Methods:** We conducted a prospective observational cohort of persons presenting to primary health care clinics with symptoms of TB in peri-urban KwaZulu Natal, between June and November, 2015. Enrollment occurred by clinic staff into the mobile interface linkage to care (miLINC) application. A specimen bar code was placed on the sputum specimen bottle and was scanned directly into miLINC, creating an immediate direct patient-specimen match. The sputum specimen followed standard lab submission process and the results are transmitted from National Health Laboratory Service (NHLS) to miLINC. TB results are available immediately in miLINC for the clinic nurse, while linkage officers are simultaneously notified of rifampicin resistant patients for tracing and linkage.
**Results:** Three clinics enrolled 4,939 patients, 52.2% female. 3,887 (78.5%) had NHLS confirmed TB results; among the 1065 patients without results, the majority (56.5%) resulted from lab rejection. Among confirmed results, miLINC matched 2880 (74.1%); among unmatched, 86.6% was due to missing barcode data. All rejected specimens resulted in an immediate notification for repeat test. TB was identified in 292/2880 (9.9%) and rifampicin resistant TB in 38/292 (13%). 33/38 (87%) drug resistant TB patients were traced. The 5 missing included 3 deaths and 2 patients who could not be traced. Patients with drug-resistant TB were linked to care and initiated on drug resistant TB treatment with an average time of 2 days 23 hours.
**Conclusions:** The combined impact of rapid diagnosis coupled with miLINC resulted in linkage and initiation of drug-resistant TB treatment in < 3 days from diagnosis. m-Health is a feasible solution for linkage to care, even in resource challenged environments.

## WEPEB045

### INTERVENTION FOR PATIENTS INTERRUPTING RIFAMPICIN-RESISTANT TUBERCULOSIS TREATMENT FOR MORE THAN 2 WEEKS: AN INTERIM COMPARATIVE OUTCOME ANALYSIS FROM KHAYELITSHA, SOUTH AFRICA

E. Mohr[1], L. Snyman[1], J. Daniels[1], X. Harmans[1], V. Cox[1], H. Cox[2], S.J. Steele[1], L. Wilkinson[1]
*[1]Médecins Sans Frontières, Cape Town, South Africa, [2]University of Cape Town, Cape Town, South Africa*
*Presenting author email: msfocb-khayelitsha-drtb-epi@brussels.msf.org*

**Background:** Treatment for rifampicin-resistant tuberculosis (RR-TB) requires two years of treatment, often resulting in debilitating side effects. In South Africa, 30% of RR-TB treatment patients experience loss from treatment (LFT). We aimed to determine if a treatment interruption (TI) intervention could reduce LFT in the RR-TB cohort.
**Methods:** From September 2013, patients interrupting treatment for >2 weeks but < 2 months, where recall methods had failed, were identified by a lay counselor at clinic-level, who undertook the TI intervention. Structured support was provided at home to identify and overcome barriers to adherence and facilitate return to care. In this before-after study, we characterize outcomes of patients initiated on RR-TB treatment from September 2011 to March 2012 (comparison cohort) and September 2013 through March 2014 (intervention cohort) at seven Khayelitsha clinics. Interruption was identified from routinely recorded compliance records. Logistic regression analysis was used to calculate odds ratios, 95% confidence intervals and p-values for differences in 18 month treatment outcomes.
**Results:** Eighty two and 116 patients initiated RR-TB treatment in the comparison and intervention cohorts, respectively. HIV co-infection rates were similar (52 (63%) versus 82 (71%); p=0.28). There were 34 (41%) patients in the comparison cohort with interruptions identified compared with 30 (26%) in the intervention cohort (p=0.02); 26 (22%) were enrolled in the intervention. Among all patients, LFT at 18 months was higher in the comparison cohort than in the intervention cohort (p< 0.01). Before the intervention, the majority of interrupters experienced LFT (24, 73%), whereas only 9 (30%) experienced LFT after the intervention (p=0.0007) (Table 1).

| 18 month outcomes amongst interrupters: | Comparison Cohort N=33* | Intervention Cohort N=30 | Odds ratio (95% Confidence Interval), p-value |
|---|---|---|---|
| Still on treatment | 7 (21.2%) | 19 (63.3%) | 0.2 (0.07-0.6), 0.0025 |
| Treatment success | 1 (3.0%) | 0 (0.0%) | |
| LFT | 24 (72.7%) | 9 (30.0%) | 6.2 (2.1-18.3), 0.0007 |
| Death | 1 (3.0%) | 2 (6.7%) | 0.4 (0.0-3.6), 0.46 |

*[Table 1: Comparison of 18 month RR-TB treatment outcomes amongst interrupters in the comparison and intervention cohorts]*

Excluded *1 transferred out
**Conclusions:** While the risk of interruption appeared to be declining, the TI intervention is likely to have contributed to a significant reduction in the risk of LFT among patients experiencing treatment interruption. Allocating resources to intensify support for these high-risk patients is likely to reduce LFT amongst RR-TB patients.

## WEPEB046

### LINEZOLID FOR THE TREATMENT OF RIFAMPICIN-RESISTANT TB IN KHAYELITSHA, SOUTH AFRICA: STRATEGIES FOR IMPROVING ACCESS

J. Hughes[1], V. Cox[1], H. Cox[2], E. Mohr[1], J. Furin[3], G. Van Cutsem[1], L. Snyman[1], L. Trivino Duran[1], J. Hill[1]
*[1]Médecins Sans Frontières, Cape Town, South Africa, [2]University of Cape Town, Cape Town, South Africa, [3]Harvard Medical School, Boston, United States*
*Presenting author email: msfocb-khayelitsha-tbdoc@brussels.msf.org*

**Background:** Rifampicin-resistant TB (RR-TB) is a major source of mortality for HIV infected individuals South Africa, and treatment is successful in only half of those diagnosed and initiated on treatment. The use of new drugs— bedaquiline and delamanid—and repurposed drugs—linezolid (LZD) and clofazimine—have potential to improve outcomes. The cost of these medications, particularly LZD, has led to restricted use even in patients who might benefit. We have previously described improved outcomes for patients treated with LZD in Khayelitsha. Here we focus on strategies for reducing drug costs to improve access.
**Description:** A retrospective record review of patients receiving LZD through a programme supported by Médecins Sans Frontieres (MSF) combined with a descriptive analysis of drug costs over time was conducted.
**Lessons learned:** In total 128 patients in Khayelitsha were treated between 2011-2015. Between 2011 and early 2014, the average cost of LZD for MSF was nearly 65 USD (700 ZAR) per tablet, which translated into about 49,000 USD (520,000 ZAR) per two-year treatment course. In June 2014, MSF obtained permission from South Africa's Medicines Control Council to import a quality-assured generic at an 88% price reduction (8 USD, or ~85 ZAR) for use in Khayelitsha, under "Section 21" conditions. Section 21 allows for the import of non-registered medications for persons with serious diseases/diseases with public health implications. As a result of price reductions MSF procured LZD for 85 (66%) patients after June 2014 compared to 43 (34%) before June 2014. Nationally, LZD is not purchased on tender for TB in the public sector and costs remain high. Work is underway to support registration of generic forms of LZD in South Africa.
**Conclusions/Next steps:** Linezolid is important for improving outcomes among persons with RR-TB, however cost has hindered wider use. MSF employed a variety of strategies to eventually secure access to a more affordable, generic version of LZD in Khayelitsha. Wider use of Section 21 import waivers to obtain more affordable LZD, and fast-tracked registration of more quality assured suppliers in South Africa, could result in wider access nationwide and ensure that all patients with a clinical indication for LZD have access to this medication.

### INCIDENCE AND RISK FACTORS OF POST ART TUBERCULOSIS IN ADULTS AND ADOLESCENTS ENROLLED IN INDIA'S NATIONAL AIDS CONTROL PROGRAMME, 2009-2014

S. Anwar Parvez[1], A. Ramesh Reddy[2], K.U. Chengappa[2], C. Nalini[2], S. Chawala[3], B.B. Rewari[4]
*[1]International Training and Education Center for Health, Global Health, New Delhi, India, [2]SHARE India, Hyderabad, India, [3]Gujarat State AIDS Control Society, Care Support and Treatment, Ahmedabad, India, [4]World Health Organization, New Delhi, India*
*Presenting author email: anwarparvezsayed@gmail.com*

**Background:** Human Immunodeficiency Virus (HIV) and Tuberculosis (TB) co-infection is a major public health problem in India.Antiretroviral Treatment (ART) improves survival and quality of life of People Living with HIV (PLHIV). Reactivation or reinfection of TB after ART is not uncommon in PLHIV. Incidence of Post- ART TB is not clearly known.
This study objective was to estimate incidence of post ART TB and to identify risk factors for its development.
**Methods:** Retrospective Cohort study was undertaken using data from four ART centers of Gujarat state; of PLHIV aged ≥ 15 years and initiated on ART between January 1stand 31st December 2011. Occurrence of TB after initiation of ART was primary end point considered until 31st December 2014. We calculated cumulative probability of no post ART TB by Kaplan-Meier estimation and identified risk factors of post ART TB byadjusted odds ratio (AORs) using multiple logistic regression model.
**Results:** Of 1727 patients initiated on ART & followed up for median 40 months period (range: 0-49 months) follow-up period, 112 patients (6.5%) developed post ART TB. Total follow-up period was 4707 person years. Incidence rate of post ART TB was 3.4 per 100 person years. Mean time to 'No Post HAART TB' was 45.96 months (95% CI=45.46-46.46).PLHIV with mean age > 39 years (AOR 2.09, 95% CI 1.36-3.22, p-0.01) ; Males (AOR 1.68, 95% CI 1.07-2.64, p-0.03); those on Nevirapine regimen (AOR2.06,95% CI 1.32-3.23,p - 0.002) and had median weight ≤47 kgs (AOR 1.55,95% CI 1.03-2.36,p - 0.004) were more likely to develop Post ART TB.
**Conclusions:** Incidence of post ART TB in ART naïve PLHIV in India was 3.4 per 100 person years of follow up. PLHIV that are male, have low body weight, age nearing forty and started on Nevirapine based ART have higher risk of post ART TB. PLHIV imitated on Nevirapine based ART and those with low body weight at ART initiation may be prioritized for TB screening , initiation of INH prophylaxis may help reducing post ART TB incidence under programmatic conditions.

## WEPEB048

### LATENT TB INFECTION DIAGNOSTIC PERFORMANCE IN HIV-INFECTED WOMEN IS INFLUENCED BY PERIPARTUM STAGE

S. LaCourse[1], L. Cranmer[2], D. Matemo[3], J. Kinuthia[3,4,5], B. Richardson[5,6], D. Horne[5,7,8], G. John-Stewart[1,5,9]
*[1]University of Washington, Division of Allergy & Infectious Disease, Seattle, United States, [2]Emory University School of Medicine and Children's Healthcare of Atlanta, Department of Pediatrics, Atlanta, United States, [3]Kenyatta National Hospital, Department of Obstetrics and Gynaecology, Nairobi, Kenya, [4]Kenyatta National Hospital, Research and Programs, Nairobi, Kenya, [5]University of Washington, Department of Global Health, Seattle, United States, [6]University of Washington, Department of Biostatistics, Seattle, United States, [7]University of Washington, Department of Medicine, Division of Pulmonary and Critical Care Medicine, Seattle, United States, [8]Firland Northwest TB Center, Seattle, United States, [9]University of Washington, Department of Epidemiology, Seattle, United States*
*Presenting author email: sylvial2@uw.edu*

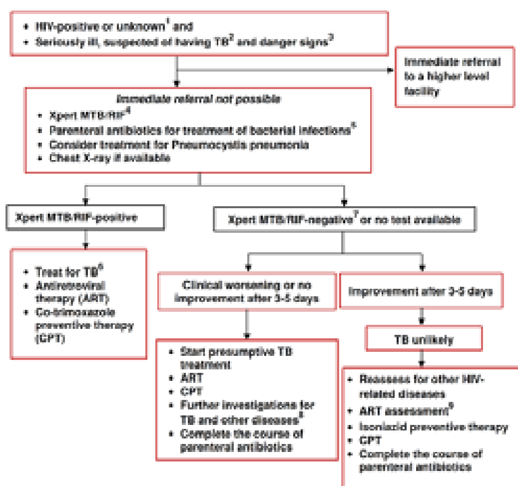
**Background:** Maternal TB/HIV co-infection is associated with poor maternal and infant outcomes. Although HIV and pregnancy may affect latent TB infection (LTBI) diagnostic test performance, longitudinal studies of test performance in HIV-infected peripartum women in Africa are lacking.
**Methods:** In this prospective study, tuberculin skin tests (TST) and interferon gamma-release assays [QuantiFERON® (QFT)] were performed on HIV-infected Kenyan women during pregnancy and 6 weeks postpartum (excluding women QFT+/TST+ in pregnancy). We evaluated test agreement and characteristics associated with results.
**Results:** Between August 2014 and August 2015, we enrolled 100 women with median age 26 years (IQR 22-32), CD4 555 cells/µL (IQR 340-730) and gestational age 27 weeks (IQR 20-32). Most (88%) were on antiretroviral treatment (ART), including 37% initiated pre-pregnancy.
Among 96 pregnant women with QFT/TST results, prevalence of LTBI (QFT+ or TST+) was 37.0%, (95% CI: 27.4-46.6). More women were QFT+ than TST+ (34.4% vs. 13.5%, p=0.006); 10.4% were concordant positive and 49.0% concordant negative. Excluding 14 QFT indeterminate results, QFT/TST agreement was 56.9% (κ=0.13, 95%CI: -0.02-0.21). Among 78 women retested at 6 weeks postpartum, more women were QFT+ than TST+ (29.5% vs. 14.1%, p< 0.0001). Agreement was 80.3% (κ= 0.44 95% CI: 0.23-0.66), with 11.5% concordant positive and 68.0% concordant negative. Among women QFT+ at both time-points, most converted from TST- to TST+ (10/18). Most indeterminate QFT results in pregnancy became QFT+ postpartum (10/12). Three women without LTBI (QFT-/TST-) in pregnancy had postpartum test conversion (1 QFT+/TST+, 2 QFT+/TST-) for an incidence of 13.4/100 person-years.
LTBI in pregnancy was associated with older age (OR 1.1/year, 95% CI: 1.1-1.16, p=0.03) and pre-pregnancy ART (OR 4.6, 95% CI 1.9-11.2, p=0.001). Later gestational age was associated with lower likelihood of TST+ (OR 0.9/gestational week, 95% CI 0.8-0.9, p= 0.03). Postpartum LTBI was associated with household TB (OR 3.6, 95% CI: 1.1-11.3, p=0.05). Among women with serial positive QFTs, mean IFN-ɣ was higher postpartum (3.46 vs. 4.85 IU/mL, p=.007).
**Conclusions:** QFT was more sensitive than TST for LTBI detection among HIV-infected peripartum women. Reliance on TST would miss >50% of women who could benefit from isoniazid preventive therapy.

## WEPEB049

### NEW WHO ALGORITHM TO PREVENT TB MORTALITY IN SERIOUSLY ILL PATIENTS WITH HIV

Y. Hamada[1], A. Baddeley[1], M. Doherty[2], N. Ford[2], W. van Gemert[1], C. Glipin[1], A. Kanchar[1], A. Korobitsyn[1], F. Mirzayev[1], H. Getahun[1]
*[1]World Health Organization, Global TB Programme, Geneva, Switzerland, [2]World Health Organization, Department of HIV/AIDS, Geneva, Switzerland*
*Presenting author email: hamaday@who.int*

**Background:** Tuberculosis (TB) remains the most common cause of in-hospital death in people living with HIV (PLHIV), accounting for one third of all mortality. WHO updated the algorithm to prevent TB mortality among PLHIV who are seriously ill.
**Methods:** A systematic review was conducted to assess the role of presumptive TB treatment for PLHIV using eight electronic databases up to March 1, 2015. Randomized controlled trials (RCTs), single-arm trials and observational studies were considered. A systematic review of literature assessing the performance of lateral flow urine lipoarabinomannan assay (LF-LAM) was conducted using 11 electronic databases up to 2 February 2015. The quality of evidence was assessed using the GRADE system. The results were reviewed by a Guideline Development Group (GDG) consisting of international external experts.
**Results:** A systematic review of presumptive TB treatment identified 2563 citations and four ongoing trials. Although one RCT (REMEMBER) was identified, the study did not meet the operational definition of presumptive TB treatment (initiation of TB treatment for PLHIV in peripheral facilities based exclusively on clinical suspicion for seriously ill patients with respiratory distress based on the judgment of the clinician). The systematic review of LF-LAM identified increased sensitivity (56%) among inpatients with HIV having CD4 count≤100 cells/µl, with specificity at 90%. Due to limited evidence, the GDG made no new recommendation on presumptive TB treatment while noting that it should be provided for PLHIV who are seriously ill and presumed to have TB. The algorithm also conditionally promotes the use of LF-LAM for PLHIV who are seriously ill regardless of CD4 count.
**Conclusions:** The new WHO algorithm suggests provision of presumptive TB treatment for PLHIV who are seriously ill and presumed to have TB. Adoption of the new WHO algorithm is likely to minimize delay in TB treatment initiation and prevent early mortality among seriously ill PLHIV.



1 In all people with unknown HIV status, HIV testing should be performed according to national guidelines.
2 Suspicion of TB is defined by the presence of any one of the following symptoms:
- For adults and adults and adolescents living with HIV: current cough, fever, weight loss or night sweats.
- For children living with HIV: poor weight gain, fever, current cough, or history of contact with a TB case.
3 Danger signs include any one of the following: respiratory rate >30/min, temperature >39°C, heart rate >120/min and unable to walk unaided.
4 In patients suspected of having extrapulmonary TB (EPTB), extrapulmonary specimens should be obtained for Xpert MTB/RIF (cerebrospinal fluid, lymph nodes and other tissues. Xpert MTB/RIF has low sensitivity for pleural fluid and there is limited data for stool, urine or blood).
The urine lateral flow lipoarabinomannan (LF-LAM) assay may be used to assist in the diagnosis of active TB in seriously ill HIV positive adults and children, regardless of CD4 count.
If Xpert MTB/RIF is not available, conduct AFB microscopy. AFB-positive is defined as at least one positive and AFB-negative as two or more negative smears. Refer specimen for TB culture where feasible.
5 Antibiotics with broad spectrum antibacterial activity (except fluoroquinolones) should be used.
6 If Xpert MTB/RIF shows rifampicin resistance, treatment for MDR-TB should be initiated. If the patient is considered at low risk for rifampicin resistance, a second Xpert MTB/RIF test should be performed on a fresh specimen. Collect and refer a sample for culture and additional drug-susceptibility testing.
7 If Xpert MTB/RIF shows negative, the test can be repeated using a fresh specimen.
8 Further investigations for TB include chest x-ray, clinical assessment, a repeat Xpert MTB/RIF using a fresh specimen, and culture. If EPTB is suspected, extrapulmonary specimens should be obtained and sent for culture and abdominal ultrasound may be performed.
9 ART should be recommended to all adults, regardless of CD4 cell count or clinical stage.

*[Algorithm for the management of people with HIV who are seriously ill and suspected of having TB]*

## WEPEB050

### USE OF DETERMINE TB-LAM TEST IN HIV-POSITIVE ADULTS WITH LOW CD4 COUNT IN PROGRAMMATIC CONDITIONS

H. Huerga[1], S.C. Mathabire[2], I. Amoros Quiles[3], J. Mpunga[4], K. Mbendera[4], C. Kabaghe[5], E. Szumilin[6]
*[1]Epicentre, Clinical Research, Paris, France, [2]Médecins Sans Frontières, Chiradzulu, Malawi, [3]Médecins Sans Frontières, Lilongwe, Malawi, [4]National Tuberculosis Program, Lilongwe, Malawi, [5]Chiradzulu District Hospital, Chiradzulu, Malawi, [6]Médecins Sans Frontières, Paris, France*
*Presenting author email: helena.huerga@epicentre.msf.org*

**Background:** Determine TB-LAM is a new point-of-care test for diagnosis of tuberculosis (TB) in HIV-positive patients performed in urine. We assessed the diagnostic value of using LAM test in programmatic conditions.
**Description:** HIV-positive inpatients, 15 years old and above were prospectively recruited in Chiradzulu District Hospital regardless of their reason for admission and CD4 count. TB diagnosis was done through clinical assessment, sputum microscopy, Xpert MTB/RIF or chest X-ray. In addition LAM test was performed but results were not used for treatment decision.
Prior to using LAM test, training of laboratory technicians was carried out in one hour. LAM test was performed in the laboratory with no extra equipment or additional staff and with minimal supervision required.
**Lessons learned:** From August to December 2015, 190 patients were included in the study. Median CD4 count was 344 (IQR:166-469) cells/µl. In total, 189 (99.5%) patients provided a urine sample, 141 (74.2%) a sputum sample, and 133 (70.0%) had a chest X-ray. LAM results were available within 2 hours, microscopy and Xpert MTB/RIF within 2 days, and X-ray in average in 4 days. Agreement between two readers was 97.2% (kappa=0.96) for the interpretation of LAM result and 98.3% (kappa=0.96) for the test grade. In total, 56 (29.5%) had a LAM positive result, 53 (27.9%) an X-ray suggestive of TB, 13 (6.8%) a positive microscopy, and 15 (7.9%) a positive Xpert result. Forty-eight patients were started on TB treatment within 2 months. Of the 56 patients with a LAM positive result, 34 (60.0%) were not started on TB treatment using other diagnostic tools. Mortality at 2 months was 26.7%: 31.0% among those not on TB treatment and 16.7% among those on treatment. Mortality in LAM-positive patients was 28.6%: 35.7% among patients not on treatment and 21.4% among those on treatment.
**Conclusions/Next steps:** LAM test is easy to implement in programmatic conditions using a simple to obtain sample and providing quick results. In a context where there are difficulties to perform other diagnostic tests LAM may detect a non-negligible proportion of TB patients among very sick HIV-positive patients that otherwise would be missed.

## WEPEB051

### EVALUATING THE INCREMENTAL VALUE OF USING THE TB LAM TEST IN INTENSIFIED CASE FINDING FOR TB IN PEOPLE LIVING WITH HIV

M. Pasipamire[1,2], A.T. Mafukidze[2], S. Mazibuko[1], M. Calnan[2], S.M. Haumba[2], R. Jeffries[2], N. Mahlalela[2], D. Khumalo[3], J. Manjengwa[2], G. Maphalala[4]
*[1]Swaziland National AIDS Programme, Mbabane, Swaziland, [2]University Research Co. LLC, Mbabane, Swaziland, [3]Swaziland National Tuberculosis Control Programme, Manzini, Swaziland, [4]Swaziland National TB Reference Laboratory, Mbabane, Swaziland*
*Presenting author email: munyapassy@yahoo.com*

**Background:** The Swaziland National AIDS Programme and National Tuberculosis Control Programme have a joint goal of improving tuberculosis (TB) case detection in People Living with HIV (PLHIV). Urine TB lipoarabinomannan (LAM) test, which detects the LAM antigen, has potential of rapidly detecting TB and/or add value to the TB screening process. This Point-of-Care test has a potential of scaling up intensified case finding (ICF) including extra-pulmonary TB cases in PLHIV. To inform this we conducted a study on the feasibility and value of adding urine TB LAM test to the national screening algorithm.
**Methods:** PLHIV, aged ≥18, and not on TB treatment were consecutively recruited at three hospital-based ART clinics. All patients with presumed TB regardless of ART status were included. Sputum, urine and blood samples were collected for Xpert MTB/RIF and culture, determine LAM, and CD4 count respectively. Sputum induction was done for those unable to produce sputum. Sensitivity and specificity analyses were conducted using Stata 12.1. Logistic regression was conducted to identify significant determinants of true positive TB LAM.
**Results:** Of the 417 patients enrolled, sputum samples were obtained in 386 patients. The prevalence of TB was 10%. The overall sensitivity of TB LAM was 15.8% (95% confidence interval (CI): 6.0-31.3) increasing to 45% (95% CI: 16.7-76.6) for CD4 count < 100. The overall specificity was 96.3% (95% CI: 93.7-98.1). The overall sensitivity of Xpert MTB/RIF was 39.5% (95% CI: 24-56.6) and 63.6% (95% CI: 30.8-89.1) for CD4< 100. Among those unable to provide sputum spontaneously, the prevalence of TB was 12% and TB LAM sensitivity was 14.3% (95% CI: 0.4-57.90). True positive TB LAM was strongly associated with CD4 count< 100 [OR: 35.8, 95% CI: 3.5-358; p-value=0.003] and Pre-ART status [OR: 11.6, 95% CI: 2.2-60.5; p-value=0.004].
**Conclusions:** TB LAM may be used in a targeted approach to diagnose TB in patients who have very low CD4 counts (< 100 cells/ml) and more importantly in pre-ART. TB LAM may be used with added value for TB screening in presumptive TB cases who have dry cough. Xpert MTB/RIF diagnostic accuracy was less than expected and require further exploration.

## WEPEB052

### ENHANCING TB CASE FINDING AMONG HIV POSITIVE CHILDREN ATTENDING AN URBAN PAEDIATRIC AND ADOLESCENT HIV CLINIC IN UGANDA

M. Sekadde[1,2], P. Amuge[2], F. Baruga[2], G. Kisitu[2], A. Mandalakas[3], A. Kekitiinwa[2]
*[1]National TB and Leprosy Program, Kampala, Uganda, [2]Baylor College of Medicine Children's Foundation Uganda, Kampala, Uganda, [3]Baylor College of Medicine, Houston, United States*

**Background:** In July 2013, the Uganda Ministry of Health introduced a revised TB screening tool adapted from WHO to intensify TB case finding in children, adolescents, and adults. The national recommendation is to screen all HIV infected patients for TB on each clinic visit and initiate Isoniazid Preventive Therapy (IPT) for those without TB while prioritizing children < 5 years with a history of TB contact. We examined the impact of the screening tool on the identification of presumptive TB, diagnosis of TB disease, and uptake of IPT among HIV infected children < 15 years.
**Methods:** We extracted data from an electronic medical record at the Baylor-Uganda clinic which is the largest paediatric and adolescent HIV clinic in Uganda. We analyzed individual patient data on TB symptom screening collected at the initial clinic visit before (April 2012 - March 2013: period 1) and after (April 2014 - March 2015: period 2) implementation of the screening tool. Children on TB treatment at the time of screening were excluded from the analysis. Data were compared using means and proportions.

**Results:** The proportion of children screened for TB increased from 83% (3673/4422) in period 1 to 95% (4167/4374) in period 2. (p < 0.05) We registered a seven fold increase in the proportion of children identified with presumptive TB in period 2 (1.6% (59) versus 10.9% (456)). The mean age for the children identified with presumptive TB was comparable for both periods (6.6 years (SD 5.0) versus 6.4 years (SD 4.0)). Majority of the children with presumptive TB in both periods were female (30 (62%) and 241 (51%) respectively). More children with presumptive TB were started on TB treatment during period 2 (51 confirmed and 88 clinically diagnosed TB) compared to period 1 (11 clinically diagnosed TB). More children were initiated on IPT during period 2 (3 versus 16 respectively).
**Conclusions:** The revised TB screening tool identified more children with presumptive TB and improved uptake of IPT. Its use should be scaled up in order to identify children with or at risk for TB.

## Other bacterial infections and parasitic infections (including malaria)

### WEPEB053

#### Latent *Toxoplasma* infection is associated with worse neurocognitive functioning in HIV-infected adults

A. Bharti[1], D. Smith[1], R. Deutsch[2], R. Ellis[3], M. Cherner[2], S. Woods[2], R. Heaton[2], A. McCutchan[1], I. Grant[2], S. Letendre[1]
*[1]University of California San Diego, Medicine, Infectious Diseases Division, La Jolla, United States, [2]University of California San Diego, Psychiatry, La Jolla, United States, [3]University of California San Diego, Neurology, La Jolla, United States*
*Presenting author email: abharti@ucsd.edu*

**Background:** HIV-associated neurocognitive disorders (HAND) are well-recognized complications of HIV-1 infection that can impede employment, activities of daily living, and ultimately survival. Antiretroviral therapy (ART) alone is often not sufficient to restore full cognitive functioning, suggesting that the cause of persisting neurocognitive impairment (NCI) may not be fully understood. Since latent *Toxoplasma* infection (LTI) may adversely impact brain function, we investigated its impact on neurocognitive impairment (NCI) in people living with HIV disease.
**Methods:** 263 HIV+ adults underwent comprehensive neurocognitive assessments and had anti-*Toxoplasma* Immunoglobulin G (anti-Toxo IgG) measured by qualitative and quantitative enzyme-linked immunosorbent assays.
**Results:** Participants were mostly middle-aged white men who were taking ART (70%). LTI was detected in 30 (11.4%) participants and was associated with a 67% increased relative risk of global NCI (57% LTI+ vs. 34% LTI-, p = 0.017) with delayed recall specifically affected (p < 0.01). In a logistic regression model of risk of NCI (overall p < 0.001), the probability of NCI increased with increasing CD4+ T-cell counts in LTI+ patients, whereas NCI was inversely related to CD4+ T-cell counts among those without LTI (LTI p = 0.021, CD4+ p = 0.001, and their interaction p = 0.019). A strong correlation between anti-Toxo IgG levels and global deficit scores (GDS) was also found. Biomarkers indicative of CNS inflammation did not differ between LTI+ and LTI- participants.
**Conclusions:** In this cross-sectional analysis of HIV-infected, predominately antiretroviral treated patients, LTI was associated with NCI especially in those with CD4 counts > 200. Higher levels of anti-Toxo IgG also correlated with risk of NCI. Longitudinal studies of patients before and after ART initiation could test our hypotheses that episodic cerebral inflammation is occurring in LTI and that immune reconstitution plays a role in the pathogenesis of cognitive impairment in patients with LTI and treated HIV infection. Interventional trials with existing or investigational drugs active against *Toxoplasma* would further strengthen our findings and could lead to new treatments for HAND in people living with LTI.

## Hepatitis (excluding hepatitis C)

### WEPEB055

#### Low prevalence of liver disease in treatment naïve HIV, HBV and HIV/HBV co-infected Tanzanians: a cross-sectional study

B. Christian[1], I. Macha[1], C. Gawile[1], S. Mpangala[1], E. Fabian[1], N. Ulenga[1], L.R. Ammerman[2], C. Thio[1], D. Sando[1], R. Murphy[1], C. Hawkins[2]
*[1]Management and Development for Health, Dar es Salaam, Tanzania, United Republic of, [2]Northwestern Feinberg School of Medicine, Chicago, United States*

**Background:** In sub-Saharan Africa, the burden of liver disease associated with HBV and HIV infection is largely unknown. We characterized liver disease using Aspartate Aminotransferase-to-Platelet Ratio Index (APRI) in patients with HIV, HBV, and HIV/HBV co-infection in Tanzania.
**Methods:** A cross sectional analysis of treatment naive HIV mono-infected (HIV+), HBV mono-infected (HBV+), and HIV/HBV co-infected (HIV+/HBV+) adults (≥18yrs) enrolled at Management and Development for Health (MDH) supported HIV and HBV treatment clinics in Dar es Salaam, was conducted. Risk factors associated with significant fibrosis (defined according to the WHO proposed low cut-off for significant fibrosis APRI≥0.5 (≥F2)) were investigated in bivariate analyses.
**Results:** 266 HIV+, 90 HBV+ and 29 HIV+/HBV+ patients were analyzed [females 221 (57.4%), median age 37.1 (IQR 14.3), BMI 21.8 (IQR 6.5)].
HBV+ patients were more likely to be male, younger, consume alcohol and have higher BMI's than HIV+ or HIV+/HBV+ patients. 61% HBV+ patients were classified as inactive carriers. HIV+/HBV+ patients were more likely to have HBV DNA levels ≥4.3 log10 IU/mL than HBV+ patients (45.0% vs. 15.2%; p< 0.01) and be HBeAg seropositive (31.3% vs. 8.2%; p< 0.01).
Median APRI was higher in HBV+ (0.36, IQR 0.14) and HIV+/HBV+ (0.31, IQR 0.38) patients compared to HIV+ patients (0.23, IQR 0.17) (p's< 0.05). A higher proportion of HIV+/HBV+ than HIV+ and HBV+ patients had APRI≥0.5 [HIV+/HBV+ (36.4%) vs. HIV+ (13.3%) vs. HBV+ (14.1%); p< 0.01]. In multivariate analyses, HIV/HBV co-infection (vs. HIV mono-infection) but not HIV or HBV mono-infection (vs. co-infection) was associated with APRI≥0.5 (OR 3.4, 95%CI 1.3, 9.2). Higher HIV RNA levels (OR 3.6, 95%CI 1.5, 8.3) and HBV DNA levels ≥4.3log10 IU/ml (OR 9.6, 95%CI 1.1, 61.0) were associated with APRI ≥0.5 in HIV+ and HBV+ patients, respectively.
**Conclusions:** Overall rates of significant fibrosis were low in this cohort of HIV, HBV and HIV/HBV co-infected Tanzanians. HIV/HBV co-infection was an independent risk factor for significant fibrosis compared to HIV and HBV mono-infection suggesting more aggressive monitoring of liver related complications in co-infected individuals is required. Further study is needed to determine the effects of HIV and HBV therapies on long-term liver disease progression in this setting.

### WEPEB056

#### Improved liver fibrosis scores in treated HBV/HIV co-infected patients in South Africa despite persistent immune dysregulation

T. Maponga[1], M. Andersson[2,3], J. Taaljaard[4], C.J. Van Rensburg[5], W. Preiser[1], R. Glashoff[1]
*[1]University of Stellenbosch, Division of Medical Virology, Cape Town, South Africa, [2]University of Stellenbosch, Department of Pathology, Division of Medical Virology, Cape Town, South Africa, [3]University Hospitals Oxford, Oxford, United Kingdom, [4]University of Stellenbosch, Division of Infectious Diseases, Cape Town, South Africa, [5]University of Stellenbosch, Division of Gastroenterology, Cape Town, South Africa*
*Presenting author email: tongai@sun.ac.za*

**Background:** HIV infection negatively impacts the natural progression of HBV infection. However, the effect of HBV on HIV progression is not completely understood. The aim of this study was to measure and evaluate the association between liver fibrosis and immunomarkers of activation and exhaustion in HIV and HBV co-infection.
**Methods:** Ethical approval was obtained to recruit 46 HBV/HIV co-infected; 47 HBV mono-infected and 39 HIV mono-infected age-matched participants from Tygerberg Hospital, Cape Town. All HIV-infected patients were on HAART for ≥3 months. Liver stiffness measurements were taken using the Fibroscan 402 (Echosens, Paris). Cell-based immunomarkers of activation and exhaustion were measured using multi-parameter flow cytometry of fresh whole blood. Soluble serum/plasma immune biomarkers were measured using ELISA and Luminex assays.
**Results:** There was increased expression of HLA-DR/CD38 and PD-1 on CD8 T lymphocytes in co-infected subjects compared to the other two groups (p<0.05). Soluble CD14 and Interferon-γ-Inducible Protein-10 (IP-10) was also significantly elevated in the plasma of co-infected patients. Co-infected subjects exhibited delayed immune recovery with lower CD4/CD8 T cell ratio; CD4 cell counts and more frequent HIV viremia (31% vs 15%) compared to HIV monoinfected participants (p<0.05). The HBV mono-infected group had the highest proportion of participants

with moderate/advanced liver fibrosis together with increased IL-1b, IL-1ra and basic-FGF compared to the other groups (p< 0.05).
**Conclusions:** There is persistent T-lymphocyte dysregulation and delayed immune recovery in HAART-experienced HBV/HIV co-infected patients. However this does not appear to be associated with severity of liver fibrosis in the South African setting. Moderate/advanced liver fibrosis in HBV-monoinfection may be indicative of inadequate access to screening and treatment of HBV.

## WEPEB057

### RESPONSE TO TRUVADA BASED CART IN HIV/HBV CO-INFECTED PATIENTS IN BOTSWANA

M. Anderson[1,2], S. Gaseitsiwe[1,3], S. Moyo[1,4], K.P. Thami[1], T. Mohammed[1,2], D. Setlhare[1], T.K. Sebunya[2], E.A. Powell[5], J. Makhema[1,3], J.T. Blackard[5], R. Marlink[1,3], M. Essex[1,3], R.M. Musonda[1,3]
*[1]Botswana Harvard AIDS Institute Partnership, Gaborone, Botswana, [2]University of Botswana, Department of Biological Sciences, Gaborone, Botswana, [3]Harvard T. H. Chan School of Public Health, Department of Immunology and Infectious Diseases, Boston, United States, [4]University of Stellenbosch, Division of Medical Virology, Faculty of Medicine & Health Sciences, Tygerberg, South Africa, [5]University of Cincinnati College of Medicine, Division of Digestive Diseases, Cincinnati, United States*
*Presenting author email: manderson@bhp.org.bw*

**Background:** Hepatitis B Virus (HBV) and Human Immunodeficiency Virus (HIV) coinfection emerged as an important cause of morbidity and mortality. We determined the response to combination antiretroviral therapy (cART) in HIV/HBV coinfected versus HIV monoinfected patients initiating Truvada containing cART in Botswana.
**Methods:** A total of stored plasma samples from 300 participants enrolled in a longitudinal cART cohort were screened for Hepatitis B surface antigen (HBsAg), HBV e Antigen (HBeAg) from baseline to 24 months using serological assays. HBV DNA load was determined using Roche TaqMan RT-PCR. We assessed predictors of HBV status, HIV, HBV suppression using logistic regression techniques.
**Results:** Of 300 participants screened (9.3% [95% CI 6.3 - 13.2]), 28 were HBsAg positive and 5 (17.9%; 95% CI 6.1 - 36.9) were HBeAg positive. There was a reduced CD4+ T-cell gain (p = 0.002) but similar overall HIV viral load suppression in HIV/HBV coinfected compared to the HIV monoinfected (73.7% ;95% CI 71.1 - 76.4) for the HIV monoinfected versus (70.8% [95% CI 59.4 - 82.1]), p = 0.664. At 6 months, 10 out of 27 (37%; 95% CI (19.4-57.6)) had lost HBsAg whereas 3 of the HBeAg positive lost, HBeAg by 6 months while the other 2 remained HBeAg positive at 24 months. HBV viral load suppression increased with time on treatment 54% (95% CI: 33-74), 67% (95% CI: 46-87), and 75% (95% CI: 56-94) at 6, 12, and 24 months, respectively. There was a significant association between CD4+ T-cell count and HBV viral load suppression at 12 months (p = 0.039). Seventy-four percent of participants who had suppressed HIV also had suppressed HBV DNA level. HBV viral load was not associated with serum transaminases levels.
**Conclusions:** HIV/HBV coinfection resulted in a blunted immunological response to Truvada based cART in this cohort and about 25% of HBV infected individuals had detectable HBV DNA at 24 months. Screening for HBV before cART initiation and monitoring of HBV response could help in optimising therapy for HBV/HIV coinfected patients especially when switching to second line regimen which might not be as effective against HBV.

## WEPEB058

### PREDOMINANCE OF HEPATITIS B VIRUS GENOTYPE D IN HIV-1 SUBTYPE C CO-INFECTED PATIENTS WITH OCCULT HEPATITIS B IN BOTSWANA

S. Gaseitsiwe[1,2], M. Anderson[1,3], K. Ryan[4], S. Moyo[1,5], K.P. Thami[1], I. Gyurova[6], T.K. Sebunya[3], J. Makhema[1,2], R. Marlink[1,2], M. Essex[1,2], J.T. Blackard[7], R.M. Musonda[1,2]
*[1]Botswana Harvard AIDS Institute Partnership, Gaborone, Botswana, [2]Harvard T. H. Chan School of Public Health, Department of Immunology and Infectious Diseases, Boston, United States, [3]University of Botswana, Department of Biological Sciences, Gaborone, Botswana, [4]Cincinnati Children's Hospital, Division of infectious Diseases, Cincinnati, United States, [5]University of Stellenbosch, Division of Medical Virology, Faculty of Medicine & Health Sciences, Tygerberg, South Africa, [6]University of Cincinnati College of Medicine, Division of Digestive Diseases, Cincinnati, United States, [7]University of Cincinnati College of Medicine, Cincinnati, United States*
*Presenting author email: sgaseitsiwe@bhp.org.bw*

**Background:** Botswana is one of the countries in the world with high prevalence rates of HIV and Hepatitis B virus (HBV). Occult hepatitis B virus infections (OBI) is a major health problem especially in HIV infected patients. There are no data on prevalence and molecular characterization of OBI in Botswana. Here we determined the prevalence and molecular characterization of OBI in Botswana.
**Methods:** A total of 300 plasma samples from an HIV treatment cohort were screened for Hepatitis B surface Antigen (HBsAg) by ELISA and the HBsAg negative samples were screened for OBI using HBV viral load assay. Furthermore, genotyping of HBsAg and OBI positive samples was done using Big Dye sequencing chemistry and the HBV sequences were analysed for genotypes and escape mutations.
**Results:** The prevalence of chronic HBV (CHBV) was 9.3% [95% CI 6.3 - 13.2]) while 26.5% [95% CI 21.3 - 32.1]) of the HBsAg negatives had OBI. A total of 28 CHBV positive and 49 OBI positive samples were successfully genotyped. Amongst the CHBV, 24 out of 28 (85.7%) were predominantly genotype A whilst 36 out of 49 (73.5%) OBI positive samples were genotype D. Conversely 12 of them (24.5%) were genotype A and one sample had genotype E (2%). Amongst the OBI, there was a significant correlation between HBV plasma DNA levels of genotype A being higher with 67% having levels above 20IU/ml (IQR: 137.6(38.5,460.5) as compared to genotype D which had 22% having levels above 20 IU/ml (IQR: 44.8(26.2,138) (Fisher's exact=0.011). Furthermore, there was a higher number (17.9%) of escape mutations in CHBV samples than OBI (9.1%) samples, however the difference was not statistically significant (p=0.258).
**Conclusions:** The HBV genotypes found in this HBV/HIV coinfected cohort were A, D, and E. Genotype A predominated in the CHBV cases while genotype D was the predominant genotype in the OBI cases. There was no differential clustering of the HBV genotypes by CHBV or OBI status. Full genome sequencing and functional analysis of the mutations of the CHBV and OBI participants will help determine the mechanism responsible for OBI.

# HEPATITIS C

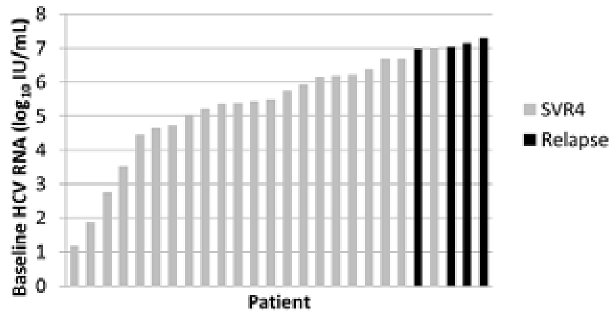
### LEDIPASIVR/SOFOSBUVIR FOR 6 WEEKS IN HIV-INFECTED PATIENTS WITH ACUTE HCV INFECTION

M. Nelson[1], S. Bhagani[2], R.H. Hyland[3], C. Yun[3], M. Mertens[4], A. Jackson[5], W. Zheng[3], D.M. Brainard[3], J.G. Mchutchinson[3], P. Ingliz[6], T. Lutz[7], J.K. Rockstroh[8]
*[1]Chelsea and Westminster Hospital, HIV/GUM Directorate, London, United Kingdom, [2]Royal Free Hospital, University College London, London, United Kingdom, [3]Gilead Sciences Inc, Foster City, CA, United States, [4]Gilead Sciences Europe Ltd, Stockley Park, London, United Kingdom, [5]Gilead Sciences Ltd, London, United Kingdom, [6]Centre for Infectiology, Berlin, Germany, [7]HIV-Cohort Frankfurt, Frankfurt, Germany, [8]University of Bonn, Department of Internal Medicine, Bonn, Germany*
*Presenting author email: mark.nelson@chelwest.nhs.uk*

**Background:** There is no currently approved treatment for acute HCV infection. Guidelines recommend 24 weeks of interferon and ribavirin in HIV-coinfected individuals with acute HCV. Shorter duration all-oral therapy may offer a better-tolerated, more efficacious alternative. We evaluated the safety, tolerability and efficacy of 6 weeks ledipasvir (LDV)/sofosbuvir(SOF) fixed-dose combination in acute HCV genotype 1 or 4 infection in HIV-infected patients.
**Methods:** Patients with an acute HCV infection of < 24 weeks duration, per NEAT AHC guidelines were enrolled. Patients were required to either be receiving HIV antiretroviral (ARV) with HIV RNA < 200 copies/mL, or not on any HIV treatment with no plans to start. Enrollment of patients with active illicit drug use was permitted; acute opportunistic infections or HBV co-infection were excluded. Primary endpoint was sustained viral response defined as HCV-RNA < lower limit of detection 12 weeks after completion of therapy (SVR12).
**Results:** Twenty-six patients were enrolled. All were male, mostly Caucasian (92%), IL28B non-CC (54%), and receiving ARV therapy (96%). Median baseline HCV-RNA was 5.4 log10 IU/mL. Nineteen (73%) patients had HCV genotype 1a infection; 7 (27%) had genotype 4. All patients completed therapy. 22/26 (85%) achieved SVR4. Four (15%) patients relapsed. There was a strong relationship between baseline HCV RNA and treatment outcome (Figure). All patients (21/21) with baseline HCV RNA < 9 million IU/mL achieved SVR4. Treatment was well tolerated; 22/26 (85%) patients had an adverse event; the majority being mild or moderate. One patient had serious adverse event related to a motor vehicle accident and illicit drug use. No patients died or experienced HIV rebound. Post treatment week 12 data will be presented.
**Conclusions:** Six weeks LDV/SOF is effective and well tolerated in HIV-infected patients with acute HCV infection with baseline HCV RNA below 9 million. Acutely HCV-infected patients with higher viral load may require longer therapy..



[Figure: Baseline HCV RNA and Response for Individual Patients]

### RETREATMENT OF HCV/HIV CO-INFECTED PATIENTS WHO FAILED 12 WEEKS OF LDV/SOF

A. Luetkemeyer[1], C. Cooper[2], S. Naggie[3], M. Saag[4], D. Dieterich[5], M. Sulkowski[6], S. Naik[7], M. Natha[7], J. Yang[8], L. Stamm[8], H. Dvory-Sobol[8], I. Walker[7], J. McHutchison[8]
*[1]University of California, San Francisco General Hospital, San Francisco, United States, [2]University of Ottawa, Ottawa Hospital and Regional Hepatitis Program, Ottawa, Canada, [3]Duke University School of Medicine, Duke Clinical Research Institute, Durham, United States, [4]University of Alabama, Center for AIDS Research, Birmingham, United States, [5]The Mount Sinai, Department of Medicine - Liver Diseases, New York, United States, [6]Johns Hopkins University, School of Medicine, Baltimore, United States, [7]Gilead Sciences, Medical Affairs, Foster City, United States, [8]Gilead Sciences, Clinical Research, Foster City, United States*
*Presenting author email: annie.luetkemeyer@ucsf.edu*

**Background:** Ledipasvir/sofosbuvir (LDV/SOF) fixed-dose combination is highly effective and safe for genotype 1 HCV-infected patients with HIV co-infection. Of the 335 HCV/HIV coinfected patients enrolled in the ION-4 Phase 3 study, 3% relapsed (n=10) after 12 weeks of LDV/SOF treatment. These patients were eligible for a retreatment substudy that evaluated the efficacy and safety of LDV/SOF (90 mg/400 mg) plus weight-based RBV for 24 weeks.
**Methods:** Eligible patients were enrolled within 60 days from the time of confirmed virologic failure. NS5A and NS5B resistance associated variants (RAVs) were evaluated by deep sequencing prior to retreatment and at the time of virologic failure post-retreatment. The primary endpoint was SVR12.
**Results:** Nine of 10 patients were enrolled and completed treatment. All patients were black, IL28B non-CC, HIV suppressed on ARV regimens with a median baseline $CD4^+$ count of 785 cells/uL
(Q1, Q3 = 404, 971). The mean age was 57 years (range 35-65) and most were male (n=7), without cirrhosis (n=7), and had genotype 1a infection (n=7). The mean baseline HCV RNA was 6.2 log10 IU/mL (range 4.4-7.1). HIV ARV regimens included tenofovir+emtricitabine (TDF+FTC) with either efavirenz (n=7) or raltegravir (n=2). Prior to retreatment, 2 patients had no NS5A RAVs and 7 patients had high-level NS5A RAVs detected (see Table). The SOF-specific NS5B RAV S282T was not detected in any patients; 1 patient had L159F. Overall SVR12 rate was 89% (8/9): 1 patient relapsed. There were no treatment-emergent SAEs. Fatigue (n=6), cough (n=4), anemia (n=2) and arthralgia (n=2) were the most common adverse events. No significant lab abnormalities were observed and creatinine clearance was stable on treatment. No patient had confirmed HIV virologic rebound (HIV-1 RNA≥400 copies/mL).
**Conclusions:** Ledipasvir/sofosbuvir with ribavirin for 24 weeks was well tolerated and demonstrated that successful retreatment is possible in the majority of these genotype 1-infected, NS5A-experienced HCV/HIV co-infected patients.

| Genotype | NS5A RAVs | SVR12 |
|---|---|---|
| 1a | None | Yes |
| 1a | None | Yes |
| 1a | L31M (>99%), H58D (>99%) | Yes |
| 1a | Y93N (>99%) | Yes |
| 1a | L31M (>99%), Y93N (>99%) | Yes |
| 1a | Y93N (>99%) | Yes |
| 1a | L31M (>99%) | No |
| 1b | L31I (11.12%), Y93H (>99%) | Yes |
| 1b | L31V (>99%) | Yes |

*[Table: Baseline NS5A RAVs for 9 Patients Prior to Retreatment with LDV/SOF + RBV for 24 weeks and Virologic Outcome]*

## WEPEB061

### AIDS - DEFINING AND SERIOUS NON - AIDS - DEFINING EVENTS COMPLICATIONS IN HIV/HCV CO-INFECTED PACIENTS

L. Marconi[1], E. Angarola[2], M. Pedrola[3], S. Lupo[1]
*[1]Instituto CAICI, Internal Medicine, Rosario, Argentina, [2]Universidad Abierta Interamericana, Internal Medicine, Rosario, Argentina, [3]AHF Fundation, Aids, Rosario, Argentina*
*Presenting author email: luisfranciscomarconi@yahoo.com.ar*

**Background:** Since many HIV-positive patients living with hepatitis C is elemental to know how both infections affect their quality of life and survival.
**Objective:** To evaluate complications related to AIDS and serious non-AIDS events (SNAEs) in HIV / HCV -coinfected patients compared to mono-HIV. Analyze its relationship with CD4, HIV viral load, HCV genotype and time coinfection and mortality and evolution of pregnancy in both groups.
**Methods:** A retrospective longitudinal observational analytic study was conducted, based on data from medical records of 111 HIV / HCV-coinfected patients compared with a control group of 111 HIV monoinfected, adjusted for sex, age and year of diagnosis of HIV, from the CAICI Institute of Rosario, diagnosed between 1985-2015.
**Results:** 33.3% of HIV / HCV coinfected and 23.4% of HIV monoinfected said at least one AIDS event. The average total number of AIDS events was higher in the first group (0.61 vs 0.36, p = 0.04), with a predominance of marker bacterial infections (OR: 2; 95% CI 1.11 to 3, 93) with a predominance of TB in coinfected group (p=0,01; $x^2$=6,06) (OR:4,5; 95% CI 1,2 to 16,4). SNAEs occurred in 10.2% of the coinfected and monoinfected 6.3%, but this difference was not significant (p = 0.29). However, the average of all events, either or not defining of AIDS, was higher in coinfected (0.75 vs 0.41;
p = 0.01), as mortality (OR 3.7, CI 95%: 1.01 to 13.69). CD4 count < 200 cells / mm3 had association with AIDS events in both groups (p < 0.01), but not with the SNAEs (p = 0.35). There was no significant difference in the time course of infections or HCV genotypes relationship with the presence of events. No vertical transmission of virus.
**Conclusions:** HIV / HCV co-infected patients had a higher total number of AIDS events, especially bacterial infections specially TB. Both the sum of events SNAEs as AIDS and mortality were higher in this group, which should be seen in the current strategies for management and treatment.

## WEPEB062

### HEPATITIS C PREVALENCE, VIRAL DIVERSITY AND SEVERITY OF LIVER DISEASE IN HIV PATIENTS IN PHNOM PENH, CAMBODIA

A. De Weggheleire[1], S. An[2], I. De Baetselier[1], S. Teav[2], V. So[2], S. Sea[2], S. Ros[2], S. Thai[2], S. Francque[3,4], L. Lynen[1]
*[1]Institute of Tropical Medicine, Clinical Sciences, Antwerp, Belgium, [2]Sihanouk Hospital Center of Hope, Infectious Diseases, Phnom Penh, Cambodia, [3]University of Antwerp, Gastroenterology Hepatology, Antwerp, Belgium, [4]University of Antwerp, Laboratory of Experimental Medicine and Paediatrics, Antwerp, Belgium*
*Presenting author email: adeweggheleire@itg.be*

**Background:** Little is known about the epidemiology of hepatitis C (HCV) in HIV patients in Cambodia. These data are critical for health resource planning, especially as efficacious and well-tolerated HCV antiviral treatments have become available. We document HCV prevalence and liver disease severity in one of the country's largest HIV cohorts.
**Methods:** All consenting adult HIV patients without HCV treatment antecedents and followed up in Sihanouk Hospital Center of Hope (Phnom Penh, Cambodia) are tested for HCV. Testing followed the CDC algorithm (Elecsys® Anti-HCV II immunoassay, followed by COBAS® AmpliPrep/COBAS® TaqMan® HCV Quantitative Test, v2.0, Roche Diagnostics). Liver fibrosis is evaluated by transient elastography (FibroScan®, Echosens) and genotype by Siemens Versant HCV Genotype 2.0 assay.
*(clinicaltrials.gov NCT02361541)*
**Results:** By 16 December 2015, 2534 of 3562 adults in the HIV cohort were enrolled. Median age was 43 years (IQR: 37-49), male/female ratio 0.77 and 98% were on antiretroviral therapy (median duration: 7 years). Key populations, including sex workers, men who have sex with men and injecting drug users were rare (N=14).
Hundred ninety-six (7.7%) patients tested positive for HCV antibodies; 86 (3.4%) were HCV-RNA positive, with viral load > 800.000 IU/ml in 62 and > 6 million IU/ml in 16 patients.
Co-infected patients were older (48 years, IQR: 43-53), male/female ratio was 0.65. Among sixty co-infected already evaluated for liver fibrosis, 31 (51.6%) had significant (liver stiffness ≥ 7.2 kPa) and 21 (35%) advanced liver fibrosis (≥ 9.5 kPa). Fourteen patients had measurements suggestive of cirrhosis. So far, genotype results are available for 40 patients. Nineteen (47.5%) had GT1 (1: 1a, 14: 1b, 4: not sub-typed), 1 GT2 (2.5%), 17 GT6 (42.5%) and 3 (7.5%) had an indeterminate result.

Two (2.3%) HCV/HIV co-infected tested positive for hepatitis B surface antigen (HbsAg), whilst HbsAg positivity was 11% among HIV mono-infected.
**Conclusions:** In this Cambodian HIV cohort with low additional risk profile, less than half of HCV antibody positive patients has an active HCV infection. The prevalence of chronic hepatitis C is 3.4%. Predominant genotypes are 1b and 6. A third of the HCV/HIV co-infected have advanced liver fibrosis and are in immediate need of HCV treatment.

## WEPEB063

### TELAPREVIR CONTAINING TRIPLE THERAPY IN ACUTE HCV CO-INFECTION: THE CHAT STUDY

C. Boesecke[1,2], G.J. Singh[3], S. Scholten[4], T. Lutz[5], A. Baumgarten[6], S. Schneeweiss[4], A. Trein[7], M. Rausch[8], P. Ingiliz[6], J.K. Rockstroh[1,2], M. Nelson[3], CHAT Study Group
*[1]Bonn University Hospital, Department of Internal Medicine I, Bonn, Germany, [2]German Centre for Infection Research DZIF, Bonn, Germany, [3]Chelsea and Westminster Hospital, London, United Kingdom, [4]Praxis Hohenstaufenring, Cologne, Germany, [5]Infektiologikum, Frankfurt/Main, Germany, [6]zipb, Berlin, Germany, [7]Gemeinschaftspraxis Schwabstrasse, Stuttgart, Germany, [8]Aerztezentrum Nollendorfplatz, Berlin, Germany*
*Presenting author email: juergen.rockstroh@ukb.uni-bonn.de*

**Background:** No published randomised controlled data on the use of direct acting antivirals (DAA) in acute hepatitis C (AHC) coinfection exist. However, with the AHC epidemic still ongoing among HIV-positive men who have sex with men (MSM) these are urgently needed. Here we evaluate sustained virological response (SVR) rates after response guided telaprevir (TPV) containing triple therapy versus pegylated interferon and ribavirin (PR) alone.
**Methods:** The CHAT study is a randomised controlled trial of PR plus TPV versus PR alone in the response guided treatment of patients with AHC genotype (GT) 1 infection and HIV-1 co-infection in Germany and Great Britain. Eligible patients were randomised in a 1:1 ratio to PR (arm 1) or TPV + PR (arm 2). Fisher's exact, chi-square and Mann-Whitney U test were used for statistical analysis.
**Results:** All 34 patients were male, median age was 40 years. Main route of transmission was MSM (100%). 55% had an IL28B C/C GT. Median baseline HCV-RNA was 291.227 IU/mL and median CD4+ T cell count 676 cells/µL. 85% of all patients received cART, 100% had baseline suppressed HIV-RNA (< 40 copies/mL). Median ALT was 105 U/l. 15 patients were randomized to arm 1, 19 to arm 2.
Upon abstract submission SVR12 data on 31 patients were available. SVR12 was seen in 10/12 (83%) patients receiving PR alone and in 15/19 (79%) patients receiving TPV + PR. Of the 4 patients without SVR receiving TPV one experienced a viral breakthrough, 2 were non-responders; in one case HCV protease inhibitor associated mutations were selected under TPV (V36M, R155K). TPV containing treatment had to be stopped in one case of severe epidermolysis. Ribavirin dose reduction (44% vs. 0%), anemia (33% vs. 20%) and rash (67% vs. 20%) were more frequent in arm 2 vs. arm 1.
**Conclusions:** Although Telaprevir containing triple therapy offers the advantage of shortened treatment duration in acute HCV coinfection treatment is associated with additional toxicities while not leading to higher SVR rates. Therefore, with the AHC epidemic still ongoing published data on safety and efficacy of IFN-free DAA regimens for AHC are urgently needed.

## WEPEB064

### SOF/VEL FOR 12 WEEKS RESULTS IN HIGH SVR12 RATES IN SUBJECTS WITH NEGATIVE PREDICTORS OF RESPONSE TO TREATMENT: AN INTEGRATED ANALYSIS OF EFFICACY FROM THE ASTRAL-1, ASTRAL-2, AND ASTRAL-3 STUDIES

M. Sulkowski[1], K. Agarwal[2], K. Patel[3], D. Samuel[4], M. Bourlière[5], Z. Younes[6], T. Morgan[7], S. Strasser[8], B. Leggett[9], S. Naik[10], B. Collins[10], M. Natha[10], L. Liu[11], X. Ding[11], J. Mcnally[12], A. Osinusi[12], D.M. Brainard[12], J. McHutchison[12], N. Afdhal[13], N. Brau[14]
*[1]Johns Hopkins University, School of Medicine, Baltimore, United States, [2]King's College Hospital, Institute of Liver Studies, London, United Kingdom, [3]University Health Network, Toronto Western Liver Clinic, Toronto, Canada, [4]Université Paris-Sud, Hepatology and Gastroenterology, Villejuif, France, [5]Hospital Saint Joseph, Hepato-Gastroenterology, Marseile, France, [6]Gastro One, Memphis, United States, [7]VA Long Beach Healthcare System, Irvine, United States, [8]The University of Sydney, A W Morrow Gastroenterology and Liver Centre, Sydney, Australia, [9]University of Queensland, St Lucia, Australia, [10]Gilead Sciences, Medical Affairs, Foster City, United States, [11]Gilead Sciences, Biostatistics, Foster City, United States, [12]Gilead Sciences, Clinical Research, Foster City, United States, [13]Beth Israel Deaconess Medical Center, Hepatology, Boston, United States, [14]Mount Sinai, Department of Medicine - Liver Diseases, New York, United States*
*Presenting author email: norbert.brau@va.govv*

**Background:** The once-daily fixed-dose combination tablet of sofosbuvir/velpatasvir (SOF/VEL) was evaluated for the treatment of genotype 1-6 HCV infection in three phase 3 studies in patients with and without compensated cirrhosis (ASTRAL-1, ASTRAL -2, ASTRAL -3). Overall SVR12 rates were > 95% across all HCV genotypes. This post-hoc analysis assesses efficacy in patients with traditional negative predictors of response.
**Methods:** This was a retrospective analysis of data from 1035 patients treated with SOF/VEL in the Phase 3 ASTRAL-1, ASTRAL -2, and ASTRAL -3 studies. Presence of cirrhosis was determined by histology, blood tests or transient elastography. Viral load and other clinical and laboratory assessments were determined prior to treatment with SOF/VEL. Prior treatment records were source verified and race was self-reported by the patient to the investigator.
**Results:** Overall, 21% of patients had cirrhosis, 74% had HCV RNA ≥ 800,000 IU/mL, 28% had prior treatment failure, 12% were ≥ 65 years old and 6% were black. Table 1 provides SVR12 rates by HCV genotype overall and for each patient subgroup. The overall SVR12 rate was 98% and was ≥96% among all subgroups. In general SVR12 rates were lower in patients with genotype 3 HCV infection compared with other HCV genotypes but were ≥90% across all subgroups.
**Conclusions:** The ASTRAL-1, ASTRAL -2, and ASTRAL -3 studies enrolled a diverse patient population that included a significant number of patients with historically negative predictors of response. There was little effect of these factors on the efficacy of treatment with SOF/VEL for 12 weeks in subjects with genotype 1-6 HCV infection.

| SVR12 | GT1 | GT2 | GT3 | GT4 | GT5 | GT6 | Overall |
|---|---|---|---|---|---|---|---|
| Overall | 98% (323/328) | 99% (237/238) | 95% (264/277) | 100% (116/116) | 97% (34/35) | 100% (41/41) | 100% (3/3) |
| Cirrhosis | 99% (72/73) | 100% (29/29) | 91% (73/80) | 100% (27/27) | 100% (5/5) | 100% (6/6) | 96% (212/220) |
| HCV RNA ≥ 800,000 | 98% (251/255) | 99% (185/186) | 94% (179/191) | 100% (74/74) | 100% (26/26) | 100% (31/31) | 98% (746/763) |
| Prior Treatment Failure | 99% (109/110) | 100% (44/44) | 90% (64/71) | 100% (52/52) | 100% (11/11) | 100% (3/3) | 97% (283/291) |
| Age> 65 | 100% (36/36) | 100% (53/53) | 100% (7/7) | 100% (11/11) | 100% (16/16) | (0/0) | 100% (123/123) |
| Black | 96% (24/25) | 95% (18/19) | 100% (3/3) | 100% (14/14) | (0/0) | (0/0) | 97% (59/61) |

*[Table 1. SVR in Patient Subgroups in ASTRAL1-3]*

## WEPEB065

### EFFECT OF THE TIMING OF HEPATITIS C VIRUS INFECTION, RELATIVE TO HIV SEROCONVERSION ON CD4 T CELL AND HIV RNA EVOLUTION AMONG HIV-POSITIVE MSM

D. van Santen[1], J. van der Helm[1], G. Touloumi[2], N. Pantazis[2], R. Muga[3], B. Bartmeyer[4], J. Gill[5], E. Sanders[6], A. Kelleher[7], R. Zangerle[8], C. Béguelin[9], K. Porter[10], M. Prins[1,11], R. Geskus[12], on behalf of the CASCADE Collaboration within EuroCoord

*[1]Public Health Service of Amsterdam, Infectious Diseases Research and Prevention, Amsterdam, Netherlands, [2]Athens University Medical School, Department of Hygiene, Epidemiology and Medical Statistics, Athens, Greece, [3]Hospital del Mar, Barcelona, Spain, [4]Robert Koch Institute, Berlin, Germany, [5]Southern Alberta Clinic, Calgary, Canada, [6]The Kenya Medical Research Institute, Kilifi, Kenya, [7]UNSW, Kirby Institute, Sydney, Australia, [8]Medical University of Innsbruck, Department of Dermatology and Venereology, Innsbruck, Austria, [9]Bern University Hospital, Bern, Switzerland, [10]University College London, Medical Research Council, Clinical Trails Unit, London, United Kingdom, [11]Center for Infection and Immunology Amsterdam (CINIMA), Department of Infectious Diseases, Academic Medical Center (AMC), Amsterdam, Netherlands, [12]Academic Medical Center (AMC), Department of Clinical Epidemiology, Biostatistics and Bioinformatics, Amsterdam, Netherlands*

*Presenting author email: dvsanten@ggd.amsterdam.nl*

**Background:** An increase in hepatitis C virus (HCV) incidence among HIV-positive men who have sex with men (MSM) has been documented since 2000. Unlike most studies examining the effect of HIV/HCV-coinfection among individuals acquiring HCV before HIV, HIV precedes HCV infection for the majority of MSM. We aim to assess the effect of HCV infection and its timing, relative to HIV seroconversion, on CD4 T-cell count (CD4) and HIV RNA (VL) evolution among HIV-positive MSM.

**Methods:** We included MSM with well-estimated dates of HIV seroconversion (HIVsc) from 17 cohorts in the CASCADE Collaboration within EuroCoord. Each newly HCV-infected individual was matched to two HCV-negative ones. We also matched on country of the cohort in ART naïve, and on time since start cART use for MSM on cART. We modeled trends of CD4 and VL using random effects models with the time origin for each triad of individuals aligned on time since HIVsc at HCV infection of the HIV/HCV-coinfected one. We used restricted cubic splines for continuous variables. We included as co-variables: interval from HIV to HCV infection, age at HIVsc and, for those on cART, time since cART initiation.

**Results:** Of 6,325 ART-naïve MSM and 4,856 MSM on cART, 262 and 149 were/became HIV/HCV-coinfected, respectively. HCV infection had a borderline significant effect on VL evolution among ART-naïve MSM, but its effect was not statistically significant among MSM on cART (p=0.05 and p=0.93, respectively). HCV infection timing had no effect on VL evolution (p=0.07 ART-naïve & p=0.54 on cART). The effect of HCV-infection on the CD4 evolution following HCV was highly significant while ART-naïve and when on cART (both p< 0.001), but did not differ by HCV infection timing (p=0.45 and p=0.54, respectively). CD4 were temporarily lower during the first two years after HCV infection compared to HIV-monoinfected individuals, especially among MSM who seroconverted for HIV at older ages. Lower CD4 was more pronounced on cART.

**Conclusions:** Among HIV-positive MSM, CD4 are temporarily lower during the first two years after HCV seroconversion, irrespective of cART usage. However, we found no significant effect of the timing of HCV infection on the evolution of CD4 or VL.

## WEPEB066

### DAA VIRAL FAILURE AND SALVAGE THERAPY IN "REAL LIFE": IS RESISTANCE TESTING (RT) NEEDED?

A. Moreno[1], M.J. Vivancos[1], S. del Campo[1], M.J. Pérez-Elías[1], C. Quereda[1], J. Casado[1], A. Díaz de Santiago[1], M. Sánchez-Conde[1], S. Bañón[1], C. Gomez-Ayerbe[1], M. Mateos[2], S. Moreno[1]

*[1]Hospital Ramon y Cajal, Infectious Diseases, Madrid, Spain, [2]Hospital Ramon y Cajal, Microbiology, Virology, Madrid, Spain*

*Presenting author email: amorenoz.hrc@salud.madrid.org*

**Background:** There is scant information on "real life" virological failure (VF) of DAAs and how to design salvage regimens.

**Methods:** To describe VF of first line DAAs- therapies, the role of RT, and SVR after salvage therapy in 300 subjects (85% HIV/HCV-coinfected, N=255) attended at an Infectious Diseases Service of a tertiary center in Madrid, Spain.

**Results:** There were 26 VF (9%), 6% among non-HIV subjects (3/45) vs 9% among HIV/HCV-coinfected (23/255), p=0.6. 58% HCV-G1 (n=15), 38% HCV-G4 (n=10), only 1 HCV G3. 35% had received RBV (n=9), 58% 24w (n=15). 85% were cirrhotics (n=22), 65% non-CC IL28B (n=17), 69% prior non responders to peg-IFN/RBV (n=18, with TPV experience in 6-33%-). Rates of VF: SOF/DCV 10% (8/82), SMV/DCV 30% (7/23), SOF/SMV 33% (7/21), r/PRV/OMB/DSV 7% (2/28), SOF/LDV 1% (2/142). VF was due to relapse in 73% (n=19), viral breakthrough in 27% (n=7): 6/7 of SMV/DCV VF -despite RBV use in all- and in 1/8 subjects on SOF/DCV. VF was highest among HCV-G4 subjects (10/48, 21%) and lowest for HCV-G3 (1/35, 3%), and similar for both HCV-G1a (9/128, 7%) and HCV-G1b (6/88, 7%). Second line 24w DAA therapy has been started in 21/26 subjects with VF (81%): 6/8 of SOF/DCV VF (guided by NS3 RT in 5): r/PRV/OMB/DSV/RBV/SOF (n=1), r/PRV/OMB/DSV/RBV (n=1), SOF/SMV/RBV (n=4); 6/7 of SMV/DCV VF (no RT-guided): SOF/LDV (n=1), SOF/LDV/RBV (n=3), SOF/DCV/RBV (n=1), and SOF/SMV/DCV/RBV (n=1); 7/7 of SOF/SMV VF (no RT guided): SOF/LDV (n=1), SOF/LDV/RBV (N=6), 1/2 of r/PRV/OMB/DSV VF (no RT-guided) with SOF/LDV, and 1/2 of SOF/LDV VF (SOF/DCV/RBV in a patient with HCV-G3a, no RT). Complete data are available in 12/21 (57%), with SVR in all: SOF/LDV/RBV (n=7), SOF/LDV (n=1), SOF/SMV/RBV (n=2), SOF/DCV/RBV (n=1), and SOF/DCV/SMV/RBV (n=1).

**Conclusions:** "Real life" VF to first-line DAAs was 9%. SMV-based therapies showed the worst performance. The highest rate of VF was in HCV-G4 VF (21%). NS3 RT guided salvage therapy in 5/7 patients using an HCV-PI (SMV or r/PRV). The high rate of SVR of 24w SOF/LDV/RBV or SOF/DCV/RBV after DCV failure suggests the lack of usefulness of NS5A resistance testing if RBV and prolonged therapy are used.

## WEPEB067

### FREQUENT CLINICAL MONITORING PREDICTS HCV CURE AMONG PATIENTS WITH HIV/HCV CO-INFECTION

S. Lakshmi[1], M. Alcaide[2], A. Palacio[2], M. Shaikhomer[1], A. Alexander[3], G. Wiehl[3], J. Lopez[1], A. Pandey[3], K. Patel[3], D. Jayaweera[2], M. Hernandez[4]

*[1]Jackson Health System, Miami, United States, [2]University of Miami, Miami, United States, [3]Miller School of Medicine, Miami, United States, [4]Veterans Affairs Hospital, Miami, United States*

*Presenting author email: seetha.lakshmi02@gmail.com*

**Background:** The Directly Acting Antiviral Agents (DAAs) have reported excellent HCV cure rates in many clinical trials. However data on HCV cure among HIV/HCV coinfected patients in the real world settings is limited. Hence this study was designed to evaluate the following objectives in the real world setting:

1. To study rates and predictors of HCV cure among HIV/HCV coinfected patients
2. To evaluate the association of frequent clinical monitoring with HCV cure.

**Methods:** This is a retrospective cohort study of adult HIV/HCV coinfected patients from 3 large outpatient settings in Miami, Florida, USA (the Miami Veterans Affairs hospital, a public hospital and a private academic hospital). Medical charts of individuals with HIV/HCV coinfection treated for HCV with DAAs between January 1 2014 and June 30 2015 were reviewed. Cure was defined as undetectable HCV viral load 12 weeks post HCV treatment. Adequate follow up was defined as attendance to clinic visit at week 4, week 6-8 and week 12 of treatment.

**Results:** Eighty four patients were evaluated 12 weeks post treatment.

The median age was 58 years (IQR 50-66), 74 (88%) were men and 42 (50%) were black.

Twenty patients (29%) had cirrhosis and 49 (58%) were HCV treatment experienced. Most commonly used regimen was Sofosbuvir/ledipasvir (33, 40%) followed by simeprevir/sofosbuvir (25, 30%). Cure was achieved in 70 (83.3%) while 10 (11.9%) relapsed and 2(2.3%) experienced virological breakthrough. Two patients (2.3%) did not complete treatment.

In multivariable analysis cure was associated with appropriate follow up clinic visits (OR=9.0, 95% CI=2.91-163, p=0.003) and use of an integrase based HIV regimen (OR=6.22, 95% CI 1.81-141, p=0.013). Age, race, genotype, presence of cirrhosis, prior HCV treatment, HCV regimen, HBV coinfection, week 4 response, CD4 counts and pre-treatment HCV RNA were not associated with cure.

**Conclusions:** Real world HCV cure rates with DAAs in HIV/ HCV coinfection are lower than those seen in clinical trials. Cure is associated with appropriate follow up clinic visits and the use of integrase inhibitors. Future studies should evaluate best antiretroviral regimens, predictors of adequate follow up visits and health care models that ensure adequate HIV/HCV care.

## WEPEB068

### PREVALENCE OF DIRECT ACTING ANTIVIRAL (DAA) HCV RESISTANCE ASSOCIATE VARIANTS (RAVS) IN THE US DEPARTMENT OF VETERANS AFFAIRS (VA)

**Background:** To determine the prevalence of DAA RAVs in a convenience sample of specimens from patients being treated for HCV infection in VA
**Methods:** Plasma samples collected prior to or after HCV treatment failure were sent frozen overnight to the VA public health reference laboratory and stored frozen until analysis. HCV RNA was extracted from plasma; then RT-PCR amplified for the NS3, NS5A, and NS5B genes using genotype-specific primers. Sanger sequencing was performed on amplicons, and sequences were aligned to genotype-specific reference strains using Geneious software, and RAVs were called based on publically available information. Genes evaluated for each sample were based on physician orders, so not all 3 genes were tested in all samples. Data on HCV genotype, HCV treatment history, and HIV status was also collected. Baseline samples in patients experiencing DAA regimen failure were not available for comparison of preexisting mutations.
**Results:** 648 unique patient samples were received from 67 different VA medical centers from 2/1-2015-1/8/2016. 43 patients (6%) were HIV co-infected. Genotypes tested were: GT1a (389), GT1b (98), GT3a (132), GT2b (21), GT4a (6), GT2a (2). RAVs were found in 106/284 (43%), 129/310 (42%), and 21/305 (7%) of NS3, NS5A, and NS5B genes tested, respectively. Seventy-seven and 11 samples had RAVs in 2 and 3 genes. Among 225 treatment-naïve and 42 DAA-naive patients (only received pegylated-interferon/ribavirin, PEG-IFN, RBV), 28% had one or more RAVs. In patients who received DAA combinations as their first regimen, RAVs were detected in one or more genes after simeprevir/sofosbuvir (22/27, 81%), ledipasvir/sofosbuvir (LED/SOF) (85/114, 74%), and ombitasvir/paritaprevir/dasabuvir/ritonavir (27/31, 87%) regimens. And of those who failed LED/SOF as their first regimen, NS5A/NS5B RAVs included: Q30R/H/E (38), Y93H/C/N (35), L31M/V (25), and S282T (3). In treatment-experienced patients (PEG-IFN, RBV or other DAAs), who then received simeprevir/sofosbuvir or ledipasvir/sofosbuvir, 19/25 (76%) and 33/40 (83%), respectively had RAVs in one or more genes.
**Conclusions:** In this convenience sample of VA specimens tested for HCV RAVs, numerous patients were found to have preexisting or post treatment HCV RAVs after regimen failure. Genotypic resistance testing may be helpful to guide initial and subsequent DAA treatment regimens.

# HUMAN PAPILLOMAVIRUS

## WEPEB069

### PREVALENCE OF HUMAN PAPILLOMAVIRUS IN ZIMBABWEAN WOMEN PRESENTING FOR CERVICAL CANCER SCREENING: DOES HIV HAVE A SIGNIFICANT ASSOCIATION WITH THE BURDEN?

R.S. Dube Mandishora[1], I. Kraus Christiansen[2], N. Chin'ombe[1], B. Ngara[3], K. Duri[4], T.B. Rounge[5], R. Meisal[2], T.M. Leegaard[2], O.H. Ambur[6], B. Stray-Pedersen[7], Z.M. Chirenje[8]
*[1]University of Zimbabwe College of Health Sciences, Medical Microbiology, Harare, Zimbabwe, [2]Akershus University Hospital, Microbiology and Infection Control, Lørenskog, Norway, [3]University of Zimbabwe College of Health Sciences, Community Medicine, Harare, Zimbabwe, [4]University of Zimbabwe College of Health Sciences, Immunology, Harare, Zimbabwe, [5]Cancer Registry of Norway, Department of Research, Oslo, Norway, [6]Akershus University Hospital, HPV Reference Laboratory, Oslo, Norway, [7]University of Oslo, Institute of Clinical Medicine, Oslo, Norway, [8]University of Zimbabwe College of Health Sciences, Obstetrics and Gynaecology, Harare, Zimbabwe*
*Presenting author email: racheal.mand@gmail.com*

**Background:** The burden of cervical and anal cancers remains high despite wide availability of antiretroviral therapy (ART), mainly as a result of persistent human papillomavirus (HPV) infections among HIV infected individuals. Recent availability of HPV vaccines provides an opportunity towards control of HPV burden. The objective of this study was to determine the prevalence of anal and vaginal HPV in Zimbabwean women reporting for routine cervical cancer screening by visual inspection with acetic acid (VIA).
**Methods:** This was a cross sectional study carried out at a tertiary hospital VIA clinic in Harare, Zimbabwe. Women ≥18 years were enrolled. HIV testing and counseling were offered. Participants provided a self-collected vaginal swab (VS) and a clinician collected anal swab (CCAS). Dacron swabs were used and stored in 500µl of guanidine thiocyanate. DNA was extracted using a standard chloroform/phenol method. For HPV detection and genotyping, 450 bp PGMY amplicons from the L1 region was sequenced using the MiSeq platform. A Chi$^2$ Fishers test was used to test for association of HPV and HIV.
**Results:** One hundred and forty four women aged 18-83 (median 38) were enrolled. All samples were positive for the beta globin gene, hence valid for analysis. Overall HPV prevalence was 72%(104/144) in VS and 48% (69/144) in CCAS. The odds of being HPV positive among the HIV infected were higher than in their HIV negative counterparts. Table 1 shows associations between HPV and HIV status. The most common high risk genotypes were; VS HPV 18(24%), 52(23%) & 16(21%) and CCAS HPVs 52(19%), 18(17%) and 16(16%).

| | CCAS p<0.001 [OR=4.8;CI(2.4-9.8)] | | VS p=0.005 [OR=2.9;CI(1.3-6.4)] | |
|---|---|---|---|---|
| | HPV Positive (n=69) | HPV Negative (n=74) | HPV Positive (n=104) | HPV Negative (n=40) |
| HIV Positive n(%) | 47 (67%) | 22 (33%) | 58 (83%) | 12 (17%) |
| HIV Negative n(%) | 22 (30%) | 52 (70%) | 46 (62%) | 28 (38%) |

*[Fishers test for association of HPV and HIV]*

**Conclusions:** HPV prevalence was very high in this cohort, with significantly higher burden in HIV infected women compared to HIV uninfected women. This data will assist Zimbabwean policy makers in upgrading cervical and anal cancer screening algorithms. We recommend that HPV DNA testing be used to reduce the incidence of cancer especially in HIV positives.

## WEPEB070

### CERVICAL CANCER RISK AND IMPACT OF PAP-BASED SCREENING IN WOMEN ON ANTIRETROVIRAL THERAPY IN JOHANNESBURG, SOUTH AFRICA

E. Rohner[1], M. Sengayi[2], B. Goeieman[3], P. Michelow[2,4], C. Firnhaber[3,5], M. Maskew[6], J. Bohlius[1]
*[1]Institute of Social and Preventive Medicine, University of Bern, Bern, Switzerland, [2]National Health Laboratory Service, Johannesburg, South Africa, [3]Right to Care, Johannesburg, South Africa, [4]University of the Witwatersrand, Cytology Unit, Dept of Anatomical Pathology, Johannesburg, South Africa, [5]University of the Witwatersrand, Department of Clinical Medicine, Johannesburg, South Africa, [6]University of the Witwatersrand, Health Economics and Epidemiology Research Office, Wits Health Consortium, Johannesburg, South Africa*
*Presenting author email: mazvita.sengayi@nhls.ac.za*

**Background:** HIV infection increases the risk of developing invasive cervical cancer (ICC), but data on ICC burden and the impact of PAP based screening in HIV-positive women in sub-Saharan Africa is scarce. We assessed ICC risk and the impact of PAP based screening in HIV-positive women receiving combination antiretroviral therapy (ART) at Themba Lethu Clinic (TLC), an ART program in Johannesburg, South Africa.
**Methods:** We included HIV-positive women aged ≥18 years who participated in the TLC cohort and initiated ART after enrollment between 2004-2011. Cervical cancer cases were identified through a record linkage with the National Cancer Registry. We used Cox models to assess risk factors for developing ICC after ART initiation. The multivariable Cox model included age and World Health Organization (WHO) HIV/AIDS stage at ART initiation, ART regimen, and ART start before or from 2009 onwards, when systematic PAP based cervical cancer screening was introduced at TLC. We present incidence rates per 100,000 person-years (pys) and adjusted hazard ratios (aHR) with 95% confidence intervals (CI).
**Results:** We included 10,654 HIV-positive women who initiated ART at TLC; median CD4 cell count at ART initiation: 113 cells/µL (interquartile range [IQR] 46-184), median age at ART initiation: 35.0 years (IQR 29.8-41.8). The median follow-up time was 2.1 years (IQR 0.7-4.2). During 27,352 pys 136 women developed ICC for an overall incidence rate of 497/100,000 pys (95% CI 420-588). With the introduction of PAP based screening in 2009 the incidence rate per 100,000 pys decreased from 545 (95% CI 457-650) to 260 (95% CI 148-458) for an adjusted HR of 0.5 (95% CI 0.3-0.9). Additional risk factors identified were advanced HIV/AIDS stage at ART initiation (WHO stage 4 versus 1, aHR 2.0, 95% CI 1.2-3.3) and older age at ART initiation (≥36 versus 18-25 years, aHR 2.2, 95% CI 0.9-5.0).
**Conclusions:** Women who initiated ART after the introduction of a PAP based cervical cancer screening program in 2009 had a much lower risk of developing ICC than those who initiated ART before. However, ICC risk on ART remained high, and ICC prevention needs to be further improved.

## OTHER SEXUALLY TRANSMITTED INFECTIONS

### WEPEB071

### PREVALENCE AND CORRELATES OF GENITAL INFECTIONS AMONG HIV-INFECTED ADULTS NEWLY ENROLLING IN HIV CARE IN WINDHOEK, NAMIBIA

G. Djomand[1], S. Sawadogo[2], M. Schlefer[2], S. Gutreuter[1], S. Tobias[3], R. Patel[2], N. Deluca[1], J. Hood[2], F. Kaindjee-Tjituka[3], D. Lowrance[4], N. Bock[1]
*[1]US Centers for Disease Control and Prevention, Atlanta, United States, [2]US Centers for Disease Control and Prevention, Windhoek, Namibia, [3]Ministry of Health and Social Services, Windhoek, Namibia, [4]US Centers for Disease Control and Prevention, windhoek, Namibia*
*Presenting author email: bya7@cdc.gov*

**Background:** Identifying and treating sexually transmitted infections (STI) among newly diagnosed HIV-infected individuals may benefit both public and individual health. There is a scarcity of information on routine STI screening in HIV care programs in sub-Saharan Africa. We assessed prevalence of genital infections and their correlates among newly diagnosed HIV-infected individuals entering HIV care services in Namibia.
**Methods:** HIV-infected adults newly enrolling in HIV care at two public health facilities in Windhoek, Namibia were recruited from June 2012 to April 2013. Behavioral and clinical data such as CD4 cell counts was collected from participants. Genital and/or blood specimens were tested for gonorrhea, chlamydia, trichomoniasis, mycoplasma genitalium, syphilis, bacterial vaginosis, and vulvovaginal candidiasis.
**Results:** Among 599 participants, 56% were females and 15% reported consistent use of condoms in the past 6 months. Bacterial vaginosis (37.2%), trichomoniasis (34.6%) and Chlamydia (14.6%) were the most common STI in women while 11.4% of men were diagnosed with mycoplasma genitalium. In comparison, prevalence of gonorrhea and syphilis was lower in both men and women. Correlates for trichomoniasis infection included being female (adjusted relative risk, [aRR], 6.6; 95% confidence interval [CI], 3.67-11.89), higher education (aRR, 0.64; 95% CI 0.4-1.0) and lower CD4 cell count (aRR, 1.67; 95% CI 1.1-2.5). Being female (aRR, 2.38; 95% CI 1.27-4.5), non-married (aRR, 2.29; (95% CI, 1.27-4.2) and having condom-less sex (aRR, 2.70; 95% CI, 1.05-6.96) were independently associated with chlamydial infection. Across all infections, after adjusting for sex, non-married participants were more likely to present with multiple STI
(aRR, 1.29, 95%CI, 1.06-1.59).
**Conclusions:** Women newly enrolling in HIV care in Namibia have disproportionately high rates of curable STI, especially trichomoniasis and Chlamydia, indicating that implementation of aggressive screening and treatment for genital infections may be useful to increase prevention and early detection of STI among persons living with HIV. Treating sexual partners, and promoting risk reduction strategies, including provision of condoms, may enhance secondary prevention efforts.

### WEPEB072

### HIGH LEVELS OF INFLAMMATORY CYTOKINES IN THE GENITAL TRACT OF WOMEN WITH BV ENGAGING IN VAGINAL DOUCHING: CROSS-SECTIONAL STUDY OF THE MIAMI WOMEN INTERAGENCY HIV STUDY (WIHS)

M.L. Alcaide, V.J. Rodriguez, M. Brown, D.L. Jones, S. Pallilkkuth, S. Pahwa, M. Roach, O. Martinez, K. Arheart, M. Fischl
*University of Miami, Miami, United States*
*Presenting author email: malcaide@med.miami.edu*

**Background:** High levels of inflammatory cytokines in the female genital tract are indicative of mucosal vulnerability and associated with an increased risk of HIV. Vaginal cleansing with commercially available douches is a major risk factor for developing bacterial vaginosis (BV) and both cleansing and BV are associated HIV acquisition.
This study evaluated inflammatory cytokines in the genital tract in women with BV who engage in vaginal douching to gain an understanding of the damaging effects of both BV and vaginal douching on the vaginal mucosa.
**Methods:** Cross sectional study of women enrolled in the Miami WIHS study. Reproductive aged women (n=72: 45 HIV+ and 27 HIV-) completed vaginal douching questionnaires. BV was assessed by Nugent score. Inflammatory cytokines (IL-6, IL-8, IL1a, IL1b, sICAM, IFNa2, RANTES, and VEGF) were measured in cervicovaginal lavages by multiplex analysis. SLIPI was measured by ELISA.
**Results:** Fourteen (19.4%) women engaged in vaginal douching, and 24 (33.3%) had BV. In univariate analysis, having BV, engaging in vaginal douching and having HIV infection were associated with increased inflammatory cytokines.

Comparison of IL-6, IL-8, IL1a, IL1b, and Slpi, sICAM, IFNa2, RANTES, and VEGF by HIV status, BV, and IVP (n = 72)

| | IL-6 Mean (SE) | IL-8 Mean (SE) | IL-1a Mean (SE) | IL-1b Mean (SE) | Slpi Mean (SE) | sICAM Mean (SE) | IFNa-2 Mean (SE) | RANTES Mean (SE) | VEGF Mean (SE) |

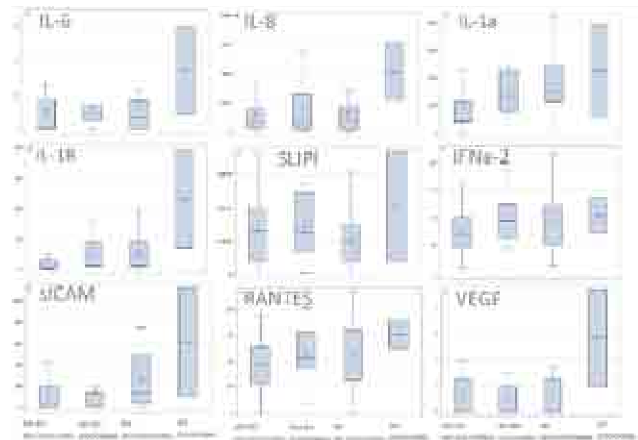
Note. Univariable Poisson regression models were used for all comparisons.

*[Figure 1]*



*[Figure 2]*

**Conclusions:** This study shows for first time that BV and the use of vaginal douches have a combined impact in increasing female reproductive tract pro-inflammatory cytokines greater than BV or vaginal douches alone. Decreasing the damaging effects of BV and the use of vaginal douches could have a substantial effect on decreasing risk for HIV.

## HIV-ASSOCIATED NEUROCOGNITIVE DISORDER (HAND)

### WEPEB073

### EVALUATING A TABLET APP FOR LAY HEALTH WORKERS TO SCREEN FOR HAND IN SOUTH AFRICA

R. Robbins[1], H. Gouse[2], V. Jonah[2], M. Arce Renteria[3], K. Thomas[4], R. Remien[1], J. Joska[2]
*[1]Columbia University and New York State Psychiatric Institite, Psychiatry, New York, United States, [2]University of Cape Town, Psychiatry and Mental Health, Cape Town, South Africa, [3]Fordham University, Psychology, Bronx, United States, [4]University of Cape Town, Psychology, Cape Town, South Africa*
*Presenting author email: rnr2110@cumc.columbia.edu*

**Background:** HIV-associated neurocognitive disorder (HAND) remains prevalent among people living with HIV and negatively impacts activities of daily living. Routine screening for HAND rarely occurs, especially in settings, such as South Africa, with limited resources and a shortage of skilled health personnel. Current HAND screening tools, which require additional equipment (e.g., stopwatch, pencils, and paper forms) and skilled personnel to administer, score and interpret, are difficult to use in South African clinical settings.
NeuroScreen, an Android tablet app, was developed as an alternative screening tool for HAND. It takes approximately 20 minutes to complete, is highly automated with standardized instructions, does not require additional equipment, and can be administered by lay health workers.
This study examined the sensitivity and specificity of NeuroScreen to detect neurocognitive impairment within HAND in a South African clinical setting when administered by lay health workers.
**Methods:** Sixty-four isiXhosa-speaking South African, HIV+ adults were administered NeuroScreen by a lay health worker. Immediately afterwards, participants completed a full neuropsychological evaluation, administered by a trained research psychometrist, consisting of well-established paper-and-pencil tests. Locally normed Z-scores were computed for all tests in the full battery and were used to calculate a global deficit score (GDS). A Receiver Operating Characteristic (ROC) curve was computed with the NeuroScreen composite Z-score and the GDS cut-score of 0.5 or higher (indicating at least mild impairment) as the state variable.

**Results:** Participants were 31.89 years old (*SD*=6.22), 80% female, and 81% not having graduated from high school. Using the GDS cut-score, 48% of the sample had impairment. The area under the curve for NeuroScreen was 76%. The NeuroScreen composite Z score of ≤ -.09 maximized sensitivity and specificity at 74%, and 79%, respectively, and yielded a positive predictive value of 77%, and negative predictive value of 76%. NeuroScreen misclassified 15 participants - 7 false positives and 8 false negatives.
**Conclusions:** Preliminary analyses suggest that NeuroScreen has clinically useful test characteristics when administered by lay health workers and may be a useful screening tool in South African clinical settings. Further research is needed to evaluate these test characteristics in larger samples, specific HAND types, and implementation in resource-limited clinics.

## WEPEB074

### AN IMBALANCE BETWEEN MATRIX METALLOPROTEINASES AND ENDOGENOUS TISSUE INHIBITORS OF METALLOPROTEINASES CONTRIBUTES TO HIV-1-ASSOCIATED CO-MORBIDITIES

Y. Xing[1,2], K. Yang[2], N. Shepherd[2], J. Lan[2], T. Amet[2], J. Dong[1], Q. Yu[2]
*[1]Medical College of Jinan University, Department of Pathophysiology, Guangzhou, China, [2]Indiana University School of Medicine, Microbiology and Immunology, Indianapolis, United States*
*Presenting author email: andyu201602@gmail.com*

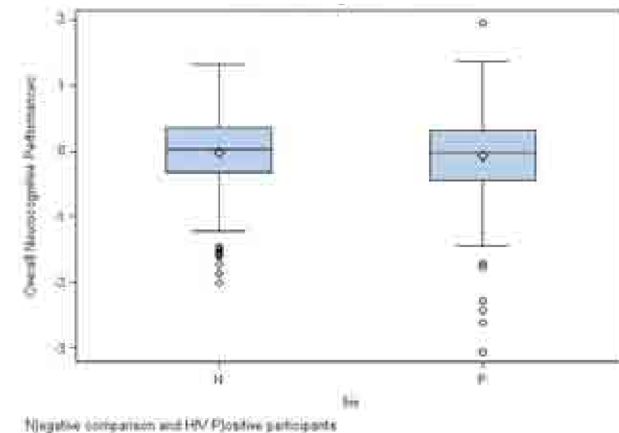
**Background:** Combined antiretroviral therapy (cART) has profoundly reduced traditional HIV-1-associated morbidity and mortality. However, HIV-1-associated co-morbidities are increasingly being seen and importantly influence patient management. For example, the prevalence of HIV-1-associated neurocognitive disorders (HAND) and HIV-1-associated cardiovascular diseases (HCVD) remains high despite widespread use of cART. While the mechanisms have not been fully understood, growing evidence suggests that an imbalance between matrix metalloproteinases (MMPs) and endogenous tissue inhibitors of MMPs (TIMPs) contributes to both HAND and HCVD.
**Methods:** Enzyme immunoassay and zymography assay were used to determine plasma level and proteolytic activity of MMPs from 10 healthy donors (HD), 43 HIV-1 patients who were cART-native ($ART^-$), and 16 HIV-1 patients with a stable virologic suppression by cART ($ART^+$). Plasma levels of TIMPs, inflammatory cytokines, microbial translocation, and the markers of monocyte/macrophage activation were also determined in these subjects.
**Results:** We found that plasma level and proteolytic activity of MMPs, specifically MMP-2 and MMP-9, were significantly increased in HIV-1 patients when compared with that in healthy individuals. TIMP-2, one of the four TIMPs, was profoundly down-regulated in HIV-1 patients, and the down-regulated TIMP-2 found in blood from HIV-1 patients was strongly correlated with elevated proteolytic activity of MMPs. The alternations of MMPs and TIMP-2 in HIV-1 patient were not affected by cART, indicating that cART extends the lifespan of HIV-1 patients but does not completely recover tissue-remodeling functions. We also found that the ratio of MMPs/TIMP-2 was correlated with elevated plasma levels of sCD14, sCD163, and inflammatory cytokines such as TNF-α and IL-6, suggesting that the imbalance of MMPs/TIMP-2 revealed in HIV-1 patients is related to monocyte/macrophage activation, inflammation and microbial translocation. Importantly, the imbalance of MMPs/TIMP-2 was more profound in HIV-1 patients with severe HAND or HCVD when compared with those without HAND or HCVD.
**Conclusions:** The imbalance of MMPs/TIMP-2 occurred in HIV-1 patients, which plays a key role in the pathogenesis of HIV-1-associated co-morbidities.

## WEPEB075

### NEUROCOGNITIVE PERFORMANCE AND NORMATIVE COMPARISON DATA IN HIV+ AND HIV- INDIVIDUALS IN RAKAI, UGANDA

K. Robertson[1], G. Nakigozi[2], A. Anok[2], N. Nakasujja[3], D. Saylor[4], X. Kong[4], S. Yosief[5], R. Gray[6], M. Wawer[6], N. Sacktor[6]
*[1]UNC Chapel Hill, Neurology, Chapel Hill, United States, [2]Rakai Health Sciences Program, Entebbe, Uganda, [3]Makerere University, Kampala, Uganda, [4]Johns Hopkins University, Baltimore, United States, [5]UNC, Chapel Hill, United States, [6]Johns Hopkins, Baltimore, United States*
*Presenting author email: kevinr@neurology.unc.edu*

**Background:** Neurocognitive impairment remains prevalent despite ART, and the CNS is an important potential latent reservoir and compartment for HIV. Many resource limited settings (RLS) do not have the training or resources to assess neurological and neuropsychological (NP) function in participants with HIV. We enrolled site specific HIV- participants to create normative data, and applied to HIV+ participants.
**Methods:** 400 HIV- and 390 HIV+ ART naïve participants in the Rakai Community Cohort Study underwent standardized neuropsychological assessments. Participants were stratified by 2 (gender) x 3 (education ) x 2 (age) matrix for deriving the normative comparison data. Education cutoffs were < 4, 4 to 6 , and >7 years; while age cutoffs were < 36 and > 35 years. All participants were administered a neuropsychological battery that assessed attention, fluency, learning, memory, gross motor, fine motor, speed of processing and executive functioning.
**Results:** We enrolled 400 HIV- participants (190 females) with a mean age of 35. years (SD 8.1) and mean of 5.74 years of education (SD 3.5); and 390 HIV+ participants (185 females) with a mean age of 35.5 years (SD 8.5) and mean of 5.2 years of education (SD 3.4). The mean CD4 cell count was 262 (SD 171) for the HIV+. At baseline, there was no significant difference in overall neurocognitive performance in these well matched HIV- (total z score M -0.02, SD .55) and HIV+ (M -0.07, SD .62). Similar results were found for the domains of functioning.



*[Overall Neurocognitive Performance in HIV- and HIV+]*

**Conclusions:** No substantial neurocognitive differences were found between the HIV- and HIV+ participants. The importance of regional specific normative comparison data is well known, but often the resources are not available to collect this necessary data. This normative comparison database will serve as a resource for both clinicians and researchers for assessing neurocognitive performance and brain functioning for years to come.

## WEPEB076

### ADHERENCE TO ANTIRETROVIRAL THERAPY AND NEUROCOGNITIVE IMPAIRMENT IN SOUTH AFRICA

R. Robbins[1], H. Gouse[2], C. Mellins[1], M. Arce Renteria[3], K. Thomas[4], V. Jonah[2], R. Remien[1], J. Joska[2]
*[1]Columbia University and New York State Psychiatric Institite, Psychiatry, New York, United States, [2]University of Cape Town, Psychiatry and Mental Health, Cape Town, South Africa, [3]Fordham University, Psychology, Bronx, United States, [4]University of Cape Town, Psychology, Cape Town, South Africa*
*Presenting author email: rnr2110@cumc.columbia.edu*

**Background:** Despite improvement in antiretroviral treatment (ART), neurocognitive impairment remains prevalent among people living with HIV (PLWH). It is generally thought that neuroinflammation, rather than high viral load, may be responsible for neurocognitive impairment in HIV, and that early ART minimizes neuroinflammation. For ART to be optimally effective high adherence (>90%) is required. Non-adherence may result in neurocognitive impairment, as well as poor health outcomes, decreased activities of daily living. This study examined the relationship between ART adherence and neuropsychological functioning among HIV+ South Africans for their first 6-months on ART.
**Methods:** One-hundred and two, isiXhosa-speaking, HIV+ Black South African adults initiating ART and who were enrolled in an ongoing ART adherence intervention trial monitoring ART adherence were administered a comprehensive neuropsychological test battery 12 months post-ART initiation. Locally normed Z-scores were computed for all tests in the battery and were used to calculate a global deficit score (GDS) where 0.5 or higher indicated at least mild impairment. Adherence was continuously measured using an electronic monitoring device (WisePill). One-year post-ART initiation viral load test results were abstracted from medical charts. Multiple linear regression examined the relationship between adherence and GDS.
**Results:** Participants were 33 years old (*SD*=7.5 years), and 81% female; most (80%) had not graduated from high school. Using the cut-score, 55% of the sample were classified as neuropsychologically impaired. Mean adherence for the first 6-months post-ART initiation was 64% (*SD*=31%). Of the 73 viral load test results available from medical charts, only 3% (*n*=2) had detectable virus. A multiple linear regres-

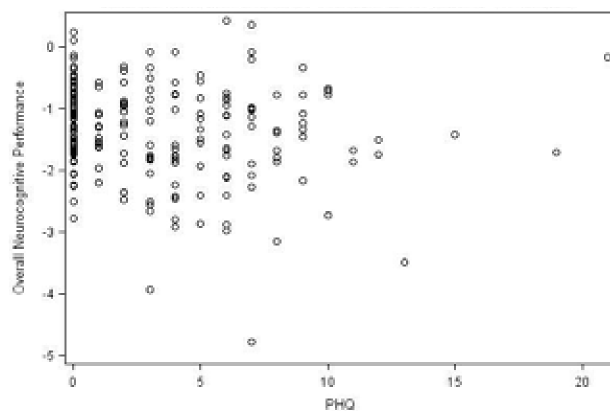
sion was calculated to predict GDS based on first 6-months adherence, gender, age, and education. A significant regression equation was found ($F(4,97)=8.52$, $p< .000$) with an $R^2$ of .26. Six-month adherence, age, and education were significant predictors of GDS, such that worse GDS was predicted by worse adherence ($B=-.27$, $p=.003$), older age ($B=.21$, $p=.045$), and lower education ($B=-.36$, $p=.000$).
**Conclusions:** These findings provide some preliminary evidence that early non-adherence may be related to worse neuropsychological functioning at one-year post-ART initiation in mostly virally suppressed HIV+ South Africans. Future research needs to examine this relationship in a larger sample.

## WEPEB077

### NEUROCOGNITIVE ASSESSMENT IN NIGERIA: THE ICON COHORT

B. Taiwo[1], B. Berzins[1], A. Ogunniyi[2], A. Adetunji[3], I. Adewole[2], B. Oladeji[2], O. Akpa[2], V. Ogaji[2], K. Robertson[4]
[1]*Northwestern University, Chicago, United States,* [2]*University of Ibadan, Ibadan, Nigeria,* [3]*University of Ibadan, Family Medicine, Ibadan, Nigeria,* [4]*University of North Carolina, Chapel Hill, United States*

**Background:** Neurocognitive impairment remains prevalent despite antiretroviral therapy (ART), and is particularly concerning in resource limited settings (RLS) where access to ART is limited. Most RLS do not have the training or resources to assess neurological and neuropsychological function in participants with HIV. We trained psychometricians to conduct neurocognitive evaluations in Ibadan Nigeria, in order characterize HIV associated Neurocognitive Disorders locally.
**Methods:** We enrolled HIV+ participants presenting for care at the HIV Clinic, UCH, Ibadan in the longitudinal Ibadan Cohort of NeuroAIDS (ICON) study. Participants were administered a neurocognitive battery that assessed total neurocognitive functioning, and the domains of fluency, attention, learning, memory, fine motor, speed of processing and executive functioning. African specific norms were utilized where available to create normalized z scores. Depression was assessed using a PHQ 9 questionnaire.
**Results:** 208 HIV+ participants were enrolled in ICON. 149 were female (72%); mean age was 37.5 years (SD 9.4); and mean educational level was 12.97 years (SD 3.1). The total z score (positive scores reflect better performance) was -1.36 (SD 0.81). Mean domain (SD) scores were fluency -1.18 (1.04), attention -2.45 (2.49), learning -1.05(1.35), memory -.73 (1.25), fine motor -.42 (.99), speed of processing -1.98 (.88), executive functioning -2.25 (1.07). Using a -1.5 total z cutoff, 42% were neurocognitively impaired. There was a significant correlation between the International HIV Dementia scale and overall neurocognitive functioning (r= .30, p< .0001) and each of the domains (p< .01). Poorer neurocognitive performance was associated with increased depressive symptoms (r = -0.14, p< .05).



*[Increased Depression with Poorer Neurocognitive Performance]*

**Conclusions:** Neurocognitive impairment was common and was associated with depressive symptoms, although regional African norms were utilized where possible. Collection of site-specific normative data from HIV seronegative participants is being undertaken to provide a more comprehensive and valid assessment.

# NEUROLOGIC DISORDERS (EXCLUDING HAND)

## WEPEB078

### INCIDENCE OF NEUROLOGICAL DISORDERS AMONG HIV-INFECTED INDIVIDUALS WITH UNIVERSAL HEALTH CARE IN TAIWAN, 2000 THROUGH 2010

Y.-C. Chen[1], N.-Y. Ko[2], Y.-T. Tsai[3], C.-Y. Hsieh[4]
[1]*National Cheng Kung University, Institute of Allied Health Sciences, Tainan, Taiwan, Province of China,* [2]*National Cheng Kung University, Nursing, Tainan, Taiwan, Province of China,* [3]*China Medical University An Nan Hospital, Nursing, Tainan, Taiwan, Province of China,* [4]*Tainan Sin Lau Hospital, Neurology, Tainan, Taiwan, Province of China*
*Presenting author email: yenchin2427@gmail.com*

**Background:** Although the introduction of highly active antiretroviral therapy (HAART) has improved the survival of people living with HIV in Western countries, neurological disorders remain a significant burden for HIV-positive people. The study aims to determine the incidence and factors associated with neurological disorders in a large Taiwanese cohort of HIV-infected persons with free access to HAART.
**Methods:** We conducted a population-based cohort study using the Taiwan National Health Insurance Research Database and identified 13,316 HIV-positive persons from 2000 through 2010. We used direct standardization to calculate age- and sex-adjusted incidence rates based on the 2000 World Health Organization world standard population. Factors associated with neurological disorders were analyzed using a Cox proportional hazards model.
**Results:** The standardized incidence of neurological disorders among HIV-infected persons increased from 22.16 per 1,000 person-years in 2000 to 25.23 per 1,000 person-years in 2010. Cognitive disorders increased significantly from 0.36 per 1,000 person-years in 2001 to 7.44 per 1,000 person-years in 2010 (trend test P < .001). The rate of neurological disorders increased with age (adjusted hazard ratios [AHR] for age 35-44 years: 1.31, 95% CI 1.08- 1.59, 45-54 years: 1.34, 95% CI 1.04-1.74, 55-64 years: 2.36, 95% CI 1.67- 3.33, ≥ 65 years: 2.68, 95% CI: 1.75-4.12, compared with age ≤ 24 years), hypertension (AHR 1.60, 95% CI 1.27- 2.00), substance abuse (AHR 1.72, 95% CI: 1.41- 2.10), opportunistic infection (AHR 1.99, 95% CI: 1.66- 2.39), and syphilis (AHR 1.53, 95% CI: 1.32- 1.77). The incidence of neurological disorders was negatively associated with adherence to HAART (adherence ≥ 90%: AHR 0.19, 95% CI: 0.15- 0.23).
**Conclusions:** The rising incidence of cognitive disorders among HIV-positive persons highlights the need to identify the causal factors of these co-infections. Receiving HAART with adherence ≥ 90% contributes to a reduced risk of neurological disorders.

## WEPEB079

### EPILEPSY PREVALENCE IN HIV-INFECTED CHILDREN AGED 0 - 16 YEARS IN TWO ANTIRETROVIRAL TREATMENT CLINICS IN THE EASTERN CAPE PROVINCE OF SOUTH AFRICA

I. Michaelis[1], C. Sabin[2], M. Nielsen[3], J. Lambert[4], C. Carty[5]
[1]*Walter Sisulu University, Paediatrics, Kwelera, South Africa,* [2]*University College London, Institute of Epidemiology & Health, London, United Kingdom,* [3]*Mersey Deanery, Paediatrics, Liverpool, United Kingdom,* [4]*Mater Misericordiae University Hospital, Infectious Diseases, Dublin, Ireland,* [5]*University of Oxford, Social Policy and Intervention, Oxford, United Kingdom*
*Presenting author email: isabelmichaelis@gmail.com*

**Background:** Neurologically symptomatic HIV-positive children present with a wide range of clinical pathologies. Among these, epilepsy is of key concern owing to its potential life-long impacts. Few studies in developing regions have investigated the prevalence and aetiology of epilepsy in HIV-infected children as a key population. We describe the prevalence of epilepsy, associated neurological disabilities, immunological status, clinical stage and history of CNS infection at epilepsy diagnosis in HIV- infected children receiving antiretroviral treatment (ART) in the Eastern Cape Province of South Africa.
**Methods:** We conducted a retrospective study (2004 - 2014) at two major referral sites for HIV-infected children diagnosed with epilepsy aged 0-16 years. Eligible subjects were extrapolated from the EMBRACE Paediatric Cohort using the Paediatric ART Data Management Tool (PADMT). Fixed data fields were interrogated for exposures to antiepileptic drugs including sodium valproate, carbamazepine, lamotrigine, phenobarbitone and clonazepam coupled with laboratory measures (CD4 and viral load) and WHO stageing. Unstructured “comments” fields were searched for the terms: epilepsy, seizures, fits and szs, as well as abbreviated versions of common antiepilpetic drug names (eg AED, CBZ). Eligible subject folders were then retrieved to validate the digital data.

**Results:** Of the 2137 children aged 0 -16 enrolled, 53 were diagnosed with epilepsy (2.48%) of which 50 (2.34%) had comprehensive medical records available. 26 were male (52.0%) and the median age at epilepsy diagnosis was 50 months. The median CD4 count was 591 cells/mm3 and the mean viral load was 4.9 log copies/ml. WHO clinical stage was available in the record for 46 of the sample, with 3, 6, 26 and 11 graded at stages 1, 2, 3 and 4, respectively. 40% had a history of CNS infection prior to epilepsy diagnosis and 30% were diagnosed with cerebral palsy.
**Conclusions:** In this descriptive study we found a prevalence of epilepsy of 2.48%, most of which was diagnosed in children with advanced HIV disease. Our findings support the use of earlier initiation of ART in HIV-infected children to reduce HIV-related neurological manifestations like epilepsy. It also reveals the effectiveness of accessing cohort-level data using novel technologies that allow for interrogation of clinical data.

## Depression and other psychiatric manifestations

### WEPEB080

#### The emergence of methamphetamine abuse among HIV-infected Vietnamese patients attending outpatient clinics: implications for HIV care and prevention

Q. Vu[1], B. Nguyen[1], T. Tran[2], T. Nguyen[3], T. Le[2], D. Do[4], C. Do[5], P. Nguyen[3], N. Galai[6], T. Ma[1], D. Celentano[6], Q. Nguyen[1], H. Nguyen[1], H. Vu[1], V. Go[7]
*[1]Johns Hopkins University, Hanoi, Vietnam, [2]Hanoi Center for HIV/AIDS Prevention & Control, Hanoi, Vietnam, [3]S. Tu Liem Medical Center, Hanoi, Vietnam, [4]National Institute of Hygiene and Epidemiology, Hanoi, Vietnam, [5]Bach Mai Hospital, Hanoi, Vietnam, [6]Johns Hopkins University, Baltimore, United States, [7]University of North Carolina at Chapel Hill, Chapel Hill, United States*
*Presenting author email: vquan@jhsph.edu*

**Background:** Methamphetamine (MET) abuse may co-occur with mental illnesses and their combination can complicate the management of medical conditions such as antiretroviral therapy (ART). This study examines the associations between recent MET use and psychiatric disorders among men attending HIV outpatient clinics in Hanoi, Vietnam.
**Methods:** HIV-infected men with a history of opioid injection released from drug detention centers were invited to participate in a study during 2013-2015 evaluating access and utilization of ART. Participants underwent an interview and urine drug testing. Anxiety and depressive symptoms were measured by Beck Anxiety Inventory and Center of Epidemiologic Studies Depression Scale (CES-D). Multiple logistic regression model was used to identify factors associated with recent MET use at baseline visit.
**Results:** Among 372 participants (mean age, 36 years old), 38% tested positive to morphine and 11% positive to MET, indicating recent use. In bivariate analyses, MET-positive participants were more likely to reside in urban areas (p=0.02), to have more depressive symptoms (p< 0.001), and to have slightly more anxiety symptoms (p=0.09). There were no significant differences in age, employment status, or income. In a multivariable model controlling for duration of drugs injecting, recent heroin use, and baseline CD4 count, recent MET use was significantly associated with depressive symptoms (adjusted odds ratio [AOR]=1.6 for 10-point increase in CES-D score, p< 0.001) and reporting to have 2 or more female sexual partners in the previous 3 months (AOR=2.5, p=0.03).
**Conclusions:** Recent methamphetamine use is prevalent among current and former opioid users in Vietnam and has a clinical impact. The study findings may be useful to guide efforts to improve HIV care through screening for and addressing MET abuse and related psychiatric disorders along with HIV treatment efforts.

### WEPEB081

#### Increasing access to antidepressant treatment for HIV+ antiretroviral therapy (ART) patients in Haiti through measurement based care (MBC): safety and preliminary efficacy

M. Jean-Gilles[1], K. Loubeau[2], R. Rosenberg[1], D. Grelotti[3], C. Beck-Sague[4], A. Saxena[4], S. Koenig[5], M.-M. Deschamps[2], J. Dévieux[6], J. Pape[2,7]
*[1]Florida International University, AIDS Prevention Program, Miami, United States, [2]Haitian Study Group for Kaposi's Sarcoma and Opportunistic Infections (GHESKIO), Port-au-Prince, Haiti, [3]University of California, San Diego, United States, [4]Florida International University, Robert Stempel College of Public Health & Social Work, Miami, United States, [5]Harvard University, Brigham & Women's Hospital, Boston, United States, [6]Florida International University, AIDS Prevention Program, North Miami, United States, [7]Weill Cornell Medical College, New York, United States*
*Presenting author email: devieuxj@fiu.edu*

**Background:** Depression is highly prevalent among people living with HIV (PLWH) and associated with HIV risk behavior, poor adherence to ART, and higher AIDS-related mortality. In resource-limited settings like Haiti, there is little or no available mental health treatment. Improving access to mental health care for PLWH is critical to the long-term success of global HIV treatment efforts. MBC was developed to improve access to depression treatment among PLWH. It is an evidence-based, task-shifting intervention where non-physicians known as Depression Care Managers (DCM) use depression treatment algorithms to advise prescribing clinicians in antidepressant treatment. Originally developed in the US, we adapted MBC for Haitian lay health workers and pilot-tested it in Port-au-Prince, Haiti.
**Methods:** HIV+ patients beginning ART received depression screening with a Haitian Creole Patient Health Questionnaire (PHQ-9). Those scoring 10 or higher received a confirmatory test for major depressive disorder (MDD). Those diagnosed with MDD were randomly assigned to MBC (regular telephone and in-person assessment of depression symptoms and algorithm-based adjustment of antidepressant (fluoxetine) dosing) or enhanced usual care (training of HIV doctors in depression care, alerting them to the participant's MDD diagnosis and PHQ9, and adding fluoxetine to the clinic formulary).
**Results:** Between May and December 2015, 482 patients were screened; 21% had confirmed MDD. Pilot participants numbered 78; 43 were assigned to MBC and 35 were assigned to enhanced usual care. Participants were 61% female. Age ranged from 20 to 60 (median 36) years. MBC and comparison groups did not differ significantly at baseline; median PHQ-9 at **baseline** was 14 (IQR=11-16.5) for the MBC group and 14 (IQR=12-16.5) for the comparison group. At 3-month follow up, the MBC group had significantly reduced depression symptoms (median PHQ9=4.0, IQR=1.5-8) compared to the comparison group (median PHQ9= 10.0, IQR=2-18) p =0.036. No study-related adverse events or serious side effects from antidepressant use were observed.
**Conclusions:** MBC resulted in a significant reduction in depression symptom severity among HIV+ patients with MDD in Haiti. The measurement, monitoring and support offered by MBC can serve to improve treatment outcomes, reduce needless suffering, and increase access to depression treatment in resource-limited settings.

### WEPEB082

#### Prevalence, recurrence and incidence of current depression among people living with HIV in Ontario, Canada: results from the Ontario HIV Treatment Network Cohort Study

S.K.Y. Choi[1,2], S. Gardner[3], E.J. Collins[4,5], E. Boyle[3,6], J. Cairney[3,7,8], S.B. Rourke[2,5,9]
*[1]University of Toronto, Faculty of Medicine, Institute of Medical Science, Toronto, Canada, [2]The Ontario HIV Treatment Network, Toronto, Canada, [3]University of Toronto, Dalla Lana School of Public Health, Toronto, Canada, [4]University Health Network, Toronto, Canada, [5]University of Toronto, Department of Psychiatry, Toronto, Canada, [6]University of Southern Denmark, Institute of Sports Science and Clinical Biomechanics, Odense, Denmark, [7]McMaster University, Hamilton, Canada, [8]Centre for Mental Health and Addiction, Toronto, Canada, [9]St. Michael's Hospital, Toronto, Canada*
*Presenting author email: srourke@ohtn.on.ca*

**Background:** Current studies of depression among people living with HIV focus on describing its point prevalence. Given the fluctuating nature of depression and its profound impacts on clinical and quality-of-life outcomes, this study aimed to examine the prevalence, recurrence and incidence of current depression longitudinally and systematically among HIV-positive patients in Ontario, Canada.
**Methods:** We conducted a prospective cohort study using linked data from the Ontario HIV Treatment Network Cohort Study and administrative health databases between October 1, 2007 and December 31, 2012. Current depression was identified using the Centre for Epidemiologic Studies Depression Scale or the Kessler Psychological Distress Scale, first at baseline and again during follow-up interviews.

Tuesday 19 July

Wednesday 20 July Poster Exhibition

Thursday 21 July

Friday 22 July

Late Breaker Posters

Author Index

The three outcomes were characterised by participants' social demographics, housing-related conditions, and health status.
**Results:** Of the 3816 HIV-positive participants with HIV care, the point prevalence of depression was estimated at 28%. Current depression was especially prevalent among participants who were younger, female, earning a low income, and having difficulty with housing-related expenses or not feeling a sense of neighbourhood belonging. Of the 801 participants who were identified with depression at baseline and had at least two-year follow-up data, 51% had a recurrent episode; the first recurrent rate was 13.8 per 100 person-years. The cumulative incidence of 1393 depression-free participants was 17%, and the incident rate was 4.4 per 100 person-years. During follow-up, participants who had history of depression (adjusted hazard ratio [aHR]: 1.3, 95% Confidence Intervals [CI]: 1.06-1.6) or felt worried about their housing situation (aHR:1.7, CI:1.3-2.2) were more likely to have elevated recurrence rate. Participants who were younger, were self-reported as gay, lesbian or bisexual (aHR:1.8, CI:1.2-2.8), or who had difficulty in affording housing-related expenses (aHR:1.5, CI:1.01-2.2) were more likely to have higher rate of incident depression whereas those who felt better control in their housing situation (aHR:0.6, CI:0.4-0.9) were protected from developing incident cases.
**Conclusions:** Depression is prevalent and likely to recur among HIV-positive patients. Our results reinforce the importance of effective delivery of mental health care in the context of HIV treatment and demonstrate the need for long-term support and routine management of depression, particularly for individuals at high risk.

## WEPEB083

### DEPRESSING SCREENING AS A TOOL FOR IMPROVING CLINICAL CARE OF YOUTH WITH HIV

A. Walsh[1], K. Wesley[2], S.Y. Tan[2], C. Lynn[2], K. O'Leary[2], Y. Wang[2], D. Nguyen[2], T. Chenneville[3], C. Rodriguez[2]
*[1]University of South Florida, Pediatrics, Tampa, United States, [2]University of South Florida, Tampa, United States, [3]University of South Florida, Psychology, Saint Petersburg, United States*
*Presenting author email: chennevi@mail.usf.edu*

**Background:** Youth represent a substantial number of new and existing HIV cases. It is well established that depressive symptoms are common among people with HIV, and there is some indication that such symptoms are more prevalent among youth compared to adults. The purpose of this study was to assess the utility of a depression screener to improve clinical care of youth with HIV.
**Methods:** A pediatric and adolescent infectious diseases program in the US conducted depression screeners with youth ages 11-25. Measures included the Patient Health Questionnaire-Adolescent (PHQ-A) and the Patient Health Questionnaire-9 (PHQ-9; Kroenke & Spitzer, 2002). Data were analyzed based on an archival review of 98 cases.
**Results:** The majority of the sample was African American (69%) heterosexual (65%) females (56%) between the ages of 18-24 (80%). Most were perinatally infected (60%). Initial findings suggest that 42% of the sample was at risk for mild to severe depression. The following symptoms were endorsed frequently: fatigue (50+%), trouble sleeping (50%), feeling bad about self (30%), and feelings of hopelessness (40%).
**Conclusions:** The clinical implications of these findings include the need for universal psychoeducation about depression, specific behavioral strategies for high-risk groups, and comprehensive biopsychosocial assessments in clinical settings for youth with HIV. To increase the quality of life and functioning of youth with HIV, further research in the area of mental health is needed.

# MALIGNANCIES (INCLUDING KAPOSI SARCOMA, LYMPHOMA, AND NON-AIDS MALIGNANCIES)

## WEPEB084

### SEROPREVALENCE AND VIRAL QUANTIFICATION OF KAPOSI SARCOMA ASSOCIATED HERPES VIRUS (KSHV) IN A HUMAN IMMUNODEFICIENCY VIRUS (HIV) INFECTED ADULT SOUTH AFRICAN COHORT

S. Singh[1], K. Naidoo[2,3], T.S. Uldrick[4], F. Shaik[5], D. Whitby[6], V. Marshall[6], W. Miley[6], A. Mosam[5]
*[1]University of KwaZulu-Natal, Human Physiology, Durban, South Africa, [2]Centre for the AIDS Programme of Research in South Africa (CAPRISA), Durban, South Africa, [3]MRC-CAPRISA HIV-TB Pathogenesis and Treatment Research Unit, Doris Duke Medical Research Institute, University of KwaZulu-Natal, Durban, South Africa, [4]National Cancer Institute, Center for Cancer Research (HIV and AIDS Malignancy Branch), Bethesda, United States, [5]University of KwaZulu-Natal, Dermatology, Durban, South Africa, [6]Frederick National Laboratory for Cancer Research, Viral Oncology Section (AIDS and Cancer Virus Program), Frederick, United States*
*Presenting author email: singhs5@ukzn.ac.za*

**Background:** Kaposi Sarcoma-associated Herpes virus (KSHV) is etiologically implicated in Kaposi's Sarcoma (KS). Serological studies of KSHV have not been well documented in the South African population, yet KS has become an increasingly prominent HIV associated malignancy. This study investigates the seroprevalence and KSHV viral load in an adult South African cohort.
**Methods:** Cross-sectional data was analyzed from 140 patients attending an urban research clinic site, Durban 2013. The cohort was divided into 70 HIV infected and 70 HIV uninfected individuals. Antibodies against latent (Orf73) and lytic (K8.1) KSHV antigens were detected on serum from all participants. Those reactive against either antigen were considered seropositive. Subjects simultaneously reactive for K8.1 and Orf73 were analyzed for KSHV DNA, extracted from saliva and quantified using primers for the K6 gene region.
**Results:** Demographic characteristics of the 140 participants regarding gender and age were similar. Seventy five subjects (54%) tested positive for KSHV with 46 (33%) reactive to K8.1, 52 (37%) reactive to Orf73 and 29 (21%) reactive to both. Fifty percent of HIV infected subjects were seropositive for K8.1, and 46% for Orf73. In the HIV negative group 16% tested seropositive for K8.1 and 29% for Orf73. The HIV positive subjects demonstrated a significantly higher percentage KSHV seropositivity (70% vs. 37%; p = 0.0001). Subjects reactive to both antigens were analyzed for KSHV DNA. This was detected on 13 of the 24 HIV infected specimens tested (mean VL of $3x10^{10}$ KSHV copies per $10^6$ cells). Viremia was detected in 3 of the 5 HIV uninfected specimens (mean VL of $6x10^3$ KSHV copies per $10^6$ cells). The VL variance between the two groups was significant (p< 0.0001) with a higher VL burden in the HIV infected group.
**Conclusions:** KSHV seroprevalence is high in adults attending an urban HCT clinic. HIV positive individuals are more likely to be KSHV seropositive. It is also suggestive that HIV positive individual are more likely to have a higher KSHV viral load.

## WEPEB085

### BEYOND CERVICAL CANCER: GYNECOLOGICAL MALIGNANCIES AND TREATMENT IN HIV+ WOMEN

A.F. Rositch[1], L. Ojalvo[2], A. Angarita[2], D. Riedel[3], K. Levinson[2]
*[1]Johns Hopkins Bloomberg School of Public Health, Department of Epidemiology, Baltimore, United States, [2]Johns Hopkins Hospital, Department of Gynecology and Obstetrics, Baltimore, United States, [3]University of Maryland, Institute for Human Virology, Baltimore, United States*
*Presenting author email: arositch@jhsph.edu*

**Background:** As life expectancy of HIV+ women increases, there is increasing need to understand gynecologic malignancies beyond cervical cancer. There are no recent reports on the care of HIV+ women with these cancers nor HIV-specific guidelines. Thus, here we describe gynecological malignancies in HIV+ women and evaluate care and adherence to general treatment guidelines.
**Methods:** Johns Hopkins and University of Maryland clinic records and billing codes were used to identify all gynecologic cancer cases from 2000-2015. Chart reviews were conducted to obtain demographic, HIV, and cancer-related information. Abstraction of cancer treatment modalities allowed determination of adherence to NCCN-guidelines for each cancer type. Descriptive statistics were calculated to describe the patient population, cancer characteristics, and provision of treatment.
**Results:** Over the 15 year period, 47 gynecologic malignancies were identified in HIV+ women. The median age at diagnosis was 45 (IQR: 36-51), 89% of women were black, 60% were smokers, and 32% reported alcohol use. A roughly equal percentage of cervical cancers were identified (49%) compared to all other types com-

bined (11% endometrial; 13% ovarian; 28% vaginal/vulvar). Women with vaginal/vulvar cancers were similar in age and CD4 count to women with cervical cancer but women with endometrial and ovarian cancers tended to be older and have higher CD4 counts at diagnosis. Treatment according to NCCN-guidelines was similar across cancer types: 96% of the 23 cervical cases; 85% of the 13 vaginal/vulvar cases although two stage I patients received no treatment; 100% of the 5 endometrial cases (all stage I); and 5/6 ovarian cases although only 1/5 late stage (III/IV) cases received ideal treatment (chemotherapy+surgery).

| Cancer Type | Distribution | Median Age (IQR) | Median CD4 count (IQR) | NCCN treatment |
|---|---|---|---|---|
| Cervical | 23 (49%) | 45 (33-47) | 224 (116-419) | 22 (96%) |
| Endometrial | 5 (11%) | 54 (44-68) | 578 (294-1195) | 5 (100%) |
| Ovarian | 6 (13%) | 50 (44-52) | 544 (309-779) | 5 (83%) |
| Vaginal/vulvar | 13 (28%) | 44 (38-50) | 298 (173-554) | 11 (85%) |

*[Characteristics of cancer cases and treatment]*

**Conclusions:** Most HIV+ women were treated according to NCCN-guidelines. However, over a third of women with cervical/vaginal/vulvar cancer did not to receive radiation-sensitizing chemotherapy, and women with late stage ovarian cancer tended to receive less than ideal treatment. Data on outcomes following cancer treatment in HIV+ women as compared to the general population are being collected to inform the need for specialized management in this population.

## WEPEB086

### CANCER TREATMENT IN ELDERLY INDIVIDUALS WITH HIV INFECTION IN THE UNITED STATES

A.F. Rositch[1], S. Jiang[1], A. Coghill[2], G. Suneja[3], E. Engels[2]
[1]*Johns Hopkins Bloomberg School of Public Health, Department of Epidemiology, Baltimore, United States,* [2]*National Cancer Institute, Division of Cancer Epidemiology & Genetics, Bethesda, United States,* [3]*Huntsman Cancer Institute, Department of Radiation Oncology, Salt Lake City, United States*
*Presenting author email: arositch@jhsph.edu*

**Background:** HIV+ individuals are at increased risk for many cancers, and with an increasing life expectancy due to widespread HAART, this is a growing problem for older adults. Previous studies also suggest that HIV+ individuals may be less likely to receive treatment for cancer. The extent to which rates or specific types of cancer treatment may differ between elderly HIV+ and HIV- individuals is unknown.
**Methods:** Using SEER-Medicare linked data, we explored differences in cancer treatment by HIV status in Americans aged 66-99 years and diagnosed with non-Hodgkin lymphoma, melanoma, or anal, bladder, breast, colorectal, kidney, liver, lung, or prostate cancer from 1991-2009. HIV+ was identified as the presence of ≥2 Medicare claims with ICD9 diagnosis codes 042, 043, 044 or V08 at least 30 days apart. Medicare claims were searched for cancer-specific surgery, chemotherapy, radiation, hormone/biologic therapy, and/or transplant.
**Results:** HIV+ cancer cases (n=617) were significantly younger than HIV- cases (n=875,082; median age: 71 vs. 75 years, respectively). Overall, HIV+ cases were less likely to receive cancer-type-specific treatment within 6 months of diagnosis compared to HIV- cases (70% vs. 75%, respectively; p< 0.01) and this difference was even more apparent in individuals ≤70 years (68% treated in HIV+ vs. 82% in HIV-). Median time to treatment was also slightly, but significantly, longer for HIV+ (34 vs. 31 days for HIV-). However, after taking into account differences by gender, race, year, socioeconomic status, comorbidities, and type and stage of cancer, there was no significant effect of HIV on receipt of treatment, regardless of age. Of note, advanced stage at diagnosis had the strongest independent (negative) association with receipt of treatment.
**Conclusions:** Differences in cancer treatment between HIV+ and HIV- individuals in the elderly American population are likely mediated through difference in personal, medical, or cancer-specific characteristics, which will be explored through advanced analytical techniques. Our findings highlight the complex interplay between age, multiple comorbidities, and cancer-specific differences by HIV, making it clear that a better understanding of factors impacting the cancer care continuum are needed.

# FAT ACCUMULATION AND LIPODYSTROPHY

## WEPEB087

### CORRELATION OF ADIPOCYTOKINE LEVELS IN DIFFERENT TYPES OF LIPODYSTROPHY IN HIV/AIDS PATIENTS

G. Dragovic[1], D. Srdic[1], K. Al Musalhi[2], I. Soldatovic[3], J. Nikolic[4], D. Jevtovic[4], D. Nair[2]
[1]*University of Belgrade, School of Medicine, Department of Pharmacology, Clinical Pharmacology and Toxicology, Belgrade, Serbia,* [2]*Royal Free Hospital and University College, Department of Clinical Biochemistry, London, United Kingdom,* [3]*Institute for Biomedical Statistics, School of Medicine, University of Belgrade, Belgrade, Serbia,* [4]*Infectious and Tropical Diseases Hospital, School of Medicine, University of Belgrade, Belgrade, Serbia*
*Presenting author email: gozza@beotel.net*

**Background:** Combination antiretroviral therapy (cART) can induce metabolic complications including lipodystrophy, dyslipidemia, and insulin resistance in HIV-infected patients. Adipokines may play important role in these alterations, especially in lipodystrophy. The aim of this study was to evaluate the relationship between serum levels of adipocytokines in four different categories of fat distribution: lipoatrophy (LA), lipohypertrophy (LH), mixed fat redistribution (MFR) and no-lipodystrophy in HIV-infected patients.
**Methods:** Cross-sectional study of 66 HIV-infected adults. Levels of adiponectin, resistin, leptin, interleukins (IL-1α, IL-1 β, IL-2, IL-4, IL-6, IL-8, IL-10), plasminogen-activator-inhibitor-1 (PAI-1), C-peptide, cystatin-C, tumor necrosis factor alpha (TNF-α), vascular-endothelial-growth-factor (VEGF), epidermal-growth-factor (EGF), interferon-gamma (IFN-γ) and monocyte-chemoattractant-protein-1 (MCP-1) were measured. Differences between groups were tested using t-test and Mann-Whitney test, and analysis of covariance to examine relationship between adiponectin and leptin and lypodystrophy categories adjusted for confounding variables.
**Results:** The lipodystrophy was observed in 29 (44%) patients, while 15 (52%) of them had LA, 4 (14%) had LH and 10 (34%) patients had MFR. LH patients had higher levels of adiponectin (p=0.011), leptin (p=0.039), cystatin-C (p=0.001), IL-6 (p=0.065), and lower levels of IL-4 (p=0.052). LA patients had lower levels of IL-4 (p=0.043), IL-10 (p=0.031) and IL-1α (p=0.051). Correlation of adiponectin with lipodystrophy remains statistically significant in the subgroup of patients with lipohypertrophy after adjustment for age, BMI, cystatin-C, PAI-1, IFN-γ (p=0.001).
**Conclusions:** Adiponectin was shown to be important marker in fat disturbances in patients undergoing cART and directly associated with lipohypertrophy, and could be the possible target for new therapeutic strategies in HIV/AIDS patients.

### CHANGES IN PLATELET AGGREGATION AND COAGULATION MARKERS IN HIV-1 INFECTED INDIVIDUALS SWITCHING TO OR FROM ABACAVIR: FIRST RESULTS FROM THE TENOFOVIR ABACAVIR PLATELET ACTIVATION STUDY (TAPAS)

F.F. Rönsholt[1], M. Helleberg[1], P.I. Johansson[2], J. Haismann[1], S.R. Ostrowski[2], J. Gerstoft[1]
[1]*Copenhagen University Hospital Rigshospitalet, Department of Infectious Diseases 8632, Copenhagen, Denmark,* [2]*Copenhagen University Hospital Rigshospitalet, Section for Transfusion Medicine, Capital Region Blood Bank 2032, Copenhagen, Denmark*
*Presenting author email: frederikkefr@gmail.com*

**Background:** Some studies have reported an association between abacavir and an increased risk of cardiovascular events. TAPAS aimed to determine changes in platelet aggregation, functional coagulation and markers of coagulation after switching to or from abacavir as part of combination antiretroviral therapy (cART).
**Methods:** TAPAS is an investigator initiated, open labeled, cross over study. Participants receiving cART containing abacavir/lamivudine switched treatment to a regimen containing tenofovir/emtricitabin (AT group) and vice versa (TA group). The third cART drug remained unchanged. Blood samples were drawn before switching and 85-90 days after therapy change. Platelet aggregation was analysed by impedance aggregometry with the following agonists: Adenosinediphosphate (ADP), arachidonic acid (ASPI), thrombin receptor agonist peptide (TRAP) and ristocetin in high (RISTOhi) and low (RISTOlow) concentrations. Functional coagulation was assessed by thromboelastography (TEG) using the variables reaction time, angle, maximal amplitude, time to maximal amplitude, lysis after 30 minutes, and clot lysis time. Further, platelet count, coagulation factors II-VII-X (CF), fibrinogen and anti-thrombin III (AT3) were measured.

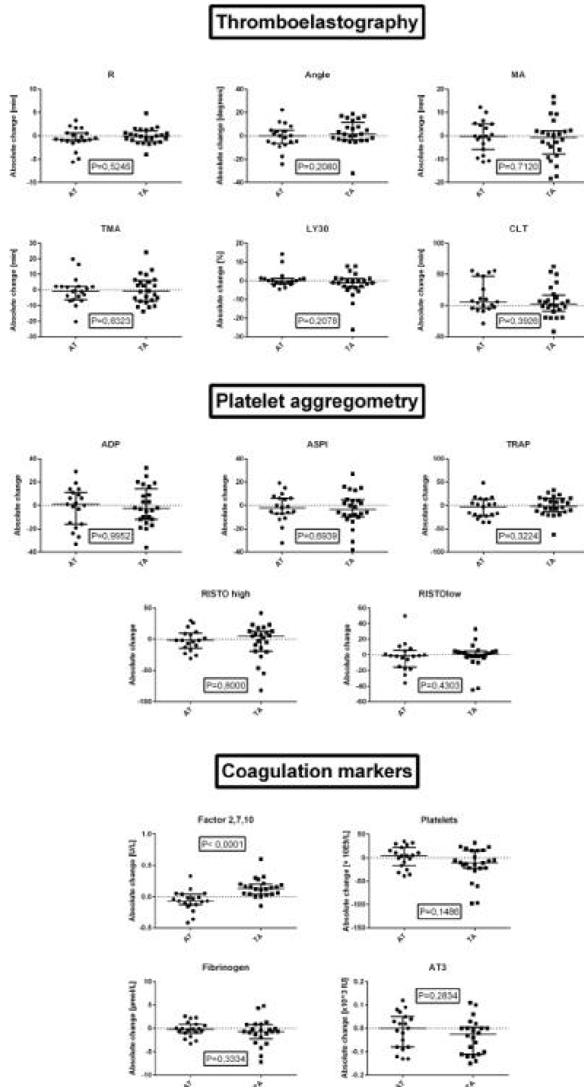
**Results:** We included 55 male individuals of whom 19 and 24 completed the study in the AT and the TA group, respectively.
The platelet aggregometry showed no differences between the groups in absolute change in platelet reactivity with either of the examined agonists.
Likewise, TEG showed no differences between the groups in absolute change in any of the given variables.
Changes in platelet counts, fibrinogen levels and AT3 levels were also similar between groups. In the TA group, CF increased median 0.13 units/L
(IQR 0.04-0.20), whereas a decrease of median -0.07 units/L (IQR -0.13 - -0.04) was observed in the AT group (P< 0.0001).
**Conclusions:** Switching between abacavir and tenofovir based cART regimens did not alter platelet reactivity, however, switching from tenofovir to abacavir resulted in an increase in coagulation factors II-VII-X. It remains unclear whether these changes have any clinical significance.



*[Absolute changes in coagulation/fibrinolysis markers]*

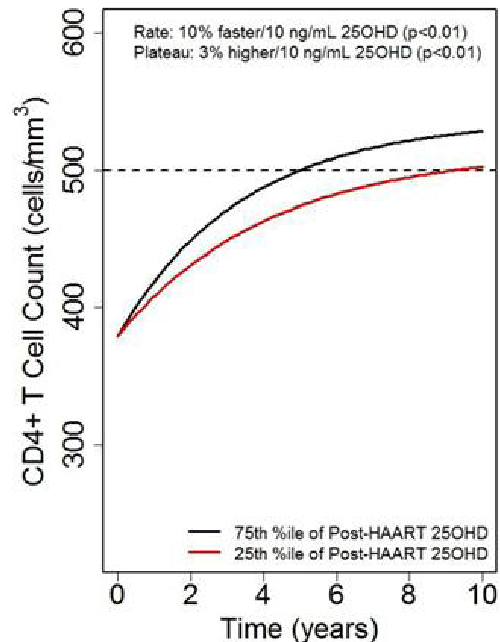
### VITAMIN D STATUS AT THERAPY INITIATION AND CD4+ T CELL COUNT RECOVERY IN HIV-INFECTED MEN IN THE MULTICENTER AIDS COHORT STUDY

A.G. Abraham[1], K. Calkins[1], B. Lau[1], L. Zhang[1], A. Tin[1], A. Hoofnagle[2], F.J. Palella Jr[3], M.D. Witt[4], L.A. Kingsley[5], L.P. Jacobson[1], T.T. Brown[6]
*[1]Johns Hopkins Bloomberg School of Public Health, Epidemiology, Baltimore, United States, [2]University of Washington, Departments of Laboratory Medicine and Medicine, Seattle, United States, [3]Northwestern University, Feinberg School of Medicine, Chicago, United States, [4]Los Angeles Biomedical Research Institute at Harbor-UCLA Medical Center, Torrance, United States, [5]University of Pittsburgh, Pittsburgh, United States, [6]Johns Hopkins University School of Medicine, Division of Endocrinology, Diabetes and Metabolism, Baltimore, United States*
*Presenting author email: alison.abraham@jhu.edu*

**Background:** There is substantial heterogeneity in both the rate of increase and plateau of CD4+ T cell count (CD4) in response to effective therapy (HAART) initiation. Since vitamin D can have immunoregulatory function, we investigated whether higher serum levels of 25 hydroxyvitamin D (25OHD) were associated with improved CD4 recovery following HAART initiation in HIV-infected men who have sex with men (MSM).
**Methods:** 25OHD level was measured following HAART initiation in 636 HIV-infected MSM with at least one post-HAART CD4 measurement. Anchoring at HAART start, CD4 over time was modeled using an exponential decay nonlinear mixed effects model with three random effects for the intercept, rate of increase and plateau. We assessed the effect of higher seasonally-adjusted post-HAART 25OHD levels on the rate of increase and plateau of CD4, controlling for age, pre-HAART CD4 nadir, and race.
**Results:** At HAART initiation, the median age was 42.3 years, the median pre-HAART CD4 nadir was 260 cells/ml, and 25.8% of men were of black race. The median post-HAART 25OHD level was 22.6 ng/ml (interquartile range [IQR]: 16.1, 29.9; 56.4 nmol/L) assessed at median time of 2.2 years (IQR: 1.7, 2.4) after initiation. The overall predicted median CD4 plateau was 523 cells/mm$^3$ (IQR: 343, 751) and the median time to CD4 plateau was 11.3 years. A higher post-HAART 25OHD level was significantly associated with both the rate of CD4 increase and plateau, with a 10% faster rate (p< 0.01) and a 3% higher plateau (p< 0.01) per 10 ng/ml (25 nmol/L) 25OHD. The Figure shows the expected difference in CD4 rebound comparing the 75%ile of 25OHD level in the cohort to the 25%ile.



*[Adjusted effect of higher 25OHD levels on CD4+ T cell count rebound following HAART initiation]*

**Conclusions:** Vitamin D levels may modestly augment the extent of quantitative CD4 increase following HAART initiation. Interventional trials are needed to determine whether supplementation at HAART initiation provides consequential clinical benefits.

## WEPEB090

### HIGH BACKGROUND OSTEOPENIA AND VITAMIN D DEFICIENCY PREVALENCE MAY ATTENUATE THE RELATIVE CONTRIBUTION OF HIV TO OSTEOPOROSIS IN ASIAN POPULATIONS

S.-A. Woon[1], L. Li[2], K.Z. Leong[1], N. Smitasin[1], I. Venkatachalam[1], D. Olszyna[1], S. Archuleta[1,2], P.A. Tambyah[1,2], N. Chew[1,2]
[1]*National University Hospital Singapore, Division of Infectious Diseases, Singapore, Singapore,* [2]*National University of Singapore, Yong Loo Lin School of Medicine, Singapore, Singapore*
*Presenting author email: nares_smitasin@nuhs.edu.sg*

**Background:** Low bone mineral density (BMD) is 3-4 times more prevalent in HIV-positive cohorts compared to HIV-negative controls. HIV-associated osteoporosis is a major concern in an aging Asian society such as Singapore, where new HIV diagnosis is often made in an older cohort or in patients with advanced stages of immunodeficiency. There is paucity of data on HIV-associated osteoporosis in Singapore and in other neighbouring Asian cohorts.
**Methods:** We conducted a cross-sectional study in the National University Hospital to examine prevalence and relevant risk factors for HIV-associated osteoporosis. BMD was measured by dual-energy x-ray absorptiometry (DXA) and normalized to a published Singapore reference range. Serum 25-hydroxy vitamin D was measured by electrochemiluminescence immunoassay. An age-matched control group was included. Statistical methods used included Student t-test, chi-squared test, Fisher's Exact Test and multiple logistic regression as appropriate.
**Results:** 104 HIV-positive patients and 52 HIV-negative volunteers were included. The prevalence of osteopenia and osteoporosis in the HIV-positive cohort was 51.9% and 11.5% respectively. Low BMD was significantly associated with low body mass index [BMI in normal vs low BMD, mean±SD: (spine) 24.2 ± 4.7 vs 21.8 ± 3.5, p=0.016; (hip) 24.4 ± 5.09 vs 22.6 ± 3.76, p=0.039]. There was no association between the traditional risk factors for low BMD and HIV clinical status with osteopenia/ osteoporosis the use of tenofovir. Surprisingly, 54% of the age-matched healthy volunteers had low BMD. A high proportion of subjects in both the HIV-positive and healthy volunteer groups had insufficient dietary intake of calcium. 70.2% of the HIV-positive cohort (versus 67.3% in the healthy volunteer group) were 25-hydroxy vitamin D deficient (< 30ug/L).
**Conclusions:** The observed prevalence of low BMD in our Singaporean HIV cohort was similar to those in the US, Europe as well as Taiwan and Japan. Surprisingly, we did not observe any difference in prevalence of low BMD between the HIV-positive versus healthy groups. We postulate that the high background prevalence of low BMD and vitamin deficiency in the Singapore population may have attenuated the relative contribution of HIV and its treatment on the pathogenesis of osteoporosis.

## WEPEB091

### CONTRIBUTION OF T CELLS TO RANKL/OPG IMBALANCE AND BONE LOSS IN HIV INFECTION

K. Titanji[1], A. Vunnava[2], A.N. Sheth[2], C. Delille Lahiri[2], J.L. Lennox[2], A. Foster[2], M.N. Weitzmann[2,3], I. Ofotokun[2]
[1]*Emory University School of Medicine, Medicine, Atlanta, United States,* [2]*Emory University School of Medicine, Atlanta, United States,* [3]*Veterans Administration Medical Center, Atlanta, United States*
*Presenting author email: mweitzm@emory.edu*

**Background:** HIV infection is associated with high rates of osteoporosis and bone fracture, which cause significant morbidity and mortality. Osteoporosis results from an imbalance in osteoclastic bone resorption relative to osteoblastic bone formation, leading to net bone loss. Osteoclast formation is regulated primarily by the ratio of the key osteoclastogenic cytokine, receptor activator of nuclear factor-κB ligand (RANKL), to that of its physiological inhibitor, osteoprotegerin (OPG). We previously reported that HIV infection leads to a decline in B cell OPG and an increase in RANKL that correlates significantly with loss of bone mineral density (BMD). Although normal human primary CD4+ T cells can synthesize OPG *in vitro*, and activated T cells are an established source of RANKL *in vivo*, the contribution of T cells to RANKL/OPG imbalance in HIV infection has not been previously studied.
**Methods:** The study population comprised men and women $\geq$ 30 $\leq$ 50 years of age, 58 HIV-uninfected (48.3% Male and 82.5% Black) and 62 antiretroviral therapy-naive HIV-infected (69.4% Male and 88.7% Black). Baseline CD4 count 149 (66,235) [Mean (Q1, Q3)]. PBMC were analyzed for expression of intracellular T cell RANKL and OPG, and T cell proliferation (Ki-67 expression) and activation (CD27 and CD69 expression) were quantified by flow cytometry.
**Results:** Here we show a significant (p=0.0005) decline in the percentage of OPG-producing T cells in HIV-infected individuals, and a strong trend toward increased T cell RANKL production (P = 0.07). We also found significant associations between the ratio of RANKL/OPG and T cell activation (CD69 expression) in CD4+ (r = 0.32, P = 0.0008) and CD8+ (r = 0.37, P < 0.0001) T cells.
**Conclusions:** Although B cells are the dominant source of basal OPG, we demonstrate for the first time that T cells also significantly contribute to OPG levels, and this T cell OPG production is reduced in HIV infection. We further show that the expanded proportion of activated T cells in HIV-infected patients produced more RANKL, leading to an increased RANKL/OPG ratio. These changes create conditions favorable for, and may contribute to, enhanced bone loss in HIV infection.

### PREVALENCE OF ABNORMAL BASELINE LABORATORY TESTS AMONG HIV INFECTED PREGNANT WOMEN INITIATED ON OPTION B+ BETWEEN OCTOBER 2012 AND OCTOBER 2015 AT MULAGO HOSPITAL, KAMPALA, UGANDA

E.C. Namara-Lugolobi[1], Z. Namukwaya[1], A. Kakande[1], A.S. Akasiima[1], I. Bangisibaano[1], S. Kamya[1], J. Byamugisha[2], P. Musoke[1,3], M. Nolan[1]
[1]*Makerere University - Johns Hopkins University Research Collaboration, Kampala, Uganda,* [2]*Makerere College of Health Sciences, Department of Obstetrics and Gynecology, Kampala, Uganda,* [3]*Makerere College of Health Sciences, Department of Pediatrics, Kampala, Uganda*
*Presenting author email: enlugolobi@mujhu.org*

**Background:** WHO recommends 'Option B+'; initiating lifelong Antiretroviral Therapy (ART) among all HIV-infected pregnant women. Baseline laboratory investigations are recommended to determine baseline function and preexisting morbidities that may require dose adjustments or an alternative to recommended first line regimen of TDF/3TCF/EFV. We describe the prevalence of anemia and abnormal renal and liver function among women eligible for OPTION B+ at Mulago National Referral Hospital in Kampala in Uganda to inform optimal baseline monitoring and clinical management.
**Methods:** We reviewed medical records for all pregnant women newly initiated on ART over a three year period to 31st October 2015 and identified those with laboratory results. Complete blood count (CBC), liver and renal function tests were done as routine baseline tests. The DAIDS toxicity tables were used to define abnormal levels for hemoglobin (HB) and serum Alanine Transaminase (ALT). The Cockcroft-Gault formula was used to determine serum creatinine clearance (SCC) with normal serum creatinine clearance defined as ≥90ml/min.
**Results:** There were 2219 HIV-infected women who newly initiated ART during pregnancy. However of these, 2174 had HB results, 1799 had ALT results and 1724 had weight, age and creatinine to allow calculation of creatinine clearance.

| DAIDS Grades of toxicities | | Normal n (%) | Grade 1 (Mild) n(%) | Grade 2 (Moderate) n(%) | Grade 3 (Severe) n (%) | Grade 4 (Life threatening) n(%) |
|---|---|---|---|---|---|---|
| Hemoglobin | Range | >10g/dl | 8.5 - 10g/dl | 7.5 - 8.4g/dl | 7.4 - 6.5g/dl | <6.5g/dl |
| N = 2174 | | 1962 (90.3%) | 162 (7.5%) | 27 (1.2%) | 6 (0.3%) | 17 (0.8%) |
| ALT | Range | < 1.25xULN | 1.25-2.5xULN | 2.5 - 5xULN | 5-10xULN | > 10 ULN |
| N = 1799 | | 1771(98.4%) | 23 (1.4%) | 4 (0.2%) | 1 (0.1%) | 0 (0%) |

*[Table 1: DAIDS toxicity grades for HB and ALT]*

| Renal function | Normal ≥90mls/min | Slightly reduced SCC (60 - 89 mls/min) | Moderately reduced SCC (59 - 30 mls/min) | Severely reduced SCC (29 - 15 mls/min) | Renal failure < 15 mls / min |
|---|---|---|---|---|---|
| Baseline creatinine clearance | 1610 (93.4%) | 101 (5.9%) | 8 (0.5%) | 4 (0.2%) | 1 (0.1%) |

*[Table 2: Creatinine clearance categories for 1724 pregnant women initiated on Option B+]*

**Conclusions:** The prevalence of anemia was common at ~10%. However morbidities that would require dose modifications or use of alternative regimens to the recommended TDF/3TC/EFV were uncommon; with 0.8% prevalence of at least moderate renal function impairment and 0.1% of grade 3 ALT with liver dysfunction. The high prevalence of anemia supports the use of AZT-sparing regimens as the first line regimen accompanied by ongoing management of anemia during pregnancy. This data suggests that baseline renal function should be considered as a routine to allow for timely switch to a renal sparing regimen or identifying those patients who require ongoing monitoring.

### IS URINARY NEUTROPHIL GELATINASE-ASSOCIATED LIPOCALIN A PREDICTIVE MARKER OF KIDNEY DYSFUNCTION IN HIV-INFECTED PATIENTS?

F. Sabbatini[1], G. Castoldi[2], A. Bandera[1], A. Muscatello[1], P. Mariani[2], N. Squillace[1], V. Perlangeli[3], M.L. Carati[3], A. Stella[2], A. Gori[1]
*[1]San Gerardo Hospital, Milano-Bicocca University, Infectious Diseases, Monza, Italy, [2]San Gerardo Hospital, Milano-Bicocca University, Nephrology Unit, Monza, Italy, [3]San Gerardo Hospital, Milano-Bicocca University, Biochemistry Laboratory, Monza, Italy*
*Presenting author email: f.sabbatini@hsgerardo.org*

**Background:** Loss of kidney function is common in HIV-infection; early predictive markers of this condition are needed. Urinary Neutrophil Gelatinase-Associated Lipocalin (uNGAL), is a marker of tubular damage successfully employed in assessing acute kidney injury. Our study investigates if variation of uNGAL could be predictive of kidney function loss over time in HIV-patients.
**Methods:** Prospective observational study, mean follow up 192 weeks, patients from San Gerardo Hospital in Monza, Italy. Inclusion criteria: HIV infection, baseline eGRF >60 ml/min. Exclusion criteria: Diabetes, Hypertension, Dyslipidemia, pre-existing proteinuria. Urinary albumine to creatinine ratio (A/C), together with uNGAL and its standardized value (Std-uNGAL: uNGAl/uCreatinine) were determined at baseline and after 48 weeks. Plasma creatinine was measured regularly until 192 weeks. Wilcoxon signed-rank test was used to compare the within patients variation. For eGFR, a repeated measures analysis of variance was applied in order to evaluate differences at baseline, week 48 and week 192. Spearman correlation coefficient was considered to evaluate potential associations between urinary and renal function markers.
**Results:** Characteristics in **Table1**. 89 patients enrolled; Median uNGAL (and its standardized values) significantly increased during follow up (from 10.3 ng/ml [6.5-15.2] at baseline to 18.1 ng/ml [10.2-32.8] at w48, p< 0.001), while urinary A/C ratio did not show significant variation. After 192 weeks eGFR showed a significant worsening from baseline (median values of about 106, 96, 88 ml/min, at baseline, week 48 and week 192, respectively).
No association was found between uNGAL levels and clinical characteristics of patients. No significant associations were found between baseline uNGAL and between uNGAL variations among 48 weeks and eGFR values at 192 weeks.

| Age (years) | 45 (41-48) |
|---|---|
| Males | 79 (88.8) |
| AIDS (CDC stage C) | 22 (24.7) |
| CD4 (absolute number/µL) | 442 (299-617) |
| Fasting glucose (mg/dl) | 86 (81-95) |
| Triglycerides (mg/dl) | 139 (111-227) |
| Total CH (mg/dl) | 172 (150-196) |
| ART treated | 77 (86.5) |
| TDF treatment | 37 (41.6) |
| Smoking | 40 (44.9) |

*[Table 1.Demographic characteristics at baseline (Median,Q1-Q3 or N°(%)]*

**Conclusions:** uNGAL is not likely to be a predictive marker of eGFR decline over time in HIV positive individuals without classical risk factors for CKD. Intrinsic features of this marker make it probably unsuitable for monitoring chronic kidney disorders.

### ASSOCIATION OF MARKERS OF GUT MICROBIAL TRANSLOCATION AND INFLAMMATION WITH INSULIN RESISTANCE IN HIV-INFECTED PERSONS

M. Reid[1], Y. Ma[2], R. Scherzer[2], A. French[3], M. Plankey[4], P. Tien[5]
*[1]UCSF, Division of ID/HIV, San Francisco, United States, [2]Veterans Affairs Medical Center, San Francisco, United States, [3]Stroger Hospital of Cook County, CORE Center, Chicago, United States, [4]Georgetown University Medical Center, Dept Medicine, Division Infectious Diseases, Washington, United States, [5]UCSF, VAMC, Infectious Disease Section, San Francisco, United States*
*Presenting author email: michael.reid2@ucsf.edu*

**Background:** Greater insulin resistance has been reported in HIV-infected persons in the modern HAART era, but the causes are unclear. Microbial translocation resulting from the destruction of gut lymphoid tissue early in HIV infection is thought to be a driver of immune activation and inflammation in HIV-infected adults. Gut microbial translocation (associated with obesity) is also thought to alter glucose metabolism. We hypothesized that markers of microbial translocation, monocyte activation, and inflammation would be independently associated with insulin resistance in HIV-infected adults.
**Methods:** Cryopreserved blood specimens collected from 502 HIV+ and 272 HIV- participants of the Study of Visceral adiposity, HIV, and HCV: Biologic Mediators of Steatosis (VAHH) and the hepatic steatosis and fibrosis substudies of the Women's Interagency HIV Study (WIHS) were tested for intestinal fatty acid binding protein (i-FABP), a marker of gut barrier integrity; soluble (s) CD14 and CD163, both markers of monocyte activation, and interleukin 6 (IL-6), an inflammatory cytokine. The association of these markers with insulin resistance estimated by the Homeostasis Model Assessment (HOMA-IR) was evaluated in a cross-sectional analysis using multivariable linear regression after controlling for traditional and HIV-related factors.
**Results:** HIV-infected participants had higher levels of i-FABP (median 871 vs. 541 pg/ml; p< 0.001), sCD14 (1.64 vs. 1.44 ng/ml; p< 0.001), CD163 (549 vs. 409 ng/ml; p=0.013) and IL-6 (1.0 vs. 0.86 pg/ml; p< 0.001) levels compared with controls, but little difference in HOMA-IR values (1.48 vs. 1.49; p=0.60). In controls, i-FABP, sCD14, CD163, and IL-6 showed little association with HOMA-IR in unadjusted or adjusted analysis. By contrast, in HIV-infected adults, higher CD163 levels (per doubling) were associated with 34% greater HOMA-IR (95% CI: 23%-45%). After multivariable adjustment, CD163 remained associated with 35% greater HOMA-IR (95%CI: 7%-69%). There was little association of i-FABP, sCD14, and IL-6 with HOMA-in unadjusted or adjusted analysis.
**Conclusions:** In HIV-infected adults, higher CD163 levels were independently associated with greater insulin resistance, but other markers of gut epithelial integrity, monocyte activation or systemic inflammation showed little association. Whether higher CD163 levels are a result of gut microbial translocation or a consequence of an alternate pathway needs study in prospective studies of HIV-infected adults.

## WEPEB095

### NARINGIN REVERSES HIV-1 PROTEASE INHIBITORS-ASSOCIATED PANCREATIC BETA-CELL DYSFUNCTION *IN VITRO*

S. Nzuza, P. Owira
*University of KwaZulu-Natal, Department of Pharmacology, Durban, South Africa*
*Presenting author email: 207508019@stu.ukzn.ac.za*

**Background:** Chronic exposure to HIV-1 Protease Inhibitors (PIs) has been associated with pancreatic β-cell dysfunction and impairment of insulin secretion. PIs have been suggested to induce β-cell dysfunction through increasing oxidative stress leading to impaired insulin secretion. The study investigated whether naringin, a naturally occurring antioxidant, could reverse PIs-induced β-cell dysfunction by reducing oxidative stress.
**Methods:** RIN-5F cells were exposed to nelfinavir (10 µM), saquinavir (10 µM), atazanavir (20 µM) 24 hr with or without glibenclamide (10 µM) in the presence of varying glucose concentrations (11-25 mM) then harvested and subjected to biochemical assays for the measurement of insulin levels, lipid peroxidation, ATP generation, Glutathione levels (GSH), Superoxide dismutase (SOD) and caspase-3 and -9 activities. Cells were further exposed to naringin (0-50 µM) in the presence of 11 mM glucose for 24 hr then subjected to insulin ELISA for insulin secretion determination. To investigate the role of PIs relative to naringin on RIN-5F cells, the cells were exposed to nelfinavir (10 µM), saquinavir (10 µM) and atazanavir (20 µM) with or without naringin (10 µM) also in the presence of 11 mM for 24 hr and similarly subjected to biochemical assays.

**Results:** PIs significantly ($p < 0.05$) reduced insulin secretion and ATP production, increased lipid peroxidation, SOD and caspase-3 and -9 activities and also reduced GSH in a glucose dependent manner. These effects were reversed by glibenclamide. Naringin (0-50 µM) caused dose-dependent increased in insulin secretion and also reduced lipid peroxidation, SOD, caspase-3 and -9 activities, increased GSH and ATP levels in cells that were exposed to PIs.
**Conclusions:** Naringin ameliorated PIs-induced impairment of β-cell dysfunction by reducing oxidative stress.

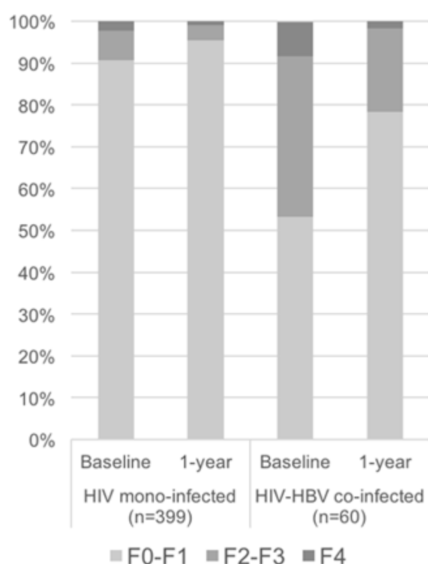
### IMPACT OF ANTIRETROVIRAL THERAPY ON LIVER STIFFNESS AMONG ZAMBIAN ADULTS WITH HIV-HBV CO-INFECTION AND HIV MONO-INFECTION

M. Vinikoor[1,2], E. Sinkala[3], R. Chilengi[2], L. Mulenga[3], B. Chi[4], Z. Zyambo[2], C. Hoffmann[5], M.-A. Davies[6], M. Egger[7], G. Wandeler[7], IeDEA-Southern Africa
*[1]University of Alabama at Birmingham, Lusaka, Zambia, [2]Centre for Infectious Disease Research in Zambia, Lusaka, Zambia, [3]University of Zambia, Lusaka, Zambia, [4]University of North Carolina at Chapel Hill, Chapel Hill, United States, [5]Johns Hopkins University, Baltimore, United States, [6]University of Cape Town, Cape Town, South Africa, [7]University of Bern, Bern, Switzerland*
*Presenting author email: mjv3@uab.edu*

**Background:** We assessed hepatic elastography change during 1-year of antiretroviral therapy (ART) among HIV-infected patients with and without viral hepatitis B (HBV) in Zambia.
**Methods:** HIV-infected ART-eligible adults in Lusaka were enrolled in a cohort with baseline screening for HBV and hepatitis C co-infection, measurement of CD4+ count, and alanine transaminase (ALT). Liver stiffness was measured using transient elastography at ART initiation and 1-year. Using established thresholds and stratified by HBV status, we categorized liver stiffness by Metavir fibrosis stages. We described the distribution of liver disease over time and modeled the predictors of a reduction in liver disease by 1+ stage using multivariable regression.
**Results:** Among 799 patients enrolled, 41 (5.1%) died, 18 (2.2%) withdrew/transferred to another facility, and 49 (6.1%) were lost during the first year of follow-up. Of 691 in care at 1-year, 459 (399 HIV mono-infected and 60 HIV-HBV co-infected) had serial elastography and were analyzed. Median age was 34 years (interquartile range [IQR], 30-41), 53% were women, median CD4 was 240 cells/mm$^3$ (IQR, 128-347), and 449 (97.2%) overall and all HIV-HBV patients received efavirenz+tenofovir+emtricitabine. No hepatitis C was found. At baseline, 2.3% of mono-infected and 8.3% of co-infected patients had liver stiffness consistent with cirrhosis. Among those with baseline F2+ measurements, stiffness reduced by 1+ stage in most HIV and HIV-HBV patients (Figure). Patients with WHO stage 3/4 (adjusted odds ratio [AOR], 1.84, 95% confidence interval [CI], 0.93-3.65), 50+ year-olds (AOR 5.32, 95%CI, 1.66-17.08), HBV patients (AOR 5.23, 95%CI, 2.51-10.90), and those with elevated baseline ALT (AOR, 3.04; 95%CI, 1.47-6.30) were more likely to have a 1-stage improvement.



*[Change in hepatic stiffness among HIV and HIV-HBV patients in Zambia over 1-year of ART]*

**Conclusions:** Hepatic stiffness decreased in both HIV and HIV-HBV during the first year of ART in Zambia, particularly in those with older age and blood markers of liver inflammation, supporting liver monitoring and prioritization of tenofovir-containing ART for HIV-HBV patients.

## WEPEB097

### NON-INVASIVE SERUM MARKERS SUGGEST BENEFIT FOR EARLY ART INITIATION ON LIVER FIBROSIS PROGRESSION WITHIN THE START STUDY

G. Matthews[1], J. Neuhaus[2], J. Rockstroh[3], L. Peters[4], F. Gordin[5], A. Arenas-Pinto[6], C. Emerson[7], K. Marks[8], J. Hidalgo[9], R. Castro[10], C. Stephan[11], N. Kumarasamy[12], S. Emery[13], on behalf of the INSIGHT/START Study Group
*[1]Kirby Institute, Sydney, Australia, [2]University of Minnesota, Minneapolis, United States, [3]University of Bonn, Bonn, Germany, [4]CHIP, Copenhagen, Denmark, [5]VA Medical Center, Washington, DC, United States, [6]University College London, London, United Kingdom, [7]Belfast Healthcare Trust, Belfast, Ireland, [8]Well Medical College of Cornell University, New York, United States, [9]Via Libre IMPACTA, Lima, Peru, [10]Hospital Joaquim Urbano, Oporto, Portugal, [11]Johann Wolfgang Goethe University Hospital, Frankfurt, Germany, [12]YRGCARE Medical Center VHS, Chennai, India, [13]Kirby Institute, UNSW, Sydney, Australia*
*Presenting author email: juergen.rockstroh@ukb.uni-bonn.de*

**Background:** Liver disease remains a major cause of morbidity in HIV infected individuals globally. The role of ART in limiting or contributing to liver fibrosis is unclear. The Strategic Timing of Antiretroviral Treatment (START) study presents an ideal opportunity to examine the effect of early or delayed ART on changes in parameters of liver health in this population.
**Methods:** Liver fibrosis was assessed using annual biomarkers by two non-invasive algorithms: the APRI and FIB-4 scores. All START participants with both serum markers available were included. Significant fibrosis ($F\geq 2$) was determined by an APRI score >0.5 or FIB-4>1.45. Prevalence and predictors of fibrosis were determined.
**Results:** 4582 participants were included (n=2274 immediate ART, n=2308 deferred). 3.7% and 2.8% were hepatitis C and B co-infected respectively. Median FIB-4 score was 0.79 (IQR 0.58, 1.07) and median APRI was 0.27 (0.21, 0.37). Significant fibrosis was present at BL in 10.8% of participants by FIB-4 and 10.4% by APRI; 15.6% of participants had significant fibrosis by either test but only 5.6% by both tests. From adjusted models, predictors of significant fibrosis using FIB-4 were older age, male gender, black race, lower BMI, hepatitis co-infection, lower CD4 count, lower albumin, lower cholesterol, and history of liver disease, whereas for APRI older age, black race, high income country, hepatitis co-infection, lower CD4, higher bilirubin, lower LDL, and history of liver disease. In those with F0-1 at BL over 10,466 person years of follow-up, significant fibrosis using FIB-4 developed in 10.8% of participants (8.2% immediate arm, 13.5% deferred arm, p< 0.001), and by APRI in 14.8% of participants (13.3% immediate ARM, 16.3% deferred arm, p=0.006).
**Conclusions:** Noninvasive markers indicating the presence of liver fibrosis were present at BL in approximately 10% of START participants. Although correlation between markers was not consistent, age, black race, hepatitis co-infection, lower CD4 and liver disease history were associated with both markers as predictors of fibrosis. Scores indicating the development of significant fibrosis were observed in 10-15% of participants over follow-up and more frequently in the deferred arm. Immediate ART initiation may reduce the incidence of liver fibrosis progression in HIV positive people with CD4>500.

## WEPEB098

### MPREVALENCE AND COFACTORS OF NONALCOHOLIC FATTY LIVER DISEASE DIAGNOSED BY TRANSIENT ELASTOGRAPHY WITH CONTROLLED ATTENUATION PARAMETER IN HIV MONO-INFECTION

E. Vuille-Lessard[1], B. Lebouche[2], L. Lennox[2], M. Klein[2], G. Sebastiani[2]
*[1]McGill University Health Centre, Montreal, Canada, [2]Chronic Viral Illness Service, McGill University Health Centre, Montreal, Canada*
*Presenting author email: elise.vuille-lessard@mail.mcgill.ca*

**Background:** Nonalcoholic fatty liver disease (NAFLD) is the most common liver disease in North America and a leading indication to liver transplantation. Due to chronic use of antiretrovirals, frequent metabolic comorbidities and chronic inflammation, HIV+ persons are at very high risk for NAFLD. Nevertheless, data on NAFLD in HIV mono-infection are scarce.
**Methods:** This was a prospective cohort study of HIV mono-infected adults without significant alcohol intake or coinfection with hepatitis B or C. We investigated the prevalence and cofactors of NAFLD and liver fibrosis by transient elastography (TE) and associated controlled attenuation parameter (CAP). Any grade (involving >10% of hepatocytes), significant (>30%) and severe (>60%) NAFLD were defined as

CAP≥232, ≥260 and ≥292 dB/m, respectively. Significant liver fibrosis and cirrhosis were defined as TE measurement ≥8 and ≥13 kPa, respectively. Cofactors of NAFLD and liver fibrosis were determined using logistic regression analysis. Models were adjusted for age, gender, duration of HIV infection, hypertension, use of protease inhibitors, CD4 count, ALT, HDL cholesterol, triglycerides.
**Results:** 300 consecutive patients (mean age 50 years, 77% men; mean CD4 570, 90% on antiretrovirals) were included. CAP identified any grade, significant and severe NAFLD in 55.3%, 33.7% and 16.3% of cases, respectively. Significant liver fibrosis and cirrhosis were found in 10% and 2.3% of cases, respectively. Multivariate analysis results are reported in Table 1. After adjustments, predictor of any grade NAFLD was BMI >25 kg/m$^2$, and predictors of significant liver fibrosis were BMI > 25 kg/m$^2$ and diabetes, whereas black ethnicity was found to be protective.

| | Any grade NAFLD | Significant liver fibrosis |
|---|---|---|
| | (CAP ≥ 232 dB/m) | (TE ≥ 8kPa) |
| *Variable* | *Adjusted OR (95% CI)* | |
| Black non Hispanic ethnicity | - | 0.042 (0.00-0.50)* |
| BMI > 25 kg/m2 | 1.29 (1.16-1.43)** | 1.16 (1.02-1.33)* |
| Diabetes | - | 6.30 (1.43-27.85)* |
| CAP ≥ 232 dB/m | - | 1.02 (1.00-1.03)* |
| TE ≥ 8 kPa | 1.28 (1.04-1.58)* | - |

*[Table 1. *p< 0.05; **p< 0.001]*

**Conclusions:** NAFLD diagnosed by TE with CAP is frequent in HIV mono-infected persons, particularly in those with obesity. Significant liver fibrosis is also a frequent occurrence, especially in those with obesity and diabetes. Screening for NAFLD and liver fibrosis with non-invasive methods should be implemented in this population with the ultimate aim of establishing early interventions and preventing long-term complications of liver disease.

## WEPEB099

### FIRST WORLD REPORT OF HIV-POSITIVE LIVER DONATION TO AN HIV-POSITIVE RECIPIENT: SHORT-TERM OUTCOME

A. Calmy[1], E. Giostra[2], C. Van Delden[3], C. Junet[4], L. Rubbia-Brandt[5], S. Yerly[6], J.-P. Chave[7], C. Toso[8], T. Berney[9]
*[1]Geneva University Hospitals, Division of Infectious Disease, HIV Unit, Geneva, Switzerland, [2]Geneva University Hospitals, Division of Gastroenterology, Geneva, Switzerland, [3]Geneva University Hospitals, Division of Infectious Disease, Transplantation Unit, Geneva, Switzerland, [4]Private Practice, Geneva, Switzerland, [5]Geneva University Hospitals, Division of Clinical Pathology, Geneva, Switzerland, [6]Geneva University Hospitals, Virology Laboratory, Geneva, Switzerland, [7]Private Practice, Lausanne, Switzerland, [8]Geneva University Hospitals, Division of Digestive Surgery, Geneva, Switzerland, [9]Geneva University Hospitals, Department of Surgery, Transplant Program, Geneva, Switzerland*
*Presenting author email: acalmy@gmail.com*

**Background:** In most countries, transplantation of organs from HIV-positive donors is illegal in order to prevent HIV transmission to the recipient. Since 2007, the Swiss Transplantation Law allows organ transplantation from an HIV-positive donor to an HIV-positive recipient independent of previous anti-HIV therapies. We report the first liver transplantation from an antiretroviral treatment (ART)-experienced HIV-positive deceased donor to an ART-experienced HIV-infected recipient in Switzerland.
**Methods:** A 53-year-old Caucasian male, diagnosed HIV-positive in 1986 (CDC, stage B3) and successfully treated since 1992 with an anti-HIV regimen (the latest being a combination of rilpivirine/tenofovir/emtricitabine for HIV and HBV infections), received an HIV-positive liver transplant (CMV D+, R -) from a donor after brain death in October 2015. The donor was HIV-infected since 1989 (CDC, stage C3) treated with dolutegravir, tenofovir and emtricitabine with undetectable viremia (HIV-RNA < 20 copies) despite multiple nucleoside retrotranscriptase inhibitor resistance mutations including M41L, E44D, T69S M184V, L210W and T215Y. He had provided written explicit consent for organ donation and died of a cerebellar haemorrhage.
**Results:** The liver graft showed immediate function, and no medical or surgical complications occurred. The immunosuppressive regimen associated tacrolimus and mycophenolate mofetil. The patient was discharged on Day 22 post-transplant. The recipient's antiretroviral therapy was modified at the time of transplant by adding raltegravir and enfuvirtide to his ongoing regimen of rilpivirine/tenofovir/emtricitabine. This regimen covered the resistance mutation pattern of the donor and recipient. Raltegravir and enfuvirtide had no interactions with immunosuppressive drugs, and target plasma levels of tacrolimus were achieved at a dose similar to that used in HIV-negative transplant recipients. No rejection episodes occurred. Plasma HIV-RNA remained undetectable throughout the four-month follow-up.
**Conclusions:** We report here the first liver transplantation from an ART-experienced HIV+ donor to an ART-experienced HIV + recipient. Despite resistance mutations in both the donor and recipient's viruses the HIV-infection remained controlled. This encouraging observation should lead policy makers to lift the restriction limiting the transplantation of organs from ART-experienced HIV positive donors towards HIV-positive recipients.

## WEPEB100

### LIVER TOLERANCE OF INTEGRASE INHIBITORS-CONTAINING ANTIRETROVIRAL THERAPY IN FRANKFURT HIV COHORT

P. de Leuw[1], J. Severain[1], N. Filmann[2], A. Haberl[1], G. Schüttfort[1], C. Stephan[1], T. Wolf[1]
*[1]HIV-Center, University Hospital, Department of Infectious Diseases, Frankfurt am Main, Germany, [2]Institute of Biostatistics and Mathematical Modeling, Department of Medicine, Goethe University, Frankfurt am Main, Germany*
*Presenting author email: jan.severain@stud.uni-frankfurt.de*

**Background:** Liver toxicity is important in the selection of antiretroviral therapy and post marketing data of patients on dolutegravir-containing regimes are scarce.
**Methods:** Data from the HIV clinical cohorts at Goethe University Frankfurt, Germany was evaluated for liver enzyme elevations in patients, who initiated dolutegravir (DTG, n=81), elvitegravir (EVG, n=11) or raltegravir (RAL, n=104)-containing regimens prior to November, 1st, 2015. 31 patients were HCV-coinfected. Study visits were at baseline, week 4, 12, 36 and 52. Statistics were done with non-parametrical tests (Wilcoxon-matched-pairs-test, Mann-Whitney-test, Kruskal-Wallis-test, Page's-L-test, Friedman-test, Van-Elteren-test). P-values < 0.05 were considered as significant.
**Results:** Median Baseline ALT levels were 30.5 IU/ml (range 10-181) in the DTG group, 35 IU/ml (r:15-134) in the EVG group, and 28 IU/ml (r:8-210) in the RAL group (p>0.1). We observed a significant increase in ALT-levels in the DTG-group (Median change 2 IU/ml (r:39-198), p=0.045) between baseline and week 4. ALT-levels declined significantly (p=0.001) consecutively and there was no difference between baseline levels and at 52 weeks (Median 23 (12-93), p>0.1). No significant change in ALT values was observed in the RAL or EVG group (p>0.1) during all study timepoints up to week 52. Median Baseline GGT levels were 34 (r:10-206) in the DTG group, 31 (r:11-219) in the EVG group, and 35 (r:10-740) in the RAL group (p>0.1); during the course, there was a significant decrease observed for DTG and RAL-groups (p=0.001, p>0.001), and a not significant decreasing trend for EVG-group (p=0.095). Compared to baseline, GGT-levels were significantly different after 52 weeks on therapy for DTG and RAL groups: median values = 26 (r:14-128; DTG group; p=0.036), 19 (r:10-320; EVG group; p>0.1), and 28 (r:9-264; RAL group; p=0.013). No significant difference in liver enzyme-levels between HCV-coinfected and HIV-monoinfected patients was observed (p>0.1) in any of the three treatment groups during 52 weeks of therapy.
**Conclusions:** The liver tolerability seems to be well on Integrase inhibitors-containing therapies. Patients on dolutegravir are at an increased hazard of developing elevated ALT levels at week 4, that alleviated thereafter up to week 52.

# AGEING IN PERSONS WITH HIV (INCLUDING FRAILTY)

## WEPEB101

### DIFFERENCES IN HEALTH-RELATED QUALITY OF LIFE HIGHLIGHT THE DIFFERENT EMPHASES OF 3 FRAILTY INSTRUMENTS IN OLDER AUSTRALIAN MEN LIVING WITH HIV

H.L. Yeoh[1], A. Cheng[1,2], C. Palmer[2,3], S. Crowe[1,2,3], J. Hoy[1,2]
*[1]Monash University, Melbourne, Australia, [2]The Alfred Hospital, Melbourne, Australia, [3]Burnet Institute, Melbourne, Australia*
*Presenting author email: hyeo6@student.monash.edu*

**Background:** As the Australian HIV population ages, there is increasing recognition of the need to identify frailty, a condition of physical and psycho-social vulnerability. The prevalence of frailty in the Australian HIV population is unknown. Thus, the aim of this study was to compare three different frailty instruments and to measure health-related quality of life (HRQOL), in order to better characterise the utility of each tool in people living with HIV (PLHIV).
**Methods:** HIV+ men aged over 50-years, on ART for >6 months were enrolled between March and November 2015 in a Melbourne HIV referral centre. Frailty was assessed using the Frailty Phenotype (FP), the Frailty Index (FI), and the Edmonton Frail Scale (EFS). Participants were assessed on standard quality of life scales (RAND 36-Item Health Survey 1.0/SF-36). The distribution of frail subjects in relation to physical and mental component scores were visualised.

**Results:** Ninety three study participants were evaluated: median age 60 years; 95% Caucasian, 92% had undetectable viral load. Using the FP, 11% were frail, 53% prefrail and 37% robust. Median FI score was 0.11, with 23% frail, 77% non-frail. Using the EFS, 12% were frail, 88% non-frail. All frailty instruments correlated with all subscales and components of HRQOL. The FP was skewed towards low physical component summary scores (PCS), but high mental component summary scores (MCS). The FI identified an equal number of participants who had high PCS but low MCS, and vice versa. Only the EFS identified frail participants who had equally-matched PCS and MCS.
**Conclusions:** This the first reported prevalence of frailty in Australian PLHIV. The FP conceptualises frailty in more physical terms, the FI frames frailty in varied terms, and the EFS describes a frailty that has a balanced impact on both physical and mental components quality of life, and is designed to be clinically implemented. Regardless of frailty instrument, frailty is associated with poor HRQOL. Each instrument is significantly different, however, consensus on the definition of frailty is required to adequately manage older PLHIV with chronic disease.

## WEPEB102

### FRAILTY IN MIDDLE-AGED AND OLDER HIV-INFECTED INDIVIDUALS IN CHINA

Y. Ding[1], H. Lin[2], S. Duan[3], M. Gao[1], N. He[1]
*[1]School of Public Health, Fudan University, Epidemiology, Shanghai, China, [2]Taizhou City Center for Disease Control and Prevention, Taizhou, China, [3]Dehong Prefecture Center for Disease Control and Prevention, Mangshi, China*
*Presenting author email: yingyding@gmail.com*

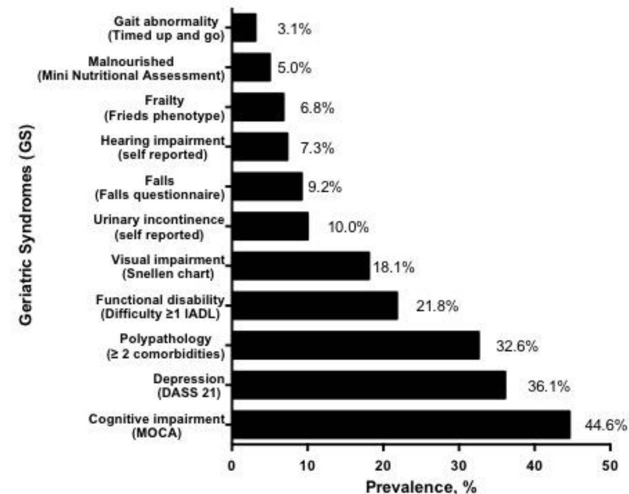
**Background:** Increasing evidence suggests that HIV infection is associated with early occurrence of frailty. We determined the prevalence and predictors of frailty in a sample of middle-aged and older HIV-infected individuals in China.
**Methods:** This study was conducted in Taizhou prefecture, Zhejiang province, China. 345 HIV-infected participants over 40 years from the National Observational HIV Cohort were consecutively enrolled between June 2014 and May 2015, and compared with 345 age-, gender- and education- frequency-matched HIV-uninfected individuals. Frailty was assessed by the Onen modified version of Fried criteria (weight loss, low physical activity, exhaustion, weak grip strength, and slow walking time). Presence of at least three out of five criteria was defined as frailty and presence of 1-2 was defined as prefrailty. Multivariable ordinal logistic regression was used to investigate the factors associated with prefrailty/frailty.
**Results:** HIV-infected individuals were more likely to be frail (6.1% vs. 0.6%) and prefrail (28.1% vs. 11.9%) than uninfected individuals (*P* trend < 0.01), and this association remained statistically significantly after adjustment for confounding variables (OR=2.26; 95% CI: 1.43-3.56). Within the HIV-infected group, older age (OR=1.36 per 10 years increase; 95% CI:1.03-1.78), current BMI < 18.5 kg/m$^2$ (vs. 18.5-24.9 kg/m$^2$) (OR=2.46; 95% CI: 1.09-5.59), more depressive symptoms (OR=1.28; 95%CI:1.20-1.35), having one or more comorbidities (OR=3.03; 1.71-5.35), longer duration since HIV diagnosis (OR=1.13 per 1 year increase; 95% CI:1.02-1.24), and having HIV-associated neurocognitive disorder using the International HIV Dementia Scale (OR=1.92; 95% CI:1.12-3.30) were independently associated with higher risk of prefrailty/frailty whereas current BMI ≥ 25 kg/m$^2$ (OR=0.44; 95% CI:0.21-0.92) and regular exercise (OR=0.53; 95% CI:0.28-0.99) were associated with lower risk of prefrailty/frailty.
**Conclusions:** HIV infection is associated with prefrailty/frailty in middle-aged and older HIV-infected individuals. Our findings suggest that longer duration of HIV infection increases the risk of frailty, but being overweight/obesity provides protective effect against frailty for HIV-infected individuals.

## WEPEB103

### HIGH PREVALENCE OF GERIATRIC SYNDROMES IN YOUNG TREATED HIV-INFECTED INDIVIDUALS

R. Rajasuriar[1,2], M.L. Chong[2], N.S. Ahmad Bashah[2], S.A. Abdul Aziz[2,3], M. McStea[4], I. Azwa[2,5], S.F. Omar[2,5], H. Sulaiman[2,5], P.S.M. Lai[6], S. Ponampalavanar[2,5], S. Kamaruzaman[4,5], A. Kamarulzaman[2,5], Malaysian HIV & Aging (MHIVA) Study Group
*[1]University of Malaya, Pharmacy, Kuala Lumpur, Malaysia, [2]University of Malaya, Centre of Excellence for Research in AIDS, Kuala Lumpur, Malaysia, [3]National University of Malaysia (UKM), Pharmacy, Kuala Lumpur, Malaysia, [4]University of Malaya, Malaysian Elders Longitudinal Research (MELOR), Kuala Lumpur, Malaysia, [5]University of Malaya, Medicine, Kuala Lumpur, Malaysia, [6]University of Malaya, Primary Care Medicine, Kuala Lumpur, Malaysia*
*Presenting author email: reena@um.edu.my*

**Background:** Geriatric syndromes (GS) represent multiple conditions which reflect the declining function of individuals and are associated with poor health outcomes. Though GS are generally assessed in the elderly, determinants of GS including substance abuse, social isolation, multi-morbidity and chronic inflammation are prevalent even in young adults living with HIV. Here, we characterised the prevalence and risk factors associated with GS in a cohort of ART-treated HIV-infected individuals with a diverse age-range.
**Methods:** Participants were selected among HIV-infected individuals attending the University Malaya Medical Centre, Malaysia. All participants were aged >25 years, had undetectable HIV RNA for at least 12 months and no acute illness at recruitment. Participants answered validated questionnaires and performed biochemical screening and physical examinations at a research clinic where a range of GS were assessed. Both clinical and socio-behavioural factors were explored using multivariate analysis to determine risk factors associated with GS expressed as a composite outcome (total score=11).
**Results:** We analysed 257 individuals with a median(IQR) age of 43 (37-50) years, 81% male, 72% Chinese, median(IQR) CD4 T-cell count and duration on ART were 536 (394-736) cells/ml and 5 (3-10) years, respectively. The prevalence of GS are as shown below.



*[Prevalence of geriatric syndromes (GS) among ART-treated HIV infected individuals]*

GS was evident even in young participants with 46% reporting two or more GS among 24-40 years, 64% among 41-55 years, 68% among 56-70 years, 100% among >71 years. Increasing GS correlated with increased risk of mortality (VACS index, p< 0.001), poorer quality of life scores (p< 0.001) and increased healthcare visits (past 12 months), (p< 0.001). In multivariate analysis, risk factors associated with increasing GS included increasing age (p< 0.001), history of AIDS-defining illness (p=0.034), low physical activity (p=0.034) and social isolation (p=0.028).
**Conclusions:** We found a high prevalence of GS in young HIV-infected individuals in our setting with both socio-behavioural and clinical factors contributing to its presence.

# IMMUNE RECONSTITUTION DISORDERS / IMMUNE RECONSTITUTION INFLAMMATORY SYNDROME (IRIS)

## WEPEB104

### IRON TRANSPORT BIOMARKERS ARE ASSOCIATED WITH HIV-ASSOCIATED IMMUNE ACTIVATION AND IMMUNE RECONSTITUTION ON ANTIRETROVIRAL THERAPY

J. Ya[1], B. Rodriguez[2], R. Kalayjian[2], M. Gallagher[2], A. Kallianpur[1,3]
*[1]Cleveland Clinic Lerner College of Medicine of Case Western Reserve University, Cleveland, United States, [2]Case Western Reserve University School of Medicine, Department of Medicine, Division of Infectious Diseases and HIV Medicine, Cleveland, United States, [3]Cleveland Clinic Lerner Research Institute, Department of Genomic Medicine, Cleveland, United States*
*Presenting author email: yaj@ccf.org*

**Background:** Persistent immune activation, despite antiretroviral therapy (ART), and the CD4 nadir may contribute to HIV-associated complications, including neurocognitive impairment, cardiovascular and kidney disease. We hypothesized that HIV-induced changes in iron transport may affect viral replication, immune activation, and CD4 recovery in HIV-infected individuals and examined associations of biomarkers of iron transport and iron stores with immune activation and immune recovery on ART.

**Methods:** We measured iron-related biomarkers (transferrin, ferritin, transferrin receptor, haptoglobin, and *beta*-2-microglobulin), iron stores (ferritin-transferrin-receptor index) and immune activation (CD40 ligand, CD40L) using validated commercial assays in plasma collected at enrollment (baseline) and again at a median of 48 weeks on-study in 60 HIV-infected adults from the Case Center for AIDS Research (CFAR) database who underwent regular follow-up and comprehensive data collection. Fifty-two participants were ART-näive at enrollment; 8 had begun ART within the previous year. Iron-biomarker associations with changes in CD4, CD4/CD8 ratio, and CD40L were evaluated by multivariable regression, adjusting for potential confounders.
**Results:** All study participants (median age 38, 18% female, median CD4 at baseline 304/mm$^3$, estimated duration of HIV infection 57 weeks), including 52 who first initiated ART on-study, had a median rise in CD40L of 348 pg/mL and in CD4 of 165 cells/mm$^3$. Ferritin (r=-0.49, p< 0.01), *beta*-2-microglobulin (r=-0.40, p< 0.01) and haptoglobin (r=-0.25, p=0.05) at baseline negatively correlated with CD4, and with VL and CD4 nadir (both p< 0.05). Although haptoglobin levels at baseline were positively associated with CD40L before and after adjustment for age and VL (β=3.4, p< 0.01), higher pre-ART haptoglobin predicted greater decline in CD40L 20-66 weeks after first initiating ART (adjusted β =-3.46, p=0.01). Lower baseline ferritin predicted CD4>500 cells/mm$^3$ post-ART (adjusted β=-0.003, p=0.03), and lower transferrin-receptor index (more replete iron status) was associated with higher CD4/CD8 ratio (adjusted β=-0.037, p=0.01) on ART.
**Conclusions:** Iron transport is associated with immune activation (CD40L) pre-ART and with change in CD40L within 20-66 weeks after first initiating ART. Lower pre-ART ferritin and higher iron stores during ART independently predicted better immune recovery in this sample. Iron status and iron transport in HIV-infected adults initiating treatment may contribute to long-term HIV outcomes.

## OTHER ADVERSE REACTIONS AND COMPLICATIONS OF ART

### WEPEB105

### THE ASSOCIATION OF HIV/HAART WITH CLINICAL AND BIOCHEMICAL INDICES IN AFRICAN WOMEN WITH PREECLAMPSIA

N.R. Maharaj[1], A. Chuturgoon[2], J. Moodley[3]
*[1]Prince Mshiyeni Memorial Hospital, Obstetrics and Gynaecology, Durban, South Africa, [2]University of KwaZulu Natal, Medical Biochemistry, Durban, South Africa, [3]University of KwaZulu Natal, Women's Health and HIV Research Unit, Durban, South Africa*
*Presenting author email: drray@vodamail.co.za*

**Background:** HIV/AIDS and pre-eclampsia contribute significantly to morbidity and mortality worldwide. However, the relationship between pre-eclampsia, HIV and HAART has not been adequately studied and remains controversial. Our objective was to determine whether the clinical and biochemical changes associated with pre-eclampsia are significantly altered in the presence of HIV infection and treatment with HAART.
**Methods:** Ninety eight women (45 HIV infected pre-eclamptic women on HAART, 53 uninfected pre-eclamptic women) were recruited and followed until delivery at a large South African hospital. A control group (45 normotensive HIV infected, 50 normotensive uninfected) was also recruited for comparison. Demographic data, clinical features, laboratory parameters and maternal and fetal outcomes were analysed.
**Results:** There were no significant differences in the clinical features and laboratory indices between the groups, except for gamma glutamyl transferase which was significantly elevated in the HIV/HAART group (*p*=0.001). Perinatal and maternal complications were similar and there were no maternal deaths. Obesity was prevalent in both groups.
**Conclusions:** The clinical features, laboratory indices, and complications among HIV infected pre-eclamptic women on HAART is similar to uninfected pre-eclamptic women. Current guidelines remain appropriate, however serial hepatic function tests are necessary. The prevention of obesity is also necessary to reduce long term cardiovascular complications associated with these conditions.

### WEPEB106

### TENOFOVIR ASSOCIATED RENAL DYSFUNCTION IN AFRICAN HIV PATIENTS ON RITONAVIR BOOSTED PROTEASE INHIBITOR REGIMEN: A RETROSPECTIVE MULTICENTER STUDY

M.J. Karoney[1], M.K. Koech[1], A.M. Siika[1], F.E. Vannobberghen[2], S.A. Walker[3], N.I. Paton[3]
*[1]Moi University, Medicine, Eldoret, Kenya, [2]London School of Hygiene and Tropical Medicine, London, United Kingdom, [3]Medical Research Council Clinical Trials Unit at University College London, London, United Kingdom*
*Presenting author email: karoneymercy@gmail.com*

**Background:** Tenofovir disoproxil fumarate (TDF) and ritonavir boosted protease inhibitors (PI/r) are frequently used together as standard second-line therapy in Africa. TDF may cause renal toxicity, especially when given with a PI/r in second-line therapy. We aimed to determine whether a TDF plus PI/r regimen was associated with greater decline in renal function compared to non-TDF and PI/r among African patients on second-line therapy.
**Methods:** We performed a retrospectivecohort study in patients randomized to the PI/r plus nucleoside reverse transcriptase inhibitors (NRTIs) arm of the Europe-Africa Research Network for Evaluation of Second-line Therapy (EARNEST) trial. The NRTIs (2 to 3) were clinician-selected without use of resistance testing. Exposure was defined as use of a TDF-containing NRTI regimen; the comparison group was those on a non-TDF regimen (all given with lopinavir/ritonavir). The primary outcome of interest wasrenal dysfunction defined ascreatinine clearance (Cockcroft Gault formula) < 60ml/min/1.73m$^2$ or a 25% decline in creatinine clearance from baseline (if baseline < 60ml/min/1.73m$^2$) occurring up to 144 weeks of follow-up. Univariate and multivariate generalized estimating equations and Cox proportional hazards regression analysis were used tothe model cumulative creatinine clearance changesover time and the association between exposure and outcome after adjusting for age and comorbidities. The cumulative incidence of renal dysfunction was calculated using life table methods.
**Results:** There were 270 exposed and 52 unexposed participants by week 144.Mean eGFRdeclined for both TDF and non-TDF groups from second-line initiation to week 144 (-13.8ml/min/1.73m$^2$ vs. -13.6 ml/min/1.73m$^2$p=0.97). Incidence rate of renal dysfunction was 28.0(95% CI 18.8 to 41.8) per1000 person-years for exposed participants and 24.2 (95% CI 10.7 to 58.1) per 1000 person-years for non-exposed. Unadjusted HR for TDF vs non-TDF was 1.16 (95% CI 0.44 to 3.04 p=0.76). After adjusting for age, infectious and non infectious co-morbidities, the HR for association between exposure and outcome was 1.30 (95% CI 0.48 to 3.49 p=0.52).
**Conclusions:** No clinically or statistically significant effect of TDF+PI/r vs non-TDF+PI/r regimenon renal dysfunction was observed.

## OTHER NON-COMMUNICABLE DISEASES (INCLUDING SCREENING)

### WEPEB107

### PREVALENCE AND CHARACTERISTICS OF THE OVERLAPPING EPIDEMICS OF HIV AND NON-COMMUNICABLE DISEASES (NCDS) IN RURAL KWAZULU NATAL, SOUTH AFRICA

A. van Heerden[1,2], H. van Rooyen[3], R. Barnabas[4], C. Celum[4]
*[1]Human Sciences Research Council of South Africa, HAST, Durban, South Africa, [2]University of the Witwatersrand, MRC/WITS Developmental Pathways for Health Research Unit, Johannesburg, South Africa, [3]Human Sciences Research Council of South Africa, HSD, Durban, South Africa, [4]University of Washington, Seattle, United States*
*Presenting author email: avanheerden@hsrc.ac.za*

**Background:** Sub-Saharan African countries face dual epidemics of HIV and chronic non-communicable diseases (NCDs). HIV is a risk factor for cardiovascular disease and is associated with depression, potentially driving a triple burden of chronic diseases (HIV, NCDs and mental illness). However, the community prevalence of NCDs and mental illness is not well-characterized in high HIV prevalence settings, such as in South Africa.
**Methods:** We conducted a home based HIV counselling and testing study in rural and peri-urban settlements in Vulindlela, KwaZulu Natal, South Africa between November 2011 and June 2012. 545 contiguous households were approached and all adults over the age of 18 were offered an HIV test. Follow-up visits were conducted in January 2015 to all consented households to conduct depression, obesity, blood glucose, cholesterol and blood pressure screening using point-of-care tests. The Patient Health Questionnaire (PHQ-9) was used to screen for depression. Logistic regression was use to compare the outcomes of obesity, hypertension, hypercholesterolemia, diabetes, and depression by HIV status and demographic variables.

**Results:** Thirty months after an initial visit, 587 (46%) of 1272 participants were located and screened. Two thirds were female (69%) and 33% were HIV positive. Prevalence of NCDs were high; 71% were overweight (BMI 25 to 29.9) or obese (BMI >= 30), 38% with glucose > 5.8mmol/L, 33% with stage 1 or 2 elevated blood pressures (define stage 1 & stage 2 BPs), low density cholesterol > 5.2mmol/L (46%) and 37% depression (PHQ >= 10). Controlling for age, gender, socio-economic status and education, HIV negative individuals were nearly twice as likely to both have hypertension (RR 0.598, p < 0.05) and elevated glucose (RR 0.566, p < 0.01). Depression, elevated body mass index and cholesterol did not vary significantly by HIV status.
**Conclusions:** In this community-based sample of adults in KwaZulu-Natal, HIV and NCDs were prevalent; approximately one-third had HIV, hypertension, diabetes or depression and two-thirds were overweight or obese. Hypertension and elevated glucose were more common in HIV negative persons than HIV positive persons. Community HIV testing programs provide an opportunity for early detection and linkage to care for NCDs and HIV.

## WEPEB108

### OCULAR CONDITIONS ARE MORE COMMON AMONG HIV-INFECTED INDIVIDUALS USING ART FOR AN EXTENDED PERIOD OF TIME

R. Peters[1,2], S. Khosa[1], J. Railton[1], H. Struthers[1], J. McIntyre[1], E. Schaftenaar[1,3,4]
*[1]ANOVA Health Institute, Johannesburg, South Africa, [2]University of Pretoria, Pretoria, South Africa, [3]Erasmus Universtiy Rotterdam, Viroscience, Rotterdam, Netherlands, [4]Rotterdam Eye Hospital, Rotterdam, Netherlands*
*Presenting author email: peters@anovahealth.co.za*

**Background:** HIV infection may directly and indirectly affect the eye. Infectious ocular disease associated with low CD4 count prior to antiretroviral therapy (ART) is relatively well documented, but limited data exist on occurrence of ocular conditions in HIV-infected patients using ART for extended period of time.
**Methods:** We recruited 342 adult participants visiting healthcare facilities in rural South Africa for HIV-related services, i.e. HIV test, pre-ART care, ART initiation or collection. We assessed occurrence of ocular conditions in four groups of individuals: HIV-uninfected (n=105), HIV-infected but not on ART (n=16), HIV-infected on ART < 12 months (n=56) and HIV-infected on ART >12 months (n=165). Demographic and clinical data were collected and full ophthalmic examination including fundoscopy was conducted. Occurrence of ocular conditions was compared between these four groups; age-adjusted odds ratio (OR) was calculated.
**Results:** HIV-infected individuals reported eye complaints more often (OR=1.9; 95% CI: 1.1-3.2, P=0.020) than those without HIV-infection and were more likely to have an ocular condition on examination (OR=3.1; 1.7-7.7; P< 0.001). Conditions affecting the external eye, anterior chamber or posterior chamber, but not the neuro-ophthalmic segment, were significantly more common among HIV-infected individuals (Table 1).

| | HIV infected on ART | No HIV infection | OR (95% CI) | P-value |
|---|---|---|---|---|
| External Eye | 40 (17%) | 7 (7%) | 2.8 (1.6-6.6) | 0.015 |
| Anterior Chamber | 79 (33%) | 18 (17%) | 6.5 (0.8-50) | 0.07 |
| Posterior Chamber | 58 (24%) | 10 (10%) | 3.1 (1.5-6.4) | 0.001 |
| Neuro-ophthalmic | 8 (8%) | 25 (11%) | ns | |

*[Table 1]*

Clinically detectable cataract was significantly more common in HIV-infected individuals on ART (52% vs. 16%; OR=4.3; 95% CI: 1.9-9.5, P< 0.001) than those without HIV-infection, especially among individuals using ART for more than 3 years (57%). Participants using ART for more than 3 years were more likely to have posterior eye segment conditions than those on ART for less than < 12 months (13 vs. 30%; OR=2.6; 1.0-5.0; P=0.047); in particular HIV retinopathy (1.4 vs. 10%).
**Conclusions:** Ocular conditions are more common among HIV-infected individuals on ART; the posterior segment is particularly affected in those using ART for extended period of time. Regular eye screening including fundoscopy may be indicated to prevent visual impairment in these individuals.

## WEPEB109

### PREVALENCE AND CLINICAL PHENOTYPE OF ASTHMA IN HIV-INFECTED ADULTS ON ART

M. McKellar[1], D. Paul[2], R. Shah[1], A. Frear[2], N. Lugogo[2], I. Riley[2], B. Neely[3], M. Kraft[4], J. Bartlett[1], D. Murdock[2], L. Que[2]
*[1]Duke University Medical Center, Infectious Diseases, Durham, United States, [2]Duke University Medical Center, Pulmonary, Allergy, and Critical Care Medicine, Durham, United States, [3]Duke Clinical Research Institute, Center for Predictive Medicine, Durham, United States, [4]University of Arizona College of Medicine, Medicine, Tucson, United States*
*Presenting author email: mehri.mckellar@duke.edu*

**Background:** Little is known about the prevalence and clinical phenotype of asthma in the HIV-infected population. Here, we estimated asthma prevalence in HIV-infected persons and describe the asthma phenotype in an HIV-infected cohort at Duke University Medical Center (DUMC).
**Methods:** Using electronic health record-based algorithms, we estimated asthma prevalence at DUMC, Durham, North Carolina. Additionally, we enrolled 29 HIV-infected asthmatic subjects on ART and 33 HIV-uninfected asthmatic controls for clinical phenotyping. Study participants were ≥18 years old, < 10 pack year history of smoking, no history of respiratory infection/antibiotic use in last 30 days, no underlying illness with altered lung function, and no use of systemic steroids in the last two weeks. Clinical phenotyping included asthma questionnaires (ACQ, SNOT22), FeNO, spirometry, methacholine challenge, and Phadiatop testing for atopic status.
**Results:** Asthma prevalence ranged from 5.2%-12.5% in HIV-infected and 4.0%-6.8% in HIV-uninfected persons. 29 HIV-infected and 33 HIV-uninfected asthmatics were enrolled for phenotyping. Demographics were similar except for more HIV-uninfected females and more HIV-infected persons with a smoking history. More HIV-uninfected asthmatics were receiving asthma treatment with combination inhaled corticosteroids/long-acting beta agonists. No significant differences in Phadiatop testing or the SNOT22 survey were seen. Although airway physiology (% predicted FEV1, FEV1/FVC% ratio, methacholine PC20, and FeNO) was similar between groups, the median asthma control questionnaire (ACQ) score was higher among HIV-infected asthmatics indicating inadequately-controlled asthma.

| Characteristics | HIV-infected (n=29) | HIV-uninfected (n=33) | Total (n=62) | p-value |
|---|---|---|---|---|
| Age(yrs; median) | 43.9 | 42.8 | 43.5 | 0.7765 |
| Female | 10/29 (34.5%) | 28/32 (87.5) | 38/61 (62.3%) | <0.001 |
| African-American | 22/29 (75.9%) | 23/32 (71.9%) | 45/61 (73.8%) | 0.881 |
| Smoker ever | 13/29 (44.8%) | 7/32 (21.9%) | 20/61 (32.8%) | 0.057 |

*[Demographics of HIV-infected asthmatics]*

| Asthma characteristics | HIV-infected (n=29) | HIV-uninfected (n=33) | Total (n=62) | p-value |
|---|---|---|---|---|
| FEV1 (% predicted); median | 88 | 85 | 87 | 0.7281 |
| FEV1/FVC%; median | 0.79 | 0.76 | 0.77 | 0.9386 |
| Methacholine PC20; median | 0.44 | 0.34 | 0.39 | 0.534 |
| FeNO (avg ppb); median | 22.25 | 19.5 | 20 | 0.7515 |
| Phadiotop positive | 23/28 (82.1%) | 22/30 (73.3%) | 45/58 (77.6%) | 0.421 |
| ACQ score; median | 1.57 | 1.14 | 1.43 | 0.2013 |
| SNOT22 score; median | 24.5 | 16 | 22 | 0.8145 |
| Taking ICS/LABA | 5 (17%) | 13 (39%) | 18 (29%) | |

*[Clinical phenotype of HIV-infected asthmatics]*

**Conclusions:** Asthma is more prevalent in HIV-infected than HIV-uninfected persons followed at DUMC. Although there were no differences in airway physiology between our two groups, HIV-infected asthmatics appear to have worse asthma control as depicted by an ACQ of 1.6. However, gender and use of asthma medications may have altered our clinical profiles. Further evaluation is needed to explain these differences.

### COOKING FUEL AND RESPIRATORY SYMPTOMS AMONG PEOPLE LIVING WITH HIV IN RURAL UGANDA

C.M. North[1,2], P.W. Hunt[3], A.R. Mocello[3], J. Martin[3], Y. Boum[4], J.E. Haberer[5], D.R. Bangsberg[5], D.C. Christiani[1,2], M.J. Siedner[5]
[1]*Massachusetts General Hospital, Pulmonary and Critical Care Medicine, Boston, United States,* [2]*Harvard School of Public Health, Department of Environmental Health, Boston, United States,* [3]*University of California, San Francisco, United States,* [4]*Mbarara University of Science and Technology, Mbarara, Uganda,* [5]*Massachusetts General Hospital, Center for Global Health, Boston, United States*
*Presenting author email: cnorth@mgh.harvard.edu*

**Background:** Household air pollution from biomass fuels is a leading cause of chronic respiratory disease in resource-limited settings. HIV infection is independently associated with chronic respiratory symptoms, but little is known about relationships between household air pollution and respiratory symptoms among people with HIV.
**Methods:** We analyzed data from the Uganda AIDS Rural Treatment Outcomes Study, a longitudinal cohort of HIV infected persons taking antiretroviral therapy. Participants completed quarterly study visits for CD4 count and viral load, and sociodemographics and physical health questionnaires. Primary outcomes included
1) cough or dyspnea in the last 30 days and
2) chronic cough (>4 weeks).
Primary exposure was cooking fuel type, and was categorized as charcoal or firewood, which accounted for 99% of study visits. Logistic regression models were fit using generalized estimating equations to detect associations between the respiratory symptoms and cooking fuel type. Separate models were used for men and women, as women typically do the majority of cooking.
**Results:** 734 participants (70% female) contributed 2,759 study visits (median 20/participant) from 2005 - 2014. At enrollment, median age was 34, 13% of women and 48% of men had ever smoked tobacco, and 55% of women and 67% of men reported firewood as their primary cooking fuel. Respiratory symptoms were common, with cough or dyspnea reported at 28% (927) and chronic cough reported at 10% (313) of visits. In models adjusted for age, smoking, occupation, household asset ownership index, CD4 count and viral load, cooking with firewood was associated with increased odds of chronic cough among women (AOR 1.41, CI 1.00 - 1.99, p 0.047), compared to cooking with charcoal. No association was seen between respiratory symptoms and cooking fuel type among men.

| | Cough or dyspnea in the last 30 days (n = 2,759 visits total) | Cough of at least 4 weeks' duration (n = 2,732 visits total) |
|---|---|---|
| Primary cooking fuel firewood vs. charcoal | | |
| Men | 1.36 (0.87, 2.10) | 0.87 (0.47 - 1.62) |
| Women | 1.09 (0.86, 1.38) | 1.41 (1.00 - 1.99) |
| p for interaction | 0.35 | 0.21 |

*[Adjusted odds ratios (95% CI) of respiratory symptoms among HIV-infected Ugandans cooking with firewood]*

**Conclusions:** Cooking with firewood as compared to charcoal is independently associated with chronic cough in HIV-infected women in rural Uganda. These results signal a need to pursue further investigations to elucidate the public health implications of relationships between HIV infection, sex, biomass fuel exposure, and chronic lung disease.

## WEPEB111

### IMMUNOPHENOTYPIC CHARACTERIZATION OF HIV-INFECTED ADULTS WITH ASTHMA

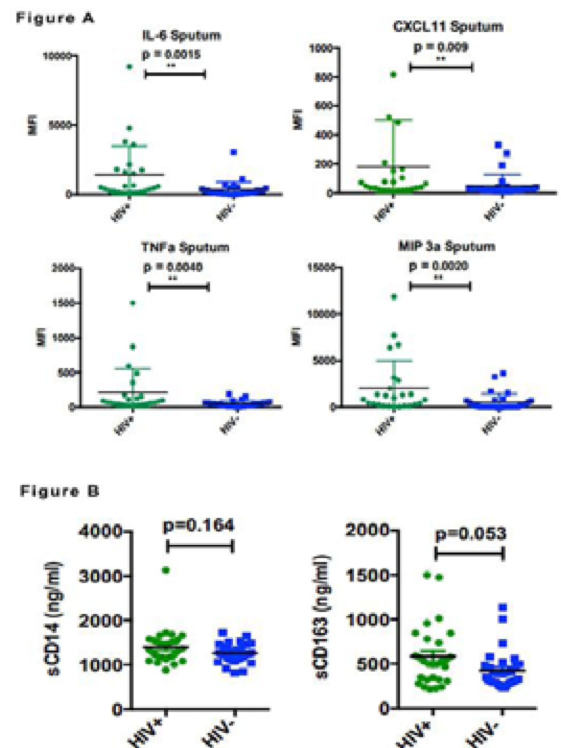
D. Murdoch[1], M. Triggiano[1], Z. Yang[1], M. McKellar[2], M. Kraft[3], J. Bartlett[2], L. Que[1]
[1]*Duke University Medical Center, Pulmonary, Allergy, and Critical Care Medicine, Durham, United States,* [2]*Duke University Medical Center, Infectious Diseases, Durham, United States,* [3]*University of Arizona College of Medicine, Medicine, Tucson, United States*
*Presenting author email: david.murdoch@dm.duke.edu*

**Background:** While HIV-infected persons are known to have accelerated rates of emphysema/COPD, the clinical and immune phenotype in HIV-infected asthmatics has not been well described. Given asthma management is complicated by disease heterogeneity, we performed prospective immunophenotyping of HIV-infected asthmatics on ART to elucidate possible immune mechanisms driving asthma in this population.
**Methods:** HIV-infected and uninfected non-smoking asthmatics were recruited at Duke University Medical Center, Durham, North Carolina. Participants underwent clinical and immunological phenotyping, including FeNO, spirometry, DLCO, methacholine challenge, Phadiatop assays, and induced sputum and plasma sampling for multiplexed cytokine analyses.
**Results:** 29 HIV-infected and 33 HIV-uninfected asthmatic participants were enrolled. Other than more males and greater smoking history among HIV-infected participants, no significant differences in pulmonary measurements or Phadiatop positivity were noted. HIV-infected asthmatics demonstrated an atopic, eosinophilic phenotype not dependent on canonical Th2 cytokines (IL-4, IL-5, and IL-13), whereas HIV-uninfected asthmatics demonstrated a neutrophilic-predominant phenotype. HIV-infected asthmatics had significantly higher levels of 8-isoprostanes, a reliable noninvasive biomarker of oxidative stress in asthma, suggesting airway inflammation.

| Sputum Characteristics, median (IQR) | HIV-infected (n=29) | HIV-uninfected (n=33) | Total (n=62) | p-value |
|---|---|---|---|---|
| % Eosinophils | 5.77 (1.28, 8.61) | 1.64 (0, 3.65) | 2.69 (0.46, 7.87) | 0.03 |
| % Neutrophils | 33.98 (12.83, 58.63) | 55.84 (37.04, 74.47) | 47.44 (18.67, 68.27) | 0.03 |
| 8-Isoprostanes (pg/mL) | 25.64 (13.18, 44.84) | 11.24 (7.33, 26.73) | 18.37 (9.97, 31.03) | 0.003 |
| Nitrite & Nitrate (nM) | 22.58 (12.79, 26.64) | 18.81 (8.67, 24.48) | 20.40 (10.31, 26.64) | 0.48 |

*[Cellular and inflammatory characteristics of induced sputum in HIV-infected asthmatics]*

HIV-infected asthmatics demonstrated higher sputum IL-6 and TNF-α, both potently produced by lung macrophages. CXCL11, a T cell chemoattractant, and macrophage inflammatory protein (MIP-3α), a macrophage cytokine elevated in BAL of asthmatics, were also higher in sputum of HIV-infected asthmatics. Plasma sCD163, a marker of macrophage activation, was elevated in the HIV-infected group.



*[Fig A) Multiplexed cytokine analysis of HIV-infected and uninfected asthmatic sputum. B) Plasma sCD14 & sCD163 in HIV-infected/uninfected asthmatics]*

**Conclusions:** Although a similar asthma clinical phenotype was present in both groups, HIV-infected asthmatics demonstrate an esoinophilic phenotype with elevated sputum IL-6 and peripheral and lung compartment cytokines indicative of chronic macrophage activation. These data suggest that a common asthma clinical phenotype can emerge from distinctly different immunologic pathways, with HIV infection prominently modulating one such pathway.

## PHARMACOKINETICS AND OUTCOMES OF ART IN WOMEN DURING AND AFTER PREGNANCY

### WEPEB112

### PRE-CONCEPTION SUPPORT FOR COUPLES LIVING WITH HIV: A STRATEGY TO REDUCE MOTHER TO CHILD HIV TRANSMISSION (MTCT) AT SENKATANA ANTIRETROVIRAL THERAPY (ART) CLINIC IN MASERU, LESOTHO

O.L. Akintade[1], A. Tiam[1], M. Sole[1], T. Mpholo[2], N. Ramajoe[1], A. Isavwa[1], M. Letsie[2], A. Thompson[3]
*[1]Elizabeth Glaser Pediatrics AIDS Foundation, Maseru, Lesotho, [2]Ministry of Health, Maseru, Lesotho, [3]Elizabeth Glaser Pediatrics AIDS Foundation, Seatle, United States*
*Presenting author email: oakintade@pedaids.org*

**Background:** Senkatana is an ART clinic with more than 4000 women on treatment, of which, 50% are young adults requiring reproductive health services. Sexual and reproductive health services(SRH) are an integral part of comprehensive HIV services, yet many clinics do not offer integrated reproductive health and HIV services. In 2012, EGPAF introduced integrated SRH into HIV service delivery to reduce MTCT.
**Description:** As part of routine HIV services, counseling on reproductive health services was provided to all HIV infected young adults, including discussions on the desire to have children and contraception. Preconception care included: health education on intended and safer pregnancy, safer sex, ART adherence counselling, and couples counselling. Couples that desired to have children had close Viral load monitoring to ensure suppression. standard Antenatal, postnatal, early infant diagnosis (EID) and child welfare services were provided.
**Lessons learned:** From October 2012-September 2015 there were 230 pregnancies and 116 deliveries. The mean age of mothers was 30.65 years and mean duration of treatment was 2.9 years. Mean gestational age at enrollment to antenatal care was 18.81 weeks. Mean CD4 at time of conception was 507; 95% were on first line regimens, while 5% were on second line. Viral loads were undetectable in 88% of cases. Table 1 below shows DNA-PCR and HIV antibody results at different time point for the infants born into this program.

| Infant age | Number of HIV tests (DNA PCR or rapid tests) | HIV-negative infants | HIV-positive infants | Total |
|---|---|---|---|---|
| 6-8 weeks | 105 | 105 | 0 | 105 |
| 14 weeks | 87 | 87 | 0 | 87 |
| 9 months | 59* | 59 | 0 | 59 |
| 18 months | 7** | 7 | 0 | 7 |

*[Results of Early Infant Diagnosis of infants born at Senkatana Centre program]*

*59 children had rapid test at 9 months of which 4 tested HIV-positive but were subsequently HIV-negative on DNA PCR **All 7 children were tested by rapid test.
**Conclusions/Next steps:** Integration of HIV treatment program and reproductive health is essential for meeting the reproductive health needs of families affected by HIV. These results further support the importance of lifelong ART for women of reproductive age in the prevention of MTCT. This approach will be scaled up while sustaining the current activities at the center.

## OTHER ISSUES RELATED TO PREGNANCY

### WEPEB113

### LOW BIRTH WEIGHT PREDICTS POST-PARTUM DETERIORATION IN VIROLOGIC CONTROL AMONG HIV-1 INFECTED WOMEN IN BRONX, NY, USA

L. Cojocaru[1], K. Deeb[2], K. Beckerman[1], R. Wright[1,3]
*[1]Bronx Lebanon Hospital Center, Department of Obstetrics and Gynecology, Bronx, United States, [2]Barry University, Professional and Career Education, Miami Shores, United States, [3]Albert Einstein College of Medicine and Montefiore Medical Center, Department of Obstetrics & Gynecology and Women's Health, Bronx, United States*
*Presenting author email: cliviu@me.com*

**Background:** The prevalence of low birth weight < 2500g (LBW) is higher among HIV-infected infants than in HIV-exposed, uninfected newborns. HIV-exposed uninfected infants are still more likely to weigh < 2500g than HIV-unexposed infants. We studied the relationship between LBW, maternal HIV-viremia and CD4 count at the first prenatal visit, at delivery and at one year post-partum in our high seroprevalance inner city urban population.
**Methods:** We reviewed all deliveries of women living with HIV who received care at our hospital from 2000 to 2015. We recorded maternal VL, CD4 count, years since diagnosis, antiretroviral treatment, demographics and social history. These categorical variables were assessed using regression analysis and Pearson's Chi-Square test.
**Results:** Of 183 HIV-infected pregnant women, 63% were Black, 36% Hispanic and 1% White. The majority (58%) delivered by cesarean. 57% had been diagnosed within 5 years of pregnancy, 18% had been infected for more than 10 years, 7.1% were perinatally infected, and 3.3% had < 1500g infants. In early pregnancy, 16% had CD4 < 200 and 42% had VL >=1000. By delivery, 13% had low CD4 < 200 and 15% had VL >=1000. 42% of perinatally infected women had LBW (p=0.02). One in six (16%, 95% CI 11-23%) newborns weighed < 2500g. 82.8% of LBW were delivered prematurely (p=0.001), with correlation to low CD4 at birth (7.7%, p=0.003).
At one year, CD4 and VL were available for 132 (72%) women. CD4 < 200 was found in 11%, while the % of women with VL >=1000 more than doubled to 36%. Multivariate regression analysis showed a significant association of LBW and years since HIV diagnosis (p = 0.04), VL at first visit and 1 year postpartum (p=0.001; $R^2$ = 0.752).
**Conclusions:** LBW was significantly associated with years since HIV diagnosis, maternal immunodeficiency (CD4< 200) and suboptimal control of HIV disease at the first prenatal visit. Additionally, LBW was a risk factor for loss of maternal viral suppression during the first postpartum year. We suggest that maternal and fetal immune responses to suboptimally controlled maternal HIV disease may play an important role in fetal growth and preterm delivery of HIV-exposed uninfected infants.

### WEPEB114

### ACCEPTABILITY OF SHORT MESSAGING SERVICE (SMS) USE AMONGST TUBERCULOSIS (TB) AND TB-HIV CO-INFECTED PARTICIPANTS IN THE IMPROVING RETREATMENT SUCCESS (IMPRESS) STUDY

B. Maharaj, A. Naidoo, A. Moosa, M. Govender, T. Gengiah, N. Padayatchi, K. Naidoo
*CAPRISA, Durban, South Africa*
*Presenting author email: bhavna.maharaj@caprisa.org*

**Background:** The use of mobile technology in resource-limited settings is rapidly increasing and cellphone based interventions have great potential for use in healthcare. SMS technology was implemented within the IMPRESS Study, to assess acceptability and feasibility amongst clinical trial participants in Durban, South Africa.
**Methods:** From May 2014 to October 2015, all participants that consented to participate had their cellphone numbers captured on the Communicate® system and SMS campaigns were generated in the form of appointment reminders, missed appointment SMS, motivational SMS, and pharmacokinetic visit instructions. Patients were interviewed at enrolment and at each follow up visit to assess acceptability.
**Results:** Uptake of mobile technology use in the study was high; of the 195 participants that enrolled in the IMPRESS Study, 181 (92.8%) consented to receive SMS of whom 131 (72.4%) were TB-HIV co-infected. Reasons for refusal (n=14; 7.7%) included not having a cellphone (n=2), sharing cellphone (n=2), didn't use SMS's frequently (n=2), didn't need SMS reminders (n=3), illiterate (n=1), no reason (n=4). Thus far, 2 patients have opted out (no longer needs reminders; didn't want child to read SMS) and 78.8% had a Zulu language preference. Thirteen (6.1%) of the participants enrolled reported shared cellphone use and 56 (28.4%) had cellphone number changes. Only 78 (43.1%) participants had access to a cellphone with internet capabilities and 63 (34.8%) participants reported internet use. Participants found the SMS's useful (98.3%), easy to read and understand (100%) and were willing to receive information related to their condition or dosing instructions by SMS (96.7%). Approximately 10% thought there was a potential for discrimination, stigma or social harm by receiving SMS's.
**Conclusions:** The preliminary findings suggest that the use of mobile technology in a format accessible on all basic cellphone types, such as SMS, is an acceptable and feasible intervention to employ amongst TB patients. Potential social harms that may result in inadvertent disclosure of disease status, although not reported, are a concern for SMS receivers. Ongoing verification of cellphone numbers is crucial to ensure successful SMS delivery. For future application system design should be compatible with both basic and smartphones.

## WEPEB115

### THE ANTIRETROVIRAL PREGNANCY REGISTRY: 25 YEARS OF MONITORING FOR BIRTH DEFECTS

V. Vannappagari[1,2], J. Albano[3], A. Scheuerle[4], D.H. Watts[5], K. Beckerman[6], D. Seekins[7], S. Sinclair[8], H. Tilson[2]
*[1]ViiV Healthcare Limited, Epidemiology and Real World Evidence, Cary, United States, [2]University of North Carolina-Chapel Hill, Gillings School of Global Public Health, Chapel Hill, United States, [3]INC Research, Late Phase, Raleigh, United States, [4]University of Texas Southwestern Medical Center, Dallas, United States, [5]Office of the Global AIDS Coordinator and Health Diplomacy, U.S. Department of State, Washington D.C, United States, [6]Albert Einstein College of Medicine, Maternal Fetal Medicine, Bronx, United States, [7]Bristol-Myers Squibb, Medical Safety, Hopewell, United States, [8]University of North Carolina Wilmington, Wilmington, United States*
*Presenting author email: vani.x.vannappagari@viivhealthcare.com*

**Background:** Antiretrovirals (ARVs) have been effective in reducing vertical transmission of HIV. The Antiretroviral Pregnancy Registry (APR) has monitored prenatal ARV use for an early signal of teratogenicity for 25 years.
**Methods:** APR is an ongoing international, voluntary, prospective exposure-registration cohort study, overseen by an independent Advisory Committee. Birth defect prevalence and risk for major birth defects are estimated and compared to internal and external comparator groups. Statistical inference is based on exact methods for binomial proportions. Sufficient numbers of 1st trimester exposures have been monitored to allow detection of at least 1.5-fold increase in risk of overall birth defects for nine ARVs and a two-fold increase for six.
**Results:** Of the 17618 evaluable prospectively enrolled pregnancies through July 2015, there were 16699 live births (LB) with prenatal ARV exposure at any time during pregnancy and 473 birth defects for overall prevalence of 2.8 defects/100 live births (95% confidence interval (CI): 2.6, 3.1). Among 7738 1st trimester exposures to ARVs, 221 birth defects were reported, with a prevalence of 2.9% (95% CI: 2.5, 3.3). Among 8959 2nd/3rd trimester exposures to ARVs, there were 250 birth defects, with a prevalence of 2.8% (95% CI: 2.4, 3.2). Prevalence Ratio comparing 1st vs 2nd/3rd trimester exposures was 1.02 (95% CI: 0.86, 1.22).
**Conclusions:** To date the overall birth defect prevalence in APR has not been significantly different from two population based surveillance systems: 2.72/100 live births reported in the Metropolitan Atlanta Congenital Defects Program (MACDP, Centers for Disease Control and Prevention); and 4.17/100 LB from the Texas Birth Defects Registry (TBDR, Texas Department of State Health Services); or the APR internal comparator of 2nd/3rd trimester exposures. For didanosine and nelfinavir a modest, statistically significant increase in prevalence is noted when compared to MACDP but not TBDR. The APR independent Advisory Committee concludes “The Antiretroviral Pregnancy Registry finds no apparent increases in frequency of specific defects with first trimester exposures and no pattern to suggest a common cause; however, potential limitations of registries should be recognized”.

## WEPEB116

### ASSESSMENT OF SERUM ADIPOKINES LEVELS IN HIV ASSOCIATED PRE-ECLAMPSIA

C.N. Mathonsi[1], T. Naicker[1], J. Moodley[2], A. Ajith[1]
*[1]UKZN, Optics and Imaging Centre, Health Science, Durban, South Africa, [2]UKZN, Womens Health and HIV Research Unit, Health Science, Durban, South Africa*
*Presenting author email: prosperity.cherish@gmail.com*

**Background:** South Africa is currently faced with high incidences of HIV, pre-eclampsia and obesity in pregnancy complications. The aetiology of pre-eclampsia remains unknown, however, adipokines have been postulated to play a role in its pathogenesis. Concurrently, HIV and obesity, have been reported to be associated with dysregulation and elevated levels of adipokines and inflammatory cytokines. Therefore, the aim of this study was to determine the level of adipokines viz., C-peptide, gastric inhibitory polypeptide (GIP), glucagon like peptide (GLP)-1, plasminogen activator inhibitory (PAI) 1, visfatin in HIV associated pre-eclampsia.
**Methods:** Patients were recruited from a regional hospital in KwaZulu-Natal (BE256/12). The study population was divided into non-pregnant (n=90), normotensive (n=121), early (n=32; EOPE) and late onset (n=58; LOPE) pre-eclamptic groups. These groups were further stratified according to their HIV status, and all had body mass index (BMI) recorded. Serum adipokine levels were quantified by the Bioplex luminex immunoassay.
**Results:** We observed a significant difference in C-peptide, GIP and GLP-1 in the non-pregnant versus the normotensive, and normotensive versus the LOPE group ($p < 0.05$). Visfatin varied between the LOPE versus the non-pregnant group (p=0.0014) and GIP between the normotensive versus EOPE groups (p=0.0239). Furthermore, a significant difference was observed between HIV positive and negative groups for, GIP (p=0.00065); GLP-1 (p=0.03) and visfatin (p=0.0108) irrespective of non-pregnant and type of pregnancy. We also observed high levels of the adipokines in the HIV positive compared to the HIV negative group.
**Conclusions:** This study concludes that C-peptide, GIP, GLP-1, PAI-1 and visfatin were significantly deregulated hence they may have predictor test value in pre-eclampsia diagnosis at an early stage. This is the first study to report adipokine dysregulation in the triad of HIV infection, pre-eclampsia and obesity.

## WEPEB117

### COMPARED TO SHORT COURSE ZIDOVUDINE, DOES TRIPLE ANTIRETROVIRAL THERAPY IMPROVE ANTIBODY TRANSFER ACROSS THE PLACENTA?

R.K. Bosire[1,2], C. Farquhar[3], R. Nduati[4], S. Lutchers[5], I. De Vincenzi[6], M. Merkel[4,7], V. Wachuka[4], D. Mbori-Ngacha[4], G. John-Stewart[3], B. Lohman-Payne[8], M. Reilly[2]
*[1]Kenya Medical Research Institute, Centre for Public Health Research, Nairobi, Kenya, [2]Karolinska Institute, Medical Epidemiology and Biostatistics, Stockholm, Sweden, [3]University of Washington, Medicine, Epidemiology and Global Health, Seattle, United States, [4]University of Nairobi, Pediatrics, Nairobi, Kenya, [5]International Centre for Reproductive Health, Coast General Hospital, Mombasa, Kenya, [6]World Health Organization, Reproductive Health and Research, Geneva, Switzerland, [7]University of Washington, Global Health, Seattle, United States, [8]University of Rhode Island, Institute for Immunology and Informatics, Providence, United States*
*Presenting author email: bosirero@yahoo.com*

**Background:** Highly active anti-retroviral (ARV) therapy given during pregnancy improves a woman's immunological profile. However, impact on antibody transfer to the foetus is unknown.
**Methods:** Human immunodeficiency virus (HIV) type 1 infected pregnant women in Nairobi and Mombasa, Kenya, with CD4 counts between 200 - 500 were randomized at 32 weeks gestation to short course zidovudine (AZT) or triple ARV (AZT/Lamivudine(3TC)/Kaletra(Lopinavir/Ritonavir)) for prevention of mother to child HIV-1 transmission (PMTCT). Levels of antibodies against measles virus, *Streptococcus pneumoniae* and rotavirus were measured at enrollment, and delivery. The two arms of the study were compared to determine effect of short course and triple ARVs on levels of maternal pathogen-specific antibodies and amounts transferred to the baby through cord blood.
**Results:** Overall, 141 women were randomized to triple ARV and 148 to short course AZT; cord blood was available only for the Nairobi site (n=20 in triple ARV arm and n=22 in short course AZT arm). Socio-demographic and clinical characteristics were similar between arms. Antibody levels to measles, S. *pneumoniae* and rotavirus were comparable at enrolment and delivery between arms. However, there were lower measles and pneumococcal antibody levels at delivery while rotavirus antibody levels at delivery were comparable to those at enrolment. There was a trend for women on triple ARV to transfer higher levels of measles antibody compared to transfer in the AZT arm.

| | Enrolment | | | Delivery | | |
|---|---|---|---|---|---|---|
| | Triple ARV (median (IQR)) | Short-course AZT (median (IQR)) | p-value | Triple ARV (median (IQR)) | Short-course AZT (median (IQR)) | p-value |
| Measles IgG (mIU/mL) | 2349 (1096-5897) | 2592 (1159-5343) | 0.3 | 1614 (676-4462) | 1858 (644-4340) | 0.9 |
| Pneumococcal IgG (mg/mL) | 45 (26-78) | 50 (28-80) | 0.9 | 36.5 (20-67) | 39 (18-65.5) | 0.8 |
| Rotavirus IgG (U/mL) | 10584 (6140-18313) | 10707 (6476-17745) | 0.8 | 10632 (5930-20784) | 9382 (6119-18139) | 0.5 |

*[Antibody levels at enrolment and delivery by treatment arm]*

Cord blood measles antibody was 5440 mIU/mL (IQR 873, 6959) vs 1943 mIU/mL (IQR 1018, 4999) and rotavirus antibody was 14226 U/mL (IQR 9435, 20792) vs 7555 U/mL (IQR 4381, 22029), p=0.1 for both. Levels of pneumococcal antibody in cord blood were similar between the two arms, 29 g/mL (IQR 11, 102) vs 29 g/mL (IQR 12, 58), p=0.6.
**Conclusions:** Transfer of measles and rotavirus antibodies was more efficient among women randomized to triple ARV compared to those on short course AZT. Initiation of triple ARV early in pregnancy could result in improved passive antibody transfer to the foetus.

## WEPEB118

### DEPRESSION, RETENTION IN CARE, AND UPTAKE OF PMTCT SERVICE IN KINSHASA, THE DEMOCRATIC REPUBLIC OF CONGO: A PROSPECTIVE COHORT

K. Fokong[1], K. Yotebieng[2], M. Yotebieng[1], J. Syvertsen[3]
*[1]Ohio State University, College of Public Health, Department of Epidemiology, Columbus, United States, [2]Ohio State University, Columbus, United States, [3]Ohio State University, Department of Anthropology, Columbus, United States*
*Presenting author email: syvertsen.1@osu.edu*

**Background:** Depression may play an important role in observed high rates of Loss-to-follow-up (LTFU) along the prevention of mother-to-child HIV transmission (PMTCT) cascade in sub-Saharan Africa. We do not know of any study that has explicitly examined the association between Depression and LTFU in PMTCT settings. The aim of this study was to assess the association between prenatal depression and
1) LTFU or
2) Uptake of PMTCT services (attended all scheduled clinic visits and accepted available services).
**Methods:** Between April 2013 and August 2014, as part of a randomized control trial to evaluate the effect of providing a small, and increasing, cash incentive conditional on attending scheduled clinic visits and accepting offered PMTCT services on retention in and uptake of PMTCT services, newly-diagnosed HIV-infected women, ≤32 weeks pregnant, registering for antenatal care, in 85 clinics in Kinshasa, Democratic Republic of Congo, were recruited and followed-up until LTFU, death, transfer out, or six-weeks postpartum, whichever occurred first. Participants were interviewed at enrollment using a questionnaire which include the Patient Health Questionnaire (PHQ-9). Depression was defined as a PHQ-9 score of ≥15.
**Results:** Among 433 women enrolled, 51 (11.8%) had a PHQ-9 score ≥15 including 15 (3.5%) with a score ≥20. At six weeks postpartum, 67 (15.5%) were LTFU and 331 (76.4%) were in care and have accepted all available PTMCT services. Of participants with depression at enrollment, 17.7% (9/51) were LTFU at six weeks postpartum compared to 15.2% (58/382) among those without, but the association was not statistically significant: adjusted OR 1.26 (95%CI 0.57-2.76); adjusted for age, education, gravity, initiation of ANC visit before 20 weeks of gestation, wealth quintile and whether the participant walk to clinic or not. On the other hand, 78.4% (40/51) of participants with PHQ-9 score ≥15 were in care at six week postpartum and had attended all there scheduled visit in time and accepted available services compared to 76.2% (291/382) among those with PHQ-9 score < 15: adjusted OR 1.04 (95%CI 0.51-2.14).
**Conclusions:** In this cohort of newly-diagnosed HIV-infected pregnant women, prenatal depression did not predict LTFU or uptake of PMTCT at six weeks postpartum.

## WEPEB119

### TUBERCULOSIS IN HIV-INFECTED PREGNANT WOMEN (PW) IN HAITI: LESSONS LEARNED (1999-2014)

M.M. Deschamps[1], J. Bonhomme[1], A. Marcelin[1], J. Pierrot[1], M. Mc Nairy[2], J.W. Pape[1,2]
*[1]GHESKIO Centers, Port-au-Prince, Haiti, [2]Weill Cornell Medical College, New York, United States*
*Presenting author email: mariehd@gheskio.org*

**Background:** Haïti is one of the countries most affected by tuberculosis (TB) and HIV in the Americas. TB infection during pregnancy among HIV-infected women is associated with poor maternal and infant outcomes. HIV prevalence among pregnant women in Haiti is estimated at 3%, and the incidence of TB among HIV-infected pregnant women is unknown, as not routinely collected by HIV programs. We report TB diagnoses among HIV-infected pregnant women enrolled in prevention of mother to child transmission (PMTCT) care at GHESKIO, one of the largest HIV programs in Haiti, from 1999 through 2014.
**Methods:** Data from all HIV-infected pregnant women enrolled in PMTCT care at GHESKIO from January 1999 to July 2014 were retrospectively analyzed. PMTCT care spans the period from HIV testing of PW through follow-up of the mom and baby 18 months post partum for final HIV infant diagnosis (according to national guidelines). TB screening and diagnosis was done using the American Thoracic Society diagnostic standards.
**Results:** 3737 HIV infected women had a total 4665 unique pregnancies. Median age was 27 years; 76% earned< $1/day. Median maternal CD4 at time of PMTCT enrollment was 494 cells/ul (IOR 328-691). Among 3737 women, TB was diagnosed in 160 patients (4.3 %) with median CD4 of 313 (23 - 1048) at time of TB diagnostic. Of the 160 TB patients, 76 (47.5%) were on antiretroviral treatment (ART). Previous history of TB was reported in 174 (4.6%) of the 3737 (PW), within a median of 16 month (1-120) prior PMTCT enrollment.
**Conclusions:** This cohort of HIV + pregnant women in Haiti has a high prevalence of TB. This may be an underestimation of TB prevalence given suboptimal screening and difficulty in diagnosing latent TB in pregnancy. There is a need to reinforce active screening for diagnostic of TB in this population to improve health outcomes.

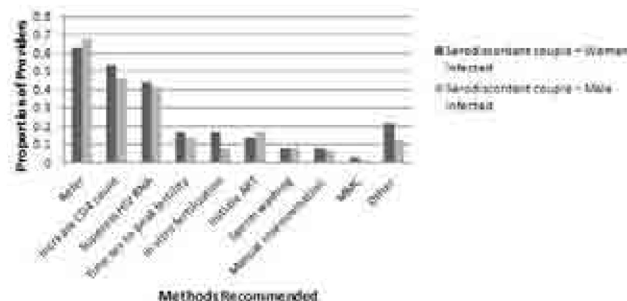
## PREP FOR CONCEPTION AND OTHER APPROACHES FOR THE SERODISCORDANT COUPLE TO ACHIEVE CONCEPTION

## WEPEB120

### KNOWLEDGE, ATTITUDES AND PRACTICES OF SAFER CONCEPTION COUNSELING AMONG PROVIDERS IN DURBAN, SOUTH AFRICA

K.M. O'Neil[1], R. Greener[2], F.N. Mosery[2], C. Milford[2], S.A. Safren[3], C. Psaros[4,5], A. Harrison[6], I.B. Wilson[7], D.R. Bangsberg[1,5,8], J.A. Smit[2], L.T. Matthews[1,5,8]
*[1]Massachusetts General Hospital, Global Health, Boston, United States, [2]University of the Witwatersrand Maternal Adolescent and Child Health Research (MatCH Research), Department of Obstetrics and Gynaecology, Durban, South Africa, [3]University of Miami, Department of Psychology, Miami, United States, [4]Massachusetts General Hospital, Behavioral Medicine Program, Department of Psychiatry, Boston, United States, [5]Harvard Medical School, Boston, United States, [6]Brown University School of Public Health, Department of Behavioral and Social Sciences, Providence, United States, [7]Brown University School of Public Health, Department of Health Services, Policy & Practice, Providence, United States, [8]Massachusetts General Hospital, Division of Infectious Diseases, Boston, United States*

**Background:** In 2011 the Southern African HIV Clinicians Society published guidelines to support HIV-affected couples to meet reproductive goals while minimizing sexual transmission of HIV. We sought to quantify how healthcare workers (HCWs) in KwaZulu-Natal, South Africa view people living with HIV (PLWH) having children, how frequently they discuss reproductive intentions, and their knowledge of strategies to reduce periconception HIV transmission (e.g. ART for infected partner, PrEP for uninfected partner, condomless sex to peak fertility, and assisted reproduction) among an at risk population.
**Methods:** Lists of HCWs from 6 public-sector clinics near Durban were generated. In November 2012, randomly-selected providers were approached to complete questionnaires developed based on formative data collected in the same clinics. Providers working for ≥12 months who had not participated in our formative interviews were eligible. Most doctors from these clinics participated in the formative interviews and were excluded.
Data were summarized utilizing descriptive statistics.
**Results:** 119 participants included 49 enrolled nurses, 28 professional nurses and 22 counselors. Median age was 40 years (IQR: 32, 50), time since training was 8 years (IQR: 4.5, 17.5) and 95% were female. While 92% agreed "it is acceptable for people living with HIV to have children", 40% and 68% never asked female or male clients about reproductive plans. 55% reported knowledge of safer conception strategies. Among those, over 60% recommended referral to another facility or provider and less than half recommended delaying conception until HIV-RNA suppression. Several reported irrelevant strategies (e.g. sperm washing for female-infected serodiscorant couple)(Figure 1).



*[Figure 1. Recommendations for HIV-serodiscordant couples who choose to conceive as expressed by providers reporting safer conception knowledge (N = 65)]*

**Conclusions:** While providers report positive attitudes towards PLWH seeking pregnancy, discussion of reproductive goals remains infrequent and knowledge of safer conception strategies is low. These data highlight the need for further education of HCWs in periconception risk reduction strategies to implement current guidelines and reduce HIV transmission among HIV-affected couples while supporting their reproductive goals.

# ISSUES RELATED TO HORMONAL AND NON-HORMONAL CONTRACEPTION

### ASSESSING THE EFFECT OF DEPOT MEDROXYPROGESTERONE ACETATE (DMPA) VERSUS NORETHISTERONE ENANTHATE (NET-EN) ON HIV DISEASE PROGRESSION AMONG RECENTLY INFECTED SOUTH AFRICAN WOMEN

A. Pather[1], L. Noguchi[2], C. Oromendia[3], G. Ramjee[1,4], T. Palanee-Phillips[5], G. Nair[6], A. Premrajh[1], R. Panchia[7], S. Riddler[8], J. Balkus[9]

*[1]South African Medical Research Council, HIV Prevention Research Unit, Durban, South Africa, [2]Johns Hopkins University, Department of Epidemiology, Baltimore, United States, [3]University of Washington, Department of Biostatistics, Seattle, United States, [4]London School of Hygiene & Tropical Medicine, Department of Epidemiology and Population Health, London, United Kingdom, [5]Wits Reproductive Health and HIV Institute, University of the Witwaterstrand, School of Clinical Medicine, Johannesburg, South Africa, [6]Centre for Aids Programme of Research in South Africa (CAPRISA), University of KwaZulu Natal, Durban, South Africa, [7]Chris Hani Baragwanath Hospital, Perinatal HIV Research Unit, Johannesburg, South Africa, [8]University of Pittsburgh, Department of Medicine, Pittsburgh, United States, [9]Fred Hutchinson Cancer Research Center, Vaccine and Infectious Disease Division, Seattle, United States*

*Presenting author email: arendevi.pather@mrc.ac.za*

**Background:** Injectable hormonal contraceptives (HC) are frequently used in South Africa, including among HIV+ women. We compared the effect of two injectable contraceptives, depot medroxyprogesterone acetate (DMPA) and norethisterone enanthate (NET-EN) on HIV disease progression.

**Methods:** Women who acquired HIV infection during the VOICE trial were invited to enroll in MTN-015, a prospective cohort study evaluating the impact of investigational HIV chemoprophylactic preventative agents on HIV disease progression. Study visits occurred at enrollment and 1, 3, and 6 months after detection of HIV infection, then 6-monthly. Contraceptive use, CD4+ T-cell count, plasma HIV-1 viral load, and antiretroviral therapy (ART) initiation were assessed at enrollment and regular follow-up visits. Among South African women reporting injectable HC use at enrollment, Cox proportional hazards models were used to compare effects of NET-EN versus DMPA on time to CD4 < 350 and ART initiation.

**Results:** Among 232 HIV+ South African women who enrolled and returned for follow-up, 184 reported using injectable HC at enrollment, 124 (67%) used DMPA and 60 (33%) used NET-EN. Median time from testing HIV+ in VOICE to enrollment was 68 days (interquartile range [IQR]: 37,114). Median age was 23 years and median CD4 count and HIV-1 viral load were 537 cells/mm$^3$ (IQR: 422,711) and 4.4 $\log_{10}$ copies/ml (IQR: 3.6, 4.9), respectively. Two women were on ART at enrollment. Demographic and clinical characteristics did not differ by baseline injectable method. Median follow-up time was 1.87 years. No significant differences were noted for time to CD4 < 350 or ART initiation by injectable method.

| | # of events/ person-years | Unadjusted HR (95% CI) | Adjusted HR (95% CI)* |
|---|---|---|---|
| *CD4 < 350* | | | |
| NET-EN | 14/61 | 1.23 (0.64, 2.38) | 1.13 (0.58, 2.20) |
| DMPA | 25/133 | Ref | Ref |
| *ART Initiation* | | | |
| NET-EN | 5/72 | 0.67 (0.24, 1.85) | 0.71 (0.26, 1.97) |
| DMPA | 15/147 | Ref | Ref |

HR = hazard ratio. *Cox proportional hazards models adjusted for baseline CD4 count and included injectable HC method as a time-varying exposure with follow-up censored if women reported stopping injectable HC. For the CD4 <350 model, follow-up was also censored at ART initiation.

*[Associations between injectable hormonal contraception and HIV disease progression outcomes among South African women recently infected with HIV]*

**Conclusions:** Understanding the effects of DMPA and NET-EN on HIV disease progression is important in South Africa where HIV prevalence is high and injectable HCs are common. Our findings suggest no substantial difference in HIV disease progression between recently infected HIV+ users of DMPA and NET-EN.

## WEPEB122

### EXPANDING THE MIX OF CONTRACEPTIVE METHODS IN AN HIV PREVENTION TRIAL

K. Bunge[1], J. Baeten[2], C. Chappell[1], D. Singh[3], C. Nakabiito[4], B. Kamira[4], J. Kamya Nsangi[4], F. Muhlanga[5], P. Hunidzarira[5], I. Harkoo[6], B. Madlala[6], T. Palanee[7], D. Hillier[1], MTN-020/ASPIRE Study Team

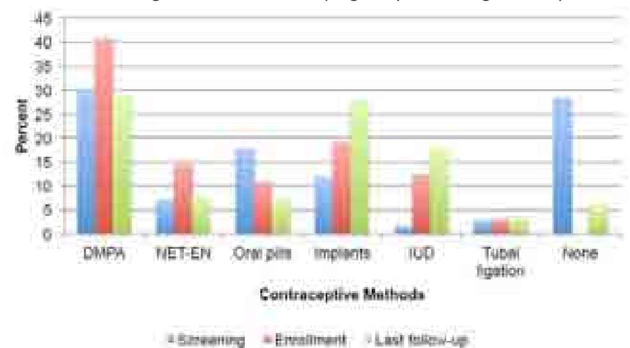
*[1]University of Pittsburgh, Department of Obstetrics, Gynecology and Reproductive Sciences, Pittsburgh, United States, [2]University of Washington, Department of Allergy and Infectious Disease, Seattle, United States, [3]Central Vermont Medical Center, Adult Primary Care, Hematology & Oncology, Berlin, United States, [4]Mulago Hospital, Makerere University, Kampala, Uganda, [5]UZ-UCSF Collaborative Research Programme, Harare, Zimbabwe, [6]CAPRISA, Durban, South Africa, [7]Wits Reproductive Health and HIV Institute, Johannesburg, South Africa, [8]Desmond Tutu HIV Foundation, Emavundleni Research Centre, Cape Town, South Africa, [9]Medical Research Council of South Africa, Durban, South Africa, [10]Queen Elizabeth Central Hospital, Johns Hopkins Research Project, Blantyre, Malawi, [11]Kamuzu Central Hospital, UNC Project, Lilongwe, Malawi, [12]Fred Hutchinson Cancer Research Center, Vaccine and Infectious Disease Division, Seattle, United States, [13]National Institute of Allergy and Infectious Diseases, DAIDS, Rockville, United States*

*Presenting author email: kbunge@mail.magee.edu*

**Background:** In many African settings with high HIV incidence, contraceptive options are limited. Comparatively fewer women use long-acting reversible contraception (LARCs) such as intrauterine devices (IUDs) and implants, than use injectable depot medroxyprogesterone acetate (DMPA), which has been associated with an increased risk of HIV acquisition in some studies. Within a large, multinational HIV prevention study (MTN-020/ASPIRE, a phase III trial of the dapivirine vaginal ring), a Contraceptive Action Team (CAT) was established to expand contraceptive options for participants.

**Methods:** Reliable contraceptive use was an enrollment requirement for MTN-020/ASPIRE. Contraceptive use was assessed monthly; motivations for switching were abstracted from the participants' charts. The CAT was comprised of 1-3 staff members per site; sites identified and addressed challenges with increasing LARC uptake.

**Results:** 2,629 women enrolled in MTN-020/ASPIRE. The CAT initially identified six key barriers to LARC uptake: provider, community, and participant bias; lack of IUD and implant insertion training, and acquisition of LARC devices. At screening, 30% used DMPA, 28% reported no method; LARC's were used by < 15% of women. Over the course of follow-up, IUD use increased from 2 to 18%, and implants increased from 12 to 28%, with 46% of women using LARCs by the end of the study (Figure 1). Oral contraceptive use decreased from 17% to 7%. Method switching during the study occurred in 1,162 women (44%) with the most commonly cited reason for the first switch being interest in LARC. The pregnancy rate during the study was 4%.



*[Contraceptive use at screening, enrollment and the last follow-up visit attended in ASPIRE]*

**Conclusions:** Expansion of the contraceptive method mix at HIV prevention research sites can be successfully achieved with on-site provision of LARCs. These data suggest that, when individually counseled and offered a range of options, women in HIV prevention settings will diversify contraceptive uptake. This approach may inform models for integrated delivery of family planning and HIV prevention services.

## WEPEB123

### DOES HIGHER BODY MASS INDEX WORSEN EFAVIRENZ-BASED ANTIRETROVIRAL THERAPY'S NEGATIVE IMPACT ON THE CONTRACEPTIVE IMPLANT'S EFFECTIVENESS AMONG HIV-POSITIVE WOMEN?

R.C. Patel[1], M. Onono[2], M. Pyra[3], J. Baeten[3], E.A. Bukusi[2], C.R. Cohen[4]
*[1]University of Washington, Allergy and Infectious Diseases, Seattle, United States, [2]Kenya Medical Research Institute (KEMRI), Kisumu, Kenya, [3]University of Washington, Department of Epidemiology, Seattle, United States, [4]University of California, Bixby Center for Global Reproductive Health, San Francisco, United States*
*Presenting author email: rcpatel@uw.edu*

**Background:** Recent data suggests an association between concomitant contraceptive implant and efavirenz-based antiretroviral therapy (ART) use and increased contraceptive failures (or pregnancies) among HIV-positive women. With other hormonal contraceptives, such as oral contraceptive pills, increasing body mass index (BMI) may also reduce contraceptive effectiveness. We aimed to determine if increasing BMI modifies the association between concomitant efavirenz use and incident pregnancies among implant users.
**Methods:** We conducted a secondary analysis of a cohort of HIV-positive women aged 15-45 years using implants enrolled in care in Western Kenya and followed from January 1, 2011 to December 31, 2013. The primary outcome was incident pregnancy diagnosed clinically. The primary exposures were ART regimen (efavirenz-, nevirapine-based ART, and no ART) and BMI (underweight: BMI≤18.5, normal weight: BMI≥18.5 but < 25, and overweight: BMI≥25 and < 30 since no pregnancies were observed in the few obese (BMI≥30) women in our cohort). We used Poisson models, adjusting for repeated measure, age, and the World Health Organization HIV stage, to compare pregnancy rates among implant users on different combinations of ART regimen and BMI.
**Results:** Our analysis included 3,457 women using implants contributing 5,885 years of follow-up with 84 incident pregnancies. Among efavirenz-based ART users, the adjusted incident rate ratios for underweight and overweight women in comparison to normal weight women were 0.94 (95% CI 0.26-3.34) and 1.49 (0.45-4.92), respectively. Among nevirapine-based ART users, the adjusted incident rate ratios for underweight and overweight women in comparison to normal weight women were 0.58 (0.17-1.92) and 0.74 (0.28-1.96), respectively. At all strata of BMI, we observed higher incident pregnancies among women on efavirenz- vs. nevirapine-based ART. The interaction term between ART regimen and BMI was not significant.
**Conclusions:** Our data does not suggest an association between higher BMIs and worsening negative impact of efavirenz on implant effectiveness. However, studies with greater number and follow-up of overweight and obese women are needed to better evaluate the effect of increasing BMI on implant effectiveness among efavirenz users. Nonetheless, until more definitive data are available, caution should be taken in considering higher BMI an additional risk factor in women considering concomitant implant and efavirenz use.

## OTHER SEX-SPECIFIC ISSUES

## WEPEB125

### AWARENESS OF MALE PARTNER CIRCUMCISION ON WOMEN'S SEXUAL AND REPRODUCTIVE HEALTH

J. Moodley[1], S. Naidoo[1], T. Reddy[2], C. Kelly[3], G. Ramjee[1,4,5]
*[1]South African Medical Research Council, HIV Prevention Research Unit, Durban, South Africa, [2]South African Medical Research Council, Biostatistics Unit, Durban, South Africa, [3]SCHARP, Fred Hutchinson Cancer Research Center, Seattle, United States, [4]London School of Hygiene & Tropical Medicine, Department of Epidemiology and Population Health, London, United Kingdom, [5]University of Washington, Department of Global Health,School of Medicine, Washington, United States*
*Presenting author email: jothi.moodley@mrc.ac.za*

**Background:** Male medical circumcision (MMC) is known to reduce the risk of HIV acquisition in men by 50-60%, with no direct HIV benefit to women. There is concern that knowledge of MMC efficacy could influence sexual risk behaviours among women. This study investigated whether women with circumcised partners displayed riskier sexual behaviour compared to women with uncircumcised partners.
**Methods:** This secondary analysis from the Vaginal and Oral Interventions to Control the Epidemic (VOICE) trial enrolled 5029 HIV uninfected women, aged 18 to 45 years, at 15 sites in Africa. Participants underwent monthly pregnancy and HIV testing and sexually transmitted infections (STI) testing at baseline and quarterly visits. Socio- demographic and sexual behaviour data were collected. Impact of partner circumcision awareness on participant STI outcomes was assessed using Cox regression models. Impact of circumcision awareness on condom usage and frequency of sex was analysed using GEE models with a logit link. Participant age, education, study site and marital status were adjusted for in all analyses.
**Results:** There were 4982 participants with a baseline response, 1561 (31%) reported having circumcised partners, 2863 (57%) having uncircumcised partners and 558 (11%) did not know the circumcision status of their partner. Partner circumcision rate varied by country: South Africa (33%), Uganda (51%) and Zimbabwe (10%). Women with circumcised partners had a significantly reduced risk of syphilis acquisition compared to all other women, [Hazard ratio 0.51 (0.26, 1.00), p-value=0.05)]. A trend toward significance remained in the adjusted model (adjusted (adj) p-value=0.06). Participants with circumcised partners tended to have significantly fewer sex acts in the past 7 days than participants with uncircumcised partners (6% less likely to have ≥1 act of sex, adjusted p-value= 0.0005). Participants with uncircumcised partners were significantly less likely to have used a condom at the last sex act compared to the other two groups, [adjusted relative risk 0.86 (0.80, 0.92), adj p-value< 0.0001].
**Conclusions:** This study found no evidence of sexual risk compensation in women with circumcised partners. Risky sexual behaviour in women with uncircumcised partners was noted. Ongoing education of couples on the benefits of MMC is essential to HIV prevention efforts.

## WEPEB126

### THE FEMALE GENITAL TRACT MICROBIOME IS ASSOCIATED WITH VAGINAL ANTIRETROVIRAL DRUG CONCENTRATIONS IN HIV-INFECTED WOMEN ON ANTIRETROVIRAL THERAPY

R. Donahue Carlson[1], A.N. Sheth[1], T. Read[1,2], M. Frisch[1], C. Mehta[3], A. Martin[4], T. Evans-Strickfaden[4], R.E. Haaland[4], C.-P. Pau[4], C. Kraft[1,5], C.E. Hart[4], I. Ofotokun[1]
*[1]Emory University, Department of Medicine, Division of Infectious Diseases, Atlanta, United States, [2]Emory University, Department of Human Genetics, Atlanta, United States, [3]Emory University, Rollins School of Public Health, Department of Biostatistics and Bioinformatics, Atlanta, United States, [4]Centers for Disease Control and Prevention, Division of HIV/AIDS Prevention, Laboratory Branch, Atlanta, United States, [5]Emory University, Department of Pathology and Laboratory Medicine, Atlanta, United States*
*Presenting author email: renee.donahue@gmail.com*

**Background:** Optimal female genital tract (FGT) antiretroviral exposure is essential for genital virologic suppression and relevant to HIV prevention methods utilizing antiretroviral therapy in women. Changes in FGT microbiota are common and occur with bacterial vaginosis (BV), sexually transmitted infections (STIs), and certain hygienic practices, and may alter genital pH and other factors that influence compartmental drug penetration. We therefore examined the relationship between microbiota and antiretroviral concentrations in the FGT.
**Methods:** Virologically suppressed HIV-infected women on tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) and atazanavir/ritonavir (ATV/RTV) without clinical BV/STIs were prospectively enrolled. Twenty participants underwent 6 twice-weekly visits (N=117) over 1 menstrual cycle where paired samples for plasma and cervicovaginal trough antiretroviral concentrations, and cervicovaginal lavage (CVL) were collected. Antiretroviral concentrations were measured using high-performance liquid chromatography-tandem mass spectroscopy. Illumina MiSeq 16S rRNA gene sequencing of CVL samples, with analysis using R, Phyloseq, and Dirichlet Multinomial Mixtures clustered each participant-visit into a unique microbiome community type (CT) based on similar abundances of bacterial taxa. Repeated-measures analyses, using generalized mixed models, were used to estimate the association between microbiome CT and FGT antiretroviral concentrations controlling for plasma antiretroviral concentrations and significant predictor variables (body mass index, recent sexual activity, and CVL blood contamination).
**Results:** Participants were 95% African American with median age 38 (range, 24-48) years. High-quality sequencing data (N=109) lead to 3 unique microbiome CTs: a low-diversity (by Shannon index) CT dominated by *Lactobacillus* (N=40), and intermediate- (N=28) and high-diversity (N=41) CTs with increased abundance of multiple anaerobic taxa. In multivariable models, compared to intermediate-diversity CTs, low- and high-diversity CTs were associated with 47.6% (95% Confidence Interval (CI), 12.1-68.7) and 54.0% (CI, 8.1-76.8) reduced ATV concentrations (P=0.03), and 49.5% (CI, 8.9-72.0) and 45.6% (CI, -27.3-76.7) reduced tenofovir (TFV) concentrations in the FGT (P=0.06), respectively. FTC concentrations were not significantly associated with microbiome CT (P=0.27).
**Conclusions:** We demonstrate for the first time in this proof-of-concept study that certain microbiome CTs are associated with decreased FGT ATV and TFV concentrations. Validation of these findings in larger studies and with additional antiretrovirals could have broader clinical implications and may influence antiretroviral drug choice for biomedical HIV prevention in women.

## WEPEB127

### SELF-COLLECTED VS. PROVIDER-COLLECTED SAMPLES FOR CERVICAL SCREENING AMONG HIV-INFECTED WOMEN USING XPERT HPV

C. Chibwesha[1,2], C. Firnhaber[1,3], B. Goeieman[1], M. Mulongo[1], D. Shilakwe[1], A. Swarts[3], M. Faesen[1], S. Levin[1], P. Michelow[4,5], T. Wilkin[6]
*[1]Right to Care, Johannesburg, South Africa, [2]University of North Carolina at Chapel Hill, Chapel Hill, United States, [3]University of the Witwatersrand, CHRU, Johannesburg, South Africa, [4]University of the Witwatersrand, Department of Anatomical Pathology, Johannesburg, South Africa, [5]NHLS, Johannesburg, South Africa, [6]Weill Cornell Medical College, New York, United States*
*Presenting author email: carla_chibwesha@med.unc.edu*

**Background:** Self-collected vaginal swabs may provide a useful and cost-effective alternative to provider-collected specimens in HPV "test-and-treat" programs. We determined agreement between self- and provider-collected samples using the Xpert HPV test, a point-of-care, real-time PCR for high-risk HPV (hrHPV).
**Methods:** This is an interim report of an ongoing cross-sectional study of HIV-infected South African women. We calculated
(1) agreement beyond chance (Cohen's Kappa statistic), and
(2) percent agreement among positives between self-collected and provider-collected swabs.
**Results:** Between December 2014 and May 2015, 106 eligible women were enrolled. The median age was 39 years (interquartile range [IQR]: 35-44) and median CD4+ cell count 396 cells/uL (IQR: 269-608). Forty-three (41%) self-collected and 35 (33%) provider-collected samples and were positive for at least one hrHPV type. Self-collected samples displayed greater cellularity, with lower mean Ct values (30.6 vs. 31.7, p=0.005). With respect to agreement between self- and provider-collected samples, the Kappa statistic for any hrHPV type, HPV16, and HPV18 or 14 were 0.64 (95% confidence interval [CI]: 0.49-0.79), 0.68 (95% CI: 0.42-0.94), and 0.71 (95% CI: 0.47-0.96), respectively.
**Conclusions:** We observed robust agreement between self- and provider-collected samples tested using Xpert HPV at the point-of-care, with greater cellularity and increased hrHPV detection in the self-collected samples. Our preliminary results suggest a potential role for self-collected samples in HPV test-and-treat programs.

## WEPEB128

### EFFECT OF GENDER ON SURVIVAL IN AND IN THE CAUSES OF DEATH IN THE AIDS RESEARCH NETWORK COHORT (CORIS) 2004-2014

C. Muñoz Hornero[1], A. Muriel[2], M.J. Vivancos[2], V. Hontañón[3], J.C. López[4], J. del Romero[5], J.R. Blanco[6], R. Palacio[7], S. Moreno[2], M.J. Pérez Elías[2]
*[1]Hospital Santa Bárbara, Medicina Interna, Puertollano, Spain, [2]Hospital Ramon y Cajal, Madrid, Spain, [3]Hospital La Paz, Madrid, Spain, [4]Hospital Gregorio Marañón, Madrid, Spain, [5]CS Sandoval, Madrid, Spain, [6]Hospital La Rioja, La Rioja, Spain, [7]Hospital Virgen De La Victoria, Málaga, Spain*

**Background:** A higher vulnerability of women admitted in the CORIS cohort was observed in recent years. Our objective was to estimate gender impact on survival and in the causes of death in the CoRIS from 2004 to 2014.
**Methods:** CoRIS is an open prospective multicentre cohort of HIV-infected adults naive to cART at entry. Gender differences in causes of Death and gender effect on time to death were studied. Kaplan Meier survival curve (log-rank test) and Cox estimative regression models were done including some at enrolment confounders (age, category of transmission, geographical origin, level of education, HIV CDC stage, CD4 cell count < 200 cel/mL and HIV-RNA level >$10^5$ copies/ml). Date of entry in the cohort was categorized in 3 periods, 1 (2004- 2007), 2 from (2008- 2010) and 3 (2011- 20014).
**Results:** Overall 371 (3.5%) deaths were observed in the studied period, 71 (4.1%) and 300 (3.4%) in women and male, without no differences in the estimated 10-year survival after entering the cohort, 88% vs. 92%, p=0.83. The most frequent cause of death was related with HIV infection (41.5 %) followed by not HIV related neoplasias (14 %), without differences according to gender or the period explored.
The effect of gender on time to death was investigated separately in the three periods, as an interaction between gender and period was shown (p = 0.003). In an unadjusted model gender has a differential effect in the three periods 1.31( 0.93,185 ;p= 0.11), 0.88(0.53,1.45; p=0.62)
and 0.36 (0.19,0.74;p=0.03), being protective in period 1 changing to a deleterious effect in Period 3. After adjusting by confounder variables gender has no longer effect on time to death 0.78 (0.36,1.73; p=0.55). A predictive model demonstrated that age, education level, HIV stage, CD4 cell count, and HCV coinfection were significantly associated with shorter time to death.
**Conclusions:** Causes of death were similar in women and men without a changing pattern during the studied years. Lower survival observed in women, in the last years is associated to the age, level of education, HIV disease severity and HCV coinfection.

## CAPACITY BUILDING FOR HIV PREVENTION RESEARCH

## WEPEC129

### WORLD REGION OF BIRTH AND AGE ARE STRONG PREDICTORS OF CD4 DECLINE: A STUDY OF HIV SEROCONVERTERS IN THE UNITED KINGDOM AND SWEDEN

Z. Yin[1], B. Rice[2], G. Marrone[3], A. Sönnerborg[3], A. Skingsley[1], T. Noori[4], V. Delpech[1]
*[1]Public Health England, HIVSTI, London, United Kingdom, [2]London School of Hygiene and Tropical Medicine, Measurement and Surveillance of HIV Epidemics (MeSH) Consortium, London, United Kingdom, [3]Karolinska Institute, Karolinska University Hospital, Department of Infectious Diseases, Stockholm, Sweden, [4]European Centre for Disease Prevention and Control, Stockholm, Sweden*
*Presenting author email: teymur.noori@ecdc.europa.eu*

**Background:** At the population level, the first CD4-cell count after HIV diagnosis is used to assess late presentation and estimate incidence (back-calculation) and probable country of HIV acquisition. At the Individual and subpopulation levels, however, CD4-cell decline after seroconversion may be variable. We developed formulas to estimate probable time period of HIV serocoversion that take into account the demographic prolife of the HIV population.
**Methods:** Analyses of national UK and Swedish HIV seroconverters with a documented negative HIV test in the previous year and at least two CD4 counts after three months (0.25 year) of diagnosis and prior to start of treatment. We fitted maximum likelihood multilevel multivariable linear models with random effects on the square root of CD4-cell counts. We defined the 'anchor' date as the date three months after diagnosis for each individual (range 0.25-1.25 years after the seroconversion).
**Results:** 1,653 seroconverters (1,233 UK; 420 Sweden) with 15,881 CD4-cell counts were analysed. The majority were men (90%) and born in Europe (84%). CD4-cell counts at the anchor date differed significantly by world region of birth and decline speed varied significantly by world region of birth and age at seroconversion (Table 1). This can be translated to an average drop of 65 cells/$mm^3$ in the first year among those born in Europe, 46 cells/$mm^3$ (p=0.003) among those born in Africa, and 67 cells/$mm^3$ among the others (p=0.654) and each year increase in age was associated with a 1.3% faster CD4-cell count decline (p=0.002). Formulas can be applied on HIV-diagnosed adults without previous negative HIV tests.

| Parameters (intercept= CD4-cell count at the anchor date) | World region of birth | | | |
|---|---|---|---|---|
| | Europe | Africa | Other areas | Unknown* |
| Upper interquartile limit of the intercept (U) | 690 | 570 | 689 | 703 |
| Median intercept (M) | 561 | 438 | 543 | 559 |
| Lower interquartile limit of the intercept (L) | 444 | 364 | 434 | 439 |
| CD4 decline speed per year (on CD4 square root) for the reference group ‡ ($S_k$) | 1.062 | 1.062 | 1.062 | 0.941 |
| CD4 decline speed per year (on CD4 square root) adjusted world region of birth ($S_r$) | 0 | -0.543 | -0.069 | 0 |
| CD4 decline speed per year (on CD4 square root) adjusted by age ($S_a$) | 0.014 | 0.014 | 0.014 | 0.015 |
| The probable longest time length between HIV seroconversion date and an adult's first CD4 cell count | $\frac{\sqrt{U}-\sqrt{first\ CD4\ cell\ count}}{S_k+S_r+S_a*(age\ at\ diagnosis)}+1.25$ | | | |
| A central estimate of the time length between HIV seroconversion date and an adult's first CD4 cell count) | $\frac{\sqrt{M}-\sqrt{first\ CD4\ cell\ count}}{S_k+S_r+S_a*(age\ at\ diagnosis)}+0.75$ | | | |
| The probable shortest time length between HIV seroconversion date and an adult's first CD4 cell count) | $\frac{\sqrt{L}-\sqrt{first\ CD4\ cell\ count}}{S_k+S_r+S_a*(age\ at\ diagnosis)}+0.25$ | | | |

* For generalization, we built a model on age and time which can be applied on people without world of region reported.
‡ Individuals aged 15 years old and born in Europe.

*[Table 1. Parameters and formulas to estimate probable time period of HIV seroconversion]*

**Conclusions:** World region of birth and age were strong predictors of CD4 decline. Our formulas can be used by other European countries to improve estimate of time from infection in key populations and better inform public health programming for most at risk populations.

## WEPEC130

### ENGAGING MEN IN MICROBICIDE VAGINAL RING TRIALS: SUCCESSES AND CHALLENGES

L. Solai[1], S. Ntshele[2], A. Van Niekerk[2], G. Schoeman[3], S. Nalutayaa[4], D. Lembethe[5], R. Masilo[6], H. Bolotini[7], W. Dyani[8], M. Mhlongo[9], A. Nel[10]
*[1]International Partnership for Microbicides, External Affairs - Africa, Cape Town, South Africa, [2]International Partnership for Microbicides, External Affairs, Paarl, South Africa, [3]Independent Consultant, Cape Town, South Africa, [4]MRC/UVRI Uganda Research Unit for AIDS, Masaka, Uganda, [5]Maternal, Adolescent and Child Health (MatcH Research), Edendale, South Africa, [6]Madibeng Centre for Research, Brits, South Africa, [7]Ndlovu Research Consortium, Elandsdoorn, Dennilton, South Africa, [8]Desmond Tutu HIV Foundation, Fish Hoek, South Africa, [9]Qhakaza Mbokodo Research Clinic, Ladysmith, South Africa, [10]International Partnership for Microbicides, Paarl, South Africa*
*Presenting author email: lsolai@ipmglobal.org.za*

**Background:** Addressing women's social and physiological vulnerability to HIV infection is a global health priority, underscored in international strategies aiming to eliminate new HIV infections. Early biomedical responses solely focused on efficacy, without a corresponding investment to broader community in which the women come from. Contemporary study designs recognize that participating women are surrounded by many influencers, e.g. household, community members and stakeholders servicing community to optimize retention and adherence. Identifying mechanisms to support women's microbicide use in communities is a critical pillar for future access.
**Methods:** Seven research centres (RCs) across South Africa (6) and Uganda (1) implemented multi-layered community engagement strategy to meaningfully involve men. Adopting UNAIDS/AVAC Good Participatory Practice (GPP) guidelines as an overarching framework, RCs tailored responses to their environments. Male community leaders, religious institutions and other positions of influence which continue to be male-dominated are targeted in culturally-sensitive, community responsive interventions. Conducted one-on-one /couples' counselling, male workshops and dialogues to reach men in diverse circumstances.
**Results:** All RCs reported increase in male acceptability and support for The Ring Study. Where men are supportive, women display improved adherence and report better psychological well-being. Participants have benefitted from this direct support from community liaison officers in engaging their partners, resulting in improved participant retention.
**Conclusions:** Successful male engagement has positively improved retention and adherence of study participants for The Ring Study. These interventions remain resource intensive and future success requires the identification of critical enablers to ensure that investments efficiently and effectively support women's decision to use vaginal microbicides. This requires a corresponding focus on women's involvement in the design and evaluation of male engagement activities.

# COMMUNITY INVOLVEMENT IN BIOMEDICAL PREVENTION

## WEPEC131

### ENGAGING WITH TRIAL PARTICIPANTS AND STAKEHOLDERS IN THE HIV PREVENTION TRIAL RESULT DISSEMINATION PROCESS IN KWAZULU NATAL, SOUTH AFRICA: OUTCOMES AND EXPERIENCES

S. Naidoo[1], N. Morar[1], G. Ramjee[1,2,3]
*[1]South African Medical Research Council, HIV Prevention Research Unit, Durban, South Africa, [2]London School of Hygiene & Tropical Medicine, Department of Epidemiology and Population Health, London, United Kingdom, [3]University of Washington, Department of Global Health, School of Medicine, Seattle, United States*
*Presenting author email: sarita.naidoo@mrc.ac.za*

**Background:** Partnering and engaging with trial participants, community, regulatory and government stakeholders is a key component of trial result dissemination plans. The South African Medical Research Council, HIV Prevention Research Unit enrolled 9796 women in four phase III and two phase IIb HIV prevention trials at community-based sites in KwaZulu-Natal between 2003 and 2012. This paper highlights the outcomes of implementing a multi-tiered dissemination plan among these participants and stakeholders.
**Methods:** Dissemination plans included timelines for presenting results to study staff, participants, community working groups (CWGs), regulatory and government stakeholders and the media. Trial outcome scenarios were communicated to participants and stakeholders approximately six months prior to release of results. Researchers worked closely with participants, CWGs, stakeholders and trial sponsors to develop key messages, presentations and press releases, which were translated into the local language. Peer educators and key CWG members were trained in media communication. Researchers contacted participants via telephone, home visits, and SMS to inform them of dissemination meetings. Stakeholders were invited to meetings via telephone, SMS and written letters. Staff, CWGs, participants and stakeholders signed confidentiality agreements when results were disseminated to them while under embargo.
**Results:** Participants received results either at planned meetings or at study sites. Approximately 60% of participants in these studies received results within one week of release. Several dissemination meetings (n=108) were held with CWGs, and other stakeholders. Participants and stakeholders appreciated the transparent and participatory dissemination process. Participants displayed a good understanding of trial results and were willing to participate in future HIV prevention research. Participants expressed disappointment with futile results and reported that some women did not adhere to the protocol and interventions. During the latter three trials, participants (n=20) and CWG members (n=8) were media spokespersons together with study investigators. Participants shared positive trial experiences despite interventions showing no effect in preventing HIV.
**Conclusions:** Using a participatory process to engage participants and stakeholders was effective in ensuring prompt dissemination of results and adequate understanding of trial outcomes. Well-developed transparent communication plans will strengthen the partnership between stakeholders, participants, and researchers and minimize challenges associated with dissemination of trial results.

# MEASUREMENT AND MODELLING OF THE IMPACT OF TREATMENT ON PREVENTION OF HIV

## WEPEC132

### COST-EFFECTIVENESS OF DIFFERENT ART SCALE UP STRATEGIES IN UGANDA: A MATHEMATICAL MODELLING STUDY

N. McCreesh[1], I. Andrianakis[1], R.N. Nsubuga[2], M. Strong[3], I. Vernon[4], T.J. McKinley[5], J.E. Oakley[3], M. Goldstein[4], R. Hayes[1], R.G. White[1]
*[1]London School of Hygiene and Tropical Medicine, Infectious Disease Epidemiology, London, United Kingdom, [2]MRC/UVRI Research Unit on AIDS, Kampala, Uganda, [3]Sheffield University, Sheffield, United Kingdom, [4]Durham University, Durham, United Kingdom, [5]Exeter University, Exeter, United Kingdom*
*Presenting author email: nicky.mccreesh@lshtm.ac.uk*

**Background:** Since September 2015, the World Health Organization (WHO) has recommended that ART be offered to all people living with HIV. Many researchers also advocate a more intensive universal 'test-and-treat' (UTT) strategy. We investigate the cost-effectiveness of these and other ART scale-up options in Uganda.
**Methods:** An individual based model was developed simulating HIV transmission and ART scale-up. The model was fitted using history matching, and 1880 baseline scenarios were created to account for uncertainties in costs, disability weights, sexual behaviour, HIV epidemiology, and ART coverage in Uganda. Six different ART scale-up strategies were simulated from 2016-2030:
1) increased HIV testing rates,
2) UTT (increased HIV testing, improved linkage to care, no CD4 threshold for ART),
3) no CD4 threshold for ART,
4) improved pre-ART care,
5) increased retention on ART, and
6) increased ART restart rates.
The cost per DALY averted was calculated (health service perspective, 3% discount rate) for each intervention and scenario, to determine which interventions are likely to be highly cost-effective or cost-effective (cost < 1 or 1-3 per-capita-GDP per DALY averted respectively), and to identify the most cost-effective option.
**Results:** Preliminary results suggest that interventions 3-6 are all likely to be highly cost-effective strategies for scaling-up ART coverage in Uganda, with removing the CD4 threshold being the most cost-effective option in 88% of scenarios. UTT is also very likely to be a cost-effective option (cost-effective in 98% of scenarios), however it is among the top three most cost-effective interventions in only 10% of scenarios. Increasing HIV testing rates is only cost-effective in 3% of scenarios, and is the least cost-effective option in 96% of scenarios.
**Conclusions:** Our results suggest that removing the CD4 threshold for ART initiation is likely to be a highly cost-effective ART scale-up option for Uganda, and it is very likely to be the most cost-effective of the options considered. We recommend that Uganda offers ART to all people living with HIV, following WHO recommendations. UTT is very likely to be cost-effective and should be considered if resources to implement it are available, however it should not be prioritised above other, more cost-effective, strategies.

## ESTIMATION OF THE NEED FOR ART

### WEPEC133

### HIGH HIV PREVALENCE AND LOW HEALTH SERVICE ACCESS AND UTILISATION AMONG MOBILE POPULATIONS ALONG THE N3 HIGHWAY IN SOUTH AFRICA

M. Grasso[1], A. Manyuchi[2], T. Osmand[3], A. Marr[3], Z. Isdahl[1], H. Struthers[2], J. McIntyre[2], T. Lane[3]
*[1]University of California, Global Health Sciences, Johannesburg, South Africa, [2]ANOVA Health Institute, Johannesburg, South Africa, [3]University of California, Center for AIDS Prevention Studies, San Francisco, United States*
*Presenting author email: mikegrassosf@gmail.com*

**Background:** In South Africa, female sex workers (FSW) and long-distance truck drivers (LDTD) have been largely understudied. Available evidence shows these populations are highly vulnerable to HIV infection and potential drivers of the HIV epidemic. Using data from the Key Populations along the N3 motorway (KPN3) study, we present HIV testing and prevalence data, explore health service access and utilisation among FSW and LDTD, and provide recommendations for programmes working with these populations.
**Methods:** Time-location sampling was used to recruit 173 FSW and 518 LDTD at rural truck stops between Harrismith, Free State and Cato Ridge, KwaZulu-Natal provinces from August to December 2014. Eligible participants completed an interviewer-administered behavioural questionnaire, underwent HIV rapid testing, and provided blood samples for laboratory HIV testing. Adjusted analyses of key variables showed no difference based on clustering effects or probability weighting.
**Results:** HIV prevalence among FSW and LDTD in the sample was 88.4% (95% CI: 83.3-93.5%) and 16.7% (95% CI: 13.5-19.9%) respectively. HIV-testing within 12 months preceding the survey was reported by 42% (95% CI: 34.6-49.3%) of FSW and 58.9% (95% CI: 54.7-63.1%) of LDTD. Nearly one fifth (19.2%) of FSW and 8.6% of LDTD in the study were newly diagnosed with HIV during study testing and were previously unaware of their status. Among LDTD who self-reported a prior HIV-positive test, 83.3% (95% CI: 72.0-94.6%) had consulted a medical professional related to their status and 71% (95% CI: 57.7-85.1%) were on ART. In contrast, a lower proportion of self-reported HIV positive FSW participants reported consulting a medical professional (71.7%; 95% CI: 63.6-79.8%) and significantly less received ART (48.3%; 95% CI: 39.4-57.2%; P< .01).
**Conclusions:** Like their urban counterparts, FSW on the N3 corridor carry a very high burden of HIV; LDTD displayed prevalence consistent with adult males in the general population. High HIV prevalence and low ART utilization suggest FSW working along transportation corridors are in urgent need of targeted comprehensive HIV services, including prevention, testing and treatment programming and interventions. Furthermore, we recommend additional surveillance to determine the HIV programming needs of FSW and LDTD along other transportation routes in South Africa.

## ESTABLISHMENT OF COHORTS TO STUDY HIV INCIDENCE / PREVENTIVE INTERVENTIONS / NATURAL HISTORY

### WEPEC134

### THE MS2COHORT, A CASE-HOLDING INITIATIVE FOR THE EARLY DETECTION OF HIV AND STI IN MSM WITH HIGH-RISK BEHAVIOR

R. Achterbergh[1], J. van der Helm[1], I. Peters[1], K. de Jong[1], E. Hoornenborg[1], T. Heijman[1], A. Hogewoning[1], H. de Vries[1,2]
*[1]Public Health Service Amsterdam, Amsterdam, Netherlands, [2]Academic Medical Center, Dermatology, Amsterdam, Netherlands*
*Presenting author email: rachterbergh@ggd.amsterdam.nl*

**Background:** Men who have sex with men (MSM) are at increased risk to acquire sexual transmitted infections (STIs) and HIV. The STI positivity rate among MSM attending the STI clinic in Amsterdam in 2013 was 18% among HIV-negative and 30% among HIV-positive MSM with a high recurrence of infections. More then 10% of the men who were diagnosed with an STI had a new infection within 1 year.
Our aim was to set up a case-holding cohort of MSM for early detection of HIV and STI and describe risk behavior, drug use and recurrence of infections.
**Methods:** In January 2014 we started a cohort of MSM with high risk behavior at the STI clinic of Amsterdam. Inclusion criteria were HIV-negative MSM: with 2 STIs or used Post-Exposure Prophylaxis in the last 12 months, or HIV-positive MSM with one STI in the last 12 months. We tested the participant 4 times yearly. Questionnaires on drug use and risk behaviour were part of each visit.
**Results:** We included 95 HIV-negative en 85 HIV-positive MSM into the cohort until December 2015. Median age was 39.5 [IQR 32-49].
In 238 of the total 961 visits an STI was diagnosed (24.8%): 121 gonorrhea, 91 chlamydia non-LGV, 38 syphilis and 17 lymfogranuloma venereum (LGV) (table 1) . Five new HIV infections occurred (6.0 / 100 person-years). Poly drugs use of 2 or more drugs in the 6 months prior to the first visit was reported by 76% (n=136) and 85% ( n=116) used 2 or more drugs during sex.

| | HIV-negative MSM | HIV-positive MSM | Total | P-value |
|---|---|---|---|---|
| First visit | 30/95 (31.9%) | 27/85 (31.4%) | 57/180 (31.7%) | 0.940 |
| Second visit | 22/89 (24.7%) | 24/85 (28.2%) | 46/174 (26.4%) | 0.599 |
| Third visit | 17/79 (21.5%) | 22/76 (28.9%) | 39/157 (24.8%) | 0.287 |
| Fourth visit | 12/68 (17.6%) | 22/72 (30.6%) | 34/140 (24.3%) | 0.075 |
| Fifth visit | 9/48 (18.8%) | 16/66 (24.2%) | 25/114 (21.9%) | 0.484 |
| Sixth visit | 6/33 (18.2%) | 11/56(19.6%) | 17/89 (19.1%) | 0.866 |
| Total* | 101/452 (22.3%) | 137/509 (26.9%) | 238/961 (24,8%) | 0.101 |

*[Table 1 STI positivity rate among MSM with high risk behavior at the STI clinic of Amsterdam, not including new HIV infections. *includes later visits]*

**Conclusions:** In this cohort of MSM with high risk behavior for acquiring HIV and STI, frequent screening revealed a high STI incidence in both HIV-positive and HIV-negative MSM and a high HIV incidence. Early treatment and linkage to care provided not only individual but also public health benefits. The association between drug use and incidence of STI/HIV will be further investigated.

## GOOD PARTICIPATORY PRACTICE AND COMMUNITY INVOLVEMENT IN PREVENTION RESEARCH

### WEPEC135

### INVOLVEMENT OF KEY POPULATIONS IN MAPPING AND ESTIMATING THE SIZE OF ‘KEY POPULATION’: EXPERIENCES FROM LAGOS, NIGERIA; GOOD PARTICIPATIVE PRACTICE AND COMMUNITY INVOLVEMENT IN PREVENTION RESEARCH

O.A. Oderinde[1], J. Ibitoye[2], A. Ojoye[2], A. Shittu[2], U.S. Nwanfor[3], R. Ugbena[4]
*[1]Society for Family Health, HIV/AIDS, Lagos, Nigeria, [2]Society for Family Health, Lagos, Nigeria, [3]Centre for the Right to Health, Lagos, Nigeria, [4]Society for Family Health, Abuja, Nigeria*
*Presenting author email: tosinoddy@yahoo.com*

**Background:** HIV prevalence amongst Men Who Have Sex with Men (MSM) in Lagos is estimated to be17.2 %. MSM are among the most hidden sexual minority population. The prevailing legal and policy environment in Nigeria exacerbates an extremely vulnerable work life. MSM face severe public stigma, discrimination and fear of being publicly identified and insulted by health workers, and are less likely to seek HIV and sexually transmitted infections (STI) services hence, identifying networks of high-risk MSM are difficult. Therefore, an innovative method is required to be able to identify MSM for HIV services. The USAID- funded Strengthening HIV Prevention Services (SHiPS) for Most at Risk Populations (MARPs) project in Nigeria conducted mapping and size estimate study of MARPs in Lagos and 6 others states and FCT in 2015 with the objective of identifying hot spots for MSM and other key population
**Description:** The study utilized the capture and re-capture methodology recommended by Mannitoba for estimating size of MSM in any location. Capture-recapture is a statistical method for estimating the numbers of individuals from groups that are hidden or hard to reach using a probabilistic calculation. Recapture activities are conducted within one to two weeks after the initial capture activities to minimize any population drifts. The study uses key population as data collectors and enumerators trained on principles of confidentiality and ethical handling of research data.The survey was conducted across the 20 Local Government Areas.
**Lessons learned:** Involvement of key populations enhanced the generation of relevant information about the location, number and typologies of MSM leading to the understanding of the hidden population with the aim of providing evidence for improved programming. Estimated population of MSM (M&C 2015 4,828) compared with recent similar study (LEA, 2012 2,838) shows more number of MSM in Lagos state.
**Conclusions/Next steps:** Considering the involvement of key populations in successful mapping and size estimation, they should be engaged in HIV programming to create ownership and sustainable program impact.

## DETERMINATION OF HIV INCIDENCE

## WEPEC136

### CHARACTERIZATION OF FALSE RECENT RESULTS IN CRF02_AG HIV-1 BY THE LIMITING ANTIGEN INCIDENCE ASSAY

N. Parkin[1], S. Keating[2], D. Hampton[2], K. Marson[3], C.D. Pilcher[3], D. Mbanya[4,5], N. Ndembi[6]
*[1]FIND, Geneva, Switzerland, [2]Blood Systems Research Institute, San Francisco, United States, [3]University of California, San Francisco, United States, [4]University of Yaoundé, Yaoundé, Cameroon, [5]Society for Women and AIDS in Africa, Yaoundé, Cameroon, [6]Institute for Human Virology Nigeria, Abuja, Nigeria*
*Presenting author email: neil.parkin@finddx.org*

**Background:** The limiting antigen (LAg) immunoassay is widely used to estimate HIV incidence in cross-sectional surveys. Differences in key assay performance characteristics including the proportion of results that are classified incorrectly as "recent" (false recent ratio or FRR) between subtypes of HIV have been reported previously. Precise estimation of incidence in cross-sectional surveys using laboratory assays requires a FRR below 2%. The performance of LAg in CRF02_AG, the subtype of HIV that is predominant in West African countries including Cameroon and Côte d'Ivoire, is unknown.
**Methods:** De-identified plasma specimens from 95 individuals living in Cameroon and infected with CRF02_AG HIV-1 for more than 2 years were studied. ART treatment naive individuals, recruited during pre-ART preparation, were screened for HIV infection using the national algorithm in Cameroon (Alere Determine HIV 1/2 and Murex Combo Ag/Ab kit). HIV-1 subtype was determined by RT-PCR using HIV-1 specific primers that amplify a fragment of *env* gp41 including the immunodominant region. Viral sequences were aligned with reference strains and phylogenetic analysis was performed using PHYLIP 3.5c. LAg testing (Sedia, OR USA) was performed according to the manufacturer's instructions.
**Results:** Gp41 *env* sequence was obtained from RT-PCR products for all 95 specimens, indicating the presence of HIV RNA at detectable levels. Sequences were found to cluster most closely with CRF02_AG reference strains. LAg normalized optical density (ODn) values ranged from 0.19 to 6.9. Two specimens had ODn below 1.0, and 3 below 1.5 (the threshold for assignment as a "recent" infection). Since all patients were infected for longer than 2 years and had detectable HIV RNA at the time of specimen collection, the FRR is 3.2% (95% confidence interval: 0.7% - 9.0%).
**Conclusions:** The FRR for LAg in this set of 95 viremic, longstanding infected CRF02_AG plasma specimens is slightly higher than has been reported for HIV subtypes A, B and C. These results should be extended and confirmed in additional studies, in order to assess whether or not cross-sectional estimation of HIV incidence using LAg or LAg plus viral load in countries or key populations where CRF02_AG is predominant is feasible.

## WEPEC137

### ESTIMATION OF HIV INCIDENCE USING RETROSPECTIVELY-COLLECTED HIV TESTING HISTORY IN BOTSWANA

N.N. Abuelezam[1], T. Gaolathe[2], U. Chakalisa[2], E. Kadima[2], N. Khan[1], S. Moyo[2], K. Powis[1], J. Makhema[2], M. Mmalane[2], V. Novitsky[1], M.P. Holme[1], S. Lockman[1], M. Essex[1], R. Wang[1], V. DeGruttola[1], G.R. Seage III[1], E.J. Tchetgen Tchetgen[1], K.E. Wirth[1]
*[1]Harvard T.H. Chan School of Public Health, Boston, United States, [2]Botswana Harvard AIDS Institute Partnership, Gaborone, Botswana*
*Presenting author email: nabuelez@hsph.harvard.edu*

**Background:** HIV incidence is used to assess the impact of prevention interventions and baseline transmission potential in a population. Laboratory capacity needed to perform recency assays to estimate HIV incidence may not be readily available, particularly in resource-limited settings. We propose an alternative approach to estimating HIV incidence based on retrospectively-collected HIV testing history.
**Methods:** We used retrospectively-collected HIV testing history from participants enrolled in the Botswana Combination Prevention Project (BCPP), a 30 community pair-matched, cluster randomized trial. Between October 2013 and November 2015, a random 20% sample of community residents aged 16-64 years enrolled. Participants completed a baseline survey. Date and documentation of last HIV test were collected. All participants without documentation of a prior HIV-positive test result were offered HIV testing. Survival analysis was conducted to account for person-time at risk, assuming that time since infection was exponentially distributed from the documented HIV-negative test date to the survey date. We restricted this analysis to participants who had tested within 12 months of baseline, following Botswana's annual testing recommendations.
**Results:** Among the 12,610 participants enrolled, 10,399 (82%) self-reported previously testing for HIV infection. Only 5,476 (53%) provided documentation of either prior HIV-positive status (N=2,995) or HIV-negative status (N=2,481). Among participants with a previous dated HIV-negative test result, the median time since last HIV test was 6.6 months (IQR: 2.6-14.9). Among 1,700 participants who tested HIV-negative within the prior 12 months, 12 tested HIV-positive at baseline. We estimated a HIV incidence rate of 1.88 cases/100 person-years (95% CI: 0.81-2.94). This incidence estimate is slightly higher than the most recent assay-based incidence estimate of 1.35 cases/100 person-years from the 2013 Botswana AIDS Indicator Survey. A trend toward higher HIV incidence in men than in women was observed (2.00 vs. 1.82 cases/100 person-years, respectively; p=0.37).
**Conclusions:** Estimation of HIV incidence using prior testing data has the potential to expand upon laboratory-based estimates. It will be important to explore how risk behavior varies with the time interval between tests. In resource-limited settings, investing in automated data collection of HIV testing with unique identifiers would allow for an alternative method of HIV incidence estimation.

## WEPEC138

### REPEAT HIV TESTING AND INCIDENT HIV DIAGNOSIS AMONG CLIENTS ATTENDING VOLUNTARY COUNSELLING AND TESTING CLINICS IN WUXI, CHINA

X. Meng[1], H. Zou[2]
*[1]Wuxi Center for Disease Control and Prevention, Infectious Disease Department, Wuxi, China, [2]University of New South Wales, Kirby Institute, Sydney, Australia*
*Presenting author email: mengxiaojunwx@163.com*

**Background:** Voluntary counseling and testing (VCT) clinics serve as an important platform for people seeking HIV testing in China. We aimed to elucidate HIV testing behaviors and incident HIV diagnosis among clients attending VCT clinics in Wuxi, China.
**Methods:** Data on clients attending 32 VCT clinics in Wuxi, China 2013-2015 were retrieved. Phone number was used to identify individuals. Simple descriptive statistics were used to describe the characteristics and HIV testing behaviors. Multivariate logistic regression was used to analyze factors associated with repeated HIV testing. Cox regression was used to explore factors associated with incident HIV diagnosis.
**Results:** In total 18359 valid records representing 16621 individuals were included. At first visit, 39.5% were men, 61.7% were younger than 30, 58.3% were married, 27.9% of men reported homosexual behaviors and 31.2% reported previous HIV testing. A total of 5568 clients had 6422 HIV tests in 2013, 5642 clients had 6268 HIV tests in 2014 and 5411 clients had 5669 HIV tests in 2015. Of the 16293 clients who were tested HIV negative at first visit, 6.7% retested during 2013-2015 with an incident HIV diagnosis rate of 4.4 per 100 person-years.
Of the 1625 men who reported homosexual behaviors and who were tested HIV negative at first visit, 17.3% retested during 2013-2015 with an incident HIV diagnosis rate of 12.2 per 100 person-years. Repeat HIV testing was associated with male gender [odds ratio(OR)=1.4, 95% confidence interval(CI): 1.2-1.7], risk behaviors [homosexual behaviors (2.5, 1.9-3.2), commercial heterosexual behaviors (1.7, 1.3-2.2) and injection drug use (7.0, 4.9-9.8), versus casual non-commercial heterosexual behaviors], having ever tested for HIV (4.3, 3.7-5.0), being HIV positive (0.5, 0.3-0.7) and ascending year (2.0, 1.8-2.1).
Incident HIV diagnosis was associated with male gender (HR=8.5, 1.9-38.1), homosexual behaviors (HR=8.4, 1.5-46.7), attending hospital-based VCT clinics (HR=7.8, 1.1-58.3) and being referred by a clinical service (HR=4.5, 1.1-20.1).
**Conclusions:** Low repeat HIV testing rate and high HIV incidence were observed among VCT clients in Wuxi, China. There is an urgent need to increase HIV testing uptake and encourage frequent HIV testing among clients with high risk behaviors, men who have sex with men in particular.

## WEPEC139

### CROSS-SECTIONALLY ESTIMATED AGE-SPECIFIC HIV INCIDENCE AMONG YOUNG WOMEN IN A RURAL DISTRICT OF KWAZULU-NATAL, SOUTH AFRICA

E. Grebe[1], H. Huerga[2], G. Van Cutsem[3], A. Welte[1]
*[1]Stellenbosch University, DST/NRF Centre of Excellence in Epidemiological Modelling and Analysis, Stellenbosch, South Africa, [2]Epicentre, Paris, France, [3]Médecins Sans Frontières, Cape Town, South Africa*
*Presenting author email: eduardgrebe@sun.ac.za*

**Background:** Population-level HIV incidence is the most sensitive indicator of epidemiological trends, especially in the era of monitoring high-level interventions in support of global HIV elimination goals. But, despite progress in methods using demographic and biomarker data, the estimation of incidence continues to be very difficult and expensive. In particular, methods to interpret age structure in prevalence, and its changes over time, are underdeveloped, leading to missed opportunities in leveraging widely available data.

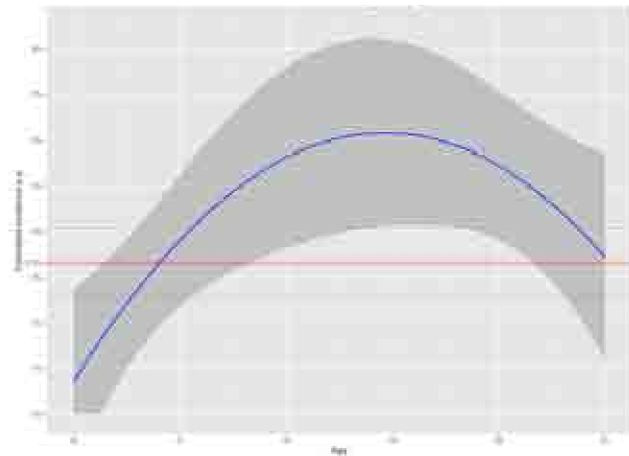
Author Index

**Methods:** Adapting a method previously described by some of the authors, regression of age-dependent prevalence measures from a population-based survey in Mbongolwane and Eshowe was used to estimate incidence and age trends in incidence, among young women (15-23 years), who experience the highest incidence and who can be regarded as a sentinel population. In addition to a prevalence 'gradient', the method requires an estimate of excess mortality of the HIV positive subpopulation, which, for young subjects, is shown to have negligible impact on the estimation procedure. Multiple parametric forms were explored to consider various trade-offs of precision against sensitivity to age trends.
**Results:** The analysis suggests a rapid escalation in incidence from age 15 to 18 years, with a peak at 19 years of 6.2% p.a. (95% CI: 4.1%-8.2%). Using an age-insensitive model produced an overall incidence estimate of 3.3% p.a. (2.6%-4.1%). The figure shows incidence estimated using the most age-flexible model deployed.



*[Age-specific and overall estimated HIV incidence among women and girls aged 16-21]*

**Conclusions:** These estimates demonstrate the potentially important use of underutilised data in support of incidence trend estimation. The very high incidence at critical ages seen in this analysis would be invisible to routine 5-year age bin analyses, and may be critical to targeting prevention interventions. Generalisation of these methods to data sets with multiple time points will be more illuminating, for example for detection of secular incidence changes, which are currently highly elusive to all established methods.

## WEPEC140

### ESTIMATING RATES AND CORRELATES OF HIV INCIDENCE USING SELF-REPORTED DATA ON PREVIOUS TESTING AND CURRENT RESULTS AMONG ADULTS REACHED BY A HOME-BASED TESTING PROGRAM IN A HIGH-PREVALENCE REGION OF NAMIBIA

A. Maher[1], A. Wolkon[2], K.M. Banda[3], T. Nakanyala[3], A.M.-A. Agovi[2], M. Chipadze[4], C. Ntema[4], S. Chaturvedi[1], N. Mutenda[3], D. Lowrance[5], N. Hamunime[3], S. Patel[5], D. Prybylski[2], W. McFarland[1]
*[1]University of California, San Francisco, Global Health Sciences, San Francisco, United States, [2]U.S. Centers for Disease Control and Prevention, Windhoek, Namibia, [3]Ministry of Health and Social Services, Windhoek, Namibia, [4]Development Aid from People to People, Windhoek, Namibia, [5]U.S. Centers for Disease Control and Prevention, Atlanta, United States*
*Presenting author email: andrew.maher@ucsf.edu*

**Background:** HIV incidence is the gold-standard metric for assessing the direction of an epidemic and impact of prevention programs. Provided that self-reported data on HIV status are reliable, comparing self-reported data on previous HIV testing to data from current testing can generate HIV incidence estimates when other methods, such as cohorts and incidence assays, are not feasible. We applied this approach to estimate HIV incidence and correlates of seroconversion among adults reached by a home-based testing program in Zambezi the highest-prevalence region of Namibia (29.4% vs. 14.0% nationally, DHS+, 2013).
**Methods:** We analyzed data collected from adults (age ≥15 years) living in five geographically contiguous areas of Zambezi region who were tested through a home-based program from 12/2014 - 7/2015. Adults self-reporting a prior HIV-negative test during the previous 24 months and receiving a subsequent test through the home-based program were included in our analysis. Person-years (PY) of observation were estimated using the current, home-based testing date and the self-reported date of the most recent previous HIV-negative test. Seroconversion was defined as a positive result from the current, home-based test. Incidence rates were compared using Cox proportional hazards analysis.
**Results:** Among 2,164 adults [60.7% female, 21.3% HIV positive (9.1% among adults age 15-24 years)], 712 (32.9%) self-reported an HIV-negative test during the previous 24 months. Among these repeat testers, HIV incidence was 8.5/100 PY (95% CI 6.3 - 11.5) based on 43 seroconversions in 504.8 PY. Incidence was higher among urban compared to rural residents (16.5 vs. 4.9/100 PY, *P*< 0.001). No significant differences in incidence were observed by sex, age, or marital status.
**Conclusions:** Repeat testers in our survey had an incidence rate well above the threshold of 3.0/100 PY used by the WHO to identify populations at "substantial risk for HIV infection", which suggests unmet prevention need among this subgroup. We recognize the potential for bias if individuals misreport their HIV status. However, the high overall and youth-specific prevalence in our study population, which is consistent with other survey estimates for Zambezi region, support this approach for understanding recent infection. This approach may be particularly useful when frequent repeat testing is possible.

## WEPEC141

### HIGH INCIDENCE OF SUBSEQUENT HIV SEROCONVERSION AMONG MONTREAL PEP USERS

N. Machouf, C. Galanakis, S. Vézina, D. Longpré, M. Boissonnault, E. Huchet, D. Murphy, L. Charest, B. Trottier, R. Thomas
*Clinique Médicale l'Actuel, Montréal, Canada*
*Presenting author email: rejean.thomas@lactuel.ca*

**Background:** Patients consulting for post-exposure prophylaxis (PEP) are at greater risk for contracting HIV compared to other MSM and non-MSM males. Few studies have examined the subsequent incidence HIV infections in this high-risk population beyond the PEP follow-up period. The aim of this study is to determine the incidence HIV seroconversions after PEP use for sexual exposures.
**Methods:** We prospectively assessed all patients consulting for PEP following sexual exposures from October 2000 to July 2014. Patients that were HIV-positive at the initial PEP consult and those that seroconverted during the 12-week PEP-follow-up were excluded. HIV-negative patients with ≥20 weeks follow-up data were evaluated for HIV seroconversion. The censoring date was the last negative/first positive HIV test/PrEP commencement. A Cox proportional hazards model was used to estimate the factors associated with HIV seroconversion.
**Results:** 1350 patients were included. Patients were male (96%) and MSM (91%) with a mean age of 33y (range 18-74y). 67% of patients had consulted for PEP for the first time, while 33% had repeated PEP episodes. 200 patients (15%) had at least one syphilis infection during follow-up. 129 patients (10%) had also consulted for PrEP. Median follow-up was 176 weeks (IQR 91-273) representing 5075 person-years of follow-up. Eighty-nine (7%) patients seroconverted after PEP use for an HIV incidence rate of 1.75cases/100py (95% CI 1.43-2.16/100py). Patients with a high exposure risk at the time of the PEP consultation have an incidence rate 2.76 times greater than those with a low exposure risk (1.96 vs 0.71 cases/100 py, respectively). All seroconverted patients were MSM with mean age of 33 years (range 21-51y). Patients that are younger (aHR=0.96; p=0.002), have a syphilis infection following PEP (aHR=4.55; p< 0.001) and have a moderate to high exposure risk at their first PEP consult (aHR=2.40, p=0.04) are at greater risk of acquiring HIV following a PEP consultation.
**Conclusions:** Patients consulting for PEP are at high risk of acquiring HIV. Young, MSM individuals with a history of STIs and at-risk behavior are most vulnerable to HIV infection. Patients consulting for PEP should consider PrEP as an alternative therapy.

# METHODS FOR ESTIMATING INCIDENCE USING CROSS SUB-CATEGORYAL SAMPLES

## WEPEC142

### COMPARISON OF MAXIM AND SEDIA LIMITING ANTIGEN AVIDITY ASSAY PERFORMANCE

J. Konikoff[1], K. Schlusser[2], C. Morrison[3], T. Chipato[4], A. Kirkpatrick[5], P.-L. Chen[3], M. Munjoma[4], S. Eshleman[2], O. Laeyendecker[2,5]
*[1]Johns Hopkins Bloomberg School of Public Health, Baltimore, United States, [2]Johns Hopkins University School of Medicine, Baltimore, United States, [3]FHI 360, Durham, United States, [4]University of Zimbabwe, Harare, Zimbabwe, [5]NIAID, Baltimore, United States*
*Presenting author email: olaeyen1@jhmi.edu*

**Background:** Accurate methods for cross-sectional incidence estimation are needed for HIV prevention research. The Limiting Antigen Avidity Assay (LAg-Avidity) has been marketed by two vendors (Maxim Biomedical and Sedia BioSciences

Corporation). Performance difference between the two LAg-Avidity assays is unknown.

**Methods:** A total 1410 treatment-naive samples from 176 seroconverters from the Zimbabwe FHI 360 Hormonal Contraception and HIV trial (subtype C endemic area) were tested using the both versions of the LAg-Avidity assay. The correlation coefficients ($R^2$) between both assays for the optical density (OD) and normalized optical density (OD-n) were calculated. We estimated the mean duration of recent infection (MDRI, the average time individuals appeared recently infected using a time window of 2 years) and false recent rate (FRR, the frequency of being identified as recently infected for samples from individuals infected >2 years) for both assays using an assay cut-off of 1.5 OD-n alone or in combination with a viral load of >400 copies/ml or >1000 copies/ml. Differences in MDRI and FRR were calculated.

**Results:** The $R^2$ for OD was 0.93 with a slope of 0.98; the $R^2$ for OD-n was 0.86 with a slope of 0.79. The MDRI (95% confidence interval) in days for Sedia was 140 (117,167) compared to 160 (138,188) for Maxim for a difference of 20 (11,31). The MDRI for an algorithm of LAg-Avidity +VL>400 copies/ml was 117 (95,141) for Sedia and 139 (117,164) for Maxim with a difference of 22 (13,32) days. The MDRI for an algorithm of LAg-Avidity +VL>1000 copies/ml was 104 (84,126) for Sedia and 123 (103,145) for Maxim with a difference of 19 (10,28) days. The FRR for any testing combination was ≤0.22%.

**Conclusions:** Performance differences between Maxim and Sedia assays are due to differences in the calibrators, since these differences were more pronounced for OD-n than OD. The MDRI of the Maxim assay was 21 days larger than the MDRI for the Sedia assay, with near identical FRRs.

## HIV TESTING AND DIAGNOSTIC STRATEGIES

### WEPEC143

### EVALUATION OF A RAPID POINT OF CARE (POC) HIV AND SYPHILIS SCREENING PROGRAM IN AN EMERGENCY DEPARTMENT (ED) SETTING IN DETROIT, MICHIGAN - 2015 - 2016

D.C. Ham[1], N. Markowitz[2,3], J. Manteuffel[4], P. Peters[1], K. Mumby[2], D. Dankerlui[2], Y. Fakile[5], K. Hoover[1]

*[1]CDC, Division of HIV/AIDS Prevention, Atlanta, United States, [2]Henry Ford Hospital, Infectious Diseases, Detroit, United States, [3]Wayne State University, Medicine, Detroit, United States, [4]Henry Ford Hospital, Emergency Medicine, Detroit, United States, [5]CDC, Division of STD Prevention, Atlanta, United States*

*Presenting author email: nmarkow1@hfhs.org*

**Background:** Cases of primary and secondary syphilis in Detroit, MI increased from 73 in 2010 to 199 in 2013: 56% of 2013 cases were in young black men who have sex with men (MSM), and 52% were HIV coinfected. To respond to a need for increased testing services, we implemented a rapid POC HIV and syphilis testing program for young men receiving care in an ED.

**Methods:** From 6/2015, we offered HIV and syphilis screening to men aged 18-34 years seeking ED care. Two rapid POC tests were employed: the Alere **Determine** HIV-1/2 Ag/Ab Combo test (Determine) and the Syphilis Health Check (SHC) treponemal test**.** All patients were also tested for HIV with the Biorad 4th generation HIV Combo Ag/Ab assay and for syphilis with a rapid plasma reagin (RPR) and treponema particle agglutination assay (TPPA). In order to reduce ED staff burden dedicated infectious disease staff conducted counseling and testing. Among patients with positive SHC results, testing staff reviewed medical records and surveillance data for evidence of past syphilis and offered immediate treatment to patients without a known previously treated infection.

**Results:** Of 582 participants tested (87% black, 5.0% MSM, median age 25 years) HIV (n=3) or syphilis (n=3) was identified in 1.0% of participants by rapid testing. One person had a false positive Determine, and another with acute HIV was only reactive with the Biorad test. The SHC was reactive for 7 individuals, but one person had a false-positive, and 3 cases represented past syphilis (RPR negative and TPPA positive). Concordance of rapid and confirmatory testing was 99.7% for HIV and 98.7% for syphilis. All 4 newly-diagnosed HIV patients were linked to care, and 2 newly-diagnosed syphilis patients received POC treatment.

**Conclusions:** A targeted HIV and syphilis screening program using dedicated, non-ED staff is feasible to implement in an ED setting. A high number of HIV and syphilis infections have been identified and treated (syphilis) or linked to care (HIV). Our results highlight a potential role for dual HIV and syphilis rapid testing in settings with patients at risk for these infections.

### WEPEC144

### WHAT IS THE TRUTH? A COMPARISON OF HIV RESULTS FROM VCT RAPID TEST WITH THOSE FROM A STANDARD ELISA FROM A POPULATION COHORT IN TANZANIA

E. Mwendo[1], J. Beard[2], J. Mngara[1], B. Mtenga[1], B. Zaba[2], J. Todd[2], M. Urassa[1]

*[1]National Institute for Medical Research, TAZAMA Project, Mwanza, Tanzania, United Republic of, [2]London School of Hygiene and Tropical Medicine, Population Health, London, United Kingdom*

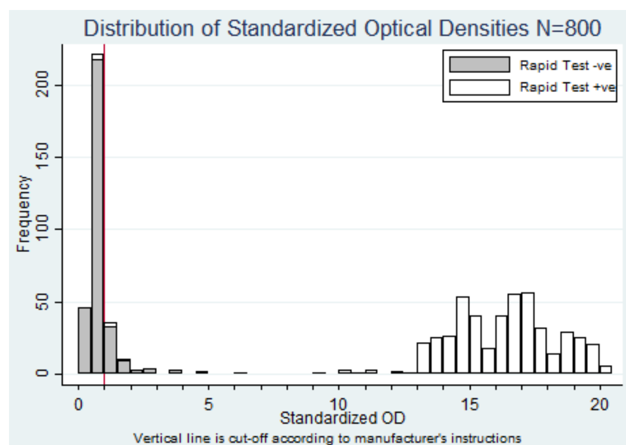
*Presenting author email: emmsmtilu@yahoo.com*

**Background:** The backbone of HIV diagnostic testing in most African countries is the use of two rapid tests to ascertain those HIV positive. Many research surveys use ELISA assays to determine HIV status, but studies have shown that the cut-off for ELISA tests is critical to their performance. Rapid tests undergo quality assurance at the Tanzanian national laboratory.

**Methods:** IIn the 8th serological survey for HIV in the Magu health and demographic sentinel surveillance (HDSS), participants were offered free VCT testing using Determine (screening) and Unigold (confirmatory) rapid tests, and asked for a dried blood spot (DBS) sample for research purposes. DBS from all positive and 6% of negative on Determine are tested on ELISA (Vironostika HIV Ag/Ab) at a reference laboratory.

**Results:** Of the 9,036 respondents to 29th Jan 2016, 8,923 (99%) provided both rapid test result and blood sample. 642 of these (7.2%) were HIV positive on the combined rapid tests. 800 samples have so far been tested by both rapid test and ELISA, of which 474 were positive by both rapid tests. There was 92% agreement between the results.

The 471 positive on both ELISA and rapid test had a median standardized OD (OD/cut-off) of 16.49 (IQR 14.75-17.61). The 62 negative on rapid test but positive on ELISA had a median standardized OD of 1.44 (IQR 1.20-2.57).



*[Distribution of standardised optical densities from Vironostika ELISA test]*

**Conclusions:** It is likely that non-specific reactions on ELISA are responsible for the Rapid Test 'false negatives'. Changing the ELISA cut-off to three time the manufacturer's value, and treating standardized ODs ≥1 and < 3 as Indeterminate (N=53), increases the agreement between the tests to 97.9% (excluding Indeterminates). Widespread use of the two rapid tests, with rigorous quality control in country, may provide a more accurate and truthful diagnosis for HIV than a ELISA test with a cut-off that is too low.

### WEPEC145

### A COMPARATIVE ASSESSMENT OF THE ELISA HIV TEST RESULTS AMONG WEAKLY POSITIVE REACTIVE SAMPLES ON DETERMINE HIV1/2, STATPAK AND UNIGOLD RAPID TEST KITS

D.S. Kigozi[1], T. Lutalo[2]

*[1]Rakai Health Sciences Program, Data Management and Biostatistics, Kampala, Uganda, [2]Rakai Health Science Program, Data Management and Biostatistics, Kalisizo, Uganda*

*Presenting author email: kdssebaggala@rhsp.org*

**Background:** A number of reports have come out showing a need to perform follow up confirmatory tests on samples with weak positive rapid test results. Using samples from a research cohort that used the Uganda National rapid test algorithm of Determine HIV1/2 as the screening test, Statpak as the confirmatory test and Unigold as a tie breaker, we investigated the proportion of weak positive on any of the three kits that returned a positive or negative ELISA/ PCR results.

**Methods:** We generated cross tabulations of the sero rapid test results against the ELISA /PCR tests indicating the percentage of weak positives that returned positive or negative ELISA/PCR results.
**Results:** A total of 231 weak positive (WP) results were selected for this analysis. 71 were WP on Determine HIV1/2, 149 were WP on Statpak and 11 were WP on Unigold. We observed that 64.8% of the WP determine results returned Positive EIA/PCR results while 35.2% returned negative results. For Statpak we observed that 19.5% WP returned positive EIA/PCR results while 80.5% returned negative results. For Unigold, 36.4% of the WP returned positive results while 63.6% returned negative results. When using a parralel or serial method, WP on both Determine and Statpak would score as positive. However, we found that out of the 11 WP (determine and statpak) on screening and confirmatory test, 54.6% returned positive results while 45.4% returned negative results.
**Conclusions:** Since at the point of care results are interpreted following manufacture's instructions, a good proportion that would have been scored as positive when one or both kits returned WP results end up with Negative results. Whenever there is a WP screening or confirmatory test, these should be run on confirmatory ELISA/PCR test kits. There is a need to evaluate this national algorithm which did not go through such an evaluation before being rolled out.

## WEPEC146

### LATIN AMERICA EXPERIENCE IN EXPANDING LARGE-SCALE ACCESS TO RAPID TESTING SERVICES IN PUBLIC SPACES

M. Pedrola[1], S. Paau[2], J.L. Sebastian Mesones[3], N. Delgadillo[4], L. Moya[1], N. Haag[5], P. Campos[1]
*[1]AIDS Healthcare Foundation Latinamerica, Los Angeles, United States, [2]AIDS Healthcare Foundation Guatemala, Guatemala, Guatemala, [3]AIDS Healthcare Foundation Peru, Lima, Peru, [4]AIDS Healthcare Foundation Mexico, Mexico City, Mexico, [5]AIDS Healthcare Foundation Argentina, Buenos Aires, Argentina*
*Presenting author email: miguel.pedrola@aidshealth.org*

**Background: :** Accordingly to the data provided by the respective National AIDS Programs, it's estimated that there are 460,784 people living with HIV in four Latin American countries: Argentina, Guatemala, Mexico and Peru. Of them, only 296,523 (67% average) know their HIV status. Hence in order to increase the number of people diagnosed, we planned and implemented an innovative campaign to conduct massive events with the use of rapid tests at strategic places within different cities in the studied countries.
**Methods:** We sought to identify and quantify the percentage of new HIV diagnoses and the number of new people accessing the HIV testing program. There were more than 1,064 events performed in all countries from Jan. 1, 2014 up to Dec. 31, 2015. All events were organized in open public spaces. We offered group pre-test information before formal testing. We used rapid tests from DETERMINE in Argentina, INSTI in Guatemala and Mexico, and ADVANCE in Peru. After each tests, we offered individual post-test counseling. All tests were offered free of charge, and on voluntary and confidential basis. Each individual was also asked to fill out a written, anonymous, self-administered survey.
**Results:** 265,540 tests were conducted in all four countries. 126,338 men were tested (47.58%). Average age for all people tested was 29 years. There were 2,478 new HIV positive results identified, 1,435 of them in men (57.91%) with an average age of 29 years. In total, 168,429 (63.43%) tests were conducted amont first-time testers.Of all positive results, 23.66% were among people who had never been tested before.
**Conclusions:** In order to accomplish the goal of 90-90-90 we need to increase access to testing that is convenient and quick. Our model has demonstrated that is suitable to be applied on a large scale, at a regional level, offering an easy way to get tested for first-time testers. We also found that prevalence level in the study was higher than the one estimated by UNAIDS with the Spectrum 4.47 model, which estimated that in 2011 the HIV prevalence in the region was around 0.3%-0.5% in people between the ages of 19 to 45.

## WEPEC147

### COMMUNITY-BASED CD4 CELL COUNT DISTRIBUTIONS AMONG HIV-POSITIVE, ART-NAÏVE ADULTS IN THE HIGHEST PREVALENCE REGION OF NAMIBIA: PROGRAMMATIC IMPLICATIONS FOR UNIVERSAL ART ELIGIBILITY

T. Nakanyala[1], A. Maher[2], S.V. Patel[3], A. Wolkon[3], K.M. Banda[1], A.M.-A. Agovi[3], S. Natanael[1], S. Sawadogo[3], S. Chaturvedi[4], G. Mutandi[3], M.R. Chipadze[5], C. Ntema[5], D. Prybylski[3], I. Mabuku[5], D. Lowrance[3], N. Hamunime[1], N. Mutenda[1], W. McFarland[4]
*[1]Ministry of Health and Social Services, Directorate of Special Programmes, Windhoek, Namibia, [2]University of California San Francisco, Global Health Sciences, Windhoek, Namibia, [3]U.S. Centers for Disease Control and Prevention, Windhoek, Namibia, [4]University of California San Francisco, Global Health Sciences, San Francisco, United States, [5]Development Aid People to People, Total Control of the Epidemic, Windhoek, Namibia*
*Presenting author email: nakanyalat@nacop.net*

**Background:** The World Health Organization (WHO) now recommends that antiretroviral therapy (ART) be initiated in everyone living with HIV irrespective of CD4+ cell count. Current ART eligibility guidelines in Namibia include treating all HIV infected persons with a CD4+ count of < 500 cells/μl. To understand the added patient burden that would result from implementation of the WHO guidelines, we estimated community-level CD4+ distributions among HIV-positive, ART-naïve adults in the highest prevalence region of Namibia.
**Methods:** A cross-sectional, household survey was conducted from 12/2014 - 7/2015 in five purposefully selected sentinel sites of Namibia's Zambezi region. Adults (age ≥15 years) completed interviews and received HIV testing if not yet diagnosed and Pima® CD4+ testing if HIV-positive and ART-naïve. Previous HIV diagnosis and receipt of ART were determined through self-report, verified in patient-carried records when available. CD4+ cell count distributions were estimated, focusing on the proportion >500 cells/μl as an indicator of the additional patient volume that would result with universal treatment eligibility.
**Results:** We enrolled 2,163 adults (66.3% participation), of whom 1,312 (60.7%) were female and 461 (21.3%) were HIV-positive. A total of 174 HIV-positive participants received a CD4+ test, of whom 41 (23.6%) had CD4+ counts of ≥500 cells/μl. CD4+ counts ≥500 cells/μl were significantly higher among urban compared to rural residents (32.1% vs. 16.1%, P=0.02). No significant differences by sex or age were observed. Among 15 previously diagnosed but ART-naïve patients, 60% had CD4+ counts < 500 cells/μl.
**Conclusions:** These data suggest an additional ART patient burden of approximately 24% can be expected in Zambezi if CD4+ eligibility criteria were removed, which has human and financial resource implications for service delivery. The true added burden is likely to be less when other routes to ART eligibility (e.g., TB or hepatitis B co-infection, pregnancy, and serodiscordancy) are considered. Urban areas would account for relatively more of the additional patient burden, as CD4+ counts are already significantly lower in rural areas. Our results also suggest that some adults who are diagnosed with HIV but not immediately eligible for ART fall out of routine pre-ART care and progress to a more advanced stage of disease.

## WEPEC148

### MODEL OF COMPREHENSIVE DIAGNOSIS OF STI AND HIV AMONG KEY POPULATIONS: THE IMPORTANCE OF COUNSELING AND ACCOMPANIMENT

M. Luna[1,2], R. Vazquez[3], P. Uribe[4], A. Garcia[1], I. Zamudio[1], Cappsida Team
*[1]Cappsida A.C, Direccion, Distrito Federal, Mexico, [2]Indre Secretary of Health, HIV, México City, Mexico, [3]Indre Health Secretary, HIV, Mexico City, Mexico, [4]Censida Health Secretary, Direccion, Mexico City, Mexico*
*Presenting author email: nitram@cappsida.org.mx*

**Background:** Based on the 90-90-90 strategy, we need to design interventions range that can reach key populations most affected by the epidemic, to promote early diagnosis and early detection, but all income to access programs a comprehensive treatment is important to strengthen strategies to reach these people if we want to change the course of the epidemic.
**Description:** With 21 years of experience we developed an intervention model called CODISE counseling, diagnosis, monitoring and evaluation, conducting workshops on MSM gathering places, young men and young women in the streets and deprived of their liberty, Counseling and implementation of rapid testing and positive cases are made to sampling for WB confirmatory test and an appointment for delivery of results and counseling, then channeled and accompanying services of government attention to verify the programmed inclusion program and quality of care, receiving care in the organization in psychology, medical care, nutritional counseling and tanatología to help improve their quality of life. The program takes place in different areas of meeting key populations and public plazas, subway stations, schools, offices of civil organizations, prisons.

**Lessons learned:** With the financial support of CENSIDA a diagnostic program for HIV and other STIs, serving a total of 2,200 people who were made rapid HIV testing, syphilis, Hepatitis B and C, with 189 HIV positive cases resulting develops confirmatory syphilis 82 to 37 to hepatitis B and hepatitis C 9, were provided with care and support achieving enroll 187 HIV-positive cases and other STI programs received government attention to their diagnosis. 60 percent women and 40% men between 19 and 47 years.
**Conclusions/Next steps:** This type of intervention tested to achieve early diagnosis and timely treatment of people who are admitted to government programs immediately with the support and care provided by the team of the organization that achieving the goal of they can be included comprehensive care to maintain their quality of life and thus also contribute to the decrease in new infections and alter the course of the epidemic. Experience shows that counseling is critical to achieving adherence to treatment and comprehensive care and thus achieved the goal of fewer HIV infections.

## METHODS FOR DETECTING ACUTE AND RECENT HIV INFECTIONS

### WEPEC149

### UNRECOGNIZED HIV INFECTION IDENTIFIED THROUGH RNA TESTING OF POOLED SERUM OBTAINED DURING DENGUE OUTBREAK IN SÃO PAULO, BRAZIL

E.M. Matsuda[1], D.R. Colpas[2], N.N. Campos[3], L.P.O. Coelho[4], A.M.S. Carmo[2], I.A. Ramos[5], L.C.F. Silva[5], L.F.M. Brígido[3]
*[1]Santo André AIDS Program, Santo André, Brazil, [2]Adolfo Lutz Institute -Santo André Unit, Santo André, Brazil, [3]Adolfo Lutz Institute- Central Unit, São Paulo, Brazil, [4]Adolfo Lutz Institute- Central Unit, virology, São Paulo, Brazil, [5]Santo André Epidemiological Surveillance Department, Santo André, Brazil*
*Presenting author email: luanaportes@yahoo.com.br*

**Background:** Many acute virological infections show common clinical manifestations. As many symptoms of acute HIV disease may be confounded with dengue, it is conceivable that some patients looking for clinical care during dengue outbreaks may actually represent incident HIV infections.
**Methods:** We accessed HIV RNA in pooled samples of seronegative dengue cases collected during the 2015 outbreak. Pools consisted of 20 serum samples, 100uL each. Samples from patients with previous HIV diagnostic, identified through electronic systems of patients' laboratory monitoring and/or drug dispensary were excluded. HIV RNA was evaluated with RealTime HIV (Abbott, USA). Samples included in pools with detectable HIV RNA were analyzed separately for HIV RNA, serology (Imunoblot DPP HIV 1/2-biomanguinhos, Brazil) and sequenced (partial pol from nested RT-PCR followed by Big Dye, Life, USA), evaluated at NCBI genotyping and Stanford HIVdb.
**Results:** Out of 3119 samples, 1143 tested dengue negative, 440 (39%) of those were tested for HIV in 22 pools. Four had detectable viremia and all negative pools were not detected, with no pool below the limit of detection (40 copies per mL). In three of these pools original samples showed high viral loads (5.85, 6.07 and 6.12 $Log_{10}$), all subtype B, with one with the K103N mutation. No nucleotide ambiguities were observed in these 3 sequences. Serology was negative in 2/3 RNA positive samples, one was gp41 reactive. Four samples from positive pools were unavailable for further testing, 2 from the fourth positive pool and one each from other positive pools; all other samples tested as not detected. Assuming one positive sample for each reactive pool, a HIV prevalence of 0.91% can be estimated; 1.59% if all missing samples were positive.
**Conclusions:** Our study documents HIV infection among individuals looking for health care due to suspected dengue infection. High viremia, indeterminate or negative serology, lack of ambiguous nucleotides and no registry in electronic systems are compatible to acute phase, probable undiagnosed HIV infections. Besides the potential for monitoring the local epidemics, these cases represent missing opportunities of a more comprehensive health care that could both benefit patients and decrease transmission at this heightened infections phase.

## NOVEL APPROACHES FOR HIV TESTING

### WEPEC150

### REACHING 90% TESTED: AN INNOVATIVE PROVIDER-INITIATED HIV TESTING MODEL WITH MODEST INCREASE IN STAFFING BRINGS HIV TESTING AND COUNSELING (HTC) TO SCALE IN 11 CLINICAL SETTINGS IN BUKOBA, TANZANIA

O. Ernest[1], H. Maruyama[1], R. Weber[2], D. MacKellar[3], G. Kundi[1], J. Gikaro[4], S. Porter[3], J. Byrd[5], F. Morales[1], D. Msalilwa[1], D. Mbilinyi[6], R. Josiah[7], C. Casalini[8], J. Justman[9]
*[1]ICAP at Columbia University, Dar es Salaam, Tanzania, United Republic of, [2]CTS Global, Inc., assigned to Centers for Disease Control and Prevention, Dar es Salaam, Tanzania, United Republic of, [3]Centers for Disease Control and Prevention, Atlanta, Georgia, United States, [4]ICAP at Columbia University, Research and Evaluation, Dar es Salaam, Tanzania, United Republic of, [5]ICF International, Atlanta, Georgia, United States, [6]Centers for Disease Control and Prevention, Dar es Salaam, Tanzania, United Republic of, [7]Ministry of Health and Social Welare, National AIDS Control Program, Dar es Salaam, Tanzania, United Republic of, [8]Jhpiego, Dar es Salaam, Tanzania, United Republic of, [9]ICAP at Columbia University, New York, United States*
*Presenting author email: dym4@cdc.gov*

**Background:** In many outpatient departments (OPDs), provider initiated HIV testing and counseling (PITC) is not available for all patients because of inadequate staffing and/or implementation. As part of the Bukoba Combination Prevention Evaluation (BCPE), a new PITC model was applied in OPDs in 11 facilities of Bukoba Municipality beginning October 2014. PITC indicators were compared one year before and one year after the new model was implemented.
**Methods:** Previously, PITC was provided by health care workers (HCWs) when they determined their patients would benefit from HIV testing. The BCPE-PITC model revised patient flow to ensure HIV testing was offered to all eligible clients without substantially delaying their OPD visit. To implement the new model, staffing at most clinics was increased by 1 HCW and 2 HIV-positive lay counselors (LCs). LCs conducted group pre-test counseling in waiting areas, individually screened all patients on their need for testing, and routed eligible patients to HCWs who conducted HIV tests in private areas (in Tanzania, only HCWs conduct HIV test procedures). After post-test counseling by LCs, patients were directed to resume their place in the clinic queue. HIV testing data were collected on monthly national and BCPE data-collection tools, and analyzed using Microsoft Excel.
**Results:** Compared with one year before, the fully staffed BCPE-PITC model yielded 4.3 times more HIV tests and 5.2 times more HIV-positive tests overall. Also, the model yielded 4.4 and 5.8 times more positive tests among males and females respectively (Table). Of the 1,951 HIV-positive clients identified through BCPE, 1,783 (91.4%) self-reported being out-of-HIV care, of whom 1,517 (85.1%) were newly HIV-diagnosed (never previously tested HIV-positive).

| | 12 months prior to BCPE Oct 2013 - Sep 2014 | | | First 12 months of BCPE Oct 2014 - Sep 2015 | | |
|---|---|---|---|---|---|---|
| PITC Indicator | Total | Male | Female | Total | Male | Female |
| Total tests in OPD clinics in 11 facilities | 8,452 | 4,191 | 4,261 | 36,347 | 12,105 | 24,242 |
| Tested HIV-positive (% of total tests) | 376 (4.4%) | 157 (3.7%) | 219 (5.1%) | 1,951 (5.4%) | 684 (5. 6%) | 1,267 (5.2%) |
| HIV positive, out-of-care (% of total tests) | Not available | | | 1,783 (4.9%) | 654 (5.4%) | 1,129 (4.7%) |

*[Results]*

**Conclusions:** A modest increase in staffing and an integrated PITC approach resulted in over four times as many HIV tests conducted, identified a higher percentage of HIV-infected patients, particularly among males, and a substantial prevalence of HIV-infected out-of-care persons. The model should be considered for scale-up in similar settings to help reach the first "90" of UNAIDS' 90-90-90 targets.

## WEPEC151

### EVALUATING THE PROFICIENCY OF LAY COUNSELORS CONDUCTING POINT OF CARE CD4 COUNT TESTS IN A RURAL COMMUNITY-BASED HIV SCREENING PROGRAM

S.V. Shenoi[1], A.P. Moll[2], N. Mntungwa[3], T. Kompala[4], L. Andrews[1], R.P. Brooks[1], G.H. Friedland[1]
*[1]Yale School of Medicine, Section of Infectious Diseases, AIDS Program, New Haven, United States, [2]Church of Scotland Hospital, Department of Health, Tugela Ferry, South Africa, [3]Philanjalo, Community Research Department, Tugela Ferry, South Africa, [4]University of California, Medicine, San Francisco, United States*
*Presenting author email: 4tonymoll@gmail.com*

**Background:** Community-based voluntary counseling and testing is an innovative strategy to improve awareness of HIV status and linkage to care, particularly among hard to reach rural populations in resource limited settings. Expanding the role of HIV counselors to provide HIV screening and a rapid point of care (POC) CD4 count in one sitting determines HIV status as well as eligibility and urgency to initiate ARV therapy. We present the POC CD4 results as determined by HIV counselors compared with nurse conducted POC and phlebotomy CD4 results within a community based screening program.
**Methods:** A team of nurses and HIV counselors provided health education and offered HIV testing at congregate community settings. Community members testing HIV positive were offered both standard nurse-performed phlebotomy for CD4 count, processed at the local district hospital by flow cytometry, and fingerstick capillary specimen collection by a nurse as well as by an HIV counselor for CD4 count, performed on site by portable PIMA technology.
**Results:** Among 249 HIV-infected study participants, 76% were female and median age was 34.4 (IQR 17-51) years. Fifty-four (22%) were evaluated at municipality events, 47 (18.8%) at homes, 26 (10.4%) at taxi ranks, and 25 (10%) at social welfare grant collection points. The mean bias by Bland Altman of HIV counselor compared to nurse POC CD4 determination was 16.3 cells/mL and LOA (-258.9, -291.5) cells/ml. Acceptable Pearson correlation was found (0.84, p< 0.0001).
**Conclusions:** POC CD4 counts determined by lay HIV counselors outside of health care settings compared favorably to results obtained by nurses and community-derived phlebotomized specimens processed at a hospital laboratory. HIV status and CD4 count can be determined in community settings in one session with appropriate referral to the next step in the cascade, whether for cryptococcal antigen test (CD4< 100), cotrimoxazole prophylaxis (CD4< 200), eligibility for ART (CD4< 500) or wellness care follow-up with Isoniazid Preventive Therapy (CD4>500). POC CD4 results permit the counselor to stress the urgency of referral especially for low CD4 counts and prioritization of ART initiation, thus facilitating the cascade of care. The role of counsellors can feasibly include POC CD4 testing.

## WEPEC152

### IS HIV SELF-TESTING ACCEPTABLE TO KEY POPULATIONS IN VIETNAM? RESULTS FROM A CROSS-SECTIONAL STUDY OF MEN WHO HAVE SEX WITH MEN, FEMALE SEX WORKERS AND PEOPLE WHO INJECT DRUGS

K. Green[1], B. Vu Ngoc[1], H. Phan Thi Thu[2], S. Vo Hai[2], M. Tran Hung[3], H. Vu Song[3], H. Tran[1], G. Ha[1]
*[1]PATH, Hanoi, Vietnam, [2]MoH/VAAC, Hanoi, Vietnam, [3]CCIHP, Hanoi, Vietnam*
*Presenting author email: kimberlyegreen@icloud.com*

**Background:** The HIV epidemic in Vietnam is concentrated among key populations (KP). Annual KP uptake of HIV testing through conventional testing services is low (~30%), posing a significant challenge to reaching 90-90-90 goals. Barriers to HIV testing include concerns regarding confidentiality of test result, long wait times, and travel/opportunity cost. Government leaders recognize the potential of HIV self-testing (HIVST) to accelerate testing uptake and case detection. Evidence is needed regarding acceptability of HIVST, test preferences and willingness to pay (WTP) among KP to inform pilot interventions and future guidelines.
**Methods:** We conducted a cross-sectional study from April-June 2015 among 1,296 people who inject drugs (PWID), 1,248 female sex workers (FSW) and 1,528 men who have sex with men (MSM) in six provinces. Sample size was calculated utilizing KP size estimations. Participants were recruited using respondent-driven sampling. Respondents were provided with standard information on HIVST and asked hypothetical questions including intention to use, test preferences, and WTP. Questions were part of larger survey assessing overall KP use, preferences and WTP for HIV goods and services.
**Results:** More than half of respondents reported intention to use an HIVST when available (55.6% FSW, 63.8% MSM, 69.3% PWID). Primary reasons for opting for HIVST were privacy (74.4%), confidentiality (63.7%) and rapid result (49.5%). The majority of those intending to use HIVST were willing to pay for the test (73.4% PWID, 82.0% FSW and 86.4% MSM). Respondents living in urban areas were statistically significantly more likely to report WTP (p< 0.001). MSM were willing to pay a significantly higher maximum price (US$5.4) for HIVST than FSW (US$4.3) and PWID (US$3.9) (p<0.001). There were statistically significant differences in the HIVST type preferred by KP (blood-based versus oral fluid) (p< 0.001): 49.0%/FSW, 46.7%/MSM and 28.3%/PWID stated preference for an oral HIVST; while 59.0%/PWID, 42.9%/FSW, and MSM/ 36.7% opted for the rapid blood-based assay.
**Conclusions:** The majority of KP interviewed reported intention to use HIVST given the privacy and convenience it offers, and willingness to pay for the test. Pilot interventions will need to be tailored in order to address differing MSM, FSW and PWID preferences and ability to pay.

## SURVEILLANCE OF HIV FOR CHILDREN

## WEPEC153

### EARLY WARNING INDICATORS OF PEDIATRIC ARV RESISTANCE IN KENYA: A MIXED METHODS STUDY

J. Okal[1], J. Matheka[1], I. Mukui[2], J. Odhiambo[2], S. Kalibala[1], S. Giebel[1], N. Pilgrim[1]
*[1]Population Council (HIVCore Project), Washington, United States, [2]National AIDS & STI Control Programme, Nairobi, Kenya*
*Presenting author email: jokal@popcouncil.org*

**Background:** In Kenya, the pediatric population represents 10% of total HIV infections. Pediatric HIV patients are at greater risk for HIV drug resistance (HIVDR) than adults. The surveillance of WHO's early warning indicators (EWIs), which are factors at ART clinics associated with HIVDR, is one strategy to combat HIVDR emergence. We assessed readiness of pediatric sites in Kenya to monitor EWIs and facilitators and barriers to EWI monitoring.
**Methods:** We conducted a mixed methods study in 23 purposively selected pediatric ART sites in 18 counties to assess readiness to monitor the five WHO EWIs:
1) on-time medication pick-up;
2) retention in care;
3) pharmacy stock-outs;
4) dispensing of mono-or dual-therapy; and
5) viral load suppression.
Readiness was defined as patient charts having the necessary information to calculate EWIs. Data collection methods included: surveys with pediatric providers (n=32); in-depth interviews (IDIs) with facility administrators (n=23); and chart abstractions of pediatric patients' records ages 0-14. Descriptive statistics were generated for quantitative data and thematic content analysis was conducted for qualitative data.
**Results:** Twelve facilities (48.2%) were missing chart information to calculate EWI(1). IDIs revealed clinic forms lacked space to record vital patient information. Facility records had the necessary information for EWI(2). However, IDIs revealed patient retention is a problem; reasons include lack of staff/resources to trace patients. For EWI(3), two facilities experienced pharmacy stock-out in the last 12 months and 8% of providers agreed that stock-out is a problem. For EWI(4), 34% of providers reported ever prescribing mono-or-dual therapy. For EWI(5), 83.6% of facilities did not have sufficient viral load test results recorded and 80% of providers agreed that testing was not conducted on time. Administrators noted long turn-around times for viral load results were a barrier to care.
**Conclusions:** Results show a need for pediatric ART sites to strengthen record keeping in order to calculate and monitor EWIs. Several structural-level changes are needed to facilitate EWI monitoring including changes to medical forms and quick turn-around time of viral load test results. Capacity building for providers to understand the importance of monitoring EWIs is also needed.

## SURVEILLANCE OF HIV FOR ADOLESCENTS AND ADULTS

### WEPEC154

### IMPACT OF PROVIDER-INITIATED HIV TESTING FOR CHILDREN ON BURDEN OF UNDIAGNOSED HIV

S. Dakshina[1], T. Bandason[2], E. Dauya[2], G. Mchugh[2], K. Kranzer[3], S. Munyati[2], P. Chonzi[4], R. Ferrand[3]
*[1]Barts Health NHS Trust, Sexual Health and HIV Medicine, London, United Kingdom, [2]Biomedical Research and Training Institute, Harare, Zimbabwe, [3]London School of Hygiene and Tropical Medicine, London, United Kingdom, [4]Harare City Health, Harare, Zimbabwe*
*Presenting author email: subadak@yahoo.com*

**Background:** Provider-initiated HIV testing and counselling (PITC) is recommended for all individuals in high burden countries. We investigated the impact of an optimised PITC intervention for children aged 5-16 years on the community burden of undiagnosed HIV.
**Methods:** Opt-out PITC was offered at seven primary healthcare (PHC) clinics in Harare, Zimbabwe to all 6-15 year old attendees over a two year period. A population-based, confidential HIV prevalence survey was conducted following two years of implementation. With guardian consent all children aged 8-17 years (having had 2 years exposure to the intervention) in randomly selected households in the catchment areas of the seven PHCs were offered anonymised HIV testing using oral mucosal transudate (OMT) tests. Data on demographics, previous HIV testing and medical history were determined through interview.
**Results:** A total of 9655 HIV tests (80% of those eligible) were conducted at the PHCs over the two year period. A total of 7146 children in 4251 households enumerated were eligible for the prevalence survey; 256 (4%) declined consent, 1395 (20%) were unavailable at the time of the household visit. The median age in 5493 participants was 12 (IQR: 10-15) years and 53% were female. The adjusted HIV prevalence was 2.5%, with no difference by gender. Among the 135 children found to be HIV-positive 53% were undiagnosed.
**Conclusions:** This survey shows a high prevalence of undiagnosed HIV in adolescents, confirming other reports from the region. Almost half of the HIV-infected children remained undiagnosed despite exposure to PITC that achieved high testing rates. Facility-based HIV testing relies on individuals presenting to the facility and is insufficient to address the substantial burden of undiagnosed HIV among older children and adolescents and alternative, community-based testing strategies are urgently needed.

## SURVEILLANCE OF BEHAVIOUR

### WEPEC155

### MEASURING CHANGES IN SEXUAL AND HEALTH BEHAVIOURS OF FEMALE SEX WORKERS AND THEIR ACCESS TO HIV SERVICES IN A SCALED UP TARGETED HIV PREVENTION PROGRAMS IN KENYA

J. Anthony[1], S. Isac[2], H. Musyoki[3], B. Ogwang[4], S. Kaosa[4], J. Kioko[4], P. Bhattacharjee[1], M. Sirengo[3]
*[1]University of Manitoba, Technical Support Unit, Nairobi, Kenya, [2]University of Manitoba, Monitoring and Evaluation, Bangalore, India, [3]Ministry of Health, National AIDS and STI Control Program, Nairobi, Kenya, [4]Partners for Health and Development in Africa, Technical Support Unit, Nairobi, Kenya*
*Presenting author email: john.anthony@ihat.in*

**Background:** Female sex workers (FSWs) in Kenya are characterized by high levels of risk in terms of the number of sexual partners, concurrency and low condom use with HIV prevalence rates at 29.3% (NASCOP 2013) among them. 133,675 FSWs are estimated (NASCOP 2012) to be in Kenya. Kenya has a scaled up HIV Prevention treatment and care for FSWs. National AIDS and STI Control Program Government of Kenya conducted two rounds of nationwide polling booth survey (PBS) in 2014 and 2015 to measure changes in behavior of FSWs as a result of program interventions and understand if the FSW programs are achieving their intended effects.
**Methods:** PBS is a group interview method, where individuals give their responses through a ballot box. Individual responses are anonymous and unlinked. Anonymity of the respondent improves reporting on sensitive and personal behaviors. Participants were selected using probability sampling and organized into small homogeneous groups of 10-12 people. Participants were also stratified by sex work typologies. 3351 FSWs from 11 selected counties participated in PBS with a consent rate of 95%.
**Results:** Condom use during last paid sex significantly increased from 87% to 93% (p<0.001). Consistent condom use with paying client significantly increased from 63% to 75% (p<0.001). Quarterly HIV testing significantly increased from 72% to 83% (p<0.001). FSWs experiencing current STIs significantly reduced from 24% to 22% (p<0.020). Condom use during last anal sex significantly increased from 40% to 55% (p<0.001). FSWs accessing Drop in Centre/ Clinic every quarter significantly increased from 51% to 69% (p< 0.001). HIV Positive FSWs enrolled in HIV Care significantly increased from 30% to 81% (p< 0.001). FSWs facing physical or sexual assault significantly reduced from 23% to 18% (p<0.001). Condom use at last sex non-paying partner reduced from 54% to 53% though this was not significant.
**Conclusions:** Responding to HIV programming needs of FSW at scale is key ingredient in national HIV response. As programs with key populations scale up in Kenya, it is important to measure KP programs effectiveness. Behavioral surveys like PBS that can measure sensitive behaviors should be part routine National program monitoring.

### WEPEC156

### EXPLORING PARTICIPANTS' UNDERSTANDING AND CONCERNS RELATING TO QUESTIONS ABOUT ANAL SEX IN A RURAL KWAZULU-NATAL SETTING: A COGNITIVE INTERVIEWING APPROACH

D. Gumede[1], T. Mutevedzi[1], N. Mcgrath[2], T. Bärnighausen[1,3], D. Pillay[1], J. Seeley[4], G. Harling[3]
*[1]Africa Centre for Population Health, Mtubatuba, South Africa, [2]University Southampton, Southampton, United Kingdom, [3]Harvard T.H. Chan School of Public Health, Boston, United States, [4]London School of Hygiene and Tropical Medicine, London, United Kingdom*
*Presenting author email: dgumede@africacentre.ac.za*

**Background:** Anal sexual intercourse can significantly increase HIV transmission risk. However, eliciting valid information on anal sex history in surveys can be complicated by heterogeneous understanding of the term "anal sex", and by the social undesirability of reporting such behaviour. We explored how questions regarding anal sex were interpreted in a high-HIV-prevalence rural KwaZulu-Natal community, including understanding of terms and acceptability of questions.
**Methods:** 341 adults (53% female) completed a quantitative questionnaire including questions about anal sex. Cognitive interviews were conducted with 13 men and 15 women post-questionnaire. Interviewers used both pre-scripted and spontaneous retrospective verbal probing techniques. Interviews were audio-recorded, transcribed and analysed.
**Results:** 3% of respondents reported ever having had anal sex; 7% declined to answer the question. Levels did not differ by gender, however those aged under 30 reported having had anal sex significantly more often (7.3%) than those aged over 30 (1.6%). In cognitive interviews, interviewees reported that anal sex is practiced locally. The majority of interviewees perceived anal sex as socially unacceptable; a few perceived it as increasing HIV infection risk. Two-thirds of men understood anal sex as being practiced primarily by men-who-have-sex-with-men, prisoners and ex-convicts.
One woman reported anal sex as a way of gaining sexual pleasure; one woman perceived it as a contraceptive method. 65% of the interviewees (59% women; 41% men) found the survey question "Have you ever had anal sex" easy to answer, although only 71% of these interpreted the term "anal sex" as intended in the survey. Other interpretations including non-anal sex ('dog style', 'thigh sex') and gendered readings ('inserting his penis into a woman's anus', 'into another man's anus').
The majority of interviewees (62%) stated that the survey question can be included in regular survey questionnaires.
**Conclusions:** Reporting of anal sex remains socially undesirable to many in this setting, but asking questions about this topic is considered broadly acceptable. Anal sex may be an important risk factor for HIV in rural KwaZulu-Natal, but given widespread misperceptions about the term, careful explanation within survey questionnaires is likely to be a pre-requisite to generating valid prevalence data.

### ESTIMATED PREVALENCE AND CORRELATES OF SEXUAL CONCURRENCY AMONG PERUVIAN MEN WHO HAVE SEX WITH MEN (MSM)

A. Ulrich[1,2], J. Lama[3], A. Duerr[1,2], J. Sanchez[3]
*[1]Fred Hutchinson Cancer Research Center, Seattle, United States, [2]University of Washington, Seattle, United States, [3]Impacta, Lima, Peru*
*Presenting author email: aulrich@fhcrc.org*

**Background:** Sexual concurrency (sexual partnerships that overlap in time) is a known driver of HIV transmission in heterosexual epidemics, yet it is still unclear if concurrency fuels epidemic spread of HIV in MSM populations. Mathematical modeling has been instrumental in estimating the impact of sexual concurrency, but relies heavily on population-specific parameter estimates. The purpose of this study is to use cross-sectional data from the 2011 Peruvian Biobehavioral Survey to quantify the level of concurrency among Peruvian MSM and to describe individual-level characteristics associated with having concurrent sexual partnerships.
**Methods:** Between June and October 2011, Peruvian MSM (N=5,148) were recruited using peer-educator outreach at social venues frequented by MSM (e.g., bars, saunas, etc.). All participants received HIV and STI testing and completed questionnaires which assessed characteristics of their last three male sex partners, including the dates of earliest and most recent sex with each partner. Multivariate logistic regression was used to identify factors associated with concurrent sexual partnerships (any vs. none).
**Results:** Among men who reported at least one male partner in the previous 3 months, 23% had concurrent partners. Estimates of concurrency were significantly higher for participants from Lima compared to participants from outside Lima (24.6% vs. 21.6%, p=0.024). In the adjusted model, men who identified their predominant sexual role as receptive or versatile were more likely than men who identified as insertive to have concurrent male partners (OR=1.40, 95% CI:1.08-1.82; OR=1.28, 95% CI:1.01-1.63, respectively). Homosexual-identified MSM were more likely to practice concurrency with male partners compared to heterosexual-identified MSM (OR=1.72; 95% CI=1.12-2.63). Location modified the association of sex work and concurrency: men who exchanged sex for money, food, drugs, etc., were less likely to have concurrent partners than non-sex workers in areas outside of Lima (OR=0.62, 95% CI=0.47-0.82), but there was no significant difference between sex workers and non-sex workers within Lima (OR=0.909, 95%CI=0.39-2.09).
**Conclusions:** Concurrency is common among MSM in Peru, yet prevalence varies according to demographic characteristics. These data will contribute to understanding concurrency's role in MSM epidemics, which is necessary to inform the design of more tailored and effective prevention strategies.

## SURVEILLANCE OF HIV DRUG RESISTANCE (INCLUDING IN PREP STUDIES)

## WEPEC158

### RESULTS OF SURVEILLANCE OF HIV RESISTANCE IN PEOPLE STARTING ANTIRETROVIRAL TREATMENT IN ARGENTINA PERFORMED ACCORDING TO WHO STRATEGY

E. Bissio[1], M.G. Barbas[2], M.B. Bouzas[3], H. Salomon[4], A. Cudola[2], L. Espínola[5], L. Mammana[3], S. Kademian[2], S. Fernandez Giuliano[3], M.L. Suarez Ornani[5], G. Ravasi[6], M. Vila[7], C. Falistocco[5]
*[1]Fundación Centro de Estudios Infectologicos, Bs As, Argentina, [2]Laboratorio Central de Córdoba, Córdoba, Argentina, [3]Hospital Muñiz, Ciudad de Buenos Aires, Argentina, [4]INBIRS, Ciudad de Buenos Aires, Argentina, [5]Ministerio de Salud de la Nación Argentina, Dirección de Sida, Ciudad de Buenos Aires, Argentina, [6]Pan American Health Organization, Washington DC, United States, [7]Pan American Health Organization, Ciudad de Buenos Aires, Argentina*
*Presenting author email: ebissio@gmail.com*

**Background:** The emergence and transmission of HIV drug resistance (HIVDR) may jeopardize the effectiveness of antiretroviral treatment (ART) programs. In Argentina, current guidelines recommend starting ART with NNRTI-based regimens, and pre-treatment HIV genotyping is optional. Currently, 70% of ARV initiators start with NNRTI-based regimens, the majority without previous resistance testing. The aim of this study was to determine the prevalence of resistance-associated mutations in people starting ART in Argentina, using a WHO-proposed methodology (PreTreatment Drug Resistance (PDR) Survey).
**Methods:** This was a cross-sectional, nationally representative study. According to WHO concept notes and using country-specific parameters, 30 ART-dispensing sites throughout the country were randomly chosen to enroll at least 330 persons starting ART (without prior exposure or re-starting ART); to generate a point prevalence estimate of resistance-associated mutations (RAMs) with a 5% confidence interval (for both the total population and for those without ARV exposure). All consecutive patients older than 18 years starting or re-starting ARV in the chosen clinics were enrolled, if provided informed consent. Samples were processed with Trugene (Siemens)®, and analyzed using the Stanford algorithm "HIVdb Program, Genotype Resistance Interpretation"(Version 6.3.1).
**Results:** Between august 2014/march 2015, we obtained 330 samples from people starting ART in the selected sites. Mean(SD) age was 35(11.0) years; 63.4% were male; median(IQR) CD4 count was 275/mm3(106-461); and 16.6% had prior ARV exposure (of these; 71% received ART, 21% MTCT prevention, 6% PEP). The prevalence of RAMs was **14%** (±2.5%). According to drug-class, 3% of the samples showed resistance to **NRTIs**, **11%** to **NNRTIs** and 3% to **PIs**. Prevalence of resistance-associated mutations in those **without** prior exposure was **13%** (±2.5%): 3% had RAMs to **NRTIs**, **10%** had RAMs to **NNRTIs**, 2% had RAMs to **PIs**). The most common mutations found were 103N, 190A, 41L and 101E (41%, 15%, 15% and 12% of those with RAMs, respectively).
**Conclusions:** This PDR surveillance study showed concerning levels of HIVDR in Argentina, especially to NNRTIs. Due to this finding, National guidelines will probably change. However, further analysis is needed to understand the potential impact of these figures, and to determine if introducing HIV genotyping before ART initiation would be a cost-effective intervention.

## WEPEC159

### ESTIMATING LEVELS OF ACQUIRED AND TRANSMITTED HIV DRUG RESISTANCE IN HIGH HIV BURDEN DISTRICTS IN KWAZULU-NATAL, SOUTH AFRICA

G. Hunt[1], A. Kharsany[2], C. Cawood[3], D. Khanyile[3], A. Grobler[2], M. Kalimashe[1], J. Ledwaba[1], A. Puren[1], L. Madurai[4], L. Morris[1]
*[1]National Institute for Communicable Diseases, Centre for HIV and STIs, Johannesburg, South Africa, [2]University of KwaZulu Natal, Centre for the AIDS Programme of Research in South Africa (CAPRISA), Durban, South Africa, [3]Epicentre AIDs Risk Management (Pty) Ltd, Cape Town, South Africa, [4]Global Clinical and Virology Laboratory, Durban, South Africa*
*Presenting author email: johannal@nicd.ac.za*

**Background:** The South African province of KwaZulu-Natal (KZN) has the largest burden of HIV infection in the country with ~850,000 persons on antiretroviral therapy (ART). Since 2008, moderate levels (between 5-15%) of transmitted HIV drug resistance have been detected among HIV-infected pregnant women in KZN. Routine HIV drug resistance testing is not typically provided for patients failing Non-Nucleoside Reverse Transcriptase Inhibitor-based regimens, or at regimen initiation. To monitor trends, in this analysis we assessed acquired (ADR) and transmitted (TDR) HIV drug resistance in treated and newly infected persons respectively.
**Methods:** Cross sectional analysis was performed on HIV positive samples obtained from the HIV Incidence Provincial Surveillance System, a household-based study designed to monitor HIV prevalence and incidence trends in the Vulindlela and Greater Edendale sub-districts of uMgungundlovu in rural KwaZulu-Natal. Self-reported ART use was determined by survey. Peripheral blood samples were tested for viral load and HIV incident infection using the LaG Avidity Assay. Genotyping of the HIV-1 polymerase gene was performed using a validated in-house method on samples with viral load of >500 c/ml, using nested PCR and Sanger sequencing technologies. Genotypic resistance was defined as the presence of resistance mutations associated with impaired drug susceptibility, using the Stanford Genotypic Resistance Interpretation Algorithm (http://hivdb.stanford.edu).
**Results:** Of the 1596 participants self-reporting to be on ART, 204 (12.7%) had HIV RNA viral levels >500 c/ml and were assessed for ADR. TDR was measured in 75 recently infected participants as determined by the LaG Avidity assay. Within this group of participants, 75% were female, and mean age was 23 years (IQR 19-28years). Total HIVDR amplification rate was 94%. Resistance (NRTI ± NNRTI) was detected in 68% of patients failing ART and 10% of recent infections.
**Conclusions:** Preliminary assessments show moderate levels of TDR amongst participants from this rural community. In addition, the proportion of participants failing ART without resistant viruses (~30%) indicates high levels of non-adherence to ART in the community. These data highlight the need for programmatic improvements in adherence counselling to limit the future development and spread of both acquired and transmitted HIVDR.

## SURVEILLANCE SYSTEMS AND METHODS

### WEPEC160

### TRACKING PEOPLE ALONG THE HIV CARE CASCADE: A TOOL TO ASSESS, DEVELOP AND IMPLEMENT HIV CASE-BASED SURVEILLANCE IN HIGH PREVALENCE SETTINGS

R. Harklerode[1], B. Rice[2], J. Todd[3], S. Xueref[4], A. Boulle[5], S. Schwarcz[1]
*[1]University of California San Francisco, Global Health Sciences, San Francisco, United States, [2]London School of Hygiene and Tropical Medicine, London, United Kingdom, [3]London School of Hygiene and Tropical Medicine, Population Health, Mwanza, Tanzania, United Republic of, [4]World Health Organisation, Geneva, Switzerland, [5]University of Cape Town, Cape Town, South Africa*
*Presenting author email: richelle.harklerode@ucsf.edu*

**Background:** World Health Organization (WHO) released new guidelines in 2015 recommending ten global indicators to collect information along the HIV care and treatment cascade as a principal way to track the epidemic and response, and measure progress towards UNAIDS 90-90-90 targets. As six of the ten indicators utilize data that originate from patient diagnosis, testing and medical records, WHO recommends case-based surveillance (CBS) systems be developed to harness longitudinal clinical data in a format that makes it readily available for use as strategic information at the subnational and national levels. Few high-burden countries have CBS.
**Methods:** To identify systems that are context appropriate, feasible, scalable, and sustainable to implement CBS, it was determined to perform a situational analysis, or strengths, weaknesses, opportunities, and threat (SWOT) analysis, in select countries. A protocol was developed by a team of surveillance experts within the Measurement and Surveillance of HIV Epidemics (MeSH) Consortium. The protocol and tools were modeled from existing resources including: the Centers for Disease Control and Prevention (CDC) Updated guidelines for evaluating public health surveillance systems; WHO Evaluating a national surveillance system, and the National Alliance of State and Territorial AIDS Directors'/CDC Case-Based Surveillance Toolkit. The SWOT protocol includes three parts: 1) desk review of country specific HIV surveillance materials; 2) questionnaire for interviewing HIV-related stakeholders; 3) site visit checklist to observe data collection, collation and flow at the local, regional and national levels. The protocol has been designed to be a comprehensive tool that can be modified for the particular focus of an assessment within different countries.
**Results:** Utilization of the SWOT protocol occurred in two ways:
1) in its entirety to conduct a comprehensive analysis of current electronic management record / surveillance systems in Tanzania;
2) modular to conduct a focused analysis of specific functionality of current surveillance systems in South Africa and Kenya.
In both instances, themes were identified in system attributes such as data quality and simplicity and in the feasibility and readiness for CBS.
**Conclusions:** The SWOT protocol can be used to assist in determining a country's readiness and strategy to develop CBS, as recommended by the WHO.

### WEPEC161

### IMPLEMENTATION OF INTEGRATED HIV BIOLOGICAL AND BEHAVIORAL SURVEILLANCE TO MONITOR HIV PREVALENCE AND INTERVENTION OUTCOMES AMONG FEMALE SEX WORKERS OUTSIDE SEX ESTABLISHMENTS, THAILAND

N. Punsuwan[1], S. Tanpradech[2], S. Jantaramanee[1], K. Yodruean[3], N. Mitipat[4], R. Senanoi[5], S. Poolkesorn[1], A. Teeraratkul[2], T. Durant[2,6], T. Plipat[1]
*[1]Bureau of Epidemiology, Department of Disease Control, Muang, Thailand, [2]Thailand MOPH - U.S. CDC Collaboration, Thailand Ministry of Public Health, Muang, Thailand, [3]Department of Disease Control, Chiangmai Provincial Health Office, Muang, Thailand, [4]Department of Disease Control, Chonburi Provincial Health Office, Muang, Thailand, [5]Department of Disease Control, Phuket Provincial Health Office, Muang, Thailand, [6]Center for Global Health, Division of Global HIV/ AIDS and TB, U.S. Centers for Disease Control and Prevention, Atlanta, United States*
*Presenting author email: niramon.ratta@gmail.com*

**Background:** In Thailand, a shift in female sex work (FSW) to outside establishments (non-venue), i.e., FSWs seeking clients in parks, streets, via phone/internet, has made FSW more difficult to reach by intervention staff. Integrated Bio-Behavioral Surveillance (IBBS) surveys have been implemented to monitor HIV prevalence and progress of interventions toward the national Ending AIDS targets (i.e., 95% condom use and 90% HIV Counseling and Testing (HTC).
**Methods:** A cross-sectional IBBS, using Respondent-Driven Sampling (RDS), has been conducted in three tourist provinces (Chiangmai, Chonburi, and Phuket) biennially since 2011. Eligible FSW were aged $\geq$18 years and solicited clients outside sex establishments in the past month. The sample size of 275 per province was designed to detect a 15% difference in HIV prevalence and behavior changes, using $\alpha$ 0.05, Power (1-$\beta$) 0.80 and a 2.0 design effect. Consenting participants completed a questionnaire and received HIV and STI (*Neisseria Gonorrhoeae* (NG) *infections)* screening. Data were analyzed using RDS Analysis Tool to generate descriptive statistics (percentage with 95% confidence interval).
**Results:** Decreased condom use during 2011 to 2015 was observed in Chonburi and Phuket, 92.1% (88.6-95.4) to 49.4% (41.1-57.7) and 96.6% (94.1-98.8) to 85.8% (79.9-91.7), respectively, but remained constant in Chiangmai at 92%. Increased HTC access was observed in all provinces, however the 2015 coverage was still less than two-thirds (Chiangmai: 36.4% (30.6-43.6) to 55.2% (47.9-62.4); Chonburi: 34.7% (27.7-41.6) to 62.1% (55.7-68.5); and Phuket: 43.2% (37.0-50.2) to 66.1% (58.7-73.5). HIV and NG prevalence remained unchanged (Figure 1).

*[Figure 1: HIV and Neisseria Gonorrhea Prevalence among Non-venue Female Sex Workers - Chiangmai, Chonburi and Phuket, IBBS-RDS, Thailand, 2011-2015]*

**Conclusions:** Although HIV and NG prevalence were not increasing, the below-target achievement for condom use and HCT coverage is critical to informing program managers for an intensified community outreach with condom promotion and HTC recruitment. On-going IBBS-RDS is recommended to monitor the intervention responses among non-venue FSW not collected as part of routine surveillance or monitoring systems.

### WEPEC162

### BIRTH OUTCOMES FOLLOWING ANTIRETROVIRAL EXPOSURE DURING PREGNANCY: RESULTS FROM THE FIRST YEAR OF THE SOUTH AFRICAN PREGNANCY EXPOSURE REGISTRY AND BIRTH DEFECT SURVEILLANCE SYSTEM

M. Dheda[1], O. Mhlongo[2], C. van Schalkwyk[3], N. Maharaj[4], N. Moran[2], P. Naidoo[5], A. Ramkisson[5], N. Naidoo[3], S. Krog[6], Y. Pillay[1], F. Renaud[7], K. Fieggen[8], A. Ntilivamunda[9], J. Mwansa[1], U. Mehta[9]
*[1]National Department of Health, Pretoria, South Africa, [2]Prov DoH, Durban, South Africa, [3]South African Centre for Epidemiological Modelling and Analysis, Stellenbosch, South Africa, [4]Prince Mshiyeni Memorial Hospital, Durban, South Africa, [5]MatCH, Durban, South Africa, [6]VP Health, Johannesburg, South Africa, [7]World Health Organization, Geneva, Switzerland, [8]University of Cape Town, Human genetics, Cape Town, South Africa, [9]World Health Organization, Pretoria, South Africa*
*Presenting author email: mukesh.dheda@gmail.com*

**Background:** Following concerns about the safety of antiretroviral therapy (ART) in pregnancy, the National Department of Health initiated a pregnancy exposure registry and birth defects surveillance (PER/BDS) system in the eThekwini District, KwaZulu Natal in 2013. We describe the findings from the first year, focusing on the risk of adverse birth outcomes (ABOs) (birth defects (BD), stillbirths(SB), neonatal deaths(NND), and low birth weight (LBW) in infants exposed to antiretroviral therapy (ART) during the first trimester (T1) compared to infants born to unexposed HIV-infected and HIV-uninfected women.
**Methods:** Clinical and medicines exposure histories and birth outcomes from maternal interviews, institutional records of women who delivered at Prince Mshiyeni Memorial Hospital (PMMH) from7/10/2013 to 6/10/2014 were analysed. A standardised neonatal surface examination was conducted on live and stillbirths of recruited women.
**Results:** Of the 14 587women delivering at PMMH, 10 417 (71.4%) were captured via the BDS system. 4013 (38.5%) were HIV-infected. 10417 deliveries yielded 10517 birth outcomes including 57 (0.5%) BD, 85 (0.8%) NND, 245 (2.3%) SB and 1307 (12.8%) LBWlivebirths ($\leq$=2500g).HIV-infected women had a higher rate of LBW infants (14.5% vs. 11.0%; risk ratio: 1.33; 95% CI: 1.20-1.47). Among the 3930 (96.7%) HIV-infected women on ART during pregnancy, 517 (13.2%) definitely initiated ART before the pregnancy (T1 exposures). 387 received an EFV-based regimen and 126 received a NVP-based regimen during T1. T1 exposure to NVP-based ART was associated with an increased risk of BD (RR 9.38; 95% CI: 3.4-26.0) as was TDF-based ART (RR: 2.9; 95% CI: 1.1-2.8). No association was noted with other ARVs including EFV. None of the T1 ARV exposures were associated with SB or NNDs. However, T1 exposure to NVP was associated with increased risk of LBW (RR 1.7; 95%CI:1.22-2.4).
**Conclusions:** No association between T1 use of EFV and ABOs was observed on 387

T1 exposures. Associations between T1 NVP and TDF and BDs, and T1 NVP and LBW needs further investigation. Given the small number of cases (many overlapping), presence of confounders and lack of a postulated common mechanism, these associations require further evidence over time to interpret.

## WEPEC163

### USING DATA TRIANGULATION TO INFORM GEOGRAPHIC PRIORITIZATION FOR PEPFAR TANZANIA: LESSONS LEARNED AND FUTURE DIRECTION

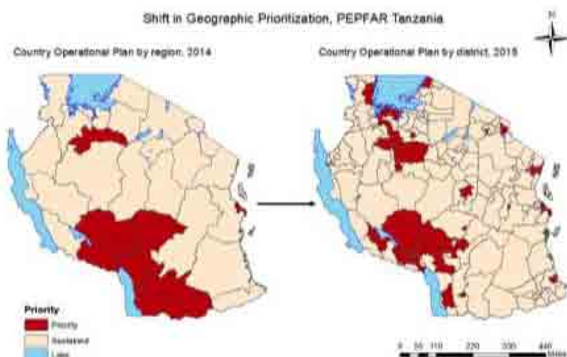
A. Khalifa[1], R. Mwiru[1], M. Washington[2], T. Koppenhaver[3], M. Roland[1]
*[1]Centers of Disease Control and Prevention, Division of Global HIV/AIDS and Tuberculosis, Dar es Salaam, Tanzania, United Republic of, [2]Centers of Disease Control and Prevention, Office of Infectious Diseases, Atlanta, United States, [3]United States Agency for International Development, Health, Dar es Salaam, Tanzania, United Republic of*
*Presenting author email: ymo4@cdc.gov*

**Background:** Tanzania's national HIV/AIDS prevalence is 5.1% (2012), but the burden varies geographically. PEPFAR 3.0 aims to strategically allocate resources at the subnational/district level in order to reach 80% of all PLHIV with treatment by 2020, to help meet UNAIDS Fast Track goals. In the absence of direct district estimates, we triangulated data sources to identify the best available method for geographic prioritization.

**Methods:** Three district-level data sources and methods were examined. First, Antenatal Clinic Sentinel Surveillance (ANC SS 2011) reports clinic-level HIV prevalence aggregated to the district. PrevR (2014), a UNAIDS geospatial model, uses survey data and geographic information to estimate HIV prevalence. Finally, PMTCT program data (2014) can be used to calculate HIV positivity rates as a prevalence proxy. We reviewed input data for completeness and timeliness and analyzed concordancy of estimates across data sources. Using PLHIV estimates derived from the most reliable method, districts were ranked from highest to lowest number of PLHIV. GIS was used to visualize and overlay estimates.

**Results:** Findings across methods were discordant. Difference between district prevalences varied from 0.02 to 12.81 percentage points. ANC SS was outdated and did not cover all districts. PrevR used outdated 2012 political boundaries and did not report estimates for new districts. PMTCT program data had reporting limitations, but it was the most timely and complete data source. We selected PMTCT program data to create HIV district estimates. Our analysis suggests that 80% of the PLHIV reside in 82 of 171 (48%) districts. Of 171 districts, 42 (25%) were selected for scale-up of testing and ART services, representing 55% of PLHIV in Tanzania (Figure 1).

**Conclusions:** Using mixed methods, we identified the best available data to geographically focus the Tanzania HIV program. All methods had limitations, highlighting the need for more complex modeling of the epidemic at a lower subnational unit.



*[Figure 1. Shift in Geographic Prioritization, PEPFAR Tanzania 2014-2015]*

## POPULATION-BASED SURVEYS WITH HIV TESTING

## WEPEC164

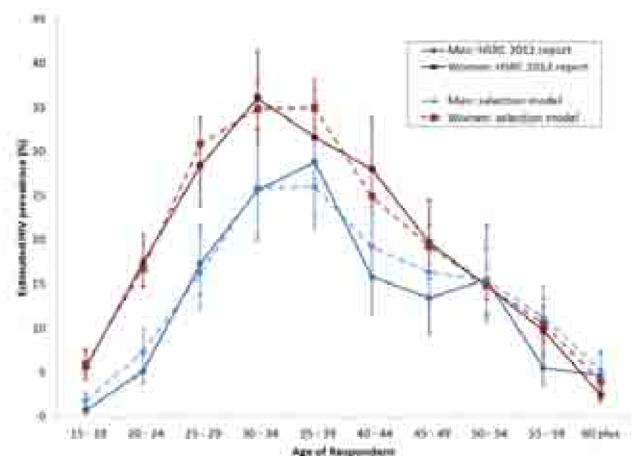
### NATIONAL SOUTH AFRICAN HIV PREVALENCE ESTIMATES ROBUST DESPITE SUBSTANTIAL TEST NON-PARTICIPATION: EVIDENCE FROM THE 2012 NATIONAL POPULATION-BASED SURVEY

G. Harling[1], S. Moyo[2], M. McGovern[3], M. Mabaso[4], G. Marra[5], T. Bärnighausen[1,6], T. Rehle[2]
*[1]Harvard T.H. Chan School of Public Health, Global Health and Population, Boston, United States, [2]Human Sciences Research Council, Cape Town, South Africa, [3]Queen's University Belfast, Queen's Management School, Belfast, United Kingdom, [4]Human Sciences Research Council, Pietermaritzburg, South Africa, [5]University College London, Department of Statistics, London, United Kingdom, [6]Africa Centre for Population Health, Mtubatuba, South Africa*
*Presenting author email: gharling@hsph.harvard.edu*

**Background:** Valid national HIV seroprevalence estimates are crucial to planning responses to the HIV epidemic, notably in South Africa, the country with the highest number of people living with HIV. Current South African seroprevalence estimates arise from HIV household surveys which may, due to substantial non-participation, produce biased estimates. We evaluated whether unmeasured factors pre-disposing respondents to decline HIV tests were biasing South African national HIV seroprevalence estimates.

**Methods:** Data arose from the nationally-representative 2012 South African National HIV Prevalence, Incidence and Behaviour Survey. We jointly estimated regression models for consent to test and HIV status in a bivariate, Heckman-type probit framework that accounts for unobserved joint predictors of test consent and HIV status. We used assigned interviewer identity as a selection variable known to predict consent but unable to affect interviewees' HIV status. From these models we estimated the HIV status of all interviewed participants, including those who did not test.

**Results:** Of the 26,710 interviewed participants invited to test for HIV, 21.3% of females and 24.3% of males declined. Interviewer identity was strongly correlated with consent to test for HIV, and declining a test was weakly associated with HIV infection. Our estimates were non-significantly different from previously reported figures for this survey: 15.1% vs. 14.5% for 15-49 year old males; 23.3% vs. 23.2% for 15-49 year old females. Our models suggested that HIV was less prevalent at peak ages but more prevalent in later life for males (see Figure). Similarly, in high-prevalence KwaZulu-Natal, HIV prevalence was estimated to be somewhat lower, and in low-prevalence Western Cape somewhat higher, than previously reported.



*[HIV prevalence estimates from the 2012 HSRC Report and from Heckman-type probit selection model]*

**Conclusions:** We conclude that the most recent HIV prevalence estimates in South Africa are robust under the strongest available test for missingness. Our findings provide support to the reliability of inferences drawn from these national survey estimates.

## WEPEC165

### THE PREVALENCE OF HIV INFECTION IN LARGE, TIME-LOCATION SAMPLE OF BLACK MSM WHO ATTEND BLACK PRIDE EVENTS IN THE UNITED STATES: RESULTS FROM PROMOTING OUR WORTH, EQUALITY, AND RESILIENCE (POWER)

R. Stall[1], L. Bukowski[1], H. Raymond[2], S. Meanley[1], M. Uzzi[1], J. Egan[1], L. Eaton[3], D. Matthews[4]
*[1]University of Pittsburgh, Behavioral and Community Health Sciences, Pittsburgh, United States, [2]San Francisco Department of Public Health, San Francisco, United States, [3]University of Connecticut, Storrs, United States, [4]University of Pittsburgh Graduate School of Public Health, Infectious Diseases and Microbiology, Pittsburgh, United States*
*Presenting author email: rstall@pitt.edu*

**Background:** Although multiple studies have documented very high prevalence and incidence rates of HIV infection among Black MSM (BMSM), few studies have attempted to recruit large samples of BMSM within community settings in order to characterize the HIV epidemic in this population. This analysis reports seroprevalence findings from POWER, a large epidemiological study of HIV infection among BMSM in the US.
**Methods:** POWER employed time location sampling (TLS) to recruit BMSM who attended Black Pride events in 6 US cities (N=3,426). Participants completed a behavioral health survey and were offered on-site HIV testing. HIV-positive men were identified either through self-report of seropositive status or through an on-site HIV test; negative men were identified through on-site testing only. After removal of individuals who were not part of the sampling frame (i.e., transgender women, duplicate participants, non-MSM, non-acceptance of HIV testing among men who reported negative status), we achieved an analytic sample of 2,391 men. Analysis was weighted to reflect TLS recruitment probabilities.
**Results:** The prevalence of HIV infection in this sample was 36%. Educational status (p< .0001), sexual identity (p< .02), and age (p< .0001) were all significantly associated with prevalent HIV infection. HIV prevalence rose by age (Table 1).

| Age Group | % (95% CI) |
|---|---|
| 18-19 | 20.6 (12.1-33.1) |
| 20-29 | 27.5 (25.4-30.8%) |
| 30-39 | 34.8 (31.1-39.8%) |
| 40-49 | 47.4 (40.3-54.4) |
| 50-59 | 57.6 (46.5-68.1) |
| 60-69 | 31.9 (12.9-59.6) |

*[Table 1: HIV Prevalence within age group among BMSM in the United States]*

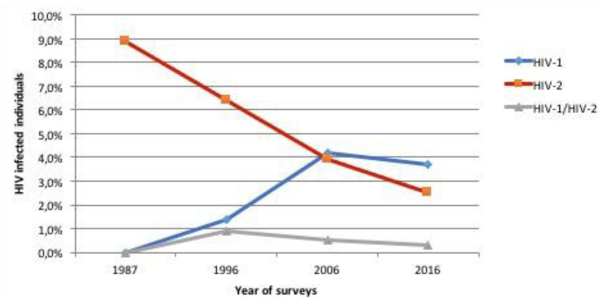
**Conclusions:** These data confirm earlier, small scale studies that used convenience sampling methods to confirm that BMSM in the US are at extraordinarily high risk for HIV acquisition, constituting one of the most heavily impacted populations in the world. Prevalence of HIV infection by age is consistent with an annual HIV incidence rate of 4.16%, which means that an explosive HIV epidemic among BMSM is now occurring in multiple major urban settings in the US. Only a concerted effort that combines behavioral, HIV treatment and PrEP/PEP programs will prevent new generations of young Black MSM from becoming infected with HIV in the U.S.

## WEPEC166

### DECLINING PREVALENCE OF HIV-2, WHILE THE PREVALENCE OF HIV-1 IS STABILIZING: A CROSS-SECTIONAL SURVEY FROM BISSAU, GUINEA-BISSAU

J.S. Olesen[1,2], S. Jespersen[1,2], Z.J. da Silva[1,3], A. Rodrigues[1], C. Erikstrup[4], P. Aaby[1,5], C. Wejse[1,2,6], L.H. Bo[1,2,4]
*[1]Bandim Health Project, Indepth Network, Bissau, Guinea-Bissau, [2]Aarhus University Hospital, Department of Infectious Diseases, Aarhus, Denmark, [3]National Public Health Laboratory, Bissau, Guinea-Bissau, [4]Aarhus University Hospital, Department of Clinical Immunology, Aarhus, Denmark, [5]Research Center for Vitamins and Vaccines (CVIVA), Bandim Health Project, Statens Serum Institut, Copenhagen, Denmark, [6]GloHAU, Center for Global Health, Aarhus University, School of Public Health, Aarhus, Denmark*
*Presenting author email: jens.steen.olesen@gmail.com*

**Background:** With 10-year intervals, the Bandim Health Project has since 1987 conducted three surveys of prevalence and incidence rates of HIV-1 and HIV-2 in Guinea-Bissau, West Africa. The highest prevalence of HIV-2 has been observed in Guinea-Bissau. The aim of the current survey was to evaluate the development in prevalence and incidence rates since 2006.
**Methods:** A cross-sectional survey with 3224 (1421 men, 1803 women) eligible adults living in a 10% sample of the houses (N=412) in the study area in Bissau was conducted between November 2014 and January 2016. Participants had a questionnaire filled out and a blood sample collected. Incidence rates were estimated from 622 individuals participating in both surveys of 2004-2006 and 2014-2016.
**Results:** A total of 2438 (76%, 996 men and 1442 women) individuals participated. The prevalence of HIV decreased from 8.6% (218/2548) in 2006 to 6.5% (159/2438) in 2016 (p< 0.01). With HIV-1/2 dual infections included, the overall prevalence of HIV-1 stabilized from 4.6% (118/2548) to 4.0% (98/2438) (p=0.30). A significant decrease was observed among men in the age group of 25-34 years (p=0.02). A decrease in the overall prevalence of HIV-2 from 4.4% (112/2548) to 2.8% (68/2438) was observed (p< 0.01). Though the prevalence decreased in both sexes, it was only significant for women in the age groups of 25-34 and 35-44 years (p< 0.01, p=0.04). The incidence rate decreased from 0.50 to 0.39 for HIV-1 and from 0.24 to 0.10 for HIV-2 per 100 person-years of observation between the time periods of 1996-2006 and 2006-2016. The female:male incidence rate ratio was 2.34 (95% CI: 0.92-5.93) for HIV-1 and 4.25 for HIV-2 (95% CI: 0.50-36.40).



*[The prevalence of HIV-1, HIV-2 and HIV-1/2 dual infections from 1987 to 2016 in Bissau, Guinea-Bissau]*

**Conclusions:** The prevalence of HIV-2 continues to decrease, although active transmission persists. The prevalence of HIV-1 has stabilized and fewer men were infected compared to 2006.

## WEPEC167

### AWARENESS AND PREVALENCE OF HIV AND STI AMONG FEMALE PARTNERS OF MSM IN ABUJA, NIGERIA

E. Paul[1], H. Omuh[1], R. Nowak[2], I. Orazulike[3], B. Kayode[4], M.E. Charurat[2]
*[1]Institute of Human Virology Nigeria, Clinical, Abuja, Nigeria, [2]Institute of Human Virology, Division of Epidemiology and Prevention, Baltimore, United States, [3]International Center for Advocacy on Rights to Health, Abuja, Nigeria, [4]Institute of Human Virology Nigeria, Research, FCT, Nigeria*
*Presenting author email: bkayode.trust@gmail.com*

**Background:** Given the stigma and discrimination against men who have sex with men (MSM), many MSM retain sexual relationships with women who may be unaware of their male partners' sexual practices. Preliminary data from the TRUST cohort study suggests that 60% of MSM in Nigeria reported having female partners, and here we report on the awareness and prevalence of HIV/STIs among this vulnerable population.
**Methods:** From August-December 2015, the Bridging TRUST pilot study recruited 55 confirmed female partners of MSM. TRUST participants who previously reported having female partners chaperoned 1 or more of their main and casual female partners to a women's clinic focused on reproductive and comprehensive HIV prevention and care services. Participants completed a structured survey instrument and clinical testing for pregnancy, HIV, *Neisseria gonorrhea*, and *Chlamydia trachomatis*. Diagnosed infections were treated with antiretroviral and/or antibiotic therapy as needed. Descriptive data on demographics, awareness of HIV/STIs, and the prevalence of HIV/STIs were calculated.
**Results:** Recruited women had a median age of 25 years (IQR: 22-28), few were Muslim (7%), and one-fourth were married or cohabitating with a man. Overall, awareness and discussion of HIV/STIs was relatively high. Women reported having tested for HIV (79%), having tested for STIs (37%) and over half were currently worried about their HIV status (56%). The majority of women reported having only main partners (61%) who they openly discussed their partner's HIV status (59%) or their own status (59%). For casual partners, they were less likely to discuss their partner's HIV status (9%) or their own status (5%). The baseline prevalence of HIV was 7.3% and fewer had an STI infection (4%).
**Conclusions:** The HIV prevalence among female partners of MSM remains higher than the national prevalence of 4% in Nigeria. Those most likely recruited into care openly discussed HIV/STI risk with their main partners and engaged in prior HIV/STI testing. When recruitment relies heavily on the MSM partner, alternative recruitment strategies are needed for the partnerships with a less open dialogue about HIV/STI risk.

## WEPEC168

### WHAT DO KEY STAKEHOLDERS THINK ABOUT HIV SELF-TESTING? ANALYSES OF QUANTITATIVE AND QUALITATIVE FINDINGS FROM A CANADIAN NATIONAL SURVEY

N. Pant Pai[1], N. Lapczak[1], M. Smallwood[1], D. Gulati[2], A. Musten[3], C. Gaydos[4], C. Johnston[5], M. Steben[6], J. Gahagan[7], B. Serhir[6], T. Wong[8], J. Kim[9], N. Engel[2], REACH National POCT Working Group
*[1]McGill University, Clinical Epidemiology, Montreal, Canada, [2]Maastricht University, Maastricht, Netherlands, [3]REACH, Toronto, Canada, [4]Johns Hopkins University, Division of Infectious Diseases, Baltimore, United States, [5]Canadian AIDS Treatment Information Exchange, Toronto, Canada, [6]INSPQ, Montreal, Canada, [7]Dalhousie University, Halifax, Canada, [8]Public Health Agency of Canada, Toronto, Canada, [9]National Labs Canada, Winnipeg, Canada*
*Presenting author email: nitika.pai@mcgill.ca*

**Background:** Approximately 21% of people living with HIV in Canada remain undiagnosed. Stigma, social visibility, privacy, and long wait times impede access to HIV testing in health facilities, for which HIV self-testing presents an empowering alternative. Since Canada has yet to approve HIV self-tests, we surveyed key stakeholders engaged with HIV testing initiatives, to identify the opportunities and challenges of implementing HIV self-testing in Canada.
**Methods:** An online survey was disseminated via email by the CIHR REACH 2.0 POCT working group to stakeholders (clinical providers, public health and laboratory professionals, researchers, community based organizations) involved in HIV testing across Canadian provinces. Questions covered the perceived needs, benefits, challenges, concerns, and areas for action. Open-ended questions and comments were analyzed via qualitative content analysis; accommodating a mixed-methods, respondent-informed approach.
**Results:** 183 stakeholders responded to the survey and their responses were grouped into major themes:
1) Needs and benefits: 65% of respondents felt that self-tests should be made available to their clients, conditional on the context of usage, clientele, post-test counseling and care. 71% of respondents felt that investment in self-testing is necessary to reach the undiagnosed, and 72% agreed that self-test instructions require improvements for linkages to treatment and counseling.
2) Concerns and challenges: Concerns about test accuracy, execution, costs, and misinterpretation of results, were highlighted. Emotional instability and coping mechanisms in the absence of counselors were perceived as potential harms. 60% of respondents agreed that clients who self-test false-negative will be less likely to engage in care. 58% felt that operationalizing linkage to care was the largest challenge associated with HIV self-testing. 42% of respondents felt their clients would be open to using innovative internet and mobile phone applications for linkages; but some may lack access to mobile devices. Respondents (21%) urged for timely action and approvals for HIV self-tests.
**Conclusions:** This survey, the first of its kind, demonstrated that key stakeholders are interested in having the option of self-tests for HIV testing in Canada, for reaching the undiagnosed. Concerns regarding linkages to care and counseling, test accuracy and costs, must be addressed before widespread implementation of HIV self-testing in Canada.

## WEPEC169

### HIV TESTING TRIPLES OVER FIVE YEARS SURVEILLANCE AMONG HIV-NEGATIVE FEMALE SEX WORKERS IN IRAN: THE FINDINGS OF A BIO-BEHAVIORAL SURVEY IN 2015

A. Noori[1], M. Shokoohi[1,2], M. Karamouzian[1,3], H. Sharifi[1], R. Khajehkazemi[4], R. Yousefi[5], Z. Farzad[6], N. Fahimfar[7,8], A. Sedaghat[9], A. Mirzazadeh[1,10]
*[1]Regional Knowledge Hub, and WHO Collaborating Centre for HIV Surveillance, Institute for Futures Studies in Health, Kerman University of Medical Sciences, Kerman, Iran, Islamic Republic of, [2]Schulich School of Medicine & Dentistry, University of Western Ontario, Department of Epidemiology & Biostatistics, London, Canada, [3]School of Population and Public Health, Faculty of Medicine, University of British Columbia, Vancouver, Canada, [4]Research Center for Modeling in Health, Institute for Futures Studies in Health, Kerman University of Medical Sciences, Kerman, Iran, Islamic Republic of, [5]Health Center of East Azarbaijan Province, Tabriz University of Medical Sciences, HIV/AIDS Prevention Programs, West Azarbaijan, Iran, Islamic Republic of, [6]Deputy of Health, Zahedan University of Medical Sciences, Zahedan, Iran, Islamic Republic of, [7]HIV/AIDS Control Office, Center for Communicable Disease, Tehran, Iran, Islamic Republic of, [8]School of Public Health, Tehran University of Medical Sciences, Department of Epidemiology and Biostatistics, Tehran, Iran, Islamic Republic of, [9]Ministry of Health and Medical Education, Tehran, Iran, Islamic Republic of, [10]University of California, Department of Epidemiology and Biostatistics, San Francisco, United States*
*Presenting author email: atefeh.noori@gmail.com*

**Background:** HIV testing practices of Iranian Female sex workers (FSWs) have been shown to be low due to individual- and structural-level barriers to testing. Given the recommendations on frequent HIV testing among FSWs, we aimed to estimate prevalence of HIV testing in a national sample of FSWs.
**Methods:** Facility-based (n=1173) and outreach (n=152) FSWs were recruited from 13 cities in 2015. FSWs aged ≥18 years with a history of selling sex to multiple clients in last year, were recruited. For the current study, only HIV negative FSWs' data were analyzed. Recent HIV testing was defined as having tested for HIV and received the results in last year. FSWs who did not answer this question were excluded. Reasons for HIV testing and not-testing were also recorded. Behavioural data was collected via a standardized questionnaire. The proportion of HIV testing in different levels of predictors was compared using Chi square test.
**Results:** Out of 1310 HIV negative FSWs, 80.6% (95% CI: 81.5, 92.4) had ever tested for HIV. Out of 1049 eligible FSWs, 88.0% (95% CI: 81.5, 92.4) had a recent HIV test. Common reasons for HIV testing were being concerned about their HIV status (82.9%) and advised by health workers (36%). However, main reasons for not tested for HIV among those who did not get tested were no self-perceived risk for HIV (32.5%), not knowing an HIV testing site(28.5%), and not having enough time (21.1%). Being recruited through facilities(88.8%), unstable housing (93.8%), having more than five paying partners (93.7%), having more than one non-paying partners (93.2%), health care services utilization (89.1%), and receiving free condom in the past year (89.9%) were significantly associated with recent HIV testing. Additional analyses on the determinants of HIV testing will be presented.
**Conclusions:** In comparison with the previous round of HIV surveillance among FSWs in Iran, the prevalence of HIV testing has tripled(27.5% in 2010). While these findings are promising and show improvement over a short period of time, scaling up rapid HIV testing should be continued, particularly among outreach FSWs.

## WEPEC170

### HIV AND SYPHILIS AMONG FEMALE SEX WORKERS (FSWS) IN ZAMBIA: RESULTS OF BEHAVIORAL & BIOLOGIC SURVEILLANCE SURVEY 2015

J. Kamanga[1], W. Kasongo[2], M. Tembo[2], F. Mwape[1], D. Mwakazanga[2], L. Chelu[1], M. Mulenga[2], N. Chishinga[1]
*[1]FHI 360, Lusaka, Zambia, [2]Tropical Diseases Research Center, Ndola, Zambia*
*Presenting author email: jkamanga@fhi360.org*

**Background:** The study was carried out to estimate prevalence and incidence of HIV and syphilis among FSWs. According to the 2013-14 Zambia Demographic and Health Survey, HIV prevalence in Zambia is 13% (15% women, 11% men) aged 15-49 years. Prevalence is not known among FSWs.
**Methods:** This was a cross sectional study done August and September 2015 in 5 districts of Zambia. Time location approach was used to recruit FSWs in brothels, bars and on the streets. A questionnaire was administered and blood was drawn after informed consent. Qualitative syphilis test using RPR and rapid HIV test using Determine and Unigold was performed in the field. Results were given to the participants the following day at a health facility. HIV and syphilis positives were referred for management. Quantitative RPR test was done at a Referral laboratory on reactive plasma. Tie breaker was performed on HIV discrepant results using Western Blot. HIV positive plasma was subjected to HIV incidence test using sedia LAg Avidity EIA. Chi-square tests was used to compare proportions in HIV-positive and negative individuals.

**Results:** 1189 FSWs were recruited and 1113 (94%) accepted HIV and syphilis testing. Median age was 26 years, education was 9 years. Overall, HIV prevalence was 56%; 1.6% were determined to have recent infection (118-142 days). Syphilis prevalence was 21%. HIV positive FSWs were older compared to negatives; median: 28 vs. 23 years (p< 0.001). HIV positivity was higher among those with syphilis than without, 30.2% vs. 9.9% (p< 0.001). HIV positivity was higher in those who consumed alcohol daily, compared to counterparts reporting no drinking.
**Conclusions:** Prevalence of HIV and syphilis is 3 times higher in FSWs compared to 2013-14 ZDHS estimate of 13% in general population. A concurrent syphilis epidemic (21%) may be a significant contributor to spread of HIV. An intervention targeting STI diagnosis and treatment is key and interventions aimed at preventing new HIV infections including test and treat strategy with cART as part of a comprehensive HIV prevention package is essential and can impact the broader epidemic in Zambia.

## WEPEC171

### CONDOM USE AND DECISION-MAKING IN THE CONTEXT OF HIV PREVENTION AMONG FEMALE SEX WORKERS IN IRAN

N. Fahimfar[1,2], M. Shokoohi[3,4], A. Valipour[1], S. Hosseini Hooshyar[4], M. Meshkati[5], M. Karamouzian[4,6], I. Navidi[7], H. Sharifi[4], P. Afsar Kazerooni[1], A. Mirzazadeh[4,8]
*[1]Center for Communicable Disease Control, HIV/AIDS Control Office, Tehran, Iran, Islamic Republic of, [2]Tehran University of Medical Sciences, Department of Epidemiology and Biostatistics, School of Public Health, Tehran, Iran, Islamic Republic of, [3]The University of Western Ontario, Department of Epidemiology & Biostatistics, Schulich School of Medicine & Dentistry, London, Ontario, Canada, [4]Kerman University of Medical Sciences, Regional Knowledge Hub, and WHO Collaborating Centre for HIV Surveillance, Institute for Futures Studies in Health, Kerman, Iran, Islamic Republic of, [5]Esfahan University of Medical Sciences, Deputy of Health, Esfahan, Iran, Islamic Republic of, [6]University of British Columbia, School of Population and Public Health, Faculty of Medicine, Vancouver, BC, Canada, [7]Markazi University of Medical Sciences, Deputy of Health, Arak, Iran, Islamic Republic of, [8]University of California San Francisco, Department of Epidemiology and Biostatistics, San Francisco, California, United States*
*Presenting author email: ali.mirzazadeh@ucsf.edu*

**Background:** Although injecting drug use continues to be the main route of HIV transmission in Iran, recent evidences suggest a growing role of sexual transmission. While condoms are freely available to high risk populations, it seems Female Sex Workers (FSWs) continue to practice unprotected sex with their paying and non-paying partners. This study aimed to assess condom use practices and reasons for protected or unprotected sex among FSWs in 2015 in Iran.
**Methods:** Consenting FSWs≥18 years who reported sex trade with multiple male clients in the past year were recruited through facilities and outreach from 21 sites in 13 cities. Using a standardized questionnaire, FSWs' condom use with paying and non-paying partners and the reasons for safe or unsafe sex were recorded.
**Results:** Out of 1337 FSWs, 96% knew a place to get male condoms. However, 59.1% (95%CI: 47.7, 69.6) reported using male condoms in their last sex with a client. Of whom, 89.5% (CI95%: 83.1, 93.7) reported preventing HIV/STIs as the main reason for using a condom. Conversely, client dissatisfaction was the main reason of condom non-use paying sex (44.7%, CI95%: 35.7, 53.9). Condom negotiation was initiated mainly by FSWs (72.2%, 95CI%: 60.3, 81.6) and rarely by clients (8.9%, 95%CI: 5.2, 14.9). Condom use at last sex with a non-paying partner was reported by 43.3% (95%CI: 32.0, 55.3) of participants; Main reasons for condom use and non-use with non-paying partners were reported as HIV/STIs prevention (84.2%, 95%CI 74.7, 90.6) and partner refusal (44.1%, 95%CI: 32.1, 56.8), respectively. Decisions over condom use were mainly made by FSWs (69.3%) and seldom their non-paying partners (8.9%). Only 9.5% (95%CI: 5.0, 17.4) of cases declared condom unavailability and just 0.3% stated condom unaffordability as the reasons for condom non-use.
**Conclusions:** Although condoms are freely available in all harm reduction centers in Iran, FSWs' condom use practices remains low with both paid and non-paid partners. Since the main reason for condom non-use is partner refusal, further programs catered towards improving FSWs' condom negotiation skills as well as educating their clients about the importance of protected sex are recommended.

## WEPEC172

### SURVEY OF PROVINCIAL GOVERNMENT EMPLOYEES TO MEASURE THE RESULTS OF WORKPLACE PROGRAMS ON HIV

L. Floyd, F. Akpan, T. Motholo, Gauteng Provincial Government IDC Team
*Gauteng Department of Health, Gauteng AIDS Council Secretariat, Johannesburg, South Africa*
*Presenting author email: elizabeth.floyd@gauteng.gov.za*

**Background:** Gauteng provincial government tendered a survey of HIV prevalence, knowledge, behaviours, utilization of services and exposure to interventions in order to measure the results of the HIV workplace program implemented for over a million government employees from 2002 to 2010.
**Methods:** HSRC won the tender bid from Gauteng government. A stratified random sample of 3 679 Gauteng provincial government employees was selected from 1.3 million employees across 11 departments. The sampled employees were tested anonymously for HIV and interviewed with a questionnaire. The questionnaire documented socio economic status, knowledge of HIV, sexual and social risk behaviours, utilization of services and exposure to interventions. The profile of government employees is documented and compared with the general population of the province
**Results:** HIV prevalence is 30% lower than the general adult population at 12.5% but the risk profile is very similar. The highest HIV prevalence is found in young unmarried women at 23%, and young women with multiple sex partners have the highest HIV prevalence. Knowledge of HIV prevention, reported condom use and utilization of services is significantly higher in government employees. 35% of people with one sex partner reported using condoms; 71% of people with two sex partners reported using condoms. 20% of men and 5% of women reported having more than one sex partner: some of this group are not using condoms.
85% of government employees had ever tested for HIV, 72% accessed peer education, 25% utilized counselling at work and 25% utilized health screening at work including HIV testing. The profile of employee deaths indicates that HIV and TB deaths continue.
**Conclusions:**
- HIV prevalence in government employees is 30% lower than the general population.
- Gauteng government workplace programs have achieved higher levels of knowledge, condom use with multiple partners and utilization of services amongst employees than the general population.
- The financial, psycho-social and health profiles of government employees require an integrated employee wellness response which extends beyond health screening and chronic medical care.
- Workplace program results should to be measured regularly with a representative sample of employees surveyed every 3 years.

## WEPEC173

### LOW ANTIRETROVIRAL THERAPY COVERAGE AMONG ADULTS, ESPECIALLY YOUNG MEN, LIVING WITH HIV IN A SOUTHERN MOZAMBICAN DISTRICT WITH HIGH HIV INCIDENCE

A.F. Auld[1], I. Casavant[2], R. Thompson[3], S. Tamele[4], V. Chivurre[5], R. Nelson[1], D. Shodell[6], S. Wei[2], E. Monterroso[2], D. MacKellar[1]
*[1]U.S. Centers for Disease Control and Prevention, Division of Global HIV & Tuberculosis, Atlanta, United States, [2]U.S. Centers for Disease Control and Prevention, Division of Global HIV & Tuberculosis, Maputo, Mozambique, [3]National Institute of Health of Mozambque, Chókwè Health Research and Training Center (CITSC), Maputo, Mozambique, [4]Ministry of Health, Mozambique, District Directorate of Public Health, Gaza, Chokwe, Mozambique, [5]Ministry of Health, Mozambique, Provincial Directorate of Public Health, Gaza, Xaixai, Mozambique, [6]Colorado Department of Public Health and the Environment, Division of Disease Control and Environmental Epidemiology, Denver, United States*
*Presenting author email: aauld@cdc.gov*

**Background:** Very high HIV incidence among adult women in Chókwè District, southern Mozambique (4.6/100 person-years) was reported in 2012 and continues to be observed through the Chókwè Health Demographic Surveillance System (CHDSS).
Here we report the first CHDSS estimates of progress towards globally-endorsed targets of diagnosing ≥90% of people living with HIV (PLHIV) and enrolling ≥81% of PLHIV on sustained antiretroviral therapy (ART).
**Methods:** CHDSS conducts annual demographic surveillance of 95,589 residents. In 2015, all CHDSS households were visited, and HIV testing services offered to residents. Consenting residents were screened for prior HIV diagnosis, HIV care, and ART. Home-based rapid HIV testing was conducted for residents with no prior HIV diagnosis, otherwise confirmatory testing was conducted at the CHDSS laboratory using whole blood.

Tuesday 19 July
Wednesday 20 July Poster Exhibition
Thursday 21 July
Friday 22 July
Late Breaker Posters
Author Index

**Results:** Of 53,227 adult residents aged 15–59 years, 25,344 (48%) tested for HIV, of whom 5,119 (20%) tested HIV-positive. Proportionally more females than males (52% vs. 41%) and more older than younger adults (50% of 25-59 year-olds vs. 45% of 15-24 year-olds) tested for HIV. Among identified PLHIV, 81% were female and median age was 36. Of PLHIV, 3,179 (62%) had been previously diagnosed, 3,092 (60%) were ever in HIV care, 2,946 (58%) received HIV care within 90 days, and 2,587 (51%) were on ART. Patient-reported ART uptake was confirmed in ≥95% of cases by observing ART pill bottles. ART coverage was lower in younger than older adults with 29%, 45%, 58%, and 61% of adults aged 15–24, 25–34, 35–44, and 45–59 years, respectively, taking ART (p< 0.001). ART coverage was lower in males than females among residents aged 15–44 (35% vs. 50%, p< 0.001), but similar between males and females aged 45–59 years (62% vs. 60%, p=0.517). ART coverage was lowest among males aged 15–24 (20%) and 25–34 years (28%) compared with any other age-stratified gender group.
**Conclusions:** Low ART coverage overall (51%) and very low coverage among young adults, especially young men, at least partly explains high HIV incidence. These findings call for urgent expansion of HIV testing and linkage to universal ART, with additional focus on reaching young adults, especially young men, with ART to improve epidemic control.

## MONITORING AND EVALUATION OF PREVENTION

### WEPEC174

### "REACHING THE HIGHER HANGING FRUITS": RESULTS FROM MULTI-YEAR NATIONAL CROSS-SECTIONAL SURVEYS ON VMMC FOR HIV PREVENTION UPTAKE AND BEHAVIOURAL DETERMINANTS IN ZIMBABWE

M.P. Mapingure[1], M. Munjoma[1], O. Tapera[1], B. Mutedzi[1], V. Zambuko[1], E. Dhodho[2], K. Chatora[3], N. Madidi[4], N. Taruberekera[5], K. Hatzold[6]
*[1]Population Services International, Research, Metrics and Information Systems, Harare, Zimbabwe, [2]Population Services International, VMMC and Malaria, Harare, Zimbabwe, [3]Population Services International, Social Marketing, Harare, Zimbabwe, [4]Population Services International, Health Programs, Harare, Zimbabwe, [5]Population Services International, Johannesburg, South Africa, [6]Population Services International, Harare, Zimbabwe*
*Presenting author email: mmapingure@psi-zim.co.zw*

**Background:** Following WHO recommendations, Zimbabwe embraced voluntary medical male circumcision (VMMC) as a constituent of HIV prevention strategies in 2009. Being a non-circumcising country with an MC prevalence of 10% without wide regional differences, VMMC represented a foreign concept for Zimbabweans. In support of the MoHCC, PSI implemented the national communications strategy to increase demand for VMMC through both mass media and interpersonal communication channels. We conducted three bi-annual national surveys to monitor coverage, knowledge and behavioral factors towards VMMC uptake.
**Methods:** We analysed data from three national cross sectional household surveys conducted among adults aged 15 to 49 years. A baseline survey was conducted in 2010 (n=2770), followed by two surveys in 2013 (n=2350) and 2015 (n=3467). Data on male circumcision status, knowledge, perceived availability of services and intention of taking up VMMC were collected through individual interviews using structured questionnaires. The interviews were conducted by trained field interviewers and analysis of variance (ANOVA) was run on the parameters to determine changes over time using STATA Version 13.
**Results:** At baseline in 2010, 11.2% males reported being circumcised. Circumcision uptake increased from 11.8% in 2013 to 24.5% in 2015, (p=0.001). VMMC knowledge increased from 58.3% at baseline to 61.0% and 84.2% in 2013 and 2015 respectively, (p=0.001). Perceived availability of VMMC services increased significantly from 68% in 2013 to 73% in 2015, (p=0.001). Intention to go for circumcision increased initially from 59% at baseline to 63% in 2013 and then decreased to 40% in 2015, (p=0.001).
**Conclusions:** Knowledge about VMMC and uptake and perceived availability of services increased over time reflecting the impact of demand creation and scaling up of services in Zimbabwe. The initial increase in intention to go for VMMC implies that demand creation was effective to motivate early adopters. More research needs to be conducted to better understand barriers to uptake and identify ways to address these among those segments of males still reluctant to get circumcised.

### WEPEC175

### USING PROGRAM EVALUATION DATA TO DESIGN STRATEGIES FOR IMPROVEMENT OF HIV EXPOSED INFANTS DIAGNOSIS (EID) OUTCOME AT HEALTH FACILITIES IN EAST CENTRAL UGANDA

T. Odong[1], H. Ndagire[2], J. Sembatya[3], R. Kimuli[3]
*[1]JSI Research & Training Institute, Inc (JSI)/Strengthening TB and HIV & AIDS Responses in East Central Uganda (STAR-EC), Strategic Information, Jinja, Uganda, [2]JSI Research & Training Institute, Inc (JSI)/Strengthening TB and HIV & AIDS Responses in East Central Uganda (STAR-EC), Technical, Kampala, Uganda, [3]JSI Research & Training Institute, Inc (JSI)/Strengthening TB and HIV & AIDS Responses in East Central Uganda (STAR-EC), Strategic Information, Kampala, Uganda*
*Presenting author email: obeltonny@yahoo.com*

**Background:** The ultimate outcome of Prevention of mother-to-child transmission (PMTCT) of HIV intervention is to achieve a HIV negative child after the mother having gone successfully through the program. However, over the past years, HIV positivity rates in EID in East Central Uganda has remained above the national target of 5% despite of numerous interventions that have been put in place ( HMIS 2013- 2015).
**Methods:** In 2015, the STAR-EC project, funded by USAID and implemented by JSI and its partners conducted an EID outcome evaluation to establish the factors that are responsible for high HIV positivity in EID in the region so as to improve the existing PMTCT / EID strategies or design new ones. The evaluation involved a mix of quantitative and qualitative methods whereby records of 98 HIV positive infants and their mothers were reviewed for a period of one year; April 14- March 15 and key informant interviews held with service providers at sampled health facilities. Only health facilities with HIV positivity rates above 5% were assessed.
**Results:** Through the evaluation, a number of factors were identified which include late or no presentation of mothers for ANC and PMTCT (only 19% of the mothers of the 98 HIV + infants attended ANC), high rate of home based deliveries, client lost to follow up, late enrolment of children for EID, lack of male involvement and lack of adherence to treatment by HIV positive pregnant women. Based on the findings, the following strategies were designed /strengthened; community sensitization, client follow up by VHTs and community mentor mothers, community mapping and referral of pregnant mothers for ANC by VHTs, option B+ campaign and HIV testing at mother baby care points.
Trend analysis of data from HMIS ( 2012- 2015) indicates that of the 2,578 infants tested for HIV in 2012, 10% were HIV positive as compared to 6.7% (n= 2,780) positivity rate registered in 2015 which improvement can partly be attributed to the implementation of the above strategies.
**Conclusions:** Using evidence from evaluation is critical as elaborated above.This therefore calls for projects to prioritize evaluation studies for better programming and program improvement .

### WEPEC176

### IDENTIFYING PRIORITY SUBPOPULATIONS AND GEOGRAPHIC VARIATION IN PREVENTION THROUGH COMMUNITY LEVEL ESTIMATES OF GLOBAL AIDS RESPONSE PROGRESS REPORTING INDICATORS IN NAMIBIA'S HIGHEST PREVALENCE REGION

S.V. Patel[1], T. Nakanyala[2], K.M. Banda[2], A. Wolkon[3], M.R. Chipadze[4], A.M.-A. Agovi[3], C. Ntema[4], M. Siboleka[2], D. Prybylski[3], S. Charturvedi[5], C. Fischer-Walker[3], S. Sawadogo[3], L. Amutenya[2], I. Mabuku[2], D. Maloboka[2], D.W. Lowrance[3], N. Hamunime[2], N. Mutenda[2], W. McFarland[5]
*[1]U.S Centers for Disease Control and Prevention, Division of Global HIV and AIDS, Atlanta, United States, [2]Ministry of Health and Social Services, Directorate for Special Programs, Windhoek, Namibia, [3]U.S. Centers for Disease Control and Prevention, Division of Global HIV and AIDS, Windhoek, Namibia, [4]Development Aid People to People, Total Control of the Epidemic, Windhoek, Namibia, [5]University of California San Francisco, Global Health Sciences, San Francisco, United States*
*Presenting author email: sjp5@cdc.gov*

**Background:** Use of subnational data to identify geographic variations and priority subpopulations for prevention is recommended by UNAIDS. However, these data are often scarce. We produced community-level estimates of standardized global AIDS response progress reporting (GARPR) prevention indicators in Namibia's highest prevalence region.
**Methods:** A cross-sectional, household survey was conducted from 12/2014 - 7/2015 in five purposefully selected sites of Namibia's Zambezi region. Individuals aged ≥15 years completed interviews and received rapid HIV testing and counseling. Point estimates of HIV prevalence and select prevention indicators were calculated and statistically significant demographic correlates of each were identified using multivariable logistic regression analysis.
**Results:** We enrolled 2,163 persons (66.3% participation), of whom 1,312 (60.7%) were female and 790 (36.5%) were youth (< 25 years). HIV prevalence among youth

was 9.1% (95%CI: 7.2-11.3) and significantly higher among female youth vs. male youth (adjusted odds ratio (AOR): 5.30, *P*=0.002) and those age 20-24 years vs. age 15-19 (AOR: 2.77, *P*=0.01). Multiple sex-partnerships was 7.5% (95%CI: 6.4-8.7) and significantly higher among males than females (AOR: 3.82, *P*=0.003) and those not-married/cohabitating vs. married/cohabitating (AOR: 2.23, *P*=0.03). Condom use at last sex among those with multiple sex-partners was 55.7% (95%CI: 47.6-63.6) and significantly lower among non-youth (≥25 years) vs. youth (AOR: 0.49, *P*=0.02) and married/cohabitating participants (AOR: 0.17, *P*=0.01). HIV serostatus awareness was 39.1% (95%CI: 37.0-41.1) and significantly lower among males (AOR: 0.43, *P*< 0.001) and non-youth (AOR: 0.54, *P*=0.02).

**Conclusions:** Our results describe significant subpopulation heterogeneity in prevention indicators within Namibia's highest prevalence region. Nearly one in ten youth were HIV positive, and the likelihood of infection increased between the late-teen and early twenty years, suggesting high incidence and need for enhanced prevention focus among youth. Older and married adults with multiple sex-partners were less likely to use condoms, highlighting points of vulnerability for infection among older adults. Males were less likely to be aware of their serostatus and have only one sex partner, suggesting that their behavior is a primary driver of HIV infection in the region. Community level estimates such as ours can be used in geographically heterogeneous epidemics to target resources and interventions where most needed.

## WEPEC177

### HOW POSSIBLE IS REPLACINING ANC HIV SENTINEL SURVEILLANCE WITH THE PMTCT PROGRAMME DATA IN A RESOURCE CONSTRAINED NATION?

E. Abatta[1], E. Ngige[1], A. Fagbamigbe[2], C. Anyaike[3], S. Araoye[3], S. Aboje[3], G. Ikwulono[3], A. Adebashorun[3], M. Kugonza[4]

*[1]Federal Ministry of Health, Public Health, Abuja, Nigeria, [2]University of Ibadan, Ibadan, Nigeria, [3]Federal Ministry of Health, Abuja, Nigeria, [4]Global Fund, Geneva, Switzerland*

*Presenting author email: emma_abatta@yahoo.com*

**Background:** HIV prevalence is measured in Nigeria through biennial sentinel surveillance survey conducted among pregnant women (PW) attending antenatal clinic (ANC) at the 160 sentinel sites using unlinked anonymous testing (UAT). This periodic exercise has been considered expensive and irregular. As a result, some authorities advocated for replacement of the ANC HIV sentinel surveys (ANC HSS) with the routine PMTCT data. Currently in Nigeria, using PMTCT data in place of ANC HSS in determining HIV prevalence may have some inadequacies as a result of poor quality data and weak M & E system.

**Methods:** PMTCT data within the same period of the ANC HSS was abstracted from the PMTCT registers and the results were compared with that of ANC HSS.. The consent rate which is defined as, "the number of PW sampled by ANC HSS who consent to PMTCT HIV testing over the total number of PW sampled by ANC HSS" was calculated. The calculation of the consent rate was restricted to sites offering PMTCT services and have data. The Non consent bias, differential prevalence ratio and level of agreement between ANC HSS and PMTCT HIV testing data were also determined.

**Results:** The findings show that the national prevalence from the ANC HSS is 3.0% compared with the 2.0% (95% CI: 0.0 - 10.2) from the PMTCT routine data. The number of PW sampled by ANC HSS who consented to PMCT HIV testing is 18,037 when compared with 32,085 pregnant women sampled by ANC HSS making the consent rate of 56.2%. There was no PMTCT data in 52 (32.5%) sentinel facilities and the highest facilities with missing data occurred in the North west zone and least (8%) in the south west zone. In many of the sites, there were incomplete documentation and data quality issues.

**Conclusions:** Much as it seems cheaper to replace the ANC HSS with PMTCT data for estimation and modeling, this may not be so soon visible without strengthening the monitoring and evaluation system and the PMTCT counseling and testing at all levels. This is because of high refusal rate for HIV testing and quality of data at the facility level.

# MONITORING AND EVALUATION OF TESTING

## WEPEC178

### ESTIMATING HIV PREVALENCE FROM DATA ON FALSE POSITIVES IN SCREENING PROGRAMS: IMPLICATIONS FOR 90-90-90

E. Thomas, S. Peskoe, D. Spiegelman

*Harvard University, Department of Biostatistics, Boston, United States*

*Presenting author email: emmathomas@g.harvard.edu*

**Background:** A goal of the UNAIDS 90-90-90 strategy is to ensure that, by 2020, 90% of people living with HIV know their HIV status. Estimating HIV prevalence among people eligible for screening allows assessment of how many additional HIV positives might be diagnosed through continued screening efforts in this population. This, in turn, could help inform decisions about how best to focus resources within a country's 90-90-90 strategy.

**Methods:** We developed statistical methods for estimating HIV prevalence from data on false positives in a sample of individuals who tested positive on a screening test with known sensitivity and specificity. We applied these methods to screening data on ART-naïve adults in Swaziland from 2014 to 2016. Participants were screened using a rapid test with sensitivity=99.0% and specificity=99.1% as given by conservative published estimates. Among those testing positive, viral load (VL) was measured by rt-qPCR. Those with VL< 100 copies/mL, the lower detection limit, were classified as false positives.

**Results:** 140 of 1778 (7.9%) test positives had VLs below the lower detection limit. Based on these results, we estimated the HIV prevalence among the population eligible for screening to be 10.6% (95%CI: 8.9% to 12.2%). This estimate was sensitive to assumptions about the properties of the screening algorithm. If WHO minimum standards for sensitivity (99%) and specificity (98%) were used instead of the published estimates, the estimated prevalence among those screened increased to 19.1% (95%CI: 16.4% to 21.8%).

**Conclusions:** We have developed methods for estimating HIV prevalence from data on false positive HIV tests. Data of this type are often collected in screening programs that seek gold-standard verification of all, or a subsample of, positive tests. In this context, our methods provide an estimate of HIV prevalence in the population being targeted for screening. If the estimated prevalence is unexpectedly low, this could mean that continued intensive screening efforts in this population are an inefficient use of resources. Alternatively, the accuracy of the screening test as implemented in the field may be lower than assumed.

## WEPEC179

### LAY COUNSELOR REDEPLOYMENT IN KWAZULU-NATAL, SOUTH AFRICA, LEADS TO CONSIDERABLE DROP IN HIV TESTING

J. Hu[1], S.J. Steele[2], K. Ortblad[3], T. Solomon[4], A. Shroufi[2], G. Van Cutsem[2], P. Matthews[5], S. Wyke[5], D. Pillay[5], T. Bärnighausen[5]

*[1]Harvard T.H. Chan School of Public Health, Global Health and Population, Boston, United States, [2]Médecins Sans Frontières, eShowe, South Africa, [3]Harvard T.H. Chan School of Public Health, Boston, United States, [4]Médecins Sans Frontières, eShowe, United States, [5]Africa Centre, Somkhele, South Africa*

*Presenting author email: jah126@mail.harvard.edu*

**Background:** In settings such as KwaZulu-Natal, South Africa, an area with both a high HIV burden and severe health worker constraints, lay counselors have played a critical role in the provision of HIV testing and counseling services as well as adherence counseling. At the end of 2014, the KwaZulu-Natal Department of Health announced the phasing out of the cadre of lay counselors, with the stated aim of retraining and identifying new careers for these individuals.

In the uMlalazi municipality, where Médecins Sans Frontières (MSF) works in collaboration with the local Department of Health in delivering HIV treatment, lay counselors have been withdrawn from 9 clinics in two waves: Jan 5th, 2015 (CW1) and June 15th, 2015 (CW2). This stepwise counselor withdrawal provides an analytical opportunity to examine the impact of this change in health worker capacity on the total number of clinic-based HIV tests.

**Methods:** We used clinic-level fixed effects analysis with data on monthly HIV testing rates from the national South African electronic HIV treatment records system (TIER.net) from August 2014 - December 2015. Clinic-level fixed effects and control for months allowed us to account for all unobserved and observed confounding variables at the clinic-level, and trends in HIV testing by calendar time, respectively.

**Results:** We observed over 16,000 tests (7020 tests administered 5 months pre-CW1, 5125 tests administered 5 months post-CW1 / pre-CW2, and 4264 tests administered post-CW2). Following CW1, the monthly average of HIV tests decreased 25% and following CW2 the monthly average decreased a further 13%. After controlling for clinic-level fixed effects and months, we found that having one less counselor is associated with 28 fewer tests per month (95% CI: 22.19 to 34.37).

Tuesday 19 July
Wednesday 20 July Poster Exhibition
Thursday 21 July
Friday 22 July
Late Breaker Posters
Author Index

**Conclusions:** These findings suggest that the counselor withdrawal substantially decreased clinic-based HIV testing. If these findings are representative of the experience province-wide, they illustrate how lay counselor withdrawal may jeopardize efforts to deliver the UNAIDS 90-90-90 strategy.

## MONITORING AND EVALUATION OF TREATMENT AND CARE

### WEPEC180

### DETERMINANTS OF CD4 IMMUNE RECOVERY AMONG INDIVIDUALS ON ANTIRETROVIRAL THERAPY IN SOUTH AFRICA: A NATIONAL ANALYSIS

T. Kufa-Chakezha[1], G. De Gita[1], N.J. Ballah[1], A. Puren[1], S. Takuva[1], S. Carmona[2], W. MacLeod[3,4], Y. Pillay[5], M. Gorgens[6], Z. Shubber[6], N. Fraser-Hurt[6]
*[1]National Institutes of Communicable Diseases, Centre for HIV and STIs, Johannesburg, South Africa, [2]National Health Laboratory Services (NHLS), National Priority Programmes, Johannesburg, South Africa, [3]Boston University School of Public Health, Department of Global Health, Boston, United States, [4]University of Witwatersrand, Faculty of Health Sciences, Health Economics and Epidemiology Research Office (HE2RO), Johannesburg, South Africa, [5]National Department of Health, Pretoria, South Africa, [6]The World Bank, Washington DC, United States*
*Presenting author email: tendesayikc@nicd.ac.za*

**Background:** Understanding patterns of CD4 immune recovery among individuals on antiretroviral therapy (ART) is important, with increasing emphasis on viral load (VL) monitoring and selective CD4 testing. South Africa's National Health Laboratory Service archives millions of CD4 and VL test results. At present this source of strategic data is underused due to difficulties in linking test results back to individual patient data. Using the NHLS database and a linking algorithm, we undertook the largest ever national analysis of CD4 immune recovery among ART patients.

**Methods:** A probabilistic matching algorithm was used linking routinely collected CD4 count and VL data (2010-2014) to unique individuals ≥15years. Individuals with ≥1 VL and ≥2 CD4 count results were included. Immune recovery was defined according to different CD4 thresholds: achieving CD4 counts of ≥200, ≥350 and ≥500 cells/m$^3$ after ART initiation. Time to recovery was estimated using survival analysis. Multivariate modified-Poisson regression was used to estimate differences in recovery according to age, sex, CD4 count at ART initiation (baseline) and VL suppression.

**Results:** The cohort included 1,070,900 individuals [4,367,924 CD4 tests, 70% female, median follow-up 24 months, age 44 years and baseline CD4 count 213 cells/mm$^3$]. Proportions achieving CD4 immune recovery to 200, 350 and 500 cells/mm$^3$ were 79.7% (in a median 10.3 months), 63.7% (12.2 months) and 41% (16.4 months) respectively. Among virally suppressed individuals (n=919,649), immune recovery was greater: 85.5% (9.4 months), 68.3% (12.4 months) and 44.4% (17.3 months) achieved recovery to 200, 350 and 500 cells/mm$^3$ respectively. Immune recovery was lower among men [adjusted risk ratio (aRR) 0.92 (95%CI 0.91-0.92)], older persons [aRR 0.93(95%CI 0.92 - 0.94) for ≥50 vs. 25- 34years], those with lower baseline CD4 counts [aRR0.70 (95%CI 0.69 -0.70) for < 50 cells/mm$^3$ vs. 150- 199 cells/mm$^3$] and those not virally suppressed [aRR 0.53 (95%CI 0.53 -0.54)]

**Conclusions:** The lack of CD4 immune recovery was greatest among those with low CD4 counts at baseline and no VL suppression in follow up. Interventions encouraging earlier ART initiation and better VL suppression should be strengthened. Analyses of routine datasets using novel record linking approaches can be used to strengthen monitoring and evaluation of ART programmes.

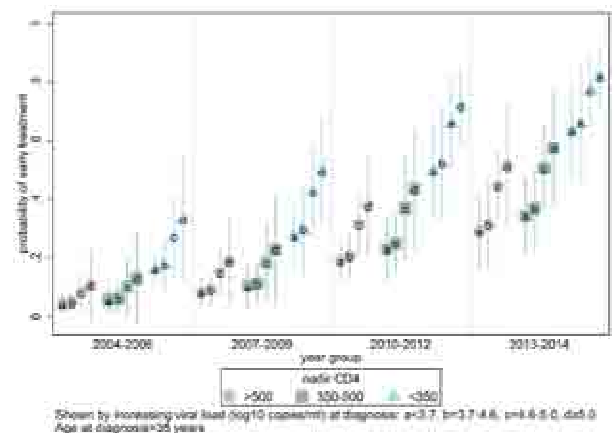
*Presenting author email: hmcmanus@kirby.unsw.edu.au*

**Background:** Early initiation of antiretroviral therapy (ART) protects people living with HIV against HIV-related morbidity and mortality (START). Early treatment is now also a cornerstone of HIV prevention (HPTN 052). We determined changes in the probability of early-treatment among a cohort of people newly diagnosed with HIV attending Australian sexual health clinics (SHCs) from 2004-2014.

**Methods:** Longitudinal data from 42 SHCs were analysed. The cohort included new HIV diagnoses between January-2004 and June-2014. Early ART was defined as commencing within 6 months of diagnosis. Bivariate mixed effects logistic regression models were developed with early ART as the outcome and the following covariates: age, sex, HIV transmission risk, geographical remoteness, nadir CD4+ count and plasma HIV load (VL) at diagnosis, Hepatitis B surface antigen and Hepatitis C antibody status. We adjusted all analyses for time period. Clinic was included as a random intercept. Significant covariates ($p<0.05$) were used to fit a predictive multivariate model.

**Results:** A total of 720 new HIV diagnoses were included in analyses. The majority of diagnoses were male (>95%) and men who have sex with men (82%) with median age of 34 years (interquartile range [IQR]:27-43). The median CD4+ count at diagnosis was 362 cells/µl (IQR: 252-510). Early ART initiation rates increased significantly over-time: 17% in 2004-6, 26% in 2007-8, 42% in 2010-12 and 53% in 2013-14 ($p<0.001$). In a multivariate model increased probability of early treatment was associated with increased age ($p=0.032$); lower CD4+ count ($p<0.001$); higher VL ($p=0.029$); and later time period ($p<0.001$) (Figure 1).



*[Figure 1: Probability of early ART initiation following HIV diagnosis by year and nadir CD4]*

**Conclusions:** In this cohort of new HIV diagnoses, early ART initiation rates have increased substantially over the study period. Patients diagnosed in 2013-14 were much more likely to have early treatment initiation compared to 2004-6. Despite this success, further strategies are needed to maximise the benefits of treatment as prevention.

## WEPEC182

### HIV TREATMENT REFUSAL IN PATIENTS WITH HIGH CD4 COUNTS: EVIDENCE FROM DEMOGRAPHIC SURVEILLANCE IN RURAL KWAZULU NATAL

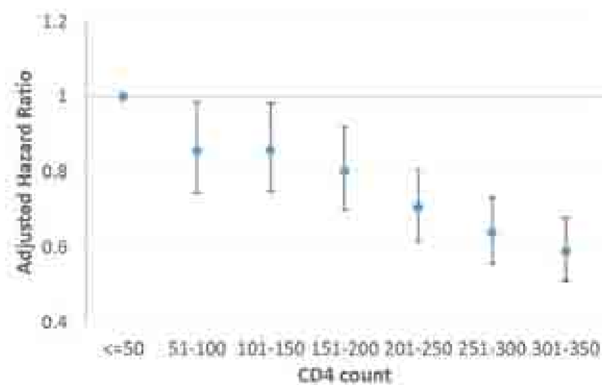
C. Chiu[1], J. Bor[1,2,3], S. Ahmed[1,2], I. Katz[4,5,6], M.P. Fox[1,2,7], S. Rosen[1,2], F. Tanser[3], D. Pillay[3,8], T. Bärnighausen[3,9]
*[1]University of the Witwatersrand, Health Economics and Epidemiology Research Office, Johannesburg, South Africa, [2]Boston University School of Public Health, Department of Global Health, Boston, United States, [3]Wellcome Trust Africa Centre for Health and Population Studies, University of KwaZulu Natal, Durban, South Africa, [4]Division of Women's Health, Brigham and Woman's Hospital, Boston, United States, [5]Center for Global Health, Massachusetts General Hospital, Harvard Medical School, Boston, United States, [6]Harvard Medical School, Boston, United States, [7]Boston University School of Pubic Health, Department of Epidemiology, Boston, United States, [8]Faculty of Medicine, University College London, London, United Kingdom, [9]Harvard T.H. Chan School of Public Health, Department of Global Health and Population, Boston, United States*
*Presenting author email: cchiu@heroza.org*

**Background:** Recent WHO guidelines recommend HIV treatment for patients regardless of CD4 count. However, healthier individuals may be less willing to start therapy than patients at lower CD4 counts. We assess predictors of ART uptake among patients presenting for HIV care in rural KwaZulu-Natal.

**Methods:** Clinical records were analyzed for all treatment-naïve adults (18+) with a first eligible CD4 count (< 350) in the Hlabisa HIV Treatment and Care Programme from August 2011 to December 2012. Cox Proportional Hazards models were used to assess the association between first CD4 count value and time from first CD4 to ART initiation, adjusting for age and sex. For a sub-set of healthier patients (CD4 200-349) who resided within the surveillance area of the Africa Centre for Population Health, we assessed a range of sociodemographic, economic, and geographic predictors of ART uptake.

**Results:** Of 4,739 patients presenting for care with eligible CD4 counts, 55%, 58%, and 59% initiated ART within 6 months, 1 year, and 2 years of their first CD4 count in Hlabisa sub-district. Rates of ART initiation fell by 9% for every 50-cell increase in baseline CD4 count (p< .001). Among healthier patients under demographic surveillance (n=193), individuals living more than 2 km from their nearest clinic (HR 0.81, 95% CI 0.57-1.16) and with children under 6 (HR 0.63, 95% CI 0.39-1.03) were less likely to initiate, whilst older individuals (HR 1.16 per year, 95% CI 1.04-1.30) were more likely to initiate. Patient sex, education, employment, wealth, and household size were not significantly associated with time to initiation.

**Conclusions:** Healthier individuals were significantly less likely to initiate ART. Children in the household and distance to clinic were identified as barriers in healthier patients. Barriers to uptake must be addressed to increase the number of people on treatment at high CD4 counts.



*[Lower Uptake of ART in Healthier Patients]*

## WEPEC183

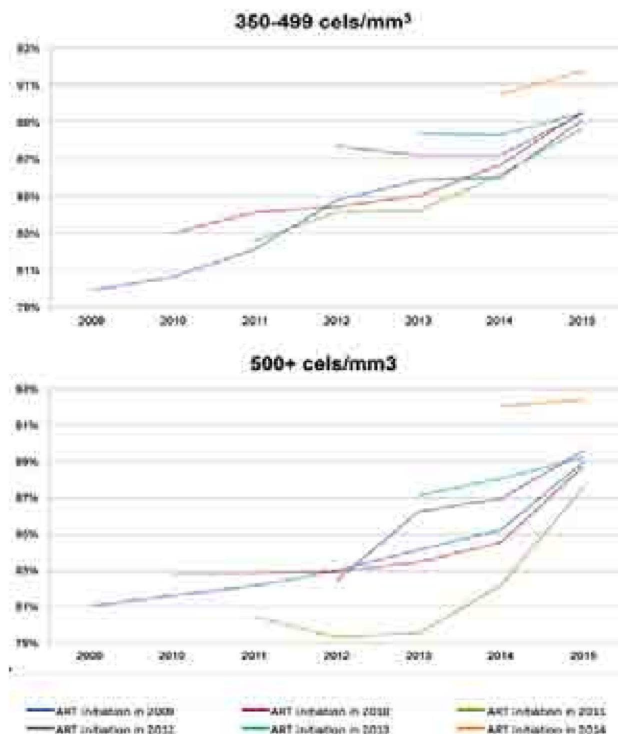
### USE OF PROGRAMMATIC DATA ON VIRAL LOAD TO ASSESS ART ADHERENCE IN BRAZIL FROM 2009 TO 2015

M. Meireles[1], A.R. Pascom[2], C.D.B. Habckost[1], F. Mesquita[1]
*[1]Ministry of Health, Brasília, Brazil, [2]Ministry of Health, Department of STI, aids and viral Hepatitis, Brasília, Brazil*

**Background:** In December 2013, the Brazilian AIDS programme changed its recommendations on ART to treat all HIV+ people regardless of CD4 count. Moreover, the country has also implemented fixed-dosed combination (FDC) (TDF+3TC+EFZ) since 2014. An important issue raised regarding the Treatment for All strategy is whether people with high CD4 counts would present poorer adherence. This study aims to use viral load suppression (VLS) rates to indirectly assess adherence in Brazil.

**Methods:** We used programmatic data on CD4, VL and ARV dispensation to assess VLS (< 1000 copies/mL) in two CD4 categories (350-500 cells/mL and >500 cells/mL) at ART initiation by cohort of ART initiation (2009-2014). CD4 categories were established using the last CD4 count performed before first dispensation (up to 180 days); selected VL was the last one performed each year, at least 180 days after the beginning of treatment. Statistical analysis for comparison of VLS rates was performed using chi-squared tests.

**Results:** Data from 55,629 patients and 148,800 VL exams were analyzed. VLS was above 79% for all years and groups analyzed; no statistical difference (p>0,05) was found between the CD4 categories for the 2013 and 2014 cohorts. The 2014 cohort presented higher VLS (p< 0,05) in both CD4 groups, when compared to all other cohorts.



*[Viral Load Supression Rates by year according to the CD4 count at ART initiation and cohort of treatment initiation]*

**Conclusions:** In 2014 and specially in 2015, a considerable increase in VLS was observed in all cohorts, and could be related to the implementation of FDC initiated in 2014. The 2014 cohort presents significantly higher VLS rates than all other cohorts, suggesting the success of the new guidelines, which restricted prescription rules to first line patients (1st line treatment should be TDF+3TC+EFZ if no contraindications). Finally, there was no difference in VLS between the two CD4 strata in 2013 and 2014 cohorts, helping refute that adherence among persons with high CD4 counts would be poorer.

## WEPEC184

### NO DIFFERENCE IN ADHERENCE TO ANTIRETROVIRAL THERAPY BY SEX IN AFRICA: A META-ANALYSIS

C.J. Korhonen, B. Kutner, J.P. Yang, W.J. Wang, J.M. Simoni, S.M. Graham
*University of Washington, Seattle, United States*
*Presenting author email: jsimoni@uw.edu*

**Background:** Adequate adherence to antiretroviral therapy (ART) is necessary to reduce morbidity, mortality, and transmission of HIV. In Africa, men on treatment have worse outcomes than women. A potential contributor to this imbalance may be a difference in levels of ART adherence. This meta-analysis compared ART adherence between men and women in sub-Saharan Africa.
**Methods:** Medline, Embase, and Web of Science were searched for articles in any language reporting ART adherence in sub-Saharan Africa through October, 2014. Abstracts were screened by two independent reviewers. Studies involving both men and women age 15 and over were assessed for inclusion. Authors reporting overall adherence were contacted for information on adherence by sex. Pooled odds ratios were calculated using random-effects models.
**Results:** From the 1796 abstracts identified, 65 articles involving a total of 29,695 men and 49,261 women met the inclusion criteria. Definitions of adherence varied by study and ranged from >80% to 100% of doses taken. The overall random effects pooled odds ratio (pooled OR) for adherence among men compared to women was 0.94 (95% CI 0.85-1.05, $I^2$=86%). In a sub-analysis by adherence measure, studies using pharmacy records to measure adherence showed a marginally significant difference in adherence between men and women (pooled OR 0.93, 95% CI 0.87-0.99, $I^2$ 34%), while studies using pill count or self-report did not (pill count pooled OR 0.81, 95% CI 0.53-1.17, $I^2$=86%; self-report pooled OR 0.99, 95% CI 0.77-1.27, $I^2$=90%). In a pooled analysis of 53 studies with individual-level data, 73% (95% CI 69%-78%) of men and 74% (95% CI 70%-79%) of women met criteria for being adherent.
**Conclusions:** Men with HIV in sub-Saharan Africa present later to care, have increased loss-to-follow-up, and have higher mortality rates than women. While the relative adherence of men and women varied greatly between studies in this meta-analysis (overall $I^2$=86%), men do not appear to have worse ART adherence than women. Instead, approximately 26%-27% of African adults, regardless of sex, have suboptimal adherence. Interventions are needed to improve adherence for both men and women taking ART.

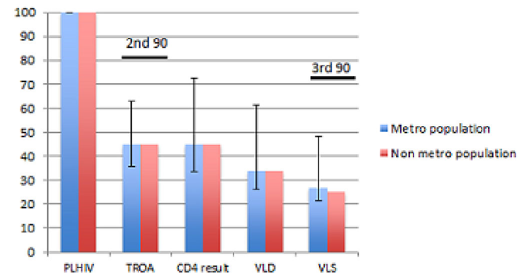
## MONITORING AND EVALUATION OF HIV CASCADE

## WEPEC185

### FAST-TRACKING OF THE HIV RESPONSE: DO THE METROS LEAD THE WAY TO REACHING 90-90-90 IN SOUTH AFRICA?

N. Fraser-Hurt[1], W. MacLeod[2,3], J. Bor[2], Z. Shubber[1], S. Carmona[4,5], Y. Pillay[6], M. Gorgens[1]
*[1]World Bank, Health, Nutrition, Population, Washington, United States, [2]Boston University School of Public Health, Department of Global Health, Boston, United States, [3]University of Witwatersrand, Health Economics and Epidemiology Research Office, Faculty of Medical Sciences, Johannesburg, South Africa, [4]National Health Laboratory Service, Johannesburg, South Africa, [5]University of Witwatersrand, Department of Haematology and Molecular Medicine, Johannesburg, South Africa, [6]National Department of Health, Pretoria, South Africa*
*Presenting author email: nfraserhurt@worldbank.org*

**Background:** City mayors worldwide have pledged to achieve the 90-90-90 targets by 2020. South Africa's 8 metropolitan municipalities (metros) are priority areas as HIV burden is generally high and populations large. HIV programme planning and progress tracking requires comprehensive data. While South Africa has a wealth of data, routine data systems work in parallel and aren't appropriately linked to allow progress tracking along the HIV Care Cascade (HCC). Poor implementation of the unique patient identifier means it's difficult to link laboratory test results back to patient data.
**Methods:** We collated data sources to understand the HCC in South Africa's metro and non-metro populations including demographic, HIV prevalence and death notification data and HIV laboratory data (2014-2015) that we linked to unique individuals using a probabilistic matching algorithm. We defined HCC using: number of persons living with HIV (PLHIV); total remaining on ART (TROA); numbers with a CD4 count and viral load (VL) test results in the past year and the number of suppressed VL tests.
**Results:** 37% of South Africa's PLHIV live in metros. HIV was the second most frequent cause of death in four metros (2014) while it ranks 5 nationally. On average, progress along the HCC is virtually the same for metro and non-metro populations with a large gap to reach 90-90-90 for both (Figure 1). The HCC showed large variations across the metros with 2-5 metros faring worse than the average non-metro population across the cascade. Across the metros, 35%-63% of PLHIV were on ART, annual CD4 and VL test coverage ranged from 33%-73% and 22%-61% respectively while viral suppression ranged from 67%-85%.
**Conclusions:** There are currently large gaps in the metro's 90-90-90 level of achievements. The District Implementation Plans will support the metros to focus HIV interventions for attaining the HCC targets by 2020.



*[Fig 1. HIV care cascade in metro and non-metro populations, South Africa (April 2014 to March 2015)]*

## WEPEC186

### LINKAGE TO CARE AND RETENTION IN CARE AMONG HIV-INFECTED MEN WHO HAVE SEX WITH MEN IN GUANGZHOU, CHINA

N.S. Wong[1,2], J. Mao[2,3], W. Cheng[4], H. Xu[4], W. Tang[2,5], J. Tucker[1,2]
*[1]UNC Chapel Hill, Institute for Global Health & Infectious Diseases, Chapel Hill, United States, [2]University of North Carolina Project-China, Guangzhou, China, [3]University of California, David Geffen School of Medicine, Los Angeles, United States, [4]Guangzhou Center for Disease Control and Prevention, Department of HIV/STD Control and Prevention, Guangzhou, China, [5]University of North Carolina - Chapel Hill, Chapel Hill, United States*
*Presenting author email: weimingtangscience@gmail.com*

**Background:** Effectively measuring linkage to care and retention are essential to meet global HIV goals, especially in light of policies promoting decentralization of services. China has a highly centralized HIV service delivery system, providing an opportunity to track patients through the care continuum. We examined the proportion of men who have sex with men (MSM) newly diagnosed with HIV linked to and retained in care over time and space in Guangzhou, China.
**Methods:** Data of HIV-infected MSM diagnosed and living in Guangzhou from 2008-2014 was accessed retrospectively from the Guangzhou CDC. Linkage to care was defined as receiving a CD4 test within 3 months of diagnosis. Retention in care was defined as receiving ≥2 CD4 tests annually after linkage. We grouped men according to year in order to examine trends over time. Univariate analysis was performed to examine associations with linkage. We also mapped the geographic distribution of residences of individuals linked and the distribution of residences of individuals retained.
**Results:** A total of 2008 MSM (4679 person-years follow-up) were diagnosed and living in Guangzhou. Their median age at diagnosis was 29 years old (IQR=24-35). At diagnosis, 17% (337/1952) of MSM were married and 79% (1586/2008) had attained at least high school education. Before diagnosis, 24% (227/952) of MSM had been diagnosed with sexually transmitted diseases. MSM with higher education levels (odds ratio=1.48,95%C.I.=1.13-1.93) were more likely to be linked. From 2008 to 2014, MSM linkage to care increased from 49% to 87%, and the rate of retention in care increased from 29% to 51%. MSM diagnosed after 2011 (OR=4.03,95%C.I.=3.16-5.13) were substantially more likely to be linked. Geographically, the rate of linkage ranged from 72%-100%, and the rate of retention ranged from 23%-60% across 11 districts in 2014.
**Conclusions:** With the increasing number of new diagnoses of HIV among MSM in Guangzhou, linkage to care has increased as well. However, the rate of retention in care is only half that of linkage to care, which may affect the overall effectiveness of HIV treatment and control.

## WEPEC187

### A COMPARISON OF THE CONTINUUM OF HIV CARE IN ELEVEN EUROPEAN COUNTRIES USING STANDARDISED METHODS

A. Gourlay[1], A. Amato[2], M. Axelsson[3], F. Cazein[4], D. Costagliola[5], S. Cowan[6], S. Croxford[7], A. d'Arminio Monforte[8], J. del Amo[9], V. Delpech[7], A. Diaz[9], E. Girardi[10], B. *Presenting author email: a.gourlay@ucl.ac.uk*

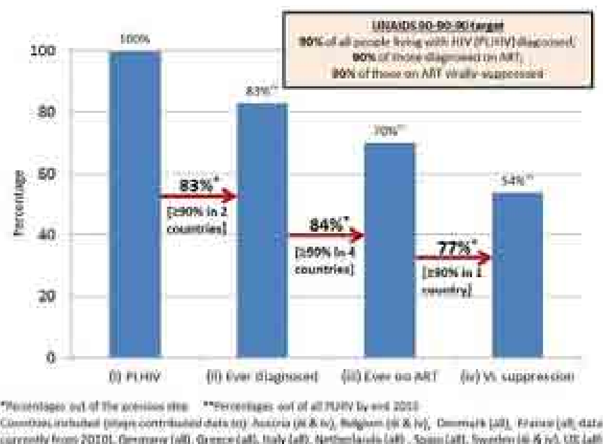
**Background:** UNAIDS has set a 90-90-90 target to curb the HIV epidemic by 2020, but methods used to derive these proportions are not standardised, hindering comparisons between countries or compilation across regions.

**Methods:** Through a collaboration between the European Centre for Disease Prevention and Control, several EuroCoord HIV cohorts and European surveillance agencies, we aimed to construct a standardised, four-point continuum of HIV care for eleven European countries for 2013 (or most recent year available). Definitions for each stage were standardised as follows:
i) number of people living with HIV (PLHIV) in the country by end of 2013;
ii) proportion of PLHIV ever diagnosed;
iii) proportion ever diagnosed who ever initiated ART (regardless of treatment guidelines);
iv) proportion ever on ART who were virally-suppressed (≤200 copies/mL) at last visit (01/07/2012 to 31/12/2013).
PLHIV estimates were derived, where feasible, using back-calculation models to estimate HIV incidence and the undiagnosed fraction from surveillance data, or using multi-parameter evidence synthesis. Stage two was based on surveillance data, if available, or cohort data otherwise. Stages three and four were derived from country-specific cohorts.

**Results:** Complete data are available from eight countries (partial data for three). One country achieved all three of the UNAIDS 90-90-90 targets, and another achieved >85% for each stage. In total, 647,249 people were estimated to be living with HIV (eight countries, prevalence 0.18%); between 5500 (0.10%) and 150,000 (0.32%) in each country. Proportions at each stage varied widely between countries and were, on average: 83% (range 71-91%) diagnosed; 84% (range 73-96%) on ART; and 77% (range 63-93%) virally-suppressed (figure).



*[Continuum of HIV care in eleven European countries]*

**Conclusions:** Few countries achieved all three of the 90-90-90 targets according to our definitions. Standardising methods for the continuum remains a challenge for all stages. These data provide useful comparisons to governments and healthcare planners.

## WEPEC188

### DISTANCE ELASTICITY OF DEMAND FOR HIV TREATMENT: SEX DISPARITIES IN UTILIZATION

C. Chiu[1], M. Over[2], G. Meyer-Rath[1,3], F. Tanser[4], D. Pillay[4], T. Bärnighausen[4,5], J. Bor[1,3,4]
*[1]Health Economics and Epidemiology Research Office, University of the Witwatersrand, Johannesburg, South Africa, [2]Center for Global Development, Washington D.C, United States, [3]Boston University School of Public Health, Department of Global Health, Boston, United States, [4]Wellcome Trust Africa Centre for Health and Population Studies, University of KwaZulu-Natal, Durban, South Africa, [5]Harvard T.H. Chan School of Public Health, Department of Global Health and Population, Boston, United States*
*Presenting author email: cchiu@heroza.org*

**Background:** The geographic distribution of HIV care and treatment services is an important determinant of access to care. Using data from a large demographic surveillance area in rural South Africa, we assessed the association between distance to the nearest HIV clinic and rates of linking to care, initiating ART, and remaining in care at 12 months after ART initiation, and examined how this association differs for men and women.

**Methods:** Distance to nearest HIV treatment clinic was calculated for all individuals residing within the catchment area of the Africa Centre Demographic Information System in rural KwaZulu-Natal, South Africa, on 31 December 2005 (n=32,157). These data were then linked to clinical records from the public sector HIV treatment and care program in the region. Associations between distance to clinic and time to linkage to care, ART initiation, and 12 month retention after ART initiation were estimated in Cox Proportional Hazards models, adjusting for age and sex. Models were additionally stratified by sex.

**Results:** Living an additional kilometre away from the nearest clinic was associated with a 6.6% (95% CI 4.9% to 8.3%) reduction in linkage to care, a 6.5% (95% CI 4.2% to 8.7%) reduction in ART initiation, and a 5.4% (95% CI 3.4% to 7.4%) reduction in 12-month retention on ART. Stratifying by sex, the association between distance to clinic and failure to link, initiate, and be retained was significant at the 0.01 level for women; no association was observed for men.

**Conclusions:** Women residing further from clinics were less likely to seek HIV care and treatment services; no such patterns were observed for men, suggesting that the geography of HIV infection and care-seeking may differ for men and women. Information on the geographic distribution of clinical services vis-à-vis patients served can be used to improve program planning and resource allocation.

Author Index

**Description:** Using a case management system, peer outreach workers (OWs) deliver HIV prevention interventions in the field to people who inject drugs (PWID), female sex workers (FSW), and men who have sex with men (MSM) including mobile HIV testing, escorted referral to health facilities (HF), behavior change communication, condom/lubricant distribution, and STI/tuberculosis screening. Each client's unique identifier code (UIC) is documented on the OW's business card which is carried by the client. OWs record the UIC in service delivery logs at each encounter and on referral forms submitted to HFs for HIV services. Service delivery and referral data are entered into a Microsoft Access database that tracks individuals longitudinally. Aggregate service delivery data measured number of individuals reached, tested, and linked to care by KP group. All HIV positive results and linkage data, and a 10% random sample of HIV negative results were verified against HF registers.
**Lessons learned:** Between October 2014 and September 2015, 1940 individuals were reached, of which 1583 (82%) were tested for HIV at least once, 63 (4%) tested HIV-positive and 34 (54%) linked to care. Testing was lowest among female PWID (34%), FSW + PWID (41%) and FSW who use drugs without injecting (PWUD, 54%). Among those tested for HIV, prevalence was highest among individuals with multiple risk behaviors: MSM + PWUD (27%), FSW + PWUD (18%), and FSW + PWID (13%); furthermore these groups were least likely to link to HIV care (Table).

| Indicator | TOTAL | Male PWID | Female PWID | MSM | MSM + PWUD | FSW | FSW + PWID | FSW + PWUD |
|---|---|---|---|---|---|---|---|---|
| Reached , n | **1940** | 837 | 41 | 173 | 19 | 759 | 37 | 74 |
| Tested for HIV, n (% out of reached) | **1583 (82%)** | 704 (84%) | 14 (34%) | 147 (85%) | 11 (58%) | 652 (86%) | 15 (41%) | 40 (54%) |
| Tested HIV+, n (% out of tested) | **63 (4%)** | 9 (1%) | 0 (0) | 2 (1%) | 3 (27%) | 40 (6%) | 2 (13%) | 7 (18%) |
| Linked to HIV care, n (% out of HIV+) | **34 (54%)** | 5 (56%) | N/A | 1 (50%) | 0 (0) | 25 (63%) | 0 (0) | 3 (43%) |

*[HIV cascade results from October 2014-September 2015, by KP group]*

**Conclusions/Next steps:** Although sample sizes were small, results suggest a need to refocus targeting of interventions to KPs with multiple risk behaviors for highest yield. Further efforts are needed to improve HIV testing uptake among female PWID and FSW who use and inject drugs through tailored messaging, targeted outreach, and mobile testing efforts.

## WEPEC190

### INSUFFICIENT PROGRESS TOWARDS THE 90-90-90 TARGETS IN THE SOUTH-EAST ASIA REGION

S. Gupta, D. Yu, R. Pendse
*WHO South-East Asia Region, New Delhi, India*
*Presenting author email: somyagupta17@gmail.com*

**Background:** In South-East Asia region of World Health Organization (WHO), despite progress in the HIV response, new HIV infections and AIDS-related deaths have plateaued since 2010. We track the progress towards the 90-90-90 targets in nine countries from the region.
**Methods:** From review of global AIDS response progress reports, direct inputs through questionnaires, and country presentations during regional workshops, data on number of people living with HIV (PLHIV) diagnosed, in care, receiving antiretroviral therapy (ART), retained on ART, and with viral load (VL) suppression were collected to construct the HIV cascades for 2014.
**Results:** PLHIV who have been diagnosed (first 90) ranged from 24% in Indonesia to 80% in Thailand.

| Country | Estimated people living with HIV or PLHIV | PLHIV diagnosed (% of estimated PLHIV) | PLHIV enrolled in care (% of PLHIV diagnosed) | PLHIV on ART (ART coverage) | PLHIV on ART as a % of diagnosed | ART retention at 12 months (in %) | PLHIV on ART who received viral load test (% of estimated PLHIV) | PLHIV on ART with viral suppression (in %) |
|---|---|---|---|---|---|---|---|---|
| Bangladesh | 8,935 | 3,111 (35%) | 1,517 (49%) | 1,287 (14%) | 41% | Not available | Not available | Not available |
| Bhutan | 1,000 | 403 (40%) | 307 (76%) | 167 (17%) | 41% | 87% | Not available | Not available |
| India | 2,117,000 | 1,400,000 (67%) | 1.1-1.5 million (79-100%) | 747,175 (36%) | 50% | 74% | Not available | Not available |
| Indonesia | 658,510 | 160,138 (24%) | Not available | 50,400 (8%) | 31% | 71% | Not available | Not available |
| Myanmar | 212,560 | Not available | Not available | 85,626 (40%) | Not available | 82% | 9,586 (11%) | 87% |
| Nepal | 39,249 | 25,839 (66%) | 25,421 (98%) | 10,407 (27%) | 40% | 84% | 1,198 (12%) | 84% |
| Sri Lanka | 3,336 | 1,737 (52%) | 825 (47%) | 644 (19%) | 37% | 91% | 581 (90%) | 42% |
| Thailand | 445,642 | 356,514 (80%) | 301,959 (85%) | 271,652 (61%) | 76% | 78% | 211,546 (78%) | 96% |
| Timor-Leste | 464 | Not available | 203 (-) | 173 (37%) | Not available | Not available | Not available | Not available |

*[Progress towards the 90-90-90 targets in nine countries in the South-East Asia Region in 2014]*

These numbers are probably overestimated in some countries since the duplications and deaths could not be removed from the cumulative HIV cases ever diagnosed. Fewer PLHIV are aware of their HIV status in countries prioritizing testing by geography and for high-risk populations. PLHIV on ART as a percentage of those diagnosed (second 90) is below 50% in all countries except Thailand (which recommends treatment for all). Even though these countries have adopted the 2013 WHO treatment recommendations, implementation is lagging far behind. Once PLHIV are on ART, 12-month retention rates are high in all countries. Limited available data show high VL suppression among PLHIV on ART (third 90) in three countries. But the above estimates are calculated using 'PLHIV on ART who have received a viral load test' as the denominator, a number that is low in countries due to limited availability of VL testing.
**Conclusions:** Except Thailand, none of the countries in the region are on track to achieve the 90-90-90 targets. Innovative HIV testing strategies and improved access to ART and VL services are urgently required. Also, countries need to strengthen their information management systems for monitoring the progress towards these targets.

## WEPEC191

### CHANGES IN ENGAGEMENT IN THE CARE CASCADE AFTER INTENSIFIED PROGRAMMING INCLUDING COMMUNITY MOBILIZATION OF FEMALE SEX WORKERS IN ZIMBABWE

X. Acharya[1], E. Fearon[1], J. Dirawo[2,3], M. Muzambi[3], S. Mtetwa[2,3], C. Davey[1], R. Wong-Gruenwald[4], T. Ndikudze[4], S. Chidiya[5], D. Hanisch[5], J. Busza[6], J. Hargreaves[7], F. Cowan[2,3,8]
*[1]London School of Hygiene and Tropical Medicine, Social and Environmental Health Research, London, United Kingdom, [2]Zimbabwe AIDS Prevention Project Trust, Harare, Zimbabwe, [3]Centre for Sexual Health and HIV/AIDS Research (CeSHHAR), Harare, Zimbabwe, [4]Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ) GmbH, Bonn, Germany, [5]United Nations Population Fund (UNFPA), Harare, Zimbabwe, [6]London School of Hygiene and Tropical Medicine, Department of Population Health, London, United Kingdom, [7]London School of Hygiene and Tropical Medicine, SEHR, London, United Kingdom, [8]University College London, London, United Kingdom*
*Presenting author email: james.hargreaves@lshtm.ac.uk*

**Background:** Female sex workers (FSW) face numerous barriers to health seeking. Targeted HIV services, community mobilization, and training health care workers to reduce stigma and discrimination may improve engagement in the care cascade. We present results from two respondent driven sampling (RDS) surveys conducted in 3 sites in Zimbabwe before and after the implementation of the *Sisters with a Voice* intervention, which included enhanced community mobilization.
**Methods:** We conducted RDS surveys in Mutare, Hwange and Victoria Falls in 2011 and 2015 among women FSW aged ≥18 years, using identical methodology. In 2011, 370, 237 and 229 FSWs were recruited in Mutare, Hwange, and Victoria Falls over six waves of recruitment. In 2015, 407, 255 and 251 FSWs were recruited. We calculated RDS-I weighted prevalence for each stage of the HIV care cascade and sociodemographic variables as shown in Table 1. We compared indicators from 2011 and 2015 to understand whether engagement with care among FSW had changed over this period.
**Results:** HIV prevalence in Mutare was increased, prevalence decreased in the other two sites. Engagement in prevention and care increased between 2011 and 2015, as summarized in Table 1.

| Cascade Variables | Hwange | | Mutare | | Victoria Falls | |
|---|---|---|---|---|---|---|
| | 2011 (N = 233) | 2015 (N = 251) | 2011 (N = 338) | 2015 (N = 400) | 2011 (N = 229) | 2015 (N = 243) |
| | RDS% | RDS% | RDS% | RDS% | RDS% | RDS% |
| HIV Prevalence | 50.6 | 41.3 | 50.6 | 63.7 | 69.6 | 62.1 |
| Negative and tested in last 6 months | 16.9 | 57.2 | 17.5 | 44.9 | 5.5 | 33.7 |
| Negative but not tested in last 6 months | 31.3 | 16.3 | 30.5 | 11.8 | 24.4 | 12.2 |
| Positive, aware of status and on ART | 14.8 | 20.4 | 19.5 | 38.6 | 17.6 | 46.8 |
| Positive, aware of status and not on ART | 11.6 | 6.1 | 5.9 | 4.6 | 16.7 | 7.2 |
| Positive, never tested/collected test results | 25.4 | 0.0 | 26.4 | 0.1 | 35.8 | 0.0 |

*[Table 1: Comparison between 2011 and 2015 cascade indicators collected during RDS surveys in three sites in Zimbabwe]*

Other differences between surveys include higher age of FSWs, higher median age at first commercial sex, and increased number of commercial sex partners in the past week in 2015 compared to 2011.

**Conclusions:** While it is difficult to attribute improvements in prevention and care due to program intervention alone, this was likely partly due to engagement with the program. Reaching FSW with effective HIV prevention and care will be key to reaching 90:90:90 in southern Africa and beyond.

## WEPEC192

### HIV TREATMENT CASCADE IN UKRAINE: A CROSS-SECTIONAL ANALYSIS OF REGIONAL PATTERNS IN 2015

Y. Sereda[1], M. Nikolko[2], I. Shvab[3]
*[1]Independent Researcher, Kiev, Ukraine, [2]USAID RESPOND Project, FHI360, Kiev, Ukraine, [3]USAID RESPOND Project, Pact Inc, Kiev, Ukraine*
*Presenting author email: mnikolko@fhi360.org*

**Background:** HIV treatment cascade is widely used tool to monitor gaps from diagnosis to viral suppression. We conducted this study to investigate heterogeneity in the cascade for people living with HIV (PLH) across 8 HIV high burden regions in Ukraine and their correspondence to the Fast-Track milestones.
**Methods:** As of 01/01/2015, data from regional routine HIV/AIDS surveillance and Spectrum were pooled together for this analysis. Following categories of care were measured: 1) estimated number of PLH; 2) HIV diagnosed; 3) enrolled in care; 4) retained in care as a number of PLH who received a clinical examination at least once within 12 months; 5) on ART; 6) undetected viral load as an estimated number of PLH who are on ART 6 months and more and have viral load less than 40 RNA copies/mL.
**Results:** In Ukraine, 59% of the estimated number of PLH in the country are diagnosed and enrolled in care. 48% of those are on ART, which represents only 28% of the PLH population. 78% of those on ART or 22% of the total PLH population have undetected viral load. Results demonstrate significant differences across regions in the extent of gaps along HIV care continuum. Proportion of diagnosed PLH ranges from 33 to 63% of the estimated number of PLH in the region. Proportion of PLH on ART varies from 14 to 33%. While over three quarters of those on ART have undetected viral load in all selected regions, only 14-25% of the estimated PLH population are virally suppressed.
**Conclusions:** Although the extent of losses along the HIV treatment cascade differs across regions in Ukraine, all regional programs must prioritize enrollment in HIV care and earlier ART eligibility. Improvement of regional cascade estimates requires data quality strengthening, such as approving indicators needed to develop cascades for PLH with regional stakeholders, validating regional PLH population size estimates and introducing a standardized electronic tracking system of HIV infected patients.

## WEPEC193

### PLACE OF DEATH: AN 11 COUNTRY, 4 CONTINENT COMPARISON FOR PEOPLE DYING OF HIV-RELATED CAUSES USING ROUTINE DEATH CERTIFICATION DATA

R. Harding[1], C. Hakanson[2], B. Onwuteaka-Philipsen[3], D. Wilson[4], M. Cardenas-Turanzas[5], Y. Rhee[6], K. Hunt[7], D. Houttekier[8], L. Deliens[8], J. Cohen[8]
*[1]Cicely Saunders Institute, Hove, United Kingdom, [2]Ersta Skondal University College, Stockholm, Sweden, [3]Vrije University, Amsterdam, Netherlands, [4]University of Alberta, Edmonton, Canada, [5]University of Texas, Houston, United States, [6]Dongduk Women's University, Seoul, Republic of Korea, [7]Southampton University, Southampton, United Kingdom, [8]Vrije Universiteit Brussels, Brussels, Belgium*
*Presenting author email: richard.harding@kcl.ac.uk*

**Background:** People continue to die with HIV Despite ART, with 1.2 million HIV-related deaths in 2012. Place of death is an important indicator of quality, and identifies where adequate resources must be provided to ensure high quality care at the end of life to reduce avoidable suffering. This study aimed to determine place of death, and associated patient and health system factors, in 11 countries across 4 continents.
**Methods:** International Place of Death (IPoD) study, collected death certificate data for one year in countries with ART coverage of at least 80%, and palliative care provision according to WHO (Belgium Canada, France, Italy, Korea, Mexico, Netherlands, Spain, Sweden, UK, USA). Data included place of death, age, sex, regional urbanization level and healthcare supply. Home death risk ratios (relative risks) and multivariable models of predictors were calculated.
**Results:** 19,739 HIV-related deaths were reported, accounting for 3.5% of all deaths. The highest proportion (per 1000 deaths) of HIV-related deaths was for Mexico (9.8), and the lowest for Sweden (0.2). The vast majority were men (75%) aged 0-49 (69.1%). Hospital was the most common place of death (56.6% Netherlands, 90.9% Korea) (see Table 2). The least common places were palliative care institution (3.3%-5.7%), nursing home (0%-17.6%) and home (5.9%-26.3%). Compared with age-standardized distribution of cancer patients, HIV patients were consistently less likely to die at home, more likely to die in hospitals and also more likely to die in a nursing home. Living in a region with a higher number of hospital beds reduced the chances of dying at home in Italy and Mexico and living in an area with a higher number of general practitioners increased the chances of dying at home in the UK and in Mexico (but reduced them in the USA).
**Conclusions:** The place of death for people with HIV is more likely to be hospital compared to data for all other incurable conditions. This may be due to lack of community resources, social isolation or unpredictability of death. However, clinical research effort is urgently needed to evaluate the quality of hospital terminal care for people with HIV.

# REPRODUCTIVE CHOICES AND INTERVENTIONS FOR WOMEN (INCLUDING SERODISCORDANT COUPLES)

## WEPEC194

### HIGH PREGNANCY INCIDENCE AND LOW CONTRACEPTIVE USE AMONG FEMALE ENTERTAINMENT AND SEX WORKERS IN PHNOM PENH, CAMBODIA: NEED FOR PRIORITIZATION OF SEXUAL AND REPRODUCTIVE HEALTH SERVICES

P. Duff[1,2,3], J.L. Evans[4], E.S. Stein[4], K. Page[4,5], L. Maher[2], Young Women's Health Study Collaborative (John Kaldor, Serey Phal Kien, Joel Palefsky, Vonthanak Sapphon, Mean Chhi Vun)
*[1]British Columbia Centre for Excellence in HIV/AIDS, St. Paul's Hospital, Vancouver, Canada, [2]Kirby Institute for Infection and Immunity (formerly the National Centre in HIV Epidemiology and Clinical Research), University of New South Wales, Sydney, Australia, [3]University of British Columbia, Department of Medicine, Vancouver, Canada, [4]Institute for Global Health, University of California-San Francisco, Department of Epidemiology, San Francisco, United States, [5]University of New Mexico Health Sciences Center, Division of Epidemiology, Biostatistics and Preventive Medicine, Department of Internal Medicine, Albuquerque, United States*

**Background:** While HIV and unintended pregnancy are occupational risks inherent to sex work, few studies have examined pregnancy incidence or reproductive need among this population. Indeed, research on the strategies utilized to prevent pregnancy among female entertainment and sex workers (FESW) in Cambodia is limited. This study therefore examined the correlates of pregnancy incidence as well as the HIV and pregnancy prevention methods of Cambodian FESWs, working in Phnom Penh.
**Methods:** Data were obtained from the Young Women's Health Study (YWHS)-2, a 12-month prospective cohort of 220 FESWs, aged 15-29 years. Interviewer-administered surveys were conducted at baseline and every three months from 2009-2010. A project clinician collected biological samples to test for HIV/STI, illicit drug use and pregnancy. Correlates of incident pregnancy were examined using bivariate and multivariable extended Cox regression analysis.
**Results:** In total, 204 FESWs were eligible for this analysis, with the majority (60.3%) of participants between the ages of 25-29. Pregnancy incidence was high (22/100py), as were indicators of unmet reproductive health need: at baseline, only 10.8% reported use of hormonal contraceptives, and 11.3% had an abortion in the last three months. Condom use (at last sex) by non-paying partners was much lower than condom use by last client (14.9% vs. 90.0%). In multivariable analysis, younger age (19-24 years versus 25-29 years) (Adjusted Hazards Ratio (AHR): 2.28; 95% Confidence Interval (CI) 1.22-4.27), lower monthly income (400,000-600,000 Riel (< $150 US) versus >600,000 Riel (>$150 US)) (AHR 2.63; 95%CI 1.02-6.77) and self-reported condom self-efficacy (AHR 0.89; 95%CI 0.81-0.98) were independently associated with incident pregnancy ($p < 0.05$).
**Conclusions:** Our results indicate high incidence of pregnancy and unmet reproductive and sexual health needs among FESWs in Cambodia. These findings suggest the need for multi-level interventions, including venue-based HIV/STI prevention interventions, in the context of legal and policy reform. The high pregnancy incidence in this population may also undermine HIV prevention intervention trials. Together these data support the exploration of innovative, comprehensive sex worker-specific sexual and reproductive health service models, including as part of HIV prevention trials.

## WEPEC195

### USE OF HIV PRE-EXPOSURE PROPHYLAXIS DURING PREGNANCY AND LACTATION AT 2 U.S. CENTERS

D. Seidman[1], S. Weber[2], K. Oza[2], E. Mullins[3], M.T. Timoney[4], R. Wright[5,6]
*[1]University of California, Obstetrics, Gynecology and Reproductive Sciences, San Francisco, United States, [2]University of California, HIVE, San Francisco, United States, [3]University of California, San Francisco, United States, [4]Bronx Lebanon Hospital Center, New York City, United States, [5]Albert Einstein College of Medicine, New York City, United States, [6]Montefiore Medical Center, New York City, United States*
*Presenting author email: shannon.weber@ucsf.edu*

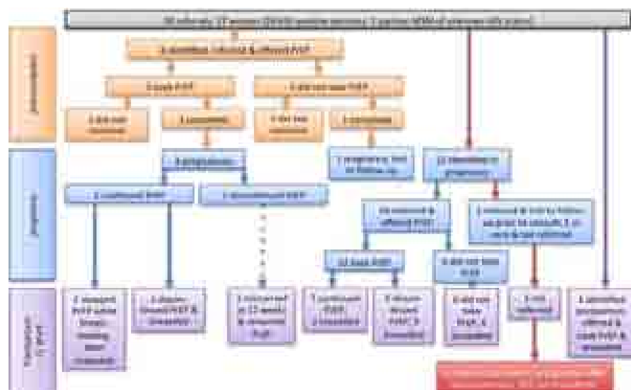
**Background:** HIV acquisition during pregnancy and lactation is associated with increased perinatal transmission. No studies report pre-exposure prophylaxis (PrEP) use after 7 weeks gestation or in lactation. We describe PrEP use in and around pregnancy to highlight implementation challenges and prompt future study.

**Description:** Two United States (U.S.) centers began offering PrEP during pregnancy in 2010 at specialty clinics for women living with HIV. Chart review was performed on women at high-risk for HIV acquisition pre-conception, during pregnancy and lactation at these centers from 2010-2015.

**Lessons learned:** 27 women and 30 referrals (3 repeat pregnancies) were identified. 26 women had an HIV-infected partner, 73% (19/26) of whom were on treatment, and 42% (11/26) of whom were virally suppressed. 39% (10/26) of partners had known detectable virus and 23% (6/26) had unknown viral loads.

The median time from identification to consultation was 30 days (IQR 2-62). Two women were lost to follow-up before consultation. One woman identified was not referred in the setting of multiple pregnancy complications. She remained in care and was HIV-negative at delivery, but was lost to follow-up until 10 months postpartum when she was diagnosed with HIV. Her infant was not infected. No other sero-conversions were identified.

In 70% (21/30) of referrals, women were pregnant at consultation; none received safer-conception counseling. Of referrals who were offered PrEP, 67% (18/27) chose to take PrEP. Median length of time on PrEP was 30 weeks (IQR 20-53). No PrEP-related pregnancy complications were identified. 57% (13/23) of women in care at delivery did not follow up postpartum.



*[Figure. Women identified as at substantial risk of HIV acquisition pre-conception, during pregnancy and postpartum at 2 U.S. centers]*

**Conclusions/Next steps:** When offered pre-conception, during pregnancy and lactation, U.S. women frequently chose to use PrEP. Further research and education are needed to close gaps in care linkage, offering women safe and effective HIV prevention methods in and around pregnancy. The postpartum period is particularly vulnerable to loss to follow-up.

## WEPEC196

### A POPULATION OF PREGNANT SOUTH AFRICAN MOTHERS LIVING WITH HIV (MLH), MOTHERS WITHOUT HIV (MWOH) AND THEIR CHILDREN OVER THE FIRST THREE YEARS OF LIFE

M.J. Rotheram[1], M. Tomlinson[2], I. Le Roux[3], S. Skeen[2], S. Comulada[1]
*[1]UCLA, Psychiatry & Biobehavioral Sciences, Los Angeles, United States, [2]Stellenbosch University, Psychology, Stellenbosch, South Africa, [3]Philani Maternal, Child Health and Nutrition Project, Cape Town, South Africa*
*Presenting author email: mrotheram@mednet.ucla.edu*

**Background:** Most attention on mothers with HIV (MLH) focuses on the perinatal period to ensure that their children are not born seropositive or become seropositive in the first six months of life. However, MLH face life-long health, mental health, and relationship challenges. This study recruited a population cohort of pregnant mothers in 12 township neighborhoods of Cape Town, South Africa and followed the families through three years post-birth. We compare the MLH and their children to mothers without HIV (MWOH) and their children over time.

**Methods:** Pregnant women in 12 Cape Town, South Africa neighborhoods (N=584) were recruited: 98% were assessed in pregnancy, 92% within two weeks post-birth, 88% at 6 months, 84% at 18 months, and 86% three years post-birth. There were 186 MLH and 398 MWOH. Child and maternal outcomes were monitored (controlling for neighborhood and repeated measures), and contrasted over time using longitudinal random effects regression analyses and, for measures collected once, with multiple regressions.

**Results:** Only 4.8% of MLH's children were seropositive; these were excluded from additional analyses. Children of MLH and MWOH died at similar rates (8.5%) and were similar in social and behavioral adjustment, vocabulary, and executive functioning at three years of age. Children of MLH tended to be significantly (p< .10) shorter, over time, had lower height-for-age Z scores (were more likely to be stunted) and were also hospitalized more often than children of MWOH. These outcomes emerged in households in which pregnant MLH were more disadvantaged compared to MWOH (less income, more informal housing, more food insecurity, depression, and alcohol use). MLH were significantly more depressed over time than MWOH, but were similar in other risks over time. MLH did not take care of their own health after pregnancy. Three years post-birth, only 62% had re-engaged in HIV care. Those MLH who did go to care received ARV.

**Conclusions:** Only the physical health of children of MLH is compromised, compared to children of MWOH-- social, behavioral, language, and cognitive functioning appear similar. Similar to global patterns, MLH face far more challenges than peers in the same neighborhoods.

## WEPEC197

### DUAL CONTRACEPTIVE USE AMONG WOMEN LIVING WITH HIV IN CANADA: POTENTIAL FOR WOMEN-CENTRED HIV CARE DELIVERY MODELS

A. Kaida[1], S. Patterson[1,2], A. Carter[1,2], E. Ding[2], P. Sereda[2], K. Salters[1,2], K. Webster[1], M. Desbiens[3], D. Dubuc[4], G. Ogilvie[5,6], N. Pick[7,8], M. Kestler[7,8], A. de Pokomandy[4,9], M. Loutfy[3,10], on behalf of the CHIWOS Research Team
*[1]Simon Fraser University, Faculty of Health Sciences, Vancouver, Canada, [2]British Columbia Centre for Excellence in HIV/AIDS, Vancouver, Canada, [3]Women's College Research Institute, Women's College Hospital, Toronto, Canada, [4]McGill University, Department of Family Medicine, Montreal, Canada, [5]BC Women's Hospital and Health Centre, Vancouver, Canada, [6]Faculty of Medicine, University of British Columbia, Vancouver, Canada, [7]Oak Tree Clinic, BC Women's Health Centre, Vancouver, Canada, [8]Division of Infectious Diseases, Department of Medicine, University of British Columbia, Vancouver, Canada, [9]Chronic Viral Illness Service, McGill University Health Centre, Montreal, Canada, [10]University of Toronto, Department of Medicine and Institute of Health Policy, Management and Evaluation, Toronto, Canada*
*Presenting author email: angelakaida@gmail.com*

**Background:** WHO guidelines recommend dual contraception for women living with HIV (WLWH) to prevent unintended pregnancy and HIV transmission. We examined the prevalence and correlates of dual contraceptive use among Canadian WLWH.

**Methods:** We analysed baseline survey data from the Canadian HIV Women's Sexual and Reproductive Health Cohort Study (CHIWOS), a multi-site community-based research study with 1,425 WLWH enrolled. Analyses were restricted to pre-menopausal, non-pregnant, cis-gender women aged 16-49, who reported consensual sexual activity within 6 months before interview. Dual contraceptive use was defined as consistent condom use with another effective contraceptive method (IUD/IUS, hormonal, or permanent). Multivariable logistic regression examined independent correlates of dual contraceptive use. With accumulating evidence that sexual HIV transmission risk approaches zero with sustained HIV viral suppression, we also explored the prevalence of dual contraceptive use applying an alternative definition: use of an IUD/IUS, hormonal, or permanent method in addition to ***either*** consistent condom use ***or*** viral suppression (< 50 copies/mL).

**Results:** 453 participants (32% of total enrolled) were included. Median age was 38 (IQR: 33,43), 23% identified as Indigenous, 31% African, Caribbean, or Black, and 41% White. 88% were heterosexual and 50% reported no pregnancy intentions. At interview, 78% were receiving antiretroviral therapy, 74% self-reported viral suppression, and 51% self-reported receipt of women-centred HIV care (WCHC). Of those with ≥1 regular sexual partner (n=418), 66% had HIV-negative and 8% had HIV status-unknown partners. By mutually exclusive categories, 18% of women used dual contraception, 27% barrier methods, 13% permanent methods, 8% hormonal methods, 6% IUD/IUS, and 27% did not use effective contraception. Women reporting receipt of WCHC had significantly higher adjusted odds of using dual contraception (aOR: 3.13; 95%CI: 1.23-8.13). When the definition of dual contraception was expanded to include viral suppression, prevalence increased to 40%.

**Conclusions:** Fewer than one-fifth of sexually-active WLWH in this study used dual contraception. Associations with receipt of WCHC suggest the potential of this HIV care model to improve dual contraceptive uptake and sexual and reproductive

health outcomes. Use of effective contraceptive methods with viral suppression may offer women an alternative dual contraception strategy to prevent unintended pregnancy and minimize HIV transmission, without condoms.

## STI CONTROL TO PREVENT HIV TRANSMISSION

### WEPEC198

### ANAL DOUCHING AND SHARING DOUCHING EQUIPMENT ARE NOT ASSOCIATED WITH ANORECTAL STIS: A CROSS SECTIONAL STUDY AMONG MSM AT THE STI CLINIC AMSTERDAM, THE NETHERLANDS

R. Achterbergh[1], J. van der Helm[1], W. van den Boom[1], T. Heijman[1], I. Stolte[1], M. van Rooijen[1], H. de Vries[1,2]
*[1]Public Health Service Amsterdam, Amsterdam, Netherlands, [2]Academic Medical Center, Dermatology, Amsterdam, Netherlands*
*Presenting author email: rachterbergh@ggd.amsterdam.nl*

**Background:** Men who have sex with men (MSM) are at high risk for anorectal sexual transmitted infections (STIs). Many MSM use anal douches in preparation for sex, which might break down the mucosal barrier function and facilitate the acquisition of STI pathogens. If shared, contaminated douching equipment itself could also be a transmission route. We determined whether anal douching and sharing douching equipment were associated with STI.
**Methods:** In a cross-sectional study among 994 consecutive MSM attending the STI outpatient clinic of Amsterdam between February and April 2011 we collected data on anal douching, sexual behaviour and STI. We used multivariable logistic analysis to determine the association between anal douching and sharing douching equipment and acquiring anorectal STI, after adjusting for high risk behaviour, i.e. age, ethnicity, condom use, number of partners, HIV-status and sexual position (top, bottom, versatile or no anal sex) .
**Results:** The prevalence of anal douching was 46% (n=460) of which 25% (n=117) shared douching equipment. In 12%(n=123) syphilis and/or anorectal infections with non-LGV chlamydia, lymphogranuloma venereum and/or gonorrhoea were found. In univariable analysis anal douching (OR 2.7, 95%-CI 1.7-4.1, p< 0.001)) and sharing douching equipment (OR 4.3, 95%-CI 2.5-7.3, P< 0.001) were significantly associated with anorectal STI. In multivariable analysis these associations were no longer statistically significant (aOR 1.3, 95%-CI 0.8-2.2, and respectively aOR 1.9, 95%-CI 1.0-3.6, p=0.14).
However in this multivariable model HIV-positivity (p< 0.001), younger age (p=0.007) and receptive anal intercourse (p=0.011) were significantly associated with anorectal STIs.
**Conclusions:** Almost half of MSM in our study sample use anal douching and a quarter of those MSM share douching equipment. Yet, after correcting for high-risk sexual behaviour such as condom use, number of partners, HIV-status, age and sexual position, anal douching and sharing douching equipment does not appear to contribute to the acquisition of anorectal bacterial STI or syphilis.

### WEPEC199

### TAKING SERVICES TO THE COMMUNITY: A CASE OF FEMALE SEX WORKERS

K. Francis
*Nkaikela Youth Group, Programmes, Tlokweng, Botswana*
*Presenting author email: kebalepile@nyg.org.bw*

**Background:** It has been shown that enrolling clients early on ARV's has a greater impact of reducing the viral load and thereby reducing the transmission of HIV.
NYG partnered with Management Sciences for Health, with funding from USAID for a programme aimed at providing adequate access to Health services for Female sex workers. A test and treat approach was used for the project..
Its main objectives were to increase access to HIV prevention services for female sex workers (FSWs), increase access to HIV counselling and treatment services, and cervical cancer screening, and promote HIV prevention behaviours among FSWs with a strong focus on correct and consistent use of condoms.
**Description:** Implementation took place in Tlokweng, Botswana,. A peer education model was employed to recruit female sex workers to participate in the programme. Up to 474 clients were successfully mobilized. Health services were made available at NYG centre. An active referral system was put in place to ensure high involvement.
**Lessons learned:** The tablebelow represents referrals for different health services among female sex for the period January - June 2015.

| | HCT HCT | | STI | STI | TB | TB | CERVICAL CANCER | CERVICAL CANCER | ART |
|---|---|---|---|---|---|---|---|---|---|
| | NEW | REPEAT | NEW | REPEAT | NEW | REPEAT | NEW | REPEAT | NEW |
| JANUARY | 64 | 0 | 56 | 1 | 51 | 2 | 44 | 0 | 0 |
| FEBRUARY | 67 | 6 | 84 | 11 | 84 | 11 | 31 | 0 | 0 |
| MARCH | 71 | 3 | 97 | 14 | 82 | 12 | 2 | 0 | 16 |
| APRIL | 37 | 2 | 57 | 5 | 41 | 3 | 9 | 0 | 6 |
| MAY | 37 | 9 | 63 | 13 | 50 | 8 | 24 | 0 | 2 |
| JUNE | 20 | 0 | 38 | 1 | 32 | 0 | 4 | 0 | 0 |
| TOTAL | 296 | 20 | 395 | 45 | 340 | 36 | 114 | 0 | 24 |

*[Referrals for Health service]*

**Conclusions/Next steps:** There is significantly low number of clients enrolled in ATR over this period, suggesting that female sex workers need a lot of attention to enable them to enrol on ARV's. A good number of clients monitoring their CD4 count declined the test and treat initiative as they felt it was not necessary.
Despite a programme that included investment in condom promotion, there are so many cases of Sexually Transmitted Infections, which refutes recent studies showing increased condom use among female sex workers.

## MALE AND FEMALE CONDOMS AND OTHER PHYSICAL BARRIERS

### WEPEC200

### WHO HAS HEARD OF OR EVER USED THE FEMALE CONDOM IN SOUTH AFRICA? THE NATIONAL FEMALE CONDOM EVALUATION IN SOUTH AFRICA

M.E. Beksinska[1], P. Nkosi[1], M. Kubeka[1], L. Phungula[1], J.A. Smit[1], Z. Mabude[1], J. Mantell[2], E. Marumo[3], T. Chidarikire[3]
*[1]MatCH Research, A Division of Wits Health Consortium, Durban, South Africa,*
*[2]Columbia University Medical Center, Columbia Psychiatry, New York, United States,*
*[3]National Department of Health, National HIV and AIDS and TB Unit, Pretoria, South Africa*
*Presenting author email: mbeksinska@matchresearch.co.za*

**Background:** South Africa (SA) has one of the largest and best-established, public-sector male and female condom (MC and FC) programmes world-wide. We are conducting the first comprehensive multi-method evaluation of the SA FC programme since FCs were introduced into SA in 1999. The primary objective of the evaluation is to describe and evaluate approaches used in the national SA FC programme and, identify predictors of FC uptake and continued use.
**Methods:** The existing National STI sentinel site surveillance sample of approximately thirty sites per province was used for this study and includes rural and urban primary health care facilities, Community health centres, mobiles and hospitals. Additionally a sample of non-public sector sites- tertiary education, NGOs, social marketing and sector (≈ 30) were included. As one component of the evaluation, we are conducting an anonymous with men and women in a sub-sample of approximately 50% of the sentinel sites and all non public. The anonymous survey asks facility clients if they have ever heard of or used FCs, whether they know they are available, and if they have been offered FCs at the facility they are attending.
**Results:** A total of 1662 surveys have been completed at 45 facilities to date. Of the 879 currently analysed, similar percentages of women (82.2%) and men (83.5%) have ever heard of FCs. However, only about two-thirds knew they were available at the facility where they completed the survey, even though all facilities surveyed had distributed FCs at some time and 92% were currently distributing them. Overall 14.7% have ever used a FC, and of these, two-thirds (65.4%) had used them for dual protection (pregnancy and STI/HIV prevention). Nearly two-fifths (37%) had ever been offered a FC in the facility they were attending, but this varied widely between facilities, ranging from < 10% to 80%. Knowledge and ever use by clients varied considerably across facilities.
**Conclusions:** Although FCs are widely available through the public and non-public sectors, clients are still not fully informed of their availability. Nevertheless, knowledge and ever use of FCs has increased compared to previous national HIV surveys.

## WEPEC201

### SILCS DIAPHRAGM AS A MULTIPURPOSE PREVENTION TECHNOLOGY: AN ACCEPTABILITY STUDY COMPARING SILCS AND STANDARD APPLICATORS TO DELIVER VAGINAL GEL IN DURBAN, SOUTH AFRICA

M.E. Beksinska[1], J.A. Smit[1], B. Maphumulo[1], R. Greener[1], N. Mphili[1], J. Foster[2], M. Kilbourne-Brook[2]
*[1]MatCH Research, A Division of Wits Health Consortium, Durban, South Africa, [2]PATH, Seattle, United States*
*Presenting author email: mbeksinska@matchresearch.co.za*

**Background:** The SILCS Diaphragm is a reusable barrier contraceptive developed to be easy to use and comfortable for both partners. The single-size design eliminates the need for an exam to determine diaphragm size. Researchers are assessing the SILCS Diaphragm as a low-cost, reusable delivery system for microbicide gel to protect from both unintended pregnancy and HIV/STIs, thus serving as a multipurpose prevention technology (MPT). This study assessed acceptability and preference for the SILCS Diaphragm for gel delivery compared to gel delivery from a prefilled applicator.

**Methods:** A randomized, crossover study among women aged 18-45 in Durban, South Africa, with data collected via coital logs, questionnaires, and focus group discussions. Women used each method during five separate sex acts. Acceptability and preference endpoints were summarized using means and medians (for continuous measures) and frequencies and percentages (for discrete outcomes). Acceptability—ranked on a 5-point scale—compared both gel delivery scenarios using Friedman's test.

**Results:** A total of 116 women were screened, 115 enrolled and 106 (92%) completed the study. Almost all women (88.3%) spent three minutes or less applying gel and inserting the SILCS. Around half of women found inserting the SILCS, checking its placement and knowing it was in the correct place, somewhat or very easy. Less than 4% found any of these procedures difficult. Gel leakage was found to be less acceptable in the gel applied by applicator compared to applied by SILCS. Slightly more women reported applicator/gel was "very acceptable" (68%) compared to SILCS and gel (60%).

68% were interested in using SILCS plus gel if it could protect from *both* unintended pregnancy and HIV, compared to 18% of women who would use SILCS for pregnancy prevention and 14% who would use a microbicide gel for HIV prevention.

**Conclusions:** This study expands knowledge about South African women's experience with the SILCS Diaphragm as a potential MPT. Results confirm that women can easily learn to use the SILCS Diaphragm, find it comfortable; and experience of sex for both partners is acceptable. The benefit of using the SILCS Diaphragm and microbicide gel as a potential MPT greatly increased women's interest in using this method.

## WEPEC202

### FACTORS ASSOCIATED WITH CONDOM USE AMONG MEN AND WOMEN LIVING WITH HIV IN LILONGWE, MALAWI

L. Haddad[1], J.H. Tang[2,3], J. Krashin[3], W. Ng'ambi[4], H. Tweya[4], B. Samala[4], J. Chiwoko[4], T. Chaweza[4], M. Hosseinipour[2], E. Lathrop[1], D. Jamieson[1], S. Phiri[4,5]
*[1]Emory University School of Medicine, Department of Gynecology and Obstetrics, Atlanta, United States, [2]UNC Project Malawi, Lilongwe, Malawi, [3]University of North Caroline School of Medicine, Department of Obstetrics and Gynecology, Chapel Hill, United States, [4]Lighthouse Trust, Lilongwe, Malawi, [5]University of North Caroline School of Medicine, Department of Medicine, Chapel Hill, United States*
*Presenting author email: lbhadda@emory.edu*

**Background:** Understanding the influences that affect condom use is a critical step towards tailoring STI/HIV prevention efforts. We aim to identify factors associated with self-reported condom use among HIV-infected individuals in Lilongwe, Malawi.

**Methods:** This is a cross-sectional analysis of 220 men and 254 women who were HIV-infected and sexually active within the past 6 months. The participants completed surveys at one of two HIV clinics in Lilongwe from September to December 2013. Multivariate logistic regression models evaluated associations between potential predictors of consistent condom use over the past 1-month (CCU) and use at last coitus (ULC).

**Results:** Among women: 37% and 55% reported CCU and ULC, respectively. Decreased CCU was associated with desire for future children (aOR 0.41 (0.20, 0.82)), coital frequency (>1x/week (aOR 0.45 (0.23, 0.87)), and making decisions alone about condom use (aOR 0.27 (0.13, 0.60), whereas increased CCU was associated with the ability to refuse sex without condoms (aOR 13.13 (6.48, 26.59)). These factors and belief that condoms prevent HIV transmission (aOR 3.35 (1.10, 10.24)) were also associated with ULC. Among men: 51% and 69% reported CCU and ULC, respectively. Decreased CCU was associated with desire for future children (aOR 0.38 (0.18, 0.79)) and alcohol or drug use during coitus (aOR 0.45 (0.22, 0.91)), whereas increased CCU was associated with ability to refuse sex without condoms (aOR 5.77 (2.70, 12.34)) and belief in need for condom use with other contraceptives (aOR 4.79 (2.12, 10.85)). Decreased ULC was associated with coital frequency >1x/week (aOR 0.47 (0.24, 0.91)), whereas increased ULC was associated with ability to refuse sex without condoms (aOR 6.53 (3.33, 12.80) and belief in need for condom use with other contraceptives (aOR 2.65 (1.23, 5.72)).

**Conclusions:** Our study highlights the need to improve condom utilization among HIV-infected individuals. While different factors are associated with condom use among men and women, the ability to refuse sex without condoms was the strongest predictor of CCU and ULC for both groups. Importantly, antiretroviral therapy and contraceptive use do not deter condom use. Promotion of joint decision-making and empowerment within a relationship are important steps towards improving condom utilization.

## WEPEC203

### PREFERENCE FOR VARIETY OF CONDOM TYPES IN A COHORT OF SOUTH AFRICAN MSM FROM PORT ELIZABETH AND CAPE TOWN

T. Sanchez[1], A. Siegler[1], L.-G. Bekker[2], P. Sullivan[1], S. Baral[3], K. Dominguez[2], R. Kearns[1], A.D. McNaghten[1], C. Yah[4], R. Zhan[1], R. Phaswanamafuya[4]
*[1]Emory University, Atlanta, United States, [2]Demond Tutu HIV Foundation, Cape Town, South Africa, [3]Johns Hopkins University, Baltimore, United States, [4]Human Sciences Research Council of South Africa, Port Elizabeth, South Africa*
*Presenting author email: travis.sanchez@emory.edu*

**Background:** Consistent use of condoms during anal intercourse is a central component of effective comprehensive HIV prevention for men who have sex with men (MSM) and may be impacted by having a choice of condom brands and types. African MSM use of different condom brands/types has not been previously reported and may be useful for prevention organizations planning for increasing condom choices for MSM.

**Methods:** Sibanye Health Project is a 1-year prospective study of combination HIV prevention among MSM and transgender women from Cape Town and Port Elizabeth, South Africa. At baseline, all participants were given a starter package of condoms that contained 7 different types, one being a standard condom (Choice) that is the most commonly available in South Africa. During follow-up, we tracked requests for additional condoms by brand/type and administered condom satisfaction surveys. We describe requests for standard condoms compared to all other varieties overall, and by city and participant baseline HIV status.

**Results:** Through January 2016, we have enrolled 201 participants and conducted 745 follow-up visits. Except for the standard condom, requests for other condom brands-types were common (51-74%) and were similar (all 2-way correlations p< 0.001). The majority of participants requested more condoms of the non-standard varieties (9,824 condoms requested) compared to only 2 requests (11 condoms requested) for standard condoms (Table). The mean satisfaction rating for standard condoms was also lower than for other condoms. Nearly all of those who were HIV-positive have requested additional non-standard condoms.

**Particpants who Requested Additional Condoms at Follow-up Visits by Participants' City and Baseline HIV Status - Sibanye Health Project, 2015-2016**

| **HIV status at baseline visit** | | |
| HIV-negative (N=167) | 143 (86%) | 2 (2%) |
| HIV-positive (N=34) | 33 (97%) | 0 (0%) |
| **Number of condoms requested** | 9,824 | 11 |
| **Mean satisfaction** (N=96)** | 4.3 | 1.8 |

* Condom brand names may be registered trademarks.
** Mean satisfaction was scaled based on 1 = low satisfaction (frown face) to 5 = high satisfaction (smile face).

*[Condom Requests in Sibanye Health Project]*

**Conclusions:** South African MSM in our cohort do not prefer the most commonly available condom brand when given a choice of other types of condoms. Further research is warranted to determine whether condom preferences and access may be associated with more consistent use, but HIV prevention organizations should consider offering other types of condoms now to meet this group's preferences.

## WEPEC204

### WILL HE LET ME USE A FEMALE CONDOM, WILL SEX BE THE SAME? ATTITUDES AND EXPERIENCES OF FEMALE CONDOM USERS ATTENDING SELECTED PUBLIC-SECTOR HEALTH FACILITIES IN KWAZULU-NATAL, SOUTH AFRICA

A.N. Mabude[1], M. Beksinska[1], J.E. Mantell[2,3], P. Nkosi[1], N. Mnguni[1], R. Greener[1], J.A. Smit[1]
*[1]MatCH Research, A Division of Wits Health Consortium Pty (Ltd), Durban, South Africa, [2]Columbia University, HIV Center for Clinical and Behavioral Studies, New York, United States, [3]New York State Psychiatric Institute, HIV Center for Clinical and Behavioral Studies, New York, United States*
*Presenting author email: zmabude@matchresearch.co.za*

**Background:** HIV infection remains a serious threat to women's lives. While the male condom has been the cornerstone of HIV prevention, many women are unable to use it with partners. The female condom (FC), is an effective alternative, but some women face use and partner negotiation challenges. ObjectivesTo assess FC attitudes and use among a cohort of new acceptors and those who last used it >six months ago attending public-sector health facilities.
**Methods:** A longitudinal cohort of 598 women aged 18-45 were enrolled from four public-sector health facilities in KwaZulu -Natal between September 2014- October 2015 and assessed at baseline, 1, 6, and 12-months. We report on baseline and 1- month follow-up results.
**Results:** 513 women completed their one-month follow-up interview. Mean age was 28 years; two-thirds had a regular partner; 17% were married. Prior to enrollment, around a third had ever used the FC for contraception. A majority (91%) reported FC use in the past month. Just over half said their FC experience was positive; 83% experienced no discomfort during sex. Most women (85%) at Month 1 reported their partners were supportive; 81% indicated that partners didn't object to FC use. The majority (85%) at Month 1 strongly agreed that the FC makes sex better compared to 57% at baseline. Almost all women knew that FC offers dual protection. 80% of women at Month 1 felt that FC puts the woman in charge compared to 56% at baseline. Most women (80%) at Month 1 said sex felt good with FC compared to 43% at baseline. Four percent of women at baseline didn't know whether using a FC takes fun out of sex, but by Month 1, 79% reported that FC doesn't take fun out of sex. Over half of women at Month 1 reported their partner's sexual experience was not affected by FC.
**Conclusions:** Women in the cohort found the female condom enhancing their sexual experiences and most reported their partners also supported FC use during sex. Monitoring attitudes and patterns of use at 6 and 12 month follow-up visits will provide key information about the influence of sexual pleasure on continued use.

## HIV TESTING

## WEPEC205

### HIV P24 ANTIGEN AMONG HIV ANTIBODY SERONEGATIVE BLOOD DONORS IN SOUTH-WEST NIGERIA

A.S. Oluremi
*Ladoke Akintola University of Technology, Department of Medical Laboratory Science, Ogbomoso, Nigeria*
*Presenting author email: asoluremi@lautech.edu.ng*

**Background:** Testing of blood donors is carried out majorly using antibody detection kits in Nigeria. These kits detect antibodies to HIV antigens which appear usually later than the p24 antigen. Transmission of HIV through infected blood and its products accounts for approximately 10% in African region.This study was therefore carried out to determine the prevalence of p24 core antigen in blood donors already screened as HIV negative by the antibody detection method.
**Methods:** AA total of 1440 blood samples were collected from regular blood donors from different hospitals in Southwestern Nigeria. Sera from the blood were screened for HIV1 and 2 antibodies by Determine™ HIV-1/2 kit (Abbott Laboratory, IL, USA) and confirmed with the Immuno Comb® II HIV 1/2 (Bispot kit PBS Organics and Israel 2005). Initially HIV antibody seronegative sera were further screened for the presence of HIV 1/2 antibodies and p24 HIV core antigen using ELISA kits (Genscreen ™ ULTRA HIV Ag - Ab). Manufacturer's protocols were strictly followed. Statistical analysis was done using packages within SPSS and P value < 0.005 considered significant.
**Results:** Out of the initial 1440 HIV antibody seronegative sera, 9(0.63%) were positive for the p24 HIV core antigen. There was significant association between the distribution of p24 antigen seropositivity with history of sexually transmitted infection (P=0.000), blood transfusion (P=0.000), and multiple sexual partners (P=0.001).
**Conclusions:** With the prevalence of 0.63% antigenaemia among blood donors in southwestern Nigeria, there is the need for the Nigerian government to urgently adopt WHO blood safety strategies for resource-limited settings and to optimize donor selection and testing algorithm. HIV screening of donors must be based on a combination of antibody-based test and p24 antigen test coupled with a stringent blood donor selection algorithm.

## WEPEC206

### ACCEPTABILITY OF HUMAN IMMUNODEFICIENCY VIRUS SELF-TESTING AS A SCREENING STRATEGY IN BEITBRIDGE DISTRICT, ZIMBABWE, 2015

T.P. Juru[1], M. Tshimanga[1], D. Bangure[1], N. Gombe[1], B.A. Maponga[2], M. Mungati[1]
*[1]University of Zimbabwe, Department of Community Medicine, Harare, Zimbabwe, [2]Provincial Medical Directorate Matabeleland South Province, Bulawayo, Zimbabwe*
*Presenting author email: tsitsijuru@gmail.com*

**Background:** Low uptake of traditional forms of HIV testing and counseling (HTC) remains a primary bottleneck toward universal access to treatment and care in Zimbabwe. In 2014 Beitbridge District, using the facility based HTC, failed to achieve its uptake target by 32%. Zimbabwe is contemplating introducing HIV self-testing (HIV ST) as an alternative to facility based HTC.
Against this background we sought to determine acceptability of, and intention to conduct HIVST in Beitbridge District.
**Methods:** An analytic cross-sectional study using Integrated Behaviour Model (IBM) was conducted. Adults (18-49 years) residing in Beitbridge district were recruited. Data on HIV ST intention were collected using pretested interviewer administered questionnaire. Statistical Package for the Social Sciences (SPSS) 17 was used to conduct exploratory factor analysis and multivariate linear regression to determine independently associated factors with HIV self-testing intention.
**Results:** Of the 289 respondents recruited, 60% were female. The median age was 28 years ($Q_1$= 23; $Q_3$= 34). Eighty per cent (n=243) reported intention to conduct HIV self-testing. About 254 (87.9%) would accept HIV ST if the kits were offered at low cost. Being single (aOR=35.2, p< 0.05), Self- Efficacy (aOR = 4.73, P < 0.05), attitude (aOR=3.59, p< 0.05), and injunctive norm beliefs (aOR=1.76, p< 0.05) independently predicted HIV ST intention. Main motivating factors was privacy n=203 (70%), whilst lack of counseling n=95(33%) was highlighted a possible barrier.
**Conclusions:** HIV self-testing is highly acceptable and preferable if kits are offered at low cost. We recommend piloting of HIV ST and strategies such as telephonic counseling or outreach schedule to address lack of counseling. Research is also required on the sustainability and cost-effectiveness of implementing program at a subsidized cost.

## WEPEC207

### SYSTEMATIC REVIEW ON HIV SELF-TESTING (HIVST) PERFORMANCE AND ACCURACY OF RESULTS

C. Figueroa, C. Johnson, A. Verster, S. Dalal, R. Baggaley
*World Health Organization, HIV Department, Geneva, Switzerland*
*Presenting author email: cheryl.llc@gmail.com*

**Background:** HIVST has potential to increase access to and uptake of HIV testing, particularly among key populations. Many countries have already or plan to introduce HIVST and WHO plans guidance for late-2016. There are, however, concerns about rapid diagnostic tests (RDTs) usability and accuracy when used for HIVST. We will summarize the evidence on HIVST accuracy to inform policy development.
**Methods:** We searched three databases and five HIV conferences abstracts (January 1995-November 2015) for studies assessing diagnostic accuracy and performance of RDTs used for HIVST. Review was restricted to reports with true/false-positive and true/false-negative, used to calculate sensitivity and specificity. We analyzed data by type of specimen collection (oral-fluid or whole-blood), type of support provided and HIV prevalence among study participants. Study results using the same RDT for HIVST were pooled.
**Results:** 15 studies were included. Study QUADAS methodological quality was variable and most studies (n=12/15) used oral-fluid RDTs. HIV prevalence was high (median: 12.6%). HIVST sensitivity (range: 65%-98.8%) and specificity (range: 94.7%-100%) were high. Studies using blood RDTs reported higher sensitivity (96.4%-98.8%) compared to those using oral-fluid RDTs (65%-97.9%). Studies reporting low sensitivity were generally among people with known HIV status and/or using ART, and rural populations with lower literacy. Except for Kurth et al (15.1%), studies using blood RDTs (0.86%-5.71%) had a higher proportion of invalids, compared to studies using oral-fluid RDTs (0.06%-3.35%). Pooled estimates for studies using the same test were similar to manufacturer's indications.

**Conclusions:** Accuracy of RDTs used for HIVST can be high, independent of type of support. Blood RDTs used for HIVST report higher sensitivity, but lead to more invalid results compared with oral-fluid RDTs. Poor sensitivity is related with inappropriate products, poor or no instructions-for-use and the use by people with known HIV status and/or using ART. Policies and regulations should adapt national testing strategies and validate testing algorithms that include HIVST.

[HIV diagnostic test accuracy and characteristics of included studies (n=15)]

## WEPEC208

### ENHANCING ACCESS TO HIV TESTING SERVICE FOR MEN WHO HAVE SEX WITH MEN (MSM) IN LAO PEOPLE'S DEMOCRATIC REPUBLIC (PDR)

B. Philavong[1], U. Kritsanavarin[2], T. Vixaysouk[3], C. Phinsavanh[1], P. Phetvixay[1], W. Kiatchanon[2], K. Duangphachanh[1], D. Xaymounvong[4], K. Banchongphanit[1], B. Jetsawang[2], A. Teeraratkul[2], S. Nookhai[2], A. Sukkul[2], C. Manopaiboon[2], T. Roels[2], M. Martin[2]
*[1]Center for HIV/AIDS/STI, Ministry of Health, Vientiane Capital, Lao People's Democratic Republic, [2]Thailand MOPH - U.S. CDC Collaboration (TUC), CDC, Division of Global HIV/AIDS and TB, Thailand/Asia Regional Office, Nonthaburi, Thailand, [3]World Health Organization (WHO), Western Pacific Region, Vientiane Capital, Lao People's Democratic Republic, [4]Division of Global HIV/AIDS and TB, U.S. CDC-Lao PDR, American Embassy, Vientiane Capital, Lao People's Democratic Republic*
*Presenting author email: pbounpheng@gmail.com*

**Background:** Men who have sex with men (MSM) have a high HIV prevalence in Lao PDR: 5.6% in Vientiane in 2007. The Lao Center for HIV/AIDS/STI, in collaboration with US Centers for Disease Control and Prevention and World Health Organization, have worked since 2009 to strengthen Global Fund-supported MSM prevention programs in Vientiane Capital and Vientiane Province. In 2015, the team introduced additional recruitment strategies and capacity building training to increase access to HIV testing and ensure HIV-infected MSM were linked to care. Here we describe the outcomes of these initiatives.
**Methods:** We conducted MSM target mapping in Vientiane Capital and Province, and training for health care providers and staff of community-based organizations on HIV counseling, program monitoring, and improving the quality of counseling and laboratory services. Monitoring systems were implemented at 13 HIV testing sites (government and a community-based drop-in center) to allow continuous quality improvement. Mobile HIV testing and an incentivized, coupon-based, peer-driven intervention (PDI) were added to expand access to HIV testing using MSM mapping information. HIV-positive MSM were referred to antiretroviral treatment (ART) sites using referral cards and outreach case managers.
**Results:** The number of MSM tested for HIV in Vientiane Capital and Province rose from 98 in 2012 to 1,009 in 2015. Of the 1,009 MSM, 410 (41%) were recruited at the drop-in center, 300 (30%) using PDI; 188 (19%) at mobile clinics; and 111 (11%) at government testing clinics. Overall, 37 (4%) MSM were HIV infected; HIV prevalence was highest among MSM recruited at the government testing clinics (14%). HIV prevalence was < 3% among MSM recruited using PDI at mobile clinics, and at the drop-in center. In Vangvieng District, HIV infection was documented for the first time among 4/33 MSM (12%) who were tested at mobile HIV testing sites. Of the total 37 HIV-positive MSM, 30 (81%) were successfully referred and registered for care at ART sites.
**Conclusions:** We implemented a model that successfully increased HIV testing among MSM. The HIV prevalence in government clinics and Vangvieng District was higher than expected, signaling a need to accelerate HIV interventions among MSM in Laos.

## WEPEC209

### ACCEPTABILITY, FEASIBILITY, AND PREFERENCE FOR HIV SELF-TESTING IN ZIMBABWE

S. Napierala Mavedzenge[1], E. Sibanda[2], Y. Mavengere[2], J. Dirawo[2], K. Hatzold[3], O. Mugurungi[4], N. Padian[5], F. Cowan[2,6]
*[1]RTI International, San Francisco, United States, [2]Centre for Sexual Health and HIV/AIDS Research (CeSHHAR), Harare, Zimbabwe, [3]PSI Zimbabwe, Harare, Zimbabwe, [4]Ministry of Health and Child Care, Harare, Zimbabwe, [5]University of California, Berkeley, United States, [6]University College London, London, United Kingdom*
*Presenting author email: smavedzenge@rti.org*

**Background:** Access to and demand for HIV testing services (HTS) remains inadequate. HIV self-testing (HIVST) may substantially scale-up acceptability and access to testing, addressing many barriers to provider-delivered testing (PDHTS) strategies. We compared the offer of HIVST versus PDHTS in Zimbabwe to examine preferred testing method and characteristics of testers by method.
**Methods:** Outreach teams visited rural and peri-urban communities in advance to promote testing using either PDHTS or HIVST, and inform them of community testing dates. Individuals ≥18 years presenting for testing who had a mobile phone and provided consent were enrolled. A baseline questionnaire was administered and participant phone numbers were registered for follow-up. Those opting for HIVST received a self-test with validated instructions, and were contacted after 2 weeks to complete a telephone questionnaire about their experience.
**Results:** 1000 participants were recruited, 500 from rural and 500 from urban areas. Mean age was 33 years (range 18-74) and 52% were male. 17% of participants had never accessed HTS. Overall, 695 (70%) participants opted for HIVST. Those who self-tested were more likely to be <35 years (p=0.02), more educated (p<0.01), have ≥1 sexual partners in the past 3 months (p=0.01), and less likely to have used a condom at last sex (p=0.06). 622 (89%) self-testers completed a telephone questionnaire. Of these, 32 (5%) had not yet used the test. Primary reasons were being busy/traveling (44%) and fear of results (19%). The Table shows telephone questionnaire results, by rural/urban setting.

| Characteristic | Total (N=590) N(%) | Rural (N=307) N(%) | Urban (N=283) N(%) | p-value |
|---|---|---|---|---|
| Self-test not at all hard to use | 564 (96%) | 299 (97%) | 265 (94%) | 0.03 |
| Tested with someone else present | 169 (29%) | 82 (27%) | 87 (31%) | 0.28 |
| Tested with a sexual partner | 120 (12%) | 64 (13%) | 56 (11%) | 0.44 |
| Reported an HIV-positive test result | 47 (8%) | 15 (5%) | 32 (11%) | 0.01 |
| Comfortable learning test result without a provider present | 540 (92%) | 289 (94%) | 251 (89%) | 0.02 |
| Would want next test to be a self-test | 510 (86%) | 276 (90%) | 234 (83%) | 0.01 |
| Would recommend self-testing to others | 586 (99%) | 306 (100%) | 280 (99%) | 0.47 |
| Of those testing HIV+ (n=47), attended post-test HIV services within 2 weeks | 25 (53%) | 8 (53%) | 17 (53%) | 0.99 |

[Post-test telephone questionnaire data among 590 participants who used the self-test, stratified by rural/urban setting]

**Conclusions:** Results suggest that HIVST is highly acceptable, and preferred by the large majority over PDHTS. HIVST may encourage testing among couples, younger people, and potentially those at higher risk. Importantly, half testing positive via HIVST had linked to post-test services by the time of follow-up, similar to available linkage data from PDHTS. HIVST represents a promising alternative for increasing knowledge of HIV status in Zimbabwe.

## WEPEC210

### HOME TESTING FOR HIV SUCCEEDS IN REACHING FIRST-TIME AND INFREQUENT TESTERS IN THE NETHERLANDS: RESULTS OF THE HIVTEST@HOME TRIAL

F. Zuure[1,2], J. van der Helm[1], J.E.A.M. van Bergen[3,4], R.A. Coutinho[5], S.E. Geerlings[2], H.M. Götz[6,7], H.J.C. de Vries[8,9], U. Davidovich[1], M. Prins[1,2]
*[1]Public Health Service of Amsterdam, Department of Infectious Diseases Research and Prevention, Amsterdam, Netherlands, [2]Academic Medical Center, University of Amsterdam, Department of Internal Medicine, Div of Infectious Diseases, Center for Infection and Immunology Amsterdam (CINIMA), Amsterdam, Netherlands, [3]STI AIDS Netherlands, Amsterdam, Netherlands, [4]Academic Medical Center, University of Amsterdam, Faculty of Medicine, Amsterdam, Netherlands, [5]University Medical Center Utrecht, Julius Center for Health Sciences and Primary Care, Utrecht, Netherlands, [6]Erasmus MC - University Medical Center Rotterdam, Department of Public Health, Rotterdam, Netherlands, [7]Municipal Public Health Service Rotterdam-Rijnmond, Department of Infectious Disease Control, Rotterdam, Netherlands, [8]Public Health Service of Amsterdam, Department of Infectious Diseases, STI Outpatient Clinic, Amsterdam, Netherlands, [9]Academic Medical Center, University of Amsterdam, Department of Dermatology, Amsterdam, Netherlands*
*Presenting author email: jvdhelm@ggd.amsterdam.nl*

**Background:** HIV self-tests (HIVST) may help to increase HIV test uptake by eliminating barriers to testing. The Amsterdam Public Health Service developed and evaluated an HIVST-service that provided reliable HIVST in combination with internet counseling for individuals at risk for HIV, especially men who have sex with men (MSM) and migrants from HIV-endemic countries.
**Methods:** Using MSM- and migrant-specific media, a campaign was launched to motivate MSM and migrants to visit www.time2test.nl. The website included information about HIVST, an optional questionnaire measuring demographics, and the option to buy HIVST packages. During a national 'HIV testing week 2015', packages could be obtained for free. Packages included an oral fluid-based test (OraSure Technologies), a manual, and a code to access online instructions and counseling. An evaluation questionnaire sent five weeks after purchase measured HIVST user experience and satisfaction, self-reported HIVST results, previous HIV-testing behaviour and linkage to care.
**Results:** From August-2014 to December-2015 the website attracted ~34000 visitors, of whom 5016 answered demographical questions. Of those, 56% (2802/5016) were MSM and 9% (472/5016) were migrants of non-Western origin. Median age was 34 years (IQR=26-44). 683 persons purchased 935 tests. During the HIV testing week 139 persons obtained 243 free tests. Of the 822 participants, 56% were MSM and 7% were non-Western migrants. Half (47%; 386/822) of all participants accessed the online instructions and counseling, and by February 2nd 2016, 15% (121/822) completed the evaluation questionnaire. The majority were (very) satisfied with the service (96%) and instructions (99%), and did not experience problems while testing (93%). 26% (32/121) were never tested for HIV, whereas for 13% (16/121) their last test was >3 years ago. 2.5% (3/121; 95%CI=0.8-7.0) tested positive, and 2/3 persons who tested HIVST positive were confirmed positive and accessed HIV care.
**Conclusions:** Although only a limited number of identified HIV infections were reported and non-Western migrants were underrepresented among our participants, our data suggest that almost 40% of the self-test users were first-time or infrequent testers. User experiences were positive and user satisfaction was high. A home-testing service for HIV is feasible and relatively easy to implement as an additional tool to identify HIV infections.

## WEPEC211

### BOOSTING VOLUNTARY AND FREE COUNSELLING AND HIV TESTING FOR MEN HAVING SEX WITH MEN IN TURKEY

P. Oktem[1], Y. Erkaymaz[2]
*[1]Positive Living Association, Istanbul, Turkey, [2]Positive Living Association, Support Centre, Istanbul, Turkey*
*Presenting author email: pinar.oktem@pozitifyasam.org*

**Background:** There are no Voluntary Counselling and Testing Centres (VCTs), no national HIV-testing guideline, nor community-based testing opportunities in Turkey, where the number of new diagnoses increased by 467% (2004-2013, WHO). Although approximately eight million HIV tests are performed each year, these are random, not targeted at most-at-risk-populations (MARP) and are not anonymous (if covered by the state health insurance system) due to various structural barriers. The community-initiated testing project presented in this abstract aimed at filling this gap and increasing the number of people who are aware of their HIV-positive status, so that they can reach treatment and reduce further transmission.
**Description:** Being the first and only of its kind, the current project, started in March 2015, provides voluntary, free and anonymous counselling and testing to men having sex with men (MSM) in Istanbul, where the prevalence is the highest, with the cooperation of the single HIV patients' organisation of Turkey and a private laboratory.
**Lessons learned:** The project is advertised in MSM bars and clubs, online platforms, billboards and social media applications. Over 1000 people applied and received counselling by a peer-counsellor. To date, 200 people got tested, 13.5% were diagnosed with HIV and directed to treatment. This is the highest prevalence rate detected in any testing initiative in the country. The country's official HIV prevalence rate is below %0.1. People diagnosed with HIV were 18 to 30 years old MSM, including undocumented migrants. Majority had CD4 counts lower than 300 and did not have medical insurance. High levels of social barriers and self-stigma preventing MSM from testing are also documented through the project.
**Conclusions/Next steps:** The project proved the success of targeted, anonymous testing and fills a data gap by generating evidence. The project provides a new model for Turkey, in which a non-governmental organisation and a private clinic collaborated. The results are used for evidence-based advocacy for the re-opening of VCTs and establishment of community-based testing venues.

## WEPEC212

### THE IMPACT OF AN ELECTRONIC ALERT EMBEDDED IN ELECTRONIC MEDICAL RECORDS ON HIV TESTING AMONG A HIGH-RISK POPULATION IN THE UNITED STATES

R. Hechter[1], Z. Bider-Canfield[1], W. Towner[2]
*[1]Kaiser Permanente Southern California, Department of Research and Evaluation, Pasadena, United States, [2]Kaiser Permanente Los Angeles Medical Center, Division of Infectious Disease, Los Angeles, United States*
*Presenting author email: rulin.c.hechter@kp.org*

**Background:** Individuals seeking diagnosis or treatment for sexually transmitted infections (STIs) are at an increased risk for HIV infection. We evaluated the impact of an electronic alert for HIV testing embedded in electronic medical records (EMRs) on same-day HIV testing rates.
**Methods:** The electronic alert was implemented around October 2012 at a large managed care organization, targeting individuals over 14 years old with undiagnosed HIV status who were tested for any of the following STIs: gonorrhea/chlamydia, syphilis, and Hepatitis B or Hepatitis C infection. We identified individuals who received at least one STI test targeted by the alert during 4.5 years prior (01/2008-06/2012) and 2.5 years after the alert implementation (01/2013-06/2015). We compared the same-day HIV testing rate during the pre- and post-implementation periods among all patient encounters that were eligible for HIV screening per the alert criteria. Stratified rate was calculated by age, gender, race/ethnicity, and type of STI test. In multivariable analyses, adjusted associations between demographics and receiving HIV testing on the same day of the STI test(s) were estimated by using logistic regression with generalized estimating equations to account for correlation within individuals.
**Results:** There were 1,287,187 (32.2% male) and 885,439 (31.1% male) individuals during the pre- and post-alert periods, contributing 3,043,792 and 1,992,715 eligible encounters in the analysis, respectively. The demographic characteristics were comparable between study samples during the two periods. The overall same-day HIV testing rate increased from 50.7% to 61.2% after the implementation of the alert. The greatest increase was observed in individuals ≥ 50 years of age (14.7%), males (12.0%), Asian/Pacific Islanders (13.6%), and those receiving only a syphilis test (18.3%). In multivariable analysis, compared with 25-39 year olds, individuals aged ≥ 50 years were the least likely to receive same-day HIV testing [odds ratio (OR) =0.258, 95% confidence intervals (CI): 0.256-0.260]. Male gender (OR=2.633, 95%CI: 2.618-2.648), and black and Hispanic race/ethnicity were associated with a greater likelihood of receiving same-day HIV testing (black: OR=1.268, 95%CI: 1.257-1.279; Hispanic: OR=1.098, 95%CI: 1.091-1.105; vs white).
**Conclusions:** Evidence-based electronic alerts embedded in EMRs have great potential as an effective systematic intervention to improve targeted HIV testing among high risk populations.

**Methods:** Between July 2013 and April 2015, Ten health facilities which represented regions with different HIV prevalence in China and designated ART providers at national, provincial and prefectural levels, adopted the program. A two rapid test algorithm was implemented to detect HIV and improve linkage. All clients with a reactive rapid HIV test (Determine HIV (1+2) electro selenium kit from United States) were offered a second rapid HIV test (colloidal gold kit, SD from South Korea) within 30 minutes. Clients with two positive results were immediately provided with pre-ART laboratory tests and counseling/treatment education to prepare them for ART initiation.
**Results:** During the study period, a total 73,073 clients were tested for HIV, with male to female ratio at 2.5:1. Clients who came for testing as a result of unprotected sex accounted for 62.8% while 34.7% of clients were not willing to share their exposure risk history. A third of the tester (33.1%) were retesters. A total of 3,999 clients (5.5%) were tested positive. Prevalence among males (6.5%) and first-time test clients (7.0%) were significantly higher than that in females (3.0%, $P< 0.001$, $\chi^2=359.97$) and previously test history clients (2.5%, $P< 0.001$, $\chi^2=338.93$). Prevalence among MSM (6.0%) data in 2015 was also significantly higher than that in other exposure populations (4.3%, $P< 0.001$, $\chi^2=34.318$). 87.6% of clients tested positive had been referred to hospitals, and 89.8% of them had been initiated ART regardless of their $CD_4$ level. The clients who were not initated (356) were found to have refused treatment because of high $CD_4$ levels.
**Conclusions:** The pilot program in China reveals a relatively high HIV prevalence and ART initiation rate, it is meaningful to expand HIV rapid testing among males, people who do not know their status and the MSM population to identify more positive patients.

## WEPEC214

### PARTNER NOTIFICATION FOR HIV TESTING SERVICES (HTS) APPROACH IN TANZANIA UNDERSCORES NEED FOR DISCORDANT COUPLE PACKAGE

M. Plotkin[1], C. Kahabuka[2], R. Kisendi[3], A. Christensen[4], E. Mlanga[5], K. Curran[6], C. Brown[7], V. Wong[7]
*[1]Jhpiego, Monitoring, Evaluation and Research, Baltimore, United States, [2]CSK Research Associates, Dar es Salaam, Tanzania, United Republic of, [3]Ministry of Health and Social Welfare, National AIDS Control Programme, Dar es Salaam, Tanzania, United Republic of, [4]Jhpiego Tanzania, Dar es Salaam, Tanzania, United Republic of, [5]USAID Tanzania, Dar es Salaam, Tanzania, United Republic of, [6]Jhpiego, Baltimore, United States, [7]USAID Washington, Washington, United States*
*Presenting author email: marya.plotkin@jhpiego.org*

**Background:** With UNAIDS's 90-90-90 goal, approaches to HIV testing which yield high positivity rates are critical for sub-Saharan Africa. Partner notification, where sexual partners of newly-diagnosed clients are contacted by their partner or a provider, is effective, but underutilized, in identifying undiagnosed individuals. Successful applications of this approach have been documented in Malawi and Cameroon. Identification of serodiscordant couples presents a critical HIV prevention opportunity given high risk of the uninfected partner. This study evaluated feasibility, acceptability and effectiveness of partner notification in facility-based HIV testing services (HTS) in Tanzania.
**Methods:** The study was conducted in 3 hospitals in Njombe (Tanzania's highest HIV prevalence region), June - September 2015. Individuals diagnosed with HIV in PITC or VCT were enrolled as index clients, and offered passive, contract or provider referral to HTS at the same facility: partners testing positive were referred into HIV care and treatment. Serodiscordant couples were defined as those in which the sexual partner indicated that they were in a current partnership with the index client.
**Results:** 390 individuals (53.1% female) enrolled as index clients and 248 of their named sexual partners were successfully referred, in all but one case via passive referral. 238 partners tested for HIV, 61.8% testing positive. More female partners tested positive (67.9% vs. 53.5% for male). 88 sero-discordant couples were identified, 87 of which were reached through passive referral - the remaining one through provider referral. 76.1% of discordant couples were husbands or wives, 15.9% were boyfriends/girlfriends and 8% were casual partners.
**Conclusions:** Tanzanian facility-based HTS settings are a feasible venue for high-positivity rate partner notification programs, including identification of sero-discordant couples. A social preference for partner notification as a means to disclose serostatus to the main partner was seen in the study, making the intervention in many cases a facilitated disclosure intervention by the HTS counselor. Given the number of sero-discordant couples identified, we recommend that partner notification programs are rolled out with a comprehensive prevention package for discordant couples, including risk reduction counseling, provision of condoms, immediate provision of ART for the index partner and PreP for the HIV uninfected partner as appropriate.

### LAY PROVIDER HIV TESTING SERVICES FOR KEY POPULATIONS: PRELIMINARY RESULTS FROM A NEW STRATEGY TO ACCELERATE 90-90-90 IN VIETNAM

B. Vu[1], K. Green[1], H. Phan[2], S. Vo[2], H. Ngo[1], A. Doan[1], T. Ngo[3], H. Nguyen[3]
*[1]PATH, Mekong Region, Hanoi, Vietnam, [2]VAAC, Hanoi, Vietnam, [3]USAID, Vietnam, Hanoi, Vietnam*
*Presenting author email: bvu@path.org*

**Background:** The HIV epidemic in Vietnam is concentrated among key populations (KP). Annual KP uptake of HIV testing through conventional testing services is low (~30%). This poses a major challenge to achieving 90-90-90. The USAID/PATH Healthy Markets Project, in collaboration with government and NGO partners, is piloting community based lay provider HIV testing to enhance KP access to HIV testing and accelerate diagnosis and treatment enrollment.
**Description:** The pilot aims to evaluate the model's acceptability, feasibility, and effectiveness for screening KP for HIV and ensuring linkages to care. Services are implemented in two mountainous and remote provinces, Nghe An and Dien Bien, and in two cities: Ha Noi and Ho Chi Minh City (HCMC). Non-health care workers (peer outreach workers and village health volunteers) were trained to proficiently offer test-for-triage (A0) in community settings using a rapid diagnostic test (RDT) (Determine™ HIV-1/2), and refer all reactive cases to health facilities for HIV diagnosis, and enrollment in treatment (confirmed cases). Standard operating procedures, video tutorials, and service algorithms were developed to reinforce the quality of testing. Local government health authorities provide supervisory support to the lay providers.
**Lessons learned:** Preliminary results are encouraging, with lay providers identifying a higher proportion of positive cases (5.4% of clients tested) than conventional HIV testing (2.4% according to national data, VAAC). All confirmed cases of HIV have been enrolled in treatment programs. In the first two months of implementation, over 1,660 people have been tested, and 90 new HIV cases were (5.4%). Male clients accounted for 90.6% of confirmed cases. Confirmed cases included those with a high CD4 count, where early treatment is particularly important for preventing transmission. Investment in training, job aids and supervision has translated into high quality testing by lay providers.
**Conclusions/Next steps:** Preliminary results indicate that lay provider testing can contribute to the identification, accurate diagnosis, and timely treatment of KP with HIV, especially those with a high CD4 count. The pilot is currently expanding to additional districts across the four provinces as requested by the provincial AIDS centers.

## WEPEC216

### WORKING EVENING AND WEEKEND SCHEDULES IS EFFECTIVE IN REACHING MORE MEN FOR HOME-BASED HIV TESTING: FINDINGS FROM HPTN 071 (POPART) IN SOUTH AFRICA

B. Yang[1], S. Floyd[2], D. van Deventer[1], R. Dunbar[1], P. Bock[1], S. Griffith[3], H. Ayles[4,5], S. Fidler[6], R. Hayes[2], N. Beyers[1], HPTN 071 (PopART) Study Team
*[1]Desmond Tutu TB Centre, Stellenbosch University, Department of Peadiatrics and Child Health, Faculty of Medicine and Health Sciences, Cape Town, South Africa, [2]London School of Hygiene and Tropical Medicine, Department of Infectious Disease Epidemiology, London, United Kingdom, [3]Family Health International 360, Durham, United States, [4]Zambia AIDS Related Tuberculosis (ZAMBART) Project, University of Zambia, Lusaka, Zambia, [5]London School of Hygiene and Tropical Medicine, Department of Clinical Research, London, United Kingdom, [6]Imperial College, Department of Infectious Disease Epidemiology, London, United Kingdom*
*Presenting author email: bliay@sun.ac.za*

**Background:** HPTN 071 (PopART) is a community-randomised trial of the impact of a combination HIV prevention package on population-level HIV incidence, being conducted in South Africa (SA) and Zambia. The package includes annual rounds of home-based HIV testing by Community HIV Care Providers (CHiPs), and must cover a high proportion of both men and women to be successful. In response to a low proportion of men being reached during regular business hours, weekend and evening work schedules were implemented in the 6 intervention communities in SA.
**Methods:** From 1 September to 13 December 2014, CHiPs worked a Tuesday-Saturday or Monday-Friday schedule. During weekdays, working-hours were 9am-5pm, 10am-6pm, and 11am-7pm for 5/5/4 weeks respectively; on Saturdays teams always worked 9am-5pm. To compare the 3 working-hour shifts, the average number of HIV tests/day was calculated for each week, excluding Saturdays, and these 14 values analysed using linear regression. To compare weekdays and Saturdays, analysis was restricted to the 10wks that CHiPs worked on Saturday; for each week, the average number of HIV tests/day was calculated separately for weekdays and Saturday, and a paired t-test used to compare 10 paired values. The number of staff working each day was consistent over the 14wk period, with minimal staff turn-over.

**Results:** 9,857 men had HIV tests during this period, with an average of 210/day. On average, 27% (262vs207) more tests/day were completed on Saturdays than weekdays, and 46% (255vs175) more tests for the 11am-7pm shift than 9am-5pm shift during weekdays.

| | Average number of HIV tests/day | 95% Confidence Interval | P value |
|---|---|---|---|
| Overall (14 weeks) | 210 | 193 - 227 | |
| Tuesday-Saturday schedule (10 weeks) | | | |
| Weekdays | 207 | 173 - 242 | |
| Saturday | 262 | 225 - 298 | 0.0003 |
| Work shift (14 weeks) | | | |
| 9am-5pm (5 weeks) | 175 | 143 - 207 | |
| 10am-6pm (5 weeks) | 166 | 134 - 198 | |
| 11am-7pm (4 weeks) | 255 | 219 - 291 | 0.004 |

*[Average number of HIV tests per day]*

**Conclusions:** Working weekend and evening schedules substantially increased the average number of HIV tests/day in men. If home-based HIV testing programmes emerge as an important component of the public health response to the HIV epidemic, they will need to reach men in large numbers; our data indicate that non-traditional work schedules will be necessary.

## WEPEC217

### THE IMPACT OF THE SCALE UP OF VOLUNTARY MEDICAL MALE CIRCUMCISION SERVICES ON MEN'S POPULATION-LEVELS OF HIV-TESTING IN RURAL ZAMBIA, 2009-2013

B. Hensen[1], J. Lewis[1], A. Schaap[1,2], M. Tembo[2], H. Weiss[1], N. Chintu[3], J. Hargreaves[1], H. Ayles[1,2]
*[1]London School of Hygiene and Tropical Medicine, London, United Kingdom, [2]Zambart, Lusaka, Zambia, [3]Society for Family Health, Lusaka, Zambia*
*Presenting author email: bernadette.hensen@lshtm.ac.uk*

**Background:** In response to recommendations by the World Health Organization, voluntary medical male circumcision (VMMC) services were launched in Zambia in 2009. Men opting to undergo VMMC are offered provider-initiated HIV-testing services (PITC) prior to circumcision. Scaling-up VMMC has the potential to increase population-levels of HIV-testing amongst all men, both directly (through the offer of PITC at VMMC services) and indirectly through normalising knowledge of ones HIV-status. The aim of this study was to assess how VMMC services contribute to uptake of HIV-testing among men.
**Methods:** We conducted an integrated analyses of programmatic data, systematic observations and population-based surveys, to describe VMMC service scale-up, including delivery, promotion and uptake, in 42 study sites in three districts. Using a 2013 population-based survey, we describe HIV-testing behaviours of men reporting circumcision between 2009 and 2013 and men reporting that they are not circumcised. We used cluster-level summary analyses to investigate whether VMMC scale-up was associated with higher levels of recent HIV-testing within 12 months prior to the survey.
**Results:** VMMC services were delivered in 62% (n=26) of study sites. Posters were observed in 58% (n=15) of sites where VMMC was delivered. No other promotional activities were observed in these sites. Between 2009-2013, 6% (n=138) of men were circumcised. Being recently circumcised was strongly associated with ever-testing for HIV, with 86% (n=118) of recently circumcised men ever-testing compared with 59% (n=1222; p< 0.01) of uncircumcised men. An estimated 45% (n=53/118) of circumcised men had HIV-tested before the year of their circumcision. The cluster-level mean of VMMC was 8% in sites where VMMC was delivered compared to 5% in sites where services had not. The cluster-level mean of recent HIV-testing was 33% compared to 30% (p=0.30), respectively.
**Conclusions:** VMMC scale-up has provided men with access to HIV testing services. Yet this study shows no evidence that scale-up is associated with increased population-levels of HIV-testing. This may be because relatively few men were circumcised and a high proportion had tested for HIV prior to being circumcised or because men in sites where VMMC services were not known to be delivered accessed services through alternate providers.

## WEPEC218

### PROVISION OF ORAL HIV SELF-TEST KITS TRIPLES UPTAKE OF HIV TESTING AMONG MALE PARTNERS OF ANTENATAL CARE CLIENTS: RESULTS OF A RANDOMIZED TRIAL IN KENYA

A. Gichangi[1], J. Wambua[1], A. Gohole[2], S. Mutwiwa[3], R. Njogu[4], E. Bazant[5], J. Wamicwe[6], R. Wafula[7], M. Mudany[8], J. Korte[9]
*[1]Jhpiego Kenya, Monitoring Evaluation and Research, Nairobi, Kenya, [2]Jhpiego Kenya, Maternal Child Survival Program, Kisumu, Kenya, [3]Jhpiego Rwanda, Kigali, Rwanda, [4]Jhpiego Kenya, USAID APHIAPlus Program, Nairobi, Kenya, [5]Jhpiego Baltimore, Monitoring Evaluation and Research, Baltimore, United States, [6]National STI and AIDS Control Council, HIV Testing Services, Nairobi, Kenya, [7]National STI and AIDS Control Program, PMTCT Department, Nairobi, Kenya, [8]Jhpiego Kenya, Nairobi, Kenya, [9]Medical University of South Carolina, Epidemiology, Charleston, United States*
*Presenting author email: anthony.gichangi@jhpiego.org*

**Background:** Kenyan women have higher HIV prevalence than men (6.9% vs. 4.4%) with 4.8% of married/cohabitating couples serodiscordant. Partner's HIV status is unknown to 42.2% of pregnant women. Antenatal care (ANC) attendance is nearly universal (95.4% attend first ANC). In 2012, 95% of Kenyan ANC clients were offered and accepted HIV testing. Despite a policy promoting male partner testing in ANC only 6% of male partners are tested. We evaluated the impact of using oral HIV self-testing on HIV testing among male partners of ANC clients in Kenya.
**Methods:** In a three-arm randomized controlled study in 14 ANC sites in Eastern and Central Kenya, consenting women at first ANC were randomized to either: Group 1 receiving standard-of-care; Group 2 receiving a card stating the importance of male HIV testing in prevention-of-mother-to-child-transmission; or Group 3 whose participants received the same card plus two OraQuick® HIV oral test kits with instructions for testing with the partner at home. Consenting women completed a baseline questionnaire and endline questionnaire after three months. Consenting male partners were surveyed three months after enrolling ANC clients. The primary outcome was male partner HIV testing, by any means, within three months after ANC client enrollment.
**Results:** 1410 women were randomized. At the time of analysis, 756 have been followed up and 669 men responded to the survey (623 couples). Baseline characteristics of the men in three study groups did not differ. (p>0.05). Of the 669 men surveyed, In Group 3, 83% of men reported having taken a HIV test, compared to 28% in Group 1 and 36% in Group 2 (p-value< .001) (overall 48%, n=326). Most men testing for HIV indicated testing together with their partner regardless of the study group. --information that was corroborated by the female partners. Of the men using HIV self-test kits, over 90% reported it was very easy to take a swab and read the test results.
**Conclusions:** Preliminary results indicate that the ANC platform offers a unique opportunity to increase HIV testing among men using oral self test kit. By increasing male partner testing, the potential exists to reduce mother-to-child-transmission and other new infections among adults.

## WEPEC219

### MOONLIGHT HIV COUNSELING AND TESTING INCREASES HIV TESTING UPTAKE AMONG MEN

J. Baligobye[1], J. Kiwanuka[1,2], M. Kahungu Muhindo[1,2], G. Ojamuge[1]
*[1]AIDS Healthcare Foundation - Uganda Cares, Kampala, Uganda, [2]School of Public Health, Makerere University College of Health Sciences, Kampala, Uganda*
*Presenting author email: george.ojamuge@aidshealth.org*

**Background:** Despite global recognition of male involvement as a key priority area in the fight against HIV/AIDS, available scientific evidence indicates low uptake of HIV counseling and testing (HCT) among men even in settings like maternal and child health (MCH) clinics where it is fully encouraged. We set out to compare male HCT uptake for two testing approaches; PITC in MCH clinic and moonlight HCT.
**Methods:** By March 2012, AIDS Healthcare Foundation (AHF) had scaled up a test and treat project in Masaka-Uganda. AHF strengthened Provider Initiated Testing and Counseling (PITC) at the Masaka regional Referral hospital's MCH clinic to encourage men test with their pregnant partners for HIV. In the same period, AHF rolled out moonlight testing (ML), specifically targeting men and the most at risk populations. HIV testing under the moonlight strategy begin at around 18:00 hours and runs to around 22:00 hours. We present here a comparison of HCT uptake by men in these two testing approaches (PITC at MCH and Moonlight HCT) for the period Jan 2015 to Nov 2015.
**Results:** In the study period, 24,336 individuals received HCT of which 6,489 (26.7%) were by moonlight HCT. Under both testing strategies, more than 86% of clients tested were aged ≥15 years, and HIV positivity was 3.1% and 2.8% for PITC and ML HCT respectively. In the reference period, 5,408 males received HCT of which 4529 (83.7%) were tested through moonlight HCT. Furthermore, of the overall testers at MCH, only 879 (4.9%) were males whereas 4,529 (69.8%) were male testers under ML HCT. HIV positivity was 4.1% and 1.9% for PITC and ML HCT respectively.

Tuesday 19 July
Wednesday 20 July Poster Exhibition
Thursday 21 July
Friday 22 July
Late Breaker Posters
Author Index

**Conclusions:** Our findings indicate that moonlight HCT is most appropriate for men compared with VCT in MCH clinics. Male HIV positivity at static health facilities is higher than it is at generalized community outreaches and therefore, combination strategies are important to improve on early HIV diagnosis among men and promotion of PMTCT services.

## WEPEC220

### A PRELIMINARY EVALUATION OF THE HIV TESTING ALGORITHM IN THE IPM 027 TRIAL

M. Isaacs[1], I. De Wet[1], A. Engelbrecht[2], C. Neate[3], M. Mlangeni[4], Z. Ismail[5], T. Vudriko[6], K. Naidoo[7], N. Mnqayi[8], A. Nel[1]
*[1]International Partnership for Microbicides, Paarl, South Africa, [2]Hutchinson Center Research Institute, HVTN Immunology Laboratory, Cape Town, South Africa, [3]Madibeng Centre for Research, Brits, South Africa, [4]Maternal, Adolescent and Child Health Research, Pietermaritzburg, South Africa, [5]Qhakaza Mbokodo Research Clinic, Ladysmith, South Africa, [6]MRC/UVRI Uganda Research Unit on AIDS, Masaka, Uganda, [7]Desmond Tutu HIV Foundation, Cape Town, South Africa, [8]Ndlovu Research Centre, Elandsdoorn, South Africa*
*Presenting author email: anel@ipmglobal.org.za*

**Background:** The Ring Study (IPM 027) is a Phase III, multi-centre, randomized, double-blind, placebo-controlled safety and efficacy trial of a Dapivirine Vaginal Ring in healthy women. An HIV testing algorithm using serial rapid tests and Western Blot confirmation was implemented in the trial. The application and evaluation of the algorithm which was used to confirm HIV seroconversions will be discussed.
**Methods:** HIV testing was performed on venous blood samples collected from participants at all scheduled post-enrolment visits. Samples were first tested using the Determine™ HIV-1/2 rapid test. In the event of a reactive result, the same sample was tested using the FDA-approved OraQuick® Advance Rapid HIV-1/2 Antibody test. In the event of discordant results between the Determine and OraQuick rapid tests, the sample was tested using the Uni-Gold™ HIV-1/2 rapid test. If two reactive rapid test results were obtained, a sample was collected for Western Blot confirmation at a central laboratory. All results were reviewed by the HIV Seroconversion Monitoring Committee (HSMC) who provided consensus confirmation of HIV seroconversion. The HSMC could request repeat of the algorithm if the Western Blot result was indeterminate or additional testing to confirm seroconversion.
**Results:** 80.8% of the total number of cases identified as potential seroconversions (two reactive rapid tests) were confirmed to be HIV seroconversions based on the standard algorithm. 14.2% of cases identified as potential HIV seroconversions required repeat of the standard algorithm prior to being confirmed. 5% of cases identified as potential HIV seroconversions required additional tests outside of the standard algorithm prior to being confirmed.
**Conclusions:** The majority of HIV seroconversion cases could be confirmed based on the standard HIV testing algorithm and this demonstrates that the algorithm was robust and effectively implemented.

## WEPEC221

### INCREASED ACCESS TO TESTING AND KNOWLEDGE OF HIV STATUS IN DOMESTIC WORKERS AND JOB SEEKERS IN KWAZULU-NATAL

M.C. Zuma, S. Bridglall
*Health Systems Trust, SA Sure, Durban, South Africa*
*Presenting author email: charlotte.zuma@hst.org.za*

**Background:** Most job seekers and domestic workers find it difficult to access health care due to their busy daily schedule as they find themselves spending hours in queues waiting to apply for jobs or finish work after the clinic has closed. The purpose of this initiative was to increase HCT (HIV Counselling and Testing) uptake among domestic workers and job seekers.
**Methods:** : A Quality Improvement Project using the challenge model was used in a suburban public sector primary clinic in Durban that has a total catchment population of 6799. Staff were coached and mentored to do bottle neck analysis and were asked to propose solutions to enhance access to HCT services. A decision was made to implement HCT through community outreach, which was implemented in August 2015. Outreach areas were visited once weekly. The HCT outreach programme was expanded to include cervical cancer screening and condom distribution. Health services were provided to clients waiting in queues either applying or awaiting responses to job applications. A room allocated to ensure privacy was used for service delivery and where unavailable, clients were taken to the clinic for procedures.
**Results:** An average of 225 clients (15-49 years) per month was provided with HCT prior to the outreach intervention and this increased to an average of 404 clients (15-49 years) per month post intervention. Condom distribution increased from an average of 5360 per month to 11160 per month and an increase in cervical screening from an average of 6 clients per month to 16 clients per month. All (100%) of clients received their cervical cancer screening results and 28 women (6%) were referred to hospital for further management as required.
**Conclusions:** HCT community outreach services contributed to an increased number of people knowing their status, increased screening for cervical cancer screening and enhanced access to condoms.

## WEPEC222

### TARGETING HIV TESTING AT A POPULATION LEVEL: A COMPARISON OF THREE APPROACHES

M.J. Pérez Elias[1], C. Gómez Ayerbe[1], C. Reverte[2], A. Muriel[3], J.C. Galán[4], S. del Campo[1], P. Perez Elias[5], A. Diaz[1], M.J. Vivancos[1], S. Moreno Guillen[1], DRIVE Study Group
*[1]Hospital Ramon y Cajal, Infectious Diseases, Madrid, Spain, [2]Ramon y Cajal Hospital, Madrid, Spain, [3]Ramon y Cajal Hospital, Statistics Dept, Madrid, Spain, [4]Ramon y Cajal Hospital, Microbiology, Madrid, Spain, [5]Garcia Noblejas, Primary Care Center, Madrid, Spain*
*Presenting author email: mjperez90@gmail.com*

**Background:** Targeted HIV testing has been proposed as the most efficient strategy to diagnose HIV infected subjects in low prevalence populations. The present work aimed to compare the accuracy of three different HIV testing targeted approaches previously validated to predict HIV infection.
**Methods:** All participants in DRIVE study (a non targeted HIV testing programme in Emergency Department and Primary Care Centre -PCC-), were tested for HIV and filled out a self-administered questionnaire on HIV risk of exposure and clinical indicators (RE&CI). The RE&CI questionnaire included 6 questions to evaluate the risk of exposure to HIV and others to asses 14 HIV associated clinical indicators (from the HIV Indicator Diseases across Europe Study -HIDES- list). One positive item defined the patient at being at risk for HIV. The other two tools considered were: Denver HIV Risk score (DHRS) with a Cut-off>30 and HIDES using only 14 clinical indicators. We calculated Sensitivity (Sn), Specificity (Sp), positive predictive value (PPV) and negative predictive value (NPV) of the three tools, considering the gold standard confirmed cases of HIV infection with EIA/WB. Number of missed HIV infections (NMHI) and tests avoided were also calculated.
**Results:** 5,329 participants between 18-60 years old completed paired valid RE&CI questionnaires and rapid HIV tests in the DRIVE study (69.3% in the PCC). 50.4% were women and median age 37 (28-47) years. Confirmed new HIV diagnoses were detected in 22 subjects (4.1‰) with this non-targeted strategy. The percentage of the population identified to be at risk for HIV infection by a positive questionnaire, DHRS>30 and with at least one item of 14 HIDES list selection was 51.2%, 39.7%, and 26.9%, respectively. Sn, Sp, PPV, NPV, NMHI and test avoided were 100%, 49%, 0.80%, 100%, 0 and 2,601 respectively in RE&CI questionnaire approach, 72.7%, 60.41%, 0.76%, 99.8%, 6 and 3,212 in DHRS, and 91%, 74.4%, 1.4%, 99.9%, 2 and 3,948 in 14 items of HIDES list.
**Conclusions:** All three tools avoided HIV tests, but only the questionnaire captured all HIV-infected subjects detected by the non-targeted strategy. A selection of HIDES list presented a high sensitivity, and was able to avoid the highest number of tests.

## WEPEC223

### WHAT ROLE DOES HIV SELF-TESTING (HIV-ST) HAVE FOR MEN WHO HAVE SEX WITH MEN (MSM) IN THE UK? TESTING NEEDS, SOCIAL NORMS AND BIOLOGICAL CITIZENSHIP

T.C. Witzel[1], F. Burns[2], P. Weatherburn[1], A. Rodger[2], T. Rhodes[2]
*[1]Sigma Research @ London School of Hygiene and Tropical Medicine, London, United Kingdom, [2]University College London, London, United Kingdom*
*Presenting author email: charles.witzel@lshtm.ac.uk*

**Background:** Continuous monitoring of health is increasingly an expectation of responsible patient citizenship. This is particularly true for those deemed to be 'most' at risk by the epidemiological and public health sciences. HIV testing among MSM in the UK may be understood as an obligation, and a requirement for participation in gay male culture.
**Methods:** Six focus group discussions (FGD) were conducted between July and November 2015 with 47 MSM aged between 18 - 64 in London, Manchester and Plymouth. MSM were purposively sampled based on HIV testing history, sexual orientation and ethnicity. FGDs covered HIV testing behaviour, HIV-ST intervention preferences and perceptions of HIV-ST in relation to other testing opportunities. FGDs were recorded and transcribed verbatim, then subjected to a narrative analysis using NVivo10.
**Results:** MSM's narratives identified three main rationales for testing for HIV: in response to risk, to seek reassurance (to 'double check'), and to conform to expectations of the medical establishment and peer groups.

When men were not confident in receiving a negative result, health care staff support was highly valued and emphasized as a crucial part of an HIV testing intervention. Concerns regarding lack of such support therefore undermined HIV-ST's role following a risk event.
Instead, HIV-ST was accepted as a technology facilitating the risk management and social expectations of medical practitioners and peers. It rarely met the goals or needs of individuals, as most do not lack access to appropriate HIV testing, but was highly acceptable despite this. HIV-ST was presented as shifting the surveillance of risk into the home creating new obligations in relation to biological citizenship.
**Conclusions:** The role of HIV-ST for MSM in the UK will likely be partly limited to testing when MSM do not perceive themselves to be at risk of infection. Instead, self-testing offers reassurance. Whilst not mobilised in response to high risk occurrences in practice, self-testing enables MSM to demonstrate responsible citizenship in keeping with public health and social expectations of ongoing risk monitoring. This implies that self-testing extends the reach of risk governance from the clinic into the home but without necessarily impacting as envisaged by public health.

## WEPEC224

### THE REASONS FOR NOT HAVING RECOURSE TO HIV TESTING FOR KEY POPULATIONS IN MOROCCO

A. Ben Moussa[1], F. Hajouji[2], L. Ouarsas[1], M. Karkouri[1], A. Oussadan[2], H. Himmich[1]
*[1]Association de Lutte contre le Sida, Casablanca, Morocco, [2]Association de Lutte contre le Sida, Agadir, Morocco*
*Presenting author email: benmoussa.alcs@gmail.com*

**Background:** In Morocco, despite tremendous efforts of Civil Society and Ministry of Health, 65% of people living with HIV (PLHIV) don't know their serostatus. HIV Testing is offered free of charge, in Morocco, in NGOs (anonymously), hospitals and primary health care centers by trained physicians using rapid testing technology. Hence the need to diversify and multiply HIV testing services (HTS) and to explore barriers to HIV Testing.
**Methods:** Association de lutte contre le Sida (ALCS), the leading NGO for HTS in Morocco, conducted in 2015 a pilot project to study the feasibility and acceptability of trained lay providers community based HIV testing and counseling (LPCB-HTC). Users of the new service were asked to complete a questionnaire rating the experience and exploring the barriers to HIV testing.
**Results:** 5275 participants used the service and completed the questionnaire, including 2016 Female Sex Workers (FSW), 1903 Men who have Sex with Men (MSM) and 762 Sub-Saharan Migrants (SSM). Only 32% have been already tested for HIV before (37.5% for SSM, 34.5% for MSM and 29.1% for FSW). Participants aged of 25 years old and above are more likely to have been tested in the past than younger.
Out of the first testers, 48% reported that they have never been tested before because they did not know that a free and anonymous HIV testing was available or did not know where it was available and 21% that they were afraid of the potentially stigmatizing attitude of the Health Care Professionals. This was more important for women than men (18.2% Vs 22.7%) but was not perceived as a barrier for SSM who only reported this reason by 10% of them.
**Conclusions:** Reducing the harm of stigma and discrimination inside the health care system is still a challenge and a barrier to expand HTS, as well as the information on the availability of the services. This should be taken into account by decision makers in order to scale up HTS in Morocco

## WEPEC225

### EVALUATING TESTING STRATEGIES FOR IDENTIFYING HIGH-RISK YOUTH AND LINKING YOUTH TO PREVENTION

R. Miller[1], P. Lindeman[2], D. Chiaramonte[1], D. Fortenberry[3], C. Boyer[4], K. Chutuape[5], B. Cooper Walker[5], Adolescent Medicine Trials Network for HIV/AIDS Interventions
*[1]Michigan State University, Psychology, East Lansing, United States, [2]Michigan State University, Program Evaluation, East Lansing, United States, [3]Indiana University, Pediatrics, Indianapolis, United States, [4]University of California San Francisco, Pediatrics, San Fransisco, United States, [5]Johns Hopkins University, Pediatrics, Baltimore, United States*
*Presenting author email: mill1493@msu.edu*

**Background:** In the United States, half of the estimated 62,000 youth living with HIV are unaware of their HIV status. We examined preliminary results from a pilot study of three strategies to encourage testing among high-risk racial minority young men who have sex with men (YMSM) ages 13 to 24 taking place in 13 urban United States' cities (Connecting to Testing and Prevention or C2TaP).
**Methods:** Data on 1750 adolescents were collected from 13 C2TaP sites during the second quarter of program implementation. Sites implemented one of three testing strategies: (1) routine testing in high-volume settings that attract youth such as school-based health centers (Mass Routine Testing. N=2 sites; 436 youth); (2) routine testing in addition to community-based testing events (Combination Testing. N=7 sites; 685 youth); (3) targeted community-based testing events including explicit outreach (Specific Targeted Testing. N=3 sites; 414 youth). Models were compared to one another on the proportion of YMSM and youth of color tested, proportion of HIV-positive cases identified, and proportion of youth successfully linked to community prevention services using Z-tests of differences in proportion with $p < .05$ as criterion for determining statistical significance. Eleven of twelve tests performed met this criterion.
**Results:** Specific Targeted Testing proved the superior strategy on nearly every outcome assessed in comparison to other testing models. 6% of youth tested via Specific Targeted Testing were identified as HIV-positive compared with 1% using Combination Testing and none using Mass Routine Testing. Specific Targeted Testing produced superior results for reaching youth of color (98% vs. 94% Mass Routine and 70% Combination) and linking negative youth to prevention (94% vs. 41% Mass Routine and 85% Combination). Specific Targeted Testing and Combination Testing performed equally well in reaching YMSM (53% vs 56%) and better than Mass Routine Testing (1%). Overall, Combination Testing produced superior outcomes compared to Mass Routine Testing.
**Conclusions:** Although preliminary, these early findings suggest targeted testing efforts may be worth their cost and effort for identifying HIV-positive youth and linking high-risk negative youth to prevention services. More rigorous studies to establish the promise of these strategies for reaching high-risk YMSM and youth of color are warranted.

## WEPEC226

### HIV EQUAL™ (HIV=™) ZIMBABWE: FIGHTING HIV STIGMA AND DISCRIMINATION USING A NOVEL AND INNOVATIVE APPROACH TARGETING ADULT GIRLS AND YOUNG WOMEN

G. Blick[1,2], S. Lucin[3], P. Greiger-Zanlungo[4], S. Gretz[5], T. Evans[6], R.W. Carroll[6], S. Frosch[7], T. Magure[8], G. Ncube[9], O. Mugurungi[10], W. Kurauone[11], N. Masuka[12]
*[1]World Health Clinicians, Inc, Chief Medical Officer, Norwalk, United States, [2]BEAT AIDS Project Zimbabwe, Victoria Falls, Zimbabwe, [3]World Health Clinicians, Inc, Public Relations and Communications, Norwalk, United States, [4]Montefiore Mount Vernon Hospital, Medicine, Mount Vernon, United States, [5]World Health Clinicians, Inc, CEO, President, Norwalk, United States, [6]World Health Clinicians, Inc, HIV Equal, Norwalk, United States, [7]World Health Clinicians, Inc, Videography, Norwalk, United States, [8]National AIDS Council, CEO, Harare, Zimbabwe, [9]Ministry of Health and Child Care, HIV Testing and Counseling, Harare, Zimbabwe, [10]Ministry of Health and Child Care, Director, HIV/AIDS and TB, Harare, Zimbabwe, [11]Ministry of Health and Child Care, District Medical Officer, Victoria Falls, Zimbabwe, [12]Ministry of Health and Child Care, Provincial Medical Director, MatNorth, Bulawayo, Zimbabwe*
*Presenting author email: blickmd@whcccc.org*

**Background:** HIV stigma and discrimination in Zimbabwe has been a significant deterrence to getting Adult Girls/Young Women (AGYW), as well as men and vulnerable populations, HIV tested. Nationwide, 11.8% of men have been tested, and the HIV infection prevalence is greatest in youth 13-24 years old. HIV=, a World Health Clinicians, Inc. (WHC) and BEAT AIDS Project Zimbabwe (BAPZ) initiative, is a testing and anti-stigma photographic campaign, launched in the US in Oct 2013, in Victoria Falls (VF), Zimbabwe in Dec 2013, and nationwide in ZIM in Oct 2015.
**Methods:** In the HIV= campaign, participants must get HIV tested and demonstrate proof of HIV-positivity to then have a free HIV= photograph taken. Each photo proclaims, "Everybody has an HIV Status. We are All HIV Equal", meaning God loves everybody, regardless of their HIV status. Each individual then chooses a "STATUS" word that describes one positive attribute about themselves. All participating individuals get a free HIV= T-shirt that stimulates conversation about what it means to be "HIV Equal".
**Results:** From Dec 2013 to June 2015, 8 HIV testing and counseling / HIV= events (2 in the Victoria Falls municipality, 6 in the Hwange district rural health clinics) were conducted. 1262 individuals (range 58-586) were HIV tested, with 41.8% men, 48.4% AGYW (13-24 yrs), 9.8% children (under 13), and 20% orphans/vulnerable children were tested and photographed.
At the request of the Ministry of Healkth and Child Care and the National AIDS Council, the HIV= campaign was nationalized, targeting AGYW and youth in two high-density suburbs of Harare with live Zimbabwean music and the most popular ZIM artists. 1564 individuals were HIV tested (1175 in one 8-hour event), 76% AGYW, and 2355 photos and T-shirts were given out. All individuals were linked immediately to care with the participating NGOs and city health departments.
A video will be shown.
**Conclusions:** The novel and innovative HIV Equal testing and photographic campaign has proven successful in targeting and testing vulnerable populations, AGYW, and men. Ten events in the 10 ZIM Provinces are planned for 2016.

## WEPEC227

### COULD PREP ENCOURAGE HIV TESTING? A QUALITATIVE STUDY OF HIV TESTING ATTITUDES AND PREP ACCEPTABILITY AMONG SOUTH AFRICAN YOUTH

K. Underhill[1], D. Operario[2,3,4], C. Kuo[2,3,4], D. Giovenco[3], J. Hoare[5]
*[1]Yale University, Center for Interdisciplinary Research on AIDS and Yale Law School, New Haven, United States, [2]Brown University School of Public Health, Department of Behavioral and Social Sciences, Providence, United States, [3]Brown University School of Public Health, Center for Alcohol and Addiction Studies, Providence, United States, [4]Lifespan/Tufts/Brown Center for AIDS Research, Providence, United States, [5]University of Cape Town, Department of Psychiatry and Mental Health, Cape Town, South Africa*
*Presenting author email: kristen.underhill@yale.edu*

**Background:** HIV testing among South African youth is low, despite high prevalence and incidence. Studies are considering safety of pre-exposure prophylaxis (PrEP) for youth. We examined how fears of HIV testing may affect future PrEP uptake among South African young people, and how PrEP access may simultaneously shape HIV testing in a generalized epidemic.
**Methods:** We conducted focus groups and interviews exploring youth PrEP acceptability with at least 20 HIV-negative and HIV-positive adolescents, and at least 17 clinicians serving youth in Cape Town. Youth were aged 16-17, approximately 60% female, and recruited via door-to-door sampling and clinic settings. We approached clinicians through networks and snowball sampling. Adolescent focus groups and interviews discussed HIV testing attitudes, willingness to use PrEP or support partner use, and predicted user behaviors. Clinician interviews explored willingness to prescribe PrEP and predicted behaviors among young PrEP users. We analyzed qualitative data thematically using NVivo.
**Results:** Among some youth, the need for HIV testing before and during PrEP use may initially deter uptake. Teens reported stigma and fear associated with testing, and anticipated discrimination by clinicians who disapprove of adolescent sex. Teens' testing fears included concerns about testing positive, but also ongoing anxiety among people testing negative, given concern about avoiding infection in a high-prevalence population. Some teens may prefer condoms over PrEP to avoid testing. Clinicians and youth also noted that as PrEP uptake increases, PrEP access may reduce fear and stigma associated with testing, as well as violence and rejection associated with status disclosure. Youth believed PrEP access would motivate increased testing, and PrEP could alleviate anxiety associated with testing negative in a generalized epidemic. Clinicians also suggested that PrEP could reframe testing as part of a preventive intervention, rather than solely identifying status.
**Conclusions:** If PrEP becomes available for youth, the need for initial and ongoing HIV testing may deter some teens. But as PrEP access expands, its availability may motivate increased testing among youth in generalized epidemics. Future research should examine how PrEP access affects testing. If youth PrEP becomes available, efforts to increase HIV testing in South Africa may advocate testing as a gateway to PrEP.

## WEPEC228

### CAN WOMEN SAFELY DISTRIBUTE HIV ORAL SELF-TEST KITS TO THEIR SEXUAL PARTNERS? RESULTS FROM A PILOT STUDY IN KENYA

K. Agot[1], S. Masters[2], G.-N. Wango[3], E. Omanga[1], R. Onyango[1], H. Thirumurthy[2]
*[1]Impact Research and Development Organization, Kisumu, Kenya, [2]University of North Carolina at Chapel Hill, Chapel Hill, United States, [3]Centers for Disease Control and Prevention, Kisumu, Kenya*
*Presenting author email: mamagifto@yahoo.com*

**Background:** Studies conducted in multiple settings and populations indicate that HIV self-testing is acceptable and feasible. One study in the US reported that men who have sex with men can distribute self-tests to their sexual partners to promote partner and couples testing. A pilot study in Kenya demonstrated the feasibility of this strategy among women who were given multiple self-tests. However, there is a need to assess concerns that women may experience intimate partner violence (IPV) as a result of distributing self-tests to their sexual partners.
**Methods:** HIV-uninfected female sex workers (FSW) and antenatal clinic (ANC) and postnatal clinic (PNC) attendees were enrolled at multiple sites in Kisumu, Kenya. Women who self-reported a concern about experiencing IPV were excluded. FSW were given 5 Oraquick oral fluid-based self-tests while ANC and PNC women were given 3 self-tests. Study staff demonstrated how to use self-tests and each self-test included pictorial usage instructions. Women were also counseled to use their discretion and assess IPV risk when determining whether to introduce self-tests to their sexual partners. At 3 months, women were asked about self-test usage as well as experience of IPV and its relation to distribution of self-tests.
**Results:** 280 women were enrolled and the majority (95% FSW, 93% ANC and 86% PNC) reported distributing self-tests to their primary sexual partner. Reported IPV during 12 months before enrollment was 44%, 27% and 46% among FSW, ANC and PNC women, respectively. At follow-up, 13% of ANC, 16% of PNC and 21% of FSW reported IPV in the 3 months since study enrollment. However, the vast majority (85%) of women reporting IPV at follow-up had also reported IPV at baseline and only four of the women attributed the occurrence of IPV to distribution or attempted distribution of self-tests.
**Conclusions:** Even in a population with high underlying IPV rates, women were able to safely distribute self-tests to their sexual partners. As more women than men attend services at health facilities, providing them with multiple self-tests for secondary distribution is a safe and highly promising strategy for increasing HIV testing among men.

## WEPEC229

### HOME VISITING AS A STRATEGY TO INCREASE HIV TESTING UPTAKE AMONG VULNERABLE CHILDREN AND THEIR CAREGIVERS: RESULTS FROM A RANDOMIZED CONTROLLED TRIAL IN SOUTH AFRICA

T.R. Thurman, B.G. Luckett
*Tulane University, School of Social Work, New Orleans, United States*

**Background:** Early initiation of antiretroviral therapy is recommended, but requires timely diagnosis. Fear of the outcome, lack of knowledge of the benefits and other intrapersonal concerns may prevent some adults from getting themselves or their children tested. Home visiting programs that offer one-on-one support and education from trained care workers have the potential to help mitigate some barriers to testing.
**Methods:** A randomized controlled trial was conducted to evaluate a home visiting program operating in urban townships of South Africa for its effectiveness to increase uptake of HIV counselling and testing services. Care workers made bi-weekly visits to the homes of children affected by orphanhood, poverty and adult chronic illness to connect those families with essential services, including HIV testing. Survey data were collected prior to program commencement in 2014 and after a year of service delivery. Equal numbers of households were randomized to receive or be waitlisted for services. Random effects models, stratified by age and gender, estimated program participation effects. 431 caregivers (92% female) completed both the baseline and impact surveys (90% retention rate) providing data on 1220 children under their care.
**Results:** Caregivers who received home visits were three times more likely to have been tested for HIV in the prior year at follow-up than caregivers in the control group (OR=3.3, 95% CI=1.6-6.6). Findings were particularly stark among intervention group caregivers younger than 35 years, as they were ten times more likely (OR=10.3, 95% CI=2.3-45.5) to have been tested than control group caregivers. Program effect did not vary by caregiver gender. Children whose caregiver both participated in the home visits and had been tested in the previous year, were more than four times more likely to have ever been tested at follow-up than other children (OR=4.7, 95% CI=1.2-18.3).
**Conclusions:** HCT is an essential stepping stone to care and treatment, but significant intrapersonal barriers to access exist. Our findings suggest that caregiver testing is a necessary precursor to child testing and demonstrate that community-based social service programs targeted to vulnerable populations can be effective in mobilizing caregivers to have themselves and their children tested for HIV.

## WEPEC230

### DRIVING HIV TESTING AMONG HIGH-RISK GAY AND BISEXUAL MEN IN NEW ZEALAND: NATIONAL HIV TESTING MONTH

J. Rich
*New Zealand AIDS Foundation, HIV Prevention, Auckland, New Zealand*
*Presenting author email: joe.rich@nzaf.org.nz*

**Background:** HIV transmission in New Zealand is concentrated among gay, bisexual and other men who have sex with men (GBM). Although past HIV prevention efforts have kept HIV prevalence and incidence low compared to other countries, evidence suggests that sexual risk-taking may be rising among GBM and that reducing the levels of undiagnosed HIV within sexual networks is necessary to realise the preventative benefits of early treatment. As part of a combination approach to preventing HIV, the New Zealand AIDS Foundation (NZAF) developed *National HIV Testing Month*, an integrated social marketing campaign, to increase rates of HIV testing among this group.
**Description:** Formative research was used to identify lack of perceived risk as a key barrier to HIV testing among high-risk GBM. Responding to this barrier, highly relevant and engaging content was created around the frequently Googled question, "Why are gay guys more prone to HIV?" This was supported this with a video that demystified the testing process and a mobile-friendly online booking form.

Advertising was placed on bus stops, street posters, gay venues, gay news sites, social media and hook-up apps. Online advertisements were shown 2.6 million times, generating 15,492 website clicks over the campaign month.
**Lessons learned:** Appointments booked online at NZAF clinics increased 218% from a monthly average of 186 to 592 in May 2015, creating a large overflow and appointment waitlist into June. 311 and 190 GBM were tested in the months of May and June, representing an increase of 130% and 41% respectively on the previous monthly average of 135 tests. Two GBM clients were diagnosed HIV positive in each month of May and June, a slight increase on the monthly average of 1.4.
**Conclusions/Next steps:** *National HIV Testing Month* was effective at driving HIV testing behaviour among GBM, however the increase in diagnosed positives was noticeably less than the increase in tests completed, indicating that GBM who engage in sexual risk-taking may not have been effectively engaged. Future social marketing efforts to promote HIV testing should explore addressing multiple barriers to HIV testing among GBM, as well as motivations, to drive behaviour among this group.

## PEP

### WEPEC231

#### DOLUTEGRAVIR WITH TENOFOVIR DISOPROXIL FUMARATE-EMTRICITABINE AS HIV POST-EXPOSURE PROPHYLAXIS IN GAY AND BISEXUAL MEN

J. Mcallister[1], J. Towns[2], A. Mcnulty[3], A. Pierce[4], R. Foster[5], R. Richardson[1], A. Carr[6]
*[1]St Vincent's Hospital, Sydney, Australia, [2]Melbourne Sexual Health Centre, Melbourne, Australia, [3]Sydney Sexual Health Clinic, Sydney, Australia, [4]The Alfred Hospital, Melbourne, Australia, [5]Royal North Shore Hospital, Sydney, Australia, [6]St Vincent's Hospital, HIV, Immunology and Infectious Diseases Unit, Sydney, Australia*
*Presenting author email: andrew.carr@svha.org.au*

**Background:** Completion rates for HIV post-exposure prophylaxis (PEP) are low. We investigated the adherence to and safety of dolutegravir (DTG) 50mg daily with tenofovir disoproxil fumarate 300mg/emtricitabine 200mg (Truvada©) as PEP in gay and bisexual men (GBM).
**Methods:** We conducted an open-label, single-arm study at 3 sexual health clinics and 2 emergency departments in Australia. One hundred HIV-uninfected GBM requiring PEP received DTG plus Truvada for 28 days. The primary endpoint was PEP failure (premature PEP cessation or primary HIV infection through Week 12). Additional endpoints were: adherence by self-report (n=98) and pill count (n=55); and safety (clinical and laboratory adverse events [AEs]).
**Results:** PEP completion was 90% (95%CI 84% to 96%). Failures comprised loss to follow-up (9%) and one AE resulting in study drug discontinuation (headache, 1%), and occurred at a median 9 days (IQR 3-16). No participant was found to have acquired HIV through Week 12. In the 55 participants with complete adherence data, adherence was 98% by both pill count and self-report. In the further 43 participants with self-report data only, adherence was 97%. The most common clinical adverse events (AEs) were nausea (25%), diarrhoea (21%), headache (10%), abdominal cramping (9%), wind (9%), and vivid dreams (7%). There were only four Grade 3-4 subjective AEs. The most common laboratory AE was raised alanine aminotransferase (25%), but there was only one Grade 3-4 ALT increase and no case of clinical hepatitis. An eGFR of < 60 mL/minBSAc occurred in 3%.
**Conclusions:** DTG with Truvada was safe and well-tolerated as once-daily PEP with high levels of adherence and completion.

### WEPEC232

#### KNOWLEDGE OF POST-EXPOSURE PROPHYLAXIS AMONG SOUTH AFRICAN MEN WHO HAVE SEX WITH MEN: RESULTS OF AN ONLINE SURVEY

J. Hugo[1], R. Stall[2], K. Rebe[1,3], J. Egan[2], G. de Swardt[1], H. Struthers[1,3], J. McIntyre[1,2]
*[1]ANOVA Health Institute, Health4Men, Johannesburg, South Africa, [2]University of Pittsburgh, Graduate School of Public Health, Pittsburgh, United States, [3]University of Cape Town, Department of Internal Medicine, Cape Town, South Africa*

**Background:** The Soweto Men's Study (2008), demonstrated an overall HIV prevalence rate of 13.2%, with 10.1% among straight-identified Men-who-have-sex-with-men (MSM), 6.4% among bisexual-identified MSM and 33.9% among gay-identified MSM. Behavioral interventions are imperative, but insufficient to prevent new HIV infections. Biomedical prevention of HIV offers a variety of combination prevention tools, including Post-Exposure Prophylaxis (PEP). PEP studies amongst MSM have been conducted in Amsterdam, Brazil and San Francisco, but never before in Africa.
**Methods:** A cross-sectional, Internet-based survey was initiated to measure knowledge, attitudes and beliefs regarding PEP among South African MSM. Recruitment was commenced in June 2014 until October 2015. Participants were recruited through banner advertisements on Facebook.com and mambaonline.com, advertisements in the local gay media and at Health4Men (H4M) MSM-targeted clinics. Outreach workers distributed flyers advertising the study in their local communities. The survey was also made available on a computer at the H4M clinics in Cape Town and Johannesburg to reach MSM who may not have Internet access.
**Results:** 408 men completed the survey. The majority of these men were under the age of 40, identified as gay/homosexual and were employed. 51% (208/408) self identified as black or of mixed race. In multivariate analysis participants who identified as gay had greater odds of having previously heard of PEP (AOR 1.91, 95% CI 1.04, 3.51; p = 0.036), as did those who reported their HIV status as positive (AOR 2.59, 95% CI 1.47, 4.45; p = 0.001). Participants with medical insurance had greater odds of having used PEP previously (AOR 2.67, 95% CI 1.11, 6.43; p = 0.029). Bivariate analysis showed that condomless sex in the past 6 months was not significantly associated with PEP knowledge (p = 0.75) or uptake (p = 0.56) of PEP.
**Conclusions:** Our findings suggest a lack of PEP knowledge and uptake among non-gay identified, HIV negative and un-insured MSM. Focusing PEP programs on these men may potentially increase uptake. Increased knowledge needs to be provided to MSM who engage in risky sexual behaviors.

## PREP

### WEPEC233

#### ARE PRIMARY CARE PROVIDERS IN THE SOUTHEASTERN U.S. READY TO PRESCRIBE PREP?

J. Seidelman[1], M. Clement[2,3], L. Okeke[2], K. McGee[1,2], B. Murthy[4], B. Johnston[5], A. Sena[6,7], M. McKellar[2]
*[1]Duke Univeristy, Department of Internal Medicine, Durham, United States, [2]Duke University Medical Center, Division of Infectious Diseases, Durham, United States, [3]Duke Clinical Research Institute, Durham, United States, [4]University of North Carolina at Chapel Hill, Preventive Medicine, Department of Family Medicine, Chapel Hill, United States, [5]Lincoln Community Health Center, Durham, United States, [6]University of North Carolina at Chapel Hill, Institute for Global Health and Infectious Diseases, Chapel Hill, United States, [7]Durham County Department of Public Health, Durham, United States*
*Presenting author email: jessica.seidelman@duke.edu*

**Background:** The U.S. Public Health Service recently issued guidelines about daily use of medication as pre-exposure prophylaxis (PrEP) to prevent HIV infection, and recommended that physicians, including primary care physicians (PCPs), offer PrEP to high-risk patients. Although there has been an increase in PrEP uptake, the CDC cites that 34% of PCPs have never heard of PrEP. We assessed the knowledge, attitudes and beliefs regarding PrEP in a large network of primary care clinics in the Southeast, which continues to have the highest rates of HIV in the U.S.
**Methods:** An online survey using Qualtrics software was emailed to PCPs in the Duke University Primary Care Network, Duke Private Diagnostic Center, and Duke Internal Medicine Program located in Durham, North Carolina. The survey consisted of 12 multiple choice questions aimed at understanding sentiments towards PrEP and potential barriers to its implementation in primary care clinics. No incentive was provided.
**Results:** Of 389 PCPs surveyed, 115 (30%) responded representing 24 clinical sites: 44% were faculty physicians, 42% resident physicians, 7% physician assistants, and 6% nurse practitioners. 78% reported seeing patients who are men who have sex with men (MSM); 12% said they did not see MSM, and 10% were not sure. Only 17% had prescribed PrEP. In response to why providers had not prescribed PrEP, 60% cited lack of knowledge, 56% said they had no candidates, and 42% mentioned lack of comfort in prescribing PrEP. Providers said that they would be more likely to prescribe PrEP if they had additional training (74%), reference materials (56%) and an infectious disease consultation by phone or pager (26%).
**Conclusions:** PrEP is a medication that has been shown to successfully prevent HIV in high-risk populations, but is not currently being prescribed by clinicians associated with a large academic US hospital in a regional epicenter for HIV. Although the majority of PCPs state that they see MSM in their practice, most respondents still did not prescribe PrEP. Our results indicate that lack of knowledge is the primary reason for not prescribing PrEP, but providers were open to additional education and reference materials.

## WEPEC234

### UPTAKE AND PREFERENCE OF DAILY AND INTERMITTENT PRE-EXPOSURE PROPHYLAXIS (PREP) IN A DEMONSTRATION PROJECT: BASELINE CHARACTERISTICS AND HIV PREVENTION CHOICES MADE BY DUTCH MSM

E. Hoornenborg[1], R. Achterbergh[1], M. Schim van der Loeff[1], U. Davidovich[1], J. van der Helm[1], A. Hogewoning[1], G. Sonder[1], Y. van Duijnhoven[1], H. de Vries[1,2], M. Prins[1,3], AMPrEP Team, Part of the HIV Transmission Elimination Amsterdam (H-TEAM) Consortium
*[1]Public Health Service Amsterdam, Department of Infectious Diseases, Amsterdam, Netherlands, [2]Academic Medical Center, Dermatology, Amsterdam, Netherlands, [3]Academic Medical Center, Department of Internal Medicine, Division of Infectious Diseases, Amsterdam, Netherlands*
*Presenting author email: ehoornenborg@ggd.amsterdam.nl*

**Background:** Information on the uptake and use of Pre-Exposure Prophylaxis (PrEP) provided by a large sexually transmitted infection (STI) clinic is limited and insight into key populations' preferences for daily or intermittent, event-driven PrEP in a real-life setting is lacking. We studied the uptake and acceptability of daily and intermittent PrEP in the Amsterdam PrEP (AMPrEP) project, a demonstration project.
**Methods:** In August 2015 enrollment into AMPrEP started at the STI clinic of the Public Health Service Amsterdam, the Netherlands. Eligible were men who have sex with men (MSM) who had, in the preceding 6 months, at least one of the following risk factors for HIV infection: condomless anal sex (CAS) with casual partners, rectal or urethral STI, Post-Exposure Prophylaxis, or having an HIV-positive partner with a detectable viral load. Eligible participants choose between tenofovir/emtricitabine PrEP daily and intermittent (IPERGAY schedule) usage modalities. Data collected until 19 January 2016 were analyzed.
**Results:** During the first 24 hours after announcement of AMPrEP 350 applications were submitted and in the next 4 weeks 185 applications, totaling 535 applications. As of 19 January 2016, 237 applicants had had a screening visit. Of those, 13 were not eligible, 6 withdrew, 20 were awaiting screening results and 198 started PrEP. Median age, STI at baseline and sexual behaviour characteristics are reported in the table.

| Characteristic | Total n=198 | Daily PrEP n=144 | Intermittent PrEP n=54 | p-value |
|---|---|---|---|---|
| Median age in years [IQR] | 41 [34-50] | 38 [33-48] | 44 [36-55] | 0.015 |
| One risk factor for HIV infection in the preceding 6 months - no. (%) | 124 (63) | 83 (58) | 41 (76) | 0.018 |
| >1 risk factor for HIV infection in the preceding 6 months - no. (%) | 74 (37) | 61 (42) | 13 (24) | |
| Bacterial STI at baseline -no. (%) | 40 (20) | 30 (21) | 10 (20) | |
| Hepatitis C RNA at baseline -no. (%) | 8 (4.0) | 6 (4.2) | 2 (3.7) | |
| Median number of unique anal sex partners [IQR] | 13 [7-25] | 15 [8-26] | 10 [5-19] | 0.017 |
| Receptive CAS with a casual partner | 134 (68) | 103 (72) | 31 (57) | 0.058 |
| Median number of receptive CAS partners in preceding 3 months [IQR] | 2 [0-7] | 2 [0-7] | 1 [0-4] | 0.037 |
| Sex-related drug use of 2 or more different hard drugs | 119 (60) | 84 (58) | 35 (65) | 0.407 |

*[Baseline Characteristics of Amsterdam PrEP Project Participants]*

Hepatitis C prevalence of 4% was higher than expected. Three quarters (144) of the participants chose to start daily PrEP. Daily users were younger (38 vs. 44 years) and reported more unique anal sex partners in the preceding 3 months (15 vs. 10). The proportions using sex-related hard drugs were comparable.
**Conclusions:** In the Netherlands, interest for PrEP use among MSM is high. Most participants preferred daily PrEP. Participants choosing daily PrEP were younger and reported more anal sex partners than those who chose intermittent PrEP.

## WEPEC235

### AWARENESS AND ACCEPTABILITY OF PRE-EXPOSURE PROPHYLAXIS (PREP) AMONG MEN WHO HAVE SEX WITH MEN IN TAIWAN

D.-M. Chuang, P. Newman, P. Baiden
*University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada*
*Presenting author email: dengmin.chuang@mail.utoronto.ca*

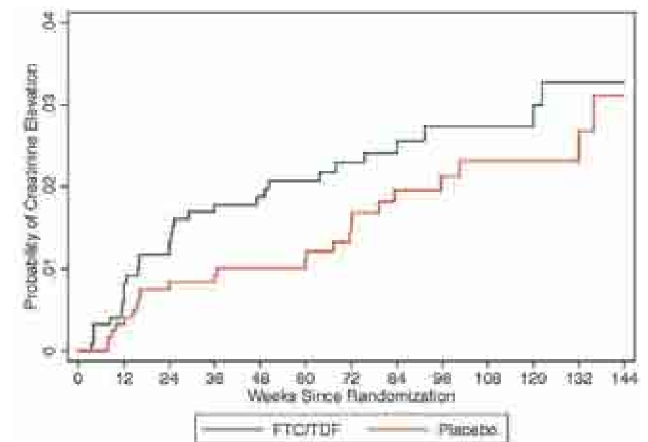
**Background:** Oral pre-exposure prophylaxis (PrEP) is highly effective in reducing HIV infection risk among men who have sex with men (MSM). Despite escalating HIV prevalence among MSM in Taiwan, little is known about awareness and acceptability of PrEP, or possible barriers to using PrEP. We examined factors associated with awareness and acceptability of PrEP among MSM in Taiwan.
**Methods:** From July-August 2014, we conducted a cross-sectional, self-administered paper-and-pencil (30-minute) survey among a convenience sample of MSM recruited from two LGBTQ community-based organizations in Taipei and Taichung, Taiwan. Items included socio-demographic characteristics, sexual risk behaviors, vicarious HIV stigma, anticipated PrEP disclosure, and PrEP awareness and acceptability. Multivariate logistic regression was conducted with PrEP awareness and acceptability as dependent variables.
**Results:** Participants' (n=176) mean age was 27.4 years; 87.5% self-identified as gay. Nearly one-third (31.3%) of participants reported inconsistent condom use; mean number of male sex partners was 2.3, past 3 months. Nearly half (47.2%) were aware of PrEP. The majority (72.2%) would accept PrEP if it became available in the future. In multivariate logistic regression, higher income (>30,000 TWD; $893 USD) (AOR=0.36, 95% CI=0.16-0.80) and inconsistent condom use (AOR=0.34, 95% CI=0.14-0.81) were associated with lower odds of PrEP awareness, and having heard about MSM taking HIV medications before condomless sex prior to PrEP licensure (AOR=25.27, 95% CI=7.43-85.95) was associated with higher odds of PrEP awareness. Higher vicarious HIV stigma (AOR=2.47, 95% CI=1.34-4.56), and willingness to tell sex partners about using PrEP (AOR=6.08, 95% CI=2.30-16.06) were associated with higher odds of PrEP acceptability.
**Conclusions:** Our findings suggest the need for tailored educational and social marketing efforts to prepare for the introduction of PrEP for MSM in Taiwan. Some MSM were aware of off-label use of HIV medication for prevention; however, marshalling PrEP awareness may be particularly warranted among MSM who engage in condomless sex with multiple partners. The associations of stigma and anticipated disclosure of PrEP use with acceptability may reflect the collectivistic orientation of Taiwanese culture, and suggest that social marketing efforts consider emphasizing benefits to others as well as oneself in promoting PrEP acceptability.

## WEPEC236

### OPTIMAL TIMING OF RENAL FUNCTION MONITORING DURING PRE-EXPOSURE PROPHYLAXIS

R.M. Grant[1,2,3], J. Guanira[4], D. Weikum[5], M. Rodolph[2], I. Mameletzis[2], R. Baggaley[2], D. Glidden[6]
*[1]Gladstone Institutes, San Francisco, United States, [2]World Health Organization, Geneva, Switzerland, [3]San Francisco AIDS Foundation, San Francisco, United States, [4]INMENSA, Lima, Peru, [5]Yale University, New Haven, United States, [6]University of California, San Francisco, United States*
*Presenting author email: robert.grant@gladstone.ucsf.edu*

**Background:** Tenofovir disoproxil fumarate (TDF) used for HIV pre-exposure prophylaxis (PrEP) has a small effect on renal function, indicated by elevations in serum creatinine (Cr). The optimal timing of renal monitoring during PrEP has not been determined.
**Methods:** The iPrEx trial was a randomized blinded placebo controlled trial of daily oral emtricitabine (FTC) plus TDF PrEP among men who have sex with men and women, including transgender women. The active and placebo arms were compared to identify the onset and timing of Cr elevations.



*[Figure: Time on FTC/TDF PrEP and Cr Elevations]*

**Results:** Among 4553 participants screened, 96 (2%) did not enroll because of baseline renal insufficiency or proteinuria. A total of 2499 participants were randomized to receive FTC/TDF (N=1251) or placebo (N=1248). Cr elevations occurred among 32 (2.6%) in the active arm and 24 (2.2%) in the placebo arm (RR 1.35 95% CI 0.80 to 2.3). Among the placebo arms, Cr elevations occurred at a constant rate of 0.86/100 person years. The majority of excess Cr elevations in the active arm occurred between weeks 12 and 24 weeks of PrEP use (N=9, 0.7%, 95% CI -0.1 to 1.6%; see

figure), and all excess events occurred by 48 weeks. Cr elevations resolved within a median of 11 days (IQR: 7 to 24) on the active arm and 15 days (IQR: 7 to 25) on the placebo arm. Eighty percent on elevations on FTC/TDF were only for a single value and 80% never discontinued drug.
**Conclusions:** The findings support the recent World Health Organization PrEP implementation guidance suggesting Cr monitoring at 3 month intervals for 12 months and less frequently thereafter. The finding that most excess creatinine elevations occur after several months of dosing suggests that PrEP can be started in people who can be recontacted while baseline Cr testing is being performed.

## WEPEC237

### COMMUNITY- AND INDIVIDUAL-LEVEL CHALLENGES FOR HIV PRE-EXPOSURE PROPHYLAXIS (PREP) UPTAKE AMONG MSM IN MUMBAI, INDIA

S. Rawat[1], M. Shunmugam[2], V. Chakrapani[2], P.A. Newman[3], R. Nelson[2], V.R. Anand[1]
*[1]The Humsafar Trust, Research Unit, Mumbai, India, [2]Center for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India, [3]University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada*
*Presenting author email: shruta.hst@gmail.com*

**Background:** Pre-exposure Prophylaxis (PrEP) is emerging as a new HIV prevention technology for most-at-risk groups, including MSM. HIV prevention strategies in India have focused on condom use and periodic HIV testing; however, MSM continue to be disproportionately affected. With high efficacy for preventing HIV infection, PrEP could be a significant addition to prevention programs in India.
**Methods:** From Oct-Dec 2014, we conducted five focus groups with MSM (n = 30) and five key informant interviews in Mumbai, India. MSM with diverse identities (*Kothi, Panthi*, Gay, and Bisexual) were recruited using purposive sampling. Focus groups and interviews were transcribed, translated into English, and analyzed thematically.
**Results:** Participants' mean age was 25.3 years and mean monthly income was INR 9500; 50% reported higher secondary education. Forty-three percent of the participants reported inconsistent condom use, 33% reported using water-based lubricants in the last year, and 23% were involved in sex work. Most participants (56%) were willing to use PrEP if available. The following community-level challenges emerged for PrEP uptake/implementation: affordability of PrEP, fear of PrEP users being judged by MSM community and family members as promiscuous/HIV positive/substance users, and risk of being outed as "PrEP users" (and thus as MSM) to family/wife. Key individual level challenges were fear of side-effects from long-term use and perceived lack of self-efficacy in adherence. Key informants highlighted ethical implications of providing PrEP in a scenario with frequent stock-outs of government-supplied free antiretroviral medications, risk compensation by individuals in the form of increase in the number of partners, lack of emphasis on condom use as well as concerns around disclosure of HIV status to steady partners.
**Conclusions:** Challenges identified highlight socio-cultural attitudes-particularly stigma toward homosexuality and people living with HIV. Ethical challenges around providing ARV as PrEP in resource-constrained scenarios too need to be mitigated as people living with HIV do not have adequate access to treatment. Future efforts to introduce PrEP among Indian MSM need to address social-structural as well as individual-level challenges for effective implementation and inclusion of PrEP into national HIV interventions.

## WEPEC238

### CHARACTERIZING BLACK MEN WHO HAVE SEX WITH MEN IN THE UNITED STATES WHO HAVE NEVER RECEIVED AN HIV TEST

D. Matthews[1], M. Uzzi[2], S. Meanley[2], J. Egan[2], L. Bukowski[2], L. Eaton[3], R. Stall[2], POWER study team
*[1]University of Pittsburgh, Infectious Diseases and Microbiology, Pittsburgh, United States, [2]University of Pittsburgh, Behavioral and Community Health Sciences, Pittsburgh, United States, [3]University of Connecticut, Human Development and Family Studies, Storrs, United States*
*Presenting author email: derrick.matthews@pitt.edu*

**Background:** Prevention and treatment responses to the high burden of HIV among Black MSM (BMSM) in the US require timely diagnosis of existing infection. Those unaware of their HIV-positivity, though a minority of BMSM living with HIV, are disproportionately represented in transmission and premature mortality. Understanding factors associated with never receiving an HIV test can inform efforts that routinize testing and link those diagnosed with HIV into care.
**Methods:** Promoting Our Worth, Equality, & Resilience (POWER) is cross-sectional observational study that recruits BMSM at Black Pride events in six US cities. Participants complete an anonymous questionnaire and are offered free, confidential HIV testing. Those who forgo testing are asked to provide an oral sample for anonymous HIV antibody testing; participants do not receive this test result. Multivariable analysis adjusted for sociodemographics, internalized homophobia, and depressive symptomatology. All analyses controlled for city and were weighted according to POWER's time-location sampling; we report unadjusted frequencies and weighted percentages.
**Results:** Our analytic sample included 2,675 BMSM who did not identify as HIV-positive. 243 (8.18%) had never received an HIV test (mean age = 29.05 years). Higher education was associated with increased odds of having received an HIV test (AOR=1.51, 95% CI: 1.33 - 1.70) and greater internalized homophobia reduced odds (AOR=0.75, 95% CI: 0.63, 0.90). Among those who never received an HIV test, greater age was associated with increased odds in assuming HIV-positivity (AOR=1.05, 95% CI: 1.01 - 1.09) and health insurance lower odds (AOR=0.19, 95% CI: 0.07 - 0.52). Though 202 (82.60%) received HIV testing through participation in POWER, a majority of those 202 testing (57.14%) elected not to receive their result. Greater age (AOR=1.07, 95%, 1.01 - 1.13), assumption of HIV-positivity (AOR=6.60, 95% CI: 1.72 - 25.23), and choosing not to receive HIV test result (AOR=2.83; 1.18 - 6.79) were all associated with increased odds of an HIV-positive test result (27.98%).
**Conclusions:** Relatively few BMSM had never received an HIV test, but this group had a high likelihood of HIV infection. Our results indicate need for alternative strategies that overcome existing barriers to providing needed HIV prevention and treatment to a group of underserved BMSM.

## WEPEC239

### PRE-EXPOSURE PROPHYLAXIS (PREP) AWARENESS AND USE AMONG A US BASED, MULTI-CITY SAMPLE OF BLACK MEN WHO HAVE SEX WITH MEN

L. Eaton[1], D. Matthews[2], D. Driffin[1], L. Bukowski[2], P. Wilson[3], R. Stall[2]
*[1]University of Connecticut, Storrs, United States, [2]University of Pittsburgh, Pittsburgh, United States, [3]Columbia University, Manhattan, United States*
*Presenting author email: derrick.matthews@pitt.edu*

**Background:** Although Pre-Exposure Prophylaxis (PrEP) is an effective and available form of HIV prevention, this approach remains largely underutilized by individuals at-risk for HIV transmission. Further, there is limited empirical work that delineates what factors relate to PrEP awareness and uptake among populations in need. In this study, we sought to examine correlates of PrEP awareness and use among a large, multi-city, US-based sample of HIV negative/unknown status Black men who have sex with men (BMSM).
**Methods:** The current paper presents data from an ongoing multi-site, community-based sample of BMSM collected in 2014 (*N*=1,274) and 2015 (*N*=1,442) at Black Pride events in Atlanta, GA; Detroit, MI, Houston, TX, Philadelphia, PA, and Washington, DC. This study employed random time-location sampling to maximize representativeness of BMSM attending these events. Bivariate and multivariate generalized linear modeling were used to examine whether demographic factors (e.g. age, income, education) or sexual risk taking (frequency of condom use, receptive or insertive anal sex) factors were related to PrEP awareness and use.
**Results:** Awareness of PrEP increased between 2014 and 2015 (38%-52%), and use of PrEP increased between 2014 -2015 (4.6%-9.4%). Findings varied greatly across cities within the US. Our analyses demonstrated that greater frequencies of condom use during anal sex as the receptive partner and as the insertive partner were associated with a significantly greater likelihood of being aware of PrEP. Further, lower frequency of condom use during receptive anal sex was significantly associated with a greater likelihood of currently using PrEP.
**Conclusions:** Overall, awareness and uptake of this HIV prevention strategy continues to lag and evidence from our study suggests that PrEP may not be reaching those in greatest need of it; we found that lower frequencies of condom use were associated with less likelihood of being aware of PrEP. Importantly though, among BMSM who are using PrEP, it does appear to be reaching BMSM who could benefit most from it. In order to slow the HIV epidemic among BMSM, we must place greater emphasis on engaging all BMSM to ensure we are not missing those who are in greatest need of prevention interventions.

### SIGNIFICANT HEALTH COMORBIDITIES IN BLACK MEN WHO HAVE SEX WITH MEN PRESENTING FOR A US PREP STUDY

L. Hightow-Weidman[1], M. Magnus[2], S. Shoptaw[3], L. Emel[4], G. Beauchamp[4], E. Piwowar-Manning[5], K. Mayer[6], L. Nelson[7], P. Watkins[8], S. Fields[9], D. Wheeler[10]
*[1]University of North Carolina-Chapel Hill, Medicine, Infectious Disease, Chapel Hill, United States, [2]George Washington University, Washington, United States, [3]UCLA, Los Angeles, United States, [4]Fred Hutchinson Cancer Research Center, Seattle, United States, [5]Johns Hopkins University, Baltimore, United States, [6]The Fenway Institute, Boston, United States, [7]University of Rochester, Rochester, United States, [8]FHI 360, Durham, United States, [9]Charles R. Drew University, Los Angeles, United States, [10]University of Albany - SUNY, Albany, United States*
*Presenting author email: sheldonfields@cdrewu.edu*

**Background:** HPTN 073 evaluated initiation, acceptability, safety, and feasibility of pre-exposure prophylaxis (PrEP) for Black men who have sex with men (BMSM) a group disproportionately impacted by the US epidemic.
**Methods:** A total of 226 HIV-uninfected BMSM in three US cities were enrolled between 8/2013 and 9/2014 and offered once daily oral FTC/TDF combined with a Client Centered Care Coordination counseling (C4) intervention. This analysis examined clinical reasons for study exclusion and pre-existing conditions among those enrolled, in order to inform programs designed to increase PrEP use among BMSM.
**Results:** A total of 118 BMSM (27.1% ≤ 25 years of age) were excluded from enrollment. Of those, 39.8% were excluded due to medical reasons, including 21.2% with abnormal liver or kidney function, 8.5% with other abnormal lab results, and 8.5% with other serious and active mental or medical illnesses. Those enrolled were younger (40.3% < 25 vs. 27.1%, $p< 0.02$) and more likely to have annual household incomes >$20,000 (50.9% vs. 36.5%, p=0.005) than those not enrolled. Among those enrolled (N=226), only 19.0% presented without pre-existing conditions. Nearly two-thirds (65.5%) had at least one clinically significant comorbidity at enrollment (Table 1). Psychiatric (29.6%), cardiovascular (15.0%), endocrine (4.9%), pulmonary (13.7%), neurologic (11.9%) and hepatic (5.8%) conditions were common. Nearly one-third (31%) had comorbidities in least two or more organ systems.

| | | Number of participants |
|---|---|---|
| Cardiovascular | Coronary artery disease, hypertension, Hypercholesterolemia, cardiomyopathy, a fib, bradychardia, heart murmur, Raynaud's Syndrome | 34 (15.0%) |
| Endocrine | Diabetes / pre-diabetes, hypogonadism, gout, gynecomastia | 11 (4.9%) |
| Renal | Proteinuria, kidney stones | 3 (1.3%) |
| Hepatic | Hepatitis C, elevated liver function tests | 13 (5.8%) |
| Pulmonary | Asthma / reactive airway disease | 31 (13.7%) |
| Psychiatric | Anxiety, depressions, attention deficit hyperactivity disorder, panic attacks, bipolar, dissociative identity disorder, post-traumatic stress disorder, schizoaffective disorder | 67 (29.6%) |
| Psychiatric | Substance abuse | 14 (6.2%) |
| Neurologic | Migraines, epilepsy / seizures, Bell's plasy, paresthesias, tremors, brain surgery (unspecified), coma, neuropathy, neuralgia, vertigo, sleap apnea | 27 (11.9%) |
| Gastrointestinal | Gastro-esophageal reflux disease, irritable bowel syndrome, proctitis, gastritis, peri-anal fistula, anal fissure, hemorrhoids, ulcer, diverticulitis | 22 (9.7%) |
| Hematology / Oncology | Neutropenia, anemia, benign tumor leg, thalassemia, Mastectomy (unknown reasons) | 12 (5.3%) |
| Genitourinary (excluding STIs) | Benign prostatic hypertrophy | 5 (2.2%) |
| Infectious disease / Rheumatologic | Skin abscess / boils, cellulitis, periodontal infections / gingival abscesses, prostate infections, sinus infections, recurrent otitis media, bacterial meningitis, staph infections, pneumonia, eye / corneal ulcers | 11 (4.9%) |
| Muskuloskeletal | Sciatica, arthritis, spinal fusion, herniated disk | 10 (4.4%) |
| Dermatologic | Eczema | 8 (3.5%) |

*[Table 1: Signficant Pre-Existing Conditions among BMSM in a US PrEP study]*

**Conclusions:** Among BMSM presenting for enrollment in this PrEP study, clinically meaningful health co-morbidities were highly prevalent. These conditions not only excluded a significant number of BMSM from study participation but also were widespread among those who enrolled. This is important given that these are relatively young men, many of whom lack insurance and are economically disadvantaged. These findings highlight the urgent need to better address the myriad health needs of BMSM to optimize HIV prevention.

## WEPEC241

### "EVERYONE'S TRYING TO MAKE SENSE OF THIS NEW REALITY": A QUALITATIVE STUDY OF THE PREP READINESS CONTINUUM AMONG GAY AND BISEXUAL MEN IN TORONTO, CANADA

P.A. Newman[1], A. Guta[2]
*[1]University of Toronto, Factor-Inwentash Faculty of Social Work, Toronto, Canada, [2]Carleton University, Health Sciences, Ottawa, Canada*
*Presenting author email: p.newman@utoronto.ca*

**Background:** Pre-Exposure Prophylaxis (PrEP) has not been approved in Canada, but some physicians prescribe off-label PrEP usage of daily emtricitabine/tenofovir. Given WHO recommendations to make PrEP accessible to men who have sex with men (MSM), we explored decision-making processes, experiences around PrEP access and use among MSM in Toronto.
**Methods:** PrEP users and non-users were recruited through flyers posted in community agencies and clinics in Toronto. We conducted in-depth, semi-structured interviews to explore PrEP knowledge, decision-making around uptake, access, sexual behaviors/relationships and health. Interviews were audio-recorded and transcribed. We applied thematic analysis, with open and axial coding, using a constant comparative method.
**Results:** From Oct-Dec 2015, 23 participants (mean age=37 years; 21 gay, 2 bisexual; 15 white, 2 Black, 2 Latino, 2 Asian, 2 Middle-Eastern), completed 45m-90m interviews. 12 were PrEP users, 11 non-users. Most reported sex with multiple partners and inconsistent condom use. All were familiar with and had accessed information about PrEP. Both users and non-users expressed strong views about personal responsibility and self-care, with trust and concern about HIV infection emerging as important themes: non-users made trust-based decisions about when to use condoms; PrEP users indicated they could only trust themselves, reporting decreased anxiety after condomless or serodiscordant sex. Non-users expressed concerns about long-term safety, needing to use condoms for other STIs, and barriers due to out-of-pocket cost/inadequate insurance coverage. PrEP users indicated uptake due to inconsistent condom use, and reported no longer using condoms unless requested by partners. Users reported no barriers or stigma from healthcare providers. Some openly disclosed PrEP use to friends, sexual partners, and family; others selectively disclosed due to anticipated stigma.
**Conclusions:** Rather than a binary, we identified a continuum of readiness to use PrEP among gay/bisexual men at risk for HIV infection. Some non-users considered PrEP a future option and some wanted to use PrEP but couldn't afford it; some users considered terminating PrEP, with most hoping for an HIV vaccine. Future research should explore the continuum of PrEP readiness among gay/bisexual men, with attention to social support, mental health, stigma, and geographic differences, and barriers in access due to cost and inadequate insurance coverage.

## WEPEC242

### ADHERENCE TO PRE-EXPOSURE PROPHYLAXIS AMONG LOW-FEE FEMALE SEX WORKERS IN CHINA

C. Zhou[1], N. Aston[1], Z. Wu[2], K. Rou[1], W. Dong[1], Y. Yang[3], X. Sun[3], X. Feng[4], Y. Yang[4], H. Zang[5], Y. Wu[5], China National HIV Prevention Study Group
*[1]National Center for AIDS/STD Control and Prevention, Division of Prevention and Intervention, Beijing, China, [2]National Center for AIDS/STD Control and Prevention, Beijing, China, [3]Zhangjiajie Center for Disease Control and Prevention, Zhangjiajie, China, [4]Liuzhou Center for Disease Control and Prevention, Liuzhou, China, [5]Pingnan Center for Disease Control and Prevention, Pingnan, China*
*Presenting author email: wuzy@263.net*

**Background:** Low-fee FSWs may be good candidates for PrEP in China due to their high HIV prevalence and low consistent condom use. No published studies have investigated PrEP adherence among low-FSWs.
Our study aims to evaluate PrEP adherence among them, and determine whether PrEP is appropriate for this population.
**Methods:** First, participants underwent physical examination and those meeting inclusion criteria (HIV positive, infected with hepatitis B, or were pregnant or breastfeeding were excluded) completed a baseline survey. The outreach workers distributed 15 TDF pills and 1 portable pill box to each participant. Participants were instructed to take one TDF pill once daily; Second, follow-up visits were conducted every 15 days .Local outreach workers counted the remaining TDF pills and then administered a structured questionnaire ; Finally, after 6 follow-up visits, a second physical examination (identical to pre-study) was carried out. Two indicators, retention rate and pill-missing rate, were used to evaluate adherence to PrEP.
**Results:** A total of 105 low-fee FSWs participated in the physical examination (7 participants tested HBV positive; and 13 participants refused to participate without giving specific reasons), 85 participants were enrolled. Three months' cumulative retention rate was 58.8%. Significant differences were found among participants of different venues, 72.7% of participants who worked in self-rented rooms or "market

day" buildings remained in the cohort while 43.9% of participants in small beauty salons/massage rooms/guest houses did (P=0.015). The main reasons for dropping out were participants' intent to return to their hometown for several months and intolerance for self-reported side effects. Pill-missing rate was highest (29.8%) in the first follow-up visit, and declined to 4.0% in the final follow-up visit. The most frequently reported reasons for missing a single dose were because participants forgot to take their pill or returned to their hometown for several days.
**Conclusions:** Low-fee FSWs who work in self-rented rooms/"market days" buildings had cumulative retention rates higher than 70% and are potentially good candidates for PrEP. Targeted adherence motivation measures should be implemented to further decrease drop out and missed pill doses.

## WEPEC243

### THE ACCEPTABILITY AND FEASIBILITY OF PERIODIC PRE-EXPOSURE PROPHYLAXIS (PREP) FOR FEMALE PARTNERS OF MIGRANT MINERS IN THE GAZA PROVINCE OF MOZAMBIQUE

J. Falcao[1], L.N. Ahoua[1], A.Z. Buba[2], P. di Mattei[1], K. O'Reilly[3], R.C. Baggaley[3], V. Chivurre[4], P. Mulondo[5], I. Ramiro[4], S. Dalal[3], F. Morales[6], W.M. El-Sadr[2]
*[1]ICAP, Maputo, Mozambique, [2]ICAP, New York, United States, [3]WHO, Geneva, Switzerland, [4]Ministry of Health, Provincial Health Directorate, Xai Xai, Mozambique, [5]TEBA Development, Xai Xai, Mozambique, [6]ICAP, Dar es Salam, Tanzania, United Republic of*
*Presenting author email: laurenceahoua@columbia.org.mz*

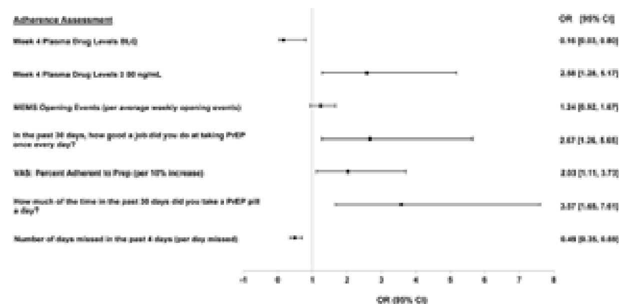
**Background:** Migrant miners returning from South Africa to Mozambique are at substantial risk for HIV infection and consequently for transmission to their sexual partners. We conducted a study to assess the feasibility, acceptability and willingness for PrEP uptake among female partners of migrant miners during miners' home visits to inform a future periodic PrEP study among female partners.
**Methods:** A cross-sectional study, including quantitative surveys, in-depth interviews and focus group discussions, was conducted in Gaza Province in Mozambique. Quantitative data were analyzed using Stata. A structured coding scheme was developed and qualitative data were entered and analyzed using Atlas.ti.
**Results:** Between September to October 2015, 207 individuals were enrolled (45% female partners of miners, 18% miners and 37% others including widows, ex-wives and/or other family members of a miner). Median age was 42 years. Most participants (95%) were willing to take PrEP for a period of 8-10 weeks.
For female partners and for miners, respectively, facilitating factors for PrEP uptake were: concerns about partner sexual behavior (66% and 59%), desire for pregnancy (32% and 11%), and their own sexual behavior (19% and 41%). For female partners, the main potential barriers for PrEP uptake were: concerns regarding side effects (33%), partner/family or community disapproval (22%), and regular pill intake (21%). For miners, the main potential barriers indicated were: regular pill intake (24%) and fear of side effects (22%).
The qualitative analysis confirmed that PrEP was highly acceptable and overall participants saw potential barriers for PrEP uptake as minor obstacles that could be overcome. The miner's influence on female partner's PrEP uptake was significant and discussed as a separate potential barrier.
There was a consensus expressed that women taking medications in general, without informing male partners, was not generally acceptable and may have adverse consequences for their relationships.
**Conclusions:** We found high interest in PrEP. The need for education of communities, families and partners regarding PrEP was highlighted to achieve male partner approval and support, high adherence with PrEP and to overcome fear of potential side effects and stigma.

## WEPEC244

### DAILY ORAL TDF/FTC PREP USE AMONG MSM IN A LOS ANGELES MULTISITE DEMONSTRATION PROJECT

R. Landovitz[1], R. Kofron[1], C.-H. Tseng[2], R. Bolan[3], R. Flynn[3], W. Jordan[4], J. Rooney[5], L. Bushman[6], P. Anderson[6], A. Wohl[7]
*[1]University of California, Center for Clinical AIDS Research & Education, Los Angeles, United States, [2]University of California, Department of Medicine, Los Angeles, United States, [3]Los Angeles LGBT Center, Los Angeles, United States, [4]Charles R Drew University of Medicine and Science, Los Angeles, United States, [5]Gilead Sciences, Foster City, United States, [6]Skagg School of Pharmacy, University of Colorado, Denver, United States, [7]Los Angeles County Department of Public Health, Division of HIV and STD Programs, Los Angeles, United States*

**Background:** Daily oral tenofovir-DF/emtricitabine (TDF/FTC)-based pre-exposure prophylaxis (PrEP) is effective for HIV prevention in MSM/TGW. Demonstration projects and clinical experience are informing real-world effectiveness and implementation challenges. Predictors of adherence and comparisons of self-report and objective measures were evaluated in the Los Angeles PATH-PrEP Demonstration Project.
**Methods:** HIV-uninfected MSM/TGW seeking HIV prevention services in Los Angeles were screened at two sites. Enrolled participants were assigned to PEP-based or PrEP-based cohorts based on self-reported risk. PrEP-participants were offered open-label daily oral TDF/FTC. Risk behavior and medication adherence were assessed over 48 weeks. PEP-participants were educated about PEP use and availability. If sexual risk increased, those assigned to PEP "escalated" into PrEP. Logistic regression determined predictors of PrEP adherence by self-report, MEMS, plasma TFV and DBS TFV-DP.
**Results:** Between May 2013 and June 2015, 823 individuals expressed interest; 301 enrolled. Median age was 34y; 50.7% non-Hispanic white, 12.4% non-Hispanic black, 28.1% Hispanic. Twenty-three (7.6%) were assigned to PEP, 19 (82.6%) escalated to PrEP. Intraerythrocytic TFV-DP levels were available from 274 participants (91%) at week 4; 85.8% had levels consistent with ≥4 doses/week. In multivariable analysis, non-Hispanic black participants (AOR 0.26, 95% CI: 0.09-0.78), reporting sex for trade in the past month (AOR 0.3, 95% CI: 0.09 - 0.98), and lower education (AOR 0.3, 95% CI: 0.09 - 0.97) were less likely to have protective TFV-DP levels. Other adherence measures variably predicted protective TFV-DP levels at week 4 (Figure). Predictive capacity did not differ by race/ethnicity.



*[Figure: Odds ratios for predictors of TVF-DP levels consistent with ≥4 doses/week in Dried Blood Spot (DBS) samples at Week 4]*

**Conclusions:** There is significant community interest in PrEP among diverse MSM in Los Angeles. Plasma TFV and some self-reports of adherence may offer feasible and scalable surrogates of biomarker assessments in PrEP clinical protocols. Increased understanding of barriers to PrEP use by at-risk black populations, those with less formal education, and sex workers is needed to maximize PrEP impact.

## WEPEC245

### FORMULATION OF A THEORETICALLY-BASED, PERSONALIZED HIV PREP ALGORITHM FOR GAY AND BISEXUAL MEN VISITING A COMMUNITY-BASED CLINIC IN LOS ANGELES, CALIFORNIA

M. Beymer[1,2], R.E. Weiss[3], C.A. Sugar[3], L.B. Bourque[4], G.C. Gee[4], D.E. Morisky[4], S.B. Shu[5], M. Javanbakht[6], R.K. Bolan[1]
*[1]Los Angeles LGBT Center, Sexual Health and Education Program, Los Angeles, United States, [2]University of California, Geffen School of Medicine, Los Angeles, United States, [3]University of California, Fielding School of Public Health, Department of Biostatistics, Los Angeles, United States, [4]University of California, Fielding School of Public Health, Department of Community Health Sciences, Los Angeles, United States, [5]University of California, Anderson School of Management, Department of Marketing, Los Angeles, United States, [6]University of California, Fielding School of Public Health, Department of Epidemiology, Los Angeles, United States*
*Presenting author email: mbeymer@lalgbtcenter.org*

**Background:** Pre-exposure prophylaxis (PrEP) has emerged as an HIV prevention tool for populations at highest risk for HIV infection. Current CDC guidelines for identifying PrEP candidates may not be specific enough to identify gay, bisexual, and other men who have sex with men (MSM) at the highest risk for HIV infection. The primary goal of this study is to create an HIV risk score for HIV-negative MSM to inform more targeted criteria for PrEP use.
**Methods:** Behavioral risk assessment and HIV testing data were analyzed for HIV-negative MSM attending the Los Angeles LGBT Center between January 2009 and June 2014 (n = 9,981). A Multivariate Cox Proportional Hazards Model was used to determine the variables significant in HIV contraction over the follow-up period.
**Results:** Self-reported history of Chlamydia, Gonorrhea, and/or Syphilis ($p < 0.0001$); receptive anal sex ($p < 0.0001$), race/ethnicity of last sex partner ($p = 0.0002$); number of sex partners in the last three months ($p = 0.0001$); methamphetamine use ($p = 0.0004$) and nitrates use ($p = 0.001$) were all significant predictors of HIV infection during follow-up. Intimate partner violence, relative age of last sex partner and ecstasy use were not significant.

**Conclusions:** Approximately 48% of MSM were above a cut-point that we chose as an illustrative risk score to qualify for PrEP, identifying 74% of all seroconverting MSM. The use of this targeted strategy more accurately outlines PrEP candidacy criteria, subsequently allowing individuals and their medical providers to make a more informed decision before use.

## WEPEC246

### COST-EFFECTIVENESS OF PRE-EXPOSURE HIV PROPHYLAXIS DURING PREGNANCY AND BREASTFEEDING IN SUB-SAHARAN AFRICA

J.T. Price[1], S.B. Wheeler[2], L. Stranix-Chibanda[3], S.G. Hosek[4], D.H. Watts[5], G.K. Siberry[5], J.S. Stringer[1], B.H. Chi[1]
*[1]University of North Carolina-Chapel Hill, Global Women's Health Division, Department of Obstetrics and Gynecology, Chapel Hill, United States, [2]University of North Carolina-Chapel Hill, Health Policy and Management, Chapel Hill, United States, [3]University of Zimbabwe College of Health Sciences, Pediatrics and Child Health, Harare, Zimbabwe, [4]John Stroger Hospital of Cook County, Chicago, United States, [5]Eunice Kennedy Shriver National Institute of Child Health and Human Development, National Institutes of Health, Bethesda, United States*

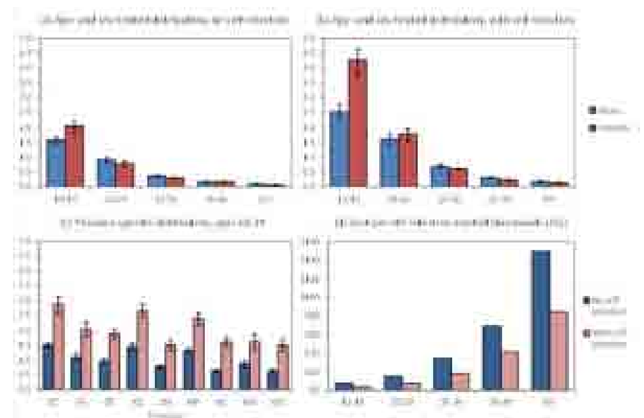
**Background:** Oral antiretroviral pre-exposure prophylaxis (PrEP) for the prevention of HIV acquisition is cost-effective when delivered to those at substantial risk. Despite the high incidence of HIV infection in pregnant and breastfeeding women in sub-Saharan Africa (SSA), an increased risk of preterm birth (PTB) attributable to PrEP could outweigh the HIV prevention benefit.
**Methods:** We developed a conditional probability model to evaluate a strategy of oral PrEP during pregnancy and breastfeeding in SSA. We approached the analysis from a health care system perspective across a lifetime time horizon. Baseline estimates and ranges were derived from existing literature and local sources. The base-case scenario included an HIV incidence in pregnancy of 0.05 per person-year (range: 0.01-0.10), a risk of vertical transmission with incident infection during pregnancy of 23% (range: 10-30%), a baseline PTB risk of 12% versus 20% (range: 10-45%) with PrEP exposure, and PrEP effectiveness of 0.55 (range: 0.30-0.95). The incremental cost-effectiveness ratio (ICER) of PrEP versus no PrEP was calculated in dollars per disability-adjusted life year (DALY) averted. We evaluated the effect of uncertainty in model inputs through one-way and probabilistic sensitivity analyses.
**Results:** Daily oral PrEP administered to pregnant and breastfeeding HIV-negative women in SSA was cost-effective. In a base case of 10,000 women, the administration of PrEP averted 381 HIV infections but resulted in 779 more PTBs. The PrEP scenario was more costly per person ($454 versus $123) but resulted in fewer DALYs (3.18 versus 3.54). The ICER of $914/DALY averted met World Health Organization standards of "very cost-effective". The ICER was most sensitive to PrEP effectiveness, which we varied based on different levels of medication adherence. Probabilistic sensitivity analyses demonstrated relative robustness of the model with nearly 90% of the iterations in Monte Carlo simulation confirming cost-effectiveness of the PrEP strategy.
**Conclusions:** Providing PrEP to pregnant and breastfeeding women in SSA is likely cost-effective, although more data are needed about adherence and safety. For this population at high risk of HIV acquisition, PrEP should be considered as part of broader combination HIV prevention efforts.

## WEPEC247

### STRATEGIES FOR MAXIMIZING THE EFFICIENCY OF PREP: A COMPARISON OF THE IMPACT AND COST-EFFECTIVENESS OF GEOGRAPHICALLY-FOCUSED, SEX-FOCUSED AND AGE-FOCUSED PREP DISTRIBUTION STRATEGIES

L. Johnson[1], L. Jamieson[2], R. Dorrington[3], L.-G. Bekker[4], G. Meyer-Rath[2,5]
*[1]University of Cape Town, Centre for Infectious Disease Epidemiology and Research, Cape Town, South Africa, [2]University of Witwatersrand, Health Economics and Epidemiology Research Office, Johannesburg, South Africa, [3]University of Cape Town, Centre for Actuarial Research, Cape Town, South Africa, [4]University of Cape Town, Desmond Tutu HIV Centre, Cape Town, South Africa, [5]Boston University, Center for Global Health and Development, Boston, United States*
*Presenting author email: leigh.johnson@uct.ac.za*

**Background:** WHO guidelines recommend the promotion of PrEP in sub-populations in which HIV incidence exceeds 3% per annum, but there may be alternative ways to identify at-risk populations, which achieve a more efficient allocation of PrEP resources.
**Methods:** To assess which PrEP distribution strategies would be most efficient and cost effective, a mathematical model of the South African HIV epidemic was developed. The model was calibrated to age-specific, sex-specific and province-specific HIV prevalence data. The model was used to predict the cumulative reduction in HIV incidence per 100 person years (PY) of PrEP, as well as the incremental cost to the HIV programme of PrEP provision per HIV infection averted, over the 2017-2027 period, under different PrEP distribution strategies. Additional scenarios assessed whether results would change in the presence of 'self-selection', assuming that high risk individuals are five times as likely to initiate PrEP as low risk individuals.
**Results:** The number of infections averted per 100 PY of PrEP are substantially higher, and the incremental cost per HIV infection averted is substantially lower, if PrEP is provided to adolescents (aged 15-19) than if PrEP is provided to other age groups (Figures 1a and d). However, limiting PrEP to one sex does not substantially alter PrEP efficiency, except in the case of adolescents if there is significant self-selection (Figure 1b). If PrEP is offered to youth aged 18-24, there are additional efficiency gains from limiting provision to provinces such as Eastern Cape (EC) and KwaZulu-Natal (KZ) (Figure 1c). Self-selection could double efficiency and cost-effectiveness.



[Figure 1: (a)-(c) HIV infections averted per 100 person years of PrEP and (d) cost per infection averted, under different distribution strategies]

**Conclusions:** The cost-effectiveness of PrEP as an HIV prevention strategy is highly dependent on the age groups in which PrEP is promoted and the degree of self-selection. To a lesser extent, PrEP cost-effectiveness may be affected by limiting access to a specific region or sex.

## WEPEC248

### CULTURALLY COMPETENT PREP CARE: INSIGHTS FROM PROVIDERS AND POTENTIAL PATIENTS (SEXUALLY ACTIVE BLACK MSM)

S.K. Calabrese[1,2], A.I. Eldahan[1], L.A. Gaston-Hawkins[1], D. Dangaran[3], N.B. Hansen[2,4], K.H. Mayer[5,6], D.S. Krakower[5,6], M. Magnus[7], T.S. Kershaw[1,2], J.R. Betancourt[8], J.F. Dovidio[1,2,9]
*[1]Yale School of Public Health, Social and Behavioral Sciences Division/Department of Chronic Disease Epidemiology, New Haven, United States, [2]Yale University, Center for Interdisciplinary Research on AIDS, New Haven, United States, [3]Yale College, New Haven, CT, United States, [4]University of Georgia School of Public Health, Department of Health Promotion and Behavior, Athens, United States, [5]Harvard Medical School, Beth Israel Deaconess Medical Center, Boston, United States, [6]Fenway Health, The Fenway Institute, Boston, United States, [7]George Washington University, Milken Institute School of Public Health, Department of Epidemiology and Biostatistics, Washington, United States, [8]Harvard Medical School, Disparities Solutions Center of Massachusetts General Hospital, Boston, United States, [9]Yale University, Department of Psychology, New Haven, United States*
*Presenting author email: sarah.calabrese@yale.edu*

**Background:** Pre-exposure prophylaxis (PrEP) could decrease HIV incidence among men who have sex with men (MSM), a population disproportionately affected by HIV. However, access to PrEP requires disclosing sexual history to a healthcare provider, which may be challenging for many given taboos surrounding sexuality and same-sex behavior. In this qualitative study, strategies and preferences for patient-provider communication surrounding same-sex behavior in the context of PrEP were examined from the perspective of both PrEP prescribers and potential PrEP patients.
**Methods:** Individual 90-minute interviews were conducted with geographically diverse, U.S.-based PrEP providers (n=18) by phone or in person (2014-2015). Six 90-minute focus groups were conducted with sexually active, HIV-negative Black MSM (n=36) in the New York City metropolitan area (2015). Interviews and focus groups were transcribed and thematically analyzed.
**Results:** Providers (94% MDs/72% men/39% White) utilized various strategies to maximize their patients' comfort and candor during sexual history discussions. Strategies included prefacing sexual history questions with acknowledgment of

their sensitivity, explaining their relevance to patient care, and providing assurance that the questions were routinely asked to all patients. Providers strove to cultivate a non-judgmental atmosphere and communicate acceptance of sexual diversity by using neutral language when inquiring about partner gender ("men, women, or both"), familiarizing themselves with colloquialisms for same-sex behaviors, and asking patients about preferred terminology. Confidentiality was also emphasized. Despite these efforts, providers recognized that patients did not always fully disclose their sexual histories. Corroborating this perception, several Black MSM receiving care from sites not specifically identified as LGBT-friendly reported limiting or modifying aspects of their sexual histories, providing only the minimum they perceived as necessary for care or indirect cues about their same-sex behavior due to discomfort with disclosure. Provider authenticity and expertise increased their comfort. They expressed a preference for PrEP to be included in routine discussions of sexual health and presented as a prevention option for a diversity of individuals vs. exclusively for MSM.
**Conclusions:** Providers may optimize PrEP care for Black MSM by clearly demarcating their practice as LGBT-friendly, communicating acceptance for sexual diversity, asking direct questions about sexual behavior, and including PrEP among the safer sex options routinely discussed.

## WEPEC249

### IMPLEMENTATION OF PRE-EXPOSURE PROPHYLAXIS (PREP) IN NEW YORK STATE

T. Nguyen[1], B. Agins[1], L. Stevens[2]
*[1]AIDS Institute, New York State Department of Health, New York City, United States, [2]AIDS Institute, New York State Department of Health, Albany, United States*
*Presenting author email: toan.nguyen@health.ny.gov*

**Background:** The New York State (NYS) Department of Health AIDS Institute convened a statewide PrEP Implementation Forum in August 2015 to provide an overview on the implementation of PrEP services in New York State. 95 participants (49 healthcare providers, 11 consumers, and 35 public health officials) attended the forum.
**Description:** At the forum, 8 clinical sites in NYS presented an overview of the structure of their PrEP programs, described the demographics of their patient populations, identified successful practices and common implementation barriers, and discussed next steps and challenges for improving implementation in NYS.
**Lessons learned:** From 2012-2015, 2577 patients enrolled in PrEP programs at 8 clinical sites throughout NYS. Sites emphasized that having a full-time PrEP specialist to handle insurance navigation, case management, and/or patient counseling was integral to program success. In addition, sites strongly recommended using a multidisciplinary team approach with a PrEP specialist, clinical providers and pharmacists, and prevention educators to provide services. Half of the sites noted that navigating insurance for under- and uninsured patients and limited PrEP knowledge among staff were the most common barriers to implementation.

| Successes (S) and Barriers (B) to PrEP Implementation | Site 1 | Site 2 | Site 3 | Site 4 | Site 5 | Site 6 | Site 7 | Site 8 | Total |
|---|---|---|---|---|---|---|---|---|---|
| Has a PrEP coordinator **(S)** | X | X | X | X | X | X | X | X | 8 |
| Uses a multidisciplinary team approach **(S)** | X | X | X | X | X | X | X | X | 8 |
| Hosts outreach events in the community **(S)** | X | X | X | | | X | X | | 5 |
| Faces under- and uninsured roadblocks **(B)** | | | | X | X | X | | X | 4 |
| Staff has limited understanding about PrEP and insurance navigation **(B)** | | X | X | X | | | | X | 4 |
| Unable to meet demands due to limited capacity **(B)** | X | | X | | | X | | X | 4 |
| Currently trying to bridge the integration of PrEP and primary care **(S)** | | | X | X | | | | X | 3 |
| Partners with specific pharmacies or has an in-house pharmacy **(S)** | X | | | | X | | X | | 3 |
| Has challenges in reaching target PrEP population **(B)** | | | X | | X | | | X | 3 |

*[Successful practices and barriers to PrEP implementation in New York State]*

| Patient Demographics | Site 1 (n=73) | Site 2 (n=180) | Site 3 (n=1230) | Site 4 (n=473) | Site 5 (n=70) | Site 6 (n=359) | Site 7 (n=8) | Site 8 (n=186) | Total |
|---|---|---|---|---|---|---|---|---|---|
| Has over 50% MSM patients | X | X | X | X | X | X | X | X | 8 |
| Has over 50% patients between 25-34 years old | X | X | X | X | X | X | | X | 7 |
| Has over 50% white MSM patients | X | | X | | X | | | X | 4 |
| Has over 50% MSM of color patients | | X | | X | | X | | | 3 |
| Has over 50% uninsured/ underinsured patients | | X | | X | | X | | | 3 |
| Has over 50% privately/ commercially insured patients | X | | X | | | | | | 2 |
| Has over 10% transgender patients | | X | | X | | | | | 2 |

*[Patient demographics]*

**Conclusions/Next steps:** New PrEP programs are inhibited by a lack of understanding among staff about PrEP insurance programs. Prioritizing resources to fund PrEP specialists and applying multidisciplinary team approaches to services were identified as essential to the success of new PrEP programs. As PrEP programs move beyond the initial phases of implementation, it is important to identify new implementation barriers and accordingly adjust best practices to respond to changing needs.

## WEPEC250

### PREP DISCONTINUATION AND ONGOING RISK ASSESSMENT AS PART OF THE DELIVERY OF AN INTEGRATED PREP AND ART HIV PREVENTION STRATEGY FOR AFRICAN HIV SERODISCORDANT COUPLES

R. Heffron[1], C. Celum[1], L. Kidoguchi[1], N. Mugo[2], K. Ngure[2], E. Bukusi[2], J. Odoyo[2], E. Katabira[3], N. Bulya[3], S. Asiimwe[4], E. Tindimwebwa[4], J. Haberer[5], D. Donnell[1], J.M. Baeten[1]
*[1]University of Washington, Seattle, United States, [2]Kenya Medical Research Institute, Nairobi, Kenya, [3]Makerere University, Kampala, Uganda, [4]Kabwohe Clinical Research Center, Kabwohe, Uganda, [5]Massachusetts General Hospital, Boston, United States*
*Presenting author email: rheffron@uw.edu*

**Background:** HIV-negative persons are vulnerable to HIV acquisition when HIV-positive partners have unsuppressed HIV viremia. PrEP is a proven prevention strategy that can provide protection during these times. When HIV risk is mitigated through ART use, however, PrEP can be discontinued.
**Methods:** We enrolled Kenyan and Ugandan HIV serodiscordant couples with high HIV transmission risk and delivered an integrated PrEP and ART strategy. All HIV-negative partners were offered PrEP until their HIV-positive partner sustained ART use for ≥6 months, when viral suppression would be expected. PrEP discontinuation was then encouraged. Couples were seen every three months for HIV prevention counseling, HIV testing and PrEP refills for negative partners, 6-monthly CD4 and viral load measurements for HIV positive partners, PrEP and ART adherence counseling, and interviewer-administered behavioral questionnaires.
**Results:** We enrolled 1013 high risk HIV serodiscordant couples from 4 sites in Kenya and Uganda. In 67% of couples, the woman was the HIV-positive partner. At enrollment, 65% of couples reported having condomless sex in the prior month and the median viral load of HIV-positive partners was 4.6 log copies/ml (3.8-5.0). After two years, 89% of HIV-positive partners had initiated ART and 91% of those were virally suppressed (HIV RNA < 400 copies/ml). 97% of HIV-negative partners used PrEP during the study for a median time of 12 months (IQR 9-18). 608 (62%) PrEP users discontinued PrEP following ≥6 months of ART use by their HIV-positive partner, 104 (10%) discontinued PrEP with < 6 months of ART use by their positive partner, and 273 (28%) continued PrEP until the study ended. When PrEP use overlapped with ART use for ≥6 months, the primary reasons for continuing PrEP included wanting longer ART use (30%), immediate fertility intentions (28%), and wanting additional protection against HIV (17%). Of those who discontinued PrEP, 38 (5%) re-started prior to exiting the study.
**Conclusions:** PrEP and ART can be delivered with an integrated approach to provide immediate protection against transmission within HIV serodiscordant couples. Ongoing HIV risk assessment of HIV-negative partners enables appropriate recommendations and counseling about continuation or discontinuation of PrEP.

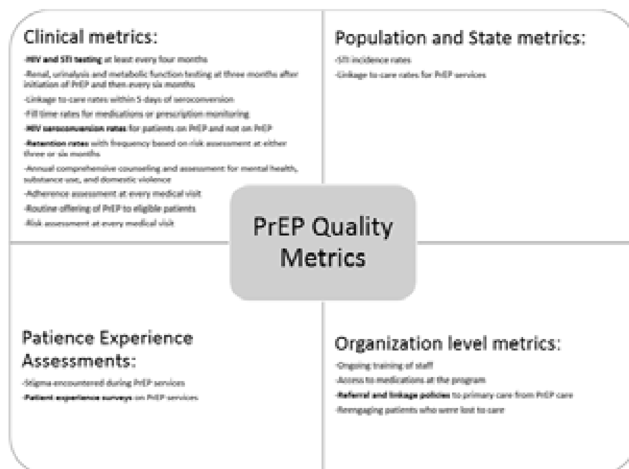
### DEVELOPMENT OF PRE-EXPOSURE PROPHYLAXIS (PREP) QUALITY OF CARE INDICATORS IN NEW YORK STATE (NYS)

T. Nguyen, B. Agins, J. Lowy, J. Fagan
*New York State Department of Health, AIDS Institute, New York City, United States*
*Presenting author email: toan.nguyen@health.ny.gov*

**Background:** Quality metrics specific to PrEP have not yet been created and widely used. The NYS Department of Health AIDS Institute convened a statewide PrEP Implementation Forum in August 2015 to generate recommendations to develop PrEP quality measures. 95 participants (49 healthcare providers, 11 consumers, and 35 public health officials) attended the forum.
**Description:** Prior to the forum, a modified Delphi survey was sent to Forum participants. Participants were divided into 4 groups and rotated "World-Café" style to provide recommendations for the measures.
**Lessons learned:** Despite the newness of PrEP service models, participants successfully identified key measures for monitoring their quality. The use of a formal Delphi survey and facilitated focus group discussions with consumers, providers, and policymakers serves as an effective platform for developing PrEP quality metrics.



*[Key forum recommendations for PrEP quality metrics]*

**Conclusions/Next steps:** As PrEP uptake and implementation increases, PrEP quality metrics will be an important tool in accurately assessing the quality of PrEP services. The results from the modified Delphi Survey and recommendations from the forum will be used to guide the development of PrEP quality metrics which will be stratified by the following categories: clinical, patient experience, organizational, and population.

## WEPEC252

### PREP IMPLEMENTATION IN AN URBAN HIV CLINIC: 1ST YEAR REAL WORLD OBSERVATIONS

P. Tiberio[1], K. Williams[1], J. Holmes[1], E.J. Edelman[2], L. Barakat[2], R. Hao[2], M. Virata[2], O. Ogbuagu[3]
*[1]Yale New Haven Hospital, New Haven, United States, [2]Yale University School of Medicine, New Haven, United States, [3]Yale University School of Medicine, Section of Infectious Diseases, New Haven, United States*
*Presenting author email: perry.tiberio@yale.edu*

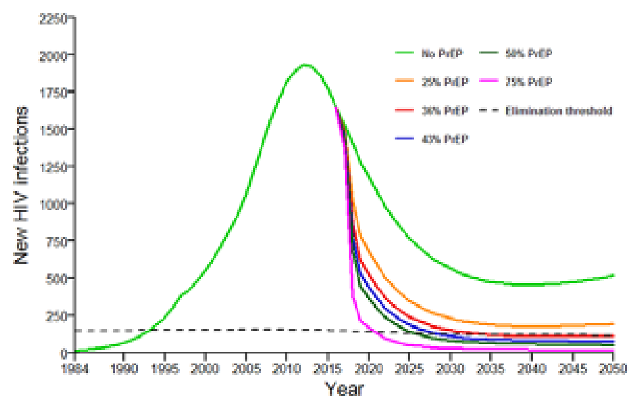
**Background:** Multiple high quality clinical trials have demonstrated the efficacy of pre-exposure prophylaxis (PrEP) for HIV prevention. However, the slow adoption of PrEP has resulted in low numbers of eligible individuals in the US utilizing this prevention tool. Its implementation has been hindered by lack of knowledge about or unwillingness of providers to offer the service, in part related to their concerns about cost/affordability, medication adherence and sexual risk compensation among PrEP users.
**Methods:** We reviewed the medical records of all clients attending two PrEP clinics within the Yale-New Haven Hospital system, Connecticut, USA. Data was collected on demographics, referral source, indications for PrEP, self-reported adherence, HIV test results, sexually transmitted infections (STIs), hepatitis B (HBV) immunity and anal or cervical pap smear results. Categorical and continuous variables were reported as simple frequencies and medians with interquartile ranges respectively.
**Results:** : Sixty-three clients have been enrolled, median age - 34 years, 59 (93.7%) are males. Majority of clients are MSM (76.2%), 6 (9.5%) self-identified as bisexual and 8 (12.7%) are heterosexual individuals in serodiscordant relationships. Leading referral sources were self (52%), community AIDS service organization, health department or clinic (17%), partners or friends (16%), and primary care physician (6%). No clients tested positive for HIV at screening, 43% were non-immune to HBV. All but 4 clients were able to initiate PrEP with barriers being low creatinine clearance (1), lack of insurance (1), cost(1) and 1 individual was determined to be of too low a risk for HIV. Twenty-two percent of all clients had sexually transmitted Infections (STIs) at screening or subsequent follow up visits including pharyngeal (7.9%), rectal (1.6%) and urethral (1.6%) gonorrhea; rectal (3.2%) and urethral (1.6%) chlamydia; and syphilis (3.2%). Of 21 pap smear results, 5 (24%) were abnormal. To date, 2 individuals reported suboptimal adherence,
1 discontinued PrEP due to gastrointestinal intolerance and no HIV seroconversions have occurred.
**Conclusions:** PrEP implementation is feasible with high uptake, adherence and effectiveness. In addition to HIV prevention, PrEP clinics have to be prepared to offer vaccinations, medication adherence counselling, manage STIs and refer individuals with abnormal pap smears for appropriate care.

## WEPEC253

### SCALING UP PRE-EXPOSURE PROPHYLAXIS (PREP) AS A STRATEGY TO ELIMINATE HIV TRANSMISSION AMONG MEN WHO HAVE SEX WITH MEN (MSM): A MODELING STUDY

H.-J. Wu[1], C.-C. Chang[1], C.-T. Fang[1,2]
*[1]National Taiwan University, Institute of Epidemiology and Preventive Medicine, Taipei, Taiwan, Province of China, [2]National Taiwan University Hospital, Internal Medicine, Taipei, Taiwan, Province of China*
*Presenting author email: wuhj527@gmail.com*

**Background:** PROUD and IPERGAY studies both demonstrated a 86% HIV risk reduction by pre-exposure prophylaxis (PrEP), nearly twice better than the 44% efficacy reported by the earlier iPrEX study. Therefore, previous modeling studies, which were based on iPrEX data, might under-estimate the actual impact of scaling-up PrEP among key population. We aimed to incorporate the newest data into evaluation of the population-level impact of PrEP and investigate the conditions under which the scaled-up PrEP program drives the HIV epidemic into elimination.
**Methods:** We constructed a dynamic model of HIV transmission and disease progression among men who have sex with men (MSM) in Taiwan, taking HIV cascades, age/risk structure, and demographic transmission into consideration. The model was fitted to HIV surveillance data from 1990 to 2014. We evaluated the impact of scaling-up PrEP to 25-75% coverage, among MSM aged 15-44, on the trajectory of the HIV epidemic among all MSM.
**Results:**



*[Figure 1. Impact of scaling-up PrEP on the trajectory of HIV epidemic among MSM in Taiwan]*

The figure shows the predicted epidemic curves under different level of PrEP scaled-up. The baseline scenario is the current level of HIV test-and-treat among MSM in Taiwan (72% knew their HIV status, 58% were prescribed highly active retroviral therapy). Without PrEP, HIV will remain endemic in MSM by 2035 and beyond, with 500 new infections annually (green line). Scaling up PrEP to 36% coverage will drive the HIV into elimination among 15-44 year-old MSM (incidence< 1/1000 person-years; dash line) by 2035 (red line), even though HIV test-and-treat remains at the current level. Increasing coverage of PrEP to 43% will achieve the goal of HIV elimination by 2030, with prevention of 17,584 new HIV infection (64%) during 2016-2050 (blue line).
**Conclusions:** Scaling up PrEP to 36% or more coverage among key population is an effective strategy to eliminate HIV transmission. Higher PrEP coverage will accelerate the achievement of the goal.

## WEPEC254

### PERCEPTIONS OF HIV PRE-EXPOSURE PROPHYLAXIS (PREP) IN KWAZULU-NATAL PROVINCE, SOUTH AFRICA

M. Ma[1], A. Moll[2], V. Guddera[3], L. Andrews[4], G. Friedland[4], S.V. Shenoi[4]
*[1]Yale School of Public Health, Epidemiology of Microbial Diseases, New Haven, United States, [2]Church of Scotland Hospital, Tugela Ferry, South Africa, [3]Philanjalo, Tugela Ferry, South Africa, [4]Yale School of Medicine, AIDS Program, New Haven, United States*
*Presenting author email: sheela.shenoi@yale.edu*

**Background:** Despite a large treatment program, South Africa continues to have high adult HIV prevalence and incidence. New prevention strategies such as oral pre-exposure prophylaxis (PrEP) for HIV using a fixed dose of tenofovir disoproxil fumarate and emtricitabine are needed to reduce HIV incidence. Previous studies, however, have shown that PrEP efficacy is highly dependent on medication adherence. Little is known about interest in PrEP and the factors that may affect adherence in rural South Africa.
**Methods:** In 2015, 200 interviews were conducted with self-reported HIV-negative community members in the rural Msinga subdistrict of KwaZulu-Natal province. Participants were recruited from community settings such as: taxi ranks, pension pay points, and municipality events. A quantitative anonymous questionnaire was used for the interview to assess demographics, HIV knowledge, PrEP knowledge and perception, and personal interest in PrEP. Fifty health care workers were also interviewed at their respective primary health care clinic within the subdistrict.
**Results:** Of the 200 community members interviewed, median age was 27 (IQR=22-34) years, 56.5% were female, 88.5% knew that condom use would protect against HIV acquisition, but 20% reported never using a condom; 30% reported at least 2 sexual partners in the last month. Both male (89.7%) and female respondents (92.9%) expressed interest in PrEP. Stigma assessments indicated 51.3% believed HIV positive individuals were infected because of their own carelessness, 59.3% believed that others would think they have HIV if they were taking PrEP, and 21.6% believed that others would avoid them if they were taking PrEP. Stigma was not associated with gender. Health care workers (90%) were interested in working with PrEP, but expressed concerns about adherence, discontinued condom use, discontinued HIV testing, and an increase in number of sexual partners.
**Conclusions:** Community members in this rural South African community are engaged in substantial HIV risk behaviour and along with health care workers, expressed great interest in and potential benefit from PrEP. However, stigma against those with HIV may influence adherence to the PrEP regimen. Further efforts are needed to engage and educate community members about PrEP and to determine its optimal implementation strategy in rural communities.

## WEPEC255

### USE OF BEHAVIOURAL ELIGIBILITY CRITERIA TO IDENTIFY HIGH-HIV RISK GAY MEN FOR ENROLMENT IN A PRE-EXPOSURE PROPHYLAXIS (PREP) STUDY IN NEW SOUTH WALES, AUSTRALIA

S.J. Vaccher[1], A. Grulich[1], G. Prestage[1,2], B.R. Bavinton[1], I. Zablotska[1]
*[1]Kirby Institute, HIV Epidemiology and Prevenetion, Sydney, Australia, [2]Australian Research Centre in Sex Health and Society, La Trobe University, Melbourne, Australia*
*Presenting author email: svaccher@kirby.unsw.edu.au*

**Background:** Pre-exposure prophylaxis (PrEP) is a highly effective HIV prevention strategy in high-risk individuals. Australian criteria for determining eligibility for PrEP focus on individuals who report high-risk behaviours, and were first trialled in the PrEP demonstration project *PrELUDE*. We assessed the risk profile of participants to evaluate how these behavioural risk criteria performed.
**Methods:** *PrELUDE* is an ongoing, open-label, single-arm demonstration study of oral Truvada as PrEP. Participants are predominately gay and bisexual men (GBM), with a small number of transgender individuals and women in serodiscordant relationships. Here, we present descriptive statistics of behavioural and demographic data from a 20-question, self-administered pre-screening form (n=295 GBM). Participants identified as medium risk were eligible to enter the study based on the prescriber's clinical judgement.
**Results:** Median age of participants was 36 years (range: 20-69 years); 64% were born in Australia. The majority (82%) were employed, and 81% had attained post-secondary education. Overall, 249 GBM (84%) met at least one, and 48% met two or more of the four high-risk eligibility criteria. Two-thirds of participants were enrolled in *PrELUDE* based on meeting the highest-risk criterion, HR2 (Table 1). Of all high-risk participants, 51% who met the criterion 2, and 78% of participants who met criterion 4, also met at least one other high-risk criterion. Furthermore, participants had a high ongoing risk of contracting HIV, with 95% believing they were likely to have multiple events of condomless intercourse in the next 3 months.

| High Risk (HR) Criteria (in last 3 months) | Number (%) |
|---|---|
| HR1: Condomless sex with a regular HIV-positive partner | 92 (31%) |
| HR2: Receptive sex with a casual male partner of HIV-positive or unknown HIV status | 198 (67%) |
| HR3: Rectal gonorrhoea or chlamydia diagnosis | 54 (18%) |
| HR4: Methamphetamine use | 110 (37%) |

*[Table 1: Distribution of high risk behavioural eligibility criteria at enrolment in PrELUDE]*

**Conclusions:** Australian behavioural eligibility criteria for PrEP can help identify GBM who are at the highest risk of HIV acquisition, whilst allowing patients with more complex needs the opportunity to access PrEP on a case-by-case basis. In PrEP demonstration studies or in settings where PrEP access is limited, PrEP can be targeted to the highest-HIV risk individuals maximising cost-effectiveness and potential prevention benefits.

## WEPEC256

### PREP INTEREST, ELIGIBILITY AND INITIATION BY MSM AND TRANSWOMEN IN CAPE TOWN AND PORT ELIZABETH, SOUTH AFRICA

L.-G. Bekker[1], P.S. Sullivan[2], K. Dominguez[1], C. Yah[3], S. Baral[4], N. Phaswana-Mafuya[3], A.D. McNaghten[2], A. Siegler[2], R. Zahn[2], R. Kearns[2], T. Sanchez[2]
*[1]Desmond Tutu HIV Foundation, University of Cape Town, Department of Medicine, Cape Town, South Africa, [2]Emory University Rollins School of Public Health, Department of Epidemiology, Atlanta, United States, [3]Human Sciences Research Council and Nelson Mandela Metropolitan University, Port Elizabeth, South Africa, [4]Johns Hopkins University Bloomberg School of Public Health, Baltimore, United States*
*Presenting author email: linda-gail.bekker@hiv-research.org.za*

**Background:** Men who have sex with men (MSM) and transgender women (transwomen) experience high rates of HIV infections globally. Pre-exposure prophylaxis (PrEP) is an efficacious prevention modality, and Truvada is approved for PrEP in South Africa. However, PrEP implementation for MSM in South Africa has been largely limited to randomized clinical trials.
**Methods:** The Sibanye Health Project is a study of MSM/transwomen in Cape Town (CT) and Port Elizabeth (PE), South Africa, recruited by outreach in community settings. At baseline, participants were tested for HIV. If HIV-negative, PrEP was offered as part of a comprehensive HIV prevention package, including prevention counseling, STI testing and condom and lubricant distribution. Demographic, behavioral, and clinical data were collected through tablet-administered surveys and by study staff. Overall and by city, we describe the proportions of MSM/transwomen who were interested in initiating PrEP, met behavioral criteria, met clinical criteria, and started PrEP. Initiation by age, race, and city were assessed using chi-square tests.
**Results:** We enrolled 292 participants (115 in CT and 177 in PE) of whom 167 (57%) were HIV-negative. Overall, 95% of HIV negative participants were interested in PrEP; 87% met behavioral criteria; 77% met clinical criteria; and 48% initiated PrEP (Figure). Eighty of 129 eligible participants initiated PrEP (62%). Of 17 ineligible for clinical reasons, most had hepatitis B infection (5) or elevated liver enzymes (7). PrEP initiation did not differ by age or race, but was higher in CT (p=0.04).
**Conclusions:** Levels of interest and eligibility for PrEP were high among MSM/transwomen in PE and CT. About two thirds of those eligible initiated PrEP. These data illustrate that interest in PrEP is high, behavioral and clinical screening for PrEP is feasible in diverse urban settings, and high PrEP coverage is possible when it is offered as part of a comprehensive package of HIV prevention services.

### BASELINE CHARACTERISTICS AND SUITABILITY OF PARTICIPANTS ENROLLED IN AN OPEN-LABEL ORAL PRE-EXPOSURE PROPHYLAXIS STUDY FOR HIV-NEGATIVE ADOLESCENTS IN SOUTH AFRICA

R. Marcus[1,2], K. Gill[1], J. Dietrich[3], T. Bennie[1], F. Kayamba[1], S. Sekhukhuni[3], G. Gray[3], L.-G. Bekker[1]
*[1]Desmond Tutu HIV Centre, University of Cape Town, Cape Town, South Africa, [2]Barts Health NHS Trust, Department of Infection and Immunity, London, United Kingdom, [3]Perinatal HIV Research Unit, University of the Witwaterstrand, Johannesburg, South Africa*
*Presenting author email: rebecca.marcus@hiv-research.org.za*

**Background:** Adolescents in sub-Saharan Africa are at high-risk for HIV, with up to 45% of heterosexual transmissions in South Africa occurring in young women. While Truvada as pre-exposure prophylaxis (PrEP) has been well established in adults, there are no data on PrEP in adolescent populations in sub-Saharan Africa. We aimed to describe the baseline characteristics and suitability for oral PrEP of participants enrolled in an open-label adolescent PrEP study.
**Methods:** PlusPills is an ongoing open-label study examining the use, feasibility and acceptability of daily oral Truvada as PrEP in HIV-negative adolescents. Female and male participants aged 15-19 years were recruited in two peri-urban settings in Johannesburg and Cape Town. Study staff collected demographic, behavioural and clinical data. Those who were not sexually active, and those who were found to be HIV positive or pregnant at screening were excluded. Eligible female participants willing to use hormonal contraception, and eligible male participants were consented for daily oral PrEP as part of a combination HIV prevention package which included condoms and sexually transmitted infection (STI) screening and treatment. Baseline characteristics recorded included age, gender, sexual behaviour, pregnancy, HIV and STI screening.
**Results:** To date, 154 adolescents were screened, and 100 participants have enrolled (recruitment target =150). Of those screened, three were HIV positive (2%) and eight girls (9%) were pregnant. Sixty females and forty males were enrolled, with a mean age of 18 (range 15-19) and 17 (range 15-17) years respectively. Of these, 57 (57%) tested positive for sexually transmitted infections (STIs) at baseline. Thirty-two participants tested positive for chlamydia, 16 for herpes simplex-2, and 9 for gonorrhoea. Participants reported high-risk sexual behaviour, with 24 of 52 (46%) participants surveyed reporting previous condomless sex, 14 (27%) reporting multiple concurrent sexual partners, and 7 (13%) reporting intergenerational sex.
**Conclusions:** The high numbers of STIs and pregnancies amongst participants indicate that we have successfully recruited from a population of adolescents engaging in high-risk sexual activity in a community with high HIV prevalence. Adolescents in this setting are therefore a key population in whom to investigate oral PrEP use and one that would derive significant benefit from pre-exposure prophylaxis.

## WEPEC258

### PREP-30: AN INNOVATIVE MODEL OF FEE-BASED PRE-EXPOSURE PROPHYLAXIS FOR HIGH-RISK INDIVIDUALS IN BANGKOK, THAILAND

D. Colby[1], M. Kongkabpan[2], S. Teeratakulpisarn[2], N. Teeratakulpisarn[2], C. Pondet[2], C. Pakam[2], P. Plodkratok[2], T. Anand[2], P. Phanuphak[2], N. Phanuphak[2]
*[1]Thai Red Cross AIDS Research Centre, SEARCH, Bangkok, Thailand, [2]Thai Red Cross AIDS Research Centre, Bangkok, Thailand*
*Presenting author email: doctordonn@gmail.com*

**Background:** Pre-exposure prophylaxis (PrEP) has been proven to be effective at preventing HIV infection for men who have sex with men (MSM) and other high-risk groups. However, awareness about PrEP and knowledge about its efficacy is still low among high-risk populations in Asia. In the region there is little experience providing PrEP and very limited availability of this new HIV prevention method.
**Description:** The Thai Red Cross Anonymous Clinic (TRCAC) has implemented the PrEP-30 project since December 2014 as part of a combination HIV prevention package. The PrEP service is operated as a fee-based model without any subsidy. Regular follow-up includes clinical examination, risk-reduction counseling, provision of condoms and lubricants, monitoring renal function, and HIV testing every 3 months. User fees total 30 Thai baht (less than US$1) per day, which include facility/physician fees, laboratory testing, and medication (local generic tenofovir/emtricitabine) costs.
**Lessons learned:** Through January 2016, a total of 231 people started PrEP. Referrals came mainly from the Adam's Love website and TRCAC HIV testing counselors. Clients were 98% biological male, 91% MSM, and 1% transgender women. Median age was 32 years (range 19-67). Risk factors as indications for PrEP included condomless anal intercourse (42%), multiple sex partners (35%), known HIV-infected sex partner (22%), previous non-occupational post-exposure prophylaxis use (14%), and/or sex work (4%). After 14 months, among those who completed follow-up HIV testing no new HIV infections have been detected.
**Conclusions/Next steps:** PrEP can successfully and sustainably be provided through a cost-sharing model that does not require public or private subsidy. Most individuals accessing PrEP in Bangkok are male and MSM. More awareness and education is needed to inform at-risk groups in Thailand and other Asian countries that PrEP is both highly efficacious and available.

## WEPEC259

### ACCEPTABILITY OF PREP FOR ADOLESCENTS IN SOUTH AFRICA, A KEY TARGET POPULATION FOR HIV PREVENTION

J. Hoare[1], K. Underhill[2], C. Kuo[3], D. Giovenco[3], D. Operario[3]
*[1]University of Cape Town, Department of Psychiatry, Groote Schuur Hospital, Cape Town, South Africa, [2]Yale, New Haven, United States, [3]Brown, Providence, United States*
*Presenting author email: hoare.jax@googlemail.com*

**Background:** Oral antiretroviral pre-exposure prophylaxis (PrEP) holds enormous potential for expanding prevention strategies for adolescents, who account for 39% of all new global infections. Little is known about how unique developmental milestones of adolescence might influence PrEP acceptability. Research is needed to explore PrEP acceptability among adolescents in generalized epidemic settings driven by heterosexual transmission and with high prevalence of serodiscordant relationships.
**Methods:** We conducted an exploratory mixed-methods study in Cape Town, South Africa from 2015-2016. HIV-negative and HIV-positive adolescents, 16-17 years of age, were recruited from an urban township using systematic door-to-door sampling and an HIV-treatment clinic using convenience sampling. A computerized, cross-sectional survey, along with semi-structured focus groups and in-depth individual interviews, were used to gather socio-demographic data, quantify perceptions of PrEP efficacy, and investigate PrEP acceptability and predicted behavioral outcomes among adolescents. *Clinicians completed a computerized survey and in-depth individual* interviews. We conducted descriptive analysis of quantitative data using SPSS and thematic analysis of qualitative data using NVivo. Brown University and University of Cape Town provided ethical approvals.
**Results:** Adolescents (n=20) were black African, completed grade 8 or higher, and spoke primarily isiXhosa. The majority (90%) reported that they would want to use PREP if they had a partner who was HIV-positive or of unknown status, or would support use of PREP by a partner. All clinicians (100%) reported they would prescribe PREP for adolescents who were sexually active and 62.5% reported they would support PREP for intravenous drug users. Message framing influenced acceptability, in that clinicians were more likely to definitively support prescription of PREP if told it had a 90% success rate (100%) as opposed to a 10% failure rate (50%). Both adolescents and clinicians voiced concerns about partial efficacy, side effects, adherence, off-label use, and potential behavioral impacts. Participants also reported conflicting opinions about which adolescents should be prescribed PrEP, with support for adolescents in serodiscordant partnership and concerns for adolescents using substances.
**Conclusions:** Findings identify key concerns that may affect PrEP acceptability among adolescents in South Africa. Future research should integrate mixed-methods to further explore potential outcomes of adult PrEP in adolescents.

## WEPEC260

### NAVIGATING PEP TO PREP TRANSITION: IMPORTANT CONSIDERATIONS AND EXPERIENCES OF A NEW YORK CITY LGBT CLINIC

P. Carneiro[1], S. Stephanos[1], S. Mosher[1], J. Barrios[1], A. Fortenberry[2], U. Belkind[3], P. Meacher[3], A. Radix[3]
*[1]Callen-Lorde Community Health Center, Prevention and Outreach, New York, United States, [2]Callen-Lorde Community Health Center, Nursing, New York, United States, [3]Callen-Lorde Community Health Center, Medicine, New York, United States*
*Presenting author email: pmeacher@callen-lorde.org*

**Background:** Callen-Lorde Community Health Center (CLCHC) in New York City is a non-profit facility that predominantly cares for the LGBT communities. In addition to primary health and HIV services, the clinic has a robust HIV prevention and outreach department. CLCHC has provided Post-Exposure Prophylaxis (PEP) services since 2006. In 2012, after state and federal guidelines were released, the center also implemented a Pre-Exposure Prophylaxis (PrEP) program, currently the largest of its kind in NY State serving over 1,400 clients. A major challenge has been moving clients with ongoing HIV risk from PEP to PrEP seamlessly.
**Description:** In 2015 CLCHC provided 881 PEP interventions to 816 ethnically and socio-economically diverse LGBT-identified patients. 212 (26%) of these patients transitioned to PrEP. This required streamlining the usual PrEP process to ensure

no gaps in antiretroviral coverage and minimize risk of seroconversions. Challenges included working with clients who were often uninsured or underinsured. Interventions included: PrEP dedicated staff, clinic-wide patient and staff education campaigns (PrEP information was displayed in public spaces and posters placed in all exam rooms) and a telephone hotline. PrEP discussions were initiated for all clients during all PEP visits.
**Lessons learned:** PEP is an important entry point for PrEP. Successful PEP-to-PrEP navigation requires identifying people at ongoing HIV risk, doing assessments for acute HIV, increasing availability of HIV 4th generation and viral load testing, ensuring dedicated staff to assist with medication access and insurance barriers and streamlining of services (timely follow-up appointments, rapid assessment for acute HIV, monitoring of labs and adherence). Having PrEP transition available reduced the number of clients returning for multiple PEP interventions.
**Conclusions/Next steps:** The PEP to PrEP program was possible because adequate resources were allocated for dedicated staff to assist patients navigating the complicated insurance and medication assistance process. PrEP empowers patients to make informed decisions about sexual health and HIV risk reduction. Implementing PEP-to-PrEP programs must be systematic and utilize innovation and flexibility. For this reason, multi-disciplinary teams of providers, social workers, and HIV counselors must work together in order to support patients along the prevention continuum of care.

## WEPEC261

### ARE WE REACHING THE PREP TARGET MARKET? EXPLORING THE RISK AND DEMOGRAPHIC PROFILE OF EARLY ADOPTERS IN A SOUTH AFRICAN PREP DEMONSTRATION PROJECT FOR MSM

B. Brown[1], K. Rebe[1,2], P. Daki[1], L.-G. Bekker[3], H. Struthers[1,2], J. McIntyre[1,4]
*[1]ANOVA Health Institute, Cape Town, South Africa, [2]University of Cape Town, Department of Medicine, Cape Town, South Africa, [3]Desmond Tutu HIV Centre, Cape Town, South Africa, [4]University of Cape Town, School of Public Health and Family Medicine, Cape Town, South Africa*
*Presenting author email: bbrown@anovahealth.co.za*

**Background:** As PrEP is being considered for broader scale up in South Africa, understanding how best to appropriately target this intervention to those who most need it is of vital importance. In 2015, the South African PrEP Demonstration Project launched in Cape Town and will offer 300 eligible MSM free access to PrEP within standard clinic settings. This project provides an opportunity to inform future roll out by assessing the profile of MSM interested in PrEP.
**Methods:** Eligible MSM received PrEP information during a standard visit to their MSM-sensitized clinic in Cape Town. Per existing guidelines, men initiated PrEP after screening and returned for periodic follow up. They received a standard package of care inclusive of risk reduction counseling. Demographics for all men were collected by a nurse using standard clinic stationary and men self-reported risk behavior through a survey not seen by clinic staff.
**Results:** Thus far 52 men have initiated PrEP and 34 have completed 1 month of PrEP use. The majority have sex exclusively with men (94%, 49/52), are white (73%, 35/48) and have a median age of 33 (IQR 31-40). Within three months before their PrEP initiation, men reported a median of 5 (IQR 2-8) sexual partners and 81% (42/52) reported having condom-less sex with at least one of these partners (median 2, IQR 1-3). After 1 month of PrEP use, men (n=34) reported a median of 3 (IQR 1-6) sexual partners and 76% (26/34) reported having condom-less sex with at least one of these partners (1.5, IQR 1-3) during this period.
**Conclusions:** The majority of MSM who have initiated PrEP through this project reported condom-less sex with multiple sexual partners both before and after PrEP initiation, although longer follow up is needed to identity significant changes in behavior and adherence. These initial findings suggest that this population are in need of, interested in, and able to use PrEP and may inform population targets for future PrEP roll out. Participant demographics may shift over time but current racial demographics suggest that targeted efforts are needed to reach a more equal distribution.

## WEPEC262

### PREFERENCES FOR LONG-ACTING PRE-EXPOSURE PROPHYLAXIS (PREP), DAILY ORAL PREP, OR CONDOMS FOR HIV PREVENTION AMONG MEN WHO HAVE SEX WITH MEN (MSM) IN THE U.S.

G.J. Greene[1], G. Swann[1], A.J. Fought[2], A.M. Carias[3], A. Carballo-Diéguez[4], T.J. Hope[5], P.F. Kiser[6], B. Mustanski[1], R.T. D'Aquila[7]
*[1]Northwestern University Feinberg School of Medicine, Medical Social Sciences, Chicago, United States, [2]Northwestern University Feinberg School of Medicine, Preventive Medicine, Chicago, United States, [3]Northwestern University Feinberg School of Medicine, Cell and Molecular Biology, Chicago, United States, [4]Columbia University Medical Center, New York, United States, [5]Northwestern University Feinberg School of Medicine, Chicago, United States, [6]Northwestern University, Department of Biomedical Engineering, Evanston, United States, [7]Northwestern University Feinberg School of Medicine, Department of Medicine, Chicago, United States*
*Presenting author email: a-carias@u.northwestern.edu*

**Background:** We addressed if long-acting PrEP delivery options now in development would be acceptable to users. Aims were to: a) document levels of awareness and uptake of PrEP among MSM; b) identify preferences for HIV prevention options; and c) explore reasons for preferences among HIV prevention options.
**Methods:** This mixed method study of an online sample of MSM (N=512; median age=22 years) conducted paired preference tests among five potential HIV prevention methods: condoms and four PrEP options - daily oral pill, a long-acting injectable, or two long-acting subcutaneous implants that differed in visibility to others. After this, we asked about preferences among only the four PrEP options.
**Results:** Of the 237 men who ever heard of PrEP (46.3%), only 6 (2.5%) used PrEP in the last 3 months. Paired preference tests indicated that while condoms were most frequently preferred (33.8%), the majority preferred a PrEP-related HIV prevention option. Kruskal-Wallis Tests indicated significant differences in the distribution of age (p=0.01) and education (p=0.01) across preferences. Participants who preferred condoms were significantly younger than those who preferred the non-visible implant (21 and 24 median age, respectively; p=0.01, DSCF multiple comparisons analyses). Those who preferred condoms and oral PrEP had lower educational attainment than those who preferred injections (p=0.04 and p=0.02, respectively, DSCF multiple comparisons analyses). Individuals who preferred the non-visible implant reported a higher percentage of condomless anal sex than those who preferred condoms (68.2% vs 47.4%; p< 0.001; Fishers Exact). In follow-up questions assessing preferences among the four PrEP options only, daily oral pills and non-visible implants were most frequently preferred (35.5% and 34.3%, respectively), followed by injections (25.2%) and visible implants (4.3%). Qualitative analyses revealed that convenience, protection duration, and privacy were the most important attributes for selecting an HIV prevention method.
**Conclusions:** MSM who engage in HIV risk behaviors report being receptive to using PrEP for protection. Aligning development with user concerns and preferences, such as the one for privacy found here, could enhance development and future uptake of long-acting PrEP with less-frequent adherence requirements. Further research is warranted to evaluate PrEP acceptability, awareness, and use.

## WEPEC263

### REPORTED CHANGES IN PREP AND CONDOM USE IN MSM DURING THE OPEN-LABEL EXTENSION OF THE ANRS IPERGAY STUDY

L. Sagaon-Teyssier[1,2,3], M. Suzan-Monti[1,2,3], D. Rojas-Castro[4], M. Danet[4], N. Hall[5], L. Fressard[1,2,3], M. Di Ciaccio[1,3,6], C. Capitant[7], V. Foubert[7], C. Chidiac[8], V. Doré[9], C. Tremblay[10], J.-M. Molina[11], B. Spire[1,2,3], ANRS IPERGAY Study Group
*[1]INSERM, UMR_S 912, Sciences Economiques & Sociales de la Santé et Traitement de l'Information Médicale (SESSTIM), Marseille, France, [2]Aix Marseille Université, UMR_S 912, IRD, Marseille, France, [3]Observatoire Régional de la Santé Provence-Alpes-Côte d'Azur, Marseille, France, [4]AIDES MIRE, Paris, France, [5]CHU, Nantes, France, [6]GREPS, Université Lyon 2, Lyon, France, [7]INSERM SC 10 US 19, Villejuif, France, [8]Hôpital de la Croix Rousse, INSERM U 1052, Department of Infectious Diseases, Lyon, France, [9]ANRS, Paris, France, [10]Research Center of the Centre Hospitalier de l'Université de Montréal, Montréal, Canada, [11]Hospital Saint-Louis, Department of Infectious Disease, Assistance Publique Hôpitaux de Paris, Paris, France*
*Presenting author email: bruno.spire@inserm.fr*

**Background:** Following the favorable results of the double-blinded phase (DBP) of the ANRS Ipergay trial, an open-label extension study (OLE) was implemented where all participants received TDF/FTC for on demand PrEP. We wished to assess whether PrEP and condom trajectory uses changed in the OLE.
**Methods:** Follow-up in OLE was performed every two months and included online questionnaires collecting sexual behaviour and PrEP adherence during the last anal intercourse. A longitudinal multi-trajectory model was implemented for two out-

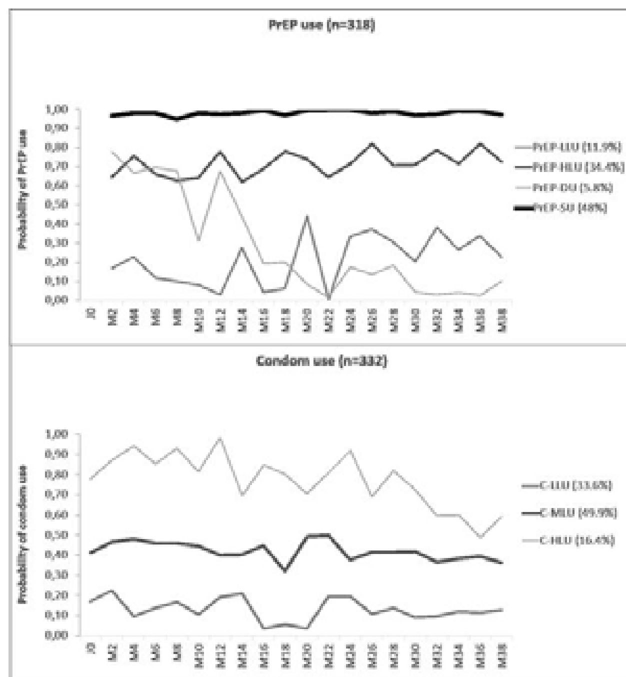
comes: PrEP use (correct/sub-optimal *versus* no PrEP), and condom use for anal sex (yes/no) and we compared DBP to OLE.

**Results:** 333 participants who participated to both study phases were analyzed. Four trajectories of PrEP use and three trajectories of condom use were identified in the DBP (Figure). During OLE, there was no change in PrEP trajectories. However, there was a decrease of condom use in the "high-level users of condom (C-HLU)" trajectory that most participants compensated by using PrEP: among participants in this trajectory 62% used PrEP systematically (PrEP-SU) and 33% used PrEP progressively (24% and 9% respectively for PrEP-HLU and PrEP-LLU). For the two remaining condom use trajectories (C-MLU and C-LLU) there was no change during the OLE, and most of participants continued using PrEP: 54% used PrEP systematically, and 35% used PrEP progressively.

**Conclusions:** In the OLE of the ANRS-IPERGAY trial, the reported decrease in condom use was compensated by high PrEP use. However, special attention must be paid to the remaining subgroup of MSM with declining use of condom that did not compensate by using PrEP.



**PrEP-LLU:** Low-level users of PrEP
**PrEP-HLU:** High-level progressive users of PrEP
**PrEP-DU:** Declining users of PrEP
**PrEP-SU:** Systematic users of PrEP
**C-LLU:** Low-level users of condom
**C-MLU:** Medium-level users of condom
**C-HLU:** High-level users of condom

*[Trajectories of PrEP and Condom use]*

## WEPEC264

### PERCEPTIONS OF BARRIERS AND BENEFITS TO ADOLESCENT PRE-EXPOSURE PROPHYLAXIS (PREP) UTILIZATION AND CLINICAL TRIAL PARTICIPATION: A STUDY OF AFRICAN AMERICAN MOTHERS AND THEIR DAUGHTERS

F. Fletcher[1], C. Fisher[2], B. Floyd[1], A. Ehioba[1], G. Donenberg[3,4]
*[1]University of Illinois at Chicago School of Public Health, Division of Community Health Sciences, Chicago, United States, [2]Fordham University, Department of Psychology; Center for Ethics Education; HIV Prevention Research Ethics Training Institute, Bronx, United States, [3]University of Illinois at Chicago School of Public Health, Community Outreach Intervention Projects and Healthy Youths Program, Chicago, United States, [4]University of Illinois at Chicago, Department of Medicine, Chicago, United States*
*Presenting author email: ffletch@uic.edu*

**Background:** Compared to their racial/ethnic counterparts, African American adolescent girls are disproportionately impacted by HIV. Accordingly, innovative methods are needed to thwart the negative effects of HIV among this population. Approved by the Food and Drug Administration in 2012, PrEP has proven highly efficacious for HIV vulnerable adults. Yet, PrEP's potential as an HIV prevention strategy for adolescent populations is currently unknown. This study sought to assess: 1) perceptions of barriers and benefits related to African American girls' (ages 14-17) participation in PrEP clinical trials, and 2) perceptions related to potential utilization of various modes of PrEP delivery such as vaginal rings, microbicide gels, and injectables.

**Methods:** Fifteen African American mother/daughter pairs (N=30) were recruited from a two-armed, family-based randomized controlled trial. Knowledge, beliefs and attitudes related to adolescent PrEP utilization and clinical trial participation were assessed through a focus group discussion and questionnaire. The questionnaire also evaluated mother-daughter communication, sexual risk behavior, and HIV knowledge and attitudes. The focus group discussion was guided by a fifteen minute PrEP educational module which included a hypothetical clinical trial informed by two local community advisory boards.

**Results:** There was a general lack of knowledge and awareness about PrEP among both mothers and daughters. However, after receiving information about PrEP, participants carefully weighed the potential harms and benefits related to adolescent PrEP utilization and clinical trial participation. Overall, most mothers expressed a willingness to allow their daughters to take PrEP once approved, but indicated concerns about clinical trial participation primarily due to a lack of available evidence related to the long-term effects of PrEP for adolescents. Conversely, daughters expressed a willingness to participate in PrEP clinical trials and described both individual and societal level benefits associated with potential participation. Daughters additionally indicated a willingness to take PrEP, but expressed concerns surrounding PrEP acceptability, adherence and stigmatization.

**Conclusions:** Study findings uncover the need to:
1) develop PrEP clinical trial participant protection procedures specific to African American adolescent girls and guardians, and
2) implement ethically-sound strategies to strengthen the availability, accessibility and acceptability of new scientific advances in HIV for HIV vulnerable populations.

# MICROBICIDES (INCLUDING VAGINAL AND RECTAL MICROBICIDES)

## WEPEC265

### KEY INSIGHTS INTO ACCEPTABILITY AND USE OF THE VAGINAL RING: RESULTS OF THE MTN-020 ASPIRE TRIAL QUALITATIVE COMPONENT

E. Montgomery[1], A. van der Straten[2,3], M. Chitukuta[4], K. Reddy[5], K. Woeber[6], M. Atujuna[7], L.-G. Bekker[7], J. Etima[8], T. Nakyanzi[8], A. Mayo[9], A. Katz[2], N. Laborde[2], C. Grossman[10], L. Soto-Torres[11], T. Palanee-Phillips[5], J. Baeten[12], MTN 020/ASPIRE Study Team
*[1]RTI International, Women's Global Health Imperative, Los Angeles, CA., United States, [2]RTI International, Women's Global Health Imperative, San Francisco, United States, [3]University of California, CAPS, San Francisco, United States, [4]UZ-UCSF Collaborative Research Programme, Harare, Zimbabwe, [5]Wits Reproductive Health and HIV Research Institute, Johannesburg, South Africa, [6]Medical Research Council of South Africa, HPRU, Durban, South Africa, [7]Desmond Tutu HIV Research Foundation, Cape Town, South Africa, [8]MU-JHU, Kampala, Uganda, [9]FHI 360, Durham, United States, [10]National Institute of Mental Health, Bethesda, United States, [11]NIH/DAIDS, Bethesda, United States, [12]University of Washington, Seattle, United States*
*Presenting author email: emontgomery@rti.org*

**Background:** The MTN-020/ASPIRE trial evaluated the safety and effectiveness of the dapivirine vaginal ring for prevention of HIV infection among African women. Participants' acceptability of and use-adherence to novel biomedical study products are essential for assessing their true effectiveness and yield important insights regarding future uptake, sustained use, and potential public health impact.

**Methods:** The qualitative component of ASPIRE was conducted at 6 of 15 study sites in Uganda, Malawi, Zimbabwe and South Africa. Qualitative study participants (n=214) were enrolled into one of 3 interview modalities: single in-depth interview (IDI; n=34), up to 3 serial IDIs (n=80), or exit Focus Group Discussion (n=100). Using semi-structured guides administered in local languages, 280 interviews were audio-recorded, transcribed, translated, coded and analyzed with Nvivo using matrices and code summary reports. Guided by a conceptual framework, we evaluated how well the ring was liked, used and integrated into participants' lives.

**Results:** Participants were on average 26 years, 45% were married, and 73% had completed secondary school. The majority disclosed trial involvement (72%) or ring use (59%) to male partners. We identified three key findings: 1) Participants liked both the ring and trial participation. Using the ring felt like being part of a "team" and doing something for a broader, communal good. They valued study benefits (e.g. free healthcare) and were encouraged by study-supported participant engagement activities and feedback about site-level adherence performance. 2) Despite initial fears about the ring's diameter and thickness and potential side effects, participants found the ring easy to use and used it consistently. Fears were overcome with ongoing group discussion, counseling and gradual familiarity with ring use through trial progression. 3) The actual or perceived dynamics of participants' male partner relationship(s) were the most consistently described influence (which ranged from positive, negative and neutral) on participants' acceptability and use of the ring.

**Conclusions:** Participants liked the ring and found it easy to use. Initial concerns with the physical attributes of the ring and perceived side effects could be proactively addressed in future activities. Factors beyond the level of the individual woman, like partners and peers, were important for encouraging positive attitudes and adherence behaviors.

## WEPEC266

### PROJECT GEL: MICROBICIDE SAFETY AND ACCEPTABILITY IN YOUNG MEN

I. McGowan[1], R.D. Cranston[1], K.H. Mayer[2,3], I. Febo[4], K. Duffill[5], A. Siegel[5], J.C. Engstrom[5], A. Nikiforov[5], S.-Y. Park[1], R.M. Brand[1], R. Giguere[6], C. Dolezal[6], T. Frasca[6], C.-S. Leu[6], J.L. Schwartz[7,8], A. Carballo-Dieguez[6]
*[1]University of Pittsburgh School of Medicine, Pittsburgh, United States, [2]Fenway Institute, Fenway Health, Boston, United States, [3]Harvard Medical School, Beth Israel Deaconess Medical Center, Boston, United States, [4]University of Puerto Rico Medical Sciences Campus, Department of Pediatrics, Gama Project, San Juan, Puerto Rico, [5]Magee-Womens Research Institute, Pittsburgh, United States, [6]Columbia University and New York State Psychiatric Institute, HIV Center for Clinical and Behavioral Studies, New York, United States, [7]CONRAD, Arlington, United States, [8]Eastern Virginia Medical School, Arlington, United States*
*Presenting author email: imcgowan@pitt.edu*

**Background:** The purpose of Project Gel was to determine the safety and acceptability of rectal microbicides in young men who have sex with men (MSM) and transgender women (TGW).
**Methods:** MSM/TGW aged 18-30 years were enrolled at three sites; Pittsburgh, PA; Boston, MA; and San Juan, PR. Stage 1A was a cross-sectional assessment from which a subsample of participants was enrolled in Stage 1B, a 12-week evaluation of a placebo rectal gel. This was followed by the final phase of the study (Stage 2) in which a subsample from Stage 1B was enrolled into a placebo controlled Phase 1 safety and acceptability evaluation of a reduced glycerin tenofovir (TFV) 1% gel.
**Results:** 248 participants were enrolled into Stage 1A. Participants' average age was 23.3 years. The most prevalent sexually transmitted infection (STIs) at baseline were Herpes simplex (HSV)-2 (16.1% by serology) and rectal *Chlamydia trachomatis* (CT) (10.1% by NAAT). 134 participants were enrolled into Stage 1B. During the 12-week period of follow-up 2 incident HIV, 7 rectal CT, and 5 rectal *Neisseria gonorrhea* infections were detected. The majority of adverse events (AEs) were infections (N=56) or gastrointestinal (N=46) and were mild (69.6%) or moderate (28.0%). Of the participants who completed Stage 1B, 24 were enrolled into Stage 2 and randomized (1:1) to receive TFV or placebo gel. All participants completed Stage 2. The majority of AEs were gastrointestinal (N=10) and mild (87.2%) or moderate (10.3%). Acceptability ratings for TFV gel did not differ in any case from ratings for the placebo gel. Most average ratings on gel characteristics, applicator and applications process, product use, and liking the product were on the higher end of 10-point scales, indicating high acceptability.
**Conclusions:** In this study we were able to enroll a sexually active population of young MSM/TGW who were willing to use placebo and antiretroviral rectal microbicides. TFV gel was safe and acceptable and should be further developed as an alternative HIV prevention intervention for this population, given their high rate of incident anogenital infections consisted with condomless sex.

## WEPEC267

### COMPARING THE ACCEPTABILITY AND CORRECT VAGINAL PLACEMENT OF TWO MICROBICIDE FILMS

K. Bunge[1], L. Rohan[2], L. Meyn[3], T. Campbell[4], I. Macio[4], S. Hillier[3]
*[1]University of Pittsburgh, Department of Obstetrics, Gynecology, and Reproductive Sciences, Pittsburgh, United States, [2]University of Pittsburgh, Department of Pharmaceutical Sciences, Pittsburgh, United States, [3]University of Pittsburgh, Department of Obstetrics, Gynecology and Reproductive Sciences, Pittsburgh, United States, [4]Magee-Womens Hospital, Department of Obstetrics, Gynecology, Reproductive Sciences, Pittsburgh, United States*
*Presenting author email: kbunge@mail.magee.edu*

**Background:** Film formulations of topical microbicides may provide efficient drug delivery while minimizing the disruption of innate immune defenses. Vaginal film technology for the delivery of antiretrovirals is in phase 1 studies. Understanding application challenges and acceptability of different film types is integral to product development. We compared women's experiences with two films which differed in size and base polymer.
**Methods:** Study participants received either 1" x 2" polyvinyl alcohol (PVA) based films (n=30 women) or 1" x 2" cellulose (CELL) based films (n=47 women). All participants received standardized insertion instructions and used the films daily for 7 days. Two hours after self-insertion of the final dose, correct film placement (defined as placement inside the hymenal ring) was noted on pelvic exam, but not shared with the participant. Participants completed an acceptability questionnaire. Demographic and behavioral factors as well as answers to acceptability questions were compared using Fischer's exact test.
**Results:** Women who used both film types did not differ with respect to demographics or previous vaginal product experience with >80% of participants having used tampons and 40% vaginal cream. Five (17%) of 30 PVA users were noted to have incorrectly placed film at the time of pelvic exam as compared to 2 (4%) of 47 CELL film users. Compared to PVA film users, more CELL film users described insertion as "easy" (51% vs 30%, p= 0.10) and were significantly less likely to note any concerns with using the product (17% vs 48%, p=0.005). Problems identified by PVA users centered around difficulties with insertion. Seventy-two percent of CELL film users reported that the product was easier to use with subsequent doses. There was no difference in comfort nor odor associated with film use; women reported that they would be likely to use either film product should it be found effective in preventing HIV acquisition.
**Conclusions:** Both films were comfortable and acceptable. The larger CELL based film was associated with fewer insertional challenges than the smaller PVA film. Both size and polymer type may impact correct film placement. Future studies are needed to evaluate which film attributes enhance correct usage.

## WEPEC268

### SELF-REPORTED RING REMOVALS AND EXPULSIONS OF THE DAPIVIRINE VAGINAL RING: QUALITATIVE DATA FROM THE RING STUDY (IPM 027)

C. Milford[1], M. Malherbe[2], C. Herman[2], C. Woodsong[2], M. Russel[2], L. Greener[1], V. Kidd[2], A. Nel[2], J. Smit[1]
*[1]MatCH Research, University of the Witwatersrand, Department of Obstetrics and Gynaecology, Faculty of Health Sciences, Durban, South Africa, [2]International Partnership for Microbicides (IPM), Paarl, South Africa*
*Presenting author email: cmilford@matchresearch.co.za*

**Background:** Under-reporting of non-adherence to women-initiated prevention technology is a risk during Phase III microbicide trials. A female initiated, self-administered long-term prevention agent such as the dapivirine vaginal ring could offer women an option to prevent HIV infection and is being tested in The Ring Study. In order to determine efficacy of the ring, participants need to use it as instructed and demonstrate adherent ring-use behaviour. We explored participants' and their male partners' discussions on accidental expulsions and purposeful ring removals during this study.
**Methods:** Individual interviews (IDIs) and group discussions (FGDs) were conducted across six research centres in South Africa and one in Uganda. Data were collected 24-36 weeks after research centre activation and again after last product use visits. Participants were purposively selected to include some who reported ring expulsion/removal. Qualitative data was organized into key themes using a theoretical framework (Mensch framework, 2012), and NVivo used to facilitate the analysis.
**Results:** Fifty-five female and 72 male IDIs and 9 female FGDs were conducted. Although most felt it was impossible for accidental ring expulsion to occur, 15 participants reported an accidental expulsion. Reported expulsions occurred mainly during sex, some during bathing and some on the toilet. There were more reports (n=25) of purposeful ring removal. The majority of expulsions/removals were reportedly for a short time. Reasons for self-reported purposeful removal included: to clean the ring or during bathing, for male partners (once-off curiosity to see the ring, or test if partners could feel it during sex), because of menses, due to discomfort, or removal when unwell. Some reported that other participants removed their rings - mainly because of fear of a partner finding out about ring use, or because of lack of commitment to The Ring Study.
**Conclusions:** The number of self-reported ring expulsions and removals were low. More women reported purposeful removals than accidental expulsions. Women were willing to discuss their own ring removal practices. These results are based on self-reported data and will need to be compared with actual ring adherence data. However, discussions provide insight into possible reasons for ring expulsion/removal which can be addressed in future user training.

## WEPEC269

### THE MANAGEMENT OF HIV DISCORDANT RESULTS AT MADIBENG CENTRE FOR RESEARCH ON A PHASE III HIV MICROBICIDE CLINICAL TRIAL

C. Neate[1], N. Mabuza[1], C. Louw[1,2], S. Kruger[1], E. Hlaletwa[1], E. Maharaj[3], C. Africa[4], M. Isaacs[4], J. Steytler[4], A. Nel[4], Madibeng Centre for Research IPM 027 Study Group
*[1]Madibeng Centre for Research, Brits, South Africa, [2]University of Pretoria, Faculty of Health Sciences, Department of Family Medicine, Pretoria, South Africa, [3]BARC Laboratories, Johannesburg, South Africa, [4]International Partnership for Microbicides, Paarl, South Africa*
*Presenting author email: cathyn.mcr@lantic.net*

**Background:** End-point assessments for an HIV prevention trial are crucial in ascertaining the safety and efficacy of study product; therefore the methodology used must be accurate and free of bias.
The IPM 027 Study, conducted at the Madibeng Centre for Research (MCR), used a set HIV rapid testing algorithm, consisting of 3 different rapid tests, performed in sequence. A first reactive test followed by two consecutive non-reactive rapid tests indicated that the participant had a discordant HIV test result.
**Methods:** The HIV rapid testing algorithm used the following tests:
1. Determine HIV1/2.
2. FDA approved OraQuick Advance HIV1/2
3. Uni-Gold HIV 1/2
All HIV rapid testing after enrolment was performed on whole blood (drawn into a 4ml EDTA test tube).
If a participant's HIV test result was discordant, repeat testing was performed 2 weeks later. A repeat discordant result was escalated to the sponsor for guidance on further testing required to establish a conclusive result. A quantitative HIV RNA PCR was performed for all discordant cases. An undetectable HIV RNA PCR result indicated the participant was not infected. A detectable HIV RNA PCR result indicated HIV-infection.
**Results:** At MCR, 16 of 482 (3%) participants had one or more discordant HIV rapid test result at some point during their trial participation [64 (0.5%) discordant results out of 11 712 tests performed]. In all these participants no HIV RNA was detectable. None of these participants seroconverted during the trial.
Though the total percentage of HIV discordancy was low, it initially caused anxiety throughout the research centre:
**Laboratory staff** expended much additional time to troubleshoot and confirm the result's validity. No external influencing factors were identified.
**Investigators** were challenged to make clinical decisions based on an inconclusive laboratory result.
**Counsellors** experienced difficulty counselling the participant regarding her HIV result and her actual status.
**Participants** were anxious due to a reactive test 1.
**Conclusions:** Since test 1 was highly sensitive it could gave a false positive HIV result, therefore discordant HIV test results could be expected with on-site HIV rapid tests. Research centre teams should be prepared and equipped to manage discordant HIV test results.

## WEPEC270

### EFFECTIVENESS OF TENOFOVIR 1% GEL IN PREVENTING HSV-2: RESULTS FROM FACTS 001

S. Delany-Moretlwe[1], G. Gray[2], C. Lombard[2], S. Cohen[1], R. Panchia[3], L. Myer[4], L. Chimoyi[1], J. Schwarz[5], G. Doncel[5], H. Rees[1], FACTS 001 Study Group
*[1]University of the Witwatersrand, Wits RHI, Johannesburg, South Africa, [2]Medical Research Council of South Africa, Cape Town, South Africa, [3]University of the Witwatersrand, Perinatal HIV Research Unit, Johannesburg, South Africa, [4]University of Cape Town, Cape Town, South Africa, [5]CONRAD, Washington, DC, United States*
*Presenting author email: sdelany@wrhi.ac.za*

**Background:** We assessed the effectiveness of tenofovir (TFV) 1% gel in preventing HSV-2 acquisition in women enrolled in FACTS 001, a phase III, multi-centre, double-blind, randomised, placebo-controlled trial.
**Methods:** From October 2011- August 2014, 2059 participants were enrolled. Participants who were HSV-2 seronegative at enrolment were included in this analysis. HSV-2 serostatus was determined by HSV-2 type-specific IgG enzyme-linked immunoassay (Kalon ™). Incident cases were identified at study exit, and further testing performed to identify the time of first positive result (index value ≥0.9). HIV seroconvertors were censored at the time of HIV seroconversion and HSV-2 status assessed. Confirmatory testing using HSV-2 Western Blot (WB) was performed. TFV effectiveness was assessed using a log-rank test, stratified by site. We assessed the association between TFV detection in quarterly cervico-vaginal lavage (CVL) and HSV-2 infection in a random sub-cohort (n=221).
**Results:** Of the 2059 enrolled participants, 1183 (57%) were HSV-2 seronegative at enrolment (TFV n=577; placebo n=605). HSV-2 seroprevalence at sites ranged from 32%-52%. 58 (5%) participants were censored prematurely because they seroconverted to HIV first; 43 were HSV-2 seronegative at the time of censoring. Overall 150 incident HSV-2 infections were observed during 1649 person-years of follow-up (HSV-2 incidence: 9.1/100 women years); 67 in the TFV group and 83 in the placebo group (incidence rate ratio [IRR], 0.81; 95%CI: 0.58 - 1.13). Similar results were observed for HSV-2 WB confirmed cases. Living with parents (adjusted hazard ratio [AHR] 0.52 95% CI 0.28-0.99) and site (AHR 0.27 95% CI 0.08-0.99) were associated with a lower risk of infection. Among participants included in the nested case-cohort (49 cases, 172 controls), a median of 5 CVL samples per participant were analysed. Tenofovir detection in CVL was not associated with reduced risk of HSV-2 acquisition (AHR 1.39 95% CI: 0.77-2.50), even when assessed amongst those that reported sex in the past 7 days (AHR 1.02; 95% CI 0.45-2.29).
**Conclusions:** Contrary to other findings, pericoital vaginal application of TFV 1% gel was not effective in this trial in preventing HSV-2 acquisition, irrespective of adherence levels.

# TREATMENT AS PREVENTION

## WEPEC271

### THE EFFECT OF HIV TESTING AND SAME DAY ENROLMENT INTO CARE ON LOSS TO FOLLOW-UP AMONG HIV PATIENTS: A COHORT STUDY FROM LUKAYA, UGANDA

J. Kiwanuka[1,2], J. Gonzalez Perez[1], A. Semeere[3], S. Asiimwe[4], G. Ojamuge[5], K. Ssamula[5]
*[1]AIDS Healthcare Foundation, Uganda Cares, Kampala, Uganda, [2]School of Public Health, Makerere University College of Health Sciences, Kampala, Uganda, [3]Infectious Disease Institute, Makerere University College of Health Sciences, Kampala, Uganda, [4]Integrated Community Based Initiatives, Kampala, Uganda, [5]AIDS Healthcare Foundation - Uganda Cares, Kampala, Uganda*
*Presenting author email: kate.ssamula@aidshealth.org*

**Background:** One of the ambitious UNAIDS 90-90-90 targets is to test at least 90% of the population and to initiate on antiretroviral therapy (ART) at least 90% of those diagnosed HIV positive. To achieve this, it has been recommended to test and immediately enroll positive testers into care. The effect of this instant enrollment on loss to follow-up (LTFU) is unknown. We evaluated the effect of same day HIV testing followed by instant enrollment into HIV care on LTFU.
**Methods:** Using routinely collected data for HIV-infected patients (≥14 years), tested and enrolled into HIV care between 1 January 2013 and 30 June 2015 at Lukaya Clinic, Uganda, we compared cumulative incidence of LTFU between those enrolled on the day they were tested for HIV to those enrolled later after testing. We used survival methods accounting for the competing risk of death to compare time to LTFU and the Fine and Gray hazards regression to assess for factors associated with LTFU.
**Results:** We studied 2,104 patients, the majority 1,233 (58.6%) were female, with median age at enrollment of 30 (Inter Quartile Range (IQR): 26 to 38) years. Over the study period, 1,227 (58.3%) tested and were enrolled instantly, and 373 (17.7%) were LTFU. The cumulative incidence of LTFU at 24 months was 18.4% (95% CI; 15.5%-21.7%) in the group that delayed enrollment and 15.8% (95% CI: 13.2%-18.7%) in the group that enrolled instantly (p=0.2). After adjusting for age at enrollment, sex, baseline CD4 at enrollment, baseline WHO stage, and ownership of a telephone, same day testing and instant enrolment was not associated with LTFU (adjusted Hazard Ratio (aHR): 0.85, 95% CI: 0.7-1.0), accounting for the competing risk of death.
**Conclusions:** We found that HIV testing and instant (same day) enrollment was not associated with LTFU. This study therefore suggests that instant enrollment into care after a positive HIV test is a viable option and henceforth, a strategy to take on to expedite achievement of the 90-90-90 testing and enrollment targets.

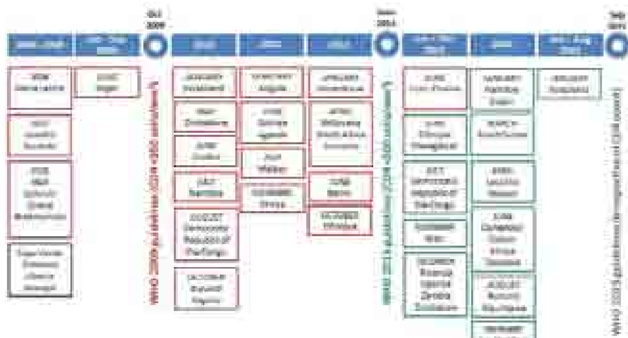
## WEPEC272

### WHEN WILL COUNTRIES MOVE TO 'HIV TREATMENT FOR ALL'? TIME LAG IN WHO TREATMENT GUIDELINES ADOPTION IN SUB-SAHARAN AFRICA

S. Gupta, R. Granich
*International Association of Providers of AIDS Care, Washington DC, United States*
*Presenting author email: rgranich@iapac.org*

**Background:** The World Health Organization (WHO) HIV treatment guidelines have been used by countries to revise their national guidelines. Our study looks at the national policy response to the HIV epidemic in Sub-Saharan Africa (SSA) and quantifies delays in the adoption of the WHO guidelines published in October 2009, June 2013, and September 2015, respectively.

**Methods:** From the Internet and www.hivpolicywatch.org, we collected 85 published guidelines from 37 countries in SSA (68% global HIV burden), and abstracted date of publication and antiretroviral therapy (ART) eligibility criteria. Four countries recommending ART at CD4 ≤200 cells/mm$^3$ were excluded from further analysis. Number of months taken to adopt the WHO 2009, 2013, and 2015 guidelines were calculated for the remaining 33 countries (97% of 2014 burden in SSA) to determine the average time lag in WHO guidelines adoption.
**Results:** Even five months after release of WHO 2015 guidelines, none of the countries have adopted the new 'treatment for all' recommendation. Of the 37 countries, 21 (71% SSA burden) are recommending ART at WHO 2013 CD4 criteria (≤500 cells/mm$^3$), 12 (26% burden) at WHO 2009 CD4 criteria (≤350 cells/mm$^3$), and four (< 1% burden) at WHO 2006 CD4 criteria (≤200 cells/mm$^3$).
The average time lag to WHO 2009 guidelines adoption in 33 countries was 24 [3-56] months. The 21 countries that have adopted WHO 2013 guidelines took an average of 9 [0-19] months, a number that will increase as the remaining countries move to CD4 ≤500 cells/mm$^3$. If the trajectories for the adoption of WHO 2009 and 2013 guidelines are followed, it may take many years for the new WHO 2015 guidelines to become national policies.



*[Timeline showing the date of release of WHO guidelines and national guidelines from 37 countries in Sub-Saharan Africa (January 2004 - February 2016)]*

**Conclusions:** There is an urgent need to shorten the time lag in adoption and implementation of the new WHO guidelines that recommend 'treatment for all' to achieve the 90-90-90 targets by 2020.

## WEPEC273

### FACTORS ASSOCIATED WITH THE ACCEPTANCE OF IMMEDIATE ANTIRETROVIRAL THERAPY AFTER HIV DIAGNOSIS AMONG HIV-POSITIVE CLIENTS OF THE THAI RED CROSS ANONYMOUS CLINIC

W. Kingkaew[1,2], B. Kanchanatawan[2], N. Teeratakulpisarn[1], D. Trachunthong[1], P. Plodgratoke[1], C. Pondet[1], C. Suksom[1], S. Noennoy[1], S. Teeratakulpisarn[1], N. Phanuphak[1], P. Phanuphak[1]
*[1]The Thai Red Cross AIDS Research Centre, Prevention, Bangkok, Thailand, [2]Faculty of Medicine, Chulalongkorn University, Psychiatry, Bangkok, Thailand*
*Presenting author email: waraporn_k@trcarc.org*

**Background:** Thailand started to recommend antiretroviral therapy (ART) immediately after HIV diagnosis, regardless of CD4 count, in 2014. Willingness and readiness of people recently diagnosed with HIV are the key to successful ART initiation and long-term adherence. We studied factors associated with the acceptance of ART among Thai people immediately after their HIV diagnosis.
**Methods:** Self-administered questionnaire and in-depth interview were used to collect data from clients of the Thai Red Cross Anonymous Clinic which is the largest HIV testing and counseling center in Bangkok. HIV testing clients who received HIV-positive test results were consecutively enrolled during July to December 2015. Demographic data, HIV knowledge, acceptance of immediate ART if offered, incentives and barriers towards ART acceptance were assessed. Binary logistic regression was performed to assess factors related to immediate ART acceptance.
**Results:** Of 216 HIV-positive participants were enrolled, 62% were men who have sex with men, 16% were heterosexual men, 2% were transgender women, 6% were bisexual men, and 15% were women. Median (IQR) age was 29 (24-36) years, median (IQR) CD4 count was 274 (168-396) cells/mm3, 72% had unprotected sex over the past 6 months, and 7% had HIV-associated symptoms/AIDS-defining illnesses. Median (IQR) HIV knowledge score was 12 out of 15 (11-13.5), 85% were aware of possible adverse health outcomes and 74% knew about resistance development, both as a result of poor ART adherence. 95.4% indicated immediate ART acceptance. Multivariable analysis showed that the awareness that poor ART adherence could cause adverse health outcomes increased immediate ART acceptance (aOR 4.40, 95%CI 1.16-16.71, p=0.03). Awareness of the relationship between poor ART adherence and resistance development was not significantly associated with ART acceptance (aOR 3.90, 95%CI 0.99-15.41, p=0.052).
**Conclusions:** Acceptance of immediate ART after HIV diagnosis was very high among newly diagnosed HIV-positive clients in Bangkok. Awareness that poor ART adherence could cause adverse clinical consequences influenced ART acceptance. More efforts are needed to make newly diagnosed clients in Thai community aware of the very few side effects and small adherence burden of the currently recommended first-line ART regimens in order to support their decision to start ART.

# VACCINES

## WEPEC274

### URBAN AMERICAN WOMEN'S WILLINGNESS TO PARTICIPATE IN HIV VACCINE TRIALS

A. Knopf[1], G. Bakoyannis[2], G. Zimet[3]
*[1]Indiana University, School of Nursing, Indianapolis, United States, [2]Indiana University, Department of Biostatistics, Indianapolis, United States, [3]Indiana University, School of Medicine, Department of Pediatrics, Adolescent Medicine Section, Indianapolis, United States*
*Presenting author email: asknopf@iu.edu*

**Background:** Women, especially women of color, are markedly underrepresented in clinical trials. Nearly 80% of incident HIV infections among American women occur in Black and Hispanic women, underscoring the importance of understanding the factors that affect their willingness to participate (WTP) in prevention studies. We describe factors associated with women's WTP in future HIV vaccine trials.
**Methods:** Between 2008 and 2011, we enrolled HIV-negative women aged ≥18 years from the waiting rooms of seven urban community health clinics in Indianapolis, Indiana, USA. Racial and ethnic minority women were oversampled. Women were asked about their sociodemographic characteristics, sexual behaviors, health beliefs, and WTP in an HIV vaccine trial if offered the chance. All questions were answered via audio computer-assisted self-interview. We evaluated factors associated with WTP using mixed-effects multivariable, adjusted logistic regression.
**Results:** Among 1,919 women aged 18-65 years (mean=42.7), 67% of whom were women of color, 22% expressed WTP in an HIV vaccine trial if offered the chance. Black women were less likely to express WTP compared to white, non-Hispanic women (OR=0.45; 95%CI=0.25,0.80). Women were more likely to express WTP in a vaccine trial if they had lower average scores on a perceived obstacles scale (OR=0.13; 95% CI=0.08, 0.20) and on a scale measuring fear of injections (OR=0.72; 95% CI=0.57, 0.91). Women with higher average scores on a perceived benefit scale (OR=16.01; 95% CI=9.32, 27.5) and on a perceived norms scale (OR=3.39; 95% CI=2.08, 5.52) were also more likely to express WTP. Women were less likely to express WTP in a trial involving 3 injections compared to single injection (OR 0.42; 95% CI=0.35,0.50). Sexual behaviors, worry about becoming infected with HIV, and other sociodemographic characteristics (e.g. education, income) were not significantly associated with WTP.
**Conclusions:** In this sample of urban adult women, few expressed WTP in an HIV vaccine trial. The strong association between health beliefs and WTP suggests that interventions that highlight the benefits of participation, create or enhance social norms favoring participation, and reduce perception of obstacles may be successful for recruitment of adult women volunteers, particularly those from minority groups.

## APPROACHES TO IMPROVING ADHERENCE TO PREVENTION INTERVENTIONS

### WEPEC275

#### STIGMATIZATION, STATUS DISCLOSURE AND SUPPORT AMONG HIV-POSITIVE WOMEN IN THE KUMASI METROPOLIS, GHANA: A MIXED METHOD STUDY

D. Boateng[1], D. Yedu Quansah[2], G. Dokuaa Kwapong[3], I. Amankwaa[4]
*[1]University Medical Centre, Utrecht University, Epidemiology, Utrecht, Netherlands, [2]Seoul National University, Seoul, Republic of Korea, [3]Kumasi South Government Hospital, Kumasi, Ghana, [4]Garden City University Colledge, Kumasi, Ghana*
*Presenting author email: amank978@gmail.com*

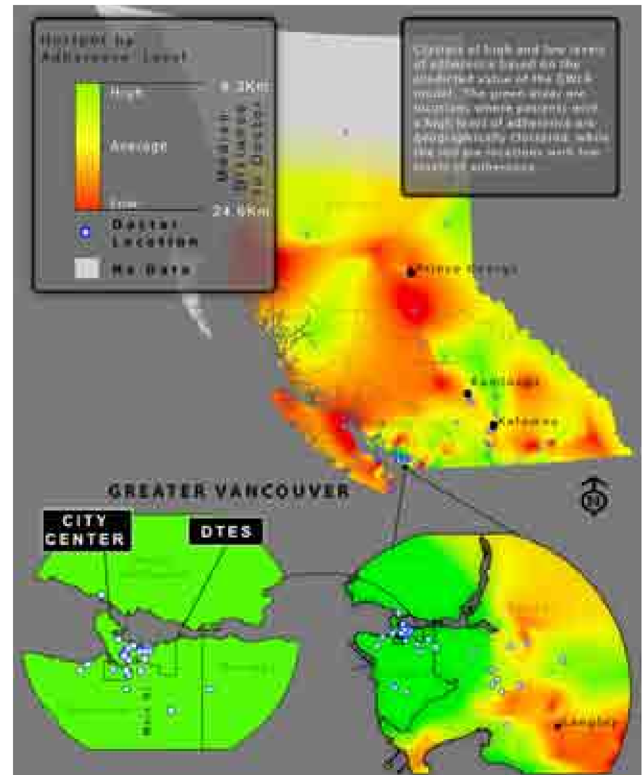
**Background:** HIV-related stigma and discrimination have been acknowledged as an impediment to mitigating the HIV epidemic. HIV-positive women are at a higher risk of being stigmatized. This parallel mixed methods study unravel issues of stigmatization and disclosure of status and how this influence adherence to ART among HIV positive women.
**Methods:** This study was conducted in three ART centers in the Kumasi metropolis of Ghana between January and June 2012. The study population consisted of 206 HIV positive women on ARVs for treatment or prophylaxis, aged 18-49 years and on ART >3 months and 14 health workers at the ART centers. Quantitative data were collected using semi-structured questionnaires. A logistic regression analysis was done to estimate the influence of socio-demographic characteristics and health worker support on the odds of disclosing HIV status or defaulting ART. The qualitative study involved 3 focus group discussions and 14 in-depth interviews and data were collected using discussion guides and audiotape recorder.
**Results:** The mean (SD) age of the HIV positive women in this study was 35 years (7.2) and most of them were married. About 88% had disclosed their status to either a partner of family member and 24% of those who had not disclosed status had no support. Being single decreased and not knowing whether partner has tested decreased the likelihood to disclose HIV status. HIV-positive women who had disclosed their status were less likely to miss ART appointment (AOR=0.3; 95% CI=0.1-0.9). In the FGDs, stigmatization and fear of divorce, rejection or abandonment were major reasons for not disclosing HIV status.
**Conclusions:** Stigmatization and fear of rejection impedes status disclose of HIV, which in turn militate against support seeking and optimal adherence to ART. Psychosocial support for HIV-positive women, especially the newly diagnosed and the unmarried is advocated.

### WEPEC276

#### THE IMPACT OF DISTANCE TO HIV CARE ON ADHERENCE TO TREATMENT: ADJUSTING FOR POPULATION AND GEOGRAPHICAL HETEROGENEITY USING ADVANCED SPATIAL ANALYSIS

O. Amram[1], L. Wang[1], S. Jabbari[1], R. Barrios[2], R. Hogg[2], J. Shoveller[2], J. Montaner[1], V. Lima[1]
*[1]BC Centre for Excellence in HIV/AIDS, Vancouver, Canada, [2]BC Center for Excellence in HIV/AIDS, Vancouver, Canada*
*Presenting author email: oamram@cfenet.ubc.ca*

**Background:** Several studies have shown a direct relationship between spatial access and health outcomes. However, measuring access is complex and it is influenced by several spatial and non-spatial factors.
The objective of this study was to examine the relationship between distance to HIV care and adherence to treatment by controlling for various individual and geographical characteristics.
**Methods:** Data from the Drug Treatment Program (DTP) of the BC Centre for Excellence in HIV/AIDS was used for this analysis. Driving distance was calculated from patient's place of residence to their doctors and it was used as the primary exposure. Adherence to treatment (< 95% and ≥95%) was used as main outcome variable. Potential confounding variables, measured at ART initiation included: gender, age, CD4 counts, viral load, history of injection drug use, having an AIDS-defining illness. We also examined the number of viral loads performed in the first 12 months. We fitted both a multivariate logistic regression and geographically weighted logistic regression (GWLR) to address our study objective.
**Results:** There were 1,528 patients who drove at least 5km to a doctor's office, for a median distance of 17.85 km (Q1=8.8km - Q3=47.2km). After adjusting for all confounding variables, patients who drove more >17.85 km to receive treatment had a 34% higher (AOR: 1.34; 95% CI 1.06 - 1.70) chance of not adhering to the treatment than their counterparts. GWLR, adjusting for spatial dependency, provided a slightly better model (Fig. 1).



*[Fig. 1]*

**Conclusions:** The results of this study clearly show that patients who travelled further to the place of treatment were more likely to not be adherent to treatment. Mapping of the results shows hotspots where spatial access plays an important role in hindering access to care.

### WEPEC277

#### RELIABILITY AND VALIDITY OF THE HOPKINS SYMPTOM CHECKLIST-25 AMONG HIV-POSITIVE PERSONS IN RURAL UGANDA

S. Ashaba[1], B. Kakuhikire[2], D. Vořechovská[3], A.Q. McDonough[3], J.M. Perkins[4], C. Cooper-Vince[3], D.R. Bangsberg[2,3], A.C. Tsai[2,3,4]
*[1]Mbarara University of Science and Technology, Psychiatry, Mbarara, Uganda, [2]Mbarara University of Science and Technology, Mbarara, Uganda, [3]Massachusetts General Hospital, Center for Global Health, Boston, United States, [4]Harvard University Center for Population and Development Studies, Boston, United States*
*Presenting author email: ashaba.schola@gmail.com*

**Background:** Depression is highly comorbid among persons living with HIV (PLWH) with a prevalence range of 23% to 63% across different countries in sub Saharan Africa. However, lack of validated instruments for use in these settings further complicates mental health research in this population. All studies in sub-Saharan Africa have focused exclusively on validating the 15-item depression subscale of the Hopkins Symptom Checklist-25 (HSCL-25). Therefore, the objective of this study was to determine the reliability and validity of both the depression and anxiety subscales of the HSCL-25 among persons living with HIV in rural Uganda.
**Methods:** We conducted a cross-sectional sub-study nested within an ongoing population-based cohort of all residents living in Nyakabare Parish, Mbarara District, Uganda. Self-reported HIV status (positive, negative, or unknown) was elicited as part of the study. All persons who self-reported that they were HIV positive were administered the depression and anxiety subscales of the Hopkins Symptom Checklist. We performed factor analysis on the scale items and estimated reliability using Cronbach's alpha. To assess construct validity we compared the depression and anxiety sub-scales to related constructs, including happiness (single item scale) and food insecurity (3-item hunger scale). We used multivariable regression to identify socio-demographic and other predictors of depression and anxiety.
**Results:** A total of 158 adults self-reported that they were HIV positive (prevalence rate of 8.7 percent). These adults had a mean age of 40.5 years, and two-thirds were women. The Pearson correlation between the depression and anxiety subscales was 0.68. Cronbach's alpha was 0.81 for the depression subscale and 0.87 for the anxiety subscale. Participants scored as having greater happiness as depression and anxiety scores declined (P for trend < 0.001 for both). Persons with moderate to severe hunger had both greater depression symptom severity (P=0.001) and greater anxiety

(P=0.001). In multivariable regression models, statistically significant predictors of greater depression included female gender (P=0.003) and happiness (P=0.001); statistically significant predictors of greater anxiety included female gender (P=0.01), happiness (P=0.005), and hunger (P=0.03).
**Conclusions:** This population-based study provides strong evidence of the reliability and construct validity of the HSCL-25 among persons with HIV in rural Uganda.

## WEPEC278

### PRISONS BASED HIV PREVENTION AND CONTINUUM CARE OF HIV POSITIVE EX-PRISONERS IN TAJIKISTAN

Z. Davlyaotova, B. Ibragimov
*AFEW-Tajikistan, Dushanbe, Tajikistan*

**Background:** Prisons are a high-risk environment for HIV transmission with drug use and needle sharing, tattooing with homemade and unsterile equipment, and high-risk of unsafe sex. In Tajikistan HIV prevention programs are rarely made available in prisons.
By the data of Penitentiary System for 2015 in 18 correctional facilities of Tajikistan 132 (59,4%) out of 222 HIV(100%) positive prisoners are provided by ART; 115 (51,8%) of all PLHIV including those who get ART had released from prisons; only 22(19,1%) from 115 released HIV positive prisoners continued treatment and registered in civilian AIDS centers; 80,9% of released PLHIV suggested as lost patients.
**Description:** During 2014-2015, *AFEW*-Tajikistan together with Penitentiary System introduced "START Plus" program in two pilot colonies. START Plus is a program ensuring prisoners access to HIV education and counseling in prison and continuity of ART during the transition period: 2 months before and 4 months after release. START Plus offers HIV mini-trainings for prisoners and provision of comprehensive package of services for pre and post release prisoners. These services are include discharge planning, health information and referring to doctors,VCT of prisoners with unknown HIV status, adherence support to PLHIV on ART and assistance on restoring the relationships with families after release. Ex-prisoners participating in START Plus supported in adherence to ART, provided by temporary accommodation and meal, restoring IDs and provision of legal support. Also program provides ex-prisoners with assistance in employment and social welfare.
**Lessons learned:** In 2015, 1359 prisoners participated in HIV education mini-trainings and provided by VCT. As result 14 new cases of HIV were detected and 27 earlier detected cases were confirmed. 26(61,9%) out of 42 released prisoners those who need social and medical support were reached by START Plus. 100% (6) of post release prisoners with HIV timely registered in civilian AIDS Centers and continuing ART after release.
**Conclusions/Next steps:** The START Plus program was recognized by Penitentiary System of Tajikistan as effective and productive approach ensuring health and social provision of prisoners and ex-prisoners. On 25 of August by its Order (№89) Head Administration of Penitentiary System is approved START Plus for introducing in correction facilities.

## WEPEC279

### FACTORS ASSOCIATED WITH RETENTION IN MULTI-SESSION EVIDENCE-BASED INTERVENTIONS: FINDINGS FROM CDC-FUNDED EVALUATION PROJECTS CONDUCTED AT 19 COMMUNITY-BASED ORGANIZATIONS

W. Williams[1], A. Moore[2], E. Shapatava[2], G. Uhl[2]
*[1]Public Health Analytic Consulting Services, Miami, United States, [2]Program Evaluation Branch, National Center for HIV/AIDS, Viral Hepatitis, STD and TB Prevention, Centers for Disease Control and Prevention, Atlanta, United States*
*Presenting author email: westonowilliams@gmail.com*

**Background:** Evidence-based interventions (EBIs) focus HIV prevention efforts among populations at risk for HIV transmission and acquisition. Retention is critical for the successful implementation of multi-session EBIs at community-based organizations (CBOs), and is an important consideration during the design, delivery, and adaptation of EBIs. From 2006-2015, CDC provided supplemental funding to 19 CBOs across the country to monitor outcomes and process indicators for 5 multi-session EBIs. Participants were those who agreed to participate in an evaluation of the EBI; data on intervention session attendance, demographics, and HIV risk behaviors were collected.
**Methods:** Data from each EBI were analyzed separately to identify factors associated with completing all intervention sessions. Differences between CBOs with respect to participant attributes and retention were also explored. Bivariate analyses were conducted, using Chi-Square, negative binomial models, and regression models depending on the variable type. Log-binomial multivariable models were constructed to assess the adjusted associations between attending all intervention sessions and a number of attributes, including race/ethnicity, age, sex at birth, education, reporting any sex without a condom, and number of sex events without a condom reported.
**Results:** Completion of all intervention sessions was achieved by 84%, 80%, 79%, 61%, and 60% of participants for 3MV, RESPECT, Healthy Relationships, WILLOW, and SISTA, respectively. Reporting sex without a condom prior to the intervention was associated with completing all intervention sessions for both SISTA (PR=1.19, p< .05) and Healthy Relationships (PR=1.08, p< .01) in a multivariable model. For SISTA, higher educational attainment was also associated with a higher proportion completing all intervention sessions (high school graduate/GED:PR=1.40, p< .0001; some college:PR=1.28, p< .05, referent:less than high school graduate).
**Conclusions:** The analysis of evaluation data from 2006-2015 offers the unique opportunity to compile retention data from 19 CBOs and examine patterns of retention in real-world settings. Findings suggest that individual factors such as baseline HIV risk behaviors and educational attainment are associated with retention, but the associations may differ by intervention. There was not a clear association between losses to retention and EBIs with more sessions or longer participation periods. This information may inform retention practices, and/or interpretation of retention indicators collected for monitoring purposes.

## WEPEC280

### AN EXPLORATORY STUDY ON ADHERENCE TO EXCLUSIVE BREASTFEEDING WITH ANTIRETROVIRAL THERAPY INTERVENTION AMONG HIV-INFECTED MOTHERS IN SOUTH AFRICA AND NIGERIA

J. Gatei[1], M. Zunza[2], H. Jaspan[3], A. Abimiku[4], K. Muldoon[5], M. Tomlison[6], S. Kagee[6], C. Gray[3], K. Rosenthal[7], B. Cameron[8]
*[1]University of Cape Town, Division of Immunology, Cape Town, South Africa, [2]University of Stellenbosch, Cape Town, South Africa, [3]Institute of Infectious Disease and Molecular Medicine Clinical Laboratory Sciences, University of Cape Town, Cape Town, South Africa, [4]Institute of Human Virology, University of Maryland School of Medicine, Baltimore, United States, [5]Clinical Epidemiology Program, Ottawa Hospital Research Institute, Ottawa, Canada, [6]Stellenbosch University, Department of Interdisciplinary Science, Cape Town, South Africa, [7]McMaster Immunology Research Center (MIRC) Michael G.Degroote Institute for infectious Disease Research (IIDR), Ontario, Canada, [8]University of Ottawa at The Ottawa Hospital, Division of Infectious Diseases, Department of Medicine, Ottawa, Canada*
*Presenting author email: swatatu@yahoo.co.uk*

**Background:** Even in the presence of HIV infection, exclusive breast feeding (EBF) is recommended for the first six months of an infant's life. However, formula-feeding or mixed feeding is still common. We aimed to assess breast-feeding practices among HIV-positive mother-infant pairs in South Africa and Nigeria.
**Methods:** Data for this analysis was drawn from the INFANT Study, a longitudinal cohort study of HIV-infected breastfeeding mothers and their HIV-exposed uninfected infants (April 2013 to March 2015). Mothers were recruited from site B Clinic in Khayelitsha, South Africa and Plateau State Specialist Hospital, Nigeria. Descriptive statistics were used to characterize breastfeeding practices and logistic regression using odds ratios (OR) and 95% confidence intervals (CI) was used to identify factors associated with EBF for the first 6 months.
**Results:** Overall 110 (32.7%) of 336 mothers practiced EBF up to 6 months. Among the sample, 246 (40%) of mother in Nigeria and 90 (18%) in South Africa EBF their infants. Compared to peri-urban South African women, more rural Nigerian women (n=246) EBF ((OR: 1.60, 95% CI: 0.84-3.32). The mean age of the mothers was 30 years (SD 5.02) and most of them had access to amenities such as running water, electricity and refrigerators. The majority (86%) of mothers had more than one baby and 62% of them had previously breastfed their last baby. Multigravidas 87% comprised of the sample in Nigerian and 82% in South Africa. The mean birth weight for was 3024g (SD 404) with a gestational age mean of 39 weeks (SD 2.9).No standard baseline demographic or clinical characteristics were significantly associated with EBF.
**Conclusions:** Despite recommendations to promote EBF for HIV-infected mothers and their exposed infants, many HIV-infected mothers do not EBF for the first six months of life. There is an urgent need to understand factors that may influence, develop strategies that improve HIV-infected women's adherence to EBF.

#### Crowdsourcing condom promotion videos: a non-inferiority randomized controlled trial (RCT) in China

W. Tang[1], J. Mao[2], C. Liu[1], T. Wong[3], K. Mollan[3], S. Tang[1], H. Li[1], Y. Qin[1], B. Ma[4], M. Liao[5], B. Yang[6], W. Ma[7], D. Kang[5], C. Wei[8], J. Tucker[1], Social Entrepreneurship for Sexual Health (SESH)

*[1]UNC Project China, Guangzhou, China, [2]UCLA, Los Angeles, United States, [3]UNC Chapel Hill, Chapel Hill, United States, [4]Beijing Danlan Gongyi, Beijing, China, [5]Shangdong Provincial Center for Disease Prevention and Control, Jinan, China, [6]Guangdong Provincial Center for Skin Diseases and STI Control, Guangzhou, China, [7]Shandong University, Jinan, China, [8]University of California, San Francisco, United States*

*Presenting author email: weimingtangscience@gmail.com*

**Background:** Crowdsourcing, the process of shifting individual tasks to a large group, may help health media interventions to promote condom use. We conducted a non-inferiority RCT to compare condom use between those who viewed a crowdsourced or a social marketing condom promotion video.

**Methods:** MSM and transgender participants (n=1173, ≥16 years old, engaged in condomless sex in the last three months) were recruited through a nationwide MSM web portal and randomly assigned into 1 of 2 video interventions. The crowdsourced video was developed by the public through an open contest while the evidence-based social marketing video was designed by experts. Participants were followed up 3 weeks (online survey) after watching the video and the main outcome was any condomless sex in the 3-week period.

**Results:** Among 1173 eligible participants who entered the study, 907 (77%) individuals from 32 provinces in 269 Chinese cities completed the 3-week follow-up. Socio-demographic, sexual risk behaviors, and non-intervention health media exposure were similar between the 2 groups. Condomless sex was reported for 146/434 (33.6%) in the crowdsourcing group and 153/473 (32.3%) in social marketing group. The crowdsourced video met the pre-specified 10% margin for non-inferiority (estimated difference: 1.3%, 95% confidence interval: -4.8% to 7.4%). The two groups also had similar proportions of condom self-efficacy, HIV testing, and condomless sex with male partners, and with female partners. The crowdsourced intervention cost substantially less than the social marketing intervention, both for total video cost (10,159 USD savings) and cost per person who reported no condomless sex (58 vs. 84 USD/person).

**Conclusions:** Our nationwide study demonstrates that crowdsourcing may be an effective tool for designing media to promote condom use. Crowdsourcing contests may help spur more creative intervention tools that promote HIV prevention and control.

### WEPEC282

#### The Women's Health Intervention using SMS for Preventing Pregnancy (WHISPER): development of a mobile phone-based health promotion intervention for female sex workers in Mombasa, Kenya

F. Ampt[1,2], E. Mangone[3,4], K. Plourde[3], C. Mudogo Mukanya[5], P. Gichangi[5,6,7], M. Lim[1,2], S. Luchters[1,2,7], M. Hellard[1,2], M. Stoové[1,2], M. Chersich[8], M. Temmerman[7], W. Jaoko[6], K. L'Engle[9]

*[1]Burnet Institute, Melbourne, Australia, [2]Monash University, Melbourne, Australia, [3]FHI 360, Durham, United States, [4]University of North Carolina, Chapel Hill, United States, [5]International Centre for Reproductive Health, Mombasa, Kenya, [6]University of Nairobi, Nairobi, Kenya, [7]Ghent University, Ghent, Belgium, [8]University of the Witwatersrand, Johannesburg, South Africa, [9]University of San Francisco, San Francisco, United States*

*Presenting author email: frances.ampt@burnet.edu.au*

**Background:** Female sex workers (FSWs) in many HIV-endemic settings are at high risk of unintended pregnancy. HIV prevention programs, while critical for promoting condom use, tend not to address broader sexual and reproductive health (SRH) needs. Due largely to poor knowledge and misconceptions about available options, FSWs in Kenya have high unmet need for dual methods and more effective and longer-acting methods of contraception.

WHISPER is an mHealth intervention aiming to reduce unintended pregnancy among FSWs. We report the intervention development process and results from workshops with FSWs.

**Methods:** Intervention development was an iterative process that included: literature review identifying key SRH domains and barriers; mapping these to cognition strategies from behaviour change theory; and involving the target population in message development. Stand-alone messages and multiple-episode 'role model stories' about FSWs adopting healthy behaviours were drafted. These were tested with FSWs in six workshops to improve relevance, cultural appropriateness and acceptability. Notes and recordings were translated into English and analysed thematically.

**Results:** Forty-two women aged 16 to 44 participated. Most had at least one child and a boyfriend or husband, in addition to clients. Despite Swahili being widely spoken, English was the preferred language for SMS because of its perceived simplicity. Participants reported that most messages were easy to understand, positive in tone, and addressed topics important to them. They found the role model stories inspiring and realistic, and identified with the characters. The intervention was modified based on participants' feedback, e.g. using text rather than voice messages, timing messages to different work schedules, and adding specific Swahili terms to improve relevance. A risk that participants may use WHISPER to seek emergency assistance was identified and an automated response message providing local emergency numbers was added to address this. Overall, participants felt they could trust the content and that it made them feel cared for and valued.

**Conclusions:** A strong basis in theory and evidence resulted in an mHealth intervention that was perceived as engaging and relevant by FSWs. Active participation of FSWs enabled intervention refinements and improvements in acceptability, appropriateness, and the potential to reduce unintended pregnancy and HIV in this high-risk population.

### WEPEC283

#### Predicting intentional barebacking by analyzing the dating profiles of the popular gay chat rooms in Taiwan

N.-Y. Ko[1], Y.-D. Chen[2], R.-C. Shen[1]

*[1]National Cheng Kung University, Nursing, Tainan, Taiwan, Province of China, [2]National Cheng Kung University, Intelligent Information Retrieval Lab, Department of Computer Science and Information Engineering, Tainan, Taiwan, Province of China*

*Presenting author email: nyko@mail.ncku.edu.tw*

**Background:** In 2015, men who have sex with men (MSM) accounted for 84% of newly diagnosis HIV/AIDS cases in Taiwan. Intentional condomless anal sex ("barebacking") and recreational drug use in MSM are the major concerns of transmission of HIV and other sexually transmitted infections. The study purpose was to analyze personal dating profile posted on the popular gay chat rooms and we developed linguistics-driven prediction models to estimate the factors associated with intentional barebacking among MSM online users.

**Methods:** UT Home is the most popular Internet site provides free online information, social networking and communication services for Taiwanese MSM online users. We downloaded all messages posted in the Message Board during October 1st to 31th in 2015 under the topic "Gay Chat Rooms." We analyzed personal dating profiles included the name, ID, nickname, and/or other interaction information openly displayed on the chat room. The data was analyzed using a machine-learning algorithm to generate predictive models. The models were constructed by converting the free-text records into words or word phrases datasets in which identified the combination of words that were associated with barebacking.

**Results:** We analyzed 290,242 interactions in the UT chat rooms. Of them, 11% were identified as the requests for sexual intercourse directly, 0.6% requested for barebacking, only 0.6% disclosed their HIV positive status, 8.0% requested for using drugs, including 3.5% for methamphetamine, followed by ecstasy (0.8%), and ketamine (0.6%). Intentional barebacking were associated with: hock on line during early morning after 1:00 am (AOR: 1.38, 95% CI: 1.22-1.56), using methamphetamine

(OR: 3.08, 95% CI: 2.65-3.59), requests for sex (OR: 6.02, 95% CI: 5.48-6.61), and self disclosure as HIV positive (OR: 2.58, 95% CI: 1.71-3.89).

**Conclusions:** Crystal methamphetamine users and self-identified as HIV positive were associated with being sexually active and intentional condomless anal sex. Future STI and HIV prevention strategies should emphasize on harm reduction advice and support to HIV-diagnosed MSM who use recreational drugs.

## WEPEC284

### DIGITAL PARTNER NOTIFICATION SERVICE AT A COMMUNITY-BASED VOLUNTARY COUNSELLING AND TESTING CENTRE FOR MEN WHO HAVE SEX WITH MEN: CHECKPOINTLX, LISBON, PORTUGAL

M. Rocha, R. Guerreiro, N. Pinto, J. Rojas, F. Ferreira, J. Esteves, R. Fuertes, J. Brito, M.J. Campos
*GAT Portugal, CheckpointLX, Lisboa, Portugal*

**Background:** Access to partner notification (PN) services should be offered in all sexual transmitted infection (STI) testing sites, especially in those tailored for HIV priority groups. PN approaches and implementation do vary across Europe Region, but recently web-based solutions, such as electronic PN for men who have sex with men (MSM) were endorsed. PN is recommended when participation is both voluntary and anonymous. CheckpointLX is a Portuguese, peer-led, community-based voluntary counselling and testing centre for HIV and other STI screening and linkage to care tailored for MSM. This centre started CheckOUT in June 2015: a web-based, free, voluntary, anonymous, confidential, client-led PN service, designed according to current recommendations.
**Methods:** CheckOUT is intended to be a tool for anonymous and client-led disclosure of a recent STI diagnosis or reactive test acknowledged at CheckpointLX, therefore only accessible to MSM attending this centre. CheckOUT runs on a reserved area of the centre official website. User logins are given to all MSM with recent STI diagnosis or reactive test. User login expires after 30 days and can only be used once. After CheckOUT service instructions page, users do login and then choose the STI to notify, insert partners phone or email, agree with disclaimers and pre-defined notification wording and submit. Service statistics are stored at website backoffice (number of users and notifications sent). Since June 2015 all people attending CheckpointLX are asked if they come for testing due to CheckOUT. Data and outcomes were collected from 20th June 2015 to 20th of January of 2016.
**Results:** CheckOUT access was granted to 78 MSM. 17 used it (22% of index cases) and informed 98 partners (≈6 notifications per person). In this period, 10 people sought CheckpointLX for STI`s screening reporting CheckOUT notification, 2 of them had a reactive HIV and syphilis rapid tests (20% reactive cases overall). All 10 attending had been tested for HIV in the previous 12 months.
**Conclusions:** Almost a quarter of MSM used CheckOUT. All people with HIV reactive test had syphillis coinfection and a recent previous nonreactive test for HIV. PN allowed early diagnosis and linkage to care and potentially prevented new HIV infections.

## WEPEC285

### ASSESSING THE EFFICACY OF HARNESSING MOBILE INTERNET TECHNOLOGY TO PROVIDE LOCALIZED AND LANGUAGE-SPECIFIC MSM HEALTH INFORMATION IN CHALLENGING AFRICAN CONTEXTS

A. Tucker[1,2], G. Reid[3], P. Semugoma[1], G. de Swardt[1], C. Dorval Defferary[4], H. Struthers[1,5], J. McIntyre[1,6]
*[1]ANOVA Health Institute, Johannesburg, South Africa, [2]University of Cape Town, Department of Environmental and Geographical Sciences, Cape Town, South Africa, [3]International HIV/AIDS Alliance, Cape Town, South Africa, [4]International HIV/AIDS Alliance, Hove, United Kingdom, [5]University of Cape Town, Department of Infectious Diseases, Cape Town, South Africa, [6]University of Cape Town, School of Public Health & Family Medicine, Cape Town, South Africa*
*Presenting author email: tucker@anovahealth.co.za*

**Background:** Numerous barriers exist to providing MSM in East African countries with targeted, accurate and context-specific sexual health information. Legal barriers and broader community-censure hinder dissemination of MSM-focused safer sex materials. Security, logistical and financial barriers limit the geographic reach of what printed local materials are available. Language barriers limit the efficacy of most online materials. MSM-focused HIV information that is easily accessed, context-relevant to East Africa and cost-effective is needed.
**Description:** Anova Health Institute and the International HIV/AIDS Alliance have designed and implemented the first online information platform for MSM in East Africa in both Swahili and English. Designed as a low bandwidth site for mobile phones, *afya4men.info* offers rapid access to holistic information that enables MSM to look after their health. It includes information on male sexuality, HIV prevention and testing, living with HIV, risks and symptoms of other STIs and the effects of alcohol and other substance use.
**Lessons learned:** In just over 12 months, over 10,000 pages of information have been viewed. Site access from across the region continues to increase significantly every month. Pages in Swahili, specifically concerning HIV transmission and STIs are by far the most popular and should be expanded upon. Traditional advertising in Uganda, Kenya, Zimbabwe and Tanzania via fliers and other promotional material had marginal impact on site uptake. Conversely, limited but targeted online advertising via social media platforms has proved extremely effective in terms of cost, reach and translation into site visits.
Cost benefit analysis highlights significant cost savings generated by using online platforms for information dissemination across the region, especially when compared to existing outreach models. However, start up costs for translation and site development must be acknowledged, as should defraying costs of access onto users via expenditure for online data.
**Conclusions/Next steps:** Success in implementation has led to translation of the site into French for access in Francophone Africa. Feedback from MSM highlights sometimes very limited knowledge regarding male biology and sexual risk. Consideration should now be given to developing language specific interactive elements whereby localized concerns can be speedily addressed.

## WEPEC286

### ECASCADE: REAL-TIME MONITORING TO MEASURE AND IMPROVE THE HIV CASCADE FOR MSM/TG POPULATIONS IN THAILAND

E. Stephan[1], M. Avery[1], C. Chariya[2], P. Chanlern[3], R. Ruenkumful[4], P. Sirinirund[5], M. Cassell[6], T. Sattayapanich[1], A. Arunmanakul[1]
*[1]FHI 360, Bangkok, Thailand, [2]Chiang Mai Provincial Health Organization, Chiang Mai, Thailand, [3]Mplus+, Chiang Mai, Thailand, [4]Caremat, Chiang Mai, Thailand, [5]Thailand National Aids Management Center, Bangkok, Thailand, [6]USAID Regional Development Mission Asia, Bangkok, Thailand*
*Presenting author email: mavery@fhi360.org*

**Background:** Mobile applications that automate data collection and track individuals through the HIV cascade can facilitate real-time monitoring to improve HIV program performance. The USAID LINKAGES Project (managed by FHI 360) constructed a comprehensive, easy-to-use smartphone app to capture data related to client flow at outreach, HIV testing, and ARV treatment points.
**Description:** The smartphone application guides outreach and clinical staff through the steps of a multi-faceted HIV cascade model in four project sites. The app tracks individuals across multiple engagements, manages UIC codes and incentive coupon systems, ensures confidentiality and consent, and leverages SMS messaging to reduce a client's potential loss-to-follow-up. This tool both guarantees adherence to essential procedures and extracts cleaner data for cascade tracking. After a phased rollout from July 2015 to February 2016, the app registered 1257 individual clients, of which 1039 (83%) were successfully tested for HIV. Among those tested, 96 were confirmed positive (9.2% HIV yield), and 63 of these individuals initiated ARV treatment (66% treatment initiation uptake within a short time period).
**Lessons learned:** The application's recruitment coupon data resulted in a direct view of the structure of clients' social networks and indicated networks with higher numbers of positives for increased outreach focus. The application's GPS function made possible a geospatial visualization of outreach, providing greater analysis of the strategies undertaken by outreach implementers. Furthermore, among the workers operating the smartphones, clinical staff require greater facilitation of application use than outreach staff, as clinical facilities' logistics and existing systems present more constraints than outreach. Finally, the important task of integrating the app with government data systems requires sustained engagement.
**Conclusions/Next steps:** Client flows through diverse outreach, HIV testing, and treatment sites require more complex cascade analyses than originally envisioned but the tool can still be valuable to measure 90-90-90 goals of the HIV cascade. Furthermore, joint HIV cascade data ownership and use by government and NGOs is key to promoting complimentary and mutually respected community-based and government services for key populations.

## WEPEC287

### A PILOT RANDOMIZED CONTROLLED TRIAL OF A MOBILE PHONE DELIVERED COUNSELING INTERVENTION TO REDUCE HIV RISK AMONG MALE SEX WORKERS IN CHENNAI, INDIA

M. Mimiaga[1,2], B. Thomas[3], K. Biello[1,2], K. Mayer[2,4,5], P. Navakodi[3], A. Dhanalakshmi[3], S. Menon[6], S. Safren[7]
*[1]Brown University, Behavioral & Social Sciences and Epidemiology, Providence, United States, [2]Fenway Health, The Fenway Institute, Boston, United States, [3]Indian Council of Medical Research, National Institute for Research in Tuberculosis, Chennai, India, [4]Harvard Medical School/Beth Israel Deaconess Medical Center, Division of Infectious Diseases, Boston, United States, [5]Harvard T. H. Chan School of Public Health, Global Health and Population, Boston, United States, [6]Sahodaran, Chennai, India, [7]University of Miami, Department of Psychology, Coral Gables, United States*
*Presenting author email: beenaelli09@gmail.com*

**Background:** Men who have sex with men (MSM) are at increased risk for HIV infection in India, particularly those who engage in transactional sex with other men (i.e., male sex workers; MSW). Despite this, HIV prevention efforts for Indian MSW are lacking. Traditional face-to-face interventions may present important challenges that may limit MSWs participation, including time spent and costs associated with transportation. The use of mobile phones among MSW are widespread; employing these technologies as part of an HIV prevention strategy may mitigate these challenges and prove to be effective.
**Methods:** MSW (N = 100) were equally randomized to:
(1) A behavioral intervention integrating HIV risk reduction counseling delivered via mobile phones, and daily, personalized text messages as motivating cues for reducing risky sexual behavior, or
(2) A standard of care (SOC) comparison condition.
Both groups received HIV counseling and testing at baseline and 6-months, and completed ACASI-based behavioral assessments at baseline, 3-, and 6-months. A mixed-effects regression, specifying a Poisson distribution, was estimated to assess the intervention effect on the primary outcome: condomless anal sex (CAS) acts with male clients.
**Results:** The mean age was 28 (SD=9.1). Half of participants completed secondary education or less, and one-third completed undergraduate college. A reduction in the reported number of CAS acts with male clients in the past month was seen overall. MSW in the intervention condition reported a faster rate of decline in number of CAS acts with male clients in the past month from baseline to 3-month follow up (p< 0.0001) and 6-month follow up (p< 0.00001) compared to the SOC condition. Post hoc contrasts indicated that differences in CAS acts with male clients were seen at both 3- and 6-months.

| | Baseline | Month 3 | Month 6 |
|---|---|---|---|
| Intervention | 7.67 (1.15) | 1.43 (0.29) | 0.24 (0.09) |
| Enhanced Standard of Care | 7.79 (1.17) | 4.85 (0.87) | 2.79 (0.79) |
| p-value | 1.000 | 0.0003 | <0.0001 |

*[Poisson-Adjusted Mean (SE) Number of Condomless Anal Sex Acts with Male Clients, Past Month by Study Condition at baseline and follow-up assessments]*

**Conclusions:** The use of mobile phone technologies to deliver an HIV prevention intervention that supports harm reduction for MSW in India was feasible and acceptable, and showed preliminary efficacy in reducing sexual risk when compared to a SOC condition. Future testing of this intervention in a fully powered, randomized controlled efficacy trial is warranted.

## WEPEC288

### POTENTIALS OF USING SOCIAL MEDIA: USE OF INTERNET, MOBILE PHONES AND OTHER E-DEVICES IN REACHING MEN WHO HAVE SEX WITH MEN WITH HIV-PREVENTION MESSAGES IN AN ERA OF RESTRICTIVE LEGISLATION

O.A. Oderinde[1], J. Ibitoye[2], A. Shittu[2], U.S. Nwanfor[3], A. Ojoye[2], S. Ikani[4]
*[1]Society for Family Health, HIV/AIDS, Lagos, Nigeria, [2]Society for Family Health, Lagos, Nigeria, [3]Centre for the Right to Health, Lagos, Nigeria, [4]Society for Family Health, Abuja, Nigeria*
*Presenting author email: tosinoddy@yahoo.com*

**Background:** In Nigeria there has been a consistent rise in HIV prevalence over the years amongst the Men Who Have Sex with Men (MSM) accounting for about 10% of new Human immunodeficiency virus (HIV) infections. The same sex law operationalized in Nigeria has made it challenging for MSM to participate in HIV prevention programming and less likely to seek for HIV and sexually transmitted infections (STI) services for fear of public stigma and discrimination, hence increased challenges in programming for this population.
**Description:** In response to the prevailing legal and policy environment in Nigeria, the capture and re-capture methodology was used to estimate MSM key population in Lagos state, Nigeria, 2015. The survey was conducted across the 20-LGAs. A total of 2,422 and 1,079 MSM were interviewed at the first count and second count respectively across hot spots.
**Lessons learned:** This study revealed among other things that MSM are dynamic and highly mobile as evidenced by the difference in the community members enumerated in the two counts. This study also found that the most commonly used means of communication by the MSM was social media (2go Chat, Instagram, and MSM parties, SMS, Whatsapp and Twitter) during capture (86.2%) and recapture phase (87.8%). The three most common means of communication among MSM in the two phases respectively were identified as social media (86.2%; 87.8%); phone calls (83%; 81.7%) and with other friends (78.6%; 84.9%).
**Conclusions/Next steps:** Higher percentages of the MSM are educated and highly mobile. HIV prevention programs for MSM should explore the potential use of social media interventions such as development of APPS that seeks to provide relevant and appropriate messages on condoms, HTS and HIV related concerns. Development of mobile APPS that works to answer frequently asked questions that addresses HIV/AIDS needs to KPS and policies and programs that seeks to include social media as a medium of BCC messaging to intended audience.

## WEPEC289

### CYBER-EDUCATORS, A NEW BEGINNING ON THE HIV INTERVENTIONS

J. Rivas[1], M. Rodas[2], S. Lungo[2]
*[1]Population Services International, Research, Guatemala, Guatemala, [2]Population Services International, Programs, Guatemala, Guatemala*
*Presenting author email: jrivas@pasmo-ca.org*

**Background:** Central America, a region with a concentrated HIV epidemic in populations of men who have sex with men (MSM) and transgender women (TW), faces challenges to reach these populations due to high levels of stigma and discrimination. The evolution of the internet has led to revolutionary approaches in various public health interventions, including HIV, and has become an indispensable partner in expanding access to HIV-related services in the region.
**Description:** With USAID financial support, the Pan American Social Marketing Organization (PASMO) has implemented a 5-year program in Central America, except Honduras, combining prevention messages for behavior change communication, products, services, and referrals for HIV prevention. An online intervention targeting MSM was created to expand accessibility to and coverage of HIV-related services among this demographic. “Cyber-educators” reach out to MSM through social media and local chat room websites where they gradually introduce educational health topics through conversation and eventually refer MSM to HIV testing and counselling.
**Lessons learned:** The results of the program are increasingly encouraging. Using a unique code to track participants, educators were able to reach a total of 12,198 individuals online in 2015, five times the number reached in the first year of the program (2012) when 2,444 individuals were reached. The online component has consistently grown and now 41% of the total MSM interventions of the program are those implemented online, up from just 20% in 2012. PASMO has also been able to reach a younger and more diverse group of MSM than those reached through face to face interventions.
The program has been so popular that conversations are now transcending HIV to include other health topics, and countries outside the region have also begun to replicate the strategy. The further step is to conduct a study to determine the impact of these interventions.
**Conclusions/Next steps:** The internet’s influence on the modern world makes including online services almost mandatory for programs to succeed. The cyber-educators initiative started only as a complementary activity but has quickly come to represent almost half of all MSM activities in the region, and its potential is changing the way PASMO approaches program implementation in Central America.

# SOCIAL AND BEHAVIOURAL CONCEPTS AND THEORIES

## WEPED290

### EVALUATION OF THE HIV-RELATED SOCIAL SUPPORT SCALE AND ITS CORRELATIONS WITH QUALITY OF LIFE

T. Xie, N. Wu, Community based HIV/AIDS Prevention and Treatment Research Group in China
*Zhejiang University, State Key Laboratory for Diagnosis and Treatment of Infectious Diseases, the First Affiliated Hospital of Zhejiang University, School of Medicine, Hangzhou, China*
*Presenting author email: hivlabzju@126.com*

**Background:** Although social support is increasingly recognized to be important in treatment of HIV infection, no validated, disease-targeted instruments are currently available. We sought to develop and validate the first disease-targeted social support scale instrument in Chinese: the HIV-related Social Support Scale (HSSS).
**Methods:** We established content validity for HSSS and administered the resultant questionnaire to 310 persons living with HIV (PLWH). We used correlation analysis to test hypotheses regarding HSSS domains and measured construct validity by comparing WHOQOL-HIV scores across several subscales. Descriptive statistics were generated for each of the variables of general characteristics. And we also used student *t* test to compare the different groups.
**Results:** The HSSS demonstrated a high level of internal consistency, both within each subscale and with the overall higher-order scale; all Cronbach's α values exceeded our a priori threshold of ≥ 0.70. The HSSS cores were positively correlated with WHOQOL-HIV total scores (Pearson correlation: 0.39, $P < 0.001$). We also found that higher educational level, personal income, CD4 cell count, and shorter duration of antiretroviral therapy are significantly associated with a higher level of social support ($P < 0.05$).
**Conclusions:** The HSSS is a valid and reliable measure that captures differences in social support and may be useful in clinical practice or in future clinical trials.

## WEPED291

### HIV/AIDS POLICIES AND THE REDEFINITION OF CITIZENSHIP IN CAMEROON

L. Kojoué
*Independent Researcher/ Activist Affirmative Action, Yaoundé, Cameroon*
*Presenting author email: larissa.kojoue@gmail.com*

**Background:** Inequalities related to class, gender, sexual orientation, place of residence, etc. increase the risk of HIV infection. The links between the fight against HIV/AIDS and LGBT mobilizations around the world have been extensively demonstrated. However, there are few empirical studies on the effects of new strategies based on performance on LGBT claims in Africa. The New Funding Model of the Global Fund for example is based on an inclusive "country dialogue" process that includes all stakeholders, but especially key affected populations such as Men who have Sex with other Men (MSM). The aim of this paper is to show how the new overall global strategies and discourses on HIV/AIDs policies influence the design of practices and critical statements on human rights issues in homophobic contexts.
**Methods:** Our research is based on content analysis: conceptual notes, reports, strategic documents, press releases. We also referred to interviews with national stakeholders engaged in the Fight against HIV/AIDS, gay rights activists and journalists.
**Results:** New funding models of international donors force the State to open new channels of participation to minorities groups. They allow sexual minorities to exercise a form of citizenship linked to their biological condition. Homosexuals or men who have sex with other men for example are given a special attention within national AIDS policies. They can have access to medical care and psychosocial support. They even have a voice in decision-making through their delegates at the Country Coordination Mechanism. Paradoxically, these new strategies crystallize postcolonial tensions, by forwarding "western values" on same sex sexualities. They also enclose the recognition of LGBT rights within a *pathologized identity*, the HIV epidemic.
**Conclusions:** Biological citizenship defines better these new rights for LGBT in Cameroon. This specific citizenship appears to be a temporary and marginal citizenship. In order to give way to full citizenship, LGBT mobilizations need to be more political than technical. They must use HIV/AIDS platforms (the only platforms where they are officially recognized) to claim more political and social rights. The political environment is unfortunately not appropriate for such claims, since most civil societies organizations feel powerless before the centrality of the State power.

## WEPED292

### PERCEPTIONS OF HIV REMISSION ("CURE") TRIALS AND TRIAL INTENTIONS AMONG POTENTIAL PARTICIPANTS TREATED IN ACUTE HIV INFECTION

H. Peay[1,2], T. Jupimai[3,4], G. Henderson[5], P. Pongtriang[6], N. Chomchey[3], N. Phanuphak[3], P. Prueksakaew[3], E. Kroon[3], J. Ananworanich[2,7], The RV254/SEARCH010 Study Group
*[1]RTI International, Research Triangle Park, United States, [2]Henry M. Jackson Foundation for the Advancement of Military Medicine, Bethesda, United States, [3]SEARCH, The Thai Red Cross AIDS Research Center, Bangkok, Thailand, [4]HIV-NAT, The Thai Red Cross AIDS Research Centre, Bangkok, Thailand, [5]University of North Carolina, School of Medicine, Dept of Social Medicine, Chapel Hill, United States, [6]Faculty of Nursing, Suratthani Rajabhat University, Surat Thani, Thailand, [7]U.S. Military HIV Research Program, Walter Reed Army Institute of Research, Silver Spring, United States*
*Presenting author email: thidarat.j@hivnat.org*

**Background:** A series of HIV remission trials are being conducted in the Thai Red Cross AIDS Research Centre. Prior to trial invitation, we surveyed eligible, acute HIV individuals on ART in the SEARCH cohort, exploring trial interest, perceived benefits and risks, and factors associated with intentions to participate.
**Methods:** A paper survey was provided in-clinic. Data collection is ongoing; results from Nov-Dec 2015 are presented. Analysis includes descriptive statistics and backwards elimination regression.
**Results:** Among 165 participants the large majority (97%) are male. 139 (84.2%) were somewhat/very interested in learning about HIV remission trials. On open-ended questioning about key factors in decision making, those somewhat/very interested most often referenced anticipated personal and altruistic benefits; those less interested most often referenced risks of harm and personal benefit. Most (n=148, 89.7%) reported that trial decision-making would be theirs alone. For personal benefit, more than half endorsed "a big chance" (n=60, 36.4%) or "definitely would benefit" (n=45, 27.3%). For risk, 59 (36.0%) chose "no chance" or "small chance of harm" and 96 (58.5%) chose "about a 50/50 chance." Most (n=118, 72.4%) chose "a big chance" or "definite" for scientific benefit. Factors associated with intentions to participate in a trial that includes stopping ART (n=96, 58.9% somewhat/very likely) were higher perceptions of scientific benefit (beta= .27, p< .001) and higher personality trait optimism (beta= .26, p< .001), $R^2$= .16 (F (2, 159)= 15.58, p< .01). Factors associated with intent to participate in a trial with an experimental drug and stopping ART (n=110, 68.3% somewhat/very likely) were higher perceptions of scientific benefit (beta= .35, p< .001) and lower perceived impact of HIV (beta= -.07, p=.03), $R^2$= .16 (F (2, 157)= 14.37, p< .01).
**Conclusions:** This cohort indicated high interest and intention to participate. Though they anticipate personal benefits and frequently described these factors as important to their decisions, the common factor associated with stated intentions was anticipated scientific benefit. Risks were less described, which may reflect uncertainty about types and magnitude of risks, and optimistic bias. The results suggest that informed consent should target the potential for and uncertainty about risks and how the trial design maximizes scientific benefit.

## WEPED293

### UNDERSTANDING COERCION IN THE CONTEXT OF SEMI-SUPERVISED HIV SELF-TESTING IN URBAN BLANTYRE, MALAWI

W. Lora[1], E. Chipeta[2], N. Desmond[1]
*[1]Malawi Liverpool Wellcome Trust, Blantyre, Malawi, [2]University of Malawi, Blantyre, Malawi*
*Presenting author email: wezzielora86@gmail.com*

**Background:** HIV self-testing (HIVST) offers great potential to increase knowledge of HIV status since it uniquely addresses tensions between convenience and confidentiality. However, the high rate of gender based violence (GBV) in Sub-Saharan Africa generates concerns over the possibility that HIVST may trigger coercive testing at household level. This paper is drawn from a study exploring the social impacts of introducing HIVST in resource-poor settings. This presentation will explore the concept of coercion in the context of HIVST in Malawi and argues that coercion is a culturally relative concept, interpreted differently in different contexts.
**Methods:** Data on coercion was collected using mixed methods but the focus in this paper is on 60 serial biographical interviews (15 men, 15 women and 15 couples) collected at two time points with individuals aged 16-49 years who collected the HIVST kit in Blantyre. Data was organised, coded and themes developed using Nvivo 10.
**Results:** HIVST kit was an empowering tool especially for women by bringing test kits into the household. Coercive testing was considered acceptable in some contexts where people were in a stable relationship or had a history of infidelity and had never disclosed HIV status. Coercive testing was often considered as a benefi-

cent act that helped people to control their future. In other cases, coercion was viewed as an infringement of human rights but actual impacts of coercive testing did not reflect perceived impacts of coercive testing.

**Conclusions:** Underlying social contexts such as power and gender imbalances informed male and female responses to coercion. In cases where coercion was considered acceptable actual realities of coercion were not considered unethical. The impact of methodological approaches needs to be understood in researching complex concepts such as coercion.

## STRENGTHENING SOCIAL AND BEHAVIOURAL DATA COLLECTION AND ANALYSIS

### WEPED294

### IMPROVED EXPECTATIONS OF HEALTH AND LONGEVITY AFTER IMPLEMENTATION OF UNIVERSAL TEST-AND-TREAT STRATEGY IN THE SEARCH TRIAL

H. Thirumurthy[1], A. Jakubowski[1], J. Kabami[2], W. Nuwagaba[2], E. Ssemmondo[3], A. Elly[4], D. Mwai[5], T. Clark[6], C. Cohen[6], E. Bukusi[4], M. Kamya[3,7], M. Petersen[8], D. Havlir[6], E. Charlebois[6]
*[1]University of North Carolina at Chapel Hill, Department of Health Policy and Management, Chapel Hill, NC, United States, [2]Infectious Diseases Research Collaboration, Mbarara, Uganda, [3]Infectious Diseases Research Collaboration, Kampala, Uganda, [4]Kenya Medical Research Institute, Nairobi, Kenya, [5]University of Nairobi, Nairobi, Kenya, [6]University of California, San Francisco, United States, [7]Makerere University College of Health Sciences, Kampala, Uganda, [8]University of California, Berkeley, United States*
*Presenting author email: hthirumu@email.unc.edu*

**Background:** Expectations about future health and longevity are important determinants of individuals' decisions to invest in physical and human capital. Few population-level studies have measured subjective expectations about longevity and examined how they are affected by scale-up of antiretroviral therapy (ART). We assessed these expectations in communities receiving annual HIV testing and universal ART.

**Methods:** Longitudinal data on expectations were collected in two waves, at baseline and year 1, in 16 intervention communities participating in the SEARCH trial of the test and treat strategy in Kenya and Uganda (NCT01864603). A random sample of households with and without an HIV-infected adult was selected following baseline HIV testing. Expectations about survival to 50, 60, 70, and 80 years of age were measured using a Likert scale. Logistic regression analyses were used to examine the association between reporting being very likely or almost certain to survive to advanced ages and HIV status, including CD4 cell count, and to determine trends in these expectations over time.

**Results:** Data were obtained from 2,932 adults at baseline and 3,726 adults in wave 1, with 2,748 adults participating in both waves. At baseline, adults reporting favorable expectations about survival to advanced ages were more likely to be male, have completed secondary education, and have higher wealth. HIV-negative adults were more likely to have favorable expectations about survival to 60 years than HIV-positive adults with CD4≤500 (adjusted odds ratio [AOR] 1.76, p< 0.001), as were HIV-positive adults with CD4>500 (AOR 1.20, p< 0.05). Favorable expectations about survival to 60 years were significantly more likely among all adults in year 1 (AOR 1.59, p< 0.001).

| | Baseline | | | Year 1 | | |
|---|---|---|---|---|---|---|
| | *HIV+, CD4≤500* | *HIV+, CD4>500* | *HIV-uninfected* | *HIV+, CD4≤500* | *HIV+, CD4>500* | *HIV-uninfected* |
| Very like or almost certain to survive to: | | | | | | |
| 50 years, % | 50.0 | 49.0 | 56.5 | 58.7 | 56.0 | 68.7 |
| 60 years, % | 35.7 | 36.3 | 46.2 | 51.4 | 44.6 | 57.6 |
| 70 years, % | 21.6 | 23.2 | 32.0 | 35.4 | 28.6 | 41.3 |
| 80 years, % | 15.3 | 17.3 | 23.7 | 24.4 | 21.3 | 30.1 |

*[Percentage of participants reporting they are very likely or almost certain to survive to advanced ages]*

**Conclusions:** Significant variation was found in expectations about survival to advanced ages in study communities, and these expectations improved considerably in a one year period. Future research from the SEARCH trial will help determine whether these changes are driven by the provision of universal ART.

## MIXED METHODS, INTEGRATED APPROACHES AND SYNERGIES IN HIV RESEARCH AND INTERVENTION

### WEPED295

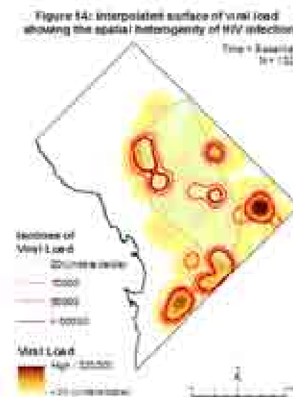
### MAPPING 'HABITUS' AND HIV INFECTION OF DRUG USERS: THE COLLISION OF PHYSICAL SPACES OF EVERYDAY LIFE, RISK NETWORKS AND HEALTH

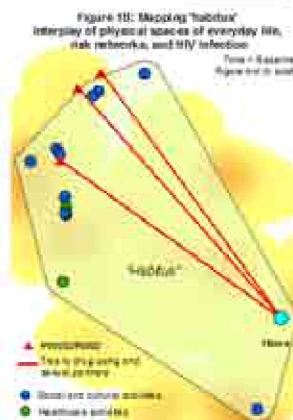
D. Ghosh[1], F.L. Altice[2]
*[1]University of Connecticut, Geography, Storrs, United States, [2]Yale University, School of Medicine, New Haven, United States*
*Presenting author email: debarchana.ghosh@uconn.edu*

**Background:** Neighborhood and risk network factors have been linked to drug use and HIV prevalence. However, it is not clear how the interplay of risk networks and individuals' daily activities within their everyday physical and social spaces affect HIV transmission and treatment. Using French sociologist Pierre Bourdieu's framework of 'habitus', we sought to visualize micro neighborhoods mediating spaces and activities and understand their association with HIV. The study population is PWUD/PWID living with HIV in Washington-DC.

**Methods:** Demographic and egocentric risk network data were obtained from a longitudinal study (n = 152). The geographic location of participant's and network members' homes and a set of daily activities (e.g. work, worship, eating and healthcare) were recorded. Outcome measures were HIV treatment (viral load VL, CD4-count) and adherence to ART 30-days prior to baseline. Next, the habitus of participants were mapped using bounding polygons that enclosed the locations of everyday activities. The area, density, and direction of the habitus were calculated. Subsequently, network analysis and GIS were used to overlay risk networks and calculate its positionality with respect to the habitus. Finally, Universal Kriging was used to model the spatial pattern of HIV infection though VL.

**Results:** The PWUD/PWID were predominantly black (98%) male (54%) with a median age of 52. 45% had suboptimal (< 85%) ART-adherence and 35% exhibited detectable VL (>400). Fig1A shows a concentration of high VL in the southeastern and southwestern neighborhoods. For a participant (VL >4000) living in these neighborhoods, everyday activities, including healthcare, were located almost 5-miles away from home (Fig1B). The average size of risk networks was 3, comprised primarily of friends (77%) and generally clustered around participants' home in high-VL neighborhoods.





*[Figure 1A-B: Mapping 'habitus' of drug users with HIV infection]*

**Conclusions:** Our unique approach visualizes the habitus to explain spatial heterogeneity of HIV in micro neighborhoods. This can inform geographic targeting of tailored HIV prevention and care interventions.

## WEPED296

### HEALTH-RELATED QUALITY OF LIFE (HRQL) AMONGST PEOPLE LIVING WITH HIV IN MATABELELAND SOUTH PROVINCE OF ZIMBABWE

T. Mucheri[1], J. John-Langba[2]
*[1]University of Cape Town, Social Development, Harare, South Africa, [2]University of Cape Town, Social Development, Cape Town, South Africa*
*Presenting author email: mchtol001@myuct.ac.za*

**Background:** Health Related Quality of Life (HRQL) is an important measure to evaluate the efficacy of various health related interventions targeted towards a specific population. People living with HIV fall under the category of hard to reach populations given the sensitivity of HIV/AIDs in marginalized rural communities. Despite the magnitude of support rendered towards ensuring utilization of HIV/AIDs-related healthcare, there is dearth of scholarly evidence to assess changes in health related quality of life. Main objective of this study was to assess HRQL of amongst PLWHIV. This paper is part of a wider research that focused on examining 'Social Capital & Utilization HIV/AIDs related Healthcare in rural Matabeleland South province in Zimbabwe.'
**Methods:** A mixed method design was used for the study. A random sample of 403 adults above 18 years was reached using Time Location Sampling procedure. Demographic, health related and socio economic data was collected through one-on-one interviews. Informed consent and ethical clearance was done for the study. HRQL was operationalized using the SF-36 tool consisting of 36 items. Kolmogorov-Smirnov test for normality was done for the central study variables. Reliability tests for the HRQL scales were done and correlations between HRQL and central study variables such as Healthcare utilization were conducted in SPSS.
**Results:** The study showed that amongst 399 PLWHIV interviewed 65% reported high health related quality of life with average absolute scores above 50. Cronbach's alpha coefficients for the HRQL scales were above 0.7. 80% of those who reported low HRQL had low Personal Social Capital Scale scores. A chi-square test of independence was performed to examine the relation between Health related quality of life and healthcare utilization. The relation between these variables was significant, X2 (2, N = 399) = 14.14, p<0.5.
**Conclusions:** Health Related Quality of Life is associated with Personal Social Capital and health care utilization among PLWHIV. These findings are consistent with previous studies which linked social capital to positive health outcomes implying a need to promote social cohesion for better health related quality of life in rural areas.

## QUALITATIVE AND ETHNOGRAPHIC METHODS IN HIV RESEARCH

## WEPED297

### USING POETIC NARRATIVE INQUIRY IN HIV-RESEARCH WITH, FOR AND BY PAN-AFRICAN COMMUNITIES

L. Chambers
*McMaster University, School of Social Work, Hamilton, Canada*
*Presenting author email: chambl3@mcmaster.ca*

**Background:** Social science researchers are revolutionizing methodological approaches that are grounded in the ways people living with HIV make meaning of their social worlds. Notably, scholars in continental Africa and the African diaspora have incorporated culturally responsive approaches to knowledge production, including performance-based narrative methods reverential to emotive, embodied expression.
**Description:** The *Because She Cares study* used poetic narrative inquiry to explore African immigrant women's experiences of HIV-related employment. Informed by transnational feminist epistemologies and decolonizing thought, this methodology draws upon performance narrative methodologies, and critical narrative inquiry. Using poetic transcription, paralanguage (speech intonation, pitch, and speed, pauses, and body language) was incorporated into narrative transcripts. Select passages from each participant (narrator) were refashioned into data poems that illustrated salient aspects of HIV and work "found" through oral narrative performance such as: tonal shifts, emotive expression, and narrator declarations. Drafted poems were then workshopped with each narrator who reviewed them alongside their original transcript and then contributed to the poems.
**Lessons learned:** Poetic narrative inquiry is a novel way of engaging participants in research. Presenting the poems before dissemination gave participants greater control over the process, and the opportunity to discuss what poems to share, how to share them, and to whom. Narrators used the poems to reflect back on their original narratives which typically generated further reflections of how they make meaning of their work in the HIV response. Concerns about using poetic narrative inquiry include matters of confidentiality and anonymity, the tensions of authenticity, control and ownership, and the potentially painful emotional resonance of poetry
**Conclusions/Next steps:** Poetic narrative inquiry offers a social science methodology that is congruent with pan- African narrativization of experience. Poetic representation is a rational and emotional expression of research evidence that can disrupt the empirical dualism of mind-body, art-science, and researcher-participant. Currently, the researcher is working with narrators to develop dissemination activities that incorporate data poems such as text installations, oral performances, and audio/video displays. Using arts-informed methodologies creates an opportunity to critically reflect on knowledge production in HIV research: who produces knowledge, what ways of knowing are valued, and what messages are conveyed through knowledge production and dissemination.

## WEPED298

### TRANSITION CARE OF THE YOUTH FROM ADOLESCENTS' TO ADULTS' ART CLINIC: LESSONS FROM UGANDA. A QUALITATIVE STUDY

W. Massavon[1,2], S. Kironde[1], A. Alowo[1], A.V. Nagawa[1], R. Ingabire[1], I. Musoke[1], C.P. Namisi[1], M.M. Nannyonga[1], P. Costenaro[3], A. Mazza[4], C. Giaquinto[5], S. Anthierens[6]
*[1]St. Francis Hospital Nsambya, Home Care Department, Kampala, Uganda, [2]Doctors with Africa, CUAMM, Kampala, Uganda, [3]Tukula Fenna Project, Nsambya Home Care, Kampala, Uganda, [4]Santa Chiara Hospital, Trento, Italy, [5]University of Padua, PENTA Foundation, Padua, Italy, [6]University of Antwerp, Department of Primary Health Care and Interdisciplinary Care, Antwerp, Belgium*
*Presenting author email: kirondesusan@gmail.com*

**Background:** Antiretroviral therapy (ART) and improved care have enhanced survival of HIV-infected infants into adolescents and young adults in many settings including Uganda.
Nsambya Home Care (NHC) is a specialized HIV/TB Department of St. Francis Hospital Nsambya, in Kampala, Uganda. In 2011, NHC initiated Youths' Transition Care Counselling to prepare youths living with HIV and their caregivers for transfer of care to a user fee applying adults' ART clinic. We aimed to explore challenges, barriers and enabling factors associated with the process.
**Methods:** We conducted a general qualitative descriptive study to examine enabling factors, barriers and challenges to the transfer of the youth from the adolescents' clinic to the adults' ART clinic at NHC. The study covered 12 months (September 2014-August 2015), and the participants included all youths living with HIV aged 17-28 years, attending the adolescents' clinic over the study period. We used semi-structured face-to-face and telephone interviews to collect data that was complemented by chart reviews. Data was analysed using techniques from thematic and framework analysis.
The Uganda National Council for Science and Technology approved the study, and we obtained informed consents for the interviews.
**Results:** We studied 132 youths; mean age 20.1 (range 17-28 years), the majority were female (60.6%), on ART (96%), education level above primary (66%). Sixty-five percent accepted a transfer from the adolescents' to the adults' clinic, but only 12% eventually transferred to the adults' clinic. Even though 85% were paying user fees, just 35% were earning incomes.
**Enabling factors:** Included perceptions of maturity, having financial security and other support structures, and feeling in a safe and secure environment (e.g. same clinic or staffs and peer support networks).
**Barriers and Challenges:** Comprised of financial insecurity, no support structures, user fees, stigma from adults and unfavourable adults' clinic appointments. Others were breaking up of peer support networks and emotional and psychological unpreparedness.
**Conclusions:** Organized transfer of the youth from adolescents' to adults' ART clinics is an added health system challenge in Uganda. Our findings provide vital considerations for securing a smooth transition care for this population.

### A DAY IN THE ANTIRETROVIRAL CLINIC: USING ETHNOGRAPHY TO UNDERSTAND RETENTION IN HIV CARE

Y. Kriel[1,2], S. de la Porte[3], N.P. Magula[4]
*[1]MatCH Research, Durban, South Africa, [2]University of KwaZulu Natal, School of Nursing and Public Health, Durban, South Africa, [3]University of KwaZulu Natal, Anthropology, Durban, South Africa, [4]University of KwaZulu Natal, Department of Medicine, Durban, South Africa*
*Presenting author email: ykriel@matchresearch.co.za*

**Background:** South Africa has achieved remarkable results by initiating more than an estimated 2.5million people on antiretroviral treatment (ART). Most ART users access their treatment from public healthcare facilities that are often overburdened and ill-equipped to handle such a large number of clients.
The purpose of this study was to understand the everyday challenges that the users experience in their attempt to access life-saving treatment and in so doing capture the lived experiences of ART users and the factors influencing their disengagement from care.
**Methods:** Between January and December 2013 a mixed methods ethnography was conducted in a public health care ART clinic in Durban, South Africa. In-depth interviews (10), focus group discussions (4) and 150 questionnaires were used to collect information. Seven months of participant observation was also done in the ART clinic. The data was triangulated for disagreements and concurrence between the qualitative and quantitative data and thematic analysis allowed for the data to reveal the most important aspects of the results.
**Results:** Invisible violence and inequality are embedded within the everyday routines and procedures of the ART clinic. Commonly reported barriers included long waiting times, poor staff attitudes, repeated monthly visits, staff shortages, and lack of information. ART users reported feeling disempowered to address these challenges due to the restrictive nature of the programme and the power imbalance that exists between healthcare providers and users. The inability of ART users to negotiate their own treatment regimens to suit their needs resulted in some cases of disengagement from care.
**Conclusions:** The everyday struggle that people have to endure to access ART was highlighted by this study. Using ethnography allowed us to identify hidden challenges that exist within the health care system that is not captured by other means of investigation in HIV research. Ethnographic findings provide key insights and understanding in health seeking behaviour and specific needs, especially in the area of continued access to HIV care.

## WEPED300

### ASCERTAINING SEXUAL RELATIONSHIP TYPES (ASERT) AMONG YOUNG FEMALES IN TANZANIA

K. Hallman[1], S. Peracca[2], A. Jenkins[3], N. Matee[4], P. Paul[5], F. Mrisho[6], I. Cerna-Turoff[7], J. Bruce[8]
*[1]Population Council, Poverty, Gender and Youth Program, New York, United States, [2]Independent Consultant, San Francisco, United States, [3]UNICEF, Freetown, Sierra Leone, [4]Independent Consultant, Dar es Salaam, Tanzania, United Republic of, [5]Restless Development, Iringa, Tanzania, United Republic of, [6]TACAIDS, Dar es Salaam, Tanzania, United Republic of, [7]Independent Consultant, New York, United States, [8]Population Council, New York, United States*
*Presenting author email: khallman@popcouncil.org*

**Background:** Despite research on age-disparate sexual relationships in Africa, few studies have explored non-age characteristics of partners, and almost none has clearly articulated young females' motivations for pursuing different types of sexual partners.
**Methods:** The *Ascertaining Sexual Relationship Types* (ASERT) method uses anonymous, group-based reporting to discern the diversity and range of sexual partner types, the criteria used in making partner choices, and partner-specific relationship attributes ranked by order of importance.
**Results:** Based on a pilot exercise in Tanzania with young out-of-school females grouped by age, the tool revealed 13 distinct sexual partner types among adolescent girls (aged 15-19) and young women (aged 20-24), as well as the motivations for pursuing each type, ranked by order of importance. Nine partner types were common to both age groups; three were distinct to 15-19s and one to 20-24s.
The 13 varieties of sexual partners lie along an economic-socioemotional continuum. Among the eight age-disparate types, all were primarily for financial assistance. Two were only for big money or fast money; six were for a mix of cash gifts combined with one or more of the following: parent-like care, transportation access, health care access, or freedom to have other sexual relationships. The five similar-age partner types were mainly for sexual satisfaction, social status, or love and future plans.
**Conclusions:** Results show that 15-19-year-olds named more sexual partner types (12) than did 20-24-year-olds (10), and that economic and structural barriers were more frequently described as motivations among the 15-19-year age group, possibly due in part to their out-of-school status. The findings emphasize the need for reaching young adolescent girls before such relationships start with age-adapted HIV prevention and social protection interventions that include school retention and economic strengthening. Data from this tool can allow HIV prevention programs to better understand the ranked criteria that adolescent girls and young women use in making sexual partnership choices.

# KNOWLEDGE TRANSLATION AND DISSEMINATION OF RESEARCH AND PROGRAMME OUTCOMES

## WEPED301

### DESPAIR AND OPTIMISM: REFLECTIONS ON MY EXPERIENCE OF RESEARCHING AND PUBLISHING SEXUALITY IN ETHIOPIA

G. Tadele
*Addis Ababa University, Addis Ababa, Ethiopia*
*Presenting author email: getnett2001@yahoo.com*

**Background:** Sexuality is sensitive and sometimes taboo issue to discuss, practice, research and disseminate openly in many societies. Leave alone in relatively conservative societies like Ethiopia, Irvine's (2014) article shows that sex research remains socially problematic even in the western world. I have been engaged in researching and publishing sexuality and HIV/AIDS since 1990s. I have undertaken a number of studies , both published or not, related to sexuality and HIV/AIDS in Ethiopia (including MSM study). Some of these studies were perceived as incriminating, exceedingly intimate or 'discrediting' to the researcher and the researched. Such topics pose not only difficulty in accessing informants but also include wider issues regarding the ethics and politics of research. The objective of this paper is to identify, discuss and implement strategies for conducting and publishing research on sexuality topics
**Methods:** This paper used extensive literature review, self-reflective accounts such as personal recollections and correspondence as primary source of data to explore the intricacies, challenges and identify better strategies of researching and publishing sexuality topics.
**Results:** Amidst the 'conservative' sexual ethics, politics, standards, and practices of Ethiopian society, researching and publishing about sexuality topics continues to pose considerable challenges and controversies, which may hamper serious scientific investigations as well as create extreme frustration for potential investigators and authors. There is a moral panic among academics and publishers (who act as gate keepers rather than as producers of knowledge), implementers (NGOs and GOs) and the public at large and feeling of insecurity among key populations such as MSM. Our intervention to improve sexuality research and publication/dissemination should target all these different groups of stakeholders.
**Conclusions:** Some of the studies I conducted on uncharted territories however seem to have given insight and courage to other researchers and the public at large and it is encouraging to see a few other studies emerging on the sensitive and hitherto taboo topics. The significance of such studies, therefore, cannot be overstated in prompting future researchers to dare engage in such sensitive topics and equipping them to better navigate the inevitable challenges associated with them.

## WEPED302

### BUDGET TRACKING, TRANSPARENCY AND ACCOUNTABILITY: THE MISSING LINK IN THE NATIONAL HIV RESPONSE IN ZIMBABWE

A. Mavheneke, L. Chingandu, R. Eghtessadi
*SAfAIDS, Programmes, Harare, Zimbabwe*
*Presenting author email: adolf@safaids.net*

**Background:** SAfAIDS and the Zimbabwe National Network of People Living with HIV/AIDS (ZNNP+) with funding support from the AIDS and Rights Alliances for Southern Africa (ARASA) are implementing a two-year human/health rights training and advocacy programme on ensuring that people living with HIV and TB and other key populations access acceptable, affordable and quality sexual reproductive health rights (SRHR), HIV and TB prevention, treatment and care services. One of the objectives of the programme is to advocate for the provision of quality health care services through enhanced transparency and accountability among health care providers on the resources provided for improvement of the health care delivery system in Zimbabwe.

**Description:** The programme is being implemented in five out of the country's ten provinces (i.e. Harare and Bulawayo Metropolitan, Manicaland, Masvingo and Matebeleland North). The programme works through community based volunteer health advocates who in turn engage health centres and their constituent health centre committees with the latter assisted to monitor how people access health services at the health centres.
**Lessons learned:** One of the key lessons drawn from the programme through a rapid assessment study conducted is that knowledge and information on the domestic public resources allocated towards the improvement of the health sector and how the resources are being used is not readily available among the Zimbabwean public. This has led to citizens who are disconnected from mainstream participation on health issues. In return, government is failing to close this gap in citizens' engagement. Yet knowledge on how the national health budget is spent against what was planned provides opportunities for communities to monitor and hold to account the health service provider(s).
**Conclusions/Next steps:** Citizens' access to information on the domestic HIV financing is a fundamental human right. It has empowerment effects, and facilitates the effectiveness of the national HIV response framework. It obligates citizens to take an active and participatory role in the demand and provision of quality healthcare services. It is thus the duty of government to ensure that information on domestic healthcare including HIV financing is made readily available, and in reader friendly formats to all citizens.

## WEPED303

### THE POSITION OF AFRICAN AUTHORS IN ACADEMIC COLLABORATION NETWORKS IN HIV/AIDS IN PUBLIC ADMINISTRATION AND GOVERNANCE AND THE RESILIENCE OF THE NETWORK TO POTENTIAL WITHDRAWAL OF INTERNATIONAL AUTHORS

M. Quayle[1,2], M. Adshead[3]
*[1]University of Limerick, Psychology, Limerick, Ireland, [2]University of KwaZulu-Natal, Psychology, Pietermaritzburg, South Africa, [3]University of Limerick, Politics and Public Administration, Limerick, Ireland*
*Presenting author email: mike.quayle@ul.ie*

**Background:** Academic co-authorship networks are the visible manifestation of academic collaborations and reveal structural features of intellectual capital and knowledge generation systems. This paper uses social network analysis to map the position of African scholars in the field of HIV/AIDS in public administration and governance. Of particular importance is (1) the extent to which African authors are embedded into the global community of scholars; and (2) the extent to which the networks of relationships between African scholars across Africa is mediated by relationships with authors from developed countries. If the African scholarship networks are bridged or mediated by international authors, then the removal of international authors from the network as international funding priorities shift will have disproportionate effects on the stability of the academic network and the ability of African scholars to maintain their productive collaborations.
**Methods:** This study exploits bibliographic data from the Thompson Web of Knowledge (formerly ISI) database to geomap the co-authorship network of international scholarship on African governance and public policy related to HIV/AIDS. Social network methods are applied to analyse patterns of relations between African and international scholars and between African scholars from different African countries.
**Results:** While African scholars are well positioned in the global collaboration network according to several key network metrics, direct links between African scholars in different African countries are less common than links between Africans and non-Africans. International authors play key bridging roles in the collaboration network, making the inter-African collaboration network vulnerable if these authors dropped out.
**Conclusions:** The African collaboration network in the field of HIV/AIDS in public administration and governance is thriving, and African authors are active and well positioned in the network. However, inter-African links are frequently mediated by international authors who have bridging functions in the network. The African academic network is therefore sensitive to shifts in funding priorities that may cause these network bridges to reduce their African collaborations. Thus if international donors plan to shift funding priorities they should first aim to increase direct inter-African collaboration to improve the resilience of the thriving African academic research network and thus facilitate African HIV/AIDS research into the future.

## WEPED304

### ACCEPTABILITY OF THE DAPIVIRINE VAGINAL RING TO FEMALE PARTICIPANTS AND MALE PARTNERS INVOLVED IN 'THE RING STUDY'

M. Malherbe[1], C. Milford[2], C. Herman[1], C. Woodsong[3], M. Russell[1], L. Greener[2], V. Kidd[1], J. Visser[1], J. Smit[2], A. Nel[1]
*[1]International Partnership for Microbicides, Paarl, South Africa, [2]Maternal, Adolescent and Child Health Research (MatCH), Department of Obstetrics and Gynaecology, Faculty of Health Sciences, University of the Witwatersrand, Durban, South Africa, [3]International Partnership for Microbicides, Silver Spring, United States*

**Background:** HIV infection in women remains a global health concern. A female initiated, self-administered prevention agent, such as, the dapivirine vaginal ring could offer women a critically needed option to prevent HIV infection and is being tested in The Ring Study (IPM 027). Correct and consistent use as well as acceptability by participants and their male partners is essential for it to be effective. Qualitative socio-behavioural data was collected as part of the Ring Study. This paper explores acceptability of the ring and experiences of participants and their male partners when using the ring.
**Methods:** Individual in-depth interviews (IDIs) and focus group discussions (FGDs) were conducted across six research centres in South Africa and one in Uganda. Data was collected 24-36 weeks after research centre activation and again after last product use visits. Qualitative data was organized into key themes using the Mensch theoretical framework (2012) and NVivo to facilitate analysis.
**Results:** Fifty-five female, 72 male IDIs and 9 female FGDs were conducted. Many factors were identified as influencing ring use and acceptability, including gender and power dynamics, vaginal attitudes and practices, motivations to join the study, partner support and awareness of own HIV risk. Women initially had concerns with ring use, which diminished over time. These concerns were commonly related to male partner's reaction to ring use, rather than physical attributes of the ring. Most women reported not feeling the ring once in-situ during day to day activities or during sexual intercourse. Very few women felt that it was uncomfortable using the ring during menses. Women preferred the low-maintenance monthly dosing regimen as opposed to an ARV gel. Male partners main concerns were initially related to physical injury to their penis or impact on sexual pleasure, but the majority reported no negative effect on sexual pleasure or physical injury following their partner's ring use.
**Conclusions:** The dapivirine vaginal ring was well accepted by both female participants and male partners and initial concerns dissipated with ring use over time. The Ring was seen as a low maintenance HIV prevention method and acceptability is promising for future use of the ring as such a method.

## COMMUNITY ENGAGEMENT IN RESEARCH AND RESEARCH DISSEMINATION

## WEPED305

### SCIENCE OR MEDIA CAFÉS: WHERE SCIENTISTS MEET THE MEDIA

E. Nakkazi[1,2]
*[1]Health Journalists Network in Uganda, Kampala, Uganda, [2]AVAC, New York, United States*
*Presenting author email: estanakkazi@gmail.com*

**Background:** The Health Journalists Network in Uganda (HEJNU), an independent organization with 80 members who report on heath regularly, brings journalists together to improve the quality, accuracy and visibility of health journalism in Uganda. In 2015, HEJNU and AVAC, a global HIV prevention research advocacy organization, began the Media Science Café programme, with the aim of increasing informed and accurate reporting of HIV prevention research in Uganda.
**Methods:** The premise of the Cafés is that many minds brought together achieve a more powerful end result than what one would have otherwise reach working in isolation. 20-25 journalists meet monthly with researchers and advocates to explore the science behind research results, new research studies and other timely topics. Journalists also critique each other's work and work collaboratively. The informal format of the Cafés helps journalists, scientists and advocates meet as equals and makes it easier to freely ask questions and foster discussion.
**Results:** The Cafés created new avenues to update the media about research milestones and discuss emerging issues and have helped build lasting trust between researchers and journalists. HEJNU analyzes each café looking at what worked and what needs improvement and monitors resulting coverage and any public debates. In surveys we found that speakers liked the relaxed environment that prompts many questions from journalists and creates lively debates. They value the chance to provide more in-depth information about their work. Journalists found the small num-

bers help them interact freely and absorb topics better. Journalists appreciate the opportunity to continuously improve their understanding of research, hone health reporting skills and create a supportive network beyond their own newsrooms.
**Conclusions:** The Cafés have created a sustained platform ensuring consistency of media coverage on HIV prevention, reaching new health journalists and supporting positive relationships between media and scientists. HEJNU helped mentor new café conveners when the program was replicated in Zimbabwe and Zambia. HEJNU and AVAC will continue to work together to support a growing café network in Africa. We also plan to expand the cafés in Uganda to other issue such as SHRH and attract additional partners.

## WEPED306

### SPACES LIKE THESE: CREATING MEANINGFUL OPPORTUNITIES FOR CAPACITY BUILDING IN COMMUNITY BASED-RESEARCH AMONG SOUTH ASIAN WOMEN IN TORONTO, CANADA

V. Chikermane[1], J.P. Wong[2], L.A. Chambers[3], R. Kteily-Hawa[4], S. Hari[1]
*[1]Alliance for South Asian AIDS Prevention, Toronto, Canada, [2]Ryerson University, Toronto, Canada, [3]McMaster University, Hamilton, Canada, [4]Queen's University, Kingston, Canada*
*Presenting author email: v.chikermane@gmail.com*

**Background:** In 2015 the Alliance for South Asian AIDS Prevention (ASAAP) initiated a Community Based-Research (CBR) Study to test the effectiveness of culturally relevant stories as an educational tool in HIV and sexual health among South Asian women. A large emphasis of the study was placed on building our collective capacity as South Asian and racialized women to meaningfully lead research. While the primary goal of the study was to determine the impact of stories on HIV knowledge, attitudes and risk perception, peer engagement and capacity building constituted a core component. The study design included structured roles for peers in facilitation, leadership and dissemination.
**Methods:** The study design included facilitated focus groups with participants who received either stories or traditional fact sheets as an HIV educational tool. Eight (8) female peer leaders representative of the South Asian diaspora in Toronto were recruited for the capacity building components of the study and extensively trained in topics such as the 'Principles of Community-Based Research', 'Research Design', 'Focus Group Facilitation and Recruitment', 'Consent and Confidentiality' and 'Referrals and Participant Support.' Peer leaders then facilitated all 11 of the study focus groups and were provided opportunities to vary their roles as lead facilitator, support facilitator or note taker.
**Results:** Peer leaders gained critical CBR skills, including outreach and recruitment, data collection and collective data analysis. Feedback from peer leaders indicated that connecting with peers to explore topics of sexual health, stigma and HIV/AIDS was empowering. They also identified the creation of a safe space for learning, growth and community building through research as critical. Peers leaders also engaged in developing a knowledge dissemination video and presented on their experiences to ASAAP's wider membership.
**Conclusions:** Since structural and systemic impediments often restrict access of racialized women to research spaces, studies that build opportunities to increase access are imperative. In traditional research spaces however, community involvement and collective capacity building is often not the norm and still debated. Sharing models that have achieved demonstrated success in this area can inspire future HIV research with, for and by communities impact by HIV.

## WEPED307

### BUILDING STAKEHOLDER ENGAGEMENT CAPACITY: A MIXED METHOD DISTANCE LEARNING APPROACH TO IMPLEMENTING THE GOOD PARTICIPATORY PRACTICE GUIDELINES

A. Schley[1], S. Hannah[2], J. Salzwedel[2]
*[1]AVAC, Cape Town, South Africa, [2]AVAC, New York, United States*
*Presenting author email: anne.schley@gmail.com*

**Background:** As the Good Participatory Practice Guidelines for biomedical HIV prevention research (GPP) continue to be rolled out across research programs there is a need to build and sustain capacity of engagement staff. The *GPP Online Training Course* is a web-based, multimodal learning approach dedicated to strengthening understanding and application of GPP among implementers and key stakeholders. The primary audience for the course is research team members who design and/or implement community engagement programs. The course offers two tracks, implementers and non-implementers, with varying levels of intensity.
**Description:** The course uses a customized, Wordpress-based learning management system and combines synchronous and asynchronous strategies such as:
1) Narrated, interactive modules with animations, case studies, practice activities, quiz questions and supplementary GPP resources;
2) Forum discussions and webinars related to module content and learners' real-world experiences, aimed at creating a GPP community of practice and culture;
3) Written work assignments in which learners critically analyze their research context, identify and prioritize key stakeholders, and develop a strategic stakeholder engagement work or action plan. Learners receive extensive individual feedback from facilitators with GPP expertise. Course modules can be accessed and viewed on a computer, iPad, or offline.
**Lessons learned:** As of December 2016, three courses have been conducted in nine countries across Africa, Southeast Asia, the U.S and Europe. A total of 54 learners have completed the course with positive learning outcomes. All learners reported gains in knowledge, self-efficacy and commitment to implementing GPP. Aspects of the course described as most valuable were its interactivity, opportunities to share perspectives with other learners through forum discussions, and facilitators' feedback on work assignments. Some learners indicated that the course required a significant time commitment; most learners in the implementer track spent five to seven hours per week completing requirements.
**Conclusions/Next steps:** Future GPP online courses are being designed with consideration of needs and interest of other audiences, including CABs, Ethics Committees, and other research fields, such as TB and Ebola. Courses will encompass a blended learning approach, with varying combinations of video webinars, e-learning and peer moderation, aimed at creating the most efficient and innovative educational approach for each audience.

# ROLE OF SOCIAL AND BEHAVIOURAL SCIENCE IN BIOMEDICAL RESPONSES

## WEPED308

### PERCEIVED BENEFITS OF HIV CURE-RELATED RESEARCH PARTICIPATION IN THE UNITED STATES

L. Sylla[1], J. Taylor[2], D. Evans[3], B. Weiner[4], A. Skinner[4], S. Greene[4], K. Dube[4]
*[1]defeatHIV Community Advisory Board (CAB), Seattle, United States, [2]Collaboratory of AIDS Researchers for Eradication (CARE) CAB, Palm Springs, United States, [3]Delaney AIDS Research Enterprise (DARE) CAB, San Francisco, United States, [4]UNC Gillings School of Global Public Health, Chapel Hill, United States*
*Presenting author email: lauzie1@live.com*

**Background:** We assessed perceptions of benefits in HIV cure clinical research in the United States. We hypothesized that perceived personal benefits, clinical benefits and social benefits affect willingness to participate in research.
**Methods:** An extensive, online cross-sectional survey was conducted among 400 American adults (22% females; 77% males; < 1% transgendered) in 2015. The sample was ethnically diverse (65% Caucasian, 17% African-American/Black, 12% Hispanic, 4% mixed and 2% Asian) and 38 U.S. states were represented. We also conducted extensive key informant interviews with 36 people living with HIV, researchers, bioethicists, members of IRBs and regulatory agencies to assess perceptions of benefits.
**Results:** The psychological benefit of feeling good about contributing to HIV cure research (80%, 95% CI: [75-85%]; n = 396) and gaining knowledge about one's health (78% [73 -83%]; n = 385) were the potential personal benefits most likely to motivate participation in HIV cure research. Increasing one's ability to fight HIV (92% [87 - 97%]; n = 381) and reducing one's HIV reservoir (85% [80 - 90%]; n = 380) were the potential clinical benefits most likely to motivate participation. Helping find a cure for HIV (95% [90 - 100%]; n = 382), helping others with HIV in the future (90% [85 - 95%]; n = 384) and contributing to scientific knowledge (88% [83 - 93%]; n = 380) were the most important perceived social benefits. We delved deeper into these perceived benefits in the key informant interviews. Potential volunteers reported feeling empowered, contributing to stigma reduction, , hope, education, bolstering one's advocacy work, financial compensation and ensuring participation of under-represented populations. Regulators and clinicians-researchers concurred that early HIV cure studies are unlikely to provide any direct clinical benefit, but indicated that participants may experience other types of indirect benefit. Demographic differences in perceived benefits were also evaluated.
**Conclusions:** Despite no expectation of direct clinical benefit from participating in early Phase I HIV cure clinical studies, the majority of potential volunteers value the societal benefit of furthering science, and believe they will experience psychosocial benefits from their participation. Results highlight the importance of managing expectations and thoroughly exploring potential for therapeutic misconception.

## WEPED309

### FACTORS ASSOCIATED WITH SOCIAL GROUP MEMBERSHIP AMONG HIV-POSITIVE AND -NEGATIVE WOMEN IN TABORA, TANZANIA

G. Woelk[1], G. Antelman[2], G. Mbita[2], R. van de Ven[2], P. Njao[3], R. Machekano[1]
*[1]Elizabeth Glaser Paediatric AIDS Foundation, Washington DC, United States, [2]Elizabeth Glaser Paediatric AIDS Foundation, Dar es Salaam, Tanzania, United Republic of, [3]Ministry of Health and Social Welfare, Dar es Salaam, Tanzania, United Republic of*
*Presenting author email: gwoelk@pedaids.org*

**Background:** The interaction of people in groups (social capital)—utilized as an indicator of empowerment—is associated with positive health outcomes and behaviors. There are few studies examining the factors associated with social capital among women attending prevention of mother-to-child HIV transmission (MTCT) and maternal and child health services in rural communities of developing countries.
**Methods:** The SAFI study in Tabora, Tanzania is a facility-based trial evaluating the effect of SMS appointment reminders and cash transport payments on attendance and facility delivery among pregnant women from 27 antenatal clinics. This 2015 baseline analysis of eligible HIV-positive and HIV-negative pregnant women (n=1,329; age≥18,) utilized a multivariable logistic regression model to describe factors associated with social capital, defined as membership of a community-based group/club who have met at least once in the past three months. Variables in the model included education (woman and partner), partner work, knowledge that ARVs reduce sex transmission of HIV, and MTCT, knowledge of partner status, joint decision-making on health care for self, being formerly employed in the past year and ever delivering in a facility.
**Results:** Overall, 12.6% (172/1,329) women were group members, with comparable HIV prevalence among group and non-group members (26% vs. 27%). Comparable proportions of group and non-group members reported joint decision-making on health care for self, partner work, were married, knew ARV decreases HIV sexual transmission, knew partner HIV status, ever delivered in a facility. However, greater proportions of group members (and their partners) completed secondary school (p=0.001, and p=0.003 respectively), were formerly employed in the past year, (p< 0.001), and knew antiretrovirals (ARVs) reduced MTCT (p=0.009). In the multivariate analysis being formally employed in the past year (adjusted odds ratio [AOR] 3.04, 95% confidence interval [CI]: 1.99, 4.65); knowing that ARVs reduced MTCT (AOR 2.65, 95% CI: 1.32, 5.33) and knowing partner HIV status (AOR 1.79; 95% CI: 1.18, 2.72) were significantly associated with social capital.
**Conclusions:** Irrespective of HIV status, women who earned an income, had enhanced MTCT knowledge, and knew their partners' status were more likely to be in social groups. Group membership may enable gains in health knowledge and facilitate partner disclosure.

## WEPED310

### PERCEIVED RISKS OF PARTICIPATING IN HIV CURE-RELATED RESEARCH THE UNITED STATES

J. Taylor[1], D. Evans[2], L. Sylla[3], L. Dee[4], B. Weiner[5], A. Skinner[5], S. Greene[5], K. Dubé[5]
*[1]Martin Delaney Collaboratory Community Advisory Board, Palm Springs, United States, [2]Delaney AIDS Research Enterprise, University of California San Francisco, San Francisco, United States, [3]defeatHIV Community Advisory Board, Seattle, United States, [4]Collaboratory of AIDS Researchers for Eradication, Baltimore, United States, [5]UNC Gillings School of Global Public Health, Chapel Hill, United States*
*Presenting author email: jefftaylorps@gmail.com*

**Background:** We investigated perceptions of risks in HIV cure clinical research in the United States. We hypothesized that perceived clinical risks, including study procedures, side effects, and social risks affect willingness to participate in research.
**Methods:** We implemented a cross-sectional survey with 400 American adults living with HIV (22% female; 77% male; < 1% transgender) in 2015. The sample was ethnically diverse (65% Caucasian, 17% African-American, 12% Hispanic, 4% mixed and 2% Asian). Most U.S. states were represented. We also conducted extensive key informant interviews with 36 people living with HIV, as well as numerous researchers, bioethicists, members of IRBs and regulatory agencies to assess perceptions of risks.
**Results:** Increased cancer risk (49% [95% CI: 42, 52%]; n = 358), developing resistance to ARVs (37% [32, 42%]; n = 358), toxicities (30% [25, 35%]; n = 358) and known risks of stopping HIV medications (30% [25, 35%]; n = 358) were the potential clinical risks most likely to discourage participation. Procedures presenting the greatest barriers were lumbar punctures (26%), bone marrow biopsies (22%), lymph node biopsies (13%), and rectal biopsies (13%). Risk of transmitting HIV in case of unsuspected viral rebound (28% [23, 33%]; n = 358) was the most concerning potential social risk to participation. Additional risks discouraging participation included various clinical risks such as side effects, pain, debilitation, irreversible harm or death, scientific uncertainty, and failure to achieve a cure. Dissuading financial risks included loss of disability insurance or employment. Social risks included disclosure of HIV status, stigma/discrimination, and media attention. The burdens of finding transportation and parking were also significant deterrents to participation. Overall, key informants agreed that the riskiest HIV cure research modalities were stem cell transplants/gene therapy, latency-reversing agents, and combination approaches.
**Conclusions:** Understanding perceptions of risks is important to inform study design, informed consent, and recruitment and retention strategies for HIV cure-related research. HIV cure clinical researchers should minimize risks to study participants while maximizing scientific knowledge gained. Community and participant confidence regarding the safety of a scalable cure should be a compelling driver for discovery and progress towards a cure.

## WEPED311

### STRUCTURAL BARRIERS TO PRE-EXPOSURE PROPHYLAXIS (PREP) ENGAGEMENT AMONG MEN WHO HAVE SEX WITH MEN (MSM) IN VIETNAM: DIVERSITY, STIGMA, AND HEALTHCARE ACCESS

M.M. Philbin[1], J.S. Hirsch[2], P.A. Wilson[2], L. An Than[3], G. Le Minh[3], R.G. Parker[2]
*[1]Columbia University, New York State Psychiatric Institute, HIV Center for Clinical and Behavioral Studies, New York, United States, [2]Columbia University, New York, United States, [3]Hanoi Medical University, Hanoi, Vietnam*
*Presenting author email: mp3243@columbia.edu*

**Background:** Men who have sex with men (MSM) in Vietnam are in urgent need of effective HIV prevention: from 2006-2009, prevalence among MSM in Hanoi rose from 11% to 20%. MSM are the only group in Vietnam whose prevalence is increasing. Pre-exposure prophylaxis (PrEP), presents a potential strategy, but little is known about PrEP-related barriers in Vietnam.
**Methods:** We conducted interviews (n=32) and six focus groups (n=42) with MSM in Hanoi. The sample varied by age, income, birthplace, and sexuality. Data were taped, transcribed, translated, and analyzed within and across cases to explore themes relevant to structural barriers to PrEP uptake in Vietnam.
**Results:** Three primary factors emerged that would influence MSM's ability to engage with PrEP: diversity, stigma, and healthcare access.
Diversity: Participants described Vietnamese MSM as segregated into Bong Kin (hidden, often heterosexually-identified MSM) and Bong Lo ('out,' transgender, or effeminate MSM), and by birthplace, occupation, age, and income. Lower-income, 'hidden' MSM from rural areas were reluctant to access services targeted to MSM. This finding demonstrates the need for multiple strategies in order to reach diverse types of MSM. Furthermore, Bong Kin perceived themselves at low risk for HIV infection because they did not identify as gay, which could affect engagement with biomedical prevention.
Stigma: MSM reported being stigmatized by the government, healthcare system, family and friends, and even other MSM; Bong Lo reported the most stigma. The extremely stigmatized nature of same-sex sexual practices represents barriers to service access and social support; it would also limit MSM's willingness to carry PrEP and to present for regular HIV testing.
Healthcare access: Because of social discrimination and labor market exclusion, many Vietnamese MSM faced economic barriers to healthcare access; MSM-friendly services only existed in large urban settings. This poses further barriers to MSM's ability to access or even learn about PrEP.
**Conclusions:** Vietnamese MSM described barriers around diversity, stigma and healthcare access that have implications for their engagement with PrEP, particularly their openness to PrEP-related messaging and services. Vietnam provides an example of the substantial structural-level barriers that must be addressed to achieve the meaningful and effective scale-up of PrEP for MSM worldwide.

## WEPED312

### EARLY INITIATION OF ART LEADS TO MAINTAINING SOCIO-ECONOMIC STATUS FOR PLHIV AND THEIR HOUSEHOLD: EVIDENCE FROM TWO NEIGHBOURHOODS IN LUSAKA, ZAMBIA

J. Reijer
*University of Johannesburg, Johannesburg, South Africa*
*Presenting author email: j.m.reijer@gmail.com*

**Background:** Discussions surrounding the best time to start ART have been long on going. In the US, ART treatment is advised for everyone who is HIV positive regardless of their CD4 count. In 2013, the WHO published new guidelines for ART arguing that early initiation of ART is beneficial to the physical well-being of PLHIV and additionally may lead to fewer new infections. This paper provides a third dimension and argues that early initiation of ART leads to maintaining socio-economic status for PLHIV and their households.

Author Index

**Methods:** The study used a mixed method model whereby quantitative and qualitative data was collected simultaneously. Research was conducted in in two urban areas in Lusaka, namely: Kalingalinga and Roma N'gombe (2010 - on-going). The research focused on the trajectories that PLHIV (18 years and above who had been on ART for a minimum of 12 months) typically go through (pre-HIV: before illness, start ART, and post-ART: current situation).
**Results:** The study shows the importance of the temporal context of PLHIV and their households and allows for an examination of the recovery process after the initiation of ART. The individual trajectories of PLHIV impact the individual recovery process and success. It was found that for those who start with ART at a late stage of infection their well-being (for example: income levels, job type, and mental- and physical-health) is lower than for those who start with ART in an earlier stage of infection. In addition, not only are the recovery processes more difficult and longer for people who start with ART in a late stage of infection but also their overall socio-economic outcomes remain lower (even years after starting with ART).
**Conclusions:** This paper adds a dimension to the already existing reasons to start with ART in an early stage of infection. The main conclusion of this research is that early initiation of ART leads to maintaining socio-economic status for PLHIV and their household and additionally leads to overall better socio-economic outcomes on the long term.

## SEXUALITIES AND SEXUAL CULTURES: MEANINGS, IDENTITIES, NORMS AND COMMUNITIES

### WEPED313

#### UNDERSTANDING EXPERIENCES AND ATTITUDES RELATED TO SEXUAL AND GENDER-BASED VIOLENCE AMONG MILITARY PERSONNEL SERVING IN SUB-SAHARAN AFRICAN MILITARIES

V. Nightingale[1], J. Harbertson[1,2,3], B. Tran[1,4]
*[1]Naval Health Research Center, DoD HIV/AIDS Prevention Program, San Diego, United States, [2]Walter Reed Army Institute of Research, US Military HIV Research Program, Silver Spring, United States, [3]Henry M. Jackson Foundation for Advancement of Military Medicine, Inc, Bethesda, United States, [4]Leidos, Reston, United States*
*Presenting author email: harmattan69@gmail.com*

**Background:** While sexual and gender-based violence (SGBV) is recognized as an important factor driving the HIV epidemic in sub-Saharan Africa, attitudes toward and prevalence of SGBV within sub-Saharan African military populations are unknown.
**Methods:** Data on SGBV were collected from military service members of nine sub-Saharan African militaries through convenience samples. Attitudes related to SGBV and characteristics of those who committed and/or experienced forced sexual activities were collected from 2009 to 2014. Data were collected on 8815 service members (8165 men and 650 women) aged 18 years or older who voluntarily participated in the Seroprevalence and Behavioral Epidemiology Risk Surveys. Data were collected on demographics, SGBV attitudes, and forced sexual activities. Descriptive and bivariate statistical analyses are reported.
**Results:** Five percent of men and 9% of women reported ever experiencing a forced sexual activity. Men and women who had experienced a forced sexual activity were significantly more likely to agree with negative gender attitudes about SGBV. The majority of those who reported experiencing a forced sexual activity reported it was committed by someone outside of the military.
**Conclusions:** This is the first study to examine SGBV in sub-Saharan military populations in nonconflict settings. It provides evidence that SGBV is experienced by both male and female service members at rates not typically found in previous research examining SGBV in other military populations. A better understanding of SGBV in sub-Saharan military service members is necessary to ensure appropriate services and interventions are part of the military infrastructure.

### WEPED314

#### UNDERSTANDING THE RELATIONSHIP BETWEEN COUPLE DYNAMICS AND ENGAGEMENT WITH HIV CARE SERVICES: INSIGHTS FROM A QUALITATIVE STUDY IN A RURAL TANZANIA SETTING

J. Wamoyi[1], D. Mbata[1], D. Nyato[1], E. Slaymaker[2], M. Urassa[1], A. Wringe[2]
*[1]National Institute for Medical Research, Mwanza, Tanzania, United Republic of, [2]London School of Hygiene and Tropical Medicine, London, United Kingdom*
*Presenting author email: jwamoyi@hotmail.com*

**Background:** Social norms that drive the formation and dissolution of sexual partnerships are likely to influence the HIV care-seeking trajectories of people living with HIV/AIDS (PLHIV). However, with the exception of couple-counselling and prevention of mother-to-child transmission programmes, HIV care strategies tend to ignore the role of sexual partners. We sought to explore the interplay between couple dynamics and the engagement of PLHIV with HIV care in rural Tanzania.
**Methods:** A qualitative study was conducted involving 47 in-depth interviews with PLHIV with a range of HIV care experiences, including current users of HIV clinics, and diagnosed persons not enrolled in care. Four seeded focus group discussions were also conducted with HIV diagnosed persons not enrolled in care. Topic guides explored experiences and expectations of providing or receiving HIV services. Thematic analysis was conducted with the aid of NVIVO 10.
**Results:** PLHIV were often motivated to be in marital unions or sexual partnerships in order to secure economic or emotional support, as well as to fulfil societal expectations, and these concerns were often manifest in HIV care-seeking decisions. Relationship issues undermined disclosure of HIV status and engagement in care, with fear of abandonment by partners cited by men and women as reasons for not attending HIV clinic appointments. Conversely, being in a relationship where there were expectations or suspicions of partner infidelity often triggered a decision to undergo HIV testing, thus initiating the process of accessing HIV care. Furthermore, the desire to be healthy enough to attract a new partner, or have a baby with a new partner, was often cited as driving ongoing engagement with HIV care and treatment. Some PLHIV actively sought out new partners of the same positive HIV status as a strategy to maintain a relationship whilst mutually and openly engaging in HIV care and treatment.
**Conclusions:** Fulfilling social norms surrounding adult unions could both promote and undermine PLHIV engagement in care. Greater focus on devising couple-friendly HIV care and treatment programmes, including ongoing supportive counselling beyond an initial HIV test, could help to promote long-term retention in care and adherence to antiretroviral therapy.

### WEPED315

#### A QUALITATIVE STUDY OF PEER NETWORK INFLUENCE ON THE PERPETRATION OF INTIMATE PARTNER VIOLENCE AMONG URBAN TANZANIAN MEN

M. Mulawa[1], L. Kajula[2], S. Maman[3]
*[1]University of North Carolina at Chapel Hill, Health Behavior, Durham, United States, [2]Muhimbili University of Health and Allied Sciences, Psychiatry and Mental Health, Dar es Salaam, Tanzania, United Republic of, [3]University of North Carolina Gillings School of Global Public Health, Health Behavior, Chapel Hill, United States*
*Presenting author email: mulawa@live.unc.edu*

**Background:** Intimate partner violence (IPV) has been shown to be strongly associated with HIV infection. Research suggests that peers may influence IPV perpetration among men in sub-Saharan Africa. Understanding how men's IPV perpetration is shaped by their interactions and conversations with peers may provide valuable insight into future intervention efforts aiming to change network norms to reduce violence.
The purpose of this study is to examine the mechanisms through which peer networks of mostly urban men, locally referred to as "camps", influence men's perpetration of IPV.
**Methods:** Men were recruited from the control arm of an ongoing camp-randomized HIV prevention trial in Dar es Salaam, Tanzania. We collected and analyzed qualitative interviews (n=40) with 20 men who previously reported perpetrating physical IPV within the last year. We wrote narrative summaries for each participant and coded transcripts using both inductive and deductive codes.
**Results:** Men described societal and peer network-level norms that reinforce expectations that men hold dominant positions within their relationships. The camp-based peer networks were described as close-knit groups through which information spread quickly. Our results suggest that men are influenced by their peer networks in several ways. First, men reported talking openly about women and about conflicts that occur within relationships. Men described reaching a consensus within these discussions and also gave examples of their peers convincing them and other men to take specific actions. Men also described seeking advice formally from leaders within their networks when responding to conflicts. Participants also

provided rich examples of how new camp members adopted new behaviors and attitudes, particularly with regard to their views towards women, after joining the camp.
**Conclusions:** Men described being influenced by the normative environment of their peer networks. Conversations about women and dealing with conflicts were common, as were examples of peers pressuring others to act in a certain way. Men also noticed changes in the way members viewed women after joining the camps. These results suggest that gender norms are socially influenced and can be changed by working within social networks. This work highlights the importance of interventions that transform gender norms within social networks.

## RELATIONSHIPS, PARTNERSHIPS, CONCURRENCY AND SEXUAL NETWORKS

### WEPED316

### IMPLICIT INEQUITIES IN SERODISCORDANT RELATIONSHIPS: THE SOCIAL CONSTRUCTION AND MANAGEMENT OF *SERO-IMBALANCE* BY HIV-NEGATIVE AND POSITIVE PARTNERS IN CANADA

A. Daftary[1,2,3], J. Mendelsohn[2,4], L. Calzavara[2]
*[1]McGill University Health Center, McGill International TB Centre, Montreal, Canada, [2]University of Toronto, CIHR Social Research Centre in HIV Prevention, Dalla Lana School of Public Health, Toronto, Canada, [3]Centre for the AIDS Programme of Research in South Africa (CAPRISA), University of KwaZulu Natal, Nelson R. Mandela School of Medicine, Durban, South Africa, [4]Pace University, College of Health Professions, New York, United States*
*Presenting author email: amrita.daftary@mail.mcgill.ca*

**Background:** As PLHIV are enjoying longer, healthier lives in many high-income settings, long-term intimate sexual relationships with HIV-negative partners are increasingly commonplace. The impact of serodiscordance on relationship quality is thus a key area of study. This qualitative study aimed to shed light on the ways in which serodiscordant partner dynamics enable and constrain intimacy and wellbeing within HIV serodiscordant relationships.
**Methods:** In 2013, we conducted in-depth interviews with individuals who were recently engaged in a serodiscordant relationship of ≥6 months. HIV-positive participants were recruited through community-based organizations, and referred us to their HIV-negative partners. Our analysis was grounded in participants' narratives, and sought to extend current understandings of HIV disclosure, 'HIV talk', 'serosilencing', and the invisibility of HIV-negativity.
**Results:** Participants included four HIV-positive and two HIV-negative persons, aged 35-59 years, and both partners of two couples. They were experienced in a diversity of relationships, ranging 0.5-15 years' duration: monogamous (6), same-sex (2), heterosexual (3), and both same-sex and heterosexual (1). Participants reported engaging in unprotected sex more frequently as their relationships matured, despite their awareness of HIV transmission risk. Participants' narratives suggested that serodiscordance introduced an imbalance into their relationships, or 'sero-imbalance', related to sexual, material and emotional needs, access to resources, and sense of control over the relationship, which were perceived differently by each partner. 'Sero-imbalance' was dynamic, and experienced with variable intensities throughout the relationship lifecourse, according to how and when HIV was emphasized or silenced in the relationship and to external networks. Consequences included continuous disharmony, temporary moments of distress, and in extreme cases, termination of the relationship. Partners managed 'sero-imbalance' in overt and covert ways that reflected a mutual desire to distance themselves from narratives of disparity and distinction, in an effort to experience their relationships as balanced and 'normal'.
**Conclusions:** The theoretical construct of 'sero-imbalance' offers a unique lens to examine relationship dynamics between HIV serodiscordant partners. Further work can inform HIV prevention and wellbeing of serodiscordant couples by enabling them to manage perceived relationship imbalances as a means to sustain emotional closeness and embrace their HIV difference.

### WEPED317

### ACCOUNTING FOR HIGH VULNERABILITY AND LOW RISK FOR HIV AMONG TRANSGENDER MEN: A SEXUAL FIELDS ANALYSIS

A.I. Scheim[1], B. Adam[2,3], Z. Marshall[4], J. Murray[5]
*[1]Western University, Epidemiology and Biostatistics, London, Canada, [2]University of Windsor, Sociology, Anthropology & Criminology, Windsor, Canada, [3]Ontario HIV Treatment Network, Toronto, Canada, [4]Memorial University of Newfoundland, Community Health & Humanities, St. John's, Canada, [5]AIDS Bureau, Ontario Ministry of Health and Long-Term Care, Toronto, Canada*
*Presenting author email: ascheim@uwo.ca*

**Background:** Despite sharing structural and psychosocial vulnerabilities with transgender women and cisgender (non-transgender) men who have sex with men, HIV prevalence and risk appear comparatively low among transgender men who are gay, bisexual, or have sex with men (TMSM). In Ontario, Canada 10% of TMSM had any past-year HIV risk, and none self-reported HIV infection. This paradox suggests the existence of protective meso-level factors, such as socio-sexual networks. Drawing on qualitative interview data, we explore how TMSM navigate sexual fields (stratified structures of erotic relations and their corresponding sites of sexual sociality) and the potential impact on HIV risk.
**Methods:** As part of a Canadian community-based participatory research project, 40 TMSM completed demographic questionnaires and participated in individual, semi-structured, qualitative interviews in 2013. Interviews were audio-recorded and transcribed, and coded using a qualitative grounded theory approach.
**Results:** Participants were 18-50 years old and were racially diverse (43% racialized and/or Aboriginal). TMSM engaged with three overarching sexual fields: gay fields were only accessible to those who had medically transitioned sex/gender; queer fields were distinguished by trans-inclusiveness, egalitarian socio-sexual norms, and limited presence of cisgender men; and online classified sites were largely populated by non-gay-identified cisgender men explicitly interested in transgender men. Participants in gay fields described strategies for navigating or circumventing disclosure of transgender status that coincidentally facilitated safer sex, including negotiating sex through apps or websites, or avoiding genital-genital sexual activity.
**Conclusions:** Results help to contextualize recent epidemiologic findings of relatively low levels of HIV infection and sexual risk among transgender men. Overall, TMSM's sexual opportunities with cisgender gay men were limited, due in part to anticipated and enacted stigma. Further, their adaptive strategies for navigating gay sexual sites, and socio-sexual norms carried across fields (e.g., varying norms regarding consent) may further reduce their HIV risk. Sexual field characteristics and associated risks and resiliencies should be considered in designing and recruiting for TMSM HIV prevention research and interventions. TMSM may benefit from interventions that challenge anti-transgender stigma and increase their confidence navigating gay men's communities, while building on the potentially protective adaptive behaviors we have identified.

### WEPED318

### "IF SHE IS DRUNK, I DON'T WANT HER TO TAKE IT": PARTNER INFLUENCE ON ALCOHOL USE AND ART ADHERENCE WITHIN SOUTH AFRICAN COUPLES

A. Conroy[1], A. Leddy[2], M. Johnson[1], T. Ngubane[3], L. Darbes[1], H. van Rooyen[3]
*[1]University of California San Francisco, Center for AIDS Prevention Studies, San Francisco, United States, [2]John Hopkins University, Bloomberg School of Public Health, Baltimore, United States, [3]Human Sciences Research Council, Social, Behavioural and Biomedical Interventions Unit, Msunduzi, South Africa*
*Presenting author email: amy.conroy@ucsf.edu*

**Background:** Hazardous alcohol use has been linked to poor ART adherence, worsening of HIV disease, and progression to AIDS and death. Not only does South Africa have one of the largest ART programs globally, but has some of the highest rates of alcohol consumption and heavy episodic drinking. As part of a qualitative study on relationship factors and ART adherence within South African couples, we examined how primary partners may shape each other's alcohol and ART use.
**Methods:** Twenty-four adult heterosexual couples (48 individuals) with at least one HIV-positive partner were recruited from local healthcare sites using maximum variation sampling. HIV-positive partners were sampled based by gender and length of time on ART. Semi-structured interviews were conducted separately, but simultaneously, with each partner between November 2014 and March 2015. Topics discussed included relationship history and dynamics, experiences with HIV care and treatment including adherence, and HIV-related social support. Data were analyzed using an iterative thematic approach in Dedoose.
**Results:** Twelve couples spontaneously raised concerns related to alcohol and ART. Discussions fell into two main categories: partner beliefs and partner influence. There was a widespread belief among partners that "alcohol and ART don't mix",

Tuesday 19 July
Wednesday 20 July Poster Exhibition
Thursday 21 July
Friday 22 July
Late Breaker Posters
Author Index

which could result in death, disease, and reduced effectiveness of ART. Partner beliefs shaped the ways partners influenced each other. Forms of partner influence included encouraging partners to:
(1) abstain from drinking;
(2) limit frequency of drinking;
(3) drink, but take pills another time to avoid drug interactions;
(4) take pills when drinking—no matter what. Encouraging partners to deviate from their normal dosing schedule was common; the effect of missing pills was believed to be less harmful than the mixing of alcohol and ART itself.
**Conclusions:** The significant role of partner beliefs and influence suggests a need for integrated alcohol and HIV services tailored towards couples. One framework to consider is a harm reduction approach, particularly when abstinence may be difficult for ART patients to achieve. Partner beliefs and influence could also have negative effects on ART adherence; thus it may be necessary to revisit messages about alcohol and ART in treatment literacy courses with couples.

## WEPED319

### ALCOHOL USE AND RELATIONSHIP QUALITY AMONG SOUTH AFRICAN COUPLES: IMPLICATIONS FOR COUPLES-BASED HIV INTERVENTIONS

S. Woolf-King[1], A. Conroy[1], K. Fritz[2], M.O. Johnson[1], V. Hosegood[3,4], H. van Rooyen[5], L. Darbes[1,6], N.M. McGrath[4,7]
*[1]University of California, Center for AIDS Prevention Studies, San Francisco, United States, [2]International Center for Research on Women, Washington DC, United States, [3]University of Southampton, Social Sciences, Southampton, United Kingdom, [4]Africa Centre for Population Health, Mtubatuba, South Africa, [5]Human Sciences Research Council, Sweetwaters, South Africa, [6]University of Michigan, School of Nursing, Ann Arbor, United States, [7]University of Southampton, Faculty of Medicine, Southampton, United Kingdom*
*Presenting author email: lynaed@med.umich.edu*

**Background:** Alcohol has been labeled as the “forgotten drug” of the HIV epidemic given that high levels of consumption co-occur with high HIV prevalence across sub-Saharan Africa. Alcohol use, particularly by male partners, has been associated with an increased risk of HIV infection and poorer HIV-related outcomes in Africa; however the role of alcohol use in relationships has been largely ignored. Research on the association between alcohol use and relationship quality is needed in order to inform ongoing couples-based approaches to HIV treatment and prevention.
**Methods:** We examined the association between alcohol use and relationship quality among 448 heterosexual couples participating in the baseline visit of *Uthando Lwethu*—a couples-based HIV-intervention trial in South Africa. Consistent with patterns of alcohol use in the region, women did not report alcohol use in our sample and thus we focused on male partner alcohol use only. We used the Alcohol Use Disorders Identification Test-Consumption (AUDIT-C) to categorized men as: abstainers (score = 0), non-hazardous drinkers (score = 1-3), or hazardous drinkers (score >=4). Relationship quality (RQ) was reported by both women and men using validated measures of intimacy, trust, communication, satisfaction and partner-support around HIV prevention and treatment (PS-HIV).
**Results:** Five separate structural equation models for each measure of RQ were fit using male partner alcohol use as a predictor of male and female RQ. Models used maximum likelihood estimation, controlling for age, education, marital status, and relationship duration. Results demonstrated that women paired with a hazardous drinker reported *higher* levels of intimacy ($p < .05$) and PS-HIV compared to women paired with abstainers. Men who were categorized as hazardous drinkers, compared to abstainers, reported *less* trust ($p < .01$) and more PS-HIV ($p < .05$).
**Conclusions:** Alcohol use by male partners was significantly associated with RQ, although the salience of RQ predictors differed by gender. Both men and women in couples with a male hazardous drinker reported higher levels of PS-HIV, however men also reported less trust in the relationship. These findings highlight the importance of addressing male alcohol use in couples-based approaches to HIV prevention and treatment that target relationship quality.

## WEPED320

### HOW CAN WE INCREASE ACCESS TO HIV SERVICES FOR KEY POPULATIONS THROUGH THE WORKPLACE?

H.M. Amakobe[1], J. Nzola[2], P. Mwangi[3], R. Ameur[4]
*[1]International Labour Organization, ILOAIDS, Nairobi, Kenya, [2]LVCT Health, WEMA Kazini, Nairobi, Kenya, [3]Bar Hostess Empowerment and Support Program, Nairobi, Kenya, [4]International Labour Organization, Pretoria, South Africa*
*Presenting author email: magutu@ilo.org*

**Background:** Kenya has a mixed HIV epidemic. Sex workers (SWs) and their clients constitute 14.1% of new infections (KMoT,2008). They are a bridge to the general population, making their partners particularly vulnerable to HIV infection through concurrent sexual partners and inconsistent condom use. Clients of SWs are often workers with at least some disposable income and may also work in settings far from their families. The vulnerability of SWs and their clients to HIV infection is compounded by stigma and discrimination that keep them from accessing HIV services.
**Description:** The ILO, in partnership with LVCT Health WEMA Kazini program and the Bar Hostess Empowerment and Support Programme (BHESP), targeted bartenders, SWs and their clients to provide onsite day and moonlight HIV voluntary testing and counseling (HTC). Mapping of hotspots included bars, brothels and massage parlors and mobilization achieved through peer-to-peer mechanisms. To avoid harassment, law enforcers were informed and sensitized. A comprehensive package was provided, including HIV services, sexual and reproductive health (SRH), screening for TB, sexually transmitted infections and substance use, PMTCT counseling and information on gender-based violence. Participants were referred to specialized clinics and follow-up was done to ensure enrollment and retention into care. HTC was also provided to the partners and children of those who tested positive. The 3-week initiative reached 7,500 sex workers and their clients. Male and female condoms and lubricants were distributed and their correct use demonstrated. A total of 1503 women and 1720 men (of whom 125 were MSM) received HTC.
**Lessons learned:**
- Integrated services provide an incentive for testing, reduce stigma associated with HIV-specific programmes and offer services combining HIV and other health-related outcomes
- It is essential to include communities surrounding hotspots--including groups of bar owners/bartenders— to reach SWs and their clients with HIV and health services
- Partnerships with local authorities and law enforcement are crucial to increase demand and access to services for key populations
- Onsite voluntary HIV testing enhances HTC uptake and is key to reaching SWs, their clients and partners.

**Conclusions/Next steps:** Scale up onsite integrated HIV/health services to SWs and their clients to other counties.

## WEPED321

### MEASURING RELATIONSHIP SATISFACTION AMONG MEN AND WOMEN IN PERI-URBAN UGANDA

A. Ruark[1], P. Kajubi[2], S. Ruteikara[3], N. Hearst[4], E.C. Green[5]
*[1]Brown University, Medicine, Providence, United States, [2]Makerere University School of Medicine, Child Health and Development Centre, College of Health Sciences, Kampala, Uganda, [3]Anglican Church of Uganda, Kampala, Uganda, [4]University of California, Department of Family and Community Medicine, San Francisco, United States, [5]George Washington University, Anthropology, Washington, United States*
*Presenting author email: norman.hearst@ucsf.edu*

**Background:** While Uganda has had well-recognized success in reducing HIV transmission nationally, HIV prevalence in urban areas remains high (8.7% in the 2011 AIDS Information Survey). Effective HIV prevention among married and cohabiting couples remains a challenge. Increasing couple relationship quality may decrease HIV risk behaviors such as multiple and concurrent sexual partnerships and increase protective behaviors such as mutual HIV testing and disclosure. While psychometric scales have been used extensively to measure relationship functioning in various contexts around the world, these scales have not been widely used in Africa.
**Methods:** Men and women aged 20-49 in peri-urban Kampala who were married or cohabiting were surveyed before and after a couple-focused HIV prevention intervention which aimed to decrease HIV risk through strengthening couple relationships and increasing sexual exclusivity. The survey explored couple relationship satisfaction and quality using psychometric scales, and also asked open-ended questions regarding relationship dynamics. Data were collected from 162 couples (interviewed separately).
**Results:** In the pre-intervention survey, 4 in 5 respondents reported that they were cohabiting but not married, with a mean relationship length of 6.6 years. When asked close-ended questions, men and women reported high relationship satisfac-

tion. For example, men had a mean score of 4.11 (on a 5-point scale with higher scores denoting a more positive relationship) on items on the Dyadic Adjustment Scale, while women had a mean score of 4.04. The great majority of men (91.6%) and women (88.5%) rated their relationship as "happy", "very happy", "extremely happy", or "perfect". However, these data contrast sharply with the responses that men and particularly women gave to open-ended questions about their relationships, in which they communicated significant distress and lack of satisfaction regarding their relationships.
**Conclusions:** These data demonstrate the challenges of validating psychometric scales for use in an African population, as well as the diverse ways that participants may present themselves depending on the data collection modality (e.g. closed-ended versus open-ended questions). Further work is needed to validate psychometric scales addressing relationship satisfaction for use in Africa, and to understand how men and women choose to represent their relationships in research contexts.

## WEPED322

### PARTNER HIV DISCLOSURE, PARTNER RELATIONSHIP AND QUALITY OF LIFE AMONG PEOPLE LIVING WITH HIV/AIDS: A LONGITUDINAL STUDY

S. Qiao[1], X. Li[1], Y. Zhou[2], Z. Shen[2], J. Zhao[3]
*[1]University of South Carolina, Health Promotion Education and Behavior, Columiba, United States, [2]Guangxi CDC, Nanning, China, [3]Henan University, Kaifeng, China*
*Presenting author email: shanqiao@mailbox.sc.edu*

**Background:** Partner HIV disclosure is a critical component in HIV prevention and treatment continuum in terms of improving medication adherence, HIV testing and safe sexual behaviors. However, a great number of empirical studies on partner HIV disclosure are limited by cross-sectional data and not able to explore the causal relationship between partner disclosure and disclosure-related variables. Based on longitudinal data, the current study explores whether and how partner disclosure affect partner relationship and quality of life among people living with HIV/AIDS (PLWH) over time.
**Methods:** We use data of an on-going longitudinal clinical trial among 791 PLWH in Guangxi, China. The participants were recruited from 16 sites (from both urban and rural areas) and assessed semi-annually since 2013. The follow-up rate is averagely 91% for the first four assessments. At the baseline, the participants were asked whether their HIV serostatus had been known by their spouse. If yes, the participants were categorized into disclosure group. We applied multilevel regression models to assess the effect of partner disclosure on the change of partner relationship quality and quality of life over time. Maximum likelihood estimates were used to fit multilevel models.
**Results:** Quality of life significantly increased in the sample (β=.037, p< .0001). Controlling for demographic characteristics, participants in disclosure group experienced a faster rate of increase in quality of life score (β=.045, p=.50). The quality of partner relationship of the cohort declined but the change did not reach the statistical significance (β=-.535, p=.163). Disclosure group showed a slower rate of decline in quality of partner relationship (β=.459, p< .0001) controlling for all the other variables.
**Conclusions:** HIV infection brings a big challenge for partner relationship, especially for the sero-discordant couple. Our findings suggest that partner disclosure may buffer the deterioration of partner relationship in long-term and improve the quality of life among PLWH. Partner disclosure should be integrated into psychological adjustment process of PLWH and their partners.

## WEPED323

### THE INFLUENCE OF MASCULINITY ON HIVST COMMUNITY INTERVENTION: A QUALITATIVE EVALUATION OF EMPIRICAL EVIDENCE FROM BLANTYRE, MALAWI

M.K. Kumwenda
*Malawi-Liverpool Welcome Trust, Behaviour and Health, Blantyre, Malawi*
*Presenting author email: kumwenda@gmail.com*

**Background:** For HIV, population surveys and cohort outcomes show men to have a higher risk of undiagnosed disease than women, and higher risk of death following diagnosis. Here we report findings from an HIV self-testing (HIV ST) study with relevance to other chronic conditions, including TB. HIVST addresses barriers associated with traditional models of providing HIV testing, giving notably high male participation. We examined the role of masculinity on HIVST decisions and subsequent actions amongst couples in urban Blantyre.
**Methods:** Sixty seven self-tested participants were interviewed at baseline, 49 at first follow-up (3-5 months) and 50 at second follow-up (12-15 months). Content analysis was used to interpret study findings.
**Results:** Conception of masculinity dictated men's actions and prescribed specific behavioral attributes, namely having control, knowledge, strength and toughness, and both sexual and economic productivity. The mandate of constant economic provision prevented men living a hand-to-mouth existence from testing with their partners, as they were not at home when HIV ST was offered. Notions of men as all-knowing could promote denial of positive HIV ST results, with men allowed to question their authenticity especially when their partner had tested negative. Even when positive HIV ST results were believed, notions of strength and resilience, combined with the relentless demands of their household provider role, dissuaded men from promptly seeking HIV care, as they felt no urgency to act when healthy. Notions of sexual productivity encouraged men to insist unprotected sex irrespective of their own or their partner's HIV status.
**Conclusions:** The social construction of masculinity, which includes relentless pressure to earn in this impoverished urban setting, restricted the potential benefits of early HIV care and prevention, even within established couples. Community HIV strategies need to explicitly account for the obstacles and barriers linked to masculinity to have full impact.

# PREVENTING AND MANAGING HIV/HEPATITIS C CO-INFECTION

### HARM REDUCTION AS A PLATFORM FOR ENGAGEMENT IN INFECTIOUS DISEASE CARE FOR PEOPLE WHO USE DRUGS: A LONGITUDINAL COHORT STUDY AT AN INNER CITY MMT CENTRE IN KUALA LUMPUR, MALAYSIA

V. Pillai, N.A. Salleh, S.H. Ali, N. Ata Abdul Muniem, N.F. Othman, A. Kamarulzaman, R. Rajasuriar
*University Malaya, Centre of Excellence for Research in AIDS (CERiA), Kuala Lumpur, Malaysia*
*Presenting author email: vnapillai@gmail.com*

**Background:** Project DRIVE aims to engage people who use drugs in health care, including screening for infectious diseases, as well as the continuum of HIV care. This cohort study looks at the capacity and effectiveness of using an MMT program as a platform of care for concomitant infectious diseases.
**Description:** The DRIVE cohort has been established at a methadone clinic in an inner city suburb in Kuala Lumpur, Malaysia. The patient population consists of people who use and inject drugs who are in a voluntary program for MMT. The study conducts baseline and six monthly social assessments, as well as quarterly medical assessments. The social assessment includes sociodemographic factors, incarceration history, housing and employment status as well as history of drug use and risk behaviours. The medical assessment conducts an annual screening for HIV, Hepatitis C and Hepatitis B. For HIV positive, CD4 count (PIMA) is conducted every 6 months, and timely referral for initiation of ARV is carried out.
**Lessons learned:** It was found that the MMT program as a platform of care was effective; Out of a cohort of 145, 56 (39%), 64 (44%) and 48(33%) had undergone screening within the last 6 months for HIV, Hepatitis B and C respectively. New diagnosis of HIV, HBV and HCV were made in 3.6% 3% and 50% of individuals in this cohort respectively. Newly diagnosed individuals were referred on for further care at a nearby health centre for confirmation, assessment and treatment as necessary.
**Conclusions/Next steps:** Initiating a similar screening process in other MMT centres could increase testing and diagnosis and therefore get clients commenced on the HIV and HCV care continuum, targeting an at-risk and hidden population that would not otherwise access the usual health facilities available. On site CD4 count monitoring and ART assessment sets the foundations for timely referrals and may encourage adherence. Creating a model of healthcare that integrates infectious disease, substance disorder treatment, mental health and general practice would be the ideal holistic care for this marginalised population.

# ETHICAL ASPECTS AND STANDARDS, INCLUDING WITH RESPECT TO RESEARCH, CLINICAL SERVICES, PUBLIC HEALTH POLICY AND PROGRAMMES, AND PROFESSIONAL CONDUCT

### MINIMIZING UNINTENDED RISKS OF HIV-RELATED PROGRAMMATIC MAPPING AMONG KEY POPULATIONS: INTRODUCING THE MAPPING READINESS ASSESSMENT

K. Muessig[1], L. Zalla[2], E. Emmanuel[3], A. Bula[4], A. Cloete[5], S. Chilundo[6], P. Sapalalo[7], M. Herce[8], W. Miller[2], K. Lancaster[2], S. Weir[2]

*[1]University of North Carolina, Health Behavior, Chapel Hill, United States, [2]University of North Carolina, Epidemiology, Chapel Hill, United States, [3]University of North Carolina, Port-au-Prince, Haiti, [4]University of North Carolina, Lilongwe, Malawi, [5]Human Sciences Research Council, Pretoria, South Africa, [6]FHI 360, Maputo, Mozambique, [7]Tchikos Consultoria, Luanda, Angola, [8]University of North Carolina, Medicine, Chapel Hill, United States*

*Presenting author email: michael_herce@med.unc.edu*

**Background:** Collecting information from key populations (KPs), including sex workers, men who have sex with men (MSM) and transgender (TG) individuals, may pose risks to KPs even if the purpose is to improve quality and coverage of health services. Unintended risks can occur through confidentiality breaches, data misuse, or drawing unwanted attention to hidden populations. An emerging global emphasis on programmatic mapping (PM) of the public locations where KPs can be reached for HIV services has raised new ethical concerns. In recognition of these risks, we developed the mapping readiness assessment (MRA) tool to engage communities in a comprehensive assessment of the risks of PM. We describe lessons learned from MRA implementation in South Africa, Haiti, Malawi, Mozambique and Angola.
**Description:** The MRA is a structured guide for obtaining qualitative input from stakeholders including KPs, healthcare providers, public officials, and law enforcement. Topics addressed include understanding the socio-legal environment for KPs, identifying available services and barriers to healthcare for KPs, and exploring the risks of collecting data on KPs. The MRA results in a decision about whether or not to proceed with PM. If consensus is reached to proceed, strategies are developed to minimize risks, contingency plan and protect KP rights and privacy.
**Lessons learned:** In all countries, the MRA revealed differential access to services and exposure to discrimination across KP sub-groups, particularly by socioeconomic class and locale. MRA implementers learned alternative ways of reaching KPs, such as through social media, in countries where punitive laws and discrimination limit their public visibility. We documented concerns that targeting KPs for HIV testing at public venues could lead to further stigmatization or violence, by reinforcing the association between sex work and HIV, or through perceptions that PM implementers are advocating for same-sex marriage or “recruiting” MSM. Action steps resulting from the MRA included decisions to provide testing to all venue patrons and to alert local leaders and authorities to PM prior to fieldwork.
**Conclusions/Next steps:** MRAs can help governments, program implementers, and civil society engage KPs in the PM process, protect KP rights, and strengthen partnerships to ensure that data collected is ultimately used to improve KP services.

## WEPED326

### ETHICAL BLIND SPOT: INFORMATION GAP REGARDING LEVELS OF COMPLIANCE WITH MATERIAL TRANSFER AGREEMENTS BY EXTERNAL LABORATORIES WHICH USE SAMPLES FROM THE DEVELOPING WORLD FOR HIV RESEARCH

K. Phiri

*Liberty Consulting, Zomba, Malawi*

*Presenting author email: kenphiri@yahoo.co.uk*

**Background:** Biological samples are crucial in HIV biomedical research. These samples come from institutions conducting HIV research from all over the world and increasingly from the developing world as a lot of clinical trials take place there owing to high disease burden. Research institutions which conduct clinical trials in developing countries almost invariably send samples to external laboratories. Transfer of such samples requires material transfer agreements (MTAs) which outline how the samples should be managed (e.g. intended use, access to, exact location, duration of retention and fate of the samples after the required analyses or the agreed duration has expired among other things). We investigated how research institutions which conduct clinical trials in Malawi, and thus routinely send biological samples to research laboratories in the developing world, monitor compliance with MTAs by the external research laboratories to which they send their research samples.
**Methods:** Laboratory managers or their delegates of the nine major research institutions in Malawi were interviewed on how they monitor adherence to MTAs by external research labs to which they send their HIV biomedical research samples. Questions included what tools, if any, they use to monitor MTA compliance, if the tools work, if the institutions, or their agents, have ever visited the external research labs to audit compliance with MTAs vis-à-vis their samples and if they receive communication regarding fate of their samples.
**Results:** None (0%) reported that they monitor MTA compliance by research labs where they send their samples. None (0%) reported that they, or their agents, have ever audited any external lab to assess MTA compliance. None (0%) reported that they have ever received any communication regarding fate of their HIV research samples. All (100%) reported that they ‘*simply trust*’ that MTAs are being adhered to.
**Conclusions:** Research institutions in Malawi have no knowledge if external research laboratories to which they send their HIV research samples comply with MTAs. Research institutions should put in place mechanisms to monitor compliance with MTA terms by research labs working on their samples to make sure that every step in the fight against HIV is taken ethically.

## WEPED327

### INTEGRATED AND ASSERTIVE HIV TREATMENT AND CARE WITHIN HOUSING AMONG WOMEN LIVING WITH HIV: BALANCING SUPPORT WITH PRIVACY AND SELF-DETERMINATION

K. Czyzewski[1], K. Shannon[1,2], F. Ranville[1], J. Chettiar[1], M. Kestler[3], J. Montaner[2,4], A. Krüsi[1,2]

*[1]BC Centre for Excellence in HIV/AIDS, Gender & Sexual Health Initiative, Vancouver, Canada, [2]University of British Columbia, Medicine, Vancouver, Canada, [3]BC Women's Hospital, Oak Tree Clinic, Vancouver, Canada, [4]BC Centre for Excellence in HIV/AIDS, Vancouver, Canada*

*Presenting author email: kczyzewski@cfenet.ubc.ca*

**Background:** In the advent of scale-up of HIV care globally, there has been an increasing shift to integrated and assertive HIV care services within housing programs (e.g. outreach, anti-retroviral therapy (ART) delivery, HIV provider home visits) to better reach marginalized populations. Given suboptimal access to ART, adherence and treatment outcomes among women living with HIV (WLWH) in Canada, it is imperative to understand how WLWH experience novel HIV care models to best promote ART access and retention, alongside individual respect for rights and privacy.
**Methods:** As part of SHAWNA *(Sexual Health and HIV/AIDS: Women's Longitudinal Needs Assessment),* we conducted 53 qualitative in-depth interviews with WLWH in Metro Vancouver between August and December 2015. Interviews were directed by a semi-structured interview guide, which was co-created with WLWH and community organizations. Drawing on concepts of structural violence this analysis explores WLWH's experiences with integrated and assertive HIV care models within housing programs.
**Results:** Our findings demonstrate how integrated and assertive HIV care within housing programs was instrumental in facilitating access to HIV care, adherence to ART and access to social services among the most marginalized WLWH. Many women spoke highly of HIV practitioners who provided respite from social isolation and delivered prescriptions to their door. At the same time, in the context of pervasive stigma, some WLWH voiced concerns regarding confidentiality and feared being ‘outed’ as living with HIV through the outreach visits. Other WLWH were uncomfortable with unannounced visits and feared judgement on their living conditions (e.g. use of drugs), and objected to the delivery of unrequested prescriptions.
**Conclusions:** Integrated and assertive HIV care models within housing programs appear to play a critical role in increasing access to ART for many hard-to-reach WLWH. However, many also describe tensions between HIV care delivered in the context of their home and rights to privacy and confidentiality, particularly where complex social and health issues and stigma surround their lives, including gender-based violence, poor mental health, and drug use. As HIV care models continue to be integrated across diverse sectors, WLWH must be consulted on HIV care models that meet their needs and that respect privacy and self-determination.

## WEPED328

### SOCIETAL NORMS VERSUS ETHICS: NATIONAL ETHICS COMMITTEE EXPERIENCES IN THE REVIEW OF HIV AND AIDS STUDIES TARGETING SEX WORKERS AND SEXUAL MINORITIES

M. Kanengoni, R. Musesengwa, R. Gutsire, S. Ruzario, M. Shana, F. Tarumbiswa, P. Ndebele

*Medical Research Council of Zimbabwe, Harare, Zimbabwe*

*Presenting author email: muchineripikanengoni@yahoo.com*

**Background:** World over, the fight against HIV and AIDS includes special populations such as sex workers and sexual minorities. This has correspondingly led to more research being conducted among sex workers and sexual minorities. Handling

of these populations especially in developing countries poses challenges as their practices are regarded as illegal, immoral and "unnatural sexual acts" yet they are key drivers of the HIV pandemic. Researching on them thus becomes a challenge to researchers and ethics committees as approving such studies may be tantamount to "legitimising" their activities. Ethics Committees are thus caught in between the line of aligning with country norms, social values, morals and the ethical obligation to approve scientific research. The aim of the study was to explore the dilemma and key considerations of Ethics Committees in the review of studies involving sex workers and sexual minority groups.
**Methods:** 12 studies focusing on sex workers and sexual minorities submitted to MRCZ between 2010 and 2015 were conveniently selected and the review criteria and process for them explored. Thematic analysis was done to determine issues discussed, key considerations during review and the outcome.
**Results:** Regarding the process it was noted that sexual minority studies took on average 16 weeks from initial submission to approval compared to others that usually take 4-6 weeks. Deliberations concerning those studies usually took longer during the meeting. EC members were uneasy on approving sexual minority studies. Members requested the study to commit to (1) increased protection of research participants identity, (2) obtain support from other requisite authorities and (3) developing a dissemination plan that would not affect participant well-being. They were subjected to more scrutiny than other studies. EC members are yet to be interviewed on their experiences of providing oversight over such studies.
**Conclusions:** Reviewing proposals on sexual minorities and sex workers pose challenges as the ECs operate within a larger society in which they are expected to follow societal values, norms and morals. Their decisions are thus expected to be a reflection of society, science and ethical merits. Ethics Committees are encouraged to remain objective, unbiased and weigh risks and benefits before reaching decisions.

## WEPED329

### ETHICAL AND PRACTICAL CONSIDERATIONS IN HIV DRUG TRIAL CLOSURE: PERSPECTIVES OF RESEARCHERS IN UGANDA

S. Nalubega[1], C. Evans[1], K. Cox[1], H. Mugerwa[2]
*[1]University of Nottingham, Nottingham, United Kingdom, [2]Joint Clinical Research Centre, Kampala, Uganda*
*Presenting author email: syliviaogwang@yahoo.com*

**Background:** Rapid advances in HIV treatment have been made possible through large numbers of clinical trials, many of which are conducted in resource poor countries. Previous research indicates an evidence gap regarding HIV post-trial care in these settings. This paper explores the perspectives of research staff on post-trial care of HIV positive trial participants in Uganda.
**Methods:** A grounded theory study was conducted using in-depth individual interviews and focus group discussions with 22 research staff from 3 different trials in Uganda, between October 2014 and August 2015. Ethical approval was secured from the Ugandan local and national research and ethics committees.
**Results:** Three major themes emerged from the data:
**Planning and preparing for trial-closure:** Research staff engaged in planning and preparation activities for post-trial care, which included instituting trial closure guidelines, planning necessary resources and informing trial participants about post-trial care. Planning was guided by existing ethical policies/guidelines.
**Facilitating participants during trial exit:** Research staff engaged in psychological and practical support activities for trial participants. These were aimed at addressing their emotional and socio-economic needs during trial closure, and also to guide them in identifying and linking to post-trial HIV treatment and care facilities. Research staff felt that their current practice could be improved by incorporating more activities such as material/financial support and through a more personalized, direct and facilitated transitioning process since linkage to care was currently indirect - mainly through referral.
**Care and support for participants after trial exit:** The support provided to trial participants after trial exit was minimal, and relied upon the individual initiatives of the staff. Staff felt that post-trial care required improvement, for example, by providing follow up care and support to respond to multiple complex needs of trial participants which often arose after trial exit.
**Conclusions:** This study established a mismatch between what researchers consider 'good' post-trial care practice in HIV trials and the current ethical recommendations, which mainly focus on the need to ensure access to trial drugs and provision of trial results. Ethics authorities should institute post-trial care guidelines which can more holistically address the care needs of HIV positive trial participants in Uganda.

## WEPED330

### EXPERIENCES OF HIV-INFECTED PEOPLE WITHIN THEIR FIRST YEAR OF LEAVING HIV CLINICAL TRIALS IN UGANDA: A GROUNDED THEORY ASSESSMENT

S. Nalubega[1], C. Evans[1], K. Cox[1], H. Mugerwa[2]
*[1]University of Nottingham, Nottingham, United Kingdom, [2]Joint Clinical Research Centre, Kampala, Uganda*
*Presenting author email: syliviaogwang@yahoo.com*

**Background:** Rapid advances in HIV treatment have been made possible through large numbers of clinical trials, many of which are conducted in resource poor countries. Previous research indicates an evidence gap regarding the meaning of trial closure for HIV positive trial participants in these settings. This paper reports the experiences of HIV positive post-trial participants in Uganda during their first year of exiting from trials.
**Methods:** A grounded theory study was conducted with 21 adult HIV post-trial participants (aged 26-59 years) from 3 trials, using in-depth interviews, between October 2014 and August 2015. Participants were recruited through their former research institutions. Ethical approval was secured from the Ugandan local and national research and ethics committees.
**Results:** Three main themes emerged:
**Accessing routine HIV services:** Although routine HIV care/treatment was freely available to all participants, there were complexities in accessing it. The main challenges included long waiting times, unwelcoming staff attitudes and HIV stigma. Accessing treatment for opportunistic infections emerged as a key problem as many facilities did not provide adequate medications to treat these.
**Experiencing a financial burden:** The majority of trial participants were of low socio-economic status and reported financial problems that affected their ability to access post-trial care. This included lack of funds to pay for transport to clinics, medicines for opportunistic infections and also food. Those suffering from opportunistic infections were often unable to work due to ill health. They faced particular financial challenges, leading to ongoing stress.
**Maintaining contact:** Trial participants reported keeping in contact with research staff or peers. Although this contact was minimal, it nonetheless proved helpful in providing them with psychological and practical support.
**Conclusions:** HIV positive participants in Uganda encounter numerous challenges during their first year of leaving a trial, which can impact on their health and well-being. The findings of this paper highlight a critical need for researchers and other stakeholders to remain involved in the care of HIV positive trial participants in Uganda, during their first year of exit from HIV trials.

## WEPED331

### ENHANCING THE EFFICIENCY OF AFRICAN RESEARCH ETHICS REVIEW PROCESSES, THROUGH AN AUTOMATED REVIEW PLATFORM

B. Mokgatla[1], P. Bahati[2], C. Ijsselmuiden[3]
*[1]International AIDS Vaccine Initiative, Research and Development, Gaborone, Botswana, [2]International AIDS Vaccine Initiative, Nairobi, Kenya, [3]Council on Health Research for Development, Geneva, Switzerland*
*Presenting author email: bmokgatla@iavi.org*

**Background:** The growing scope and complexity of biomedical research in the developing world poses new challenges for research ethics committees' (RECs). The sheer amount of research being conducted, under-resourced RECs, and the lack of modern review technologies has resulted in unprecedented review timelines—with an estimate of 1.5 years to get clearance in many African countries.
**Methods:** The Research for Health Innovation Organiser (Rhinno), a cloud-based ethics review platform, has ushered in a new frontier of digital ethics review in Africa. It facilitates, manages and tracks the throughput of research applications throughout the research projects life cycle; from submission, distribution, to approvals and follow-ups. Rhinno integration is estimated to reduce the review timeline by 12 months. In 2015, Rhinno was actively used by 25 RECs in 8 African countries. We evaluated its impact on efficiency, data security and cost using an online questionnaire administered to chairpersons/administrators in user countries.
**Results:** A 100% response rate was received from 47% national, 47% institutional and 6% private RECs. The REC membership ranged from 46 to 9, protocols reviewed annually ranged from 2040 to 50 and all the RECs reviewed various phases and types of research. Reported high impact (100% of respondents) areas highlighted included: improved protocol submission, distribution; easy platform accessibility; improved communication between the REC and researchers; data confidentiality and security; platform's adherence to international standards; standardisation and harmonisation of the ethics review process. The medium impact areas (60-80% of respondents) included: reduction of workload for REC administrators; prompt notifications; reduction of RECs' administrative costs. Low impact areas included: easing the review of multicenter trials, mostly due to the current few countries us-

Late Breaker Posters
Author Index

ing Rhinno. Only 12% of RECs reported increased review efficiency from 30 to 12 days, the remaining 82% mentioned it is too early evaluate the impact of Rhinno on timeframe.
**Conclusions:** Implementation of Rhinno has achieved high-impact on data security, submission process, communication, harmonization and cost reduction. However, a long-term evaluation approach is needed to determine impact. Integration of new M&E indicators on efficiency and cost effectiveness into the Rhinno system would improve capacity for RECs to conduct long-term impact.

## WEPED332

### INCREASING PARTICIPANTS' SAFETY IN HIV CLINICAL TRIALS THROUGH ADVERSE EVENTS MONITORING BY RESEARCH ETHICS COMMITTEES: ZIMBABWE EXPERIENCE

S. Ruzariro[1], R. Gutsire[2], R. Musesengwa[2], M. Kanengoni[2], P. Ndebele[2], S. Ruzario[2]
*[1]Medical Research Council of Zimbabwe, Research Oversight Unit, Harare, Zimbabwe, [2]MRCZ, Harare, Zimbabwe*
*Presenting author email: sithembileruzario@yahoo.co.uk*

**Background:** The Zimbabwe National Research Ethics Committee is committed to human research participants` safety throughout the research continuum. An increase in HIV clinical trials over the past years, has led to an increase in Adverse Events being reported from different clinical trial sites in Zimbabwe. We share our experiences as the National Research Ethics Committee on strategies employed to increase participants' safety in HIV clinical trials through adverse event monitoring.
**Description:** To increase research participants` safety in HIV clinical trials, the Zimbabwe National Ethics Committee effected an SOP on adverse events handling which was communicated to all researchers. Passive and active clinical trial site monitoring has been intensified and participants interviewed for any problems encountered. Participants were educated on importance of keeping diaries and reporting any problemss since some adverse events can be subtle. Adverse events causality assessment was integrated in monthly protocol review meetings to determine relatedness to study product. Participants` diaries were reviewed to uncover unreported adverse events.
**Lessons learned:** Integration of adverse events causality assessment in monthly REC protocol review meetings led to improved and strengthened adverse event monitoring.In the last two years, a total of 520 adverse event reports were received from 45 active approved HIV clinical trials. 48 site inspections were carried out, 28 adverse events were not documented in the CRF, hence, were not reported. 55 were not timely reported as per the agreed SOP.
**Conclusions/Next steps:** .It is possible to evaluate each and every adverse event reported and participants play a big role in adverse event monitoring thereby making education vital for their safety.

## WEPED333

### WHEN 'BAD' PATIENTS TRANSFORM INTO 'GOOD' PATIENTS: MEDIATING AGENCY IN THE THERAPEUTIC ALLIANCE TO OVERCOME BOTTLENECKS ALONG THE HIV CASCADE OF CARE

M. Moshabela[1,2], V. Dlamini[1], M. Skovdal[3], F. Odongo[4], J. Wamoyi[5], E. McLean[6], D. Bukenya[7], R. Ssekubugu[8], J. Seeley[6], V. Hosegood[9], A. Wringe[6]
*[1]Africa Centre for Population Health, Mtubatuba, South Africa, [2]University of KwaZulu Natal, Department of Rural Health, Durban, South Africa, [3]University of Copenhagen, Department of Public Health, Copenhagen, Denmark, [4]Kenya Medical Research Institute, Kilifi, Kenya, [5]Tanzanian National Institute of Medical Research, Mwanza, Tanzania, United Republic of, [6]London School of Hygiene and Tropical Medicine, London, United Kingdom, [7]Medical Research Council, Uganda Virus Research Institute programme on AIDS, Entebbe, Uganda, [8]Rakai Health Sciences Program, Rakai, Uganda, [9]Southampton University, Southampton, United Kingdom*
*Presenting author email: moshabela@ukzn.ac.za*

**Background:** Notions of 'good' or 'bad' patient behaviour affect patient-provider relationships in the domain of HIV care. We know little about the role of these social and moral representations in shaping access throughout the cascade of HIV services. In this study, we sought to explore factors that mediate bad and good patient behaviour, and to examine how these mediation processes could serve to overcome barriers along each stage of the cascade.
**Methods:** A qualitative study was conducted in six African countries (Uganda, Tanzania, Malawi, Kenya, Zimbabwe and South Africa) through the ALPHA network. We sampled different types of health workers involved in HIV care and patients from each stage of the cascade. Data were collected through in-depth interviews and were analysed inductively, using both open and axial coding. The constant comparison method was used to assess relational themes within and between site-level data.
**Results:** Providers often labelled certain patients as 'challenging' or 'difficult', such as defaulters and late presenters. However, patients were often seen as blameless, with social and contextual factors, such as poverty and stigma, implicated as barriers to 'good' patient behaviour. Patients were also forgiving to providers failing to maintain high standards of care given health system constraints, such as staff and treatment shortages. Success in mutual understanding resulted in both providers and patients making an effort to accommodate each other, and to find solutions that enhanced access to HIV services along the cascade of care. However, failed mutual understanding resulted in helplessness, apathy and poor attitudinal behaviour among both health providers and patients which hindered patients' progression through the cascade of care.
**Conclusions:** In most sites, patients and providers often reached a state of mutual understanding, and formed stronger therapeutic alliances to overcome barriers to access. While the label of 'bad' patients carry a negative connotation, providers are shifting the blame from individual patients to socio-contextual factors that constrain access and perpetuate poor health-seeking behaviour. Similarly, patients recognise health system constraints faced by providers. Therefore, mutual understanding is a potential mediator of agency in the therapeutic alliance, and may serve to unlock bottlenecks along the cascade of care.

# INTELLECTUAL PROPERTY AND TRADE REGIMES REGARDING ACCESS TO HIV TREATMENT AND DIAGNOSTIC MEDICAL DEVICES

## WEPED334

### NEVERGREENING: CIVIL SOCIETY ROLE IN CHALLENGING AND PREVENTING UNFAIR PATENTS MONOPOLIES IN BRAZIL

P. Villardi, M. Vieira, F. Fonseca
*Associação Brasileira Interdisciplinar de AIDS, Working Group on Intellectual Property, Rio de Janeiro, Brazil*
*Presenting author email: pedro@abiaids.org.br*

**Background:** Since 2003, the Working Group on Intellectual Property (GTPI, acronym in Portuguese), a group of civil society organizations (CSOs) from Brazil, has been working to mitigate the impact of patent monopolies on access to medicines. Patents allow pharmaceutical companies to set high prices for medicines, threatening access all over the world. It has being well documented the practice by pharmaceutical companies to file patent applications of low quality to extend the monopoly over drugs. This practice in known as evergreening. In Brazil - and other countries -, any interested part may offer arguments to patent examiners showing why a given patent application should not be granted. This mechanism is called pre-grant opposition and might be used to protect public health from unmerited monopolies.
**Description:** Since 2006, GTPI have challenged patents applications for medicines for HIV and Hepatitis C. GTPI filled in total seven pre-grant oppositions: two for tenofovir (2006,2009); two for lopinavir/r (2006,2011); one for tenofovir+emtricitabina (2010); one for atazanavir (2015); one for sofosbuvir (2015).
**Lessons learned:** After 10 years filling pre-grant oppositions in Brazil, the results are: the two patents challenged for tenofovir were not granted. Nowadays tenofovir is free of patents in Brazil and it is being produced by local companies at cheaper price, which resulted in increased access. Lopinavir/r is still under monopy due to the patent that was granted for the molecule, however pre-grant opposition helped to prevent seven extra-years of monopoly. In the case of atazanavir, the opposition might avoid 8 extra-years of monopoly. And for sofosbuvir, the pre-grant opposition may put the drug in public domain. Decisons about the patent application are still pending in those two cases.
**Conclusions/Next steps:** This shows how CSOs may take part in the patent examination process in order to remove patent barriers and put medicines in public domain. Also, it shows how important it is to democratize and stimulate the use of mechanisms capable of fostering generic competition, such as pre-grant opposition, by goverments and CSOs.

## WEPED335

### ONLINE HUMAN RIGHTS TRAINING ON INTELLECTUAL PROPERTY RIGHTS: A CRITICAL STEPPING-STONE FOR INFORMED POLICY DEVELOPMENT, AN AFRICAN CASE STUDY

J.N. Segale
*ARASA TRUST, Training and Capacity Strengthening, Roodepoort, South Africa*
*Presenting author email: jacob@segale.co.za*

**Background:** The AIDS and Rights Alliance for Southern Africa (ARASA) is a partnership of over 90 human rights, TB and HIV organisations working together in Southern and Eastern Africa to promote a Human Rights-based response to HIV and TB.
**Description:** Access to essential medicines such as generic HIV/AIDS treatment is essential in many countries in Africa. Many African countries still have many challenges to access health care services and amongst them is unavailability of adequate supply of HIV and TB drugs, unavailability of adequate diagnostic machines such as CD4, Viral load and TB testing machines and anti counterfeit laws and policies which are impediments to equal access to quality affordable medicines. These issues need to be addressed to ensure adequate access to quality health care services at a community level.
In 2015 ARASA introduced an online training on intellectual property rights and access to medicine. The training targeted human rights activist, community leaders, policy makers and service providers within country specific intellectual property rights offices. After the training the participants where supposed to develop advocacy campaigns that focused on reviewing current anti counterfeit laws to ensure that they do not become impediments to generic drugs through some provisions within this Acts. In SADC ARASA worked with various organisations and stakeholders to advocate for the review and reform of anti counterfeit laws and policies. In Zambia the anti counterfeit Act is now being reviewed to ensure that it does not classify quality approved generic medicine as a counterfeit.
**Lessons learned:** Scaling up online training on intellectual property rights can be a catalyst for review and reform of Intellectual property rights and policies that laws that are stumbling block to access to quality affordable medicines.
**Conclusions/Next steps:** On going advocacy on access to quality, affordable and essential generic medicines should be scaled up to ensure that vulnerable communities such as People living with HIV and AIDS are not denied life saving medicine they require.

## WEPED336

### CHANGING THE INTELLECTUAL PROPERTY NARRATIVE: PATIENTS BEFORE PATENTS

Y. Vawda, L. Lotz
*University of KwaZulu-Natal, School of Law, Durban, South Africa*
*Presenting author email: lotzl@ukzn.ac.za*

**Background:** The University of KwaZulu-Natal (UKZN) School of Law has launched a new postgraduate (LLM) module on Human Rights Intellectual Property and Access to Medicines following on a successful intensive short course on this topic for five years, delivered to lawyers, activists and health workers. The aim of this module is to develop successive cohorts of students and activists who are able to critically analyse this area of the law from an access to medicines perspective, and thus challenge the dominant IP narrative as the right holders' prerogative to reap super profits from the suffering of people.
**Description:** The Human Rights Intellectual Property and Access to Medicines module provides an opportunity for the intersection of several disciplines, including the IP; Human Rights; Trade; and Regulatory Science. The module is a rights-based offering that aims to place human rights and social justice at the centre of the IP debate. It draws on local and international scholarship and advocacy efforts in order to provide a different narrative to the existing paradigm of IP hegemony.
Some module outcomes include:
- An understanding of core human rights concepts, theory and practice;
- A critical and evaluative approach to analysing Human Rights, Intellectual Property and Access to Medicines in South Africa and elsewhere; and
- The ability to apply this knowledge in the cause of increasing access to medicines.

**Lessons learned:** The development of a cadre of advocates for access across the African continent. Many beneficiaries of such programmes are active in the process of reforming patent laws in their respective countries. Also, supporting the major challenges to IP control that have come from civil society; and working with governments in areas of policy reform.
**Conclusions/Next steps:** The module will have impact both in the manner in which law teachers understand their craft, and how law students are trained to practice law for the benefit of society as a whole.

## WEPED337

### BARRIERS TO ACCESS AFFORDABLE ARVS IN MIDDLE-INCOME COUNTRIES (MICS)

O. Mellouk[1], P. Radhakrishnan[2], T. Amin[2]
*[1]ITPC, Marrakesh, Morocco, [2]I-MAK, Lewes, United States*
*Presenting author email: omellouk@itpcglobal.com*

**Background:** Of the roughly 15 million people living with HIV who do not have access to antiretrovirals (ARVs), two-thirds live in middle income countries (MICs) - home to nearly 73% of the world's impoverished people. By 2020, it is estimated that 70% of people living with HIV will reside in MICs. These statistics signify that there is a serious treatment gap facing MICs now and even more so in the future. This situation is compounded by two key factors:
(i) drug companies routinely charge higher prices in MICs, given that these are "emerging markets", and exclude them from "access programs" or voluntary licenses;
(ii) there is little international pressure addressing this gap as compared to intervention in low-income countries. Failure to address this widening gap sets back past work to address access to ARVs and there is a need for an urgent response by all actors.
**Description:** This presentation will discuss what civil society-led patent interventions are doing in addressing affordability and access issues for HIV and Hepatitis C drugs in MICs. Special focus will be given to law and policy reform, legal patent challenges, and strengthening patent examination. Evidence-based analysis will be presented for the first time to showcase pricing and patenting trends in a subset of countries, providing recommendations for how to address the treatment gap going forward.
**Lessons learned:**
1) MIC status is fluctuating, as country classifications change, which potentially has an adverse impact on affordability of medicines.
2) Legal and advocacy strategies by civil society are serving as leverage for country governments and emerging as an important negotiating tool with pharmaceutical companies.
3) Information asymmetry is a key barrier in MICs. Challenges persist to obtaining pricing and patent data around key HIV and Hepatitis C drugs in MICs.
**Conclusions/Next steps:**
1) Rising medicine costs and decreasing international support require MICs to enact health-friendly patent policies that promote affordable medicines.
2) Investment is critical in PLHIV networks and their advocates to dialogue with government patent offices, patent offices and health ministries and address information gaps.
Academic research institutions and other actors need to leverage their expertise to support governments to address information asymmetry.

# HUMAN RIGHTS OF PEOPLE LIVING WITH HIV AND KEY POPULATIONS

## WEPED338

### GLOBAL FUND AFRICA REGIONAL GRANT ON HIV - REMOVING LEGAL BARRIERS: COUNTRY COORDINATING MECHANISMS (CCM) ENDORSEMENT FROM PROGRAMME COUNTRIES

D. Patel[1], D. Diouf[2], M. Clayton[3]
*[1]UNDP, HIV and Health, Addis Ababa, Ethiopia, [2]Enda Sante, Dakar, Senegal, [3]AIDS and Rights Alliance for Southern Africa (ARASA), Windhoek, Namibia*
*Presenting author email: deena.patel@undp.org*

**Background:** In 2013, UNDP and four regional NGOs in Africa who are recognised for their work on HIV and human rights (ARASA, Enda Sante, KELIN and SALC), developed a partnership to successfully apply for a regional grant through the Global Fund New Funding Mechanism. The award was made at the end of 2015 and is the first Global Fund Africa Regional Grant which addresses human rights of key populations (KPs).
**Description:** In order for the award to be made, the consortium sought endorsement from the CCMs of all 10 project countries (Botswana, Cote D'Ivoire, Kenya, Malawi, Nigeria, Senegal, Seychelles, Tanzania, Uganda, Zambia). A project Steering Committee developed country summaries, which were sent to the respective CCMs. Follow-up was handled on a case by case basis. For example, some CCMs requested clarification by email, whereas others requested for an in person presentation. In each case, open communication was maintained so that each CCM was able to send multiple rounds of questions that were answered as swiftly and comprehensively as possible. As a result, all 10 programme country CCMs endorsed the project Concept Note, and will continue to remain involved in the project through communication with the Africa Steering Committee (ASC).

**Lessons learned:** More face to face engagement with CCMs is required when dealing with human rights issues due to possible sensitivities. Multiple forms of communication need to be prepared and offered (presentations, fact sheets, summaries) to satisfactorily answer questions that CCM members may have. KP involvement in presentations to CCMs is critical, but it is important that the project Steering Committee actively supports KPs in this role. In some cases capacity development in human rights is necessary for CCM members to make a fully informed endorsement.
**Conclusions/Next steps:** Endorsement by the CCMs has proven to be essential in development and implementation of this regional grant. The method of seeking endorsement can be replicated by others who are also undergoing the same process.

## WEPED339

### A VIDEO ABOUT A BRAZILIAN HIV-POSITIVE POSTER

J.A. Beloqui[1,2], C. Pereira[2], T. Martins[2], R. Pinheiro[3]
*[1]University of São Paulo, Mathematics, São Paulo, Brazil, [2]GIV (Group for LIfe Incentive), São Paulo, Brazil, [3]State of São Paulo AIDS/NGO Forum, São Paulo, Brazil*

**Background:** In the last years, Brazilian HIV/Aids related campaigns were focused only on prevention and testing. Campaigns focused on stigma and prejudice against people living with HIV/Aids (PLHA) are needed.
**Description:** After discussions with a publicity agency, a poster entitled "I am an HIV+ Poster" was produced in April 2015, featuring a drop of blood from a PLHA. The title "reveals" the serological status of the poster; in low case, it compares itself to a PLHA. It follows asserting that it cannot transmit HIV, such as a PLHA in efficacious treatment or using condoms does not, and that it is possible to live with it like with any other poster. The production was donated by publicity, video and sound agencies.
Some posters were distributed in São Paulo City bus stops for a week. Some of the blood donors stayed near the poster, talked with the readers, and then revealed that the blood in the poster was their own. Reactions were all positive! A 3 minutes video was produced with testimonies by 9 PLHA, and public reactions in streets.
The video has versions for deaf people and subtitled in English, French, Mandarin, and Spanish.
**Lessons learned:** The parallel between the poster and PLHA sensitized people about stigma and discrimination, thus allowing a reflection, both rational and emotional, on their concepts. Visualizations in our youtube channel, were more than 300,000, and exceeded 350,000 in that of the publicity agency; one Brazilian user downloaded the video in her facebook page and surpassed a million visualizations. In Argentina, visualizations exceeded 4 millions. Several people and organizations from Mexico, Philippines, South Africa etc, asked to replicate the campaign. Among other prizes, the poster won a Golden award at "El Ojo De Iberoamerica" Festival, Bronze Lion award at Cannes Festival. Many health care services, educational institutions, prisons, NGOs asked for copies of the original poster.
**Conclusions/Next steps:** The repercussion in social media showed the poster and video revived the discussion on stigma and prejudice related to HIV, both in Brazil and the world, stressing the globality of the subject. An Exposition on this poster and video is planned for 2016.

## WEPED340

### ADDING TO THE EVIDENCE BASE FOR RIGHTS-CENTERED HIV PROGRAMMING: COMPREHENSIVE COUNTRY-LEVEL INVESTIGATIONS SUPPORTED BY THE GLOBAL FUND

J. Csete[1], R. Jürgens[2]
*[1]Columbia University, Mailman School of Public Health, New York City, United States, [2]The Global Fund to Fight AIDS, TB and Malaria, Community, Rights and Gender, Geneva, Switzerland*
*Presenting author email: ralf.jurgens@theglobalfund.org*

**Background:** Human rights-based approaches to HIV programming are essential to ensure effectiveness and sustainability of programs. The Global Fund to Fight AIDS, TB and Malaria is committed to rights-based and gender-sensitive programming, as reflected in the rights sub-objectives in its 2017-2021 strategy. It encourages including human rights interventions in proposals for programs addressing the three diseases. But inclusion of human rights interventions in proposals and final grant agreements has been infrequent, and the few interventions included have rarely been brought to adequate scale.
**Description:** The Global Fund is undertaking a major five-year effort to evaluate and add to the evidence base on the importance of human rights programming for HIV (and TB and malaria). The centerpiece of this effort, the methods for which were developed in consultation with external experts and key affected populations, are prospective qualitative and quantitative evaluations of the costs and impacts of human rights interventions relating to HIV programs in 15-20 focus countries. The interventions this research focuses on are the seven identified by UNAIDS and the Global Fund as essential for effective HIV programs, namely reduction of stigma and discrimination; access to legal services; "know your rights" information programs; reform of laws and policies that impede access to services; elimination of gender discrimination and disparities; human rights training of health workers; and human rights training of police. Mathematical modelling is being undertaken in some locations on the health impact of these interventions.
**Lessons learned:** Research/evaluation teams are best identified through an open bidding process. Experts consulted emphasized the need for participation of affected populations in these investigations and for using this research as a teaching opportunity for community-based organizations engaged in monitoring and advocacy for rights-based programs.
**Conclusions/Next steps:** The evidence generated from this effort is more comprehensive and more reality-based than some of the evidence previously available on rights-centered approaches to HIV. The results of the country-level investigations will be disseminated in user-friendly ways to policy-makers and program decision-makers and will also inform routine program evaluation approaches in the Global Fund.

## WEPED341

### CURBING SAFETY AND SECURITY RISKS OF WORKING WITH MSM THROUGH ENGAGEMENT OF POLICE AND TRADITIONAL LEADERS

V. Odira
*Men against AIDS Youth Group Organization, Kisumu, Kenya*
*Presenting author email: vincent.kongoro@gmail.com*

**Background:** Lesbian gay, bisexual transgender and intersex (LGBTI) Kenyans experience widespread verbal and physical assault from members of the community on a daily basis. These have a significant impact on the mental health and well-being of LGBTI people and also hamper continuing HIV prevention, treatment and care efforts. Historically, LGBTI community and organizations have also faced numerous challenges from law enforcement.
On April 19th 2014, ten police officers raided MAAYGO office, confiscated office materials and arrested, harassed and beat the organization's director and finance officer, as well as one of its members, for "illegally promoting homosexuality" and detained all three in police cells.
**Description:** Men Against AIDS Youth Group Organization (MAAYGO) works in the front lines in theHIV response led the establishment of security network to dialogue and review the incident and what it meant in HIV programming. MAAYGO initiated sensitization forum with local chiefs and police officers to understand and familiarize them with MAAYGO work and sexual orientation and gender identity (SOGI) and rights.
**Lessons learned:** As a result of the sensitization forum, the police commander, local chiefs and police officers are now supporting MAAYGO interventions. These stakeholders now understand how HIV programming for MSM contributes to the national HIV response.MAAYGO continues top proactively and constructively engage with the police and have been allocated sessions to conduct sensitization and training to police officers and local chiefs. MAAYGO also participates at community local chiefs "barazas"to sensitize other community members on LGBTI issues in order to increase tolerance and acceptance.
There are now a number of police officers who understands the plight of LGBTIKenyans and can articulate the issues they face.
**Conclusions/Next steps:** Developing a security plan, scanning the environment before implementing activities, are important when building partnership with the community. Continuous sensitization of law enforcers, local chiefs and communities on LGBTI issues and contributes to a more positive and enabling environment for MSM-focused programming.

## WEPED342

### LEGAL ENVIRONMENT ASSESSMENT FOR HIV RESPONSE IN NIGERIA

K. Adeniyi[1], D. Owolabi[2], A. Akinrimisi[3], O. Falola-Anoemuah[4], P. Umoh[5]
*[1]National Agency for the Control of AIDS, Legal Services Department, Abuja, Nigeria, [2]UNDP, HIV, Health and Development, Addis Ababa, Ethiopia, [3]CEHWIN, Consultant, Lagos, Nigeria, [4]National Agency for the Control of AIDS, Gender and OVC, Programme Coordination Dept, Abuja, Nigeria, [5]Heartland Alliance, Programme, Abuja, Nigeria*
*Presenting author email: yinkaduke@yahoo.co.uk*

**Background:** The 2011 Political Declaration on HIV and AIDS and the Global Commission Report on HIV and the Law recognize that the law can have a profound impact on the lives of vulnerable and marginalized people. The primary aim of a legal and regulatory assessment is to identify and review HIV, health and any other

related laws, regulations; and policies and practices, in order to establish their relevance to, and impact on the national response to HIV and AIDS. While the 1999 Constitution of the Federal Republic of Nigeria (as amended), offers general protection against discrimination and protects the rights of all Nigerians, there are concerns that the legal and regulatory environment for HIV response could be improved especially given the recent enactment of the Same Sex Marriage Prohibition Act, 2014. This is important, given the disproportionately higher HIV prevalence rates among Key Populations

**Description:** The assessment was government led, anchored by NACA and steered by a Technical Working Group comprising Key Populations (FSWs, MSM, PWID), UN Agencies, PLHIV, Academia, Ministries, Department and Agencies of government. It is believed that given the hostile legal environment especially for key populations, it is important to come up with an assessment involving critical stakeholders in the HIV/AIDS response including the Key Populations to provide evidence base for advocacy for legal and policy reforms.

The assessment which has been completed and validated by stakeholders reveals the existence of a wide range of laws and policies with dire implications for HIV/AIDS.

**Lessons learned:** With the enactment of the Same Sex Marriage Prohibition Act, 2014, hence the hostile legal environment, one of the key lessons learned from the assessment is that advocacy for legal and policy reforms should be informed by evidence based assessment aligned with global and regional documents. It is also important to involve key populations and key government stakeholders in the design and implementation of legal assessment. It gives hope that some of the punitive criminalizing legislations against most at risk populations will be reversed.

**Conclusions/Next steps:** The LEA will inform the development of the National Plan of Action and Accountability Framework for all key stakeholders

## WEPED344

### ACCESS TO ART FOR FOREIGN PRISONERS IN BOTSWANA: STRATEGY AND LITIGATION IN *TAPELA AND OTHERS V THE ATTORNEY GENERAL AND OTHERS*

A. Raw[1], C. Kelemi[2]
*[1]Southern Africa Litigation Centre, Health Rights Programme, Johannesburg, South Africa, [2]Botswana Network on Ethics, Law and HIV/AIDS, Gaborone, Botswana*
*Presenting author email: annabelr@salc.org.za*

**Background:** In August 2015 the Botswana Court of Appeal delivered a judgment, upholding a previous High Court order, in which the Botswana government was compelled to provide antiretroviral treatment (ART) to foreign prisoners. The judgment marks a milestone in a long battle by local and regional civil society to change a government policy in which foreign prisoners were discriminated against in the denial of ART.

**Description:** Spanning a period of three years, the strategy coordinated by the Botswana Network on Ethics, Law and HIV/AIDS (BONELA) and the Southern Africa Litigation Centre (SALC) included legal proceedings at both High Court and Court of Appeal, interim contempt-of-court proceedings, extensive advocacy, and engagement with government officials. The call to dedicate public resources to non-citizen prisoners was unpopular in public discourse and encountered stern government resistance. In addition, Botswana's constitutional framework explicitly endorses exceptions to non-discrimination provisions in the case of non-citizens and in public expenditure. The achievement of policy change was therefore a significant accomplishment following coordinated efforts of various parties.

**Lessons learned:** The implementation of the strategy required clearly-framed, harmonised and sustained advocacy goals and activities on local, national, regional and international levels. The legal strategy was carefully framed in acknowledgment of the jurisprudential context, ensuring outcomes useful to long-term strategic ends in advancing access to healthcare in prisons. However significant hurdles were faced in accessing the prison system in order to monitor compliance with the High Court and Court of appeal orders. Concerns particular to prisoners as litigants need to be accommodated when including litigation in strategies to advance access to treatment.

**Conclusions/Next steps:** SALC and BONELA intend to use the success in the judgment to improve civil society's footprint in HIV-services in Botswana's prisons. Efforts to support the enforcement of the judgment and to use the enforcement process to create opportunities for dialogue are required to ensure sustainable gains in prison health in Botswana.

## WEPED345

### VIOLATIONS OF SEXUAL AND REPRODUCTIVE HEALTH AND RIGHTS OF WOMEN LIVING WITH HIV IN CLINICAL AND COMMUNITY SETTINGS IN UGANDA

D. Namutamba, R. Nandelenga
*International Community of Women Living with HIV/AIDS Eastern Africa, Programmes, Kampala, Uganda*
*Presenting author email: dorothynamutamba@yahoo.com*

**Background:** Women living with HIV experience more stigma and rights violations in health care settings than HIV-negative women. There is need to further unpack the complex issues of stigma, gender-based prejudices, discrimination, and human rights violations in the context of clinical and community health settings. As part of the Link Up project, ICWEA worked to improve the sexual and reproductive health and rights (SRHR) for young women living with HIV in Uganda. ICWEA conducted a research study focusing on SRHR violations of women living with HIV in their reproductive age (15-49 years) in clinical settings, with a particular focus on coerced and forced sterilisation.

**Methods:** The study was conducted in 2014 in the 8 regions of Uganda. It involved both qualitative (a desk review, focus group discussions, in-depth interviews and selected case studies) and quantitative (a field based inquiry) methods. Over 700 women living with HIV were interviewed. Other respondents included service providers, opinion and district leaders, CSOs and men The approach was participatory: 35 young women living with HIV trained as research assistants.

**Results:** Of 72 women who had undergone tubal ligation as a family planning method, 20 women had been forced or coerced. Their education level was relatively low - 54% had only primary school level - and they are mainly low income earners (34%). Most (95%) sterilizations occurred during child birth, when the woman got a C-section. Coerced and forced sterilization was characterized with misinformation, and no signed consent was sought. Other violations, especially in community settings, included forced abortions, gender-based violence, abandonment by spouses, women forced to give birth beyond number of children desired, and stigma and discrimination.

**Conclusions:** Cultural and social factors remain barriers to access SRHR services. Unequal power relations between women and health workers, spouse or family members lead to women's low bargaining power, limited education, and low economic status. Women lack information about their rights.

There is need to sensitize health workers on women's SRHR, empower women living with HIV to increase their ability to negotiate and resist SRHR violations, and; provide legal redress and justice to women who have undergone SRHR violations, especially forced/coerced sterilization.

## WEPED346

### IMPLICATIONS OF SEXUAL REPRODUCTIVE HEALTH RIGHTS VIOLATIONS ON CARE, SUPPORT AND PREVENTION OF HIV: EXPERIENCES OF WLHIV ON FORCED AND COERCED STERILIZATION IN KENYA

G. Kiio
*African Gender and Media Initiative Trust, Nairobi, Kenya*
*Presenting author email: gkiio@gem.or.ke*

**Background:** When sexual reproductive health rights are respected and upheld those who need to access reproductive health care feel safe and dignified and are likely to seek these services whenever they need them. The contrary would lead to apathy and seeking alternative ways of addressing reproductive health needs which may expose those seeking care to unprofessional care leading to mortality among other health challenges.

Cases of forced and coerced sterilization of WLHIV came to the fore in 2011 during support group meetings in Nairobi, Kakamega and Kisumu. A study conducted in the same year set to document evidence of such cases and initiate psychosocial support and advocacy to stop the practice.

**Methods:** This study was conducted between September and December 2011 in Nairobi and Kakamega. Respondents were identified through snowball within support groups of WLHIV. Data was collected through in-depth face to face interviews, the respondents identified places they felt comfortable to hold the interviews; this was done to protect confidentiality. Quantitative data was analyzed through graphical displays and tabulations while qualitative data was analyzed according to emerging themes which provided in-depth information to generate close to verbatim accounts of the respondent's experience.

**Results:** The study found out that; non- consensual sterilization was happening in both public and private hospitals, health care workers and family members were the main perpetrators, the affected women suffered psychological stress and were disinherited of their matrimonial property, stigma and discrimination was the main driver of forced sterilization which led to many women shying away from disclosing

Tuesday 19 July

Wednesday 20 July Poster Exhibition

Thursday 21 July

Friday 22 July

Late Breaker Posters

Author Index

their HIV status, finally the study highlighted how the intersection of low socio-economic status, HIV and gender increases vulnerability of WLHIV to nonconsensual sterilization.

**Conclusions:** There is need to accelerate reproductive health rights awareness among women living with HIV, health workers and community members to sustain the gains made in HIV response.

## WEPED347

### THE ROLE OF NGOS IN CONFRONTING ANTI-GAY LEGISLATION: A PANACEA TO COMBATING THE SPREAD OF HIV/AIDS AMONG MSM IN NIGERIA

M.C. Chiaha[1], I.K. Orazulike[2], B. Ibe[1]

*[1]International Center for Advocacy on Rights to Health (ICARH), Human Rights Department, Abuja, Nigeria, [2]International Center for Advocacy on Rights to Health (ICARH), Executive Director, Abuja, Nigeria*

*Presenting author email: martinchiaha@gmail.com*

**Background:** : In January 2014, the ex-president of Nigeria signed into law a legislative Act that formally criminalizes same sex oriented citizens and other Lesbian, Gay, Bisexual, Transgender and Intersex (LGBTI) persons living in Nigeria for their human person, their sexual orientation and gender identity. Apart from the Criminal and Penal Code which impose 14 years jail term on homosexuals or bisexuals, the Resent Same Sex Marriage Prohibition Act criminalizes civil partnerships, marriages of same sex persons, organizations that provides developmental intervention programs, professionals who support LGBTI people such as nurse, doctors and lawyers, association of HIV positive gay men by the virtue of sexual orientation and people who identify with LGBTI persons by association (which could include family members) among others. This drove many gay men underground and hinders the CSOs from providing medical support and care to LGBTI and those living with HIV/AIDS.

**Methods:** : In 2015, the International Centre for Advocacy on Right to Health-ICARH engaged a legal practitioner on a full time job to further her critical intervention on Human Rights in order to promote and defend the fundamental Human Rights of sexual minority population in the Federal Capital Territory Abuja, Nigeria. Also, in October 2015, ICARH and other NGOs conducted 'Legal Environmental Assessment' on the impact of Nigerian Legal System in the fight against HIV/AIDS. The Assessment attracted the Federal Ministry of Health, the National Agency for the Control of AIDS, CSOs, Donors, Lawyers, Doctors and Allies of the LGBTI.

**Results:** The Human Rights Lawyer responds quickly in cases of arrest/detention of community member to secure their bail having in mind that some of the detained community members on *ARV therapy do not have access to drugs while in cell. Fortunately*, **ICARH's** clinic now records more MSM accessing **ARV drugs** due to intensive sensitization by the organization.

**Conclusions:** There is need for Government Policies to be void of discrimination but geared towards equality for all.

## WEPED348

### ESTABLISHING A COMMUNITY-OWNED SYSTEM TO MONITOR AND RESPONSE TO HIV-RELATED HUMAN RIGHTS CHALLENGES: LESSONS LEARNT SO FAR

G. Reid[1], R. Lusimbo[2], G. Atwiine[3], J. Kehler[4], G. Caswell[1]

*[1]International HIV/AIDS Alliance, Cape Town, South Africa, [2]Sexual Minorities Uganda (SMUG), Kampala, Uganda, [3]Community Health Alliance Uganda (CHAU), Kampala, Uganda, [4]AIDS Legal Network (ALN), Cape Town, South Africa*

*Presenting author email: greid@aidsalliance.org*

**Background:** Right, Evidence and Action (REAct) is an information technology (IT)-based human rights monitoring and response system used and owned by community-based organisations. Since mid-2014,REAct has been set up in Myanmar, Lebanon, Uganda, Senegal, South Africa and Zimbabwe by organisations of PLHIV, LGBTI people, migrants, women from key populations and sex workers. Through REAct, organisations document human rights-related barriers, including gender violence, to accessing HIV and health services. REAct produces information to inform provision of adequate rights-based programmes; responds to individual emergencies; generates evidence for advocacy, and generates data for improving rights-based programming.

In 2015, there was formative evaluation on REAct with two strands: an overview of its contribution to the existing body of evidence about human rights reporting and response systems; and a specific field evaluation in Uganda.

**Description:** The overall evaluation used a mixed method approach, including a desk review of information provided by participating organizations and in the public domain and appreciative inquiry/semi-structured interviews with 25 persons, including global key population networks, REAct implementers and strategic partners.

In Uganda, a cross-sectional research design was adopted. Qualitative research with one-two-one and focus groups totaled 28 individuals (17 implementers, four managers and seven beneficiaries). Atlas,ti-computer software and Martus software were used for thematic qualitative data analysis.

**Lessons learned:** REAct has improved skills and human rights knowledge among target population, enhanced the sense of ownership and legitimacy of implementing organisations among their beneficiaries. It has contributed to providing responses to crises responses and generating evidence for advocacy, guided HIV response and programming among Key Populations and improved the diagnosis of human rights-related needs. There is need for further technical assistance on both human rights research and IT use; security risks need to be further factored in and addressed. The inherent suitability of the system needs to be reinforced with robust referrals and partnerships with human rights service providers.

**Conclusions/Next steps:** REAct contributes to the essential needs among communities to own their own monitoring and response system for human rights violations. REAct needs to be developed to contribute to generating evidence towards the fulfilment of the Sustainable Development Goals and to be openly accessible to other organisations.

## WEPED349

### REASONABLE ACCOMMODATION MADE EASY: PRACTICAL GUIDELINES FOR EMPLOYERS OF ALL SHAPES AND SIZES

A. Torriente[1], M. Bell[2], W. Porch[3], L. Wong[4], S. Tromel[4], M.M. Travieso[4], S. Mabhele[5]

*[1]ILO, ILOAIDS, Geneva, Switzerland, [2]Trinity College, Law, Dublin, Ireland, [3]Canadian Working Group on HIV and Rehabilitation, Toronto, Canada, [4]ILO, Geneva, Switzerland, [5]ILO, ILOAIDS, Pretoria, South Africa*

*Presenting author email: torriente@ilo.org*

**Background:** All workers should enjoy equal access to employment, yet some encounter physical, procedural or psychological barriers—including discrimination--that may put them at an unfair disadvantage. If not addressed, such barriers also deprive companies of a broader, more diverse pool of workers, a factor that can also place businesses at a disadvantage in both the local and global marketplace. Many employers lack information on why reasonable accommodation is both a human right and good business practice, when and how to provide an accommodation, and low cost options for doing so.

**Description:** To fill this knowledge gap, the International Labour Organization (ILO) has developed practical, step-by-step guidelines for employers large and small, taking the employer through the accommodations process with concrete examples, and making the business case for diverse workplaces that accommodate workers' needs in varying circumstances. The guide focuses on four specific groups: persons living with or affected by HIV or AIDS, persons with disabilities, persons with family responsibilities; and persons who hold a particular religion/belief.

The guidelines were developed through extensive consultation with a working group of experts from around the world. In particular, sections focusing on the needs and concerns of workers living with or affected by HIV were developed in consultation with the Canadian Working Group on HIV and Rehabilitation and take the episodic nature of HIV and AIDS into account. The guidelines are divided into sections designed to help employers understand the concepts behind reasonable accommodation and the process and steps for implementing accommodations during the employment cycle. They also contain a model policy on reasonable accommodation that can be adapted for use by businesses of varying size, complexity and resources.

**Lessons learned:** Collaboration with experts from academia, businesses and civil society organizations was essential to ensure the development of practical, flexible guidelines that meet the concrete, specific needs of employers and their workers.

**Conclusions/Next steps:** Dissemination of the guidelines will be scaled up among employers and other world of work stakeholders, to promote increased provision of reasonable accommodation for all workers, including those living with or affected by HIV or AIDS.

## WEPED350

### HUMAN RIGHTS AND HIV: ZERO DISCRIMINATION YOUTH TASK FORCE IN THE RESPONSE TO THE AIDS EPIDEMIC IN BRAZIL

G. Braga-Orillard[1], F. Mesquita[2], J. Netto[3], V. Araujo[3], C. Euzebio[4]
*[1]UNAIDS, Director, Brazil Country Office, Brasilia, Brazil, [2]UNAIDS, Consultat, Brasilia, Brazil, [3]Ministry of Health, AIDS Department, Brasilia, Brazil, [4]UNAIDS, Civil Society Mobilization, Brasilia, Brazil*
*Presenting author email: bragag@unaids.org*

**Background:** In Brazil, HIV infections rose 11% from 2005-2013 in the population as a whole, with a noted high vulnerability of young people. From 2005-2014, notified AIDS cases between 15-19 years old individuals more than tripled (from 2,1 to 6,7 cases per 100,000 inhabitants). UNAIDS and the Ministry of Health identified gaps in the response, including that of young people also, which were less and less involved in issues related to HIV, with very few young activists. Information to promote adherence was also lacking.
**Description:** · The Zero Discrimination Youth Task Force brings together young activists from different human rights areas (women's movements, race and ethnic, indigenous, land reform, etc.) as well as HIV-positive youngsters, in order to fight discrimination, empower young people from key populations and those most vulnerable in society. The approach is cross-cutting through five transdisciplinary themes: educommunication; social mobilization; advocacy; ethics and culture of peace and conflict mediation. Mobilization is innovative, through social media and crowdsourcing of ideas, with primary focus on virtual environments and communities. The group is active on virtual mobilization on social and human rights issues and also very prominent in welcoming and supporting young people who have recently discovered their HIV positive status. The task force also facilitates, mediates and helps in the development of social intervention strategies.
**Lessons learned:** The application of nonviolent communication principles and culture of peace in cross-cutting issues was beneficial. The gathering of leaders of human rights movements into AIDS-related issues has been very important for mutual learning. Through the deconstruction of misconceptions, it was provided a space for dialogue was created that allowed the approach and perception of the other as a partner.
**Conclusions/Next steps:** Since the establishment of the task force a significant increase for noted in the participation of networks and youth movements in response to the AIDS epidemic in Brazil. Similarly, there was an increase of visibility in the youth agenda and their demands. Through ongoing training, it is expected the expansion and strengthening of this network.

## WEPED351

### SECURING LAND RIGHTS FOR WIDOWS LIVING WITH AND AFFECTED BY HIV USING CUSTOMARY JUSTICE STRUCTURES

A.A. Maleche[1], O. Ondeng[2], J. Oluoch[2], E. Otieno[2]
*[1]Kenya Ethical and Legal Issues Network on HIV and AIDS & Rachier & Amollo Advocates, Human Rights Litigation, Nairobi, Kenya, [2]Kenya Ethical and Legal Issues Network on HIV and AIDS, Kisumu, Kenya*
*Presenting author email: amaleche@gmail.com*

**Background:** In Homabay and Kisumu counties of Kenya, many widows and orphans become vulnerable to HIV when their husbands and fathers die, due to disinheritance by their families and communities, which leaves them destitute. These counties are among the 47 with the highest HIV prevalence rate, with Homabay at 25.7% and Kisumu at 19.3%, as against the national prevalence of 6.04%. Many are evicted from their rural homes and flee to urban areas where they find themselves vulnerable to physical and sexual abuse, increasing their vulnerability to HIV. Often they resort to high-risk behavior, such as polygamy or involuntary sex work in order to earn enough money to survive. For women and children living with HIV it becomes very difficult to access consistent treatment.
**Description:** KELIN trained over 50 elders and 100 widows on HIV and the rights based approach. The widows who had been evicted were linked to the trained elders who mediated over their cases. The widows were then resettled on their land. Each case took an average of three months to be resolved.
**Lessons learned:** The use of customary justice systems has not only ensured access to justice to over 300 widows living with HIV, but has helped secure land and property rights, enabling them to become economically independent and productive members of the community. Women's access and control over land is a basic necessity for a decent livelihood, especially in rural agricultural areas and critical to ensuring women living with HIV or widowed by HIV can protect themselves from infection, cope with illness, and support their families. By facilitating the widows to access justice it ensure that they enjoy their right to health.
**Conclusions/Next steps:** KELIN has developed a tool for those who want to replicate similar programs. The tool outlines a simple guideline for implementation in any community where harmful cultural practices have a negative impact on HIV exist. KELIN has documented all the cases that have been settled by the widows and is now working with the Judiciary to formalise the process of access to justice by way of mediation as envisioned by Article 159(2) of the Constitution of Kenya.

## WEPED352

### CRIMINALIZATION OF SEXUAL MINORITIES RIGHTS FOSTERING STIGMA AND DISCRIMINATION: CASE OF BURUNDI

S. Rugori, I. Iradukunda, R.J. Ninteretse, C. Rumu
*Mouvement pour les Libertes Individuelles, Bujumbura, Burundi*
*Presenting author email: srugori@outlook.com*

**Background:** On April 22, 2009, Burundi amended its Criminal Code to criminalize sexual relations between consenting adults of the same sex for the first time in its history. The State of Burundi has legal obligations to protect the rights of all its citizens arising from the Universal Declaration of Human Rights, and various treaties, pacts and international conventions that the State of Burundi has ratified, as well as under the Constitution of the State of Burundi. Nonetheless, sexual minorities in Burundi continue to be the victims of human rights violations and face increasing discrimination and stigmatization.
**Description:** The research was carried to produce first ever data on the extent of discrimination by le Mouvement pour les Libertes Individuelles - MOLI whose work is around documentation an research on human rights abuse and violations based on real or perceived sexual orientation and gender identity. The authors analyzed MOLI's archives and verified the accuracy of the files and case documentation of MOLI employees, as well as other reports produced by the organization since 2010, where over 17 cases were documented.
**Lessons learned:** The research recognized remarkable progress has been made securing the right to health for sexual minorities since 2007, especially with regard to HIV/Aids prevention programs. However, the institutionalization of homophobia materialized by official intolerance and promotion of homophobic attitudes, and detention and threats of detention incite some health providers to not giving comprehensive services to MSM & Transgender while contributing that they go on background and prefer to not disclose their sexual practices to health providers. Also, sexual minorities identifying organizations were found denied registration impacting their ability to organize and mobilize various constituencies.
**Conclusions/Next steps:** Laws and punitive provisions against sexual minorities continue to hamper effective responses to HIV/Aids as well as for them to attain the highest level of health services as most of them fear of being viewed as criminals. Thus, initiatives on documenting and addressing issues human rights, sexual orientation and gender identity needs to be encouraged in other to adopt a human rights based approach to HIV/Aids.

## WEPED353

### CHALLENGING ANTI-PROSTITUTION LAWS WITH HELP OF CEDAW

R. Elliott, M. Golichenko
*Canadian HIV/AIDS Legal Network, Toronto, Canada*
*Presenting author email: relliott@aidslaw.ca*

**Background:** Female sex workers are among the populations most vulnerable to HIV in Eastern Europe and Central Asia (EECA) — vulnerability which is directly linked to stigma and discrimination that is perpetuated by anti-prostitution criminal and administrative laws. Yet there is neither public pressure to repeal these laws locally, nor calls for change from international allies. From 2013-2015, sex worker activists from Sheikh-Aim Network, Kyrgyzstan and Silver Rose Association, Russia, with support from the Canadian HIV/AIDS Legal Network and International Women's Rights Action Watch Asia Pacific (IWRAW) sought to build international pressure for sex work law reform in the region.
**Description:** Activists submitted periodic country reports to the Committee on the Elimination of Discrimination against Women (CEDAW Committee) in order to secure recommendations regarding anti-prostitution laws in Kyrgyzstan and Russia. Sex workers attended pre-sessions and review sessions of, and presented reports to, the CEDAW Committee. In 2015, the CEDAW Committee issued a strong recommendation to repeal anti-prostitution administrative laws because they are discriminatory and increase the vulnerability of sex workers to HIV.
**Lessons learned:** When it comes to sex work, the CEDAW Committee is considered a fairly conservative UN human rights body, which at best promotes the so-called Swedish model, where sex workers are tolerated but clients are punished. Before 2015, the CEDAW Committee recommended the decriminalization of sex work on several occasions, but never challenged administrative prohibitions against sex work. The 2015 recommendation was a clear step forward by a UN human rights

body in recognizing the human rights of sex workers. The main driver of success was the active participation of sex worker activists in CEDAW sessions. CEDAW Committee members had the opportunity to hear first-hand experience concerning the ways in which anti-prostitution laws exacerbate stigma and discrimination against sex workers and increase their vulnerability to HIV.
**Conclusions/Next steps:** The 2015 CEDAW recommendation will be used to fight anti-prostitution laws in the EECA. Sex worker activists plan to approach senior government officials to urge them to implement the recommendation. Activists will also maintain a dialogue with the CEDAW Committee to amplify the voices of the communities most affected by HIV.

## WEPED354

### EXPLORING EQUITY IN COCHRANE HIV SYSTEMATIC REVIEWS USING THE PROGRESS PLUS FRAMEWORK: A BIBLIOMETRIC ANALYSIS

T. Aves[1], T. Kredo[2], V. Welch[3], S. Mursleen[1], S. Ross[1], B. Zani[2], V. Nkengafac[2], L. Quinlan[4], L. Mbuagbaw[1,5]
*[1]McMaster University, Department of Clinical Epidemiology and Biostatistics, Hamilton, Canada, [2]South African Cochrane Centre, South African Medical Research Council, Cape Town, South Africa, [3]University of Ottawa, Centre for Global Health, Ottawa, Canada, [4]University of Ottawa, Bruyère Continuing Care, Ottawa, Canada, [5]St. Joseph's Healthcare, Biostatistics Unit, Father Sean O'Sullivan Research Centre, Hamilton, Canada*
*Presenting author email: mbuagblc@mcmaster.ca*

**Background:** Inequities undermining the efforts to curb the HIV epidemic are increasingly being documented such as, gender based differences in prevention and treatment, the role of religion in sexual behavior and adherence to care, access to social capital in prevention and engagement with care and level of education in HIV testing. These issues raised above would suggest that elements of inequity should be integral parts of HIV research, practice and policy. The objective of this research was to describe and summarize equity reporting in HIV systematic reviews and explore the extent to which equity issues are addressed in HIV reviews using the PROGRESS Plus framework; a tool to measure variation in health across socially stratifying forces.
**Methods:** We conducted a bibliometric analysis of all the systematic reviews published by the Cochrane HIV/AIDS group as of March 2014. The reviews were grouped into four categories: behavioral, social or policy interventions (n=16); biomedical prevention (n=16); health services and care (n = 9); and therapeutics, prognostics and diagnostics (n = 62) giving a total of 103 reviews. PROGRESS Plus items were identified as present or absent in the reviews and recorded by pairs of seven reviewers using a standardized data extraction form. PROGRESS Plus items included place of residence (P), race or ethnicity (R), occupation (O), gender (G), religion (R), education (E), socio-economic-status (S), social capital (S), age (Plus item) and sexual orientation (Plus item).
**Results:** The analysis included 103 reviews published as of March 2014, with a median of 5 studies per review (min 0, max 44). Reporting of PROGRESS-Plus factors was as follows: Place of Residence (low, middle and high income) (55.3%), Place of Residence (urban or rural) (24.3%), Race or Ethnicity (20.4%), Occupation (10.7%), Gender (65.0%), Religion (1.9%), Education (7.8%), Socioeconomic Position (10.7%), Social Networks and Capital (1.0%), Age (1.9%) and Sexual Orientation (3.8%).
**Conclusions:** Gaps in the reporting of relevant equity indicators were identified in the research suggesting HIV research is not consistently conducted through an equity lens. There is a need to incorporate more socially stratifying factors into both primary and secondary studies.

## WEPED355

### HOW USEFUL IS PUBLIC IMPACT LITIGATION AS AN ADVOCACY TOOL TO ADDRESS THE STRUCTURAL DRIVERS OF HIV AND TB IN PRISONS: A CASE STUDY OF EXTREME OVERCROWDING IN POLLSMOOR

A.D. Nevin
*Sonke Gender Justice, Policy Development and Advocacy, Cape Town, South Africa*
*Presenting author email: ariane@genderjustice.org.za*

**Background:** South Africa has the benefit of a legislative framework that aims to protect the rights of prisoners - from a progressive and comprehensive constitution that guarantees the rights of prisoners and detainees to human dignity, adequate accommodation, regular exercise and access to health care services, to policies directed at dealing with the prevention of sexual abuse and the treatment of HIV and TB in prisons.
**Description:** The prevailing inhumane conditions, including extreme overcrowding, inadequate sanitation facilities, inadequate staffing, poor nutrition and lack of regular exercise, make it nearly impossible to implement the policies necessary to ensure prisoners' rights. For example, it is impossible to prevent sexual abuse, a driver of the spread of HIV in prisons, if it is impractical to separate vulnerable and predatory detainees, or to prevent the spread of TB if infected detainees cannot be accommodated separately from healthy ones. If we are successfully to implement practices designed to halt the spread of HIV and TB in prisons, it is necessary to remove the structural obstacles that prevent their effective implementation.
**Lessons learned:** Extensive engagement with relevant officials often simply yields the response that until the broader, upstream challenges within the criminal justice system are addressed, the inhumane conditions and extreme overcrowding in prisons will persist.
**Conclusions/Next steps:** Following several years of unsuccessful engagement with the Department of Justice and Correctional Services on issues of extreme overcrowding, Sonke Gender Justice represented by Lawyers for Human Rights launched a court application in December 2015 challenging the unconstitutional conditions in Pollsmoor Remand Detention Facility. The author provides a case study of this litigation as it is unfolding, and assesses the merits and limitations of public impact litigation, a tool that has been used to great effect in other instances - securing antiretrovirals or textbooks - as a method of addressing structural drivers of HIV and TB in South African prisons, such as overcrowding.

## WEPED356

### ANTI-GAY LAW, MSM AND HIV: HUMAN RIGHTS INFLUENCES AND HIV/OTHER STIS AMONG MEN WHO HAVE SEX WITH MEN IN NIGERIA (MSM)

C.C. Ifekandu
*Population Council, HIV Division, Abuja, Nigeria*

**Background:** Results from the recent Integrated Behavioural and Biological surveillance Survey (IBBSS) 2014 indicates that HIV prevalence among Men who have sex with Men is skyrocketing: From 13.5% (in 2007) to 17.2% (in 2010) and 22.9 (2014). Despite the tremendous donor money spent on MSM-HIV programming, the passing of the anti-gay law in Nigeria is having a huge impact on efforts already made to mitigate HIV new infections among this sub-population in Nigeria.
**Objective:** To measure the impact of the anti-gay law HIV programming in Nigeria
**Methods:** Between October to December 2015, a well-structured questionnaire were administered to the clients at the Strengthening HIV Prevention Services (SHiPS) Nigeria HIV Drop-in- Centre (DIC) for HCT/STI syndromic management services to MSM in Benue and Nasarawa States. The data were evaluated in a cross-sectional analysis. Logical regression was used to determine the correlates of the anti-gay law.
**Results:** A total of 436 MSM were reached. This figure indicates 65% of enrollment at the facilities before the signing of the antigay law in Nigeria. Mean age was 23 years +/- SD. HIV prevalence was 6.8%, 19% reported Anal warts cases, 11% for herpes Simples virus (HSV) and 6% for Gonorrhea. 67% visited the drop-in-Centre (DIC) two or more weeks after having the sign and symptoms of the STI, because they are concerned about the attitude of the Healthcare workers if they inform them of their same-sex practice. 39% reported engaging in self-medication before visiting the DIC. 13% were asked to pay double or more at a Health care facility (HCF) because of their sexual orientation and fear of being handed over to the law enforcement agencies. 42% have female sex partners in other to cover up suspicions they could be MSM by the general populations. More than half of the clients are aware of an MSM with an STI but not willing to visit the HCF due to the anti-gay law.
**Conclusions:** Criminalization of consensual sex among MSM is limiting their uptake of continuum of care and services at the various health facilities thus, increasing their vulnerabilities in increased risky behaviours.

## CHILDREN'S RIGHTS AND HIV

### WEPED357

#### FIGHTING FOR CHILD RIGHTS THROUGH COMMUNICATION FOR DEVELOPMENT (C4D), A SUCCESS STORY FROM MALAWI, 2014-2015

E. Chibweya Kayimba[1,2]
[1]*Chikwawa Diocese, Health, Blantyre, Malawi,* [2]*Catholic Health Commission, Health, Lilongwe, Malawi*
*Presenting author email: emilykayimba@gmail.com*

**Background:** More need to be done to protect children from HIV as incidences of sexual abuses keep increasing. This threatens the attainment of zero HIV and AIDS by 2030. In response to this, Chikwawa Diocese started a C4D approach to give children voice so that their views, concerns, and interests are heard and given legitimacy. C4D is an approach that empowers children as subjects, story-tellers and advocates of their own rights through child-created narratives, photos and videos. It facilitates dialogue between children and their parents, duty bearers and policy makers.
**Description:** In 2013, a total of 198 (100F, 98M) children aging from 9 to 17 years were mobilized to form groups of 20 each. In 2014, the children and 20 (10M,10F) community members were trained in C4D elements which are child rights**,** Community Journalism, Video shooting and Photography skills, Storytelling and Children Indaba. The children and community journalist produce videos and write community news articles that trigger discussion against bad practices affecting children in their communities. The groups are linked to police, local courts, health facilities, education offices and other social providers for care and support.
**Lessons learned:** C4D exposured various child abuses happening in the communities. In 2014, 7 cases of sexual abuse were reported as compared to 2 in 2015, 21 girls were withdrawn from marriages. 37children (14M, 23F) were brought back to school, 14 (5M, 9F) children were brought out from child labour. 5 cases of corporal punishment were discussed in 3 primary schools. Community journalism skills have also promoted writing ability and storytelling among children.
**Conclusions/Next steps:** C4D can expose hidden child abuses that can be dealt with in order to meet the zero HIV and AIDS by 2030.
Empowered children can help to challenge abuses that impact their development.
C4D to be implemented at a scale to empower more children.

## GENDER EQUITY

### WEPED358

#### DON'T FORGET THE BOYS: EQUITY AND GENDER CONSIDERATIONS IN VULNERABLE CHILDREN ATTENDING COMMUNITY-BASED PROGRAMMES IN SOUTH AFRICA AND MALAWI

S. Skeen[1], M. Tomlinson[1], I. Hensels[2], A. Macedo[2], K. Roberts[2], L. Sherr[2]
[1]*Stellenbosch University, Psychology, Stellenbosch, South Africa,* [2]*UCL, Health Psychology, London, United Kingdom*
*Presenting author email: skeen@sun.ac.za*

**Background:** HIV can lead to illness, poverty, bereavement, and stigma, in both HIV-infected and affected children. Girls and boys face different challenges, yet current global data is not disaggregated by gender until adolescence or adulthood. Much research shows negative effects of HIV on girls, most notably reduced educational opportunities and caregiving burden, and programming for girls has flourished. Boys, however, also face challenges, and a focus on gender should not inadvertently disadvantage them.
**Methods:** Longitudinal data were gathered from 989 children (including 135 HIV+) and primary caregivers in two African countries with high infection rates, from attenders at a randomly selected sample of community organisations (99% response rate, 86% at follow up 15 months later).
**Results:** At baseline, there were no gender differences according to country, child age, school attendance, child home, parental bereavement or HIV status. However, boys were more likely to experience community violence ($\chi^2$=13.24,$p$< .001) and harsh physical discipline
(52.9% -vs-43.1%;$\chi^2$(1)=9.41,$p$=.002). Boys were less often in the correct class (66.1%-vs-76.0%; $\chi^2$=11.24,$p$=.001), scored lower on educational functioning ($M$=82.30-vs-$M$=88.27, $t$(908)=4.17,$p$< .001) and suffered a higher number of educational risks ($M$=0.93-versus-$M$=0.64, $t$(864)=4.27,$p$< .001). Boys displayed more behavioural and emotional problems ($M$=3.25, and were more likely to report engaging in delinquent behaviours $t$(903)=3.49, $p$=.001). Controlling for cognitive abilities, developmental delay, carer HIV status and school attendance, girls were still approximately 1.5 times more likely to be in the correct class for their age than boys (odds ratio (OR), 1.51;CI1.06-2.15), with better educational functioning (B=5.60; CI, 2.76-8.44), and lower total educational risks (B=-0.22; CI, -0.35 - -0.097).
Further analyses showed the association between gender and educational functioning was mediated by exposure to community violence and harsh physical discipline. A similar mediation effect was found for educational risk. All the gender differences at baseline were still significant at follow-up. Furthermore at follow-up boys reported a significantly lower quality of life ($t$(831)=2.51, $p$=.012).
**Conclusions:** Our data shows boys affected by HIV are exposed to specific risk factors which contribute to poor educational outcomes and quality of life. A sustained approach to preventing HIV for both girls and boys should include a focus on specific programming for boys.

### WEPED359

#### OPPORTUNITIES FOR ADVANCING WOMEN'S RIGHTS THROUGH COMMUNITY-BASED CARE OF CHILDREN AFFECTED BY HIV: EVIDENCE FROM SWAZILAND

M.R. Brear[1,2], P.N. Shabangu[2], J. Fisher[1], H. Keleher[3]
[1]*Monash University, School of Public Health and Preventive Medicine, Jean Hailes Research Unit, Melbourne, Australia,* [2]*Matjana Research and Action Group, Manzini, Swaziland,* [3]*Monash University, School of Public Health and Preventive Medicine, Melbourne, Australia*
*Presenting author email: michelle.brear@monash.edu*

**Background:** Women's disproportionate burden of care-related labor prevents them attaining human rights including gender equality, fair work conditions and health. International policies advocate care of children affected by HIV in families and communities, where care-related labour is typically undervalued, unpaid "women's work". Unless they address gender inequalities, these policies may detract from women's rights. In this presentation we aim to highlight opportunities for advancing women's human rights through community-based care policies and programs.
**Methods:** Data detailing community-based, care-related labor were generated through mixed-method participatory action research. It investigated health, participation and empowerment in a rural Swazi community caring for children affected by HIV. We performed thematic and descriptive statistical analyses of relevant data from a household census, structured and unstructured observations of participation at a community preschool and neighborhood care point and focus group discussions with teachers, volunteer carers and male and female community members.
**Results:** Child care was conceived as "women's work". In 91 percent of households women were the primary carers for a median of three children. Some focus group participants perceived providing child care increased sexual risk for poor women because they relied on men, who often expected sex in return for providing food and essential material goods. Women did the majority of voluntary, care-related labor at community facilities for children, including neighborhood care points and schools. FGD participants perceived these facilities and the spirit of volunteerism were benefits to the community. However volunteer child-carers reported feeling undervalued and unsupported (emotionally and materially) by community members and external organizations, performing hard physical tasks which provided limited learning opportunities and not always receiving the food-for-work parcels they expected.
**Conclusions:** There is an urgent need to advocate for gender equity and many opportunities to advance women's rights through community-based care policy and programming. The results of this study suggest that providing a living wage, increased psycho-social support, learning opportunities and access to labor-saving technology for home and community-based child carers, and sensitizing communities about women's rights and the importance of child care-related labor, can simultaneously advance women's rights and improve children's care.

### WEPED360

#### MAPPING OF POLICIES, LAWS AND SERVICES ON GBV AND HIV INTERSECTIONS IN NIGERIA

O. Falola-Anoemuah[1], D. Owolabi[2], A. Akinrimisi[3], A. Ndieli[4], I. Madueke[5]
[1]*National Agency for the Control of AIDS, Programme Coordination Department, Gender and OVC Division, Abuja, Nigeria,* [2]*UNDP, HIV, Health and Development, Addis Ababa, Ethiopia,* [3]*CEHWIN, Independent Consultant, Lagos, Nigeria,* [4]*UN Women, Programme, Abuja, Nigeria,* [5]*Independent Consultant, Consultant, Abuja, Nigeria*
*Presenting author email: yinkaduke@yahoo.co.uk*

**Background:** Studies have shown that exposure to violence is a strong predictor of HIV infection (WHO, 2000). In Nigeria, HIV prevalence among the general population is 3.4%. and the national median prevalence among pregnant women is 4.1%. Result of the National HIV/AIDS Reproductive Health Survey (2007) revealed that gender inequality is an important driver for the epidemic. Prevalence rates have been found to be higher among females (4.0%) than males (3.2%).

**Description:** The objective of the exercise was to map existing laws, polices, services and other mechanisms available in the country for GBV and HIV /WWD/SRH intersections; assess the gaps in response and the opportunities available for engaging men in addressing the problem of GBV and its intersection with HIV/WWD/SR. It was a follow up to the UNDP global initiative on GBV and HIV. It was government led and anchored by NACA. The mapping which was completed in 2013 and validated by stakeholders reveals the existence of a wide range of gaps in laws, policies and services with dire implications for GBV/HIV intersections and informed the development in 2014 the National Plan of Action (NPOA) on GBV/HIV Intersections.
**Lessons learned:** The findings and recommendations provided evidence based advocacy for the passage of the Violence Against Persons Prohibition Act 2015 which had been with the National Assembly for up to ten years before then. A key lesson learnt from the mapping is that advocacy for legal and policy reforms should be informed by evidence based assessment aligned with global and regional documents. It gives hope that some of the punitive criminalizing legislations against most at risk populations will be reversed.
**Conclusions/Next steps:** Government should be supported to own and implement the NPOA on GBV and HIV intersections at National and sub-national levels as one of the strategies for ending AIDS by 2030.

# ETHICS AND HUMAN RIGHTS ASPECTS OF ACCESS TO PREVENTION, DIAGNOSIS, TREATMENT AND CARE INTERVENTIONS

## WEPED361

### OPPORTUNITIES TO WORK WITH LAW ENFORCEMENT, COMMUNITY MEMBERS AND POLITICAL LEADERS TO ENHANCE THE EFFECTIVENESS OF HIV PREVENTION PROGRAMMES FOR PEOPLE WHO INJECT DRUGS IN THREE SOUTH AFRICAN CITIES

S. Shelly[1,2], A. Scheibe[3,4], N. Medeiros[5], K. Padayachee[6], C. Williams[6], A. Lambert[6], M. Busz[7], J. Wildschut[7], H. Hausler[6], R. Basson[6]
*[1]University of Cape Town, Psychiatry and Mental Health, Cape Town, South Africa, [2]TB/HIV Care Association, PWUD, Cape Town, South Africa, [3]Independent Consultant, Cape Town, South Africa, [4]University of Cape Town, Desmond Tutu HIV Centre, Institute of Infectious Diseases and Molecular Medicine and Department of Medicine, Cape Town, South Africa, [5]OUT LBGT Wellbeing, Tshwane, South Africa, [6]TB/HIV Care Association, Cape Town, South Africa, [7]Mainline, Amsterdam, Netherlands*
*Presenting author email: shaun@tbhivcare.org*

**Background:** Wrongful arrest, confiscation of injecting equipment and assault contribute to high-risk injecting and unsafe equipment disposal among people who inject drugs (PWID). Human rights violations affecting PWID in South Africa have not been quantified. We aimed to measure these violations and map the electoral wards (wards) where they occurred in a needle and syringe programme (NSP) in Cape Town, Durban and Pretoria (South Africa). Political and community resistance to the NSP occurred between September and November 2015 in two wards; one in Pretoria and another in Cape Town.
**Methods:** Data collection began in August 2015 as part of service delivery and included data on: confiscation of injecting equipment; arrest for needle and syringe possession; detention without cause or processing; physical assault, and wards where violation occurred. Data was recorded on paper forms, entered into a spreadsheet and analysed using frequencies, proportions and geospatial mapping.
**Results:** Between August and December 2015, 232 violations were reported (116 in Pretoria, 108 in Cape Town and 22 in Durban), namely: confiscation of injecting equipment (144), arrest without cause or processing (20), and physical assault (28). Fifty six per cent (65/116) and 75% (81/108) of the violations occurred in the wards where resistance to the NSP were experienced in Pretoria and Cape Town, respectively. In Pretoria, the needle return rate in the ward that experienced resistance dropped by 29% (350 to 250 per day) between August and November 2015. In Cape Town, the number of PWID accessing NSP services from the NSP mobile clinic between 1 November and 15 November 2015 in the ward experiencing resistance dropped from 30 to 5 per day after the clinic relocated in early November 2015 due to political pressure.
**Conclusions:** More human rights violations occurred in wards where resistance to the NSP was experienced compared to wards where no resistance was encountered. Resistance and human rights violations negatively affected injecting equipment disposal and access to NSP services. The effectiveness of NSPs to prevent HIV infections among PWID could be improved through focused advocacy and training around evidence-based HIV prevention interventions for PWID within law enforcement agencies, the broader community and political leaders.

## WEPED362

### TRANSFORMING THE NEXUS BETWEEN SUBSTANCE USE TREATMENT AND HIV/AIDS IN VIETNAM

T. Hammett[1], O.T.H. Khuat[2], T.D. Tran[2], K.V. Le[3], H. Nguyen[4]
*[1]Abt Associates, International Health Division, Cambridge, United States, [2]Center for Supporting Community Development Initiatives, Hanoi, Vietnam, [3]Vietnam Ministry of Labor, Invalids, and Social Affairs, Hanoi, Vietnam, [4]Center for Supporting Community Development Initiatives (SCDI), Hanoi, Vietnam*
*Presenting author email: ted_hammett@abtassoc.com*

**Background:** The ~200,000 people who inject drugs (PWID) and their sexual partners are focal populations in Vietnam's HIV/AIDS epidemic; thus, the HIV/AIDS response and substance use policy are highly interdependent. Long-prevalent views of drug use as a "social evil" produced a system of compulsory drug detention centers, which reached a peak of >120 centers with >100,000 residents in 2008. These centers' regimen - detoxification, "moral education", and labor - has no basis in evidence and is highly ineffective (relapse rates > 90%), extremely expensive, and violates human rights.
**Description:** Advocacy by civil society and international organizations combined with evidence from methadone maintenance treatment (MMT) to produce major changes in substance use policies. Successful pilots begun in 2008 prompted MMT expansion to 43 provinces. Vietnam also decriminalized drug use (2009) and requires court decisions to send PWID to compulsory centers (2012). Civil society and other stakeholders worked with the Ministry of Labor, Invalids, and Social Affairs (MOLISA) to develop a "Renovation Plan", approved by the Prime Minister in 2013, that recognized drug addiction as a chronic, relapsing condition and committed to a transition from compulsory detention to voluntary, evidence-driven treatment. Timelines and targets for closure of compulsory centers or their conversion to voluntary treatment programs were promulgated. By 2015, the number of compulsory centers was down to 95 and residents to 15,500. SCDI, a local NGO, is working closely with MOLISA to develop in three provinces the voluntary treatment programs called for in the Renovation Plan, training programs on addiction treatment and social work, and a monitoring and evaluation framework for the Renovation Plan.
**Lessons learned:** This experience demonstrates that government is willing to work with civil society and follow evidence to transform substance use treatment, which in turn will strengthen the HIV/AIDS response. However, the transition will be lengthy, with some powerful interests still opposed, and periodic setbacks likely.
**Conclusions/Next steps:** The M&E framework should be implemented so that progress in the transition may be monitored and stakeholders have data to advocate full implementation of the Renovation Plan and ongoing improvement in uptake, quality, outcomes, and cost-effectiveness of voluntary treatment.

## WEPED363

### ADDRESSING THE TREATMENT ACCESS BARRIERS FOR PERSONS LIVING WITH HIV (PLHIVS) IN GOVERNMENT PATIENT SUPPORT CENTERS IN KISUMU COUNTY

E. Oloo
*Youth Arise against HIV/AIDS and TB, Programmes, Kisumu, Kenya*
*Presenting author email: elizabetholoo437@yahoo.com*

**Background:** Incidents of stigma and discrimination among Persons living with HIV accessing care and treatment support at government health facilities has been documented in the Kenya. Research finding indicates that stigma and discrimination has caused PLHIVs to avoid or fear accessing quality HIV care and treatment services, including counseling, prevention and support.
Youth Arise Against HIV/AIDS and TB's advocacy interventions seek to see an improved engagement with the collaborative HIV and TB response to promote human rights and engage in national-level advocacy around rights issues.
**Description:** A half day forum was conducted for selected **30 PLHIVs** who were members of support groups, some of whom are Community Health Volunteers, caregivers, parents and young people that access care at Jaramogi Oginga Odinga Teaching and Referral Hospital (JOOTRH)in Kisumu County. The meeting was convened to discuss and identify issues affecting PLHIV in accessing care at JOOTRH and other different government patient support centers and suggest ways of addressing them. The main objective was to empower everyone involved to ensure they don't infringe right of PLHIVs as they access care , Come up with a report as well as a memorandum to engage Key stakeholders at the Kisumu County Health Ministry in Kisumu County so as to improve services and also come up with ways of addressing it.
**Lessons learned:** The PLHIVs representatives came up with a petition signed with 1000 signatures, which was presented to the Kisumu County MOH that manages the facility. After getting the signed petition, the MOH scrapped off the baseline tests and registration fee that were barring PLHIVs from accessing treatment and also led to high rate of default and none adherence . The MOH and the facilities

representatives decided to engage the PLHIVs representatives to solve the stigma/discrimination that was a fear factor among staff and clients, to engage PLHIVs as peer educators and mentors to enhance Meaningful Involvement of PLHIVs (MIPA) in decision making.
**Conclusions/Next steps:** Initiative to enhance meaningful involvement and participation of PLHIVs should be promoted and supported globally.

## WEPED364

### DELIVERING A HUMAN RIGHTS BASED APPROACH TO ANTENATAL CARE: HEALTH CARE PROVIDERS' EXPERIENCE AND PERCEPTIONS IN CONTEXTS OF HIGH HIV PREVALENCE AMONG PREGNANT WOMEN AND GIRLS

L. Carmody
*Amnesty International, Southern Africa Regional Office, Johannesburg, South Africa*

**Background:** In Southern Africa, HIV-related illnesses are a major cause of death among pregnant women and girls and have exacerbated the region's high rates of maternal mortality. In South Africa nearly 30% of pregnant women and girls are living with HIV, available antiretroviral treatment can improve maternal health outcomes and reduce the risk of mother-to-child transmission. Early access to antenatal care is particularly important in this context. Despite commendable health policies, many pregnant women do not access antenatal care until the latter stage of pregnancy, indicating human rights failures.
A human rights based approach (HRBA) to health care policy development and implementation aims to ensure availability, accessibility, acceptability and quality of services. Health care providers can play a key role.
This study focused on health care providers' experiences and perspectives of delivering antenatal care in settings with high prevalence rates of HIV among pregnant women and girls. It aims to evaluate the challenges of delivering a HRBA to antenatal care.
**Methods:** The primary research relates to a qualitative study, and interviews with 32 health care providers involved in provision of antenatal care services in public primary health care facilities in KwaZulu-Natal and Mpumalanga. Permission for the study was granted the provincial Departments of Health and ethical clearance from the Human Sciences Research Council. The data was analysed on a thematic basis for commonalities.
**Results:** In contexts of high HIV prevalence the lack of privacy, patient confidentiality and informed consent at health facilities, especially in HIV testing during antenatal care may result in delays accessing care; Difficult working conditions for health care providers, including understaffing and lack of human rights training exacerbates challenges in providing care and treatment to pregnant women living with HIV in a manner consistent with a HRBA.
**Conclusions:** Health care providers were supportive of a HRBA but often unable to fulfil requirements without resources and support. In resource scarce setting, a HRBA may lead to small changes in implementation that improve access. Ongoing human rights training for health care providers could assist women and girls at risk of multiple forms of discrimination in accessing essential antenatal services.

# AWARENESS, INFORMATION AND RISK PERCEPTION REGARDING HIV TRANSMISSION AND PREVENTION

## WEPED365

### HEALTH BELIEFS AND HEALTH-SEEKING BEHAVIOR AMONG PRAYER GROUPS IN ACCRA

D.Y. Fiaveh[1], M.P.K. Okyerefo[2]
[1]*Centre for Men's Health and Sex Studies, Accra, Ghana,* [2]*University of Ghana, Legon, Sociology, Accra, Ghana*
*Presenting author email: fiaveh@yahoo.com*

**Background:** Christian faith healing has edged out traditional religious healing due to the rapid growth of Pentecostal-Charismatic churches in Ghana (de Graft Aikins, 2005). The study investigates the religious and health beliefs and practices of prayer groups in Achimota Forest as part of the health-care seeking process, with particular reference to better understanding their knowledge of care-seeking behaviour. Specifically, we identify which types of illnesses are the central concerns of prayer group members, describe the attitudes of prayer group leaders and members towards biomedicine and traditional healers and, determine what type of care, including care-giver prayer groups, these members first turn to when they are sick.
**Methods:** Data was collected by conducting in-depth individual (18) and group interviews (4 with eight people in a group) with 50 interviewees in total. Participant observation was used as well to observe the religious expression of the groups in the forest, which prayer group members believe to be the most ideal space to commune with God.
**Results:** The initial findings show that a disease might have either spiritual or physical origins, they sought both biomedical and spiritual care. Interviewees were convinced that hospitals can help with physical diseases, but spiritual diseases require spiritual solutions such as prayer. HIV/AIDS was given as an example of an illness that could be either physical or spiritual. In terms of spiritually caused HIV/AIDS, according to respondents, test results can change from HIV positive to negative through prayer. In their health beliefs and health-seeking attitudes, prayer group members and their leaders make a salient differentiation between treatment and healing. The interviewees shared in the general belief that doctors can treat certain conditions, but only God heals.
**Conclusions:** The study lends credence to a considerable lack of knowledge or misconceptions about physical causes of illnesses, especially regarding HIV/AIDS. Therefore, we recommend the development of health outreach programmes including public health education. The emphasis here is to alter beliefs and cultural practices of a huge constituency in the field of health care in Ghana.

## WEPED366

### TALKING SEX AND INTERPRETING HIV RISK IN SOUTH AFRICA AND ZAMBIA: AN ANALYSIS OF THE INFLUENCE OF COLLOQUIAL DISCOURSE ON CONCEPTUALISATIONS OF SEX, HIV-RELATED RISK AND STIGMA

A. Thomas[1], G. Hoddinott[1], J. Seeley[2,3], V. Bond[2,4], G. Carolus[1], M. Simuyaba[4], J. Hargreaves[5], L. Viljoen[1], On behalf of the HPTN 071 (PopART) Study Team
[1]*Stellenbosch University, Desmond Tutu TB Centre, Department of Pediatrics and Child Health, Cape Town, South Africa,* [2]*LSHTM, Department of Global Health and Development, London, United Kingdom,* [3]*MRC/UVRI Uganda, Entebbe, Uganda,* [4]*Zambart, Lusaka, Zambia,* [5]*LSHTM, Social Epidemiology and Public Health Evaluation, Department of Global Health and Development, London, United Kingdom*
*Presenting author email: thomasa@sun.ac.za*

**Background:** Speaking about sex is often awkward, and sometimes taboo in many southern African contexts. Colloquialisms are used to create a conversational way for people to talk about sex. We ask, how does the way people talk about sex (using discursive tools like metaphor, idiom, slang, and euphemism) influence the way they think about HIV risk?
**Methods:** In preparation for the HPTN 071 trial, mixed-method qualitative data from 21 urban communities in Zambia and South Africa were collected between December 2012 and May 2013. In each place, semi-structured observations, 130 group discussions (participants = 1107) and 95 interviews were conducted about 'HIV prevention in this community'. Purposive sampling was used to include diverse participants (by gender, age, and role in this community/health system). Narrative analysis was used to identify conceptual themes.
**Results:** As anticipated, participants did not discuss sex openly. Colloquialisms were used to describe sex acts. In turn, this sex 'language' extended into conceptualisations of HIV risk in four ways: (1) Categorical distinctions made between different sex acts facilitate a conceptualisation of HIV risk and stigma that is highly sex act specific. For example, 'thigh sex' is only appropriate with casual partners. (2) Metaphors of sex after succumbing to pressure support conceptualisations of HIV risk as a form of retribution and 'justifies' stigma toward people living with HIV (PLWH). For example, 'stumbling' into infidelity resulting in HIV infection. (3) Language affirming the role of sex in relationships positioned HIV as an 'outside' element that is allegorised as 'seeking to harm' and HIV risk to be pernicious. For example, accusations of PLWH being driven by evil influences to vindictively spread HIV. (4) Euphemisms for PLWH reiterate that the body is damaged (permanently) and strongly emphasizes HIV riskiness and is stigmatising toward PLWH. For example, *gebrokenheid* ('the state of brokenness') is an Afrikaans term sometimes used to describe PLWH and perceived as adversely affecting sexual prowess.
**Conclusions:** Colloquialisms used to talk about sex extend into the way people think about HIV-related risk and are stigmatising toward PLWH (emphasizing vulnerability to retribution and frailty). Public health promotion should engage these colloquial discourses to facilitate messaging comprehension.

## WEPED367

### SEX, MARRIAGE AND HIV RISK: REACHING REGULAR FEMALE PARTNERS OF MSM, TRANSGENDER WOMEN AND HIJRAS TO IMPROVE IMPACT OF INDIA'S HIV RESPONSE, EXPERIENCE FROM PEHCHAN

A. Aher, S. Shaikh, A. Sarkar, R. Sarkar, V. Nair, Rohit Sarkar, Vijay Nair, Sonal Mehta and James Robertson
*India HIV/AIDS Alliance, Programme and Policy, New Delhi, India*
*Presenting author email: aaher@allianceindia.org*

**Background:** The Pehchan programme, implemented by India HIV/AIDS Alliance with support from the Global Fund, has strengthened 201 CBOs and reached more than 430,000 MSM, transgender women, and hijras (MTH) with expanded HIV services. The programme's baseline in 2011 showed that 34% of MTH were legally married to female spouses, and of these MTH, 73% of them lived with their wives. In the 2015 Pehchan Impact Assessment Study, data showed that 50% of MSM studied also have regular or occasional sex with female partners. Only 50% of them reported any condom use with these partners, and consistent condom use was only 41%. Similarly, 65.88% of MTH surveyed had regular sex with male partners, 96% of which was penetrative. Only 77% of them used condoms in their last sexual encounter. Low condom usage, marital status, and relationship issues increase HIV vulnerabilities of MTH and their sexual partners.
**Description:** Pehchan has worked intensively to reach female sexual partners of MTH. 2,679 female partners of married MSM were provided sexual and reproductive health (SRH) services through linkages to Family Planning Association of India (FPAI) clinics, ensuring access to good quality SRH services. Counselling, support groups for married MTH, and focus group discussions with female partners were undertaken. A training module for Pehchan staff on MTH with female partners was developed, along with other IEC materials. A pilot intervention at programme sites in three states helped mitigate and prevent intimate partner violence.
**Lessons learned:** Engaging MTH with female partners has facilitated improved understanding of SRH, fostered higher levels of support for female partners by MTH, expanded uptake of SRH services, increased HIV testing, and reduced partner violence. This approach has proved effective in reducing HIV vulnerability in MTH and their female sexual partners.
**Conclusions/Next steps:** HIV prevention interventions often fail to develop strategies to reach the sexual partners of key populations. The HIV response in India needs to incorporate a more inclusive approach to ensure that interventions address the range of HIV and SRH needs of those at risk for HIV acquisition, both MTH themselves and their sexual partners, including spouses and other female partners.

## WEPED368

### LOVELIFE'S GROUNDBREAKER MODEL: ADDRESSING STRUCTURAL DRIVERS OF HIV AND AIDS AMONG SOUTH AFRICAN YOUTHS

J.F. Mangoma[1], L. Maroo[2], N. Malope[3], P. Magogodi[4], groundBREAKER Evaluation Study Group
*[1]New loveLife Trust, Programme Measurement and Design Department, Johannesburg, South Africa, [2]New loveLife Trust, Executive Management, Johannesburg, South Africa, [3]New loveLife Trust, Schools and Games Department, Johannesburg, South Africa, [4]New loveLife Trust, Psycho Social Support Department, Johannesburg, South Africa*
*Presenting author email: jaqualine.mangoma@lovelife.org.za*

**Background:** loveLife is South Africa's largest national HIV prevention initiative. A nation-wide youth volunteer service corps called groundBREAKERs implements loveLife's various HIV prevention campaigns across the country. Youth leadership and development are at the core of the groundBREAKER programme, which was started in 2001 for South Africans aged 18-25. This paper focuses on evaluations conducted with the 2009, 2010 and 2011 cohorts and seeks to understand the self-reported outcomes and impact of the programme on participants during this period.
**Methods:** The groundBREAKER evaluation model is a non-experimental design that uses a mixed method approach that includes quantitative and qualitative questions. The programme is evaluated at three different stages: a pre-questionnaire, a post-questionnaire and an ex-post questionnaire two years after groundBREAKERS have exited the programme.
**Results:** Both outgoing and alumni respondents hold the groundBREAKER programme in high regard. The data also suggests that alumni have a greater consciousness about their risk of HIV infection and have learned strategies to assist them in modifying their risky behaviour. Perhaps most importantly, groundBREAKERS also reported behaviour that is conducive to risk reduction two years after having completed the programme. A high percentage of respondents reported that they can get their boyfriend or girlfriend to use a condom, even if he/she does not want to: 94% in 2010 and 92.3% in 2011. Approximately eighty percent of alumni respondents from each cohort also reported using a condom the last time they had sex (82.7% in 2009, 79.8% in 2010 and 81.4% in 2011). Further to this, four out of five alumni respondents reported having an HIV test in the past six months which is an indication of regular testing after exiting from the programme. Finally, the fact that the vast majority of alumni respondents from 2010 and 2011 credit loveLife with changing their sexual behaviour (80.8% in 2010 and 92.4% in 2011), should be viewed as a major programmatic achievement.
**Conclusions:** The findings from the evaluations for all three cohorts strongly indicate that the programme has helped loveLife in contributing to the reduction of HIV incidence among young people.

## WEPED369

### KEY DETERMINANTS OF MOTHER TO CHILD TRANSMISSION AMONG WOMEN ON THE EMTCT PROGRAMME IN MASHONALAND EAST PROVINCE

W. Dube
*National AIDS Council, Programmes, Marondera, Zimbabwe*
*Presenting author email: wilfdube@nac.org.zw*

**Background:** The national objective of the elimination of mother to child transmission of HIV in Zimbabwe is to have a transmission rate below 5%. However, in Mashonaland East province transmission rates as high as 11% were recorded in 2015. This study therefore sought to establish the reasons for for such high rates in the province.
**Methods:** A case-control methodology was adopted for the study, whereas cases were defined as any baby testing HIV positive at birth and in neo-natal care; controls were babies born HIV negative at birth and in neo-natal care. Cases and controls were matched on the basis of demographic variables,knowledge about eMTCT, attitude towards eMTCT, health seeking behaviour, and practices during pregnancy and eMTCT. The respondents were HIV positive mothers whose babies tested HIV positive or negative after 6 weeks of birth.The sampling frame was based on the ANC register and the identified participants were to be traced to their communities.
**Results:** A total of 573 questionnaires were received ,and 555 records were considered for analysis as they were more than 80% complete. Of those included for analysis 31.2%transmitted the virus to the child whilst 68.8% did not transmit the virus to the child.The odds of transmitting the virus to those who had booked for ANC were 62% less likely compared to those who did not book for ANC. Those who were tested during pregnancy were 59% less likely to transmit the virus compared to those tested after pregnancy. Those who delivered at home were 2.5 times likely to transmit the virus to the baby compared to those delivered at the clinic and it was statistically significant. Babies who received prophylaxis had 85% less chances of being infected compared to those who did not, and it was statistically significant.
**Conclusions:** The study established HIV transmission among pregnant women in province is a result of HIV positive women delivering at home rather than heath centres, pregnant HIV positive women enrolling late for ANC,failure to get tested for prophylaxis by both mothers and babies, failure to get tested for STIs before and during pregnancy, and failure to adhere to exclusive breastfeeding in neo-natal care.

## WEPED370

### WINNING THE BATTLE AGAINST INVISIBILITY: FEMALE SEX WORKERS ORGANISED FOR CHANGE IN THE HIV RESPONSE APPROACH IN NIGERIA

A. Alban Menkiti[1], A.O. Enemo[2]
*[1]Renewed Initiative against Diseases and Poverty, Management, Abuja, Nigeria, [2]Nigeria Sex Workers Association, Abuja, Nigeria*
*Presenting author email: renagaids@yahoo.com*

**Background:** Past HIV prevention interventions for female sex workers in Nigeria had been organized by others for the community with little attention paid to addressing structural interventions that can create the needed support for HIV response for the Community. Female sex workers realized the need to change the current paradigm of HIV prevention and treatment management for female sex workers and therefore took actions to make the needed changes.
**Methods:** In 2014, Female sex workers in Nigeria took the opportunity created by the Global Fund NFM initiative to organize the first ever national meeting of female sex workers in Nigeria. Discussions at the meeting included the need to self organize to increase access of female sex workers to HIV prevention tools and STI management through demand for drop-in-centres, and how to improve the structural intervention needs of female sex workers by directing national efforts to reduce female sex workers harassments. In addition, strategies to institute safe guard measures for preventing HIV transmission were also highlighted. As a first step, representatives of FSW were charged with the responsibility of organizing focus group discussions at the state level.

**Results:** Thirty focus group discussion meetings were held to step down the outcome of the national meetings to peers. The number of participants at each meeting ranged from 24 to 50. Second, the national executive focused attention on the National stakeholders' and instituted requests for the establishment of drop-in-centres. These demands have resulted in the creation of 24 drop-in-centres in Nigeria. Finally, 125 female sex workers participated in a road show during the 2015 World AIDS Day in Abuja, Nigeria highlighting the needs to respect the rights of female sex workers, and respect their contribution as part of the national workforce in Nigeria.
**Conclusions:** Female sex workers can self-organize if and when given the space. Organizing the female sex worker community in Nigeria would facilitate tailored intervention for the community and make a difference for the national HIV response in Nigeria.

## WEPED371

### FINDINGS FROM A QUALITATIVE EVALUATION OF *INTERSEXIONS II:* CRITICAL ELEMENTS FOR A SUCCESSFUL TELEVISION DRAMA

H. Hajiyiannis[1], L. Myers[1], A. Clarfelt[1], T. Matekane[1], L. Mahlasela[2], R. Delate[2]
[1]*CADRE, Johannesburg, South Africa,* [2]*Centre for Communication Impact, Pretoria, South Africa*

**Background:** The second series of the highly acclaimed South African drama series, *Intersexions,* was broadcast from February to October 2013. The series aimed to show the risks of keeping secrets that can impact on sexual and reproductive health; highlight sexual networks and the concomitant HIV infection risk; emphasise HIV risk reduction practices, and to promote tolerance and acceptance of the lesbian, gay, bisexual, transgender and intersex (LGBTI) community.
**Methods:** Utilising a qualitative approach, 14 focus groups and 12 interviews were conducted with target and secondary audiences in six provinces across South Africa. The objective of the evaluation was to find out what regular audiences thought of the drama and how it was meaningful to them in the context of their own lives.
**Results:** Aspects identified as critical to the success of the drama in having an impact on regular viewers included:
*Realism:* The series was lauded for its astounding realism and was often referred to as a *'reality show'* in the way it *'exactly'* depicted *'the things that you see happen in life'.*
*Critical self-reflection:* Participants reflected on their own relationships and the quality and type of communication they have with their sexual partners.
*Social media: Intersexions* broke new ground in terms of how social media platforms can be strategically used within health communication programmes.
*Interpersonal communication:* Watching *Intersexions* created a space for a new level of openness in a number of participants' family relationships.
*Sexual minorities:* Numerous participants indicated that storylines promoting acceptance of sexual minorities were effective at reinforcing existing positive attitudes or by helping to build greater acceptance of the LGBTI community.
*Behaviour change:* Meaningful self-reported behaviour change as a result of participants' engagement with *Intersexions* included HIV testing, increased condom use, reduction in number of sexual partners and uptake of MMC.
**Conclusions:** The power of mass media to create much needed spaces for interpersonal dialogue and conversation about sexuality, relationships, and HIV prevention is significant. *Intersexions* appears to have broken through the cultured silence about HIV and the *'HIV fatigue'* that often accompanies efforts to raise awareness about HIV prevention, care and support.

## WEPED372

### THE ROLE OF BEHAVIOUR CHANGE COMMUNICATION IN IMPROVING COMMUNITY KNOWLEDGE ON TB AND HIV IN SOUTH AFRICA

L. Legoabe[1], S. Nyathi[1], J. Zingwari[1], R. Matji[1], B. Pearce[2]
[1]*University Research Co., LLC, Pretoria, South Africa,* [2]*Centre for Communication Impact, Johannesburg, South Africa*
*Presenting author email: siphon@urc-sa.com*

**Background:** HIV/ AIDS and TB remains a concern in South Africa, with an estimated 6.8 million people affected by the disease at the end of 2014. South Africa has made significant strides in prevention interventions and improving access to treatment the spread of the epidemic is still of serious concern. The need to increase community knowledge on TB and HIV remain critical to influence factors that lead to individuals making healthy choices.
**Methods:** 'We Beat TB' is a national mass media campaign developed under the USAID TB Program South Africa and continued under the USAID TB CARE II South Africa Project, aimed to improve health-seeking behaviour among South African communities by increasing knowledge on TB and TB/HIV prevention, encouraging early presentation for diagnosis, treatment and treatment adherence. Messages on TB and TB/HIV co-infection were broadcast on national television and radio channels between the years 2010-2013. The 'We Beat TB' campaign included community partnerships to raise awareness on symptoms of TB and HIV, and tested messages were distributed in the form of pamphlets and billboards in area specific language. The campaign was evaluated in 2014 through a Khayabus omnibus survey which sampled 3,598 nationally representative population through in-home face to face Computer Assisted Personnel interview. The survey sample was weighted to the entire adult South African population, aged 15 years and older. A margin error of 1.63% is applicable.
The evaluation assessed the campaign's impact on knowledge, attitudes and behaviours towards testing for HIV and TB.
**Results:** The 'We Beat TB' campaign achieved awareness on TB and HIV information among 45% of the South African population. South Africans who were exposed to the campaign were more likely to remember TB prevention strategies. The campaign successfully motivated behavioural change in that those who recall being exposed to the campaign were more inclined to get tested for HIV and TB.
**Conclusions:** Effective communication campaigns can reach large numbers of people in the population, impact on key health knowledge and health seeking behaviour for better population health outcomes.

## WEPED373

### OPPORTUNITIES AND OBSTACLES FOR PREVENTION AND PSYCHOSOCIAL SUPPORT SERVICES FOR OLDER PERSONS LIVING WITH HIV IN UGANDA

F. Kakembo
*Ndejje University, Research and Community Engagement, Kampala, Uganda*
*Presenting author email: fredkakembo@gmail.com*

**Background:** HIV prevalence among older people (above 50 years) stands at more than 13% of sub-Saharan HIV positive persons. This is attributed to; new infections among elderly, prolonged survival that follow improved treatment (anti-retro-viral therapy); cultural practices including trans-generational sex, polygamy and wife inheritance. Age-related vaginal thinning and dryness among older women increase the risk of infection. The Elderly have inadequate prevention and support services because they are not considered to be sexually active and symptoms of HIV among them are attributed to 'normal aging'.
**Methods:** This study attempted to examine opportunities and obstacles for HIV prevention and psycho-social support services for elderly people. The study depended on secondary data from a longitudinal qualitative study of older people in Uganda infected and affected by HIV. It was embedded within a larger cross-sectional study on indirect and direct effects of HIV for 510 older people living in southern Uganda. Monthly visits for up to 12 months were done to collect an oral diary on each participant's life during the preceding week. For data analysis, standard methods for thematic content analysis were conducted and the NVIVO software was used.
**Results:** Disclosure about HIV by the elderly is hindered by stigma of being associated with HIV; given the esteem associated with being elderly in the African society. While kinship ties that used to be instrumental in the provision of care and support services for elderly are being eroded by increasing mobility and urbanization, opportunities for alternative care-giving schemes exist. The paper discusses these opportunities in light of numerous obstacles which include among others;
1) perceived invulnerability of elderly people to HIV;
2) Messages, formats and media campaigns for HIV prevention that are designed for younger generations.
**Conclusions:** Prevention and psycho-social support services should be age-segmented to;
a) address peculiar needs of various age groups;
b) create awareness that elderly people are equally susceptible to HIV despite their age and status in society.

## HIV COUNSELLING AND TESTING IN HEALTH CARE AND COMMUNITY SETTINGS

### WEPED374

### WORKING TOWARDS INCREASING THE NUMBER OF HIV-INFECTED PEOPLE WHO KNOW THEIR STATUS IN CAPE TOWN SOUTH AFRICA: LEARNING FROM TWO INNOVATIVE COMMUNITY-BASED HIV COUNSELLING AND TESTING STRATEGIES

L. September, M. van Niekerk, S.-A. Meehan
*Desmond Tutu TB Centre, Stellenbosch University, Department of Paediatrics and Child Health, Cape Town, South Africa*
*Presenting author email: leandies@sun.ac.za*

**Background:** South Africa has adopted the UNAIDS goal, which includes 90% of all people living with HIV will know their status by 2020, making HIV testing services essential. Health services cannot test everyone. Community-based HIV counselling and testing (CBHCT) strategies can reach populations who do not typically access health services, e.g. males. This study analysed the routine data collected from two innovative CBHCT strategies, strategically implemented around Cape Town, to increase the number of HIV positive individuals who know their status.
**Methods:** In 2015, the Desmond Tutu TB Centre at Stellenbosch University implemented:
(1) mobile HCT services using tents and a van at a major city transport hub, targeting commuters for "walk-in" services, and
(2) systematic door-to-door mobilization for mobile HCT services in the community, targeting people living in a high HIV/TB burden area. Data was collected between 23 June and 23 September 2015.
All HIV rapid testing was done according to the provincial algorithms. Data was collected in HCT registers and entered into a database for analysis.
**Results:** Of the 3921 clients who attended HCT, 3859 received an HIV test, of which 48% were men. Overall HIV positivity was 7%. Females had a higher positivity (8%) compared to males (5%) across both strategies. The majority of HIV-infected clients (93%) accepted a referral letter to HIV care, irrespective of sex. Linkage to care (LTC) was self-reported by clients that they had attended HIV care at a health facility. LTC was higher for door-to-door mobilization compared to the transport hub for both males (61% and 32% respectively) and females (58% and 44% respectively).

| | Transport Hub (n=1880) | | Door to door mobilization (n=2041) | | Total (n=3921) |
|---|---|---|---|---|---|
| HIV indicators | Males | Females | Males | Females | Total |
| Counselled | 949 (50%) | 931 (50%) | 936 (46%) | 1105 (54%) | 3921 |
| Tested for HIV | 931 (98%) | 907 (97%) | 931 (99%) | 1090 (99%) | 3859 (98%) |
| HIV Diagnosed | 43 (5%) | 77 (8%) | 47 (5%) | 91 (8%) | 258 (7%) |
| Received a referral letter | 41 (95%) | 71 (92%) | 44 (94%) | 85 (93%) | 241 (93%) |
| Linked to care | 13 (32%) | 31 (44%) | 27 (61%) | 49 (58%) | 120 (50%) |

*[HIV outcomes across two innovative community-based HCT strategies]*

**Conclusions:** HIV positivity was higher in both CBHCT strategies compared to the HIV prevalence for the Western Cape Province overall. Innovative and strategically directed CBHCT strategies can increase the number of HIV infected individuals who know their status and can access males, who do not typically access health facilities.

### WEPED375

### HIV TESTING MODELS AND THEIR IMPLICATIONS FOR PATIENT ENGAGEMENT WITH HIV CARE AND TREATMENT ON THE EVE OF "TEST AND TREAT": FINDINGS FROM THE BOTTLENECKS STUDY

A. Wringe[1], M. Moshabela[2], C. Nyamukapa[3], D. Bukenya[4], F. Odongo[5], J. Renju[1], J. Seeley[1], W. Ddaaki[6], K. Church[1], V. Hosegood[7], O. Bonnington[1], for the ALPHA Network
*[1]London School of Hygiene and Tropical Medicine, Population Health, London, United Kingdom, [2]Africa Centre, KwaZulu-Natal, South Africa, [3]Biomedical Research and Training Institute, Harare, Zimbabwe, [4]Medical Research Council, Entebbe, Uganda, [5]KEMRI-CDC, Kisumu, Kenya, [6]Rakai Health Sciences Program, Rakai, Uganda, [7]University of Southampton, Southampton, United Kingdom*
*Presenting author email: alison.wringe@lshtm.ac.uk*

**Background:** In the context of ever-expanding opportunities to undergo HIV testing, we sought to understand the circumstances under which people living with HIV/AIDS (PLHIV) learned their status and considered how these experiences influenced their subsequent engagement in HIV care.
**Methods:** As part of a multi-site qualitative study to understand bottlenecks in HIV care, we conducted in-depth interviews with 5-10 health providers and 20-30 PLHIV in: Uganda, South Africa, Tanzania, Kenya, Malawi and Zimbabwe. Topic guides explored patient and provider experiences of HIV testing and treatment services. Themes were derived through inductive and deductive coding aided by NVivo10. Ethical approval was gained in all countries.
**Results:** In all sites, providers primarily viewed testing as an opportunity for delivering moral messages regarding sexual behaviours and expectations of HIV clinic use. In contrast, PLHIV were rarely motivated by the opportunity to gain health workers' advice, but rather wanted to "check" or "know" their status, particularly if they were ill, or perceived themselves at risk from a partners' known or unknown status and sexual behaviours.
HIV testing through provider-initiated models was generally appreciated by PLHIV, but was rarely perceived as a choice, and there were instances of coercion including excessive insistence on "counselling until acceptance", testing without consent or withholding further medical attention. Responses to "submission" during the testing process included subsequent disengagement from the HIV care process.
Repeat testing was common, even among those already diagnosed, and could be provider or patient-initiated. Providers rarely accepted documented test results from other facilities. Some patients re-tested because of doubts over the accuracy of prior test results, or over the persistence of HIV infection after treatment initiation. However both cases represented an opportunity to develop familiarity with clinic and testing procedures, as well as to build mutual trust with health workers.
**Conclusions:** Opt-out clauses in provider-initiated testing must be respected. Provider-initiated re-testing suggests missed opportunities for communication between service providers. Patient-initiated testing and re-testing represented an enactment of agency in the context of uncertain risks, which was often more important in promoting acceptance of an HIV diagnosis and facilitating engagement with long-term care than the moral messages delivered by counselors.

### WEPED376

### FORMATIVE RESEARCH AS A TOOL TO ADDRESS ETHICAL CONCERNS DURING A FAMILY-BASED HOME-BASED COUNSELLING AND TESTING (FBCT) INTERVENTION DEVELOPMENT PROCESS IN KWAZULU-NATAL

N.L.E. Ngcobo[1], Z. Essack[1], N. Gillespie[1], L. Knight[2], T. Rochat[1], H. van Rooyen[1]
*[1]Human Sciences Research Council, Human and Social Development, Pietermaritzburg, South Africa, [2]University of Western Cape, School of Public Health, Cape Town, South Africa*
*Presenting author email: nngcobo@hsrc.ac.za*

**Background:** Conducting formative research is a scientific, ethical and community engagement imperative. This paper discusses formative data on the perspectives of key informants and community stakeholders regarding a family-based home based counselling and testing (FBCT) intervention. We draw on a popular ethical framework for research in developing contexts (Emanuel et al., 2004) to analyse these perspectives.
**Methods:** In-depth interviews were conducted with 20 key informants and 20 community stakeholders to explore their perspectives on components of the FBCT model, potential implementation challenges, possible barriers or facilitators to uptake, potential social harms and ethical issues when working with children and families. Respondents were purposively selected to include key informants with extensive knowledge and/or experience of the topic and community stakeholders who previously participated in a HBCT intervention, or from existing social and community networks in the area. Data were analysed thematically using NVivo software.
**Results:** The formative research identified areas of support and concern regarding the FBCT intervention. Following Emanuel and colleagues these can be clustered according to eight key ethical benchmarks: collaborative partnerships, social value, scientific validity, favourable risk/benefit ratio, informed consent, independent review, fair selection of participants, and on-going respect for participants. Respondents raised concerns about confidentiality of their HIV results which relates to the principle of on-going respect. Concerns that adolescents will be coerced to test for HIV relates to informed consent, and fears of disclosure to family members and the broader community relate to risk-benefit considerations. Respondents reported potential positive outcomes of the intervention including enabling families to access a service at home rather than a clinic (risk-benefit ratio) and improved opportunities for disclosure (social value). This data was used to refine the intervention and address stakeholders' concerns by engaging the community, training intervention staff on ethics, and incorporating independent consent mechanisms for adolescents that recognises their legal right to independent testing but allows opportunities for family-based testing and disclosure.
**Conclusions:** Formative data assisted the research team to address concerns prior to piloting the FBCT model, and to address family, socio-cultural and community factors that may impact the effective delivery of a FBCT intervention.

## WEPED377

### PEER COUNSELLING TO IMPROVE PLHIV ACCESS AND ADHERENCE TO CARE AND TREATMENT: EXPERIENCE FROM THE VIHAAN PROGRAMME IN INDIA

J. Nirmali, N. Mazumder, V. Arumugam, R. Chauhan, H. Rosenara, S. Mehta, J. Robertson
*India HIV/AIDS Alliance, Delhi, India*
*Presenting author email: jnirmali@allianceindia.org*

**Background:** The estimated PLHIV population in India is 2.1 million (NACO 2015). Access and adherence to care and treatment services remain a challenge for people living with HIV (PLHIV) due to associated stigma and discrimination. India HIV/AIDS Alliance implements the Global Fund-supported Vihaan care and support programme for PLHIV to increase treatment adherence, reduce stigma and improve access to services.
**Description:** Vihaan has established 350 Care & Support Centres (CSC) across India. Counselling services are provided through CSCs to encourage access to care and treatment services for PLHIV. The CSC counselling is done by both technical and peer counsellors. 349 peer counsellors across India have been trained to support PLHIV to access family testing, treatment and health services. Peer counsellors also counsel PLHIV on opportunistic infections (OI) management, sexual and reproductive health and rights, positive prevention, nutrition and family planning.
**Lessons learned:** A total of 872,582 PLHIV are registered in CSCs, of whom 76% (669,661) received counselling from peer counsellors in 974,495 counselling sessions. Peer counsellors function as a bridge between clients and the technical counsellor, linking PLHIV to the services they need. They also act as role models and positive speakers, which also helps to encourage affirmative health seeking behaviours among PLHIV. Along with peer counselling, 171,937 PLHIV were linked for OI management counselling, 57,018 for partner testing counselling, and 387,872 for ART adherence counselling with the technical counsellor.
**Conclusions/Next steps:** Vihaan's strategy of engaging PLHIV community members as peer counsellors has proven to be successful in improving client access to care and treatment services. The peer-counselling strategy, complementary to technical counselling, should therefore be continued and expanded in other community-based interventions for PLHIV to improve access, adherence and overall well-being.

## WEPED378

### PROMOTING VOLUNTARY COUNSELING TESTING ON HIV: A COMMUNITY AND WORKPLACE OUTREACH STRATEGY

P.C. Romao[1], R. Ameur[2], S. Mabhele[3]
*[1]ILO, ILO/AIDS, Maputo, Mozambique, [2]Internaitonal Labour Organization, Pretoria, South Africa, [3]International Labour Organization, Pretoria, South Africa*
*Presenting author email: promaomoz@yahoo.com.br*

**Background:** Mozambique is one of the ten countries most affected by the HIV epidemic, with prevalence rates of approximately 11.5% among the adult population. While there has been an increase in the number of people tested, according to the 2014 Global AIDS Response Progress Report, as of 2011, more than 75% of Mozambican men aged 15-49 were unaware of their HIV status, compared with 55% of Mozambican women of corresponding age[1].
**Description:** To contribute to filling the testing gap, ILO launched the global VCT@Work initiative, which aims to increase the demand for voluntary confidential HIV testing among workers and their families, to facilitate their access to HIV services, including testing and treatment.
In order to ensure increased uptake of VCT, the VCT@Work initiative builds on partnerships with different actors from the public and private sectors, such as:
- The Business Coalition on HIV and AIDS (ECoSIDA); the Mozambique Railway Company (CFM);
- The sugar industry;
- The Mozambique Airlines;
- The Ministry of Health, through the Provincial Directorates;
- The National AIDS Council (NAC);
- The Ministries of Transport and Labour;
- Civil society organizations (including women's organizations (*Associação Avante Mulher*) and service providers (*Associação para a Defesa da Familia (AMODEFA)*) and the *Centro de Desenvolvimento Comunitário*, a local non-governmental organization.

For this end, 130.000 workers and community members from 2014 to 2015 have been voluntarily tested under the VCT campaign with the HIV positive people having been referred to the health system for follow up. Therefore, 57.000 men and 43.000 women have been tested and there were recorded 3.230 men had positive status and 3100 women from workplace and community level have tested positive and then referred.
**Lessons learned:** Using the workplace as an entry point to create demand for VCT is an effective vehicle to reach workers with HIV services. This strategy also expands health services to the communities surrounding the workplace. The VCT@Work initiative has increased the demand for testing at community and workplace levels.
**Conclusions/Next steps:** ILO will continue to promote public-private partnerships to reach more workers and their families with VCT services.

# ACCEPTABILITY AND IMPACT OF PROMOTING ABSTINENCE, MONOGAMY AND/OR SEXUAL FIDELITY

## WEPED379

### UNDERSTANDINGS OF SEXUAL FAITHFULNESS AND RELATIONSHIP SATISFACTION AMONG MEN AND WOMEN IN PERI-URBAN UGANDA

A. Ruark[1], P. Kajubi[2], S. Ruteikara[3], N. Hearst[4], E. Green[5]
*[1]Brown University, Medicine, Providence, United States, [2]Makerere University School of Medicine, Child Health and Development Centre, College of Health Sciences, Kampala, Uganda, [3]Anglican Church of Uganda, Kampala, Uganda, [4]University of California, Department of Family and Community Medicine, San Francisco, United States, [5]George Washington University, Anthropology, Washington, United States*
*Presenting author email: ahruark@gmail.com*

**Background:** While Uganda has had well-recognized success in reducing HIV transmission nationally, HIV prevalence in urban areas remains high (8.7% in the 2011 AIDS Information Survey). Men and women living in high-density, low-income, peri-urban areas may be particularly likely to engage in multiple and concurrent sexual partnerships and other high-risk sexual behaviors which put them at risk of HIV infection. Effective HIV prevention among married and cohabiting couples remains a challenge. Increasing couple relationship quality may decrease HIV risk behaviors such as multiple and concurrent sexual partnerships and increase protective behaviors such as mutual HIV testing and disclosure.
**Methods:** As part of a couple-focused HIV prevention intervention in peri-urban Kampala (which aimed to decrease HIV risk through strengthening couple relationships and increasing sexual faithfulness), single-gender focus group discussions were held to explore issues of couple relationship quality and satisfaction. A total of 39 men and 50 women participated in 8 focus group discussions. All participants were between the ages of 20 and 49 and were married or cohabiting.
**Results:** Men and women presented diverse opinions on the degree to which couples were satisfied in their relationships, although there was consensus that many couples were not satisfied and that this lack of satisfaction drove men and women to seek other (concurrent) sexual partners. Common relationship problems included financial issues, lack of sexual satisfaction (for men and women), and domestic violence. Participants reported that while some couples decided to stay together because they had children together, relationships were often characterized by deception, secrecy, and a lack of trust and positive communication. Having outside (concurrent) sexual partnerships was felt to be common, and to often lead to the ending of a relationship. Participants were aware that multiple and concurrent sexual partnerships increased risk of HIV and other STIs, and some mentioned fear of HIV, STIs, and pregnancy as reasons to be faithful to a sexual partner.
**Conclusions:** These data demonstrate the need for couples-focused HIV prevention interventions, particularly those which help men and women to develop relationship skills and build more mutually satisfying and faithful relationships.

# CONDOM AND LUBRICANT AVAILABILITY, ACCESSIBILITY, DISTRIBUTION AND/OR SOCIAL MARKETING

## WEPED380

### ENSURE KEY POPULATION GET ACCESS TO CONDOMS AND LUBRICANT

S. Nou
*Population Services Khmer, Communication, Phnom Penh, Cambodia*
*Presenting author email: nsovann@psk.org.kh*

**Background:** Despite an overall decline in HIV prevalence among adults aged 15-49 years (from 2% in 1998 to 0.7% in 2013[1]) in Cambodia, prevalence remains high among members of Key Population (KPs): female entertainment workers (FEWs), men who have sex with men (MSM), transgender people (TG), and people who in-

Author Index

ject drugs (PWID). In Cambodia, the most common mode of transmission for HIV is unsafe sex. HIV prevalence was estimated at 14% among FEWs, 2.1% among MSM was and 2.6% among TG[2]. All populations report low condom use, especially with a regular partner: 36.1% among FWEs, 77.4% among MSM and 79% among TG[3]. A high-risk venue (HRV) is a venue where sex among KPs and partners is negotiated and may take place. The proportion of HRV that sells condoms on-site remains low. Based on geographic information system (GIS) data, 26% of HRV have condoms available on-site.

**Description:** To avoid new infections and reduce HIV risk, PSK provides technical assistance to socially market HIV prevention products, aiming to increase visibility and availability of condoms and lubricant among KPs in high-risk venues. A "peer to peer sale approach strategy" has been employed by PEPFAR/USAID-funded Flagship program to implement on-site peer marketing of condoms and lubricants.

**Lessons learned:** PSK works with 5 Centres of Excellence (CoE) in three provinces to implement this strategy and ensure product availability for KPs. From December 2013 to September 2014, 1,507,680 Condoms were distributed to KPs. Of these, 85% were sold through peer-to-peer sales inside HRV and 15% were distributed for free by CoE during outreach sessions. Peer-to-peer sales strategy led to constant condom availability in locations accessible to KPs, and motivated the people selling them.

**Conclusions/Next steps:** The success of this innovation was recognized, and it has been replicated as a core activity in the National HIV/AIDS strategic plan for 2014-2020 under the prevention package. Additionally, it has been replicated under the Global Fund's New Funding Model.

## SEROADAPTIVE BEHAVIOURS: PREFERENCE, PRACTICE AND IMPACT

### WEPED381

#### FACTORS ASSOCIATED WITH HIV-POSITIVE AND HIV-NEGATIVE PREGNANT WOMEN DISCLOSING THEIR HIV TEST RESULT TO THEIR PARTNER IN TABORA, TANZANIA

G. Mbita[1], G. Antelman[1], R. van de Ven[1], P. Njau[2], G. Woelk[3]

*[1]Elizabeth Glaser Pediatric AIDS Foundation, Dar es Salaam, Tanzania, United Republic of, [2]Ministry of Health, Community Development, Gender, Elderly and Children, Dar es Salaam, Tanzania, United Republic of, [3]Elizabeth Glaser Pediatric AIDS Foundation, Washington DC, United States*

*Presenting author email: gmbita@pedaids.org*

**Background:** HIV testing during pregnancy is almost universally available and accepted now and recently, Tanzania adopted targeted universal ART including discordant couples. Understanding factors associated with HIV status disclosure among HIV-positive and HIV-negative women is essential to effectively enroll discordant couples into HIV prevention and treatment services.

**Methods:** EGPAF is studying the effect of SMS appointment reminders and cash transport payments on clinic attendance and facility-based delivery for HIV-positive and HIV-negative women, and HIV testing of exposed infants. Multivariate regression analysis of baseline data (n=1149) identified factors associated with HIV status disclosure to a partner. Inclusion criteria included pregnant women (>=18 years) attending antenatal care who had at least one prior pregnancy.

**Results:** The mean age of participants was 27 years; 86% were married; 46% were HIV-negative, 29% were known HIV-positive, and 25% were newly identified HIV-positive. The prevalence of partner disclosure was 58% overall (48% among HIV-negative; 66% among HIV-positive). In multivariate analysis, partner disclosure was more likely among women with known positive status (adjusted odds ratio [AOR]=10.5, 95% CI: 6.2,17.8) or newly diagnosed positive status (AOR=1.8, 95% CI: 1.2,2.8) compared to those testing HIV-negative. Women whose health care was usually decided by others (AOR=1.8, 95% CI: 1.1,2.8) were more likely to disclose compared to women who decided themselves. Disclosure was positively associated with being married (AOR=4.0, 95% CI: 1.9,8.1) or cohabiting (AOR=2.9, 95% CI: 1.4,5.9), and negatively associated with having a partner with some education (AOR=0.69, 95% CI: 0.50,0.95). Compared to women who knew their partner was negative, women with known positive partners were more likely to disclose HIV status (AOR=3.4, 95% CI: 2.0,5.9) while those who did not know their partner's status were less likely to disclose HIV status (AOR=0.08, 95% CI: 0.05,0.15).

**Conclusions:** Disclosure is more common among pregnant women who are HIV-positive, rely on others for health care decisions and know their partner is HIV positive. The lower rates of disclosure among HIV-negative women suggest that lack of open communication about HIV risk and HIV status may limit identification of discordant couples; service providers should strengthen and update communication-relevant key messages into post-test counseling for those testing negative.

## ACCEPTABILITY AND UPTAKE OF VOLUNTARY MEDICAL MALE CIRCUMCISION

### WEPED382

#### LOW UPTAKE OF VOLUNTARY MEDICAL MALE CIRCUMCISION (VMMC) AMONG HIGH-RISK MEN IN MALAWI

M.A. Carrasco[1], T.Q. Nguyen[2], F. Genari[3], M.R. Kaufman[2]

*[1]United States Agency for International Development, Office of HIV/AIDS, Washington DC, United States, [2]Johns Hopkins Bloomberg School of Public Health, Health, Behavior and Society, Baltimore, United States, [3]George Washington University, Milken Institute School of Public Health, Washington, United States*

*Presenting author email: floriza.genari@gmail.com*

**Background:** Among 14 priority countries identified by the World Health Organization for voluntary male medical circumcision (VMMC) scale up, Malawi is among those with the lowest VMMC uptake, indicating an urgent need to increase VMMC demand to enhance HIV epidemic control. This study analyzes the HIV risk profile of men accessing VMMC services in Malawi to provide local demand creation programs crucial information to increase uptake.

**Methods:** Using latent class analysis, we evaluated the risk profile of 269 men (16 years and older) accessing VMMC services in three districts in southern Malawi and examined any differential VMMC uptake by class membership. Classes were defined based on four HIV risk factors: ever tested for HIV, condom use at last sex, having casual or concurrent sexual partners in the previous three months, and using alcohol before sex in the previous three months. Poisson regression was used to determine if being in the high risk group was associated with specific socio-demographic characteristics, including education, age, marital status, religion, district, and location (urban/rural).

**Results:** Two distinct classes were identified: high and low/medium risk. Only 8% men in the sample were high risk while 92% were low/medium risk. Results also indicate that men who have a lower level of education (Risk Ratio [RR]: 0.934, p<0.05) and are in the 19-26 age group (compared to 16-18 age group) (RR: 1.076, p<0.05) are more likely to be in the high risk group than in the low/medium risk group.

| Risk factors | Class 1, Low/medium risk | Class 2, High risk |
|---|---|---|
| Class prevalence | 0.92 | 0.08 |
| Estimated number in each class | 248 | 21 |
| **Probabilities of risk behaviors given class membership** | | |
| 1. Never been tested for HIV | 0.32 | 0.29 |
| 2. No condom use at last sex | 0.79 | 0.43 |
| 3. Casual or concurrent partners (prev. 3 mn.) | 0.08 | 1.00 |
| 4. Alcohol use before sex (prev. 3 mn.) | 0.06 | 0.47 |

*[Probability of risk factor given class membership]*

**Conclusions:** Findings highlight the importance of understanding the risk profile of men accessing VMMC to design more targeted VMMC demand creation programs. The results indicate a need to implement specialized strategies to improve VMMC uptake among men in the high risk group, who only comprise 8% of those accessing VMMC and who are more likely to be in the 19-26 age group and have a lower level of education.

### WEPED383

#### CORRELATES OF CONDOM USE AND PROCEDURE KNOWLEDGE AMONG MEN ACCESSING VOLUNTARY MEDICAL MALE CIRCUMCISION IN MALAWI

M.A. Carrasco[1], V. Wong[2], K. Ahanda[3], M.R. Kaufman[4]

*[1]United States Agency for International Development, Office of HIV/AIDS, Washington DC, United States, [2]United States Agency for International Development, Office of HIV/AIDS, Washington, United States, [3]United States Agency for International Development (USAID), Office of HIV/AIDS, Washington, United States, [4]Johns Hopkins Bloomberg School of Public Health, Health, Behavior and Society, Baltimore, United States*

*Presenting author email: vwong@usaid.gov*

**Background:** Research about voluntary medical male circumcision (VMMC) in sub-Saharan Africa has focused on cost effectiveness analyses, service quality, and factors influencing uptake and scale-up. There is a dearth of information about the HIV risk taking behaviors of men accessing VMMC and their HIV knowledge. This study aimed to analyze the VMMC knowledge and condom use correlates among men ac-

cessing VMMC services in Malawi to understand their demographic characteristics and HIV risk profile to provide insights into how to better target communication efforts to improve uptake of VMMC in a country that has had very low VMMC uptake since scale up efforts started in 2011.
**Methods:** In August 2013, 269 men ages 16 or older accessing VMMC were recruited at service sites in Southern provinces in Malawi. Bivariate and multivariate logistic regressions were used to determine associations and the relative odds of condom use at last sex and VMMC knowledge. Correlates tested included: education, age, location, religion, marital status, ever tested for HIV, having casual or concurrent sexual partners, and alcohol use before sex.
**Results:** Multivariate analysis revealed condom use was associated with having a casual/concurrent partner in the previous 3 months (Adjusted OR [AOR]: 2.54, CI: 1.15 - 5.60), being single (AOR: 0.40, CI: 0.20 - 0.81), and being 27 or older (AOR: 0.28, CI: 0.10 - 0.75). VMMC knowledge was associated with education (AOR: 2.08, CI: 1.21 - 3.55) and location (AOR: 2.73, CI: 1.620 - 4.587), with men with higher education levels and living in urban areas more likely to know that VMMC partially protects against HIV compared to counterparts.
**Conclusions:** Results highlight the need to ensure information about VMMC is appropriate for men with a low level of education and living in rural areas. Results also suggest men exhibiting low HIV risk behavior may be accessing VMMC more than men with high-risk behaviors. Further research is needed to understand the HIV risk profile of men accessing VMMC and the reasons why men who do not know VMMC partially protects against HIV are accessing the service as this will provide information to inform efforts to increase uptake.

## WEPED384

### Demographic, socioeconomic, behavioural and psychosocial determinants of willingness to circumcise among men in Botswana

E. Ngome, K. Mumba
*University of Botswana, Department of Population Studies, Gaborone, Botswana*
*Presenting author email: enock.ngome@gmail.com*

**Background:** Botswana remains one of the countries most affected by the HIV/AIDS epidemic. Almost all the HIV infections in Botswana are through heterosexual intercourse. In addition to adopting encouraging use of condoms, sticking to one partner and abstaining from sexual intercourse as preventive measures of HIV against sexual HIV infection, Botswana recently promoted male circumcision as recommended by the World Health Organization (WHO). However, the uptake of male circumcision in Botswana has been sluggish. This paper investigates the demographic, socioeconomic, behavioural and psychosocial factors associated with willingness to circumcise among men aged in Botswana with the intention to guide the HIV/AIDS prevention efforts.
**Methods:** The study uses a sample of 2565 males aged 10 to 64 years who reported to have not circumcised using data from the Botswana AIDS Impact Surveys 2013 (BAIS IV 2013). The outcome variable for the study was whether males were willing to circumcise during the next 12 months. A total of six logistic regressions models were employed to determine factors associated with willingness to circumcise.
**Results:** Out of the 2565 males who were not circumcised, 45% had intentions of circumcising during the next 12 months from the time of the survey. Findings from the logistic regression analysis revealed that demographic and socioeconomic factors such as age, marital status and level of education were important predictors of willingness to undergo circumcision. Those aged 30 years and above were more than twice as likely to be willing to circumcise during the 12 months after the survey as those aged 10 to 19 years. The never married were less likely to be willing to undergo circumcision (Odds ratio, 0.79) than the ever married. Those with tertiary education were 1.4 time more likely to be willing to undergo circumcision as compared to those with primary education and below. Behavioral and psychosocial factors considered were not statistically associated with willingness to circumcise.
**Conclusions:** In order to increase the uptake of male circumcision in Botswana, promotion of male circumcision strategies should target the young, the never married and those with secondary education or less to increase their likelihood of male circumcision.

# Initiation, deferral and interruption of antiretroviral treatment, including treatment as prevention

## WEPED385

### Fear and transformation: giving social meaning to the barriers and facilitators of engagement in HIV care in Zambia

S.M. Topp[1,2], C. Mwamba[2], L.K. Beres[3], N. Padian[4], I. Sikazwe[2], E.H. Geng[4], C.B. Holmes[2,3]
*[1]James Cook University, College of Public Health, Medical and Veterinary Sciences, Townsville, Australia, [2]Centre for Infectious Disease Research in Zambia, Lusaka, Zambia, [3]Johns Hopkins University, School of Public Health, Baltimore, United States, [4]University of San Francisco, San Fransisco, United States*
*Presenting author email: globalstopp@gmail.com*

**Background:** Zambia has implemented rapid and widespread roll-out of life-long, free HIV care and treatment (C&T) since 2005. Despite this success, large numbers of people living with HIV (PLHIV) are known to have left or 'disengaged' from care. Nested within a 4-province study of care and treatment outcomes and recognising the dynamic role of social and service-related factors, this research examined how and why Zambian PLHIV engage and disengage from care.
**Methods:** In-depth interviews were conducted with a stratified random sample of 75 adults across five patient categories: engaged in-care, pregnant in-care, disengaged, facility transfer, friend/family of deceased patient. Sixteen focus group discussions were also convened with lay and professional health workers serving the same catchment areas. Audio transcripts were translated, transcribed and uploaded to Nvivo QSR™ for thematic analysis incorporating inductive and deductive coding.
**Results:** Severe ill-health and transformative effects of antiretroviral therapy were powerful motivators for starting and remaining in HIV-care. However, the significance of physical recovery and associated motivation to remain in care were consistently described in terms of their social implications; i.e. how they helped PLHIV resume and sustain their role as healthy, productive members of society. Barriers to engagement were also framed in terms of social meaning, especially, self- and community-stigmas that branded people accessing HIV-care (and thus visible to the community) as 'immoral' and 'dependent'. Particularly in the absence of a 'lazarus-like' recovery (e.g. for pre-ART or antenatal clients) such stigmas fed PLHIV's perception of their own social isolation and decisions to disengage. (In)sensitive or (in) convenient service-delivery were frequently reported, but were typically described as reinforcing - versus determinative - factors.
**Conclusions:** The social implications of engaging or not engaging in HIV-care remain central to Zambian's HIV treatment decisions. More focus must be placed on social programs and policies targeting local communities' understandings of HIV and HIV-care, in order to counter negative perceptions and the associated social pressures to disengage from treatment.

## WEPED386

### Use and non-use of antiretroviral treatment among people living with HIV in Australia between 1997 and 2015

J. Power, A. Lyons, G. Brown, G. Dowsett, J. Lucke
*La Trobe University, The Australian Research Centre in Sex, Health and Society, Melbourne, Australia*
*Presenting author email: jennifer.power@latrobe.edu.au*

**Background:** Current international targets aim for 90% of people diagnosed with HIV to be on antiretroviral treatment (ART). Australia is a high income country in which most people living with HIV have access to affordable healthcare and ART. Despite this, recent national surveillance data indicate that 23 to 30 per cent of Australians living with HIV are currently not using ART. The aim of this paper was to identify socio-demographic and attitudinal factors associated with ART non-use over time in four samples of Australian people living with HIV.
**Methods:** Data for this paper were derived from a cross-sectional survey of PLHIV repeated at four time points: 1997, 2003, 2013 and 2015. There were approximately 1,000 respondents to each survey. The survey included close to 250 items related to health, wellbeing, ART use, and attitudes toward ART use. Univariate and multivariate logistic regression analysis were used to examine factors associated with ART non-use.
**Results:** ART use in the 2015 sample approximated the international target of 90%. There was a significant decrease in ART use between 1997 and 2003, followed by an increase between 2003 and 2015. Factors associated with ART non-use were consistent across all cohorts. People less likely to be using ART were younger (all cohorts), diagnosed with HIV for a shorter period, working full time and reporting salary, rather than social security, as their main source of income (2003, 2012). Multivariate models showed that, over the 18 years covered by these data, belief in the health benefits of delayed ART uptake was associated with non-use.

Tuesday 19 July

Wednesday 20 July Poster Exhibition

Thursday 21 July

Friday 22 July

Late Breaker Posters

Author Index

**Conclusions:** ART use among PLHIV in Australia is close to international targets. However, these findings suggest that a belief in the health benefits of delayed ART uptake has persisted among non-users since the 1990s and may be a factor preventing more widespread uptake, particularly among younger, newly diagnosed PLHIV.

## WEPED387

### POWER, AGENCY AND CHOICE: PEOPLE LIVING WITH HIV'S INITIATION OF EARLY ANTIRETROVIRAL THERAPY IN THE CONTEXT OF PRACTITIONER-PATIENT RELATIONSHIPS IN SHISELWENI, SWAZILAND

S. Horter[1,2], A. Wringe[2], V. Dlamini[1], B. Kerschberger[1], S. Mazibuko[3], B. Rusch[4]
*[1]Médecins Sans Frontières, Research Team, Nhlangano, Swaziland, [2]London School of Hygiene and Tropical Medicine, London, United Kingdom, [3]Swaziland National AIDS Programme, Ministry of Health of Swaziland, Mbabane, Swaziland, [4]Médecins Sans Frontières, Geneva, Switzerland*
*Presenting author email: shona.horter@lshtm.ac.uk*

**Background:** The World Health Organisation now recommends immediate antiretroviral therapy (ART) initiation after a HIV diagnosis for all adults, following evidence of associated health benefits and transmission reduction. Swaziland is one of the first countries to pilot early access to ART (EAA) for all adults diagnosed with HIV under routine programme conditions. A qualitative study was conducted to explore people living with HIV's (PLHIV) experiences with EAA in Shiselweni, Swaziland.
**Methods:** Médecins sans Frontières and the Swaziland Ministry of Health started EAA in Shiselweni in October 2014. Participants were recruited purposively from the pilot cohort, to include those otherwise ineligible for ART (e.g. with CD4 counts above 350), and those who had, and had not, initiated ART. 15 in-depth interviews were conducted with individuals newly diagnosed with HIV. Interview transcripts were analysed thematically using coding, with constant comparison of patterns and concepts within and between cases, and discrepancies from majority themes were actively sought. Nvivo 11 aided analysis.
**Results:** Participants described the need to 'surrender to' and 'obey' the 'law' of health services, demonstrating subservience in their relationships with providers. There was an expectation that patients should follow health advice as prescribed, with the 'experts' being deemed as responsible for patients' lives. As a result, patients generally exhibited limited autonomy regarding the decision to initiate early ART, with some wanting to do as they were advised, as well as some feeling unable to refuse ART. However, patients' agency could break the bounds of these typically hierarchical practitioner-patient relationships, and some participants would exert their resistance of this power, for example by reportedly agreeing to initiate ART to providers and then not taking the drugs.
**Conclusions:** The power dynamics within practitioner-patient relationships can undermine patients' autonomy in deciding whether to initiate early ART. Some patients bow to the EAA rules and expectations, with many initiating early ART accordingly; and others demonstrate ways to resist them. Further research among those who initiate early ART is needed, to explore how these issues will influence their on-going engagement with treatment and care over time.

# INTEREST IN AND EXPERIENCE OF USE OF PRE-EXPOSURE PROPHYLAXIS OR POST-EXPOSURE PROPHYLAXIS

## WEPED388

### INTENTION TO LEARN MORE ABOUT PRE-EXPOSURE PROPHYLAXIS AMONG VIEWERS OF TIME2PREP: AN ONLINE VIDEO CAMPAIGN SERIES TO INCREASE INFORMATION-SEEKING AMONG MEN WHO HAVE SEX WITH MEN IN NEW YORK CITY

A. Grosso[1], D. Bermudez[1], K. Shults[2], R. Scheinmann[1], M.A. Chiasson[1]
*[1]Public Health Solutions, Research and Evaluation, New York, United States, [2]Connected Health Solutions, Brooklyn, United States*
*Presenting author email: grossoas@gmail.com*

**Background:** In New York City (NYC), men who have sex with men (MSM) accounted for more than half of 2,718 newly-identified HIV infections in 2014. Despite the efficacy of pre-exposure prophylaxis (PrEP) for HIV prevention, in New York state (where half of people living with HIV are insured through Medicaid) only 1,330 people filled Medicaid prescriptions for PrEP from 7/2014-6/2015. Barriers to uptake include stigma and lack of information. Online video-based interventions have effectively addressed other HIV prevention behaviors among MSM and are a promising avenue for promoting critical thought and follow up.
**Methods:** We developed an online video campaign (Time2PrEP) to increase information-seeking about PrEP among NYC MSM. The videos were marketed through Facebook, Twitter, Instagram, Black Gay Chat, and Scruff and highlighted in publications including Towleroad, OUT Magazine, The Advocate, HIV PLUS Magazine, Manhunt Blog, and The Huffington Post. Individuals who watched one or more videos on www.hivbigdeal.org could complete a questionnaire in SurveyGizmo. We used Stata SE/14.1 and bivariate logistic regression to assess correlates of intention to get more information about PrEP after watching the video(s).
**Results:** The videos were viewed 52,586 times on YouTube, including 5,804 from www.hivbigdeal.org from 11/2015-1/2016. The majority of the 156 survey participants identified as white (60%), male (94%), and gay (76%). Many (48%) said they definitely would seek more information about PrEP after watching the videos. Under one quarter (24%) had ever used PrEP, but they were more likely to want more information about PrEP (OR:2.34, 95% CI:1.08-5.06). One third (33%) said they would definitely start or continue using PrEP in the future, and this group had higher odds of planning to seek more information (OR:10.08, 95% CI:3.20-31.72). Those who would like their sexual partner(s) to use PrEP (66%) were also more likely to report information-seeking intentions (OR:6.32, 95% CI:1.30-30.77). African American participants (22%) were more likely to want to get more information about PrEP than participants of other races (OR:2.21, 95% CI:1.02-4.80).
**Conclusions:** The popularity of the Time2PrEP video series and self-reported intention to seek more information among viewers shows that this type of intervention is a promising tool for HIV prevention.

## WEPED389

### "COMO CONEJILLO DE INDIAS": CRITICAL ROLE OF MEDICAL AND RESEARCH MISTRUST IN ACCEPTABILITY OF PREP AMONG TRANSGENDER WOMEN IN LIMA, PERU

A. Perez-Brumer[1], X. Salazar[2], A. Silva-Santisteban[2], S. McLean[3], J.C. Prenner[3], J.R. Lama[4,5], J. Sanchez[4,5], M.J. Mimiaga[3,6,7], S.L. Reisner[3,6], K.H. Mayer[3], J.L. Clark[8]
*[1]Columbia University Mailman School of Public Health, New York, United States, [2]Universidad Peruana Cayetano Heredia, Lima, Peru, [3]The Fenway Institute, Fenway Health, Boston, United States, [4]Asociación Civil Impacta Salud y Educación, Lima, Peru, [5]University of Washington, Department of Global Health, Seattle, United States, [6]Harvard T.H. Chan School of Public Health, Department of Epidemiology, Boston, United States, [7]Brown University School of Public Health, Department of Behavioral and Social Sciences, Providence, United States, [8]University of California, Department of Medicine, Division of Infectious Diseases, Los Angeles, United States*
*Presenting author email: aperezbrumer@gmail.com*

**Background:** Pre-exposure prophylaxis (PrEP) is a leading biomedical HIV prevention strategy for key populations such as, transgender women (TW). However, successful real-world implementation is contingent on community-level acceptability to ensure knowledge, usage, and adherence to PrEP.
**Methods:** Between May-July 2015, four focus groups (FGs; n=32) and brief demographic surveys were conducted to inform a social network-based PrEP intervention for TW in Peru. FGs lasted 90-120 minutes and followed a semi-structured format (themes probed: socialization, social network formations, acceptability and preferences for intervention methods). Audio files were transcribed verbatim and analyzed via an immersion crystallization approach using Dedoose (v.6.1.18).
**Results:** Among TW (mean age: 29 years) 16% reported prior knowledge of PrEP including, participation or knowing a previous participant in HIV prevention trials in Peru. Across FGs medical and research mistrust emerged as key, multidimensional and interrelated barriers to PrEP acceptability including:
1) Mistrust of health care systems and providers,
2) Wariness of research focused on TW,
3) Suspicions of PrEP efficacy, and
4) Fear of potential adverse effects.
Disillusionment with experimental trial designs (blinded allocation to placebo versus study drug), perceived drug effects (questions of Truvada efficacy), and of study staff (mistrust of reported results, lack of information on side effects or potential interactions with hormone therapy) emerged as key themes. Participants voiced suspicion of research and apprehension regarding the current public health emphasis on TW as a "key population" for HIV prevention efforts. Participants' discussion regarding transphobia among medical providers further emphasized the perceived focus on TW as disingenuous. These narratives also questioned the scientific community's labeling of TW as "high-risk" (especially compared to their cisgender male sexual partners).
**Conclusions:** Perceptions of the rationale for and conduct of biomedical HIV prevention research may have unintended consequences for PrEP acceptability among Peruvian TW. Mistrust of medicine, clinical research, and public health systems underlie narratives of resistance to PrEP as an HIV prevention strategy. Efforts to increase community involvement in clinical research trials and to differentiate health services from health research are needed to combat existing mistrust, fortify relationships with TW communities, and facilitate the successful implementation of biomedical HIV prevention strategies with this population.

## WEPED390

### "YES, I WOULD LIKE TO USE THEM, BECAUSE SEX IS MY WORK": AWARENESS OF AND WILLINGNESS TO USE PREP AND PEP AMONG FEMALE AND MALE SEX WORKERS IN MOMBASA, KENYA

A. Restar, Y. Lafort, J. Tocco, P. Gichangi, T. Masvawure, J. Mantell, S. Chabeda, T. Sandort
*HIV Center for Clinical and Behavioral Sciences, New York Psychiatric Institute and Columbia University, Department of Psychiatry, New York City, United States*
*Presenting author email: jem57@cumc.columbia.edu*

**Background:** Pre- and post-exposure prophylaxes (PrEP and PEP) effectively reduce HIV infection, yet PrEP, though recently approved by Kenya's Ministry of Health, is not yet available in public health facilities and PEP is underutilized in Kenya. We explored awareness of, willingness to use, and utilization of PrEP and PEP among female and male sex workers (FSWs and MSWs) in Mombasa, Kenya.
**Methods:** We conducted in-depth semi-structured interviews with 25 FSWs and 25 MSWs recruited from eighteen bars/clubs in Mombasa. Of those who self-reported being HIV-negative (21 FSWs; 23 MSWs), we asked about their awareness of, willingness to use, and use of PrEP and PEP. Interviews were transcribed, thematically coded, and analyzed using Dedoose.
**Results:** Awareness of PrEP and PEP was low overall, with MSWs slightly more aware than FSWs. PEP utilization was also low for both MSWs and FSWs. None of the participants reported use of PrEP. However, after learning about PrEP and PEP in the interview, most sex workers expressed that they were very willing to use them, with greater willingness among FSWs than MSWs. Primary reasons among those willing to use PrEP were failure to use condoms consistently with clients, unpredictable number of clients per night, and self-protection. In addition, participants expressed willingness to use PEP if they believed they had put themselves at risk of HIV infection because of condom breakages and/or non-use with their clients. On the other hand, concern for potential negative side effects was a barrier described by all participants interested in PrEP and PEP. Yet, willingness to use PEP was not affected by the negative side effects among participants who had used PEP previously, citing the need to prevent HIV infection.
**Conclusions:** FSWs and MSWs expressed a general lack of awareness but a marked willingness to use PEP and PrEP, if and when it becomes available. PEP underutilization, despite its availability, was due to lack of awareness rather than unwillingness. These findings point to the urgent need for increased availability and targeted PrEP and PEP education and promotion for FSWs and MSWs in Kenya.

## WEPED391

### EXPERT PERSPECTIVES ON PREP USE DURING PREGNANCY: IS PREP READY FOR IMPLEMENTATION?

K. Beima-Sofie[1], M. Kelley[2], S. Trinidad[3], K. Ngure[1,4], R. Heffron[1,5], J. Baeten[1,5,6], G. John-Stewart[1,5,7]
*[1]University of Washington, Department of Global Health, Seattle, United States, [2]University of Oxford, Ethox Centre, Nuffield Department of Population Health, Oxford, United Kingdom, [3]University of Washington, Department of Bioethics and Humanities, Seattle, United States, [4]Jomo Kenyatta University of Agriculture and Technology, Department of Public Health, Nairobi, Kenya, [5]University of Washington, Department of Epidemiology, Seattle, United States, [6]University of Washington, Department of Allergy and Infectious Diseases, Seattle, United States, [7]University of Washington, Department of Medicine, Seattle, United States*
*Presenting author email: beimak@uw.edu*

**Background:** Pregnant women in high HIV prevalence settings are at risk for acquiring HIV. Pre-exposure prophylaxis may significantly decrease infection rates in HIV-uninfected pregnant women but has yet to be programmatically implemented on a large scale. Our project evaluated how a diverse group of key international stakeholders weighed biologic, social/cultural, and ethical value trade-offs in the possible implementation of PrEP in pregnant women.
**Methods:** Global representatives from HIV policy, research, treatment, and implementation were identified from WHO, NIH, PEPFAR, USAID, CDC, Ministries of Health, and clinical and research facilities. Semi-structured, individual interviews were conducted with 25 representatives from 7 countries using a standardized guide, were recorded, and transcribed verbatim. Transcripts were systematically coded using a constant comparative approach. Themes related to barriers and facilitators of PrEP implementation in pregnant women were identified.
**Results:** Expert opinions were mixed regarding whether PrEP was ready for implementation during pregnancy. Those who supported immediate PrEP implementation emphasized urgency to prevent HIV and considered potential fetal risks to be outweighed by known harms for women and infants should they acquire HIV. Experts not supporting PrEP implementation believed fetal safety and PrEP adherence should be better defined prior to implementation. Experts noted concerns regarding who should be offered PrEP and felt that women's ability to accurately characterize their own HIV risk and HIV stigma would obstruct acceptance of and adherence to PrEP. Some feared that clinician attitudes and beliefs about sexual behaviors during pregnancy, combined with diminished autonomy and power for women in patient/provider and women/male relationships, could pose a significant barrier. Experts also raised a number of concerns related to the distribution of scarce resources and the prioritization of PrEP over ARVs for treatment. Potential facilitators identified included improved motivation and uptake of medical interventions during pregnancy, education and outreach with women, partners, providers and communities to improve acceptance and knowledge, and the development of clear guidelines and infrastructure.
**Conclusions:** Delivery of PrEP in pregnancy could avert HIV infections in a vulnerable population but will require addressing potential barriers to successful implementation including concerns regarding safety, resource allocation, stigma, and identifying the appropriate target population.

## WEPED392

### GETTING PREPARED TO OFFER PREP TO YOUNG WOMEN

G. Chapwanya, I. Mahaka, D. Nhamo, A. Miti, M.S. Dunbar
*Pangaea Global AIDS, Pangaea Zimbabwe AIDS, Harare, Zimbabwe*
*Presenting author email: gchapwanya@pangaeaglobal.org*

**Background:** Adolescent Girls and Young Women (AGYW) aged 16-24 are twice as likely to get HIV infection than their male counterparts due to socio-economic factors and gender disparities, including challenges in negotiating safer sex methods such as condoms. WHO has recently recommended PrEP for all people at substantial risk of contracting HIV. In Zimbabwe, this includes AGYW. However, questions remain about the acceptability of PrEP among AGYW, and how to best to implement and ensure adherence among those who use it.
**Methods:** Two consultations were held at the SHAZ! "HUB", a youth drop-in centre offering comprehensive SRH/HIV services, with AGYW (n=30, age 16-26) involving questions about the acceptability, uptake and adherence of PrEP among AGYW. English language transcripts were thematically analysed using participatory methods.
**Results:** Most participants were unaware of PrEP as an HIV prevention option. Once PrEP was explained, they expressed enthusiasm for using the method - as it would allow them to take ownership of prevention efforts and they would be able to use the method discreetly. However, when researchers showed participants the pills and bottle they come in, concerns were expressed about taking HIV drugs as prevention, and the fear that if they were seen taking these pills people would suspect they were HIV positive. They expressed a desire to repackage and otherwise disguise pills for greater confidentiality. Participants also suggested that PrEP be offered in private, safe places like the HUB or other youth friendly environments. Adherence issues were discussed. Participants taking oral contraception reported they would take them the same time as their contraceptive pills. Others discussed potential challenges with adherence such as living with family members who do not know they are taking the pills, to remembering to take them, and starting and stopping when they have or do not have partners.
**Conclusions:** AGYW are enthusiastic about the prevention option offered by PrEP. However, attention must be paid to packaging and acceptable service delivery methods to ensure confidentiality. Given that PrEP offers the only female controlled ARV based prevention option, it is critical that programs respond to the specific needs of AGYW in roll-out.

## WEPED393

### EXPERIENCES WITH LONG ACTING INJECTABLE (LAI) CABOTEGRAVIR (CAB) AS PREP: A QUALITATIVE STUDY AMONG MEN PARTICIPATING IN A PHASE II STUDY (ECLAIR) IN NEW YORK AND SAN FRANCISCO

D. Kerrigan[1], A. Mantsios[1], R. Grant[2], M. Markowitz[3], P. Defechereux[2], M. La Mar[3], M. Murray[4]
*[1]Johns Hopkins University, Health, Behavior & Society, Baltimore, United States, [2]University of California, Gladstone Center for AIDS Research, San Francisco, United States, [3]Rockefeller University, Aaron Diamond Research AIDS Center, New York, United States, [4]ViiV Healthcare, London, United Kingdom*
*Presenting author email: dkerriga@jhsph.edu*

**Background:** Pre-exposure prophylaxis (PrEP) has been found to be efficacious in preventing HIV, with US national guidelines recommending its use in higher risk populations. Adherence challenges with oral PrEP have stimulated interest in alternate modes of administration.

**Methods:** We conducted 30 in-depth interviews including 26 trial participants (18 MSM and 8 heterosexual men) and 4 clinical providers in a Phase IIa study (ECLAIR) to evaluate the safety, tolerability and acceptability of LAI CAB in New York and San Francisco. Uninfected adult males at low to moderate risk of HIV acquisition were randomized to 4 weeks of oral PrEP or placebo followed by 3 injections of LAI CAB or LAI placebo every 12 weeks. Interviews explored attitudes and experiences with LAI CAB and perceived advantages/disadvantages in comparison to daily oral PrEP. Interviews were audiotaped, transcribed, coded and analyzed using thematic content analysis.
**Results:** Almost all participants experienced some level of side effects associated with LAI CAB, mostly temporary injection site soreness. Yet, all reported being satisfied and interested in continuing LAI CAB. Participants described the convenience of LAI CAB and perceived advantage of not having to worry about adhering to a daily oral. Participants described the peace of mind associated with LAI CAB given the possibility for missed oral doses among themselves or their partners who may be on PrEP, particularly in the context of ongoing sexual risk behavior. MSM participants, particularly in San Francisco, described a surrounding culture whereby MSM were expected to be on PrEP to be seen as safe sexual partners. Participants described the dynamic nature of their HIV risk, with periods of lower and higher risk behavior. While several participants felt oral PrEP may be contributing to increased sexual risk behavior in the broader community, only a few reported increased risk behavior during their participation in the trial. Providers expressed the need for guidelines to assist patients in choosing when to start, stop and/or transition between oral PrEP and LAI CAB.
**Conclusions:** LAI CAB was seen as preferable to oral PrEP among men in this Phase II study. Further research is needed on LAI CAB among women and in other settings.

## WEPED394

### "I WOULDN'T TRY SOMETHING THAT I DON'T TRUST": PERCEPTIONS OF PRE-EXPOSURE PROPHYLAXIS (PREP) AMONG WOMEN WHO INJECT DRUGS IN WESTERN KENYA

J. Syvertsen[1], A. Bazzi[2], G. Rota[3], K. Agot[4]
*[1]Ohio State University, Anthropology, Columbus, United States, [2]Boston University, Community Health Sciences, Boston, United States, [3]Kenya Medical Research Institute, Kisumu, Kenya, [4]Impact Research and Development Organization, Kisumu, Kenya*
*Presenting author email: syvertsen.1@osu.edu*

**Background:** Women who inject drugs experience heightened vulnerability to HIV due to overlapping drug-using and sexual networks and engagement in sex work. In Kenya, where injection drug use is a growing public health concern, offering preexposure prophylaxis (PrEP) could be an effective HIV prevention tool. However, despite Kenya being one of the first African counties to approve PrEP for HIV prevention, little is known about how gender and the social context of drug use may shape willingness to adopt such interventions in this setting. To identify potential opportunities and barriers to PrEP adoption among women who inject drugs, we qualitatively explored perceptions of PrEP delivery mechanisms, including oral antiretroviral medications (e.g., Truvada®), vaginal rings, and microbicide gels.
**Methods:** We drew from a mixed methods study of injection drug use and HIV risk in Kisumu, Kenya. In 2013-2014, 151 men and women who reported recent injection drug use completed surveys assessing sexual and drug-related risk behaviors. This analysis draws on qualitative interviews completed by a subsample of 17 female participants. Semi-structured interviews explored reproductive health topics including perceptions, knowledge, and acceptability of various PrEP methods.
**Results:** Participants' average age was 26 years (range: 20-35) and half were already HIV positive. The majority expressed a general lack of awareness of PrEP. After explaining PrEP methods, participants voiced a mixture of interest, uncertainty, and mistrust. While acceptability of oral PrEP was generally highest, a few women felt that people who are "not sick" should not take medication. Over half of the women expressed concern regarding inserting a vaginal ring or gel, especially related to potential side effects and inability to hide these methods from their partners. Others expressed interest in learning more about "protecting" themselves, particularly if methods could also act as contraceptives.
**Conclusions:** Our findings suggest limited acceptability of PrEP among women in western Kenya, especially regarding anticipated side effects of various methods. To reach an "AIDS free generation," it will be critical to understand the social contexts surrounding PrEP adoption in diverse communities affected by HIV. Increasing the acceptability and adoption of PrEP will require continued engagement of these communities in further intervention research.

## WEPED395

### INCREASING THE UPTAKE OF POST EXPOSURE PROPHYLAXIS (PEP) BY RAPE SURVIVORS IN GHANA: THE ROLE OF THE GHANA POLICE SERVICE

J. Blantari[1], T.S. Ndeogo[1], E. Awotwi[2]
*[1]Ghana Police Hospital, Accra, Ghana, [2]United Nations Population Fund, Accra, Ghana*
*Presenting author email: blantarijm@gmail.com*

**Background:** Survivors of GBV including rape and defilement experience physical and emotional trauma. In Ghana, most rape and defilement cases are not reported to the police. For cases that are reported, police referrals to health facilities are mainly for establishing that a crime has been committed, with no consideration for access to Post Exposure Prophylaxis (PEP). Late reporting of cases to health facilities makes it almost impossible to administer PEP. The Police Service records between 280 and 376 rape cases yearly, with average of 1100 defilement cases yearly nationwide. However, referrals of survivors of sexual abuse for PEP services from 2010-2012 represented only 5.79%, 5.47% and 6.39% respectively of the total cases reported. Timely reporting of sexual abuse and empowerment of police in availing survivors with PEP services are essential to avoid HIV transmission and unwanted pregnancies.
**Description:** The Ghana Police Service AIDS Control Program with support from UNFPA held workshops for 190 police personnel in 6 Police Regions. Participants learned about the vital role of police in ensuring rape/defilement survivors are offered the lifelines of PEP. Emphasis was laid on promoting community involvement in timely reportage of sexual abuse. Participants agreed on roles of the various police units and developed action points and monitoring systems for increasing PEP referrals. The police held meetings with community leaders and engaged local radio stations to educate communities on the need to protect rape/defilement survivors by facilitating access to prompt medical attention. Investigators and community members agreed on surveillance and reporting systems to ensure that survivors received timely and appropriate medical attention.
**Lessons learned:** Police returns (monitoring) indicated a sharp increase for survivors accessing PEP services from 6.39% in 2012 to 24.25% in 2013 and 27% in 2014. Notwithstanding these achievements, it was observed most of the perpetrators of the abuses were close relations of survivors, resulting in fear that reporting to the police might attract harsh punishments and affect family cohesion.
**Conclusions/Next steps:** Engaging the police in public education enhances uptake of PEP by rape/defilement survivors. Continuous police/community partnerships in addressing GBV prevention and management will increase access to PEP by survivors.

# ADHERENCE TO ANTIRETROVIRAL THERAPY, INCLUDING WHEN USED AS PREVENTION OR FOR CHEMOPROPHYLAXIS

## WEPED396

### PROMOTING ADHERENCE TO ANTIRETROVIRAL THERAPIES (ART): A CHALLENGE FOR CLINICIANS

*[1]MGH Institute of Health Professions, School of Nursing, Boston, United States, [2]Texas Children's Hospital, Pavillion for Women, Houston, United States, [3]Texas A & M University, School of Nursing, Corpus Christi, United States, [4]University of North Carolina Wilmington, School of Nursing, Wilmington, United States, [5]Rutgers University, Schol of Nursing, Newark, United States, [6]Hunter College and Graduate Center, CUNY, School of Nursing, New York, United States, [7]University of Ottawa, Faculty of Health Sciences, Ottawa, Canada, [8]University of California, Community Heath Systems, San Francisco, United States, [9]University of Puerto Rico, San Juan, United States, [10]University of Namibia, Windhoek, Namibia, [11]St. Louis College, Faculty of Nursing, Bangkok, Thailand, [12]University of California, School of Nursing, San Francisco, United States, [13]Yale University, School of Nursing, New Haven, United States, [14]Case Western Reserve University, Bolten School of Nursing, Cleveland, United States, [15]Ohio State University, College of Nursing, Columbus, United States, [16]University of California, San Francisco, United States, [17]University of Hawaii, School of Nursing, Honolulu, United States, [18]Harris Health System, Nursing Strategic Initiatives, Houston, United States*
*Presenting author email: icorless@mghihp.edu*

**Background:** Promoting medication adherence is a central concern for clinicians caring for people living with HIV (PLHIV). A myriad of scales and indices have been used to measure the well-being of PLHIV, but the comparative importance of these measures in predicting medication adherence has been little studied.

**Methods:** We conducted a cross-sectional study of medication adherence with an international convenience sample of 1,812 PLHIV attending clinics in Canada, Namibia, Puerto Rico, Thailand, and the United States. We categorized respondent medication adherence into None (0%): Low (1-60%); Moderate (61-94%); High (95-100%) levels based on self-report. Thereafter, controlling for age, sex assigned at birth, education, and ability to pay for care, we used a stepwise multinomial logistic regression to investigate the predictive importance of 13 measures including depression, stressful life events, chronic disease self-efficacy, and perceived stigma.
**Results:** Using bivariate analysis, we found that the mean scores of all 13 scales/indices differed by adherence category and were correlated with one another. In the stepwise model, adherence self-efficacy, depression, stressful life events, and perceived stigma were significant predictors of medication adherence, controlling for race, sex assigned at birth, education, and ability to pay for care. For every one point increase in the chronic disease self efficacy score, the odds of being in the None, Low, or Moderate adherence category were 5%, 6%, and 3% lower respectively compared to the High category. Further, every additional stressful life event increased the odds of being in the None or Low category by 5% compared with the High category. Among the demographic variables which were forced into the model, only race was a significant predictor with non-white race being associated with double the odds of being in the None category.
**Conclusions:** Clinicians need tools to identify those PLHIV who may find maintaining medication adherence a struggle. Given that most clinicians have limited time with patients, these results suggest that asking about self-efficacy, depression, stigma, and stressful life events, and particularly the latter, routinely, may have the greatest benefit in distinguishing those patients who may require additional support.

## WEPED397

### Antiretroviral therapy interruption among people who use drugs in a setting with a community-wide HIV treatment as prevention initiative

R. Mcneil[1], T. Kerr[1], B. Coleman[1], L. Maher[2], M. Milloy[1], W. Small[1]
*[1]BC Centre for Excellence in HIV/AIDS, Urban Health Research Initiative, Vancouver, Canada, [2]UNSW Australia, Sydney, Australia*
*Presenting author email: rmcneil@cfenet.ubc.ca*

**Background:** HIV Treatment as Prevention (TasP) programs seek to promote antiretroviral therapy (ART) access and optimal adherence (≥ 95%) to produce viral suppression among people living with HIV (PLHIV) and prevent the onward transmission of HIV. ART interruptions (defined as ≥30 consecutive days without taking ART) remain more common among people living with HIV (PLHIV) who use drugs and undermine the effectiveness of TasP. This study was undertaken in a setting with a community-wide TasP initiative to examine individual, social, and structural influences on ART interruptions among PLHIV who use drugs.
**Methods:** Semi-structured qualitative interviews were conducted with thirty-nine individuals recruited from an ongoing prospective cohort study comprised of PLHIV with histories of drug use in Vancouver, Canada. We identified participants who had experienced treatment interruptions (defined as ≥ 30 days without refilling an ART prescription) through a linkage with a local HIV/AIDS treatment registry. Data were analyzed using deductive and inductive approaches, and interpreted by drawing on the concept of structural vulnerability.
**Results:** While study participants positioned ART interruption events as the result of “treatment fatigue,” our analysis of participant accounts revealed underlying individual, social, and structural factors as primary drivers of these events, including:
(1) prior adverse ART-related experiences among those with long-term treatment histories (≥15 years) who transitioned to more complex ART regimens;
(2) experiences of social isolation related to structural vulnerability (e.g., stigma, colonialism) led to depression and undermined motivation to adhere to ART regimens; and,
(3) disruptions to daily routines and breakdowns in the continuity of HIV care stemming from events that increased structural vulnerability (e.g., residential eviction, incarceration).
**Conclusions:** These findings demonstrate the importance of comprehensive structural reforms (e.g., housing interventions, drug policy reforms) and targeted interventions across the continuum of HIV care to optimize ART adherence among drug-using PLHIV and maximize the individual and community health benefits of TasP.

## WEPED398

### “I am taking ARVs. I am smoking nyaope. It is not good.” Challenges to ART adherence among substance-using women living with HIV in Pretoria, South Africa

J. Ndirangu, F. Browne, W. Wechsberg, W. Zule
*RTI International, Substance Use, Gender and Applied Research Program, Research Triangle Park, United States*
*Presenting author email: jndirangu@rti.org*

**Background:** Substance abuse affects the delivery and outcome of HIV treatment and management. People living with HIV and substance dependence are less likely to access HIV clinical care and to receive and adhere to ART, and more likely to have rapid disease progression. In South Africa, women who use alcohol and other drugs (AOD) continue to encounter barriers in the HIV treatment cascade.
**Description:** A NIDA-funded cluster randomized trial, which recruited high-risk AOD-using women in Pretoria, compared standard HIV testing and referrals to the Women’s Health CoOp, an evidence-based behavioral intervention with linkage to care and ART initiation and adherence monitoring. Participants who knew their HIV status but were not on ART at enrollment increased ART initiation after their final appointment. Despite the increase in ART uptake, adherence was low. To elucidate the challenges to adherence, we conducted 18 semi-structured in-depth interviews with participants from the intervention arm who had completed their final follow-up.
**Lessons learned:** Most participants reported an initial denial of their HIV status, but gained self-efficacy to prioritize clinic visits and to stay healthy for themselves and their families. A majority were aware of the benefits of ART; however, AOD use impeded ART adherence. Participants also reported that nonadherence may have been exacerbated by the fear of mixing AODs with ART, which may have been evoked by clinicians’ zero-tolerance and stigmatizing attitudes about AOD use. Participants who reported discriminatory treatment in clinics were less likely to adhere to ART than those who did not report discrimination. Long clinic wait times and lack of documentation also were barriers. Participants identified lack of family support, low self-worth, and poverty as inhibitors. The shortage of affordable substance abuse treatment in the community was a recurring barrier.
**Conclusions/Next steps:** Because of their substance use and stigmatization, these South African women experienced barriers to ART initiation and adherence. Comprehensive HIV treatment services that address structural barriers and include gender-based interventions with a focus on substance use as a comorbidity within the HIV treatment cascade are essential. HIV prevention programs targeted at key populations need to adopt a holistic approach in order to reach the UNAIDS 90-90-90 treatment target.

# Risk compensation: conceptualisation, assessment and mitigation

## WEPED399

### Risk compensation following medical male circumcision: results from a one-year prospective cohort study of circumcised and uncircumcised school-going youth in KwaZulu-Natal, South Africa

K. Govender[1,2], G. George[1], S. Beckett[1], C. Montague[3], J. Frohlich[3]
*[1]University of KwaZulu-Natal, Health Economic and HIV/AIDS Research Division, Durban, South Africa, [2]University of KwaZulu-Natal, Psychology, Durban, South Africa, [3]Centre for the AIDS Programme of Research in South Africa, Durban, South Africa*

**Background:** Voluntary medical male circumcision (VMMC) in young men is an important component of national HIV prevention programmes, given its protective effect in the heterosexual transmission of HIV. Concerns have been raised that circumcised men will increase their sexual risk behaviours following circumcision as a result of lowered perceptions of HIV-risk. This possibility of risk compensation has the potential to reverse the public health benefit of VMMC. Accordingly, this study documented sexual practices of circumcised (n= 616) and uncircumcised (n=589) learners in 42 mixed sex secondary schools over a 12 month period in Vulindlela, KwaZulu-Natal who were targeted by a national department of health VMMC campaign.
**Methods:** During the VMMC campaign (March 2011 To February 2013) 5165 learners were circumcised and 5923 refused to be circumcised. We randomly selected participants for each cohort from March 2012 until May 2013. Study participants aged 16 to 24 years were interviewed at baseline, 6 months after baseline and at 12 months. Mixed effect models were used to account for the longitudinal data and the clustering of learners in schools.

Tuesday 19 July
Wednesday 20 July Poster Exhibition
Thursday 21 July
Friday 22 July
Late Breaker Posters
Author Index

**Results:** The uncircumcised cohort was slightly older than the circumcised group (17.4 vs 17.7 years, p < .01). In terms of sexual behaviours, the uncircumcised cohort was more likely to be sexually active at the baseline interview (54 vs. 41%; p < .01). There were no statistically significant differences between the circumcised and uncircumcised cohort in terms of number of sexual acts in the previous 6 months (p=.32) and the number of sexual partners in the previous 6 months (p = .77). Further, perceptions of HIV risk were significantly lower in the circumcised cohort than in the uncircumcised cohort at study endpoint (p = .01). The uncircumcised group reported higher incidence of transactional sex than the circumcised group (7% vs. 2%, p < .01).
**Conclusions:** There was no evidence of risk compensation in this study. Early involvement of young men in VMMC is optimal for HIV prevention, however the intensification of prevention activities needs to be addressed for high risk young men such as those who engage in transactional sex and refuse circumcision.

## EMERGING APPROACHES FOR COMBINATION HIV PREVENTION

### WEPED400

#### EXPERIENCES OF ADOLESCENT GIRLS AND YOUNG WOMEN (AGYW) PARTICIPATING IN AN INTEGRATED COMBINATION OF EVIDENCE-BASED PROGRAMME IN RESOURCE CONSTRAINT SETTINGS, SEDIBENG AND ORANGE FARM IN GAUTENG PROVINCE

E. Zibengwa
*HIVSA, Community Systems Strengthening, Johannesburg, South Africa*
*Presenting author email: zibengwae@hivsa.com*

**Background:** HIV risk is a formidable concern for Adolescent Girls and Young Women (AGYW) in South Africa, with the highest number of estimated new HIV infections happening among AGYW aged 15-24 years (Shisana et al, 2014). Over the years, research data suggest limited effectiveness of stand-alone HIV-prevention programmes for AGYW, leading to arguments for economic strengthening and HIV prevention education combination prevention approaches which interrupts the pathway to HIV infection and promotes protective, risk reduction, and opportunity opening behaviors (Cluver et al, 2014). Despite these calls, the efficacy of combination programmes in low resource constrained settings, particularly in semi-urban and informal settlements, is shrouded with limited evidentiary basis as they remain under-tested. The goal of this study is set to explore the perceptions of AGYW on their experiences of participating in an integrated combination programme.
**Methods:** Utilising a qualitative approach and a collective case study design, semi-structured one-on-one interviews are being conducted with 25 participants that were sampled from 75 AGYW based at Community Based Organisations in Sedibeng and Orange Farm in Gauteng province who are participating in HIVSA's combination programme. Non-probability purposive sampling and simple random sampling procedure of probability sampling, respectively, are being used to select study participants.
**Results:** The research allows "relevant" and "information rich participants" to share their experiences. Emerging data obtained from AGYW after a year of participating in an combination programme indicate that there is strengthened building of skills leading to HIV testing, uptake of treatment and care services; as well as change of Knowledge and Attitudes related to HIV risk perception. However, AGYW are reporting no success in opening of savings accounts and in establishing linkages that enhance their entrepreneurial and employability capacity. Issues of reach, accessibility, acceptability and effectiveness are also being explored and recommendations for replication are being made by participants.
**Conclusions:** Outcomes from the qualitative assessment have potential to add to a body of evidence important for fine-tuning, contextualizing and strengthening the efficacy of combination approaches in HIV prevention and empowering AGYW sustainably in disadvantaged socio-economic contexts. The practicality, synergistic effects and barriers of combining HIV and economic strengthening programming require more specific research.

### WEPED401

#### IMPACT OF COMBINATION PREVENTION APPROACHES ON HIGH-HIV PREVALENCE IN FISHING COMMUNITIES: A CASE OF SIGULU ISLANDS, NAMAYINGO DISTRICT, EAST CENTRAL UGANDA

E. Tibenderana[1,2], S. Mashate[1,2], M. Ndifuna[1], A. Mugume[1], F. Herbert Kazibwe[1], H. Ndagire[1], F. Ajok Odoch[1]
*[1]JSI Research & Training Institute, Inc. (JSI)/ Strengthening TB and HIV&AIDS Responses in East Central Uganda (STAR-EC), Jinja, Uganda, [2]AIDS Healthcare Foundation (AHF) / Uganda Cares, Kampala, Uganda*
*Presenting author email: etibenderana@starecuganda.org*

**Background:** In 2009, combination HIV prevention was recommended by PEPFAR as an essential component of a balanced response to the global HIV epidemic. Combination HIV prevention defined as "Combining quality biomedical, behavioral, and structural interventions to craft a comprehensive prevention response to targeted subpopulations with mutually reinforcing interventions." Fishing communities are known to be at higher risk of acquiring HIV infection in many sub-Saharan African countries. STAR-EC, an eight-year district-based project funded by USAID and implemented by JSI and its partners, supported integrated outreach to fishing island communities from April 2010 to Oct 2015.
**Description:** Quarterly integrated combination prevention service delivery outreaches were conducted to the Sigulu Islands, an archipelago of 11 islands in Lake Victoria. Services included HIV testing and counseling (HTC), voluntary medical male circumcision (VMMC), family planning, malaria treatment, TB diagnosis and treatment, chronic HIV care, condom education and distribution, risk-reduction interventions, and dissemination of IEC materials. The program used multidisciplinary teams of health workers and trained 345 village health teams and 216 condom peer educators to deliver services in static health facilities and mobile community outposts.
**Lessons learned:** During the period of April 2010 to Oct 2015, 22,315 individuals received HTC; 1,219 people, including 251 pregnant and lactating mothers who started on antiretroviral therapy (ART); 6,200 males were circumcised; 107 TB patients completed treatment, 1,444 clients received sexually transmitted infection treatment; and 611,077 condoms were distributed. This archipelago has experienced a significant reduction in HIV positivity, from 19% in 2010 to 4.8% in 2015, steady progress toward the goal of 'zero new HIV infections.'
**Conclusions/Next steps:** Combination HIV-prevention approaches help reduce HIV transmission in high-prevalence pockets. These approaches should be adopted by community and facility health workers who provide HIV&AIDS services in high HIV prevalence communities.

## PREVENTION WITH HIV-POSITIVE PEOPLE

### WEPED402

#### QUALITATIVE FORMATIVE RESEARCH TO REFINE A THEORY-BASED MULTI-LEVEL SEXUAL RISK REDUCTION INTERVENTION FOR HIV-POSITIVE MSM IN INDIA

V. Chakrapani[1], T. Subramanian[2], A. James[1], R. Nelson[1], M. Rajan Hari[1], P.P. Vijin[1], M. Shunmugam[1], T. Kershaw[3]
*[1]Centre for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India, [2]National Institute of Epidemiology (NIE), Chennai, India, [3]Yale School of Public Health, Yale University, New Haven, United States*
*Presenting author email: vijinpp0007@gmail.com*

**Background:** Studies from India have indicated high levels of sexual risk among HIV-positive MSM (HIV+MSM) and thus the need for effective/culturally-appropriate interventions. Based on the Social-Personal Model and our previous studies, we designed a multi-level (individual and MSM community levels) intervention for HIV+MSM to promote safer sex and to promote acceptance of HIV+MSM among MSM communities. We conducted a qualitative formative research among MSM to understand their perspectives and to get inputs on the intervention content and implementation.
**Methods:** In 2015, we conducted five focus groups and in-depth interviews with a total of 17 HIV+MSM and 20 HIV-negative/unknown status MSM in urban/rural settings in Tamil Nadu, India. Using NVivo-10, narrative thematic analysis was using the techniques of framework analysis and grounded theory.
**Results:** Participants identified several barriers to safer sex among HIV+MSM: discrimination towards HIV+MSM within MSM communities and from the society, non-disclosure of HIV status to friends/partners, and challenges in sexual communication/negotiation skills. Facilitators of safer sex such as supportive friends/partners and personal resolution to practice safer sex were also reported. Discussions revealed that HIV-negative MSM disapprove of sexual activity of HIV+MSM even if they reported condom use. HIV+MSM were concerned about the location of the

individual-level counselling intervention (community-based organisation vs. other private settings) as they feared that other MSM might come to know their HIV status. Some MSM preferred 'non-community' counsellors as they believed that he/she will keep their HIV status confidential, while some others preferred peer/MSM counsellors. For intervention length, participants suggested about 3-6 individual individual sessions with a gap of two to four weeks. Decreasing the discrimination faced by HIV-positive MSM was noted as key to promote voluntary disclosure of HIV status and early engagement in care. Imparting messages to accept HIV+MSM within MSM communities through dramas and skits at community events and drop-in centres of community-based organisatons were suggested for the community intervention.

**Conclusions:** Formative research helped us refine the intervention content (e.g., stigma, mental health support, preparing a tailored plan for safer sex/disclosure) and implementation strategies (e.g., type of counsellor, location, length) - thus improving the acceptability/robustness of the proposed multi-level intervention among HIV+MSM.

## WEPED403

### OUTCOMES OF A PILOT RCT TO PROMOTE SAFER SEX PRACTICES AMONG MSM LIVING WITH HIV IN TAMIL NADU, INDIA

V. Chakrapani[1], P.P. Vijin[1], T. Kershaw[2], T. Subramanian[3], M. Rajan Hari[1,3], A. James[1], R. Nelson[1]
*[1]Centre for Sexuality and Health Research and Policy (C-SHaRP), Chennai, India, [2]Yale School of Public Health, Yale University, New Haven, United States, [3]National Institute of Epidemiology (NIE), Chennai, India*
*Presenting author email: vijinpp0007@gmail.com*

**Background:** Studies have pointed out that MSM living with HIV (MSMLH) in India need an effective and culturally appropriate intervention to promote safer sex. As part of a multi-level intervention based on Social-Personal Model, we developed and tested a pilot individual level counselling intervention using motivational interviewing techniques to promote initiation and maintenance of safer sex among MSMLH.

**Methods:** We present preliminary analyses from a two-arm pilot randomized controlled trial (RCT) among 46 MSMLH (intervention: n=26; control: n=20) in Chennai, India. MSMLH in intervention group received 4-session tailored sexual risk reduction counseling (tailored risk reduction plan, mental health, sexual communication/negotiation). Participants completed assessment at baseline (pre-intervention) and at the end of 3 and 6 months. We developed a sexual risk score (based on condom use in anal sex, HIV status of sexual partners, number of partners, etc.) to assess sexual risk. Mixed-ANOVA analysis was conducted (SPSS-21), with intervention/control condition as between-subjects factor and time (baseline and endline) as within-subjects factor. Process evaluation included activities to assess intervention fidelity (e.g., observation of sessions by external evaluator) and post-intervention satisfaction survey.

**Results:** Participants' mean age was 37.8 (SD=9.9) and monthly income was INR 8875 (SD = 5050). More than half self-identified as kothi (feminine/receptive) and the rest as double-deckers (versatile role), and two-thirds were never married. There were no significant differences in the baseline characteristics of intervention and control groups, except monthly income. Out of the 46 participants, 3 persons in the control group and 6 persons in the intervention group did not complete the endline survey. Intent-to-treat analysis showed the intervention group decreased their sexual risk compared to control participants (d=.29, indicating a small/moderate effect). When the 9 drop-out cases were excluded from the analysis, we obtained similar results. Process evaluation indicated high intervention fidelity and high satisfaction among intervention group participants.

**Conclusions:** We found that our individual level counseling intervention to reduce sexual risk in MSMLH was feasible, acceptable, and had evidence of effectiveness equal to or greater than other HIV-positive interventions.

# SCHOOL-BASED SEXUAL EDUCATION, LIFE SKILLS AND GENDER EQUALITY EDUCATION

## WEPED404

### A SCHOOL-BASED CLINIC-LINKED SEXUAL REPRODUCTIVE HEALTH AND RIGHTS PROGRAM IN A RURAL HIGH-SCHOOL IN SOUTH AFRICA: PROGRAM OUTCOMES

N. Shaikh, A. Grimwood, Z. Ncama, E. Mothibi, G. Fatti
*Kheth'Impilo, Cape Town, South Africa*

**Background:** Adolescents in Sub-Saharan Africa carry a disproportionate burden of HIV disease and experience poor access to Sexual Reproductive Health and Rights (SRH&R) services. Improving SRH&R services for youth is a policy priority in SA and initiatives are planned to improve unmet needs. With the existing model of service delivery, school-health services are unlikely to be able to address these needs. This study reports on the outcomes of a school-based clinic-linked SRH&R program for adolescents in a rural high-school.

**Methods:** The intervention comprising of an integrated school-health SRH&R service that provided information, education, counseling and referral to a youth-friendly SRH&R clinic or social protection services to 1258 learners in a co-ed school. The program was evaluated through routine program data and through surveys at baseline and post -intervention for the period May 2014- August 2015. Analysis including univariate, bivariate analysis was undertaken using *t*-test and *Chi* square tests.

**Results:** Baseline demographic profile showed that 52% of learners were male and with an age- range of 14-26 years(μ=17.2;SD 2.5)years**).** Learners came from households that were mainly female-headed (70%), food insecure(33%) and relied on state grants (88%). Learners faced challenges of coming to school hungry(58%), feeling tired (42%) and unsafe when walking to school(20%). Gender-based violence and sexual coercion was higher in females compared to males(raped first time I had sex(4.6% vs 1% ) and ever forced to have sex(8.3% vs 4.6%)). Between the baseline and post SRH&R life-skills education intervention(89% learners completed), basic knowledge and attitudes changed significantly; condoms can prevent HIV(51%-68%), willing to have HIV test(66.4%-84.6%), sex with virgin prevents HIV(17.7%-9.5%) and STIS are treatable(28.6%-49.4%). Reported behavior improved; used condom at last sex(23.6-36.5%),sought care at youth-friendly clinic(31.7 to 50.5%). There was a 73% uptake of the school-based clinic-linked SRH&R service and 89% were self-referred. Of total learners, HCT uptake was 40%, VMMC by male learners(36%), pregnancy-rate per annum(14%).

**Conclusions:** These findings show that learners faced socio-economic, nutritional challenges, GBV and sexual coercion. The high uptake of services despite the challenges learners face, suggest that unmet needs amongst learners within these schools can be addressed through school-based clinic-linked adolescent-friendly services.

## WEPED405

### SEXUALITY EDUCATION IS TAKING HOLD: HOW AN INCREASING COMMITMENT TO CSE WILL REAP BENEFITS FOR HIV PREVENTION AND SEXUAL AND REPRODUCTIVE HEALTH

J. Herat[1], J. Babb[1], I. Zhukov[2], E. Benomar[2], C. Castle[1]
*[1]UNESCO, Paris, France, [2]UNFPA, New York, United States*
*Presenting author email: c.castle@unesco.org*

**Background:** Comprehensive sexuality education (CSE) aims to ensure that all young men and women gain the knowledge and skills to make conscious, healthy and respectful choices about relationships and sexuality. CSE is one of five key recommendations made by UNAIDS and the African Union to fast track the HIV response and end the AIDS epidemic among young women and girls across Africa. Good quality CSE that is accessed by all adolescents and young people remains a key input to combination prevention services that empower them to protect themselves from HIV, STIs and unintended pregnancies.

**Description:** UNESCO, with UNFPA, carried out a review of CSE implementation and coverage in 48 countries in 2015, through the analysis of existing resources and studies, assessing whether curricula meet international standards. The review also examines the evidence base for CSE and its positive impact on young people's health outcomes. It takes stock of political support for CSE and factors that influence programme success such as CSE's position within school curricula, the content covered, teacher training for classroom delivery, and partnerships with parents and communities.

**Lessons learned:** A majority of countries are now embracing CSE and actively strengthening its implementation at a national level through policy, curriculum or teacher training. Despite these efforts, gaps remain between policies and classroom implementation. Whilst many countries' curricula meet basic international standards, most curricula need to be strengthened in terms of gender and rights and to address the needs of young people living with HIV. Adequate teacher training is

an essential component to quality delivery. The review found that where sexuality education is not fully compulsory or is extra-curricular, a large number of students will not reap the benefits.

**Conclusions/Next steps:** Evidence clearly shows that CSE contributes to HIV prevention and improves sexual and reproductive health and gender equality outcomes. As such, CSE is a critical enabler that should form part of national HIV and SRH programmes, and one that young people themselves repeatedly demand. Continued support is needed to ensure that gender and rights is better highlighted and to strengthen teacher capacity to deliver CSE. Ongoing advocacy will help hard-won gains take hold and grow.

## WEPED406

### EVALUATION OF THE IMPLEMENTATION AND RESULTS OF THE DANCE4LIFE SCHOOLS PROGRAM IN ARGENTINA

I. Aristegui[1,2], B. Caceres[3], C. Valeriano[3], L. Villalba[3], V. Zalazar[1], K. Frieder[4], V. Brizuela[5], L. Cahn[6]

*[1]Fundacion Huesped, Social Research Program, Buenos Aires, Argentina, [2]Universidad de Palermo, Center of Research in Psychology, Buenos Aires, Argentina, [3]Fundacion Huesped, Direction of Programs, Buenos Aires, Argentina, [4]Fundacion Huesped, Executive Director, Buenos Aires, Argentina, [5]Harvard T. H. Chan School of Public Health, Boston, United States, [6]Fundacion Huesped, Buenos Aires, Argentina*

*Presenting author email: leandro.cahn@huesped.org.ar*

**Background:** Since 2010, Fundacion Huesped and the Youth for Health Network have implemented the dance4life program in public schools. An evaluation was conducted assessing the results of the program to determine if predicted outcomes occurred, and drawing conclusions about the possible impact of results on the sexual and reproductive health of the youth.

**Methods:** A retrospective evaluation was conducted in 2014 by an external evaluator analysing program implementation at public high schools of the Buenos Aires Metropolitan Area from March 2010 to December 2013. A mixed-methodology (qualitative-quantitative), using validated tools and frameworks, was applied through self-reported surveys, semi-structured interviews and focus groups with students, peer educators, teachers, and staff.

A literature review of past reports and program-related documents complemented this. Interviews and focus group transcripts were analysed using a directed content framework for coding main themes. Quantitative data was analyzed using Excel.

**Results:** The program was implemented in an innovative and successful way, training over two thousand ¨agents4change¨ (youth facilitators) over a four-year period. The experiences reported were generally positive, its methodology being the most novel and attractive part. Youth participation in the execution of the program was a valuable point for all the stakeholders. Teachers and young people reported that one of the positive aspects was that it was an international program, demonstrating large global involvement. 93% of respondents answered correctly about modes of transmission. Knowledge in relation to contraceptive use also was high: 68% for the injectable form; 99% for the condom. Positive attitude changes were reported: respondents indicated changing a lot in their respect for PLHIV (72%) and their capacity for talking openly about sexuality (60%). 80% said they knew how to avoid having sex if not wanting to.

**Conclusions:** Although the dance4life program has had very positive results in almost all the variables, including greater awareness of sexuality and confidence in decisions about sex; there are issues that need to be addressed: project sustainability assuring lasting effects on school culture; health system integration to improve health outcomes. Having baseline and follow-up data is critical in order to compare changes in young people's knowledge, attitudes, and practices before and after implementation.

## WEPED407

### SCALING UP COMPREHENSIVE SEXUALITY EDUCATION IN AFRICA: ARE WE WINNING THE QUALITY BATTLE?

P. Machawira[1], E. Gondwe[2], M. Njelesani[3], J. Herat[4]

*[1]UNESCO, Regional Support Team for Eastern and Southern Africa, Johannesburg, South Africa, [2]Ministry of Education Zambia, Curriculum, Lusaka, Zambia, [3]UNESCO, HIV and Health Education, Johannesburg, South Africa, [4]UNESCO, HIV and Health Education, Paris, France*

*Presenting author email: p.machawira@unesco.org*

**Background:** Comprehensive Sexuality Education (CSE) aims to increase young people's chances to form safe and satisfying relationships, prevent HIV, safeguard their sexual and reproductive health and wellbeing, and advocate for their rights to dignity and equality. As CSE gains momentum and interest at international, regional and national levels, governments in Eastern and Southern Africa (ESA) are increasingly putting in place measures to scale up school based delivery.

**Methods:** To assess the quality of CSE curricula and delivery, UNESCO commissioned a five country study (Uganda, Zambia, Lesotho, Malawi, Namibia) and used an in depth assessment tool (Sexuality Education Review and Assessment Tool (SERAT)) completed with key stakeholders (92). Key informant interviews were conducted with government officials (24), teachers (44) and learners (72) from selected schools and secondary data was obtained from national population based surveys. Data was analysed using SERAT; charts were generated to show the strength of various features of the program.

**Results:** Interview and SERAT results across all 5 countries revealed moderate to strong curriculum content from 9-18 age ranges, and very weak to no content for the 5-8 year age group. Teachers' inability to deliver due to a lack of subject matter specialization and poor quality of teacher training in comprehensive sexuality education were cited as common challenges. This coupled with high pupil teacher ratio; high pupil textbook ratio; and poor linkages with health services were critical factors affecting quality of classroom delivery and the desirable outcomes for young people. Absence of a strong M&E system providing real time data on CSE delivery and outcomes was cited as a challenge.

**Conclusions:** To improve quality of CSE delivery, countries need to ensure that CSE starts early, is age appropriate; teachers are well equipped with content and facilitation skills to deliver using innovative methods and engaging health resource persons. Including CSE indicators in Management Information Systems is critical for tracking progress and quality of CSE delivery. As efforts to reach large numbers of young people escalate, it is critical to ensure that the CSE programs maintain quality, content, and delivery methods necessary to attain the desired outcomes.

## WEPED408

### ADVENTURE UNLIMITED: A PATHWAY TO CHILDREN HIV/AIDS EDUCATION

L. Chimankata

*Youth Alive Zambia, Accounts, Lusaka, Zambia*

*Presenting author email: listerchimankata@yahoo.com*

**Background:** The Adventure Unlimited is the programme targeting children aged between seven (7) to 13 years, who most programmers overlook especially for HIV and AIDS awareness as they are considered young for some sexual oriented packages associated with such awareness. A moralist defense is always given as this age group is seen as "innocent." In the mid 90s the age group between five (5) to 14 years was called the window of hope as it was seen as free from HIV infection. With the change of scenario thus: all the below 25years considered the HIV "generation" and the children below 15 years being the target of all sorts sexual violence including defilement need has arisen to give age-suitable sexual and reproductive health to this age group.

**Description:** The Adventure Unlimited is a nine session psychosocial and value based approach programme adopted from The Scripture Union that among other topics addresses; self-awareness, socialization process, family and friends as social units, reproductive and sexual awareness, social environment and other helpful human values. It is delivered in schools in a very relaxed environment using an enter-educate approach.

**Lessons learned:** From the facilitators reports YAZ has discovered that many children have been willing to disclose sexual abuse that has either happened to them or a friend and are willing to undergo counseling .The participants in the Adventure Unlimited sessions have been discussing reproductive and sexual matters, which society does not associate with this 'innocent' age. The programme is an eye opener and can be used as a good pathway to impart knowledge on HIV and AIDS in this age group which will develop into preventive skills before they grow into becoming sexually active.

**Conclusions/Next steps:** New infections can be controlled properly by reaching out to those below the age of 15years and build a value system with their socialization process so that they grow with a preventive awareness. This also helps in acquiring useful psychosocial life skills to deal with different risky situations in life.

## WEPED409

### Addressing teachers' comfort levels to teach sexuality education: the case of South Africa

B. Mpini[1], V. Kisaakye[1], S. Maasdorp[2]
*[1]UNESCO, Johannesburg, South Africa, [2]Department of Education, Eastern Cape, South Africa*
*Presenting author email: b.mpini@unesco.org*

**Background:** In South Africa the recent SACMEQ Data indicates poor levels of HIV knowledge among learners in schools (less than 40 %) whereas teachers' knowledge levels are 100%. The gap of knowledge between learners and educators can be attributed to educators' lack of capacity to transmit their knowledge and the conflict between the educator personal values and teaching of sexuality education/ life skills. Evidence show that effective Comprehensive Sexuality Education (CSE) consistently increases learners HIV knowledge and other health issues, delays the age of sexual debut, and increase their use of contraceptives including condoms.
**Description:** UNESCO in collaboration with UNFPA and the John Hopkins HC3 project developed an online course on CSE to provide teachers with knowledge and skills to implement age appropriate, human rights and gender based comprehensive sexuality education in the classroom. 50 HIV and Life Skills District Coordinators as Master Trainers (13 Males and 37 Females ) from the Eastern Cape Department of Education (DoE)were trained through a 40 hour on-line sexuality education course blended with values clarification exercises. The seven modules focused on: Sexuality; Adolescent Social and Emotional Development; Fertility, Pregnancy and Reproduction; Preventing STIs and HIV; Gender and Relationships. Knowledge assessments was done upon completion of each module, and teach backs facilitated to demonstrate how to deliver content in the classroom setting using scripted lesson plans on sensitive topics.
**Lessons learned:** The average pass rate achieved by participants was 81% with an average of 11.7 % knowledge increase from prior to undertaking the course. 92% of the participants found that the online course was relevant and has increased their capacity to implement CSE in the classroom. Implementing an on-line course requires sufficient access to computers and internet connectivity and provides a safe space for participants to learn at their own pace.
**Conclusions/Next steps:** The on-line course on sexuality education provides an accessible resource that support teacher training through ICTS. DoE in the Eastern Cape intends to expand the on-line course to reach 850 teachers in 21 Districts through utilising 15 ICT Centres.

## WEPED410

### Scaling up access to SRH education and services in Zambia: mission impossible without faith-based partners Saili Alice, Mwilu Mumbi, Remmy Mukonka, Yusuf Ayami, Dymus Nyeleti institutions: UNESCO, ZINGO, Zambia

A.M. Saili
*UNESCO, HIV and Health Education, Lusaka, Zambia*
*Presenting author email: a.mwewa-saili@unesco.org*

**Background:** The purpose of the project is to improve the sexual and reproductive health (SRH) outcomes of young people in Zambia through the national roll-out of comprehensive sexuality education (CSE) in schools and increased access to sexual and reproductive health services. Baseline data showed that only 25% of school learners scored 95% correct or higher on HIV and AIDS basic knowledge, that 77% of schools did not provide comprehensive life skills-based HIV and sexuality education, and that among 15 year olds, 12.4% of girls and 21.9% of boys had had sex.
**Description:** To ensure a successful national scale-up of the provision of CSE and access to SRH services, an intersectoral and comprehensive approach was used: curriculum development, teacher training, development of teaching and learning materials, strengthening of referral systems, mass media outreach, etc. all of which has required stronger coordination within the government spheres and in-country partners. However, the debate on children being taught sexuality education is a very sensitive and emotive issue, especially among the religious community. As one of the main barriers to successful implementation is community and parental resistance, the project teamed up with an inter-faith organization, ZINGO, who trained religious leaders on CSE, and facilitated the provision of parent-child communication on SRH. The dialogues on sexuality education have made parents and guardians aware of what is being taught in school, and has allowed parents and young people to discuss sexuality education in an open manner. The acceptance of the communities has in turn empowered schools to provide CSE and referrals.
**Lessons learned:** The partnership with ZINGO has provided a platform for dialogue with the religious community and created an opportunity to break religious and community barriers that impede the successful implementation of CSE. Building partnerships with civil society organizations works as a quick enabler for impactful implementation of CSE.
**Conclusions/Next steps:** The effective scale-up of a national programme, requires partnering with faith-based organisations, as integration and intersectoral collaboration without taking into account the fears and resistance of communities, cannot succeed.

## Community-based approaches, including empowerment, outreach and culturally appropriate service delivery

## WEPED411

### Taking stock of the Kamhlaba program: making room for key populations in Swaziland's HIV response

D. Adams[1], R.C. Wolf[2], W. Benzerga[3], N. Metheny[2], L. Maloney[4], B. Sithole[4], K. Lukhele[5], S. Matse[5]
*[1]Johns Hopkins Bloomberg School of Public Health, Department of Epidemiology, Center for Public Health and Human Rights, Key Population Program, Baltimore, United States, [2]U.S. Agency for International Development, Office of HIV/AIDS, Washington, D.C., United States, [3]U.S. Agency for International Development, Mbabane, Swaziland, [4]Health Communication Capacity Collaborative, Mbabane, Swaziland, [5]Ministry of Health, Swaziland National AIDS Programme, Mbabane, Swaziland*
*Presenting author email: darrinjadams@gmail.com*

**Background:** Swaziland's national HIV prevalence is 31% among adults ages 18-49. Female sex workers (FSW) and men who have sex with men (MSM) have 70.3% and 17.6% prevalence, respectively. The Swaziland National AIDS Programme (SNAP), President's Emergency Plan for AIDS Relief, United States Agency for International Development-funded Health Communication Capacity Collaborative (HC3) embarked on the KaMhlaba program to reduce HIV among these populations. Objectives included development of evidence-based programs, strengthening SNAP's leadership and coordinating capacity, improving access to and quality of HIV cascade services for MSM and FSW, and strengthen FSW/MSM constituent-led networks to foster an enabling environment.
**Description:** In November 2015, external evaluators conducted a stock-taking exercise to assess strengths, challenges, and opportunities for KaMhlaba. They interviewed government, community-based organizations, implementing agencies, donors, service delivery providers, and a health care worker training institution. They analyzed existing data comparing age-disaggregated general population prevalence to FSW and MSM, and demonstrated the increased HIV burden among FSW/MSM. FSW follow the same peak prevalence across time as women generally, though FSW prevalence is up to twice has high. MSM have a similar prevalence trajectory over time as general population males, and contrast at ages 35-39 where MSM prevalence sharply increases.
**Lessons learned:** KaMhlaba program implemented size estimation and a "hotspot" venue mapping to identify gaps in the HIV cascade. HC3 established a formal relationship with SNAP to jointly execute activities, including the national coordinating body - the Key Population Technical Working Group. A similar coordinating group was formed among MSM organizations, called the "Super Group", to inform and plan interventions for MSM. Building upon the success of the MSM Super Group and capitalizing on regional FSW support groups, a FSW Group was formed by electing members from the regional support groups and meets monthly. Comprehensive mobile services are available to FSW/MSM in 15 hotspots including CD4 testing, sexual reproductive health/family planning and referral to ART, adherence and psychosocial support. Older MSM have tailored, separate interventions from younger MSM.
**Conclusions/Next steps:** Kamhlaba will scale-up and increase quality through Super Group engagement and outreach efforts to clinical providers. These nascent outreach efforts will grow into enhancing active linkages for care and treatment.

## WEPED412

### Combining road safety and health testing and counseling among truck drivers: the case of South Africa and Zimbabwe

E. Tapfuma[1], J. Viner[2]
*[1]Swedish Workplace HIV/AIDS Programme, HIV/AIDS, Harare, Zimbabwe, [2]Swedish Workplace HIV/AIDS Programme, HIV/AIDS, Stockholm, Sweden*
*Presenting author email: edith.maziofa@yahoo.co.uk*

**Background:** HIV remains a major challenge in the Sub Sahara Region. While significant progress has been made in addressing the epidemic amongst the general population prevalence is still very high in key populations who include long distance Truck drivers & sex workers. This challenge for long distance truck drivers is compounded by Road safety concerns and high records of traffic accidents on the transport corridor.

**Description:** It is against this background that the Swedish Workplace Programme developed interventions to reach out and target long distance truck drivers in South Africa, and Zimbabwe. The campaign in the 2 countries involved a Road-side Stop and Test Campaigns in South Africa and Zimbabwe in partnership with Scania group ,Ministry of Transport & ILO

Objectives of the Driver Road Safety and HTS campaigns:-

1. Raising awareness on HIV & Wellness among long distance truck drivers
2. Raise awareness on the importance of Road Safety to reduce Traffic accidents
3. Offering Health Testing services to drivers at the stop and test sites
4. Ensuring linkages to treatment, care and support for those tested where necessary
5. Sensitisation on union social protection schemes
6. Promote Wellness and healthy lifestyles
7. Provide bumper check on vehicles stopped at the road side campaigns and issue a defects report where necessary.

**Lessons learned:** There is a need for continued awareness about HIV and Wellness among Truck drivers, Truck stops, toll plazas and border posts are convenient places to offer awareness and testing services for long-distance truck drivers, Provide syndromic treatment and HIV counseling at strategic points along major trucking routes to allow easy access to Health testing services ,mobile clinics along trucking routes to provide STD treatment and counseling to truck drivers and sex workers.

**Conclusions/Next steps:**

1. Replicate along Transport corridor in Southern Africa to reach more drivers
2. Complement the HTS programme with education activities in the surrounding community in order to reduce risky behaviours, encourage HIV prevention and early diagnosis of HIV and opportunistic infections as well as early treatment.
3. Combining Road safety, car fitness and HTS resulted in increased uptake of HTS among Truck drivers.

## WEPED413

### THE INTERPLAY BETWEEN HIV/AIDS COMPETENCE IN THE HOUSEHOLD AND COMMUNITY-BASED TREATMENT ADHERENCE SUPPORT FOR PEOPLE LIVING WITH HIV/AIDS IN SOUTH AFRICA

C. Masquillier[1], E. Wouters[1], D. Mortelmans[1], B. van Wyk[2], H. Hausler[3], W. Van Damme[4]

*[1]University of Antwerp, Sociology, Antwerp, Belgium, [2]University of the Western Cape, Cape Town, South Africa, [3]TB/HIV Care Association, Cape Town, South Africa, [4]Institute of Tropical Medicine, Antwerp, Belgium*

*Presenting author email: caroline.masquillier@uantwerpen.be*

**Background:** The size and scale of the HIV/AIDS epidemic compelled South Africa to respond to their human resource shortages by developing innovative means of delivering health care. In this respect, the HIV/AIDS epidemic was a catalyst for renewed focus on community health workers (CHWs). CHWs bring care closer to people living with HIV/AIDS (PLWHA) and their household environment. The socio-ecological and individual-familiy-community models draw attention to the fact that the dynamic interplay with the household level should be taken into account, in order to study the impact of HIV/AIDS comprehensively. As community-based interventions to support PLWHA have largely ignored the social context in which they are implemented, the following research aim will be addressed: *examining the way in which household dynamics hamper or facilitate the impact of community-based treatment adherence support.*

**Methods:** During the participatory observations, 48 community based treatment adherence support sessions in patient's houses were observed in a township on the outskirts of Cape Town, South Africa. Furthermore, 32 in-depth interviews were conducted with PLWHA, as well as 4 focus group discussions with 36 CHWs. By making use of Nvivo, the data was analyzed carefully in accordance with the Grounded Theory procedures.

**Results:** Despite the fact that the CHWs try to present themselves as not being openly associated with HIV/AIDS services, results show that the presence of a CHW is often seen as a marker of the disease. Depending on the HIV/AIDS competence in the household, this association can challenge the patient's hybrid identity management and his or her attempt to regulate the interference of the household in the disease management. Moreover, the degree of HIV/AIDS competence present in a PLWHA's household affects the manner in which the CHW can perform his or her job and the associated benefits for the patient and his or her household members.

**Conclusions:** This study draws attention to the importance of taking pre-existing dynamics in a patient's social environment, such as the HIV/AIDS competence of the household, into account when designing community-based treatment adherence programs - in order to provide long-term quality care, treatment and support in the context of human resource shortages.

## WEPED414

### BRIDGING THE GAP FROM PEDIATRIC ART TO ADULT ART FOR ADOLESCENTS THROUGH ART MENTORSHIP

P. Kamusiya

*AIDS Counselling Trust, Programmes, Harare, Zimbabwe*

*Presenting author email: pcamsiah@yahoo.com*

**Background:** Studies have shown that adolescents living with HIV on antiretroviral therapy (ART) often have lower viral suppression rates compared to both adults and younger children. This sign of treatment failure is mainly due to poor adherence as a result of inadequate support during the transition period from paediatric to adult ART. In addressing this problem AIDS Counselling Trust (ACT) came up with a project to support adolescents on ART through Community Based ART Mentors (CBAM) who are young adults who have been on ART for more than 5 years. The CBAM were trained in Treatment Literacy, Adolescent Sexual and Reproductive and Basic Counselling so that they will be effective in dealing with adolescents on ART and be able to respond to respective developmental needs.

**Description:** The organisation collaborated with local health facilities in Dzivarasekwa and Dzivarasekwa Extension to refer adolescents who would have come to collect their medication to CBAM for ongoing support.

The adolescents were given the option to choose the CBAM of their choice from a list that was readily available at the clinic. The project overall objective was to increase ART adherence from 65% to 100% for 150 adolescents in Dzivarasekwa by December 2015.

**Lessons learned:**

· Adherence to treatment increased to 95-100% for the 172 participating adolescents (93 girls; 79 boys)

· Drug fatigue due to being on treatment from infancy was cited as a contributing factor to lower adherence rate.

· The use of young CBAM proved to be an innovative strategy that enhanced the adolescent's self belief and esteem as they had someone who faced similar challenges but managed to survive and still look healthy. Some have established families.

· HIV-positive adolescents need factual information on how to establish intimate relationships, sexual and reproductive health.

**Conclusions/Next steps:** The concept of bridging the gap from paediatric ART to Adult ART for Adolescents through ART mentorship can be adopted by all Health Care providers as a strategy to enhance adherence. For increased efficacy of the project additional ART support services like viral load testing and management of side effects should be available, accessible and affordable.

## WEPED415

### INDIGENOUS WOMEN-CENTERED HIV CARE: RESPONDING TO CULTURE AND SAFETY

K. Czyzewski[1], F. Ranville[1], S. Pooyak[2], C. Reading[3], A. Krüsi[1,4], K. Shannon[1,4]

*[1]BC Centre for Excellence in HIV/AIDS, Gender & Sexual Health Initiative, Vancouver, Canada, [2]Canadian Aboriginal AIDS Network, Victoria, Canada, [3]University of Victoria, Centre for Aboriginal Health Research, Victoria, Canada, [4]University of British Columbia, Medicine, Vancouver, Canada*

*Presenting author email: kczyzewski@cfenet.ubc.ca*

**Background:** Indigenous women globally are disproportionately affected by HIV. In 2014, 30% of new diagnoses in women were among Indigenous women, despite Indigenous peoples representing just 4.3% of Canada's population. Alongside gender inequalities, the intergenerational impacts of colonialism in shaping Indigenous women's exposure to HIV infection are well known; and yet we know less of the voices and experiences of Indigenous WLWH in navigating HIV care and culturally safe practices.

**Methods:** As part of SHAWNA *(Sexual Health and HIV/AIDS: Women's Longitudinal Needs Assessment),* a community-based longitudinal project, we conducted 53 qualitative in-depth interviews with women living with HIV (WLWH) in Vancouver, Canada in 2015, 23 of whom were Indigenous women. Indigenous women participated in the development of the interview guide, the interviews and the data analysis. An adapted Medicine Wheel was used to identify conceptualizations of health. Indigenous women's narratives were analyzed drawing on decolonizing, critical and feminist theories and participatory research with WLWH.

**Results:** Many Indigenous WLWH shared the significance of spirituality and balance in their conceptualizations of health and HIV care. Narratives about health conjured up the legacies of colonialism wherein women recalled how culture, community and safety were stolen from them through colonial policies like the residential schools. Their narratives about interlocking oppression from care providers and agents of the State made suppressing their viral load challenging. Many identified culture as part of treatment but women stated obstacles to cultural revitalization from limited access to urban healing ceremonies and barriers to visiting home communities. Women wanted greater access to HIV services delivered by Indigenous peers, Elders and in groups. Ultimately, Indigenous family-centred HIV care that is responsive to

women's complex realities was not available and the current care landscape further jeopardizes Indigenous WLWH's health outcomes.
**Conclusions:** Despite the high prevalence of Indigenous WLWH, HIV services offer limited engagement with Indigenous epistemologies, spiritualities and collective healing. These stories construct a call for services to be more responsive to Indigenous women. Ultimately, women want their HIV care delivered in culturally safe and holistic ways that honour their resilience and Indigeneity.

## WEPED416

### WORK-RELATED CORRELATES OF ATTITUDES TOWARD ENGAGEMENT IN HIV PREVENTION AMONG VILLAGE DOCTORS IN CHINA

J. Pan[1], Y. Mao[2], X. Li[2], S. Qiao[2], J. Huang[1], D. Wu[1], Y. Zhou[3]
*[1]Beihai Municipal Center for Disease Control and Prevention (CDC), Beihai, China, [2]University of South Carolina, Health Promotion, Education, and Behavior, Columbia, United States, [3]Guangxi Center for Disease Control and Prevention (CDC), Nanning, China*
*Presenting author email: juxianpan58@gmail.com*

**Background:** Most of China's HIV/AIDS cases are found in the rural areas[XL1]. China's Village doctors have played a significant role in improved access to health care for people living with HIV/AIDS (PLWHA). Their attitudes toward engagement in HIV prevention can have a direct impact on health and welling of PLWHA. Existing literature suggests the association of quality of working life, job satisfaction and burnout with engagement. However, there is a lack of rigorous academic research on village doctors' attitudes towards HIV prevention and their work-related factors, which can be reflected in poor policy-making and unjust distribution of resources. The purpose of the current study is to examine the work-related correlates of attitudes toward engagement in HIV prevention among a sample of village doctors in China, after controlling for basic demographic variables and others' attitudes. [XL1] Most of people living with HIV/AIDS (PLWHA) in China are rural residents.
**Methods:** A self-administered cross-sectional survey of 230 village doctors 20 to 74 years of age was conducted in Beihai, Guangxi, China. Measures included their demographics, work-related instruments (quality of working life, job satisfaction, and burnout), attitudes toward engagement in HIV prevention and others' attitudes. We correlated burnout with job satisfaction and quality of working life. We also performed multiple regression analysis using work-related factors, others' attitudes, and basic demographic information.
**Results:** Scales showed relatively good internal reliability among the sample of village doctors with Cronbach alphas ranging between 0.68 and 0.88. Correlation analysis showed that burnout, quality of working life, and job satisfaction were significantly correlated with each other ($p < 0.0001$). Multiple regression analysis indicated that attitudes of village doctors toward engagement in HIV prevention were significantly associated with work burnout ($\beta=-.13$, $p < 0.05$) and others' attitude ($\beta=.24$, $p < 0.0001$).
**Conclusions:** Exploring attitudes toward engagement in HIV prevention among the village doctors is especially important, since they are closely related to the health and well-being of PLWHA in the rural communities in China. HIV prevention intervention efforts should help village doctors to prevent work burnout through enhancing their working conditions, and general well-being.

## WEPED417

### PILL TAKING IN A RESOURCE-POOR SETTING IN SOUTH AFRICA: IMPLICATIONS FOR PRACTICE

J. Boffa[1,2], M. Mayan[3], S. Ndlovu[4], R.L. Cowie[1], R. Sauve[1], T. Williamson[1], D. Fisher[1]
*[1]University of Calgary, Public Health Medicine, Calgary, Canada, [2]Stellenbosch University, Desmond Tutu Tuberculosis Centre, Cape Town, South Africa, [3]University of Alberta, Community and University Partnerships, Edmonton, Canada, [4]Izimbali Zesizwe, Pietermaritzburg, South Africa*
*Presenting author email: jody.boffa@ucalgary.ca*

**Background:** Since 2011 isoniazid preventive therapy (IPT) has been offered widely to prevent tuberculosis (TB) disease among people living with HIV (PLWH) in uMgungundlovu District, South Africa. Clients who accept IPT take a daily tablet for six months, often in addition to antiretrovirals and other medications. In light of existing pill-burden and the historical mistrust of Western medical intervention in the region, we worked with Zulu communities to learn more about healthcare seeking, explanatory models of TB infection and disease, and the experience of IPT and pill-taking in general.
**Methods:** This study was embedded within a larger research project on the effectiveness of isoniazid. Utilising a hybrid of community-based participatory and ethnographic methods, nine individual interviews with PLWH offered IPT and eight focus group discussions (FGDs) with community members were undertaken in three sites of uMgungundlovu District from October 2014 to May 2015. uMgungundlovu has a high incidence of HIV-related TB, and public hospitals and clinics service predominantly overcrowded, marginalised Zulu communities. Transcripts were coded in NVivo version 10 and analysed using qualitative content analysis. Findings were member-checked and discussed with community advisory teams for validity.
**Results:** For many participants, sickness is represented solely by a physical manifestation of pain. Data suggest a general uncertainty about which health systems are trustworthy (Zulu versus Western healing practices, public versus private health systems). There is also confusion about the quality of pharmaceutical interventions due to unregulated pricing by chemists and street vendors. Lifelong treatment, e.g. antiretrovirals or blood thinners, may take precedence over short-term or presumptive regimens. Daily tablets may necessitate cleansing of the gut from the build up of long-term medications through vomiting practices and the use of suppositories.
**Conclusions:** In an environment with high pill-burden, pill taking for potential prevention appears secondary to treatment for lifelong illness or disease symptoms, especially pain-related symptoms. While the use of local herbalists is common, trust remains an issue in all spheres of health seeking, and transparent guidance on drug content and efficacy is desired. Cleansing practices may affect drug-efficacy, and healthcare providers should discuss optimal timing for cleansing and potential effects on drug action with client.

## WEPED418

### "GOOD MEDICINE": THE IMPORTANCE OF CULTURALLY-GROUNDED COMMUNITY-BASED RESEARCH WITH HIV-POSITIVE INDIGENOUS WOMEN: THE VISIONING HEALTH EXAMPLE

K. Shore[1], T. Prentice[2], D. Peltier[3], C. Beaver[4], R. Masching[3], E. Benson[5], W. Whitebird[6], T.S. Dopler[7], C. Loppie[2]
*[1]All Nations Hope, Regina, Canada, [2]University of Victoria, Victoria, Canada, [3]Canadian Aboriginal AIDS Network, Halifax, Canada, [4]PASAN - Prisoners HIV/AIDS Support Action Network, Toronto, Canada, [5]Independent, Vancouver, Canada, [6]Oahas, Toronto, Canada, [7]Sharp Solutions, Ottawa, Canada*

**Background:** Despite a decade of HIV research in which Indigenous women in Canada have been a priority population, they continue to be inequitably impacted by HIV. Indigenous and non-Indigenous scholars agree that the on-going impacts of colonization that deliberately interrupted the inter-generational transmission of cultural values and teachings is the root cause of ill-health across Indigenous communities; however, the vast majority of research designs do not address this colonial legacy and do little to reconnect participants with their cultural traditions.
**Description:** *Visioning Health* was a strengths-based, culturally-grounded, arts-informed and community-based participatory research pilot project that explored the intersections of health, culture and gender from the perspective of HIV-positive Indigenous women. This academic-community partnership, including Indigenous and non-Indigenous team members, was guided by Indigenous principles and grounded in Indigenous culture in multiple ways that evolved over time. We worked closely with Traditional Knowledge Keepers to ensure that culture, ceremony and traditional teachings were not 'add-ons' but integral aspects of our research practice. We also used Indigenous methods such as sharing circles and arts-informed inquiry using traditional Indigenous art-forms. In total, we engaged 13 women across three research sites in semi-structured group research processes. Total time spent with each group was 50-60 hours. We followed this with participatory analysis and community-driven culturally-grounded knowledge translation and exchange that participants referred to as "good medicine".
**Lessons learned:** Incorporating culture and ceremony into our research design-was an important innovation that enhanced our research practice, and increased relevance and reliability of our research results. Unexpectedly, it also acted as a health promotion intervention by creating a safe space in which participants could explore, re-store and re-connect to their cultural teachings and their cultural identity. In turn, they reported a stronger sense of connectedness, self-determination (self-mastery) and social support.
**Conclusions/Next steps:** *Visioning Health* was a conduit for the positive Indigenous women in our research to reclaim their culture and reconnect to their Indigenous identity. Building on the success of this pilot study, we have secured funding for a culturally-grounded intervention study that specifically explores the connections between the Visioning Health approach and enhanced health for positive Indigenous women in Canada.

### DOES INTEGRATION OF TARGETED INTERVENTION PROGRAM WITHIN COMMUNITY ORGANIZATIONS AFFECT OUTREACH AND FUNCTIONALITY?

B. Madhusudana[1], A. Porwal[2], S. Kishor Patel[2], A. Rajatshuvra[2]
*[1]Population Council, New Delhi, India, [2]Population Council, HIV/AIDS Programs, New Delhi, India*

**Background:** Avahan phase-III program in India focuses to reduce vulnerabilities among FSWs as well as MSM and make the Community Organizations (COs) strong and sustainable. Program focuses on (i) social protection (social entitlements and schemes) (ii) financial security, (access to formal financial sources), (iii) safety, security and justice, and (iv) institutional development. The earlier phases of Avahan program in India has led to some COs functioning with the Targeted Intervention (TI) program, and some without. This study assesses the differences of functioning between TI based COs and non-TI based COs.
**Methods:** Data were collected from 87 Community Organizations in India on CO level characteristics from May to July, 2015 as part of Avahan phase-III evaluation survey. This study uses data from 75 FSW based COs. Bivariate analysis between various profile and CO functioning indicators, and TI versus non-TI based COs was performed.
**Results:** Outreach of TI based COs was better than that of non-TI based COs, in terms of the number and percent of FSWs who registered as members at the CO. Only 19% COs reported having nodal crisis response teams in all sites. 96% COs responded to violence incidents in less than 24 hours. A higher percentage of non-TI based COs had a help desk compared to TI based COs (76% vs. 54%, p=0.033). There was no significant difference between the TI and non-TI based COs (p>0.05) in; annual financial plan (89%), external auditing (91%), internal auditing (88%) and a sustainability plan (61%). higher proportion of TI based COs reported that auditing was done compared to non-TI based COs (100% vs. 83%, p=0.009).
**Conclusions:** The TI based COs were able to reach a larger population which is an important factor for systematic capacity strengthening of Cos. It may be more beneficial for the program to integrate COs and the TI program. Not only will this encourage collaboration between the different aspects of HIV prevention and vulnerability reduction, it will also enable the COs to expand their outreach and services.

## WEPED420

### MECHANISMS FOR FAITH-COMMUNITY RESPONSE TO HIV: SURVEY OF TWO DECADES OF ENGAGEMENT WITH CASE EXAMPLES OF EFFECTIVE EXPERIENCE

J. Olivier[1], S. Smith[2]
*[1]University of Cape Town, School of Public Health and Family Medicine, Cape Town, South Africa, [2]UNAIDS, Geneva, Switzerland*
*Presenting author email: jill.olivier@uct.ac.za*

**Background:** A Fast Track approach calls for accelerated, more equitable and strategic delivery of services, along with advances on human rights issues, with the goal of ending AIDS as a public health threat by 2030. Community responses to HIV are an integral part of this strategy, however, they are not often integrated into national plans or sufficiently funded by domestic resources. UNAIDS estimates that to achieve Fast Track goals it will be critical to increase community-based services and advocacy (including investment for this). Evidence supports awareness that faith-inspired communities provide a range of HIV services, often filling gaps and serving key populations (as demonstrated in a 2015 special edition of The Lancet). These responses are often culturally
(or religiously) appropriate. However, there is limited translation of knowledge about faith-specific community response into policy and planning.
**Methods:** We report on a systematic literature review and linked case study conducted as part of a UNAIDS Best Practice effort. The review assessed literature on the faith response to HIV/AIDS (international scale, 2000-2015). The case study assessed distinctive models of faith-community response to HIV/AIDS by collating findings from a survey, indepth interviews (25) and programmatic documentation. Cases were selected based on assessment of their 'effectiveness' (demonstrating 'good public health' as well as 'good theology'), and variation (geography, religion, and service type).
**Results:** We identify unique intervention models for effective engagement with faith communities. Cases include targeted engagement with key populations such as sex workers; adaptations of ART to including 'blessing' and religious ritual for increased uptake; community financing models through congregational emergency funds; community systems strengthening which improve linkage to care; and theological engagement with religious leaders leveraging their role as 'key influencers' for prevention.
**Conclusions:** We identify positive and negative experiences of engagement with faith communities (which translates into challenges and opportunities for future engagement). There is a major knowledge-translation barrier between information and experience of (faith) community response to HIV, and effective policy engagement. This barrier perpetrates a historic lack of integration of community response into national public health strategy and investment.

## WEPED421

### "WE MUST BE REALISTIC, A LOT OF YOUNG PEOPLE DO NOT ABSTAIN": A QUALITATIVE STUDY TO UNDERSTAND THE EFFECTS OF TRAINING FOR CBO'S TO REACH YOUNG PEOPLE EFFECTIVELY

M. Groenhof[1], V. Akinyi Omollo[2], J. Reinders[3], M. Musinguzi[4], W. Kakaire[5]
*[1]Stop AIDS Now!, Policy and Programme, Amsterdam, Netherlands, [2]Centre for the Study of Adolescence, Kisumu, Kenya, [3]Rutgers, Internatational Programmes, Utrecht, Netherlands, [4]ICCO Cooperation, Central and Eastern Africa Regional Office, Kampala, Uganda, [5]Restless Development Uganda, Kampala, Uganda*
*Presenting author email: mgroenhof@stopaidsnow.nl*

**Background:** Developing interventions that target the right needs and take the context into account are essential for young people to have access to quality behavioural HIV prevention strategies and Sexual and Reproductive Health (SRHR) education. Some programmes are mainly based on providing knowledge, without taking the broader context into account. Sometimes programmes are based mainly on moral values instead of facts and evidence.[1] Training of trainers, related to effective intervention development and implementation, could be an effective way to reach a large number of community-based organisations (CBO's) and thus ultimately young people.
[1] Stanger-Hall K.F. & Hall D.W. (2011). Abstinence-Only Education and Teen Pregnancy Rates: Why We Need Comprehensive Sex Education in the U.S.. PLoS ONE 6(10): e24658.
**Methods:** We scaled up a Training of Trainers pilot project in which trainers support CBOs in qualitative programming following the intervention mapping approach. The aim of this study is to understand the impact of this project. Forty seven local trainers working for civil society organisations from 12 African countries were trained. They supported 142 CBO's in their countries in three years. For this qualitative study we analysed results of the training and support for 22 CBO's in 3 different countries, through analysis of; 40 in-depth interviews, 13 quality assessments[1] and 11 monitoring visits.
[1] Kirby, D., Laris, B.A., & Rolleri, L. (2006). The Impact of Sex and HIV Education Programs in Schools and Communities on Sexual Behaviors among Young Adults. Research Triangle Park, NC: Family Health International.
**Results:** Interventions are adapted and improved. Supported staff report to increase meaningful involvement of young people, strengthen linkages with other actors around them, identify the importance to conduct a needs assessment and more effectively address stigma and discrimination and gender inequality. CBO's implemented more activities to create demand among young people to access health services.
**Conclusions:** To fast track the HIV response and reduce other SRHR problems among youth, evidence of effective programming, who are culturally appropriate must be applied in practice on a large scale. From our project it is clear that working with a pool of trainers is an effective approach to support civil based organisations.

## WEPED422

### UNIFIED FACILITATION OF SERVICES TO REDUCE KEY POPULATIONS SOCIAL AND ECONOMIC VULNERABILITIES

P. Bhoopathy[1], S. Karkal[2], S. Kumar[2]
*[1]Swasti, Health Sector, Chennai, India, [2]Swasti, Health, Bangalore, India*
*Presenting author email: pbhoopathy76@gmail.com*

**Background:** Swasti is a health resource centre established in 2002 with a focus on achieving public health outcomes for those who are socially excluded and poor. Swasti had been implementing the Avahan Phase III initiative, supported by the Gates Foundation, across 84 community organisation in 5 states of India (Karnataka, Tamil Nadu, Andhra Pradesh, Telangana and Maharashtra). The Initiative has two major priorities. One is at an individual level, to reduce vulnerabilities of HIV among female sex workers, MSM and Transgender community (which affect risks) and second is to strengthening community organizations to make them robust and sustainable.
**Description:** Key populations (Sex workers, MSM & TG Community) are not able to access the schemes and services due to various reason like stigma, lack of knowledge, illiteracy etc. In order to overcome these challenges, Unified Help Desks (UHD) has been set up and facilitators have been appointed in all the community organizations to facilitate social protection and financial services. They also provide support when crises cases are reported. These facilitators will be the face of the

UHDs. A separate UHD phone number has been provided to each of the UHD and this number has been popularized with the key populations to dial in for any services and products related to social protection, financial services and crisis related incidents. This approach has been very successful and has provided a wonderful way to Sex workers, MSM & TG Communities to access many key services.
**Lessons learned:** Multiple services need to be provided by a community organization to the communities that are served by it, and a UHD helps to channelize all these services by providing a platform for the community. The easy accessibility and low cost of services truly embodies the spirit of "All for One, One for All".
**Conclusions/Next steps:** Within six months of establishment, the UHDs have been able to generate **39,632** applications on social protection and financial products. Apart from these, **4,983** cases of crises have been resolved among female sex workers. This confirms that Unified Help Desk approach is a new phenomenon and a sustainable module for providing services to the most marginalized communities.

## WEPED423

### A QUALITATIVE EXPLORATION OF PSYCHOSOCIAL CHALLENGES FOR PERINATALLY HIV-INFECTED ADOLESCENTS AND FAMILIES IN BANGKOK, THAILAND

D.F. Nestadt[1], S. Lakhonpon[2], G. Pardo[3], C. Saisaengjan[2], P. Gopalan[3], T. Bunupuradah[4], M.M. McKay[3], J. Ananworanich[2,5], C.A. Mellins[1]
*[1]Columbia University and New York State Psychiatric Institite, HIV Center for Clinical and Behavioral Studies, New York, United States, [2]SEARCH, The Thai Red Cross AIDS Research Center, The Children and Youth Program, Bangkok, Thailand, [3]New York University Silver School of Social Work, McSilver Institute for Poverty Policy and Research, New York, United States, [4]The HIV Netherlands Australia Thailand Research Collaboration (HIV-NAT), The Thai Red Cross AIDS Research Centre, Bangkok, Thailand, [5]U.S. Military HIV Research Program, Henry M. Jackson Foundation for the Advancement of Military Medicine, Bethesda, United States*
*Presenting author email: danielle.nestadt@gmail.com*

**Background:** Globally, pediatric HIV is becoming an adolescent epidemic, with perinatally HIV-infected (pHIV+) children surviving into adolescence and fewer infants infected at birth. pHIV+ adolescents are at increased risk for a host of adverse behavioral outcomes, yet few evidence-based interventions exist to meet their needs. Although Thailand has the highest HIV prevalence in Asia and is home to nearly 10,000 HIV+ adolescents, with thousands more younger HIV+ children, there are no evidence-based psychosocial interventions for this population. Studies identifying the psychosocial needs of Thai pHIV+ adolescents are sparse, thus the current study aimed to explore those needs to inform intervention approaches.
**Methods:** Focus group discussions (FGD) with pHIV+ adolescents aged 12-16 and their adult caregivers, as well as in-depth interviews with health/social work care providers were conducted at a research/ health care center in Bangkok, Thailand. FGD explored concerns about living with HIV, mental health, and risk behaviors, child-caregiver communication, peer relationships, and issues of adherence, disclosure, and stigma. Interviews examined critical issues for HIV-affected families, including disclosure, adherence, coping and mental health, and perceptions about needed psychosocial interventions. Data were analyzed thematically.
**Results:** Multiple challenges emerged from the data. Adherence to antiretroviral treatment was a significant challenge that was attributed to lack of adult support, medical factors, including side effects or not feeling ill, and not wanting to disclose or acknowledge sickness. Concerns about stigma and discrimination in Thai society emerged strongly, related to difficulty disclosing HIV status to children and to others. Most kept HIV a secret based on fear of rejection. Poor communication, misunderstandings, and conflict between children and caregivers was a key concern, based on the Thai cultural expectation of obedience, generation gaps, and harsh discipline. Respondents also identified positive approaches to addressing these issues including greater social and HIV+ peer support for children and better communication skills for children and caregivers.
**Conclusions:** Significant psychosocial challenges exist for Thai pHIV+ adolescents and families. Interventions to address these issues are needed that are adapted to the Thai context, given the particular cultural, social, and familial environment and the role of HIV stigma/discrimination.

## WEPED424

### STOPPING THE VIOLENCE BEFORE IT STARTS: EVIDENCE FROM A GBV PREVENTION PROGRAMME IN MALAWI

B.A. Ushie[1], A. Muntali[1], T. Panga[1], L. Langhaug[1], B. Gwezera[1], G. Alufandika[2]
*[1]REPSSI, Randburg, South Africa, [2]REPSSI, Lilongwe, Malawi*
*Presenting author email: brighton.gwezera@repssi.org*

**Background:** A growing body of evidence from sub-Saharan Africa highlights the interface between gender-based violence (GBV) and HIV infection. Recent studies indicate high levels of school-based violence in Sub-Saharan Africa. Predominantly, girls and women are viewed as victims, with boys and men as perpetrators.
Recent programme evidence suggests that these two populations are rarely tackled together; even fewer programmes focus on young girls and young boys. REPSSI has developed a unique holistic programme to prevent GBV that focuses on boys, girls, and their community.
We report here on results from a pre- and post-test survey.
**Methods:** A total of 497 (88.6%) out of 561 primary school pupils aged 10-18 years from nine schools in Lilongwe District, participated in the follow-up survey. Data was collected using an ACASI interviewer-administered questionnaire, which captured household poverty, mental health, and violence-related experiences and attitudes.
**Results:** At baseline, pupils mean age was 13.4±1.8 years; 50.1% were female. Poverty was high with 8.2% having endured a whole day without food in the past week. A quarter of pupils (25.3%) reported having ever been punched or hit on the head at home, 11.8% and 3.7% lived in households where parents shouted and hit each other at least once a week, respectively. At school, 39.4% reported receiving corporal punishment; 18.2% were teased and bullied, and 13.0% reported not feeling safe around school toilets. Pupils exhibited poor mental health (males=20.6%; females=16.4%. At follow-up, we found no changes in pupil's attitudes to gender based violence, improved mental health, or sexual health knowledge. However, over 70% of girls reported using skills acquired during the programme to prevent physical and verbal abuse. Almost 80% of boys reported using an acquired skill to prevent a girl from being verbally abused.
**Conclusions:** While this programme did not impact attitudes, young people were able to immediately use the skills gained on the programme to defend themselves and their peers. This study provides strong initial evidence that programmes aimed at young people can prevent GBV.

## WEPED425

### COMMUNITY-LED MECHANISM TO IMPROVE ACCESS TO HIV TREATMENT IN WEST AFRICA: A CASE OF THE STOP PROJECT

B. Kouame Epse Konan[1], S. Bukiki[2], C. Ako[3]
*[1]ITPC West Africa, Abidjan, Cote D'Ivoire, [2]International Treatment Preparedness Coalition - West Africa, Abidjan, Cote D'Ivoire, [3]ICHANGE CI, Abidjan, Cote D'Ivoire*
*Presenting author email: ndjoulo@gmail.com*

**Background:** The Project STOP (Stop Stock Out Project) is a two years project implemented by ITPC West Africa to improve communities' access to HIV treatment through a community based monitoring of ART procurement and use. The project was implemented in Cote d'Ivoire, Gambia and Sierra Leone.
**Description:** Three Rapid Situational Analysis were conducted in countries to understand treatment access and supply chain management issues. Based on information collected, an Advocacy for Community Treatment (ACT) toolkit was developed to train community activists to address threats to treatment access. In addition they were trained on ART monitoring. Community data collection on ART availability and access was carried out by data collectors trained. Data collected were channeled to project national focal point in respective countries for analysis by project focal point. When drug shortage was proven, a Community Consultation Group made up of key populations, PLHIV, discuss on findings from data collectors and write to ITPC-West Africa for advocacy activities.
**Lessons learned:** Knowledge of affected communities on drugs procurement and supply systems in the three countries was strengthened.
Stock-out information were collected all over the 20 health regions in Cote d'Ivoire. This reduced to 3 days maximum breaks stock out which occurred more than 14 days. Ten treatment activists were trained and deployed in 10 health regions in the Gambia to provide feedback on the state of stocks in the Central Medical Stores.
Treatment Supply Chain was monitored in Sierra Leone, thus reducing drugs stock out of ARVs and laboratory equipment's from a maximum of 60 days to 5 days.
**Conclusions/Next steps:** Community mechanisms can generate real-time information that guides effectively drug and commodities quantification and supplies. But also STOP Project is an example of accountability in managing ART and this system involved PLHIV. Strengthen the monitoring of the access to services around local treatment committees at all districts levels.

### ROLE OF APPRENTICESHIP IN IMPROVING THE LIVELIHOOD OF HIV-POSITIVE ADOLESCENTS WHO PREMATURELY DROP OUT OF SCHOOL: THE MILDMAY UGANDA EXPERIENCE

A. Businge[1], O. Nantale[1], S. Musimenta[1], F. Kyamanywa[1], S. Luyinda[1], G. Sempiira[1], G. Kabunga[1], M. Odiit[1], Y. Karamagi[1], B. Namata Mukasa[1], H. Chemusto Chelimo[2]
*[1]Mildmay Uganda, Kampala, Uganda, [2]Harriet Chemusto, Kampala, Uganda*
*Presenting author email: alice.businge@mildmay.or.ug*

**Background:** HIV& AIDS has adverse effects on the livelihood of adolescents especially when parents die or are poor due to ill health. They are therefore left with no support, thus fail to keep clinic appointments, engaging in anti-social behavior like use of drugs, risky sexual behavior etc. Mildmay Uganda has an apprenticeship programme that helps such children acquire skills with the hope that these skills will help improve their quality of life. This study is aimed at exploring the extent to which this program contributes to the improvement their livelihood.
**Methods:** A retrospective review of data of all adolescents who had been enrolled on the apprenticeship programme from January 2012 to January 2014 was done to document their progress and any lessons learnt. A vulnerability index tool was used to assess vulnerability levels and at same time to measure the progress and improvement of livelihood.
**Results:** A total of twenty [20] adolescents enrolled on the apprenticeship programme during the stated period. Twelve [12] were male and eight [08] were female. They were in the age range of 17-24 years. Six [06] of them dropped out at primary level and fourteen [14] dropped out at secondary level. All the clients studied were orphaned either by one parent or both. The skills given were: tailoring [02], hairdressing [06], mechanics [03], plumbing [01], Jewellery [01], knitting [01], barbering [01], cobbler [01], cookery [04] among others. Sixteen out of the 20 [80%] have been able to use the acquired skills to improve their livelihood. The vulnerability level assessment outcome showed graduation from extremely poor to poor. These adolescents are now able to meet their basic needs, keep clinic appointments and are emotionally stable. Reasons for the 20% failure include distraction from the opposite sex and desire for a better job.
**Conclusions:** Apprenticeship is one way that can be used successfully to improve the livelihood of adolescents who prematurely drop out of school.

## WEPED427

### CHALLENGES TO COLLABORATION BETWEEN COMMUNITY ORGANIZATIONS AND PRIVATE COMMUNICATIONS AGENCIES IN DEVELOPING HIV/AIDS COMMUNICATIONS CAMPAIGNS IN QUEBEC/CANADA BETWEEN 2004 AND 2014

R. Légaré[1], K. Monteith[2], L. Lacharpagne[3]
*[1]COCQ-SIDA, Communication, Montréal (Québec), Canada, [2]COCQ-SIDA, Executive Director, Montréal, Canada, [3]COCQ-SIDA, Montréal, Canada*
*Presenting author email: liz.lacharpagne@cocqsida.com*

**Background:** In Canada, since the beginning of the 1990s, community organizations have been collaborating with communications agencies to develop campaigns aimed at preventing new infections and fighting the stigmatization linked to HIV. At the onset of the epidemic, collaboration between the two sectors was facilitated by the urgency of the need to spread information, and the simplicity of the message - HIV = death. Campaign concepts were generally created by agencies, and proposed to community organizations. This aspect of the working relationship was renegotiated starting in the 2000s, as a result of the growing complexity of the messaging and the context of community action.
**Description:** Since the 1990s, COCQ-SIDA has produced numerous communications campaigns. These campaigns were always the result of partnerships with various communications agencies. With the therapeutic advances of the late 1990s and a better understanding of the impact of stigmatization on people living with HIV or AIDS, COCQ-SIDA was looking to renew its communications messages and approach. In light of this, in the early 2000s COCQ-SIDA developed new ways of working, increasing its autonomy in relation to its agencies, with the aim of producing campaigns that better responded to the needs of Quebec's HIV sector at the community level. It accomplished this by
1) choosing local communications agencies
2) introducing preliminary meetings with agencies
3) creating a very detailed client brief for each campaign.

**Lessons learned:** Implementing this changed working relationship between COCQ-SIDA and its agencies was not without challenges. Among other things, it led to the end of a partnership with a large international agency. Additionally, the presentation of nuanced data and the sheer volume of information to transmit did not always allow for the creation of the types of punchy messaging and visuals that were possible in the early years of the HIV epidemic.
**Conclusions/Next steps:** The evolution of the collaboration between COCQ-SIDA and its communications agencies through, among other things, the development of relationships with smaller communications agencies, allowed for the creation of campaigns adapted to the needs of Quebec's HIV sector at the community level.

## WEPED428

### THE RESEARCH IS THE INTERVENTION: STRENGTHENING NETWORKS OF PERSONS LIVING WITH HIV THROUGH PARTICIPATORY ACTION RESEARCH

A. Benton[1], M. Arnold[2], L. Sprague[3], S. Skipper[1], A. Hampton[4], J. Alvarez[5], L. Taton-Murphy[6], B. Minalga[7], J. Loveluck[1]
*[1]UNIFIED-HIV Health and Beyond, Community Research and Innovations, Detroit, United States, [2]Harder+Company Community Research, Oakland, United States, [3]Global Network of People Living with HIV North America, Ann Arbor, United States, [4]Wayne State University, Horizons Project, Detroit, United States, [5]OLHSA, A Community Action Agency, Pontiac, United States, [6]Detroit Health and Wellness Promotion, Detroit, United States, [7]University of Michigan, Ann Arbor, United States*
*Presenting author email: laurelsprague@me.com*

**Background:** HIV stigma and discrimination is a perpetual issue among many disenfranchised populations of people living with HIV (PLHIV) and a fundamental barrier to addressing the HIV epidemic. Grounded in the principles of the Greater Involvement of People Living with HIV (GIPA), the first U.S. implementation of the PLHIV Stigma Index was piloted in the greater Detroit, Michigan area. The study engaged PLHIV leadership into each phase of the research process, including data collection, analyses, and advocacy.
**Description:** The PLHIV Stigma Index survey was adapted and facilitated by the convening of The Global Network of PLHIV North America and *UNIFIED-HIV Health and Beyond* to capture the social, cultural and economic challenges. Five diverse HIV-positive leaders from key populations were recruited and trained to administer the survey. The interviewers, along with a coalition of HIV positive community leaders, formed The Leadership Council to govern the direction of the project. We report study implementation perspectives from group and individual interviews conducted with the leadership council (n=7), and study interviewers.
**Lessons learned:** Through community input having participatory-action research by PLHIV members facilitated the recruitment of populations considered "hard-to-reach". The HIV-status and racial, gender, and age diversity of interviewers improved the speed and scope of data collection from diverse PLHIV in the area. Interviewers' backgrounds also facilitated openness and sharing for interviewees, many of who have not had opportunities to feel heard or may be distrustful of organizations based on stigmatizing experiences. The research study increased the capacity of the leadership council to respond to community needs. Solidarity was fostered among council members who shared similar concerns despite belonging to different populations groups. The survey results informed four action priorities for the council: internalized stigma, HIV criminalization, youth and transgender empowerment, and faith-based networks.
**Conclusions/Next steps:** With increased solidarity and capacity across diverse communities, we learned the research itself was in fact the intervention—a stigma reduction approach to community concerns. We discuss opportunities for using community research as a means of reducing HIV stigma in local communities. This framework is currently being used to disseminate The Stigma Index in other North American cities and states.

# ACCESS TO APPROPRIATE PREVENTION, DIAGNOSIS, TREATMENT, CARE AND SUPPORT SERVICES, INCLUDING FOR CO-INFECTIONS AND CO-MORBIDITIES

### EVALUATION OF DIFFERENT HIV RAPID TEST ALGORITHMS AS AN ALTERNATIVE TO HIV INFECTION CONFIRMATION AMONG MSM IN CHINA

S. Ming[1], Y. Bao[1], M. Qiu[2]
*[1]AIDS Healthcare Foundation (AHF), Beijing, China, [2]National Center for AIDS/STD Control and Prevention, Beijing, China*
*Presenting author email: yugang.bao@aidshealth.org*

**Background:** The HIV rapid test is quicker, easier and more cost-effective than the traditional Western Blot (WB) plus Nucleic Acid Test in HIV diagnosis. This study aims to evaluate the performance of different HIV rapid test algorithms and advocate for revision of national guidelines in China.
**Methods:** From July in 2014 to June in 2015, On-site blood specimens were collected from MSM clients at You'an Hospital in Beijing, China. All specimens were screened with 3 rapid test kits and confirmed by WB plus nucleic acid test where necessary. Different combinations of rapid kits algorithms were explored and compared to the conventional standard algorithm. Shanghai Kehua, Xiamen InTec, and Zhengzhou Autobio HIV rapid test kits were selected in this study because of high sensitivity (>99%), high specificity (> 98%) in previous research and wider availability in China.
The results of two-kit or three-kit algorithms were recorded as positive or negative if all kits produced the same results and as indeterminate if any discordant result was produced.
**Results:** Among the 1419 on-site MSM blood specimens, 1046 were negative (2 of them were WB indeterminate, subsequently identified as negative by nucleic acid test) and 373 were WB positive. The sensitivity and specificity of the selected 3 HIV rapid test kits were 99.7 - 100% and 99.6 - 99.9% respectively; With the kits number increase in an algorithm, the positive predictive value(PPV) and negative predictive value(NPV) increased from 98.9% to 100% and 99.7% to 99.9% respectively while because of the indeterminate results, the positive coincidence rate, negative coincidence rate and total coincidence rate respectively decreased from 100% to 99.4%, 99.9% to 99.5% and 99.7% to 99.4%.
**Conclusions:** HIV rapid test algorithms work well, especially the three-kit rapid test algorithms given high sensitivity and specificity of rapid test kits. The findings add to the mountain evidence that revision of national guidelines in HIV detection in which a new three-kit HIV rapid test algorithm is essential.

## WEPED430

### HOW AMBIVALENCES IN THE PROVIDER-PATIENT RELATIONSHIP MEDIATES ACCESS TO CARE AND TREATMENT AMONG PEOPLE LIVING WITH HIV IN WESTERN KENYA: INSIGHTS FROM A QUALITATIVE STUDY

F. Odongo[1], O. Bonnington[2], A. Nyaguara[1], V. Akelo[1], D. Kwaro[1], K. Church[2], A. Wringe[2]
*[1]Kenya Medical Research Institute (KEMRI), Kisumu, Kenya, [2]London School of Hygiene & Tropical Medicine, Epidemiology & Population Health, London, United Kingdom*

**Background:** The provider-patient relationship is central to successful navigation through the 'cascade' of care for people living with HIV (PLHIV). Currently there is a paucity of qualitative data relating to the dynamics and consequences of this relationship within the Kenyan context. We aimed to explore the complexities and contradictions within this relationship to elucidate patient trajectories through the HIV 'cascade' of care.
**Methods:** This qualitative study, conducted in Kisumu, Kenya, draws upon 50 in-depth interviews with purposively sampled PLHIV at different stages of the 'cascade' (never initiated on antiretroviral therapy [ART], recently initiated on ART, initiated but defaulted from ART, stable on ART), along with 10 family members of people who died due to HIV, and 8 HIV healthcare workers. Data were collected in 2015-2016 using topic guides which explored patient testing and ART treatment journeys. Thematic analysis was conducted, aided by NVivo 10 software.
**Results:** The patient-provider relation was characterized by ambivalence. The relationship at the point of testing was commonly mutual, with providers often giving tailored, flexible advice and encouragement to diagnosed patients. However, where patients did not enrol at an HIV clinic, there was little attempt by providers to re-engage them. For those that initiated ART, the relationship frequently became asymmetrical with patients less empowered and more coerced, particularly during pre-ART adherence counselling sessions. During treatment, nurses often shifted responsibility for HIV management onto patients, providing limited practical or psychosocial support, making adherence problematic. This was often compounded by abusive communication which could result in patients either ceasing to attend the clinic or seeking healthcare elsewhere. However, where patients conformed to providers' ideal type of patient as an adherer to treatment, the relationship was often cordial.
**Conclusions:** The provider-patient relationship changes at different stages along the 'cascade' and is often characterized by ambivalence which influences patients' interactions with the health care system. Greater efforts to enhance ongoing supportive relationships between patients and providers with tailored and non-judgemental advice could promote patients' engagement in long-term HIV care and treatment and improve ART adherence.

## WEPED431

### OPPORTUNITIES AND CHALLENGES FOR 'TEST-AND-TREAT' IN EASTERN AND SOUTHERN AFRICA: INSIGHTS FROM A MULTI-COUNTRY QUALITATIVE STUDY ABOUT ACCESS TO HIV TREATMENT

M. Skovdal[1], C. Nyamukapa[2], J. Wamoyi[3], W. Ddaaki[4], D. Bukenya[5], F. Odongo[6], E. McLean[7], M. Moshabela[8], J. Seeley[7], O. Bonnington[7], A. Wringe[7]
*[1]University of Copenhagen, Department of Public Health, Copenhagen, Denmark, [2]Imperial College London, London, United Kingdom, [3]National Institute for Medical Research, Mwanza, Tanzania, United Republic of, [4]Rakai Health Sciences Program, Kampala, Uganda, [5]Medical Research Council, Entebe, Uganda, [6]KEMRI/CDC, Kisumu, Kenya, [7]London School of Hygiene and Tropical Medicine, London, United Kingdom, [8]University of KwaZulu Natal, Durban, South Africa*
*Presenting author email: connienyamukapa@gmail.com*

**Background:** In September 2015, the WHO released revised global guidelines to HIV treatment and care, recommending lifelong antiretroviral treatment (ART) for anyone testing positive for HIV - an approach that has been dubbed 'test-and-treat'. Health departments and key stakeholders, across sub-Saharan Africa, are currently developing strategies for to roll-out 'test-and-treat'. In the interest of informing these discussions, this paper draws on findings from a multi-country qualitative study about local perceptions of different HIV treatment programmes, and their influence on access to HIV treatment, to identify possibilities and challenges for the 'test-and-treat' policy.
**Methods:** The study was conducted in 2015-2016 and draws on interviews from 180 people living with HIV (including people who had, and had not accessed ART), 36 health care providers, and 36 family members of people known to have died from HIV. The participants were purposively sampled from sites in Uganda, South Africa, Tanzania, Kenya, Malawi and Zimbabwe. Topic guides explored patient and provider experiences of HIV testing, care and treatment services. Transcripts were imported into NVivo 10 analysed thematically.
**Results:** The analysis revealed three core challenges - cutting across all sites - to the implementation of 'test-and-treat': One, constantly changing guidelines, coupled with hybrid implementation systems, contributed to a general sense of confusion amongst health care staff around who to treat when, although this confusion manifested itself differently between countries. Two, perceptions of need for treatment have not changed in accordance with evolution in policy guidance, particularly amongst seropositive and asymptomatic people. Three, experienced and anticipated HIV-related stigma**,** meant newly diagnosed eligible patients refrained from using health services optimally. On the other hand, challenges pertaining to the interval between HIV diagnosis and ART initiation, and delays experienced by patients who are motivated to start on ART, are likely to be addressed through the introduction of 'test-and-treat'.
**Conclusions:** Country programmes implementing 'test-and-treat' must consider the role of time and readiness in shaping access to treatment. New and shifting guidelines, expanding the eligibility for ART, in combination with old perceptions of need for treatment and stigma, do not provide many PLHIV with the time and space needed to adopt a treatment-enabling patient persona.

### IMPACT OF EFFICIENT PSYCHOSOCIAL FOLLOW-UP ON VIRAL LOAD SUPPRESSION RATE AMONG HIV-POSITIVE PATIENTS TREATED WITH ANTIRETROVIRAL THERAPY

J.D.D. Ndagijimana Ntwali[1], D. Twizeyemungu[2], J.D. Makuza[3]
*[1]Rwanda Biomedical Center, HIV/AIDS, STI's and OBBI Division, Kigali, Rwanda, [2]Ruhengeri Hospital, HIV Clinic, Musanze, Rwanda, [3]Rwanda Biomedical Center, HIV, STI's and OBBI Division, Kigali, Rwanda*
*Presenting author email: ntwalijeado@gmail.com*

**Background:** Psychosocial services play a great role in the management of HIV infected patients. In Rwanda, we consider this program as a priority for the success of HIV antiretroviral therapy. However, this program is challenged by a high turnover of trained staff, which results in a poor management of HIV infected patients in our health facilities.
To understand the impact of psychosocial follow up on the success of HIV treatment, we considered viral load test. We assumed that a suppressed viral load is a good indicator of antiretroviral treatment success.
**Methods:** This is a retrospective descriptive study, conducted in 35 health facilities from four district hospitals in Rwanda from September up to November 2014.
We assumed that an efficient psychosocial service can have an impact on viral load suppression rate for patients on anti-retroviral treatment.
A regular psychosocial recording in patient files, a psychosocial worker available, trained and working regularly (more than 5 hours daily) in HIV clinic, home visits for patients and availability of adolescent support groups were considered as independent variables. Logistic regression has been used to look for factors associated with viral load suppression.
**Results:** A total number of 35 health facilities were assessed (85.3% of all health facilities in the eligible area). 16 health centers (45.7%) had viral load suppression rate above 80% and 19 health centers (54.2%) have viral load suppression below 80%.
Among variables studied, trained psychosocial staff working regularly in HIV clinic was the only which is associated with viral load suppression rate, statistically significant with P= 0.001, OR= 16 and CI= 3.001- 85.304. Other variables, a regular psychosocial follow up recorded in patient files (P=0.078), home visits for patients (P=0.393) and availability of adolescent support groups (P=0.245) were not statistically significant.
**Conclusions:** This study showed that psychosocial support initiatives have a significant impact on viral load suppression. Availability of social workers in our health facilities is a key component in HIV care. We recommended availing social workers in all HIV clinics working at least 5 hours daily.

## WEPED433

### THE COST OF ACCESSING ART: SOCIO-ECONOMIC BARRIERS TO CONTINUOUSLY ACCESSING ANTIRETROVIRAL TREATMENT (ART) FROM THE PERSPECTIVE OF LONG-TERM ADULT ART USERS AT A PUBLIC HEALTHCARE CLINIC IN DURBAN, SOUTH AFRICA

Y. Kriel[1,2], S. de la Porte[3], N.P. Magula[4]
*[1]MatCH Research, Durban, South Africa, [2]University of KwaZulu-Natal, School of Nursing and Public Health, Durban, South Africa, [3]University of KwaZulu-Natal, Anthropology, Durban, South Africa, [4]University of KwaZulu-Natal, Department of Medicine, Durban, South Africa*
*Presenting author email: ykriel@matchresearch.co.za*

**Background:** The South African Antiretroviral Treatment (ART) programme is the largest ART programme in the world, with over 2.5 million people receiving treatment. However, the rapid increase in ART users has resulted in health system barriers that threaten the continuity of access and cause disengagement, which potentially has a significant impact on the success of the ART programme in the future. This ethnographic investigation examined barriers to continuously accessing ART, as perceived by ART users in the public healthcare system in Durban, South Africa.
**Methods:** A mixed methods ethnography was conducted in an urban ART clinic based at one of Durban's largest public hospitals. A total of 190 participants were involved in this study. Ten in-depth interviews, four focus group discussions and 150 questionnaires were completed with adult male (n=57) and female (n=133) ART users, who had been on treatment for more than one year. Participant observation was conducted for a period of 7 months within the ART clinic. The data was triangulated, coded and thematically analysed using NVivo 10 and SPSS software.
**Results:** A number of important social factors were elucidated, including stigma (healthcare, social and work related), gender, personal health beliefs and social support. Stigma due to service design and implementation posed an important obstacle for continued access to treatment. Various economic factors were reported and included transport costs, time off work, monthly visits and irregular income. Borrowing money from relatives was described as a common strategy to navigate costs or lack of funds. However, the monthly visits to access treatment impact on employment, presenting a more challenging obstacle to overcome, since they are beyond the control of the individual.
**Conclusions:** Remaining in care is a challenge that ART users have to face on a monthly basis to ensure their own health and survival. Social and economic factors threaten continuous access to the ART programme, which in the long term may lead to individual disengagement from the programme. The study highlights the importance of conducting implementation science projects to address socio-economic challenges within the healthcare setting to improve long-term ART outcomes and retention in ART services.

## WEPED434

### SOCIAL DETERMINANTS OF RETENTION IN CARE AMONG MEN WHO HAVE SEX WITH MEN (MSM) AND TRANSGENDER WOMEN *(WARIA)* LIVING WITH HIV IN INDONESIA: A CROSS-SECTIONAL STUDY

A. Nugroho[1], V. Erasmus[1], S. Koirala[2], O. Nampaisan[2], J.H. Richardus[1]
*[1]Erasmus MC, University Medical Center Rotterdam, Public Health, Rotterdam, Netherlands, [2]Asia Pacific Network of People Living with HIV/AIDS (APN+), Bangkok, Thailand*
*Presenting author email: a.nugroho@erasmusmc.nl*

**Background:** Many people living with HIV in Indonesia do not consistently visit health care once diagnosed. Accordingly, only 10-20% of all HIV-positive people currently receive ART. As Indonesia is a country where being gay or homosexual is highly stigmatised, MSM and *waria* (Indonesian term for transgender women) living with HIV face unique barriers in accessing health care, compared to other populations. Therefore, we sought to explore the predisposing, enabling, and reinforcing factors that promote retention in HIV care.
**Methods:** This cross-sectional study involved 298 self-reported HIV-positive MSM (n=165) and *waria* (n=133) in seven major cities in Indonesia. Participants were recruited using targeted sampling and interviewed using a structured questionnaire. In this analysis, we defined retention in HIV care as at least one health-care visit every three months once a person is diagnosed HIV positive. A stepwise multivariable logistic regression was applied to test factors associated with retention in care.
**Results:** Of all participants, 66% were adequately retained in care, and about half were already on ART. Overall, MSM participants were younger ($p < 0.05$), and had higher rate of retention in care compared to the *waria* group ($p < 0.01$). Retention was more likely among participants who had been exposed to HIV-related information from the internet (AOR, 2.12; 95% CI: 1.01-4.46), enrolled into a medical insurance program (AOR, 2.81; 95% CI: 1.27-6.21), or were currently on ART (AOR, 6.08; 95% CI: 3.00-12.3). Conversely, individuals reporting stronger social support (AOR, 0.54; 95% CI: 0.32-0.92) and membership in an HIV-related organization (AOR, 0.47; 95% CI: 0.24-0.92) were less likely to be retained in care.
**Conclusions:** Our findings suggest it might be possible that increasing internet-delivered HIV information could improve retention in care, and that it is crucial to provide access to medical insurance for MSM and *waria* living with HIV. More research is needed to identify how social support and organizational membership affect retention in care of these groups in Indonesia.

## WEPED435

### RANDOMIZED CONTROLLED TRIAL OF A PEER NAVIGATION INTERVENTION TO IMPROVE RETENTION IN HIV CARE AND VIRAL SUPPRESSION AMONG HIV+ MEN BEING RELEASED FROM LARGE URBAN JAIL: POTENTIAL MEDIATORS AT BASELINE

W. Cunningham[1], D. Seiden[1], J. Arzinger[1], J. Smith[1], T. Nakazono[1], S. Ettner[1], R. Hechter[2]
*[1]University of California, Department of Medicine / Division of General Internal Medicine, Los Angeles, United States, [2]Kaiser Permanente Southern California, Research and Evaluation, Pasadena, United States*

**Background:** Antiretroviral therapy (ART) has both clinical and public health benefits, yet little is known about potential mediators of retention in HIV care and viral suppression (VS) for HIV+ persons released from incarceration.
**Methods:** We recruited 356 HIV+ jail inmates, performed a baseline assessment, and randomized them 1:1 (180 intervention, 176 control) to a peer navigation intervention vs. transitional case-management control upon release. Viral load blood samples were drawn at baseline, & follow-up. The follow-up is underway. Here we report baseline associations of two dependent variables: retention in HIV care (at least 3 primary care visits in 12 months) and VS (viral load < 200) among those prescribed ART. The main independent variables were self-reported access to care (6-item scale, alpha =0.78,), competing basic needs (5-item scale, alpha =0.80), life chaos (6-item scale, alpha =0.81,), and social stigma (12 items scale, alpha =0.77). We conducted separate multivariate logistic regressions of retention in care and VS with each potential mediator independent variable, controlling for sociodemo-

graphics and CD4 count. To gauge the magnitude of the association, we used predictive margins to estimate values of retention and VS for values of independent variable 1 SD above and below the mean, and 95% CI of the difference with p-values.
**Results:** Among 356 participants, mean age was 39.6; blacks were 42%, Latinos 31%, whites 27%; MSM 50% transgenders 15%. Half had annual incomes of $20,000 or less, while 55% were uninsured. Overall 46% were retained in HIV care and 50% had VS. Significant multivariate correlates of both retention in care and VS were access to care, competing needs, and social stigma (Table 1).
**Conclusions:** Access to care, competing basic needs, and social stigma were strongly associated with continuum of care for HIV+ men leaving a large U.S. jail, and make key targets for the intervention underway.

| | Retention | | | Viral Suppression (VS) | | |
|---|---|---|---|---|---|---|
| Potential Mediator Variables (no. items) | 1 SD Above Mean | 1 SD Below Mean | Difference in probability of retention (95%CI of difference) | 1 SD Above Mean | 1 SD Below Mean | Difference in probability of VS (95%CI of difference) |
| 1. Access to medical care (6) | 0.74 | 0.46 | 0.28 (0.14, 0.41)**** | 0.61 | 0.40 | 0.21 (0.07, 0.34)*** |

## WEPED436

### UNMET MENTAL HEALTH AND SOCIAL SERVICE NEEDS OF FORMERLY INCARCERATED WOMEN WITH HIV LIVING IN THE DEEP SOUTH

D. Pantalone, C. Sprague, B. Rhadakrishnan, S. Brown
*University of Massachusetts, Boston, United States*
*Presenting author email: david.pantalone@umb.edu*

**Background:** In the U.S., the Deep South is the epicenter of new HIV infections (CDC, 2014). Additionally, new HIV diagnoses among women have remained steady since 2008. The Southern and female HIV epidemics overlap demographically (rural, Black). Similarly, the psychosocial risk factors for HIV-infection and incarceration dovetail for women, especially substance abuse and victimization. Given the significant need for mental health and social services of this population—women living with HIV who have incarceration histories—we sought to triangulate information about services offered/needed, and utilization/satisfaction with those services.
**Methods:** We focused on two urban areas in Alabama, Montgomery and Birmingham. We gathered three types of data:
(a) We conducted qualitative interviews with HIV-positive women (n = 28) who had been incarcerated 2x or more in jail/prison. We transcribed interviews verbatim and used content analysis with multiple, independent coders to elucidate themes related to their mental health and social services experiences.
(b) We also conducted qualitative interviews with key informants (n = 11), including front-line service providers and managers at non-profits focused on people living with HIV, previously incarcerated women, etc. Finally,
(c) we conducted an internet search for governmental and non-governmental organizations in both cities providing services in ten domains, including health, mental health, post-incarceration/re-entry, transportation, etc.
**Results:** Triangulating across sources, the following themes emerged:
(a) Criminal offenses were primarily drug-related; substance use treatment is available but does not appear to be based on evidence-based practice.
(b) No re-entry counseling was offered to most women for most releases. Re-entry services that address subsistence needs, such as housing and transportation, were judged as vital.
(c) HIV healthcare services provided by university-affiliated clinics were judged as life-saving. And
(d) chief unmet needs across data sources were services to address job training/placement (to promote financial independence) and treatment for trauma/PTSD (which precipitates drug relapse).
**Conclusions:** In Alabama, the most needed and helpful services for formerly incarcerated HIV-positive women were offered by struggling non-governmental organizations. Intense coordination of services across agencies, framed as re-entry counseling, and the addition of long-term services to promote independence, are needed to improve the quality of life of this highly stigmatized, vulnerable group.

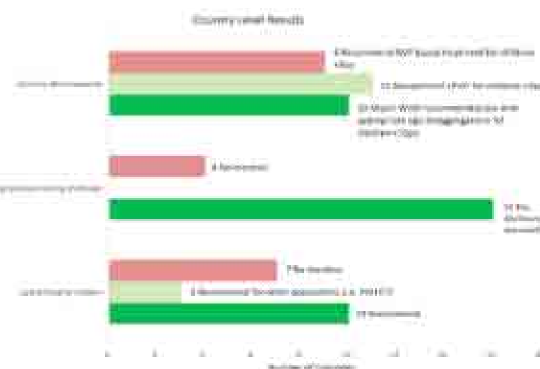
# POLICIES REGARDING HIV PREVENTION, DIAGNOSIS, TREATMENT, CARE, PROTECTION AND SUPPORT

## WEPED437

### ARE KEY COMPONENTS OF COUNTRY-LEVEL PEDIATRIC NORMATIVE GUIDANCE KEEPING UP? A TWENTY-COUNTRY REVIEW

S. Wright[1], A. Amzel[1], M. Srivastava[1], S. Bowsky[2], N. Sugandhi[3], B.R. Phelps[1]
*[1]USAID, Washington D.C., United States, [2]Futures Group, Washington D.C., United States, [3]Clinton Health Access Initiative, New York City, United States*
*Presenting author email: msrivastava@usaid.gov*

**Background:** As of 2014, 2.8 million children are living with HIV (CLHIV) worldwide, and programming high-quality pediatric HIV care remains a priority.[1, 2] This study examined the national HIV guidelines of 20 PEPFAR priority countries for content related to key components of pediatric service delivery that have changed rapidly in recent years, and as such tend to vary across countries with a high burden of pediatric HIV.
**Methods:** The latest HIV guidelines for 20 PEPFAR priority countries were reviewed for content related to: (1) nurse-managed pediatric HIV service delivery (task-shifting), (2) pediatric disclosure, and (3) first-line pediatric antiretroviral (ARV) regimens. For this review, pediatric disclosure was defined as the process by which a child learns his or her HIV status. The 2015 WHO pediatric ART guideline recommendations were considered the standard of care.[3,4,5]
**Results:** Of the 20 country guidelines reviewed, 10 of the 20 countries (50%) referenced the importance of task shifting to increase access to care for children living with HIV (CLHIV). Language supporting the initiation of the disclosure process during childhood was included in 16 of the 20 reviewed guidelines (80%). The recommended age to start disclosing, however, varied, as did guidance on who should lead the process. Ten country guidelines (50%) included first-line treatment regimens matching WHO recommendations for children < 10 years of age. Only 11 countries (55%) recommended a Lopinavir/Ritonavir (LPV/r)-based ART regimen as first line for children younger than three years of age. In adolescents older than 10 years, all but one of the reviewed guideline (95%) documents matched WHO guidelines. (See Table 1).



*[Country Level Results]*

**Conclusions:** As best practices in the pediatric HIV service delivery evolve, country programs must continue to do so as well. Normative guidance is critical to increasing access to high-quality services for CLHIV. Recommendations on appropriate task-shifting, pediatric disclosure, and effective first line therapies often keep pace with (or even outpace) international normative guidance. This review highlights a few of the current gaps where service providers and policy-makers may improve existing guidelines so that CLHIV increasingly have the opportunity to thrive.

### SIGNIFICANT ACHIEVEMENTS FOR THE KEY POPULATIONS MULTI-SECTORAL HIV PROGRAMMING IN UGANDA (2011-2015): EVERY ONE COUNTS

P. Mudiope[1], Z. Karyabakabo[2], R. Kindyomunda[3], C. Ondoa[2], V. Nantulya[2]
*[1]Uganda AIDS Commission, HIV Prevention, Kampala, Uganda, [2]Uganda AIDS Commission, Kampala, Uganda, [3]United Nations Population Fund, Kampala, Uganda*
*Presenting author email: pmudiope@gmail.com*

**Background:** In 2011, Uganda acknowledged that sex workers, MSM, PWIDs, uniformed service men, fisher folks among others, were at increased risk of HIV; with barriers to accessing HIV services compared to the general community. Guided by the global movement to target sources of new infections amidst the primitive socio-cultural and legal environment, the country embarked on a road map to improve HIV response among KPs. This paper describes the programmatic milestones and achievements made in HIV response among KPs in Uganda.
**Description:** Initially Uganda identified barriers to the KP response to include; limited coordination and representation of KP communities, lack of agreed indicators to track interventions, and knowledge on the KPs sizes and profiles, uncoordinated provision of KPs friendly health services, stigma and discrimination. Since 2013, HIV Experts and leaders visited the India BRIDGE and SHARE projects to bench mark HIV programming for KPs in settings with hostile legal environment. Following the visit, the national Multi-sectoral KPs coordination committee was setup to track and re-organize the HIV response among KPs. The committee meets quarterly p.a to guide and direct HIV response among KPs in Uganda.
**Lessons learned:** The KPs have representatives to the Global Fund Country Coordination committee, MARPs steering committee and MARPs sectoral committees that coordinate the HIV response in Government. Due to local KP advocacy, Uganda received a Global fund grant worth USD 1.2million, which has been used to strengthen leadership for KP networks and accelerate HIV services delivery among KPs in 11 districts. Uganda conducted a KPs profile and size estimate study that informed targeting for the national KPs programming.
Over 2000 KPs are accessing HIV services, from the MOH/CSOs collaboration, KPs friendly clinics in four national and Regional level government hospitals.
The repeal of the Anti-Homosexuality Act 2013, resulted in increased demand and access health services by KPs.
**Conclusions/Next steps:** Previously considered hostile, Uganda is fast progressing towards advocating and offering KPs friendly services. The country is embarking on completing the KP priority action plan and guidelines for HIV services provision to KPs. The country plans to conduct nationwide hotspot mapping and KP size estimate to further guide HIV programming.

## WEPED439

### ACCESS TO ANTIRETROVIRAL TREATMENT, TOWARD 90-90-90 GOAL IN ANTENATAL CARE IN THE AMAJUBA DISTRICT

T. Mabaso
*Department of Health KwaZulu Natal, Amajuba, South Africa*
*Presenting author email: thembisite.tshabalala@kznhealth.gov.za*

**Background:** The KwaZulu Natal (KZN) province in South Africa has high antennal HIV prevalence rates, an estimated 40.1% in 2013. Improved access to ART has resulted in declining HIV prevalence rates in some districts of KZN. In Amajuba, for example, the HIV prevalence rate has declined from 46.0% in 2006 to 32.8% in 2013 with a concurrent increase in the uptake of ART among pregnant women.
**Description:** In 2013, the South African Department of Health's (DoH) policy changed from a single dose ART prophylaxis to lifelong ART initiation for all mothers who tested HIV positive. The PMTCT accelerated plan, a national DoH initiative to address high transmission areas, comprising both facility and community based activities initiated community dialogues to encourage service uptake as well as the mothers-to-mothers peer to peer support programme where mentor mothers convened support groups with newly initiated mothers to encourage and offer support with ART.
At the facilities, a steering committee was set up and all clinics were encouraged to produce process maps of their PMTCT facility and regular feedback sessions were held with the clinic staff where they were able to present to other facilities on the progress made and challenges they faced.
**Lessons learned:** These interventions have led to an increase in the uptake of ART with mothers initiated on ART at ANC increasing to a high in 2014. Having more clients on lifelong ART is an important prerequisite for decreasing population level HIV incidence.
**Conclusions/Next steps:** In a setting where almost all mothers present for antenatal care at a health facility, there is a great opportunity to initiate patients who are found to HIV infected. A strong community support initiative running parallel to facility based services can improve ART adherence with wider public health benefit.

| Year | Number of pregnant women initiated on ART |
|---|---|
| 2012 | 754 |
| 2013 | 1754 |
| 2014 | 2448 |

*[Antenatal clients initiated on ART in the Amajuba District of KwaZulu Natal]*

## WEPED440

### ADOLESCENT HEALTH POLICIES IN UGANDA! MAKE THEM REAL

G. Atwiine
*Community Health Alliance Uganda, Advocacy, Kampala, Uganda*
*Presenting author email: gatwiine@chau.co.ug*

**Background:** Uganda has a significant young population, approximately 53% of the population are under the age of 15 years; and one in four are aged 10-18. Uganda's Adolescent Sexual and Reproductive Health Policy aims to mainstream adolescent health concerns into the national development agenda; and improve the quality of life of adolescents, who have specific health and social needs. The policy has a number of objectives, including to provide and increase availability and accessibility of quality information and health services to adolescents and to provide policy makers and key actors guidelines for addressing adolescent health concerns. while Uganda has a comprehensive policy, it is not operationalized. Both district health officials and adolescents do not know about the policy.
**Description:** Community Health Alliance Uganda collaborated with two networks of young people to sensitise decision-makers and youths about the adolescent health policy in 2015. The training included 50 decision makers including parliamentarians in the districts of Nakasongora, Luwero, Namutumba and Bugiri. The youth networks trained 150 youth advocates on adolescent health policy. Youth advocates learnt how to identify opportunities and engage in the design, implementation and monitoring and evaluation of programmes for young people. This included specifically demanding youth-friendly services in health facilities, where young people are involved in the design and implementation.
**Lessons learned:** Young people who understood the adolescent health policy were better able to demand health services because they knew the responsibilities of government
Training youth advocates resulted in specific asks for youth-friendly services and spaces managed by young people themselves
**Conclusions/Next steps:** Young people's advocacy has led to greater commitment and intensified support for actual implementation of the adolescent health policy from district level officials, parliamentarians, policymakers, programmers, young people and parents. 50 youth friendly corners were established. The focus on a specific ask for advocacy provided a practical focus of the advocacy skills learned and hands-on experience engaging with decision-makers has established an ongoing dialogue between the various groups.

## WEPED441

### WHAT IS THE STATUS OF NATIONAL COMMITMENTS AND POLICIES FOR MULTISECTORAL HIV AND AIDS RESPONSE FOR VULNERABLE CHILDREN?

C. Suzuki[1], C. Lunny[2], P. Murphy[1], T. Fenn[1], P. Idele[1]
*[1]UNICEF NY, New York, United States, [2]Consultant, Melbourne, Australia*
*Presenting author email: pidele@unicef.org*

**Background:** With national responses for orphans and vulnerable children (OVC) increasingly incorporated into broader social protection and child protection efforts, the National Commitments and Policy Instrument (NCPI) of the 2014 Global AIDS Response Progress Reporting (GARPR) was revised to evaluate the commitment to HIV-sensitive social protection in national HIV and AIDS programmes. The 2014 NCPI data were analysed to assess: a) the extent to which national HIV and AIDS responses have integrated HIV and AIDS programming into sectoral and multisectoral policy, strategy, and planning; and b) the extent to which children affected by AIDS are supported within child protection, social protection, and other development-focused policy, strategy, and planning.
**Methods:** Quantitative and qualitative analyses were conducted on the 2014 NCPI responses from government and civil society stakeholders; HIV domestic spending data from 2009-2013; and National AIDS Spending Assessments.
**Results:** In 2014, 119 out of 201 countries submitted NCPI reports (59%). The majority of the 119 countries (97%) responding to the NCPI had a national and multisectoral HIV strategy in place. Only two-thirds of respondent countries noted the integration of HIV into poverty alleviation strategies and less than one-fifth reported integration of HIV into a sector-wide approach. Seventy percent of countries re-

porting OVC spending from 2009-2013 show that international sources accounted for 90% or more of total OVC funding. Further, laws and policy environments that negatively impact key populations' access to prevention, treatment, care and support services were also prevalent.
**Conclusions:** An effective national HIV response is premised on strong interactive links between all national sectors, strategies, policies, and planning instruments. This analysis reveals that while some headway has been made to integrate HIV responses into a broader multisectoral and HIV-sensitive approach, more effort is required. Further integration of HIV into poverty reduction strategies, as well as the adoption of a cross-sectoral approach and the commitment of adequate national resources, are encouraged to create a comprehensive policy and planning response to the epidemic, and to meet the needs of orphans, children, and youth vulnerable to HIV.

## WEPED442

### TEST AND TREAT: MINIMUM PROGRAM AND FINANCIAL CONSIDERATION FOR A NATIONAL PROGRAM IN A SCENARIO OF DIMINISHING FUNDING FOR HIV

B.B. Rewari[1], A.S. Rathore[2], V. Purohit[3], M. Bamrotiya[2], M. Mhetre[2], S. Kumar[2]
*[1]WHO India, New Delhi, India, [2]National AIDS Control Organization, Ministry of Health and Family Welfare, New Delhi, India, [3]I-TECH, New Delhi, India*
*Presenting author email: drbbrewari@yahoo.com*

**Background:** The global HIV treatment guidelines, aiming to end HIV as public health threat by 2030, evolved from absolute lymphocyte counts< 1200 and CD4 count < 200/cmm to CD4 < 350/cmm, < 500/cmm and recently, to test and treat. Recommendations, though scientifically evidenced, carries lot of operational and programmatic considerations. Cut off of CD4 < 350 is followed as the eligibility for ART in India (soon to be revised to < 500). Clinical stage 3 & 4, pregnant women, children below 5 years, HIV TB and hepatitis C co-infected are eligible irrespective of CD4 count. We attempt to quantify implications of these guidelines.
**Description:** A desk review of number of PLHIV estimated and in HIV care was done. The basic unit costs currently used in the program for ARV and its monitoring were used to calculate financial implications.
**Lessons learned:** There are estimated 2.1 million PLHA in India, 11,70,006 are already enrolled under the program with 9,19,141 receiving ART and rest receiving Pre ART care. Adopting the "treat all" WHO recommendation translates into immediate need for all these 2.5 lakhs PLHIV. There are estimated 220,000 new enrollments in HIV care that would be the additional load on the existing ART centers. The increased work load will need expansion of facilities, commodity supply and additional Human resources.
The detailed immediate implications are tabulated below

| Implication | | Current scenario (CD4<350/cmm) | Immediate additional implication of treat all (2.5 lakh PLHA in pre ART) | Future implications Year 1 (2.2 lakh new estimated enrollments / year) |
|---|---|---|---|---|
| Program expansion | Number of centers | 520 ART centers | 650 ART centers, Additional HR, training and infrastructure costs | Maintain number of centers |
| Commodity cost (considering only ARV, and monitoring treatment as bare minimum) | ARV | Baseline | 28 million USD over baseline | Baseline + 56 million USD every year |
| | CD4 test | Baseline | Baseline plus 1.45 million | Baseline plus 2.9 million USD |
| | Viral load | Baseline | Baseline plus 7.25 million USD | |
| • Not including program management, M & E, supervision costs | | | | |

*[Immediate implications]*

**Conclusions/Next steps:** There is ample evidence on long term benefits of test and treat approach for individual as well as prevention globally. However, adaptation of these guidelines translates into extensive programmatic issues like more service delivery sites, human resources, training and commodities. These factors need to be well thought and planned before the adaptation really occurs and the governments, development and funding partners should consider this if the targets under 90-90-90 and ending AIDS as public health threat is to be achieved by 2030.

## WEPED443

### BUILDING CONSENSUS TO PROMOTE SYNERGY BETWEEN BIOMEDICAL ADVANCES AND HUMAN RIGHTS IN THE CANADIAN RESPONSE TO THE HIV EPIDEMIC

J. Betteridge[1], T. Rogers[2], B. Leheay[3], B. Santosuosso[1], P. Cupido[2], J. McCullagh[3]
*[1]Canadian Treatment Action Council, Toronto, Canada, [2]CATIE, Toronto, Canada, [3]Positivelite.com, Toronto, Canada*
*Presenting author email: glenn@ctac.ca*

**Background:** Three national HIV organizations indentified unproductive tensions in Canada between community-based responses to HIV and responses that privilege biomedicine. This dynamic may have contributed to ongoing gaps in the HIV response, including failure to adequately address the complex and inter-related health, psychosocial, and basic support needs of marginalized people living with and affected by HIV. We struck a working group to develop a *Canadian Consensus Statement on the health and prevention benefits of HIV antiretroviral medications and HIV testing*.
**Description:** We
(1) held two focus group consultations with a diversity of stakeholders;
(2) researched and drafted the Consensus Statement;
(3) solicited key opinion leader feedback;
(4) conducted an open, six-week on-line consultation;
(5) finalized the Statement taking into account key opinion and public feedback;
(6) developed communications tools and dissemination strategies for each stakeholder group; and
(7) published the consensus statement and invite signatures from individual and organizations.
**Lessons learned:** Stakeholder groups in the civil society response to HIV in Canada (key populations, heath care professionals and researchers, AIDS service and other community-based organizations) support a national HIV response based on the latest scientific evidence and human rights. Two factors contributed consensus. First, we consulted broadly with stakeholders, through successive rounds, over a prolonged period of time (18 months). Second, we used the draft Consensus Statement to set out in plain language recent scientific and medical breakthroughs in HIV, and the importance of human rights. Significant tensions existed regarding expanding HIV testing. Specific and detailed statements regarding HIV testing were required to achieve consensus. Acceptance of the synergy between biomedical advances and respect for human rights is key to promoting GIPA/MEPA and increasing access to and uptake of HIV testing, ARV treatment, PEP and PrEP.
**Conclusions/Next steps:** We will identify champions to promote the Consensus Statement as a basis to foster collaboration among stakeholder groups committed to developing policies, programs and interventions that integrate biomedical advances and human rights. This ongoing consensus building process and the Consensus Statement can become important tools for addressing the complex needs of the diversity of people living with and affected by HIV in Canada, especially the most marginalized people.

# POLICIES ADDRESSING SOCIAL AND ECONOMIC DETERMINANTS OF VULNERABILITY

## WEPED444

### HARNESSING THE POTENTIAL OF ENVIRONMENTAL IMPACT ASSESSMENT (EIA) POLICY AND REGULATION TO SUPPORT AND SUSTAIN GHANA'S AIDS RESPONSE

B. Ofosu-Koranteng[1], B. Amankwa[2], T. Sellers[3]
*[1]UNDP, HIV, Health and Development, RSC Africa, Addis Ababa, Ethiopia, [2]UNDP, Accra, Ghana, [3]UNDP, Addis Ababa, Ethiopia*
*Presenting author email: benjamin.ofosu-koranteng@undp.org*

**Background:** Ghana's Shared Growth and Development Agenda puts a huge premium on the development of large infrastructure in the energy and oil/gas sectors. Bodies such as ECOWAS, SADC and the AU have strategically prioritized large capital projects as a way to boost economic growth and regional integration. Studies in Lesotho, Mozambique, Namibia and South Africa confirms the direct links between the development of large capital projects and HIV prevalence. Ghana has made huge strides in dealing with the HIV epidemic and has a current prevalence rate of 1.3%. Sustaining these gains require innovative ways of addressing key drivers of the epidemic given the emphasis on infrastructure development. The UNDP/AfDB initiative on strengthening the integration of HIV and gender issues in EIAs aims to ensure the proper estimation of HIV risks and the development of appropriate measures to proactively mitigate the negative social and environmental impacts associated with the execution of large projects.

**Description:** The overall purpose of the initiative is to strengthen the integration of health and gender issues in Ghana's EIA processes through a partnership with the National AIDS Council, EPA, National Development Planning Commission and the Ghana Health Service.
**Lessons learned:** Though the initiative is in its infancy, it has demonstrated the potential to involve non health sectors for the achievement of health outcomes. This has included (a) creating awareness among public and private sector actors within non health sectors - mines, energy, gender and academia - of the need to work with the NAC and Ghana health services more systematically in the EIA process; (b) development of an 8 point country action plan (2016-2018) focusing capacity development in the areas of health, gender, human rights and occupational safety in university curriculum; and (c) initiation of a process to develop a certification system for EIA practitioners which includes health and gender as requirements.
**Conclusions/Next steps:** Given the rapid expansion of the oil and gas industry in Ghana and the linkages between large projects and health, mainstreaming HIV and gender issues into the EIAs provides an innovative way for non health sectors to contribute to HIV and health outcomes in Ghana.

## WEPED445

### HEALTH, HIV AND GENDER IN INTERNATIONAL ENVIRONMENTAL AND SOCIAL SAFEGUARD SYSTEMS: ARE WE DOING ENOUGH?

B. Ofosu-Koranteng[1], B. Walmsley[2], T. Sellers[1]
*[1]UNDP HIV, Health and Development, RSC Africa, Addis Ababa, Ethiopia, [2]Southern African Institute for Environmental Assessment, Windhoek, Namibia*
*Presenting author email: benjamin.ofosu-koranteng@undp.org*

**Background:** Most large capital projects in Sub-Saharan Africa are funded by multilateral development banks (MDBs). All of these developments require an environmental and social impact assessment to be conducted prior to the approval of a loan - both in terms of national environmental legislation and as a funding requirement for most MDBs. There is evidence that shows that in spite of these requirements, HIV prevalence, and other co-morbid conditions are always exacerbated around large development projects. Why is this the case?
**Description:** The UNDP/AfDB initiative on Integrating HIV and Gender Equality into Environmental Assessment Processes in Africa has carried out studies into the causes of this conundrum. One such study involved a desk review of five international environmental and social safeguard systems (ESSs) to determine the extent of integration of social and health issues. The systems chosen included those of the World Bank and IFC, as these are applied globally at government and private sector levels respectively.
**Lessons learned:** All the ESS systems reviewed have weaknesses. The main issue being that none clearly define upfront what is meant by 'social', 'health', 'wellbeing' and 'gender'. The inclusion of health issues is also inconsistent within and between ESSs. In terms of communicable diseases (CDs), HIV and STDs are mentioned by all, but there is no identification of other CDs and their linkages with HIV, such as TB. Other development-induced health issues such as malnutrition and psychological problems including mental health are barely mentioned, while risk factors of non-communicable diseases are not recognised in the context of development project ESIA at all. None of the ESSs reviewed make the explicit link between gender and health and none offer a comprehensive analysis of the underlying causes or drivers of health and HIV issues.
**Conclusions/Next steps:** The study recommended that the terms 'environment', 'social', 'health' and 'gender' should be more clearly defined ESS. If gender, community health and occupational health issues are all given full consideration prior to a loan agreements signed for these projects, there is an opportunity for much greater inter-sectoral cooperation, both within the MDB project appraisal teams and in the host nation's governance structures.

# POLICIES ADDRESSING HIV AND AIDS IN THE WORKPLACE AND EDUCATIONAL INSTITUTIONS

## WEPED446

### WE ARE FAMILY: INCLUSIVE HUMAN RESOURCE POLICIES TO ENSURE GREATER ENGAGEMENT AND OPPORTUNITIES FOR TRANSGENDER EMPLOYEES: EXPERIENCE FROM INDIA HIV/AIDS ALLIANCE

V. Sreekumar[1], S. Shaikh[2], P. Sarbeswar Patnaik[2], R. Mani[2], S. Mehta[2], J. Robertson[2]
*[1]India HIV/AIDS Alliance, Human Resources, New Delhi, India, [2]India HIV/AIDS Alliance, New Delhi, India*
*Presenting author email: skumarv@allianceindia.org*

**Background:** Lack of employment opportunities is one of the biggest challenges faced by transgender people in India. Stigmatization and harassment at the workplace further compound this issue, as transgenders face transphobia in many organizations. An enabling and sensitive work environment is key to address the unique challenges faced by this group.
**Description:** India HIV/AIDS Alliance (Alliance India) follows a community-centric approach in its programmes and actively recruits qualified staff from affected communities. The organization strongly believes in equal opportunity principles and has laid down a clear human resource policy that outlines core values of non-discrimination, including free expression of gender identity. With zero-tolerance for all gender-based discrimination, Alliance India also has a sexual discrimination and harassment policy to respond effectively in the event of any incidents. Periodic sensitisation training programmes are carried out for staff and service providers used by the organization. Alliance India successfully negotiated a comprehensive private health insurance policy that includes provisions for partners of transgender and sexual minority staff. Gender identity, HIV status, and health information of every employee are kept confidential, and sharing such information is up to each staff member. Extra support is granted to ensure equity for staff who face particular challenges due to their gender identities, such as legal assistance to help secure identity documents that reflect chosen gender and subsidies for private accommodation during hospital stays.
**Lessons learned:** Alliance India has succeeded in fostering an inclusive and enabling workplace environment by ensuring the safety, comfort, and holistic development of all staff, including transgenders or gender non-conforming employees. This has enabled workplace integration and helped reduce stigmatizing behaviours and attitudes at the workplace.
**Conclusions/Next steps:** A clear and supportive human resource policy nurtures better psychological health and job satisfaction among all employees. There may be initial costs in ensuring supportive policies at the workplace, such as extending health benefits to partners of LGBT employees or establishing policies responsive to the needs of staff living with HIV. However, sensitive human resource management helps attract and retain talented people, fosters a supportive and innovative workplace, and creates greater value proposition for stakeholders in our work.

# POLICIES RELATED TO TREATMENT ACCESS AND INTELLECTUAL PROPERTY

## WEPED447

### PATENT OPPOSITIONS AS IMPORTANT TOOL FOR INCREASING ACCESS TO HIV/AIDS TREATMENT

M. Trofymenko
*All-Ukrainian Network of People Living with HIV/AIDS, Legal Unit, Kyiv, Ukraine*
*Presenting author email: m.trofymenko@network.org.ua*

**Background:** Nowadays pharmaceutical companies use bad faith strategies in a sphere of patenting because of existing imperfect R&D model. One of such strategies is evergreening of pharmaceutical patents. Evergreening refers to a variety of legal and business strategies by which companies with medicines patents that are about to expire retain royalties from them by obtaining new unmerited patents. Evergreening patents are dangerous because they may decrease access to life-saving medicines by allowing pharmaceutical companies to keep exorbitant prices for their products for a long period of time.
HIV/AIDS organizations in different countries are seeking opportunities to increase access to medicines by removing evergreening patents. One of the powerful tools for removing evergreening patents are patent oppositions.
**Methods:** Patent opposition is a tool that allows individual or legal entity (mainly patient organization) to oppose a patent application. It may be submitted while

application is still under analysis by a patent office (pre-grant opposition) or after patent has been granted (post grant opposition). In 2002, civil society won its first battle in opposing a patent when Thai AIDS Foundation struck down BMS monopoly on the HIV/AIDS drug didanosine.
At present day, patent oppositions are submitted by HIV/AIDS organizations in different countries around the world (Brazil, Argentina, Ukraine and others).
**Results:** Summing up experience of patent oppositions submitted in different countries around the world following lessons may be learned:
- close cooperation and sharing of data among patient organizations from different countries is very useful (sharing of scientific arguments, joint PR campaign etc.);
- consultations with global advisors with top level scientific experts (such as I-MAK) are also very useful;
- involvement of generic manufacturers in patent oppositions is a good idea. National and foreign generic manufacturers are interested in preventing patent monopolies and they may support patient organizations during patent opposition proceedings;
- advocacy campaign to raise awareness of society, patent office, judges and healthcare authorities about harmful influence of evergreening patents on public health is extremely important.
**Conclusions:** Patent opposition is an important tool for removing of evergreening patents and should be used more often for increasing access to HIV/AIDS treatment around the world.

## WEPED448

### PATENT OPPOSITIONS: BREAKING PATENT MONOPOLIES

L. Menghaney, S. Gupta
*Medicins Sans Frontieres, MSF Access Campaign, New Delhi, India*
*Presenting author email: shailly.gupta@msf.org*

**Background:** The availability of affordable generic ARVs from India has been crucial in providing and expanding treatment for millions of people living with HIV globally. The key contributing factor for this uninterrupted supply have been safeguards in the patent law enabling the generic companies to develop, register and supply generic versions of drugs patented elsewhere. After introduction of product patent regime in 2005 in India restricting entry of generics in the market, use of public health safeguards such as patent oppositions facilitated in protecting generic competition.
**Description:** Our research will showcase all the key patent oppositions filed by patient groups in India on patent claims covering ARV drugs and the impact of these in stopping unwarranted patents from blocking people's access to more affordable medicines. Some of the key patent applications opposed that has been covered in this research include
- Lamivudine/ zidovudine
- Tenofovir
- Nevirapine syrup
- Abacavir
- Lopinavir/ritonavir
- Atazanavir
**Lessons learned:** Patent oppositions for ARVs have been very useful in deterring patent 'evergreening' of HIV medicines. In most cases, patent oppositions have been followed by rejections, with the final result of ARVs being brought into the public domain. This has played a huge role in expanding HIV treatment to 16 million people globally today.
**Conclusions/Next steps:** Opposing patents is increasingly becoming a useful tool for civil society to challenge questionable monopolies, increase competition and access domestically. As PLHIVs today are dying of co-infections such as TB and Hepatitis-C, filing oppositions could pave the way for early market entry of generic versions of new ARVs, direct acting anti-virals (DAAs) and TB medicines.
To encourage more people to file oppositions, a civil society platform in form of Patent Opposition Database has been set and is continously updated with help from experts enagaged in opposition work across the world. This is an online resource for individuals seeking to explore how to challenge the weak patents on essential medicines and actively seek contributions from the public to make the Database as complete and useful a resource as possible.

## WEPED449

### SUCCESSFUL DIALOGUE WITH PATENT OFFICE TO PREVENT PATENT MONOPOLY FOR MEDICINE IN ABSENCE OF FORMAL PRE-GRANT OPPOSITION PROCEDURE

S. Kondratyuk
*All-Ukrainian Network of People Living with HIV/AIDS, Advocacy, Kiev, Ukraine*
*Presenting author email: s.kondratyuk@network.org.ua*

**Background:** To ensure better economic affordability of one of the direct acting antivirals for treatment of hepatitis C that is very promising for treatment of people living with HIV with co-infection within the project supported by IRF Ukraine (OSF) in 2015 the 'informal' pre-grant patent opposition was tested in Ukraine on patent application filed by the originator company.
**Description:** Although, Ukrainian patent law does not set out any formal patent oppositions procedure, the All-Ukrainian Network of People Living with HIV/AIDS ('Network') and involved patent attorneys conducted dialogue with the Ukrainian Patent Office on not enough inventive nature of pending patent application, the social importance of the patent application and potential public costs, if the patent is granted. As a result, the patent application, which was supposed to be granted in May 2015, was twice preliminary rejected by the Ukrainian Patent Office using provided by civil society activists arguments.
**Lessons learned:** The project shows that in absence of formal pre-grant oppositions procedure it is still possible to conduct effective dialogue with the patent office to prevent granting unmerited patent monopolies. Strong arguments on novelty and inventive step played a key role in rejecting the patent application. Scientific arguments were prepared for the opposition by local patent attorneys and were strengthened with global support from I-MAK. Patent oppositions are easier to control for NGOs as it is not as dependent on political will of state authorities, as it is the case for compulsory licensing.
**Conclusions/Next steps:** For patients' organizations pre-grant patent oppositions is a good instrument in work with patent monopolies, as it is easier to oppose patent application, than already granted patent. The IRF/Network project in Ukraine on opposition to patent application shows that it is possible to do successful 'quasi' pre-grant opposition by conducting close dialogue with patent office, using strong scientific and advocacy arguments, even in the absence of formal pre-grant opposition procedure provided by law. This creates opportunities for patients' organizations in countries without formal pre-grant oppositions procedure to be able to address anticipated unmerited patent monopolies for medicines.

## WEPED450

### USING PEER MOTIVATION TO UPSCALE NURSE INITIATED MANAGEMENT OF ART (NIMART) IMPLEMENTATION IN KWAZULU-NATAL

L. Dlamini
*HAST Unit, Department of Health, Richards Bay, South Africa*
*Presenting author email: linda.dlamini@kznhealth.gov.za*

**Background:** Section 27(1) of the Constitution of South Africa provides that everyone has the right to have access to healthcare services. This places a duty on the government both from an administrative as well as an implementation point of view, through its employees, to provide health care services to its citizens. It is in the provision of these services that healthcare workers need to be guided by ethical principles to ensure that services are provided in a timely, safe and efficient manner to those deserving.
**Description:** 7 disctricts have been visited to record NIMART documentaries being told by nurses who are implementing NIMART at DoH facilities especialy primary health care settings. Acknowledging the unavailability of skilled personnel whilst simultaneously rejecting the misuse of human resource shortages as justification for paralysis, the NSP had identified task-shifting as a priority. NIMART is one aspect of a broader strategy commonly referred to as task-shifting.
According to the WHO (2008:7), task shifting refers to a process of delegation whereby tasks are moved, where appropriate, to less specialized health workers so that by reorganizing the workforce in this way, task shifting can make more efficient use of the human resources currently available. Task-shifting in the form of NIMART has been advanced as one of the strategies through which the government and citizens of South Africa can make quick gains in reversing the devastating effects of this pandemic.
**Lessons learned:** Service areas that had previously not participated in ART sercices are now coming up with innovative ways of scaling up care using different service point and intergration.
**Conclusions/Next steps:** out of the 1722 trained nurses only 888 were ready for certification in September 2015. the documentaries have increased the number of nurses who are now demanding to complete their portfolios of evidence so that they can be recognized as NIMART trained nurses. The social proof theory states that when people are unsure of the action they should take they seek out the direc-

tion their peers are following. The documentaries have put NIMART nurses at the limelight where every nurse want to be thus influencing the need for psychological mind shift.

## POLICY ANALYSIS AND INDICATORS OF POLICY EFFECTIVENESS

### WEPED451

### AN ORGANIZATIONAL SELF-REFLECTION ON THE OPERATIONALIZATION OF THE GIPA/MIPA PRINCIPLES: ACCHO, A CASE STUDY

V. Pierre-Pierre, M. Sumner-Williams, T. Mbulaheni
*African and Caribbean Council on HIV/AIDS in Ontario (ACCHO), Toronto, Canada*
*Presenting author email: t.mbulaheni@accho.ca*

**Background:** Acknowledging the importance of the GIPA/MIPA Principles in the response to HIV/AIDS, the African and Caribbean Council on HIV/AIDS in Ontario (ACCHO) embarked in a process to assess and improve the ways in which it meaningfully involves and/or creates opportunities for the participation of persons living with HIV/AIDS (PHAs).

**Description:** To gain an understanding of the ways in which ACCHO engaged and involved PHAs, all ACCHO staff members and some executive members completed a "MIPA Assessment Survey‟ developed by the NGO Code of Good Practice Project. They also did one-on-one interviews focused on examining their perceptions of ACCHO's MIPA practices at the time. The data collection methods were intended to be complementary, resulting in a well-informed evaluation process.

**Lessons learned:** Being able to clearly define and articulate what MIPA means was a strength that all ACCHO's key players had. They were able to identify several ways in which ACCHO demonstrated leadership in incorporating the MIPA principles within the organization. There were, however, areas where ACCHO required strengthening and capacity building in order to better implement MIPA. Such areas included communication, increasing the contributions of PHAs at the highest level of decision-making in the organization, diversifying the PHA voices engaged, and strengthening community engagement.

**Conclusions/Next steps:** ACCHO created a MIPA Committee consisting predominantly of PHAs. This Committee organized a "MIPA Retreat" for ACCHO staff, executive members and other key stakeholders, where participants worked together to develop an action plan to improve ACCHO's operationalization of the MIPA Principles. Since then, ACCHO has created a statement affirming its commitment to MIPA, which has been embedded in many ACCHO documents, including committee terms of reference, the collective agreement, etc. ACCHO also signed onto the Ontario Accord - a statement of solidarity with GIPA/MIPA. To this day, ACCHO continues to implement this action plan and to make improvements.

### WEPED452

### FROM POLICY TO PRACTICE: AN ANALYSIS OF TB-HIV INTEGRATION

M. Slutsker[1], R. Crockett[2], S. Kirk[3], D. Bryden[4]
*[1]RESULTS Educational Fund, ACTION Global Health Advocacy Partnership, Washington, United States, [2]RESULTS UK, London, United Kingdom, [3]RESULTS International Australia, Sydney, Australia, [4]RESULTS, Washington, United States*
*Presenting author email: mslutsker@action.org*

**Background:** Despite being preventable and treatable, TB is responsible for one out of three AIDS-related deaths. Recognizing the urgency of this co-epidemic, the WHO put forward guidelines outlining collaborative activities to fight TB and HIV together. ACTION analyzed the extent to which donor programs and national health policies include the WHO guidelines.

**Description:** The policy research focused on the WHO 41 High Burden TB-HIV countries. In addition to country National Strategic Plans, five donor agencies were chosen for review: the Global Fund to Fight AIDS, Tuberculosis and Malaria; the United States President's Emergency Plan for AIDS Relief (PEPFAR); the United Kingdom Department for International Development (DFID); the United States Agency for International Development (USAID); and, the World Bank. All programs, grants, and National Strategic Plans were comprehensively reviewed for inclusion of the 12 WHO TB-HIV collaborative activities.

**Lessons learned:** Despite the WHO recommendations released four years ago, Analysis of donor programs and National Strategic Plans continue to show the burden of implementing collaborative TB-HIV activities falling heavily on TB programs and budgets, which have fewer resources than their HIV counterparts. TB grants had a budget one-eighth the size of HIV grants, yet allocated nearly three times the amount of TB-HIV funding.

**Conclusions/Next steps:** WHO recommendations to integrate TB and HIV programs have not been embraced equally across donors and implementing countries, and efforts to integrate TB and HIV are significantly under resourced. Increased funding, political will and collaboration between TB and HIV programs are needed to achieve the end of this deadly co-epidemic.

## MONITORING AND EVALUATION OF POLICIES AND THEIR IMPACT ON PEOPLE LIVING WITH HIV AND KEY POPULATIONS

### WEPED453

### HIV POLICY IMPLEMENTATION IN SOUTH AFRICA: EVIDENCE FROM A NATIONAL POLICY REVIEW AND HEALTH FACILITY SURVEYS IN TWO RURAL DEMOGRAPHIC SURVEILLANCE SITES

F.X. Gomez-Olive[1,2], V. Hosegood[3], R.G. Wagner[1,4], N. Chimbindi[5], J. Michel[5], K. Church[6], J. Todd[7], P. Mee[1,7], A. Wringe[6]
*[1]University of the Witwatersrand, MRC/Wits Agincourt Research Unit, School of Public Health, Johannesburg, South Africa, [2]Harvard University, Center for Population and Development Studies. School of Public Health, Cambridge, United States, [3]University of Southampton, Southampton, United Kingdom, [4]Umeå University, Umeå, Sweden, [5]University of KwaZulu Natal, Africa Centre for Health and Population Studies, Somkhele, South Africa, [6]London School of Hygiene & Tropical Medicine, Department of Population Health, London, United Kingdom, [7]London School of Hygiene & Tropical Medicine, London, United Kingdom*
*Presenting author email: nchimbindi@africacentre.ac.za*

**Background:** Understanding contradictions between national HIV policies and their implementation in health facilities is essential for improving the effectiveness of national HIV programmes. This study compares national policies on HIV testing, prevention of mother-to-child transmission (PMTCT), antiretroviral therapy and retention in care with survey data from health facilities serving the populations of two South African health and demographic surveillance sites (HDSS) in Agincourt and uMkhanyakude in order to assess implementation of national HIV policies.

**Methods:** Ten national HIV policy documents published in 2003-2015 were reviewed, with content extracted on implicit or explicit adherence to 54 pre-defined indicators likely to influence service access and retention in care across the HIV cascade.

Purposively-sampled health facilities in Agincourt and uMkhanyakude (N=26) were surveyed in October 2013 to May 2014 using a structured questionnaire covering the same HIV services and indicators. Survey data were analysed descriptively and the findings compared to national policy indicators for each site.

**Results:** South African HIV policies closely adhered to WHO recommendations despite several gaps, notably in relation to quality of care, with health facilities in both sites reporting high client loads and limited refresher training in HIV testing and ART delivery. In terms of HIV treatment, facilities in both sites were weaker in terms of medical management and PLHIV support than in service coverage and access. There were policy gaps in relation to access to HIV treatment and retention in care, but these were often compensated by practices in the facilities, notably in relation to provision of Option B+ which was provided in 88% of facilities in Agincourt and 22% in uMkhanyakude, despite the its absence from policy.

**Conclusions:** Despite numerous policy gaps for HIV testing, PMTCT, access to ART and retention in care, we found that implementation within health facilities was broadly similar across these two rural South African sites, and sometimes exceeded national recommendations. Future research should explore factors that facilitate or inhibit policy development and implementation, and assess whether differences in HIV service delivery are reflected in HIV mortality patterns in the two HDSS sites.

### WEPED454

### SECURING THE FUTURE OF WOMEN CENTERED CARE: A COMMUNITY -ASED ANALYSIS OF THE UNMET NEEDS OF WOMEN LIVING WITH HIV IN THE UNITED STATES

N. Khanna, A. Rogers
*Positive Women's Network - USA, Oakland, United States*
*Presenting author email: nkhanna@pwn-usa.org*

**Background:** The Ryan White program is the largest payer of HIV-specific medical care in the United States, providing a range of medical and social support services. Ryan White is currently up for reauthorization, and the health care landscape for people with HIV is changing under Affordable Care Act implementation.

**Methods:** To determine the unique medical, social and structural support needs of women with HIV in the face of changing health care coverage, service delivery infrastructure, and quality of life concerns, Positive Women's Network - USA (PWN-USA), a national membership body of women living with HIV (WLHIV) facilitated a community based participatory research project led and executed by 16 WLHIV to inform future advocacy. A survey addressing access to care and quality of care for WLHIV was developed by the 16-member research team. The survey was administered in eight geographic areas in the US. A total of 180 WLHIV completed surveys.
**Results:** Data revealed high levels of stigma and multiple barriers to care. Transportation presented the largest barrier to successful engagement in medical care (doctor visits and prescription refills) for women with HIV, whether in rural or urban areas. Nearly two-thirds of respondents had been diagnosed with depression, and 17% had been diagnosed with post-traumatic stress disorder. There was a large unmet need for mental health services and social support, including support groups. Sexual and reproductive healthcare was inconsistently available; less than half of respondents of reproductive age had been asked in the past year whether they were interested in getting pregnant and just over 40% had been informed by a provider that viral suppression would reduce the risk of onward HIV transmission.
**Conclusions:** As women with HIV are changing, so are care needs. Nearly five years after the data from HPTN052 was published, treatment as prevention science still has not penetrated into communities of WLHIV in the US and sexual and reproductive healthcare (SRH) are substandard. In future iterations, the Ryan White program will need to consider delivering SRH care to people with HIV of all ages and genders. Employment services must be integrated, and there is an urgent need to address transportation barriers.

## WEPED455

### SHIFTING POLICE PRACTICES TO SUPPORT HIV PREVENTION: INITIAL FINDINGS FROM AN ASSESSMENT OF A POLICE EDUCATION PROGRAM IN A MEXICAN SETTING

L. Beletsky[1,2], J. Arredondo[1], M.L. Rolón[1,3], E. Patiño Mandujano[3,4], T. Rocha Jiménez[1], D. Abramovitz[1], I. Artamonova[1], V.M. Alaníz Morales[5], C.L. Magis Rodríguez[6,7], E. Clairgue Caizero[8], E. Bustamante Rojo[3,8], A. Bañuelos Pérez[5], M.G. Rangel Gómez[7,8], S.A. Strathdee[1]
*[1]University of California San Diego, Division of Global Public Health, La Jolla, United States, [2]Northeastern University, School of Law and Bouvé College of Health Sciences, Boston, United States, [3]Universidad Xochicalco, Facultad de Medicina, Tijuana, Mexico, [4]Dirección Municipal de Salud, Tijuana, Mexico, [5]Secretaría de Seguridad Pública Municipal, Dirección de Planeación y Proyectos Estratégicos, Tijuana, Mexico, [6]Centro Nacional para la Prevención y el Control del VIH/SIDA, México DF, Mexico, [7]Secretaría de Salud, México DF, Mexico, [8]Comisión de Salud Fronteriza México-Estados Unidos, Sección México, Tijuana, Mexico*
*Presenting author email: lbeletsky@ucsd.edu*

**Background:** In countries where people who inject drugs (PWID) are disproportionately affected by HIV, policing practices fuel behaviors that increase their vulnerability to HIV, viral hepatitis and STIs. Based on prior findings of adverse police encounters and prevalent extralegal police practice, we designed a police education program (PEP) for municipal police in Tijuana, Mexico. The training bundles occupational safety content with legal knowledge and harm reduction material to align policing practice with HIV prevention goals.
**Methods:** The PEP evaluation includes a pre- and post-training evaluation of all trainees on legal knowledge, harm reduction attitudes, autonomous support, and self-reported practices, to be administered to approximately 1200 active-duty personnel of the Tijuana municipal police. A subsample of 500 officers is randomly selected to receive follow-up assessments at 3, 6, 12, 18, and 24 months in a modified stepped-wedge design. Univariate logistic regression with robust variance estimation using time as a within-subjects effect was used to assess the effect of time (follow-up vs. baseline) on various outcomes of interest.
**Results:** Among the 202 officers completing baseline and 3-mo follow-up thus far, we observed significant shifts between baseline and follow-up reports of risky occupational practices, including breaking syringes (OR=.37; 95% Confidence Interval [CI]:.24-.56) and discarding syringes in the trash (OR=.36; 95%CI: .24-.55). At follow-up, trainees were less likely to report arresting drug users for syringe possession (OR=.41; CI:.29-.59), heroin possession (OR=63; CI: .49-.81) and more likely to report referring drug users to harm reduction services (OR=1.45; CI:1.03-2.06). Respondents also exhibited improved knowledge, including in the domain of understanding the law relating to syringe possession (OR=2.89; CI: 1.96-4.25), heroin possession (OR=4.47; CI:2.79-7.15), and marijuana possession (OR=3.34; CI:2.03-5.49). Officers reported improved attitudes towards harm reduction programs, including opioid substitution therapy (OR=3.06 CI: 2.16-4.34) and syringe exchange (OR=2.09; CI: 1.36- 3.2).
**Conclusions:** Although there a number of existing limited assessments of PEPs designed to align policing and HIV prevention exist, this is the first study to prospectively evaluate the impact of this structural intervention in a longitudinal cohort. Initial results indicate promise of PEP in shifting street-level police practices. Programmatic and policy implications are discussed.

## WEPED456

### THE U.S. RYAN WHITE HIV/AIDS PROGRAM'S SUPPORT FOR COMPREHENSIVE ENABLING SERVICES AND INTEGRATED CARE HELPS PLWH REMAIN IN CARE, ACHIEVE VIRAL SUPPRESSION

S. Cahill[1], K. Mayer[2,3,4], S. Boswell[4,5]
*[1]Fenway Institute, Health Policy Research, Boston, United States, [2]Fenway Institute, Boston, United States, [3]Beth Israel Deaconess Medical Center, Boston, United States, [4]Harvard Medical School, Boston, United States, [5]Fenway Health, Boston, United States*
*Presenting author email: scahill@fenwayhealth.org*

**Background:** The Ryan White HIV/AIDS Program (RWP) funds community-based HIV care and support services for low-income, uninsured, and underinsured people. Until 2014 most people living with HIV (PLWH) in the U.S. could not access private insurance. The 2010 Affordable Care Act (ACA) prohibits preexisting condition exclusions, and removes annual and lifetime coverage limits. Consequently, PLWH can now access subsidized marketplace insurance. Many PLWH without an AIDS diagnosis or dependent children can now access public insurance (Medicaid) in 31 of 50 states. As a result, some have questioned whether the RWP is still necessary.
**Description:** Public policies, peer-reviewed research, conference abstracts, and gray literature were analyzed. Interviews were conducted with researchers and policymakers.
**Lessons learned:** The RWP funds an integrated continuum of HIV health care and support services not covered by insurance, including case management, treatment adherence counseling, housing support, nutrition, and transportation. People living with HIV often have life challenges and complex comorbidities—such as substance use and mental illness—that complicate their ability to maintain treatment adherence and continuous care. The RWP funds services that help many highly vulnerable individuals maintain stability in their lives, and are essential to the success of core medical treatments. Half of the 1.2 million PLWH in the U.S. access RWP services. Nearly half of PLWH on treatment access the RWP's AIDS Drug Assistance Program. Those receiving RWP care are more likely to receive regular medical care, and are more than twice as likely to be virally suppressed, compared with PLWH not in RWP care. The RWP is still needed due to the non-expansion of Medicaid in most Southern states, where 55% of Black PLWH live.
**Conclusions/Next steps:** The RWP funds integrated care and support services that help about 600,000 U.S. PLWH achieve viral suppression and continuity in care. RWP funding, which has remained flat since 2001 even as the caseload has nearly doubled, should be increased. Targeted loan forgiveness, increased support for clinical training, and increased Medicaid reimbursement rates could help train the next generation of HIV specialists. Health and elder service providers should be trained to provide culturally competent, nondiscriminatory care to older PLWH.

# POLICY DEVELOPMENT PROCESSES, INFLUENCES AND CONSTRAINTS

## WEPED457

### CHILDREN (0-14) AND HIV/AIDS PUBLIC POLICIES IN CAMEROON: A CRITICAL ANALYSIS

L. Kojoué
*Independant Researcher, Activist with Affirmative Action, Yaoundé, Cameroon*
*Presenting author email: larissa.kojoue@gmail.com*

**Background:** Three major initiatives directed at Orphans and Children made Vulnerable due to HIV/AIDS (OVC) or children whose survival, well-being and development are being compromised by HIV and AIDS have been implemented in Cameroon : the bi multi-OVC program (2004-2008), the National Support Program for OVC (NSP-OVC 2006-2010) and the Children, HIV and AIDS program (2008-2012). Behind each of these initiatives stands a foreign and institutional operator (UNICEF, the French Cooperation, or the Global Fund). The implementation of these programs has been tricky and quite far from the intended goals. Les than 10% of children in need of treatment have access, and less than 2% of the budget have been dedicated to OVC. Actually, there is no specific program in the National Strategic Plan for children facing HIV/AIDS, despite stated objectives.
**Methods:** This paper outlines the social and political context that shaped the development of AIDS policies targeting children under fourteen. By highlighting the weaknesses of local policy entrepreneurs despite their numbers, but more specifically the passive attitude of program officials and community-based organizations, my aim is to show why the Cameroonian government is failing to respond effectively to the spread of AIDS and its consequences among children.
Based on critical analysis of three National Strategic Plans, in-depth interviews with key stakeholders and observations in medical structures and non-governmental organizations, this study questions and analyzes structural factors such as decision-

making procedures, bureaucratic capacities, political leadership, financial resources and health system. I also question HIV/AIDS global policies, their transformations and their (re) appropriation in national and local contexts.
**Results:** A long-term and effective response to children with HIV/AIDS needs to target children's health as a whole. Instead, each national program (malaria, vaccination, OVC, etc.) has a separate agenda, budget and actors. That means organizations and government policies must create and increase accessibility to health services for every child, especially those who are no longer with their mothers.
**Conclusions:** Children and HIV/AIDS public policies are hampered by institutional constraints, as a result of inappropriate and non-inclusive patterns of political leadership and global policies. There is a need to emphasize on school clinics all over the country.

## WEPED458

### LOBBYING FOR POLITICAL CHANGE UNDER ADVERSE POLITICAL CONDITIONS: LESSONS FROM ADVOCACY WORK IN NORTH CAROLINA

L. Storrow[1], D. Rowan[2]
*[1]North Carolina AIDS Action Network, Raleigh, United States, [2]University of North Carolina at Charlotte, School of Social Work, Charlotte, United States*
*Presenting author email: lee@ncaan.org*

**Background:** Since 2010, the North Carolina AIDS Action Network has led advocacy and lobbying efforts in North Carolina (NC), a state in the southern United States, related to HIV/AIDS treatment and prevention.
**Description:** Currently there are 36,300 people living with HIV in NC and 7,278 (1,910 female, 5,310 male, 58 transgender) people are enrolled in the NC AIDS Drug Assistance Program (ADAP), which provides free HIV medication.
With the 2010 & 2012 state elections, political control of the NC General Assembly and Governor's Office changed from the Democratic to the Republican Party. Since then, legislative leadership has largely opposed expansion of LGBTQ rights and significant investments in public health initiatives.
Even under adverse political conditions, the HIV/AIDS advocacy movement has experienced successful outcomes by focusing on three key strategies:
1. Build a network/database of educated activists through grassroots organizing and digital outreach, focusing on individuals impacted directly and those living in political districts of key legislative leaders;
2. Sustain investment in building personal relationships with targeted legislators and staff in the NC Governor's office and state health department;
3. Regularly educate journalists about HIV/AIDS, and frequently submit and cultivate HIV/AIDS content in traditional and digital media.
**Lessons learned:** Legislators and lobbyists say that advocacy efforts in NC have had a critical role in achieving these positive outcomes over the last six years:
a. An increase in eligibility for ADAP from 125% of poverty level in 2011 (the lowest in the United States) to 300% in 2016.
b. Overall enrollment growth from 6,241 people in 2011 to 7,278 as of January 2016.
c. Creation of an assistance program that reduces costs for patients who purchase their own health insurance. 90.97% of the 155 patients in the program are virally suppressed, compared to 82.12% of overall enrollment in 2016.
**Conclusions/Next steps:** Policy change is a multi-year process requiring long-term investment resources. Current HIV policy campaigns in North Carolina are focused on further expansions of ADAP to cover full health insurance costs, closing the Medicaid coverage gap so all people with HIV have access to health care, and repealing NC's HIV criminalization health code.

## WEPED459

### POLICY DEVELOPMENT PROCESS TO COMBAT HIV/TB CO-INFECTION IN INDIA: A STAKEHOLDER ANALYSIS

S. Kondreddy, S. Sahay
*National AIDS Research Institute, Pune, India*
*Presenting author email: ksreddy.nari@gmail.com*

**Background:** This research is set within the context of evolving HIV/ TB co-infection policy in India. The international-national policy transfer, advocacy and research-policy interface for HIV/ TB co-infection policy development were studied through stakeholder analysis, an approach for policy analysis.
**Methods:** Qualitative research using purposive sampling was carried out among fifty consenting respondents (N=50) group of:
1) policy makers,
2) researchers,
3) advocacy and
4) beneficiaries including the high risk and key populations.
The interviews were audio recorded with prior permission from each respondent. Free listing exercise was performed with 8 community representatives. The transcribed interviews were coded using QSR NUD*IST software version 6.0 and analyzed using grounded theory.
**Results:** Both the Indian policy makers (IPM), and the civil society felt that in the presence of independent programs for TB and HIV in India, a third policy for HIV/ TB co-infection is not needed as the co-infection is not larger than the independent diseases. Policy advocates observe disparities in the national HIV/ TB program and therefore recommended collaborative policy which should be inclusive to address co-infection in all high risk population including intravenous drug users. The policy makers too emphasized evidence based collaborations between the two programs. If researchers and advocates feel otherwise, they should be able to generate preferably local evidences as IPMs are not averse to new evidences and making amendments. Possible role of people living with HIV/AIDS (PLHA) as a DOTS (directly observed treatment, short-course) provider was also recommended. Addressing the issue of community demand and access 'Concept of Health Post' has been suggested to facilitate awareness about co-infection policy and service delivery. Advocacy for HIV/ TB collaborative policy was felt to be in nascent stage requiring consultative and inclusive approaches for communication between IPM and researchers with advocates as catalyzing the process.
**Conclusions:** The IPMs and community align together on the issue of HIV/ TB collaborative policies. Service utilization was considered critical and effective access to services was suggested through 'health posts'. PLHAs, as DOTS provider would be an effective way of strengthening the HIV-TB collaborative activities especially the service provision.

## WEPED460

### UNDERSTANDING AND ADDRESSING CHALLENGES TO THE EFFECTIVE IMPLEMENTATION OF HIV LEGISLATION IN SUB-SAHARAN AFRICA

P. Eba[1], A. Strode[2]
*[1]UNAIDS, Geneva, Switzerland, [2]University of KawZulu-Natal, School of Law, Pietermaritzburg, South Africa*
*Presenting author email: ebap@unaids.org*

**Background:** The law is an important structural tool that can influence individual behaviour, ensure the protection of those living with or vulnerable to HIV, and create the conditions for an effective AIDS response. As of 31 July 2014, 27 countries in sub-Saharan Africa had adopted HIV-specific legislation to address the legal issues raised by HIV.
Whether legislation achieves its objectives and the goals of its drafters depends primarily on its implementation and enforcement. Yet, more than ten years after the first HIV-specific laws in Africa were gazetted; there is very little evidence of their effective implementation and enforcement.
Critical factors that explain the limited implementation of HIV-specific laws in sub-Saharan Africa are to be found in the intrinsic flaws in their normative content.
**Methods:** This study is based on a desk analysis of the implementation challenges that stem from the normative content of 26 HIV-specific laws adopted in sub-Saharan Africa. The analytical framework used in the review and analysis of the implementation challenges in these HIV-specific laws is based on themes and approaches in the implementation literature for developing better statutes with the greatest likelihood to be implemented.
**Results:** This study shows that drafters of HIV-specific laws in sub-Saharan Africa paid limited attention to intrinsic issues in these laws that might have ensured their effective implementation and enforcement. Serious gaps and concerns in the normative content of HIV laws help to understand why in so many countries, their implementation has been less than adequate. These gaps can be summarised into three key elements, namely: (i) the failure of HIV laws to uphold sound public health and human rights approaches; (ii) lack of clarity and vague provisions in these laws; and (iii) limited attention in HIV laws to implementing or monitoring entity.
**Conclusions:** More attention should be paid to the enforcement of protective provisions in HIV legislation. Efforts to develop or reform HIV legislation should include a clear focus on ensuring that key intrinsic flaws that compromise their effective implementation are addressed. These recommendations are also relevant for the development of other health legislation.

## WEPED461

### INCLUDING MEN WHO HAVE SEX WITH MEN IN NATIONAL AIDS PROGRAMS, 2001-2014

T. McKay[1], N. Angotti[2]
*[1]Vanderbilt University, Center for Medicine, Health & Society, Nashville, United States, [2]American University, Department of Sociology and Center on Health, Risk & Society, Washington, DC, United States*
*Presenting author email: tara.mckay@vanderbilt.edu*

**Background:** In the last decade, men who have sex with men (MSM) have come to the fore of global policy debates about AIDS prevention. In stark contrast to programs and policy during the first two decades of the epidemic, MSM are now identified as "marginalized but not marginal" to the global response. This paper examines predictors of whether and when MSM have been integrated into national AIDS responses consistent with current UNAIDS recommendations.
**Methods:** From 2001 to 2014, UN member countries submitted Country Progress Reports on HIV/AIDS biennially (N=915). Researchers coded all Progress Reports for level of inclusion of MSM in surveillance and prevention activities using an ordinal scale from 1 "No prioritization," to 2 "Weak prioritization," to 3 "Strong prioritization." Data from Progress Reports were combined with country-level data on political/legal context, formal participation in international organizations, informal links to transnational advocacy networks, and levels of development assistance for health (DAH).
**Results:** Although countries generally increased prioritization of MSM, changes were marginal overall. Of countries that did not prioritize MSM at all in their first report (time *t*), less than half (46%) showed evidence of weak prioritization in a subsequent report (time *t*+1). Transitions from weak to strong prioritization were more limited; only 12% of countries transitioned from weak to strong prioritization. Probit models estimating the likelihood of a change in prioritization among aid receiving countries demonstrate that criminalization of same-sex sex presented a significant obstacle to prioritization of MSM. Country engagement in international organizations and links to transnational advocacy networks significantly increased the likelihood that countries expanded programs targeting MSM. Consistent with null findings on the effects of human rights contingencies on aid, levels of DAH from donor countries advocating for decriminalization of same-sex sex did not predict increased prioritization of MSM.
**Conclusions:** As countries have become more accountable to the UN through the use of Progress Reports on HIV/AIDS, many countries are now "talking the talk" of inclusion of MSM. However, far fewer have advanced from planning stages to active, long-term engagement with MSM, suggesting a need for targeted efforts to help countries bridge the gap between policy adoption and implementation.

## WEPED462

### INFLUENCING THE SCOTTISH REGULATORY FRAMEWORK FOR PRE EXPOSURE PROPHYLAXIS (PREP)

K. Smith, L. Beattie, A. Collins, G. Valiotis
*HIV Scotland, Edinburgh, United Kingdom*
*Presenting author email: george.valiotis@hivscotland.com*

**Background:** The effectiveness of PrEP has been proven by a number of international studies to be an effective method of HIV prevention. PrEP presents Scotland with a major opportunity to reduce rates of new HIV. PrEP is not currently available on Scotland's national fully subsidised healthcare system (NHS). Without advocacy we felt there could be an unnecessary delay in the availability of PrEP, pending approval from the European Medicines Agency and Scottish Medicine Consortium. HIV Scotland is the national policy NGO.
**Description:** HIV Scotland worked proactively on the inclusion of PrEP in Scotland's Sexual Health and Blood Bourne Virus Framework, the policy document that dictates public health policy and practice in this area. The document now includes a commitment that the Scottish Government will monitor the regulatory position of PrEP in Scotland.
A strong Framework has allowed HIV Scotland to argue for and facilitate the creation of a consensus statement and prescribing criteria for PrEP from clinical representatives. HIV Scotland has published good practice recommendations, advocating safe use of and access to PrEP.
This work bought together policy makers, public health funders, clinicians and community stakeholders. HIV Scotland has pushed to place PrEP on the wider public agenda. Coinciding with World AIDS Day 2015, a motion was lodged in the Scottish Parliament affirming the role of PrEP HIV prevention. The motion received cross party support.
**Lessons learned:**
- Cost effectiveness, risk taking behavior and licensing are key concerns for provision of PrEP in the NHS.
- Engagement of key stakeholders has been critical for putting PrEP on the specialist and wider public agendas.
- The voice of community critically informed our work.

**Conclusions/Next steps:** By lobbying the Scottish government to include PrEP in the Sexual Health and Blood Bourne Virus Framework, PrEP has been placed high on the agenda of critical stakeholders, increasing the likelihood of timely inclusion of PrEP as part of the comprehensive prevention package provided by the NHS. This required a highly coordinated linking of political decision makers, funding bodies, clinicians and community members. We argue that HIV Scotland is uniquely placed to enable this work, bridging the gaps that exist between these influential parties.

# ROLE OF MEDIA IN POLICY MAKING

## WEPED463

### KEY CORRESPONDENTS LAC: SIX YEARS AS THE COMMUNITY MEDIA OUTLET IN LATIN AMERICA

J. Hourcade Bellocq[1], L. López Tocón[2]
*[1]International HIV/AIDS Alliance, LAC Team, Buenos Aires, Argentina,*
*[2]Corresponsales Clave, Coordination, Lima, Peru*
*Presenting author email: javier.bellocq@gmail.com*

**Background:** Key Correspondents LAC was launched in 2009 in Lima, in 2009, during AIDS Latin American Forum. Twenty community journalists were trained in the first workshop with a clear objective: bring the voices of Key populations, disseminate stories and information of the global and regional HIV the response , in order to generate political change.
**Description:** The Key Correspondents LAC team is now a network of more than 40 volunteer community based journalists, covering all LAC Spanish speaking countries, who join KC-Lac to speak their world and communicate their experiences and advocate/communicate with decision makers. Key Correspondents LAC also play a key role as the watchdog in issues regarding Global Fund grants implementation. In its first six years, thanks to the continued support of International HIV/AIDS Alliance and UNAIDS, Key Correspondents LAC Initiative trained five groups of community journalists, with a total of 150 young men and women, including gay men, transgender women and people with HIV, who developed and strengthened their abilities to write and tell their stories and what happens in their own communities.
A total of 1260 articles have been published in Key Correspondents LAC, in Spanish, that has reached to more than 30,000 people per year around the world. Visit www.corresponsalesclave.org
**Lessons learned:**
1. Meaningful engagement of PLHA, young people and Key Population ensure that your stories are relevant.
2. You need to continuously replenish a volunteer based project.
3. You need to study and adapt media to new trends and technology, like social media, where youth member are critical.
4. Most of the articles need to target decision makers, use them as advocacy tools rather than covering events.
5. You need to be prepare to cover recent new, even some developments that happens on the same day.
6. People in countries and regionals that speak other languages than English needs these tools to learn what is happening worldwide.

**Conclusions/Next steps:** People have the power to access to information. Communities are now using media and social media for change. We must support the mass auto-communication where people build their relevant news. Media is about improving citizen quality of life and watchdog decision makers including governments. You could engage and train people visually.

## WEPED464

### LOUD MEDIA CAMPAIGN IS THE MOST EFFICIENT INSTRUMENT TO OVERCOME CORRUPTION DURING PUBLIC PROCUREMENTS

A. Romanuyk
*CF 'Patients of Ukraine', PR and Media, Kyiv, Ukraine*
*Presenting author email: aliona.r@patients.org.ua*

**Background:** Over 40% of public funds have been stolen during the national drugs procurement for people living with HIV, tuberculosis and hepatitis because of corruption schemes in the Ministry of Health of Ukraine. It amounts approximately USD 50 million per year. Every day around 1600 Ukrainians die due to the lack of medicines in Ukraine.
**Description:** For more than a year CF "Patients of Ukraine" has been fighting to transfer the function of medicine procurement from the MoH to international organizations. It is the only efficient instrument that will allow to overcome corruption

schemes in the Ministry of Health and save thousands of people living with HIV, tuberculosis and hepatitis.
To confront the pharmaceutical companies blocking this process, CF "Patients of Ukraine" launched an extensive media campaign: two protest actions "4 billion hryvnias cake for the MoH" and "4 barrels with ink for the Cabinet of Ministers", three press-briefings, wide social media campaign, a number of open letters to the MoH, the Parliament and the Prime Minister of Ukraine. The facts of corruption in the MoH during tenders in Ukraine were widely discussed in the mass-media and among higher officials.
These actions triggered national and international media frenzy: 70 TV-spots, more than 30 articles in newspapers and 600+ online publications. This was the major victory for patients and the main success in healthcare reform in Ukraine in 2015.
**Lessons learned:** High resonance through wide media coverage at home and especially abroad made Ukrainian Government transfer the procurement of medicine to international organizations.
Creative media campaign which has the powerful influence on politicians is the only way to fight corrupt system in Ukraine.
Open faces of patients and direct actions shocking the media helped to keep up the constant interest to this topic.
**Conclusions/Next steps:** Now, no official can steal even one Ukrainian hryvnia from severely ill patients, leaving them without medications. Millions of patients will receive the quality treatment on time. We are keeping tender process under control and communicate with media about cost savings due to medicine procurement through international organizations. We will use our media experience to enhance healthcare reform in Ukraine.

## WEPED465

### HOW THE MEDIA PREPPED THE WORLD FOR A NEW HIV PREVENTION OPTION: AN ANALYSIS OF PREP IN THE MEDIA FROM 2009-2015

H. Sohn, K. Marshall, M. Chatani-Gada
*AVAC, New York, United States*
*Presenting author email: heeyoung@avac.org*

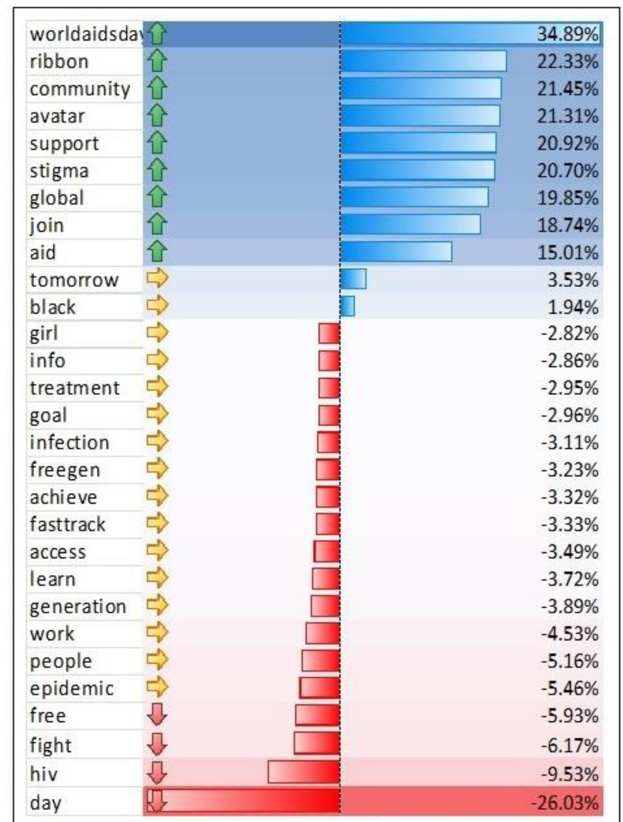
**Background:** Media coverage plays an important part in acceptance of new public health interventions. Coverage of oral tenofovir-based pre-exposure prophylaxis (PrEP) has been increasing since 2009. We analyzed media coverage to determine:
· Number of articles published over time and correlation with PrEP milestones.
· Geographic distribution of articles.
· How media's perception of PrEP changed over time.
**Methods:** Using news monitoring site, we conducted a search of keywords related to HIV and PrEP from Jan 1, 2009 through Dec. 31, 2015 among 300,000 news sources. Removing duplicate and irrelevant articles, we calculated numbers of articles per year and where peaks occur. We analyzed content and tone of subset of articles around PrEP milestones to determine how journalists' knowledge and perceptions of PrEP changed.
**Results:** From 2009-2012 peaks in PrEP coverage correlate with positive results from iPrEx and Partners PrEP, along with US FDA approval of Truvada. Flat results from VOICE generated most coverage for 2013, but there is a general decrease in articles published. In 2014, coverage quadrupled as CDC released PrEP guidelines. The number of articles steadily increased into 2015, with PrEP widely accepted as a prevention option by the public and release of positive results from PROUD and IPERGAY.
PrEP media coverage has not always been positive. In 2012 coverage peaks as controversy escalates with public anti-PrEP skepticism campaigns. By 2015, controversy largely disappeared as advocates continued to speak in support of PrEP and media became more knowledgeable on the science.
From 2009-2015, PrEP coverage increased significantly - more than 3,400 articles are written in 2015 than 2009. US coverage dominated, but the number of articles published in other countries also increased: in South Africa, 4 articles published in 2009 vs. 89 in 2015.
**Conclusions:** Analysis shows that media coverage is mostly driven by milestones in research results and expanded roll-out. Skepticism appeared in the news at times, but we found when advocates and researchers work together to educate the media, it resulted in a more balanced and accurate coverage. We conclude that researchers and advocates working together with the media is crucial to public acceptance of new public health interventions.

## WEPED466

### HIV/AIDS AND THE POST-2015 AGENDA: HAS THE GLOBAL CONVERSATION SHIFTED? A PUBLIC SENTIMENT ANALYSIS IN TWITTER DATA FROM WORLD AIDS DAY TWEETS IN 2014 AND 2015

S. Yoon, M. Odlum
*Columbia University, School of Nursing, New York, United States*
*Presenting author email: mlodlum12@gmail.com*

**Background:** Public diffusion of the MDGs successfully raised HIV/AIDS awareness, catalyzed action and directed cooperation to halted the spread and begin the reversal of HIV/AIDS[1]. The MDGs increased public awareness to improve the catastrophic effects of the pandemic (e.g., mother-to-child transmission, HIV education, orphans[1]. The MDGs inspired the belief in an AIDS-free generation and the pandemic's end.
The SDGs build on the success of the MDGs. However, they contain one target, to end the epidemic by 2030[1]. The SDGs are criticized for being broad, difficult to implement and bureaucratic; making them less reachable and uninspiring to the general public[1]. Public support is critical for global unity and for the motivation to drive eradication efforts forward.
Our study sought to explore public sentiment on HIV/AIDS. Tweets were collected during live three-hour, Twitter chats by ABC News' chief health editor; on World AIDS Days 2014 and 2015.
**Description:** A total of 39,940 unique Tweets (10,027,038,772 users) in 2014 and 78,215 unique Tweets (33,370,938,359 users) in 2015 were analyzed. Tweets were extracted with geocodes via NCapture software. Response frequencies were aggregated using natural language processing[2].
**Lessons learned:** Topics tweeted ≥35 times were visualized (Figure 1). Results show decrease in frequency of tweets associated with fighting to end HIV and achieving an AIDS-free generation. In 2015, an increase in tweets associated with an integrative approach, (e.g.,community).



*[Figure1. 2015 Shift in HIV/AIDS Tweet Public Sentiment from World AIDS Day 2014 and World AIDS Day 2015. N= 39,940 (2015) N=78,215 (2014)]*

**Conclusions/Next steps:** As we move from MDGs to SDGs, global conversation shifts are apparent. An increase in tweets regarding a universal, integrative approach speaks to the SDGs theme. However, a decrease in tweets regarding an active fight to end the pandemic and achieving an AIDS-free generation must be explored. Public motivation is critical in meeting the 2030 agenda and must be addressed.

## Evidence-informed advocacy regarding policy and budget priorities

### WEPED467

#### PLHIV in Africa demand for viral load testing as the gold standard for monitoring HIV

M.M. Gwaba, People Living with HIV Team Study Group
*Treatment Advocacy and Literacy Campaign, Advocacy and Resource Mobilization, Lusaka, Zambia*
*Presenting author email: bagwaba@yahoo.com*

**Background:** In 2013, Zambia adapted it's Consolidated Guidelines for Treatment and Prevention of HIV infection to be in line with the World health Organization June 2013 Consolidated Guidelines on the use of Antiretroviral Drugs for Treating and Preventing HIV Infection. One of the key recommendations in the guidelines is the use of viral load testing as the preferred monitoring approach to determine the performance of cART in an individual.
**Description:** ARASA and ITPC conducted short surveys in Botswana, Cameroon, Cote'd' Ivorie, Egypt, Kenya, Malawi, Morocco, Swaziland, Tanzania, Uganda, Zambia and Zimbabwe where it was established that CD4 testing was the standard test in use to monitor HIV in individuals even though the WHO guidelines state that viral load testing should be the gold standard for monitoring HIV. On 30th October 2015, the Viral Load campaign was launched in the 12 countries where the survey was conducted. The main launch was held in Zambia because the country had already adapted and rolled out the implementation of the WHO June 2013 guidelines. Through TALC and its partners, 6 petitions were presented to the Minister of Gender who was representing the Minister of Health, WHO Country Representative, UNAIDS Country Representative, PEPFAR Country Coordinator, High Commissioner of Malawi, COMESA and the National AIDS Council demanding the immediate roll out of Viral Load Testing as the gold standard to monitor HIV in individuals.
**Lessons learned:** Zambia has now rolled out viral load testing to all people living with HIV in line with the new guidelines. Once policy makers realize that citizens know their entitlements, and demand for them, they are bound to find the resources required to fulfill their obligations. If citizens remain ignorant of their rights, policy makers will always take advantage of them and not meet their obligations.
**Conclusions/Next steps:** Citizens must hold their leaders and policy makers accountable to implement and roll out promises they make when they sign international treaties and agreements. Other countries in Africa must adopt the model implemented in Zambia as a best practice for policy advocacy.

### WEPED468

#### Training and education on the risks associated with injecting drugs: from research to legislation

T. Brigand[1], V. Laporte[1], C. Spire[1], D. Rojas Castro[1,2], P. Roux[3,4,5], P. Carrieri[3,4,5], A. Haas[1], J.-M. Le Gall[1], C. Mey[1], F. Pilorge[1], A. Toullier[1], C. Andreo[1], S. Mouveroux[1]
*[1]AIDES, Pantin, France, [2]Université Lyon 2, Groupe de Recherche en Psychologie Sociale (GRePS) EA 4163, Lyon, France, [3]INSERM, UMR_S 912, Sciences Economiques & Sociales de la Santé et Traitement de l'Information Médicale (SESSTIM), Marseille, France, [4]Aix Marseille Université, UMR_S 912, IRD, Marseille, France, [5]ORS PACA, Observatoire Régional de la Santé Provence-Alpes-Côte d'Azur, Marseille, France*
*Presenting author email: tbrigand@aides.org*

**Background:** In France, despite the effectiveness of needle exchange programs among injection drug-users (IDUs), the risk of HIV transmission persists, the prevalence of HCV remains high (according to the ANRS-Coquelicot survey, 40 to 60% of IDUs who frequent risk reduction facilities are infected with this virus), and injection site complications often occur. In late 2009, to reduce this risk, Doctors of the World and AIDES, in partnership with Inserm and the ANRS, conducted a study to experiment training and education sessions on the risks associated with injecting drugs (AERLI). The preliminary results were presented to the IAS in 2014. This intervention has led to a reduction in unsafe HCV transmission practices: 44% of the participants reported at least one such practice before the intervention compared to 25% six months after it. On the basis of these research results, AIDES called for the legal recognition of AERLI.
**Description:** Advocacy strategies were defined according to the different players and steps in the legislative process. 1. To take advantage of the fact that healthcare legislation was being prepared for 2015, the results of this research were submitted to the office of the Health Minister. A specific injection support and education provision was included in the first version of this legislation in October 2014. 2. Amendments were proposed to certain key parliamentarians to support and strengthen this provision. 3. A parliamentary watch was conducted to anticipate any risk of backtracking. 4. Scientific results do not always make an effective argument in public debates. To avoid sterile debates, AIDES left the media out of its strategies. 5. To build a favourable environment, AERLI was also promoted among harm reduction stakeholders.
**Lessons learned:** The healthcare legislation was passed in December 2015 and includes a section recognising AERLI.
**Conclusions/Next steps:** These advocacy strategies supported by scientific data proved effective. Implementation now requires enabling texts spelling out the mechanics of AERLI. The Ministry of Health's administration, which is drafting these texts, should now be made aware of the results of this research. It will also be necessary to advocate with the regional health authorities responsible for the territorial implementation of the legislation.

### WEPED469

#### Understanding and optimizing the landscape of antiretroviral treatment regimens in Russia: results and recommendations based on ARVT procurement monitoring project in 2015

S. Golovin[1], K. Babikhina[2]
*[1]Treatment Preparedness Coalition, St. Petersburg, Russian Federation, [2]Treatment Preparedness Coalition, Moscow, Russian Federation*
*Presenting author email: kbabikhina@itpcru.org*

**Background:** Russia remains among the fastest-growing HIV epidemics. The number of people receiving treatment based on official estimates is approximately 200,000. The country has faced numerous access-related challenges: drug stock-outs, limited access to preferred options (including tenofovir) and fixed-dose combinations (FDCs). "Treatment Preparedness Coalition" has been analyzing the government procurement programme to identify gaps and elaborate recommendations for enhancing treatment access.
**Methods:** In 2015, 2380 contracts were included into the analysis (excluding peadiatric formulations). The analysis included 28 international non-proprietary names of antiretroviral drugs registered in Russia based on the website grls.rosminzdrav.ru. The drugs were divided into three groups: nucleoside/ nucleotide reverse transcriptase inhibitors (NRTIs); non-nucleoside reverse transcriptase inhibitors, protease inhibitors (excluding ritonavir), integrase inhibitors, CCR5 inhibitors, and fusion inhibitors; and FDCs containing complete regimens. The number of patients per year for each drug was calculated by diving the total amount of items purchased by the recommended daily dose and 365. The number of patients who could potentially receive treatment was calculated based on the number of third drugs and the number of possible combinations of NRTIs assuming that each combination should contain either 3TC or FTC. The total sum of FDCs containing complete regimens was added to the total number of third-drug regimens.
**Results:** In total, approximately 158,000 patients could receive treatment based on the sum of third drugs and FDCs containing complete regimens. The most widely used third drugs are lopinavir/ritonavir (54,500) and efavirenz (53,000). In the NRTI group, the number of patients who could potentially receive regimens containing either 3TC or FTC is approximately 134,300. The number of patients who could potentially receive TDF-based regimens is approximately 4000; the number of D4T-based regimens is 8,600. The number of patients receiving FDCs containing complete regimens (ABC/3TC/AZT; 3TC/AZT/NVP; FTC/TDF/RPV) is 250.
**Conclusions:** The number of patients who could potentially receive antiretroviral treatment in Russia can be 20% lower than the official estiames. Only 2,5% receive TDF-based regimens. Less than 1% receive FDCs containing complete regimens; none of them receives the preferred WHO option 3TC(FTC)/TDF/EFV as a single pill. These data should be used as a basis for optimizing procurement and provision policy.

### WEPED470

#### Community engagement in universal access to DAA hepatitis C treatment: the Portuguese case

D. Simões[1], R. Freitas[1], B. dos Santos[1], R. Fuertes[2], L. Mendão[1]
*[1]GAT - Grupo de Ativistas em Tratamentos, Lisboa, Portugal, [2]GAT - Grupo de Ativistas em Tratamentos, In-Mouraria, Lisbon, Portugal*
*Presenting author email: daniel.simoes@gatportugal.org*

**Background:** Moving from low efficacy and high adverse events rate regimens to new DAA's was a priority in Portugal from 2013 to 2015. Special nominative authorisations of use were possible, but less than 100 people accessed new treatments. Several meetings took place (Sitges 2007-2014, FDA and EMA consultations, 2008) and position papers were issued between 2009 and 2014, along with bilateral meetings with government officials and pharmaceutical industry representatives; pressure for an agreement led the agenda.

Tuesday 19 July
Wednesday 20 July Poster Exhibition
Thursday 21 July
Friday 22 July
Late Breaker Posters
Author Index

**Methods:** GAT promoted contacts during 2 years, raising awareness about new treatment options, pressuring stakeholders to pursue an affordable universal access program using new DAAs, and helping set this agenda in Europe.
Community mobilization of people living with HCV and PUD, high level meetings with government, pharmaceutical and regulatory agency and leading clinicians kept the issue of affordable access a political priority, and attracted media.
Although not part of the official negotiation committee, GAT worked with several of the negotiators on defining the scope of the agreement which, after 7 different proposals, was finally signed (February 2015).
**Results:** Currently, in Portugal, DAAs are the standard of care, theoretically accessible to everyone with Hepatitis C, with priority criteria such as co-infection with HIV, liver fibrosis stage, cirrhosis and people with higher risk of transmission.
Payment is on a cost/volume framework, the final price being applied to all treatments and only cures are paid for. A centralized funding mechanism avoids Hospitals' budget constraints.
Real time data on treatments is available at the National Regulatory Agency's website; a committee monitors the implementation of the agreement. Recent data (February 1st) indicates 5992 initiated treatments, of which 1202 successful and 49 unsuccessful.
**Conclusions:** The community's involvement and pressure were key to keep the issue on the agenda and reach an agreement.
A step in the right direction, the agreement still includes only one company (two molecules); people who use drugs and people in prison have low access levels, and there is no investment in diagnosis (estimated 50-100 000 people living with HCV in Portugal; approximately 13 000 in the Health System). These issues will be on the advocacy agenda over the next years.

## WEPED471

### ADVOCACY IN ZIMBABWE CHALLENGING PEPFAR AND THE GLOBAL FUND: GAME-CHANGING PARTNERSHIPS

C. Mashoko[1], D. Tobaiwa[2], A. Russel[3]
[1]*Advocacy Core Team Zimbabwe, Harare, Zimbabwe,* [2]*Jointed Hands Zimbabwe, Harare, Zimbabwe,* [3]*Health GAP, Kampala, Uganda*
*Presenting author email: korarain@gmail.com*

**Background:** The US Presidential Emergency Plan for AIDS Relief (PEPFAR) and Global Fund (GF) were created to help save the lives of PLHIV. Both PEPFAR and GF contribute above 50% of HIV response in Zimbabwe. Annually, PEPFAR country team develops a Country Operational Plan (COP), which is the basis of PEPFAR's funding. The COP lays the important decisions regarding how money will be allocated, what interventions will be supported, where PEPFAR will focus geographically and programmatically, and what goals the country program will work to achieve. However, before 2012, civil society's involvement in the process was tokenistic compared to GF. The Global Fund Country Coordinating Mechanism (CCM) in Zimbabwe provides an important platform for engagement and advocacy. Significant pressure from civil society resulted in meaningful engagements - a game changing partnership.
**Description:** In 2012, civil society leaders in advocacy in Zimbabwe engaged PEPFAR Zimbabwe team demanding meaningful involvement in the COP process. Little space was created. However, civil society felt the engagement was piecemeal and wrote to Ambassador Eric Goosby expressing concerns about how the COP process sidelined civil society. Significant pressure was exerted on the CCM for meaningful engagement in the CCM.
**Lessons learned:** There is usually flexibility in determining the budget for a PEPFAR COP—but it requires evidence informed advocacy. When spaces are denied, write to the in country PEPFAR team and copy the Coordinator. PEPFAR team listens and accommodates well organized CSO coalitions. Fragmentation of CSO leads to limited meaningful input into grant decisions especially the Global Fund Concept Note.
**Conclusions/Next steps:** A costed CSO PEPFAR Engagement Plan was crafted and planning is already underway to meaningfully consult on GF HIV Concept Note as well as key CSO writing team members, way ahead of the application and country dialogue process. The advocacy team and PEPFAR team will be meeting quarterly going forward. CSO CCM reps are chairing all committees-HIV, TB, Malaria, Management ethics and HR and oversight committees.

## WEPED472

### INTRODUCING RIGHTS-BASED HIV PROJECT IN MYANMAR (REACT) AND ITS IMPACT

N.L. Tun[1], G. Gray[2], M.T. Oo[2], S. Naing[2], E.M. Soe[2]
[1]*International HIV/AIDS Alliance in Myanmar, Program, Yangon, Myanmar,*
[2]*International HIV/AIDS Alliance in Myanmar, Yangon, Myanmar*
*Presenting author email: naylintun87@gmail.com*

**Background:** According to sentinel surveillance, HIV prevalence among female sex workers aged 15-19 and 20-24 was 5.5 % and 7.9% respectively (2013), compared to adult HIV prevalence at 0.53% (2011). UNAIDS (2014) estimated that 23 percent of HIV-infections in Yangon and Mandalay occurred among sex workers. Government of Myanmar and UN figures (2013) estimate that 40,000 to 80,000 of Myanmar women aged 15 to 49 are engaged in paid sex work.
The Suppression of Prostitution Act 1949 criminalizes sex work with penalties of imprisonment of one r to three years. The Act also limits sex workers' access to healthcare and makes them vulnerable to threats and harassment from law enforcement.
**Description:** The REAct (Rights, Evidence and Action) project, a community-based monitoring and response system on human rights-related barriers to accessing HIV and health services, was started in Myanmar at the end of 2014. The Alliance in Myanmar works with four CBOs (2 for sex workers and 2 for MSM) to monitor and document cases of rights violations experienced by young people from key population groups. The beneficiaries receive emergency responses and support and referrals to a continuum of HIV, SRH, health and legal services.
**Lessons learned:** A total of 47 cases were documented using REAct. 10 cases from young men who have sex with men were documented and have resulted in all of the individuals being released from arrest. Of the 37 sex worker cases 13 are still in custody of law enforcement, despite all of the legal aid and services provided. We found that sex workers generally lack awareness about their arrest rights and because of their low legal literacy they are easy prey to police intimidation and harassment.
**Conclusions/Next steps:** In addition to documenting cases and providing emergency responses, additional skills in legal literacy and skills and negotiation are needed amongst sex workers and MSM. REAct data can be used to gain support and support policy makers and law enforcement to understand the impact of criminalization on HIV risk and key populations.

# DEFINING AND MEASURING THE QUALITY OF HIV SERVICES AND PROGRAMMES

## WEPEE473

### REDUCING LOSS TO FOLLOW-UP AMONG HIV EXPOSED INFANT IN MANICA AND SOFALA PROVINCES IN CENTRAL MOZAMBIQUE

M. Napua[1], L. da Costa Vieira[2]
[1]*National Institute of Health of Mozambque, Beira Operations Research Center, Beira, Mozambique,* [2]*Beira Operations Research Center (CIOB), Reseaarch, Beira, Mozambique*
*Presenting author email: luciadacostaviera@gmail.com*

**Background:** To reduce of mother to child HIV transmission to less than 5% by 2015, care improvement in pediatric HIV cares and early ART for HIV-positive infants are strategic priorities for the Mozambican Ministry of Health (MOH).
Beira Operations Research Center, is conducting an implementation research study to address high postpartum (PP) loss-to-follow-up (LTFU) of mothers and HIV-exposed infants in six health facilities in the Sofala and Manica provinces of central Mozambique.
**Description:** The study goals is to Determine early diagnosis time among HIV-exposed infants in central Mozambique, Determine the proportions of HIV-exposed infants from maternities enrolled in Child-at-risk clinics and pediatric HIV care. Determine the proportions of HIV-exposed infants from PP care enrolled in CCR and pediatric HIV care.Determine the proportion of HIV-positive PP mothers provided with FP services.
**Lessons learned:** The waiting time from PCR sample collection to sending of the sample to the laboratory ranged from 1 to 12 days with an average of 5 days. The waiting time since sample was send to the referral lab and arrival at HF ranged from 14 to 43 days with an average of 28 days. The waiting time from sample collection to initiation of ART ranged from 35 to 136 days with an average of 86 days.The median age of HIV diagnose was 3 months, minimal of 2 and maximal of 18 months. We learn that no early HIV infant diagnose is occurring in central Mozambique and we need some intervention to address the challenge.
**Conclusions/Next steps:** Despite the efforts undertaken at the HF level to reduce time of HIV diagnosis in HIV exposed infant, there are still many difficulties in this process. The waiting time for PCR test results continues to be a big gap hinder-

ing early diagnosis of HIV in exposed infant and delaying early initiation of ART. At the community level stigma is still high for HIV positive people, interfering with initiation and retention in HIV care services. And Nex step is to design and conduct an intervention to improve retention of HIV exposed infant and they mothers in cascade of care.

## WEPEE474

### EVALUATING HIV PREVENTION PROGRAMS DELIVERED BY CDC-FUNDED COMMUNITY-BASED ORGANIZATIONS IN THE UNITED STATES

T. Pierce[1], J. Atere-Roberts[2], R. Ellington[1], A. Eke[3], T. Griffin[1], A. Hickman[1], M. Marano[1], A. Moore[1], A. Rakestraw[1], E. Shapatava[1], R. Stein[1], G. Uhl[1], C. Wright[1]
*[1]Centers for Disease Control and Prevention, Atlanta, United States, [2]Georgia State University, Atlanta, United States, [3]Karna, Atlanta, United States*
*Presenting author email: dii7@cdc.gov*

**Background:** Since the late 1980s, CDC has partnered with community-based organizations (CBOs) to expand the reach of HIV prevention in affected communities. Because of their accessibility, history, and credibility in the community, CBOs are important partners in providing comprehensive high-impact HIV prevention (HIP) to people living with and at greatest risk for HIV infection.
**Description:** To reach populations lacking access to treatment, prevention, care and support services, CDC currently funds U.S. CBOs to deliver HIP through two Funding Opportunity Announcements (FOAs). PS11-1113 (September 2011- September 2016) funds 34 CBOs to provide HIV prevention to young men of color who have sex with men and young transgender persons of color and their partners; PS15-1502 (July 2015-June 2020) funds 90 CBOs to reach members of racial/ethnic minority communities and members of groups at highest risk for acquiring and transmitting HIV, regardless of race/ethnicity.
CDC developed Rapid Feedback Reports (RFRs), one of several mechanisms, to describe program achievement and progress towards meeting FOA goals for PS11-1113.
**Lessons learned:** RFRs use data reported by CBOs in Annual Progress Reports. In three years of funding, PS11-1113 CBOs conducted HIV testing among 41,350 individuals, identified 1,294 new HIV-positive individuals, and linked 84% of newly identified HIV-positive individuals to HIV medical care.
CBOs used RFRs to inform HIV testing priorities, share best practices with other CBOs, and enhance funding applications and reports. RFRs also stimulated discussion at CDC about how to best measure CBOs' performance.
Challenges included differences in how CBOs interpreted FOA objectives and variation in data collection and quality assurance. RFRs can be improved by reporting on all critical indicators and should consider local conditions and their effect on performance.
**Conclusions/Next steps:** RFRs are a first step in evaluating CBO HIV prevention program performance. For PS15-1502, CDC will expand data sources to include National HIV Prevention Program Monitoring & Evaluation (NHM&E) data and continue to incorporate other mechanisms for providing feedback for continuous program improvement.
NHM&E data are standardized variables that align with the National HIV/AIDS Strategy and CDC's HIP approach. NHM&E data and RFRs allow CDC to evaluate CBOs' progress towards reaching populations at highest risk for acquiring HIV.

## WEPEE475

### TREKKING THE JOURNEY ALONG THE HIV CASCADE: TRENDS IN TRANSITION TIMES FROM HIV DIAGNOSIS TO ENROLLMENT IN CARE AND ART INITIATION, NAMIBIA 2003-2015

G. Mutandi[1], A. Baughman[1], M. De Klerk[1], N. Hamunime[2], F. Tjituka[2], N. Mutenda[2], P. Luphahla[2], S. Agolory[1]
*[1]US Centers for Disease Prevention and Control, CGH/DGHT, Windhoek, Namibia, [2]Ministry of Health and Social Services, Directorate of Special Programs, Windhoek, Namibia*
*Presenting author email: gmutandi@cdc.gov*

**Background:** Recent studies have demonstrated immense individual and public health benefits when antiretroviral therapy (ART) is initiated early and patients achieve HIV viral load (VL) suppression. This has prompted WHO to introduce new test-and-treat guidelines recommending ART for all patients living with HIV. We investigated the trends in transition times from HIV diagnosis to the time of ART initiation and the median CD4 cell counts among patients enrolling in HIV program in Namibia.
**Description:** We performed a retrospective cohort analysis of a complete census of national program data of patients enrolling in HIV program during 2003 - 2015. We evaluated time from HIV diagnosis to enrollment in care and time from enrollment in care to ART initiation. Differences in percentiles by gender and age group we assessed using quantile regression.
**Lessons learned:** 224,099 patients (63%; Females) were included in the study comprising 209,624 adults (≥ 15 years) and 14,475 children. During the evaluation period, the median time from HIV diagnosis to enrollment in care declined from 387 (IQR,67-1305) days to 8 (IQR,0-37) days among adults, and from 423 (IQR,59-601) days to 7 (IQR,1-32) days among children. Median times from HIV diagnosis to enrollment in care were significantly higher throughout study period (p< 0.01) for adult females.
The median time from enrollment into care to adult ART initiation steadily increased from 0 (IQR,0-21) days in 2003 to a peak of 105 (IQR,29-665) days in 2011 before declining to 28 (IQR,4-210) days in 2015. The median time from enrollment into care to pediatric ART initiation steadily increased from 0 (IQR,0-14) days in 2003 to a peak of 43 (IQR,16-213) days in 2011 before declining to 10 (IQR,0-35) days by 2015. The median CD4 count among adults at ART initiation increased from 108 (IQR,57-177) cells/µL in 2003 to 297 (IQR,163-426) cells/µL in 2015.
**Conclusions/Next steps:** To maximize individual and public health benefits of ART, programmatic monitoring of time from HIV diagnosis to ART initiation should become important quality measures of HIV programmes. Namibia HIV program will maximally benefit from early ART initiation by implementing interventions to reduce transition times from HIV diagnosis to ART initiation.

## WEPEE476

### EVALUATING TURNAROUND TIMES FOR EARLY INFANT DIAGNOSIS SAMPLES IN KENYA FROM 2011-2014

C. Wexler[1], A.-L. Cheng[2], V. Okoth[3], B. Gautney[4], C. Bawcom[4], S. Khamadi[3], K. Goggin[2,5], S. Finocchario-Kessler[1]
*[1]University of Kansas Medical Center, Department of Family Medicine, Kansas City, United States, [2]University of Missouri-Kansas City, Kansas City, United States, [3]Kenya Medical Research Institute, Nairobi, Kenya, [4]Global Health Innovations, Kansas City, United States, [5]Children's Mercy Hospitals and Clinics, Health Services and Outcomes Research, Kansas City, United States*
*Presenting author email: skhamadi@gmail.com*

**Background:** Delays in sample processing can hinder the success of early infant diagnosis (EID) programs. In Kenya, it can take up to 8 weeks for infant HIV DNA PCR test results to be returned to hospitals. The HITSystem is an eHealth intervention that alerts clinicians and lab technicians when services are overdue or samples are delayed.
**Methods:** We conducted a retrospective analysis of 3669 HIV-exposed infants enrolled in the HITSystem from 2011-2014 at 15 hospitals, served by three laboratories in Kenya. We assessed mean and median turnaround times (TAT) from when a:
1) sample was obtained to when it was shipped to the laboratory,
2) sample shipped to when it was received at the laboratory,
3) sample received to when a result was available, and
4) sample obtained to result available.
TAT were compared by lab, year, and month of sample collection.
**Results:** Of the 3669 samples collected, 3625(98.8%) had results posted by end of 2014. For all labs, the average TAT from sample collection to shipping was 5.23 days (median=3; range = 0-698 days), from when a sample was shipped to received at the lab was 2.00 days (median=0; range=0-253), and from when it was received at the lab to a result posted was 17.44 days (median=13; range=0-744). All said, it took an average of 24.70 (median=19; range=0-776) days from when a sample was obtained until when the result was posted. There was significant variation in TAT between labs, particularly in processing times once received at the laboratory. TAT was significantly higher in December and showed a decreasing trend from 2011-2014.

| | N* | Mean Days (SD) | Median Days (Range) | P-value |
|---|---|---|---|---|
| TAT: Obtained - Shipped to Lab | | | | |
| All Labs | 3582 | 5.23 | 3 (0-698) | <.0001 |
| Lab 1 | 1823 | 6.47 (10.02) | 5 (0-277) | |
| Lab 2 | 1388 | 4.55 (19.89) | 2 (0-698) | |
| Lab 3 | 371 | 1.66 (3.75) | 1 (0-63) | |
| TAT: Shipped – Received at Lab | | | | |
| All Labs | 3565 | 2.00 | 0 (0-253) | <.0001 |
| Lab 1 | 1814 | 1.52 (9.32) | 0 (0-238) | |
| Lab 2 | 1382 | 3.09 (15.97) | 1 (0-253) | |
| Lab 3 | 369 | 0.34 (2.07) | 0 (0-34) | |
| TAT: Received at Lab- Results Available | | | | |
| All Labs | 3539 | 17.44 | 12 (0-744) | <.0001 |
| Lab 1 | 1797 | 17.62 (15.43) | 14 (0-185) | |
| Lab 2 | 1442 | 12.51 (21.46) | 10 (0-744) | |
| Lab 3 | 300 | 40.18 (26.60) | 35 (0-126) | |
| TAT: Obtained – Results Available | | | | |
| All Labs | 3544 | 24.70 | 19 (0-776) | <.0001 |
| Lab 1 | 1800 | 25.55 (21.55) | 21 (0-438) | |
| Lab 2 | 1444 | 20.07 (33.15) | 15 (0-776) | |
| Lab 3 | 300 | 41.89 (26.61) | 36 (1-127) | |

*Total sample size varies dues to missing data.

*[Table 1. Mean and median turnaround times in days by laboratory]*

Tuesday 19 July
Wednesday 20 July Poster Exhibition
Thursday 21 July
Friday 22 July
Late Breaker Posters
Author Index

**Conclusions:** Compared with TATs reported in other Kenyan studies, the HITSystem achieved shorter TAT of PCR results. However, significant variation between laboratories indicates the need to strengthen protocols and infrastructure to ensure that all laboratories throughout Kenya can provide rapid, high-quality services.

## WEPEE477

### EVALUATION OF HIV CARE QUALITY INDICATORS DURING THE IMPLEMENTATION OF ELECTRONIC MEDICAL RECORDS IN A LARGE SUB-SAHARAN HOSPITAL IN KENYA

N. Gitahi-Kamau[1,2], K. Mutai[3], P. Muiruri[3], K. Kirui[4], E. Mugambi[5]
*[1]University of Nairobi, Department of Medicine and Therapeutics, Nairobi, Kenya, [2]Jomo Kenyatta University, Nairobi, Kenya, [3]Kenyatta National Hospital, Nairobi, Kenya, [4]Palladium Group, Nairobi, Kenya, [5]University of Nairobi, Nairobi, Kenya*
*Presenting author email: gnyawira@gmail.com*

**Background:** The revision of the WHO guidelines will result in an unprecedented increase in individuals requiring HIV care and treatment. Monitoring of quality of care will require robust systems. Previous studies have reported improved completeness of medical records, reduction of errors and ease of patient outcomes data analysis through electronic medical records (EMR) implementation. Little is known about variations in quality of care and the performance of HIV care indicators during and after EMR implementation. The objective of this study was to evaluate EMR as a quality improvement tool during EMR implementation.
**Methods:** A cross -sectional study design was used to analyse data from 466 patients. Bi-phasic EMR implementation comprising of a paper based central data entry step followed by a transition to real-time (provider based) EMR. Repeated measures methods were used to test the changes in documentation of HIV quality of care indicators (Cochran's Q test) and mean time interval between CD4 tests (Friedman's test) in the three implementation phases, Paired comparisons were carried out using McNemar's test and Wilcoxon matched pair signed test.
**Results:** Documentation of quality of care indicators improved as data management system transitioned to provider-based EMR. Documentation of weight improved significantly (p<0.001) throughout the implementation period from 89.5% Pre-EMR to 100% in the provider-based EMR period. Both TB screening and adherence assessment documentation by clinicians increased significantly throughout all the EMR implementation phase (p<0.001). Documentation of laboratory tests increased during real-time EMR from 90.3% to 92.9 % (p<0.001) but did not significantly improve during the paper-based central data entry phase. This study reported significant (p<0.001) improvement in clinicians' compliance to CD4 patient monitoring guidelines from a median time interval of 9 months (IQR 6.0-14.0 months) between CD4 test ordering during pre-EMR phase to 6 months (IQR 5.0-7.0 months) during the real-time EMR.
**Conclusions:** In the background of expected increased in numbers enrolled in HIV care, this study finds the implementation of provider based 'real-time' electronic medical records beneficial in the improvement of HIV quality of care.

## WEPEE478

### CONTRIBUTING FACTORS OF LOSS TO FOLLOW-UP OF HIV EXPOSED CHILDREN IN CENTRAL MOZAMBIQUE

M. Napua
*Beira Operations Research Center, Research, Beira, Mozambique*
*Presenting author email: mnapua@hotmail.com*

**Background:** Early diagnosis of HIV infection in children is fundamental to ensure early treatment and reduce the mortality of HIV-infected children. In Mozambique, HIV prevalence is 11.5% (IDS-2011) and the retention of HIV exposed infants in the cascade of care is less than 50%. CIOB[i] is conducting a study to determine the factors contributing to loss to follow-up (LTFU) of HIV exposed infants.
[i] Beira Operations research Center.
**Methods:** Cross-sectional study with mixed methodology and design of the intervention were escalated based on formative research results. Study population was HIV + exposed infants identified in post-partum clinic and in the high risk child clinic. Six health facilities, all of which offer Option B+, were selected to be study sites. They are all located in the Beira Corridor (Munhava, Macurungo, Dondo, Primeiro-de-Maio, Nhamaonha and Gondola). We observed waiting times, collected registry data, and conducted individual and group interviews. Data was analyzed using Excel.
**Results:** Waiting times of 240 HIV+ women were observed. The median of waiting time at CCR was 94 minutes (maximum time 5 hours) average time spent at health facility was roughly 5 hours (4 hours 57 min). Median turnaround time for PCR results to the health facility was 28 days (max 56 days) in Manica province and 24 days (max 82) in Sofala province. PCR results were communicated to caregivers with an average time of 30 days (max 120 days) in Manica province and 28 days (max 100 days) in Sofala. Triumune baby was frequently stocked out at health centers (maximum time 7 days). Focus groups identified stigma as a major contributing factor (in 87% of respondents) in loss to follow up as was lack of male involvement.
**Conclusions:** LTFU of HIV exposed infants occurs in all stages of the cascade of care, but particular weaknesses were identified in high risk child clinic and ART clinic. Prolonged wait times for services, delays in receiving PCR results, stigma and lack of male involvement were all found to contribute to LTFU and poor retention of HIV exposed infants.

### ANALYZING QUALITY OF CARE OF ANTIRETROVIRAL TREATMENT IN NIGERIA: AN APPLICATION OF ITEM RESPONSE THEORY (IRT) METHODS

D. Contreras-Loya, C. Pineda Antunez, S. Bautista-Arredondo
*Instituto Nacional de Salud Publica, Health Economics, Cuernavaca, Mexico*
*Presenting author email: dcloya@gmail.com*

**Background:** Substandard quality of care of Antiretroviral treatment (ART) accounts for the largest losses in survival and quality of life, because treatment effectiveness is maximized when patients receive proper regimens of antiretroviral drugs and other elements of care such as psychological and nutritional support are provided. Proper measures of health providers' levels of competence - or knowledge - are scarce in the literature of HIV health services. We analyzed medical vignettes data from the ORPTHEN study of costs and quality in Nigeria.
**Methods:** We used data from 115 facilities providing ART services in Nigeria. Medical vignettes were developed according to WHO and country-specific treatment guidelines, and administered to a sample of 146 doctors, 58 nurses and 51 counselors (n=255), to assess knowledge of the content of baseline and follow-up examinations. The data were analyzed using Item Response Theory (IRT) methods, in order to select the critical elements that distinguish between providers with high and low competence. A competence score was generated with Principal Component Analysis (PCA) and Pearson correlations with provider and facility characteristics are reported.
**Results:** The location parameter of the logistic equations showed that the most difficult items (i.e. those that providers struggled the most to answer correctly) at baseline clinical evaluation were: i) staging with immunological classification, ii) development of adherence strategy, iii) evaluate nutritional status, and iv) evaluate psychological status. For follow-up evaluation of eligible ART patients, the most difficult items were: i) check for cancers, ii) check for pregnancy, iii) ask about fatigue and iv) ask about appetite changes. Bivariate analyses showed that patient load and the number of hours/week correlated positively with competence. With respect to facility characteristics, no differences in competence were found between public and private facilities, or between levels of care.
**Conclusions:** The analysis showed that medical vignettes of ART provide sensible data to obtain plausible and accurate indicators of competence. Substantial variation in the competence score was found in the sample, which suggests opportunities for improvement. Provider characteristics related to different levels of competence can assist in hypothesis generation of the supply-side determinants of quality of care and its trade-off with cost-efficiency.

### CONDUCTING EXTERNAL QUALITY ASSESSMENTS FOR VOLUNTARY MALE MEDICAL CIRCUMCISION (VMMC) PROGRAMS: EXPERIENCES FROM FOUR COUNTRIES

J. Ndirangu[1], D. Jacobs[1], F. Dikgale[1], P. Mohapi[2], V. Kiggundu[3], E. Njeuhmeli[3]
*[1]University Research Co., LLC, Quality & Performance Institute, Pretoria, South Africa, [2]Moyatech, Johannesburg, South Africa, [3]USAID, Office of HIV/AIDS, Washington,, United States*
*Presenting author email: jamesn@urc-sa.com*

**Background:** Funding from the President's Emergency Plan for AIDS Relief (PEPFAR) has been supporting implementation of Voluntary medical male circumcision (VMMC) programs in 14 priority countries, since 2010. In order to ensure VMMC quality, External Quality Assessments (EQAs) were conducted at selected sites within these countries, by interagency (CDC and USAID) PEFAR teams. In 2014, additional PEPFAR reporting requirements (SIMS) necessitated identification of a more efficient system of data collection to facilitate the VMMC EQA process. The USAID ASSIST project was funded to develop a VMMC EQA mobile application, as well as to support USG EQA teams in 4 countries. This paper describes these experiences.
**Description:** From Sep2015-Jan2016 four EQA/SIMS visits were conducted, in Swaziland, Lesotho, Zimbabwe and Tanzania. USG EQA teams comprising staff from OHA, in-country USAID missions, USAID ASSIST, HC3-JHU and MOH conducted a total of 24 site-level EQA/SIMS visits. In all countries there were 2-3 EQA teams.

Each team comprised between 5-8 members, and visited 4-7 sites over a five day period. At each site, a joint EQA / SIMS tool derived from WHO/UNAIDS normative standards and PEPFAR SIMS guidance was used. The EQA team performed document and chart reviews; observations of facilities, VMMC procedures, equipment and clients; and discussions with key personnel at the site. Site-level data was collected and the team also observed in-person communication, group and individual counseling, VMMC procedures and follow up review. Briefing meetings were held with MOH and in-country USAID missions prior to and following EQA/SIMS visits. Detailed site-level and country-level EQA and SIMS reports were provided to USAID 2-3 weeks following the EQA/SIMS visits. All four countries responded enthusiastically to the joint EQA/SIMS visits.
**Lessons learned:** Conducting joint EQA/SIMS visits has allowed for greater program efficiencies and reductions in costs, as one site visit may be utilized to fulfill two purposes. It has also allowed for creativity, innovation and improvement in the overall EQA design and process, through engagement of various stakeholders, including USAID ASSIST.
**Conclusions/Next steps:** The success of joint VMMC EQA/SIMS visits can be attributed to the engagement of various stakeholders working towards a common goal.

### THE PREVALENCE, TYPES OF ERRORS AND FACTORS ASSOCIATED WITH IRRATIONAL PRESCRIPTIONS OF ANTIRETROVIRAL THERAPY FOR CHILDREN UNDER 15 YEARS IN EAST CENTRAL UGANDA

V.S. Mulema[1], I. Lukabwe[2], N. Niyonzima[3,4], P. Elyanu[5], D. Akena[6], J. Nakiyingi-Miiro[7]
*[1]Clinton Health Access Initiative, HIV Access Team, Kampala, Uganda, [2]STD/AIDS Control Program/Ministry of Health, Kampala, Uganda, [3]Uganda Cancer Institute, Kampala, Uganda, [4]University of Washington, Fred Hutchinson Cancer Research Center, Seattle, United States, [5]University of Texas, School of Public Health, Houston, United States, [6]Makerere University, Department of Pyschiatry, College of Health Sciences, Kampala, Uganda, [7]University of London, London School of Hygiene and Tropical Medicine, London, United Kingdom*
*Presenting author email: vivmulema@gmail.com*

**Background:** HAART is instrumental in improving growth and immune responses in HIV-infected children. To be beneficial, children must receive HAART according to standard treatment guidelines. However, prescribing HAART in children is complicated by weight bands, age, CD4 counts, PMTCT exposure and TB co-infection creating high chances of error, failure to achieve desired treatment response and development of ARV resistance. The level of irrational prescriptions and associated factors is unknown in Uganda.
**Methods:** We conducted a retrospective cross-sectional study in one public and one private hospital in East Central Uganda, between April and September 2013. Data on prescriptions for children under 15 years was collected from patient files. We reviewed facility records to determine site-specific factors and prescribers completed semi-structured questionnaires to highlight prescriber-related reasons for errors. Data was entered into Epi data software and analyzed using STATA.
**Results:** A total of 166 children were observed, 63% from the private facility and 37% from the public health center. Overall, 58.4% (n=97) of children had at least one irrational ARV prescription. 71.1% of these were from the private site. While in the public facility most (60.7%) of the children had one irrational prescription, in the private setting, majority (46.1%) had 2- 4 irrational prescriptions.
All 12 children newly initiated on ART had an irrational prescription. Errors of commission, majorly prescribing adult formulations, were the commonest types of errors (71%) followed by integration errors such as regimens that were not HAART (18%). Mid-level prescribers wrote majority of the irrational prescriptions at 44%.
Children on treatment for less than a year were 14 times more likely to have an irrational prescription as compared to those on treatment for more than a year (95%CI: 2.75-72.09, P-value=0.002). Children attending the private facility were 2.7 times more likely to have irrational prescriptions in comparison with those in the public setting (95% CI: 1.28-5.60, P-value=0.009).
**Conclusions:** There is high prevalence of irrational prescriptions among children in Uganda putting them at risk of treatment failure and drug resistance. Quality improvement strategies that reduce patient load and automate decision-making should be implemented to mitigate the incidence of irrational prescriptions.

### CLIENTS' PERCEPTIONS AND SATISFACTION WITH HIV COUNSELLING AND TESTING: A CROSS-SECTIONAL STUDY IN SOUTH AFRICAN HEALTH FACILITIES

M.G. Matseke[1], N. Mohlabane[2], K. Peltzer[2,3,4], A. Mwisongo[5]
*[1]Human Sciences Research Council, HAST Research Programme, Pretoria, South Africa, [2]Human Sciences Research Council, HIV/AIDS, STIS and TB, Pretoria, South Africa, [3]University of Limpopo, Turfloop Campus, Department of Psychology, Sovenga, South Africa, [4]Madidol University, ASEAN Institute for Health Development, Salaya, Thailand, [5]University of the Witwatersrand, School of Public Health, Johannesburg, South Africa*
*Presenting author email: nmohlabane@hsrc.ac.za*

**Background:** Client satisfaction serves as a predictor for acceptance of HIV Counselling and Testing (HCT) services. Hence, clients' perception and satisfaction studies provide insight to improving HCT programmes in many countries.
**Objectives:** The aim of this study was to assess clients' satisfaction with HCT as well as describe perceived barriers and facilitators of HIV testing by HCT clients in South Africa.
**Methods:** A cross-sectional survey was conducted through interviews with 494 clients purposefully selected at the end of an HCT visit at 56 HCT sites throughout the country.
**Results:** All study participants had tested for HIV with 98.8% receiving their results. The vast majority (75.5%) of clients reported that they had decided to be tested for HIV by themselves. Most participants were females (62.2%) as compared to males (37.8%). High levels of satisfaction with HCT service (89.8%), low levels (27.7%) of difficulty in making the decision to have an HIV test, and the high levels of perceived confidentiality (94.6%) of the HIV test results, were reported in this study.
The most cited perceived barrier to HIV testing was lack of awareness about the HCT service (98%), while staff attitudes (37%), confidentiality (29.6%) and privacy (23.6%) were perceived facilitators. In logistic regression, sex, age, relationship status, facility type, geotype, length of time for counselling, length of time to receive HIV test results and staff attitude, were not statistically significant predictors of clients' satisfaction.
However, when adjusted for all the other factors, staff attitude was statistically significant in predicting client satisfaction.
**Conclusions:** Uptake of HIV testing in this study is high, with most making a decision to test by themselves and a commendable proportion of participants reporting receipt of their test results. Although not all significant, client related and service-delivery factors contribute as predictors of satisfaction with HCT in this study.

## WEPEE483

### IMPROVING HEALTHCARE SERVICE DELIVERY TO PLHIV THROUGH THE DUAL ADMINISTRATION OF A STANDARDIZED MONITORING TOOL AND TARGETED CAPACITY-BUILDING: EXPERIENCES FROM KEBBI STATE, NORTHERN NIGERIA

N. Onuaguluchi[1], M. Makumbi[1], N. Ndulue[1], G. Egesimba[1], A. Etsetowaghan[1], E. Nwabueze[1], F. Mairiga[1], V. Adepoju[1], A. Atobatele[2]
*[1]Management Sciences for Health, Clinical, Abuja, Nigeria, [2]USAID, Monitoring & Evaluation, Abuja, Nigeria*
*Presenting author email: nonuaguluchi@msh.org*

**Background:** Despite efforts to improve Tuberculosis (TB) and HIV collaborative services to PLHIV in Nigeria, delivery of these services remains low. Management Sciences for Health implements the USAID-funded ProACT Project which administers PEPFAR's Site Improvement through Monitoring Systems (SIMS) as a standardized monitoring tool for assessing quality of service delivery at site-level. This study examined the effect of the dual administration of the SIMS tool at routine facility visits and targeted capacity building of health workforce, on improving HIV service delivery at Sir Yahaya Memorial Hospital (SYMH) a government-owned secondary health facility in Kebbi State, Northern Nigeria.
**Description:** The SIMS Tool was administered at SYMH on 9th June 2015 to assess two Core Essential Elements (CEEs) of HIV service delivery; provision of routine HIV testing and counseling to all adult and adolescent Tuberculosis patients and routine HIV testing in children. This revealed that 30% of HIV-positive adult TB patients had documentation of ART initiation and 0% of pediatric in-patients had documented HIV testing and counselling. An innovative approach that involved targeted mentoring of the Directly Observed Therapy Short Course (DOTS) focal person on appropriate documentation in the Tuberculosis Register and conducting a Continuing Medical Education program for Physicians and Nurses on HIV testing in pediatric patients, was developed and implemented. The SIMS Tool was re-administered on 15th July 2015 and 2nd October 2015 to assess the same CEEs.
**Lessons learned:** Documentation of ART initiation in HIV-positive adult TB patients increased to 70% (2nd visit) and 80% (3rd visit); while HTC for pediatric in-patients remained at 0% at the 2nd visit but rose to 70% by the 3rd visit.

**Conclusions/Next steps:** The implementation of the SIMS standardized monitoring tool (SIMS) at the site-level to assess the quality of healthcare services was beneficial to tailoring interventions to address noted gaps. Developing healthcare workforce capacity to conduct HIV testing within TB departments, establish adequate complete referral systems between departments and manage co-infected patients are vital to the implementation of quality TB-HIV collaborative services. This intervention was shown to improve healthcare service delivery to PLHIVs in Kebbi State, Northern Nigeria.

### HEALTHCARE TRANSITION PRACTICES ACROSS THE BAYLOR COLLEGE OF MEDICINE INTERNATIONAL PEDIATRIC AIDS INITIATIVE (BIPAI) NETWORK OF PEDIATRIC HIV CLINICS

S.L. Gillespie[1], E.D. Pettitt II[1], G.M. Anabwani[2], M. Hlatshwayo[3], P.N. Kazembe[4], E.Q. Mohapi[5], L.F. Mwita[6], C.M. Wiemann[7], A.C. Hergenroeder[7], M.E. Paul[1]
*[1]Baylor College of Medicine, Pediatrics - Retrovirology/BIPAI, Houston, United States, [2]Botswana Baylor Children's Clinical Center of Excellence, Gaborone, Botswana, [3]Baylor College of Medicine Children's Foundation - Swaziland, Mbabane, Swaziland, [4]Baylor College of Medicine Children's Foundation - Malawi, Lilongwe, Malawi, [5]Baylor College of Medicine Children's Foundation - Lesotho, Maseru, Lesotho, [6]Baylor College of Medicine Children's Foundation - Tanzania, Mwanza, Tanzania, United Republic of, [7]Baylor College of Medicine, Pediatrics - Adolescent Medicine, Houston, United States*
*Presenting author email: slg@bcm.edu*

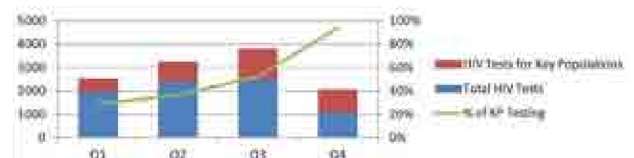
**Background:** The Baylor College of Medicine International Pediatric AIDS Initiative (BIPAI) network has provided care to over 250,000 HIV-infected and -exposed children and youth resulting in a large number of youth that will transition from pediatric- to adult-model care. The purpose of this study is to describe the characteristics and current healthcare transition practices of BIPAI clinics in order to assess transition-related needs and identify ways to improve the transition process.
**Methods:** Seven of eight BIPAI sites responded to a 40-item survey: Gaborone, Botswana; Maseru, Lesotho; Lilongwe, Malawi; Mbabane, Swaziland; Mbeya, Tanzania; Mwanza, Tanzania; and Houston, Texas, USA. The survey elicited information about clinic staffing, patient demographics, current healthcare transition-related activities, and perceived barriers to youth healthcare transition.
**Results:**
***Demographics:*** A total of 16,453 active patients were enrolled at the 7 sites, ranging from 127 to 5320 patients per site; 53% were female, 18.6% were adolescents (15-19 years), and 17% were youth ≥20 years of age. Almost all patients were perinatally infected.
***Clinic Structure:*** Each clinic described a multidisciplinary model of care including medical and psychosocial services as well as significant additional support services for adolescent and young adult patients including support groups, nutritional support, camps, and life skills education.
***Transitioning:*** A total of 263 patients were transferred from BIPAI clinics in the past year. The number of patients transitioned ranged from 5 to 87 patients per site. Reasons for transferring patients included age, pregnancy and changes in residence, school and/or work location. Clinic respondents cited concerns regarding transition-readiness of patients and the lack of support services outside of the pediatric clinic as potential barriers to healthcare transition.
**Conclusions:** Across the BIPAI network there is a significant and rapidly increasing number of patients to transition to adult-model care. The number of patients transitioned varied widely by site due in part to concerns about patient readiness and the potential loss of services available in the pediatric clinic. Improving patient readiness and active linkage to community support services may reduce resistance to transition. A systematic evaluation and improvement of the transition process at each site and follow-up of those who have transitioned is recommended.

## WEPEE485

### THE PEPFAR PIVOT: ENGAGING ORGANIZATIONS LED BY KEY POPULATIONS TO MAXIMIZE REACH

J. Quelch[1], J. Simpson[2]
*[1]Society Against Sexual Orientation Discrimination, Projects, Georgetown, Guyana, [2]Society Against Sexual Orientation Discrimination, Georgetown, Guyana*
*Presenting author email: coordinator@sasod.org.gy*

**Background:** The United States' President's Emergency Plan For AIDS Relief (PEPFAR) is transitioning its focus from direct service delivery to technical assistance and collaborative support. PEPFAR has continued to shift its support to programming for key populations (KPs) most-at-risk for HIV and simultaneously building capacity for KPs service delivery, promoting targeted, evidence-based interventions for these groups.
**Description:** This 'Pivot' has streamlined service provision in strategically positioned areas where KPs are concentrated; it focuses on Region 4 of Guyana - the most densely populated administrative region - where the most reported cases of HIV positives were recorded, and primarily reaching men who have sex with men (MSM), transgender persons, and sex workers. Since the shift, KP-led organizations have recorded a surge in the numbers of KPs that have been met with HIV Prevention Interventions, including Voluntary Counseling and Testing for HIV (VCT). The KP-led organizations subsequently included through contract with USAID's Advancing Partners and Communities (APC) Project showed significant improvement in contributing to meeting targets for the fiscal year, with these organizations contributing 33% of the overall reach, despite only joining the project for the last four (4) months.
**Lessons learned:** As the findings demonstrate, KP-led organizations have proven to be more effective at reaching their peers with HIV prevention interventions in the Guyana context.
Given the data above, of the eight (8) total grantees now under the project, only three (3) were providing HIV prevention services for KPs, which showed a 94% contribution to the total number of persons tested, as compared to 52% just four (4) months before.
**Conclusions/Next steps:** Given this evidence, national AIDS programs and donor partners should engage KP-led organizations to reach their peers and maximize uptake of HIV prevention services among KPs. This greater involvement of KPs, as a fundamental strategy, will demonstrate more effective results towards universal access.



*[Graph showing increase of KP testing]*

## FACILITY-LEVEL QUALITY IMPROVEMENT (QI) INITIATIVES

## WEPEE486

### TELEPHONIC DEFAULTER TRACING BY MENTOR MOTHERS

W.O. Nango, R. Towett, C. Muruka, M. Simba
*mothers2mothers, Department of Programmes and Technical Services, Nairobi, Kenya*
*Presenting author email: milker.simba@m2m.org*

**Background:** An EMTCT strategic framework launched in 2012 by the Kenyan Ministry of Health identified five strategic directions which included meaningful involvement of HIV- positive mothers as Mentor Mothers (MMs), which led to the development of guidelines for implementation of the Kenya Mentor Mother Program (KMMP). KMMP seeks to improve PMTCT uptake and retention in care through peer education and psychosocial support.
